- When the **no** form of the command is used, the DHCP Snooping configuration is *removed* and dynamic binding table entries are cleared.

Examples

```
-> dhcp-snooping admin-state enable
-> dhcp-snooping admin-state disable
-> no dhcp-snooping
```

Release History

Release 7.3.4; command introduced.
Release 8.6R1; **no** form of the command added.

Related Commands

dhcp-snooping vlan	.Enables or disables DHCP Snooping on a per-VLAN basis.
show dhcp-snooping	Displays the current DHCP Snooping configuration for the switch.

MIB Objects

`dhcpSnoopingMode`

dhcp-snooping mac-address-verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

dhcp-snooping mac-address-verification admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP MAC address verification for the switch.
disable	Disables DHCP MAC address verification for the switch.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping mac-address-verification admin-state enable
-> dhcp-snooping mac-address-verification admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping option-82-data-insertion	Globally enables or disables DHCP Option-82 data insertion for DHCP packets.
show dhcp-snooping	Displays the current DHCP Snooping configuration for the switch.

MIB Objects

```
dhcpSnoopingMacAddrVerificationStatus
```

dhcp-snooping option-82-data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

dhcp-snooping option-82-data-insertion admin-state {enable | disable}

Syntax Definitions

enable	Enables inserting the DHCP Option-82 field into DHCP packets.
disable	Disables inserting the DHCP Option-82 field into DHCP packets.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, Option-82-data-insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> dhcp-snooping option-82-data-insertion admin-state enable
-> dhcp-snooping option-82-data-insertion admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping admin-state	.Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping option-82 format	Configures the type of information that is inserted in both the Circuit ID and Remote ID suboption of the Option-82 field.
show dhcp-snooping	Displays the current DHCP Snooping configuration for the switch.

MIB Objects

```
dhcpSnoopingOpt82DataInsertionStatus
```

dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

dhcp-snooping bypass option-82-check admin-state {enable | disable}

Syntax Definitions

enable	Bypasses the Option-82 field check.
disable	Checks DHCP packets for the Option-82 field.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

Examples

```
-> dhcp-snooping bypass option-82-check admin-state enable
-> dhcp-snooping bypass option-82-check admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping admin-state	Globally enables or disables DHCP Snooping for the switch.
show dhcp-snooping	Displays the current DHCP Snooping configuration for the switch.

MIB Objects

```
dhcpSnoopingBypassOpt82CheckStatus
```

dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

dhcp-snooping option-82 format [base-mac | system-name | user-string *string* | **interface-alias | auto-interface-alias | ascii [{ remote-id | circuit-id} {base-mac | cvlan | interface | interface-alias | system-name | user-string** *string* **| vlan} {delimiter** *string***}]]**

no dhcp-snooping option-82 format ascii {remote-id | circuit-id}

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
string	A user defined text string. Supports up to 64 characters.
interface-alias	The alias configured for the interface.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: SystemName_slot_port. ascii ASCII format.
ascii	ASCII format. **remote-id** | **circuit-id**: Select the sub-id fields of option-82 to configure ASCII. **base-mac**: The base MAC address of the switch. **cvlan**: The Customer VLAN ID. **interface**: The interface name. **interface-alias**: The alias configured for the interface. **system-name**: The system name of the switch. **user-string**: A user defined text string. **vlan**: The VLAN ID of which the client is a member. string: A user-defined text string. **delimiter**: The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are | (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

Defaults

parameter	default
user-string *string* | system-name | interface-alias | base-mac | auto-interface-alias | ascii	base-mac
ascii	base-mac

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a string for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the string “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the interfaces alias command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the interface-alias and auto-interface-alias commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID or Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- In order for the backward slash “\” delimiter to be parsed correctly it must be entered as “\\”.
- Use the **no** form of this command to remove the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 fields option-82-check admin-state disable.

Examples

```
-> dhcp-snooping option-82 format user-string “Building B Server”
-> dhcp-snooping option-82 format system-name
-> dhcp-snooping option-82 format base-mac
-> dhcp-snooping option-82 format interface-alias
-> dhcp-snooping option-82 format auto-interface-alias
-> no dhcp-snooping option-82 format ascii remote-id
-> no dhcp-snooping option-82 format ascii circuit-id
-> dhcp-snooping option-82 format ascii circuit-id cvlan cvlan delimiter “\\”
```

Release History

Release 7.3.4; command introduced.

```

dhcp-snooping option-82 policy

Specifies whether to keep, replace, or drop the Option-82 field from DHCP packets entering the switch.

dhcp-snooping option-82 policy [replace | keep | drop]

Syntax Definitions

replace	Replaces Option-82 field in the incoming DHCP packets.
keep	Keeps Option-82 field in the incoming DHCP packets.
drop	Drops the packet with Option-82 in the incoming DHCP packets.

Defaults

By default, the Option-82 field is replaced in the DHCP packets.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> dhcp-snooping option-82 policy replace
-> dhcp-snooping option-82 policy keep
-> dhcp-snooping option-82 policy drop
```

Release History

Release 8.5R2; command introduced.

Related Commands

dhcp-snooping admin-state	Globally enables or disables DHCP Snooping for the switch.
show dhcp-snooping	Displays the global DHCP Snooping configuration.

MIB Objects

```
dhcpSnoopingOption82Policy
```

dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

dhcp-snooping vlan *vlan_id***[-***vlan_id2***] [mac-address-verification | option-82-data-insertion] admin-state {enable | disable}**

no dhcp-snooping vlan *vlan_id***[-***vlan_id2***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	The VLAN identification number. Valid range is 1–4094. Use a hyphen to specify a range of VLANs (10-15).
mac-address verification	Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
option-82 data-insertion	Enables or disables inserting Option-82 information into DHCP packets.
admin-state	Enables or disables DHCP snooping feature for specified VLAN.

Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

parameter	default
mac-address verification	Enabled
option-82 data-insertion	Enabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the DHCP Snooping configuration for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.

- Note that disabling the DHCP Snooping Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

```
-> dhcp-snooping vlan 100 admin-state enable
-> dhcp-snooping vlan 100 admin-state disable
-> dhcp-snooping vlan 100 mac-address-verification admin-state enable
-> no dhcp-snooping vlan 100
-> dhcp-snooping vlan 200-205 admin-state enable
-> dhcp-snooping vlan 200-205 admin-state disable
-> dhcp-snooping vlan 200-205 option-82 data-insertion admin-state enable
-> no dhcp-snooping vlan 200-205
```

Release History

Release 7.3.4; command introduced.
Release 8.6R1; **no** form of the command added.

Related Commands

dhcp-snooping admin-state	Globally enables or disables DHCP Snooping for the switch.
show dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.

MIB Objects

```
dhcpSnoopingVlanTable
   dhcpSnoopingVlanNumber

   dhcpSnoopingVlanStatus
   dhcpSnoopingVlanAdminState
```

dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

dhcp-snooping port *chassis*/*slot1*/*port***[-***port2***] {block | client-only | trust}**

Syntax Definitions

chassis	The chassis identifier.
slot1/*port***[-***port2***]**	The slot and port number (1/1/3). Use a hyphen to specify a range of ports (1/1/3-8).
block	Blocks all DHCP traffic on the port.
client-only	Allows only DHCP client traffic on the port.
trust	Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.

Examples

```
-> dhcp-snooping port 1/1/24 trust
-> dhcp-snooping port 1/1/1-10 block
-> dhcp-snooping port 1/1/8 client-only
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping admin-state	Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.
show dhcp-snooping port	Displays the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
```

dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

dhcp-snooping linkagg *agg_id***[-***agg_id2***] {block | client-only | trust}**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (1-5).
block	Blocks all DHCP traffic on the link aggregate.
client-only	Allows only DHCP client traffic on the link aggregate.
trust	Allows all DHCP traffic on the link aggregate. The link aggregate behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the **show dhcp-snooping port** command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping linkagg 1 trust
-> dhcp-snooping linkagg 5-8 trust
-> dhcp-snooping linkagg 2 block
-> dhcp-snooping linkagg 5-8 block
-> dhcp-snooping linkagg 3 client-only
-> dhcp-snooping linkagg 5-8 client-only
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping admin-state	Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
```

dhcp-snooping ip-source-filter admin-state

Enables or disables the DHCP Snooping IP source filtering functionality for the switch.

dhcp-snooping ip-source-filtering admin-state {enable | disable}

Syntax Definitions

enable	Enables IP source filtering for the switch.
disable	Disables IP source filtering for the switch.

Defaults

By default, the DHCP Snooping IP source filtering functionality is enabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When IP source filtering is disabled for the switch, the user-defined IP source filtering configuration is maintained but not operationally active.
- When DHCP Snooping is disabled for the switch, the status of IP source filtering is not changed; if IP source filtering is enabled, the functionality is still applied to static binding table entries.

Examples

```
-> dhcp-snooping ip-source-filter admin-state disable
-> dhcp-snooping ip-source-filter admin-state enable
```

Release History

Release 8.6R1; command introduced.

Related Commands

dhcp-snooping ip-source-filter	Enables or disables DHCP Snooping IP source filtering for a port, link aggregate, or VLAN.
show dhcp-snooping ip-source-filter	Displays the global IP source filtering status.

MIB Objects

`dhcpSnoopingIpSourceFilterAdminState`

dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability on a port, link aggregate, or VLAN. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

dhcp-snooping ip-source-filter {vlan *vlan_id***[-***vlan_id2***]| port** *chassis*/*slot*/*port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	The VLAN identification number (1–4094). Use a hyphen to specify a range of VLANs (10-15).
chassis	The chassis identifier.
slot1/*port***[-***port2***]**	The slot and port number (1/1/3). Use a hyphen to specify a range of ports (1/1/3-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (1-5).
enable	Enables IP source filtering for the specified port, link aggregate, or VLAN.
disable	Disables IP source filtering for the specified port, link aggregate, or VLAN level.

Defaults

By default, IP source filtering is disabled for a port, link aggregate, or VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled as follows:
  - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
  - on all the ports when DHCP Snooping is globally enabled for the switch.
- The user-defined IP source filtering configuration is not operationally active unless the IP source filtering functionality is globally enabled for the switch. By default, the global functionality is enabled and is configurable through the **dhcp-snooping ip-source-filter admin-state** command.

Examples

```
-> dhcp-snooping ip-source-filter port 1/1/1 admin-state enable
-> dhcp-snooping ip-source-filter port 1/1/1-5 admin-state enable
-> dhcp-snooping ip-source-filter linkagg 2 admin-state enable
-> dhcp-snooping ip-source-filter vlan 10 admin-state enable
-> dhcp-snooping ip-source-filter vlan 20 admin-state disable
```

Release History

Release 7.3.4; command introduced.
Release 8.5R2; support for port ranges added.

Related Commands

dhcp-snooping ip-source-filter admin-state	Enables or disables DHCP Snooping IP source filtering functionality for the switch.
show dhcp-snooping ip-source-filter	Displays the ports or VLANs on which IP source filtering is enabled.

MIB Objects

```
dhcpSnoopingSourceFilterVlanTable
   dhcpSnoopingSourceFilterVlanNumber
   dhcpSnoopingSourceFilterVlanFilteringStatus
dhcpSnoopingPortTable
   dhcpSnoopingPortIpSourceFiltering
```

dhcp-snooping binding admin-state

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

dhcp-snooping binding admin-state {enable | disable}

Syntax Definitions

enable	Enables the creation of binding table entries.
disable	Disables the creation of binding table entries.

Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.

Examples

```
-> dhcp-snooping binding admin-state disable
-> dhcp-snooping binding admin-state enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingStatus
```

dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

dhcp-snooping binding timeout *seconds*

Syntax Definitions

seconds	The number of seconds to wait before the next save. The valid range is 1–600.

Defaults

By default, the timeout value is set to 1 second.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the **dhcpBinding.db** file in the **/flash/switch** directory.
- The **dhcpBinding.db** file is time stamped when a save of the binding table contents is successfully completed.

Examples

```
-> dhcp-snooping binding timeout 600
-> dhcp-snooping binding timeout 250
```

Release History

Release 7.3.4; command introduced.
Release 8.6R1; default timeout changed to 1 second and valid timeout range changed to 1–600 seconds.

Related Commands

dhcp-snooping binding admin-state	.Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingDatabaseSyncTimeout
```

dhcp-snooping binding action

Triggers a purge, renew, or save action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file. A save action saves table entries in switch memory to the **dhcpBinding.db** file.

dhcp-snooping binding action {purge | renew | save}

Syntax Definitions

purge	Clears all binding table entries that are maintained in switch memory.
renew	Populates the binding table with entries saved in the **dhcpBinding.db file** located in the **/flash/switch** directory on the switch.
save	Saves the binding table entries in switch memory to the **dhcpBinding.db file** located in the **/flash/switch** directory on the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **save** option to invoke an explicit save of binding table entries to the **dhcpBinding.db** file.
- To sync the binding table contents with the contents of the **dhcpBinding.db** file:
  - use the **purge** option to clear the binding table entries, then
  - use the **renew** option to repopulate the binding table with entries saved in the **dhcpBinding.db** file.

Examples

```
-> dhcp-snooping binding action purge
-> dhcp-snooping binding action renew
-> dhcp-snooping binding action save
```

Release History

Release 7.3.4; command introduced.
Release 8.6.R1; **save** option added.

Related Commands

dhcp-snooping binding admin-state	.Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

```
dhcpSnoopingBindingDatabaseAction
```

dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

dhcp-snooping binding persistency admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping binding persistency.
disable	Disables DHCP Snooping binding persistency.

Defaults

By default, DHCP Snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the **show dhcp-snooping** command to display the current status.

Examples

```
-> dhcp-snooping binding persistency admin-state enable
-> dhcp-snooping binding persistency admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding admin-state	Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

```
dhcpSnoopingBindingPersistencyStatus
```

dhcp-snooping binding

Creates a static entry in the binding table.

dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

no dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

Syntax Definitions

mac_address	The client MAC address.
chassis	The chassis identifier.
*slot1/port***[**-*port2***]**	The slot and port number (3/1).
ip_address	The IP address that the DHCP server offered to the client.
vlan_id	The VLAN identification number (1–4094).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.
- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.

Examples

```
-> dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
-> no dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan
200
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.
show dhcp-snooping binding	Displays the contents of the DHCP Snooping binding table (database).

MIB Objects

```
dhcpSnoopingBindingTable
   dhcpSnoopingBindingMacAddress
   dhcpSnoopingBindingIfIndex
   dhcpSnoopingBindingIpAddress
   dhcpSnoopingBindingVlan
   dhcpSnoopingBindingRowStatus
```

show dhcp-snooping

Displays the global DHCP Snooping configuration.

show dhcp-snooping

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When DHCP Snooping is enabled for the switch or for a specific VLAN, the DHCP Snooping binding database status is automatically enabled and additional fields are displayed.
- When DHCP Snooping is enabled at the switch level, the “Option 82 Data Insertion Per Switch” and “MAC Address Verification Per Switch” fields are displayed; these fields do not display when DHCP Snooping is enabled at the VLAN level.

Examples

```
-> show dhcp-snooping
DHCP Snooping :
  DHCP Snooping Status                              =  Disabled
  DHCP Snooping Bypass Opt82-Check                  =  Disabled,
  DHCP Snooping Opt82 Format                        =  Base MAC,
  DHCP Snooping Opt82 String                        =  2c:fa:a2:13:e4:02,
  DHCP Snooping Binding DB Status                   =  Disabled,
  DHCP Snooping Option-82 Policy                    =  Replace,

-> dhcp-snooping admin-state enable
-> show dhcp-snooping
DHCP Snooping :
  DHCP Snooping Status                              =  Switch-Level Enabled,
      Option 82 Data Insertion Per Switch           =  Enabled,
      MAC Address Verification Per Switch           =  Enabled,
  DHCP Snooping Bypass Opt82-Check                  =  Disabled,

  DHCP Snooping Option-82 Policy                    =  Replace,
```

output definitions

DHCP Snooping Status	Displays whether DHCP Snooping is enabled at the **Switch-Level**, **VLAN-Level**, or **Disabled**.
Option 82 Data Insertion Per Switch	Indicates whether or not (**Enabled** or **Disabled**) the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server. Configured through the **dhcp-snooping option-82-data-insertion** command.
MAC Address Verification Per Switch	Indicates whether or not (**Enabled** or **Disabled**) the source MAC address is compared to the client hardware MAC address in the DHCP packet; if there is a mismatch the packet is dropped. Configured through the **dhcp-snooping mac-address-verification**
DHCP Snooping Bypass Opt82-Check	Indicates whether DHCP packets received on untrusted ports are checked to see if they contain the Option-82 field (**Disabled**) or not checked (**Enabled**). Configured through the **dhcp-snooping bypass option-82-check** command.
DHCP Snooping Opt82 Format	Displays the type of Option-82 information inserted into the Circuit ID and Remote ID suboptions of the Option-82 field. Configured through the **dhcp-snooping option-82 format** command.
DHCP Snooping Opt82 string	Displays the contents of the Option-82 string that is inserted into the Circuit ID and Remote ID supoptions of the Option-82 field.
DHCP Snooping Binding DB Status	Displays whether the DHCP Snooping binding table functionality is **Enabled** or **Disabled**. Configured through the **dhcp-snooping binding admin-state** command.
Database Sync Timeout	The amount of time, in seconds, between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. Configured through the **dhcp-snooping binding timeout** command.
Database Last Sync Time	The last date and time DHCP Snooping binding table entries were saved from memory to a file on the switch.
Binding Persistency Status	Indicates whether a binding table entry is retained (**Enabled**) or removed (**Disabled**) if the MAC address is missing from the MAC address table when the binding table database is synchronized. Configured through the **dhcp-snooping binding persistency** command.
DHCP Snooping Option-82 Policy	Indicates whether to **keep**, **replace**, or **drop** the Option-82 field information contained in DHCP packets received by the switch. Configured through the **dhcp-snooping option-82 policy** command.

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping admin-state	Enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping at the VLAN level.

```

show dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show dhcp-snooping ip-source-filter {vlan | port}

Syntax Definitions

vlan	Displays the VLANs on which IP source filtering is enabled.
port	Displays the ports on which IP source filtering is enabled.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

Examples

```
-> show dhcp-snooping ip-source-filter port

Global Admin Status : Enabled

              IP Src
   Port      Filtering
----------+-------------
1/1/7       Enabled
1/1/12      Enabled
1/4/30      Enabled
1/4/35      Enabled
```

output definitions

Global Admin Status	The status of DHCP Snooping IP source filtering functionality for the switch (**Enabled** or **Disabled**).
Port	The chassis, slot, and port number.
IP Src Filtering	The IP source filtering status (**Enabled** or **Disabled**) for the port.

```
-> show dhcp-snooping ip-source-filter vlan

Global Admin Status : Enabled

 VLAN    Ip Src
  ID    Filtering
------+------------
 10     Enabled
 11     Enabled
```

output definitions

Global Admin Status	The status of DHCP Snooping IP source filtering functionality for the switch (**Enabled** or **Disabled**).
Vlan ID	The VLAN ID number.
IP Src Filtering	The IP source filtering status (**Enabled** or **Disabled**) for the VLAN ID.

Release History

Release 7.3.4; command introduced.
Release 8.6.R1; “Global Admin Status” field added.

Related Commands

dhcp-snooping ip-source-filter admin-state	Enables or disabled the DHCP Snooping IP source filtering functionality for the switch.
dhcp-snooping ip-source-filter	Enables or disables IP source filtering for a specific port, link aggregate, or VLAN.

MIB Objects

```
dhcpSnoopingIpSourceFilterAdminState
dhcpSnoopingSourceFilterVlanTable
   dhcpSnoopingSourceFilterVlanNumber
   dhcpSnoopingSourceFilterVlanFilteringStatus
dhcpSnoopingPortTable
   dhcpSnoopingPortIpSourceFiltering
```

show dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

show dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show dhcp-snooping** command to determine the status of DHCP Snooping at the switch level.

Examples

```
-> show dhcp-snooping vlan
VLAN    Admin      Opt82        MAC Addr
 ID     State     Insertion   Verification
------+----------+----------+--------------
 50    Enabled    Enabled      Enabled
 60    Enabled    Enabled      Enabled
 100   Enabled    Disabled     Enabled
 200   Enabled    Enabled      Disabled
 300   Disabled   Enabled      Enabled
 1500  Disabled   Disabled     Disabled
```

output definitions

VLAN ID	The VLAN identification number for the DHCP Snooping VLAN.
Admin State	The administrative status of DHCP Snooping for the VLAN (**Enabled** or **Disabled**).
MAC Addr Verification	Indicates whether or not MAC address verification is enabled for the VLAN (**Enabled** or **Disabled**).
Opt-82 Insertion	Indicates whether or not Option-82 data insertion is enabled for the VLAN (**Enabled** or **Disabled**).

Release History

Release 7.3.4; command introduced.
Release 8.6R1; “Admin State” field added.

Related Commands

dhcp-snooping vlan	Enables or disables DHCP Snooping, MAC address verification, and Option-82 data insertion for the specified VLAN.
show dhcp-snooping	Displays the current DHCP Snooping configuration.
show dhcp-snooping port	Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

```
dhcpSnoopingVlanTable
   dhcpSnoopingVlanNumber
   dhcpSnoopingVlanMacAddrVerificationStatus
   dhcpSnoopingVlanOpt82DataInsertionStatus
   dhcpSnoopingVlanStatus
   dhcpSnoopingVlanAdminState
```

show dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports and link aggregates that are filtered by DHCP Snooping.

show dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports and link aggregates is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports and link aggregates that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports and link aggregates that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

Examples

```
-> show dhcp-snooping port
            Trust   Opt82       MAC       Server     Relay      Binding
   Port     Mode    Violation  Violation  Violation  Violation  Violation
----------+--------+----------+----------+----------+----------+----------
1/4/1      Blocked        0          0          0          0          0
1/4/2      Client         0          0          0          0          0
1/4/3      Client         0          0          0          0          0
1/4/4      Trusted        0          0          0          0          0
1/4/5      Client         0          0          0          0          0
 0/10      Trusted        0          0          0          0          0
```

output definitions

Port	The chassis, slot, and port number or a link aggregate ID number
Trust Mode	The DHCP Snooping trust mode for the port (**Blocked**, **Client**, or **Trusted**). Configured through the **dhcp-snooping port** command.
Opt82 Violation	The number of DHCP packets dropped due to a DHCP Snooping Option-82 violation.

output definitions (continued)

MAC Violation	The number of DHCP packets dropped due to a mismatch between the packet source MAC address and the client hardware address contained within the packet.
Server Violation	The number of DHCP server packets dropped because they originated from outside the network or firewall.
Relay Violation	The number of DHCP packets dropped because the packet included a relay agent IP address that was not 0.0.0.0.
Binding Violation	The number of DHCP packets dropped due to a mismatch between packets received and binding table information.

Release History

Release 7.3.4; command introduced.

Related Commands

show dhcp-snooping	Displays the current DHCP Snooping configuration.
show dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.
dhcp-snooping clear violation-counters	Clears the DHCP violation counters.

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
   dhcpSnoopingPortOption82Violation
   dhcpSnoopingPortMacAddrViolation
   dhcpSnoopingPortDhcpServerViolation
   dhcpSnoopingPortRelayAgentViolation
   dhcpSnoopingPortBindingViolation
```

dhcp-snooping clear violation-counters

Clears the DHCP violation counters.

dhcp-snooping clear violation-counters {port *chassis/slot/port* **[-***port2***]} | slot** *chassis/slot* **| linkagg** *agg_id* **| all}**

Syntax Definitions

chassis/slot/port **[-***port2***]**	Clear DHCP snooping violation counters for the specified physical port or range of ports
chassis/slot	Clear DHCP snooping violation counters for all ports of the specified slot.
agg_id	Clear DHCP snooping violation counter for the specified link aggregate.
all	Clear DHCP snooping violation counters on all ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **port**, **slot**, or **linkagg** parameter options to clear the DHCP violation counters for a specific port, all ports on a chassis/slot, or a specific link aggregate.

Examples

```
-> dhcp-snooping clear violation-counters port 1/2
-> dhcp-snooping clear violation-counters port 1/2/3
-> dhcp-snooping clear violation-counters port 1/2/4-9
-> dhcp-snooping clear violation-counters linkagg 5
-> dhcp-snooping clear violation-counters slot 3/2
-> dhcp-snooping clear violation-counters all
```

Release History

Release 8.5R2; command introduced.

Related Commands

show dhcp-snooping port	Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

```
dhcpSnoopingClearViolationTable
   dhcpSnoopingClearViolationIfIndex
   dhcpSnoopingClearViolationAction

dhcp-snooping clear isf-statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When this command is used, the counter statistics displayed with the **show dhcp-snooping isf-statistics** command are reset to zero.

Examples

```
-> dhcp-snooping clear isf-statistics
```

Release History

Release 8.5R2; command introduced.

Related Commands

show dhcp-snooping isf-statistics	Displays the ISF drop counters.

MIB Objects

N/A

show dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

show dhcp-snooping binding [port *chassis/slot/port***] | linkagg** *agg_id* **| ip-address** *ip_address* **| snapshot [static | dynamic]]**

Syntax Definitions

chassis/slot/port	The chassis, slot, and port number for which binding table entries are displayed.
agg_id	The link aggregate ID for which binding table entries are displayed.
ip_address	The IPv4 address.for which binding table entries are displayed.
snapshot	Displays binding table entries in the configuration snapshot format.
static	Displays only static binding table entries.
dynamic	Displays only dynamic binding table entries.

Defaults

By default, all binding table entries are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **dhcp-snooping binding** command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> show dhcp-snooping binding

Total Number of Binding Entries: 12

       MAC                      IP          Lease    VLAN     Binding
     Address         Port      Address       Time      ID      Type
------------------+------+--------------+---------+-------+-----------
00:20:95:11:22:10   1/1/4  100.100.100.10     -        100    Static
02:00:00:00:0a:00   1/1/5  100.100.100.11    30        100    Dynamic
00:20:95:11:22:11   1/1/5  100.100.100.20     -        100    Static
02:00:00:00:02:00   1/1/6  100.100.100.10    30        100    Dynamic
02:00:00:00:09:00   1/1/6  100.100.100.18    30        100    Dynamic
02:00:00:00:08:00   1/1/6  100.100.100.6     30        100    Dynamic
02:00:00:00:05:00   1/1/6  100.100.100.8     30        100    Dynamic
02:00:00:00:03:00   1/1/7  100.100.100.3     30        100    Dynamic
02:00:00:00:01:00   1/1/7  100.100.100.17    30        100    Dynamic

dhcp-snooping binding 02:00:00:00:04:00 linkagg 1  address 100.100.100.15 vlan 100
```

output definitions

MAC Address	The MAC address of the client.
Port	The chassis/slot/port designation for the switch port that received the DHCP request.
IP Address	The IP address offered by the DHCP server.
Lease Time	The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.
VLAN ID	The VLAN ID of the VLAN to which the client belongs.
Binding Type	Indicates whether the binding table entry is **dynamic** or **static**. Static entries are created using the **dhcp-snooping binding** command.

Release History

Release 7.3.4; command introduced.
Release 8.5R2; **snapshot, static, dynamic** parameters added.
Release 8.6R1; **port**, **linkagg**, **ip-address** parameters added.

Related Commands

show dhcp-snooping	Displays the current DHCP Snooping configuration.
show dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.
show dhcp-snooping port	Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

```

dhcpv6-snooping vlan admin-state

Enables or disables DHCPv6 Snooping on a per-VLAN basis.

dhcpv6-snooping vlan *vlan_id***[-***vlan_id2***] admin-state {enable | disable}**

no dhcpv6-snooping vlan *vlan_id***[-***vlan_id2***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	The VLAN ID on which DHCPv6 Snooping must be enabled or disabled. Use a hyphen to specify a range of VLANs (10-15).
enable	Enables DHCPv6 Snooping on the specified VLAN.
disable	Disables DHCPv6 Snooping on the specified VLAN.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- DHCPv6 Snooping can be enabled on per-VLAN basis or globally on the switch.
- The global DHCPv6 Snooping must be disabled before enabling the per-VLAN DHCPv6 Snooping.
- When DHCPv6 Snooping is configured on a per-VLAN basis, DHCPv6 snooping is limited to a maximum of 64 VLANs.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations, only the first address will be stored in the binding table.
- To completely remove DHCPv6 snooping configuration from a VLAN, use the **no** form of the command.

Examples

```
-> dhcpv6-snooping vlan 1 admin-state enable
-> dhcpv6-snooping vlan 10-20 admin-state enable
-> dhcpv6-snooping vlan 1 admin-state disable
-> dhcpv6-snooping vlan 10-20 admin-state disable
-> no dhcpv6-snooping vlan 2
-> no dhcpv6-snooping vlan 10-20
```

Release History

Release 8.5R3; command introduced.
Release 8.6R2; VLAN range added.

Related Commands

dhcpv6-snooping binding	Configures a static entry in the binding table.
dhcpv6-snooping binding persistency	Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.
dhcpv6-snooping ipv6-source-filter	Enables or disables the IPv6 source filtering capability at a port, link aggregation, or VLAN level using the DHCPv6 Snooping binding table.
show dhcpv6-snooping	Displays the global DHCPv6 Snooping configuration.
show dhcpv6-snooping interfaces	Displays the DHCPv6 Snooping configuration status on per-VLAN.

   alaDHCPv6SnoopingInterfaceIndex
   alaDHCPv6SnoopingInterfaceAdminStatus
   alaDHCPv6SnoopingInterfaceRowStatus
```

dhcpv6-snooping global admin-state

Enables or disables DHCPv6 Snooping globally on the switch.

dhcpv6-snooping global admin-state {enable | disable}

Syntax Definitions

global	The DHCPv6 Snooping is enabled or disabled globally on the switch.
enable	Enables DHCPv6 Snooping for the switch.
disable	Disables DHCPv6 Snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- DHCPv6 Snooping can be enabled on per-VLAN or globally on the switch.
- The per-VLAN DHCPv6 Snooping must be disabled before enabling global DHCPv6 Snooping.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations only the first address will be stored in the binding table.

Examples

```
-> dhcpv6-snooping global admin-state enable
-> dhcpv6-snooping global admin-state disable
```

Release History

Release 8.5R3; command introduced.

   alaDHCPv6SnoopingInterfaceIndex
   alaDHCPv6SnoopingInterfaceAdminStatus
   alaDHCPv6SnoopingInterfaceRowStatus
```

dhcpv6-snooping binding

Configures a static entry in the binding table.

dhcpv6-snooping binding vlan *vlan_id* **link-local** *ipv6_address* **[global-address** *ipv6_address***] [mac-address** *mac_address***] [port** *chassis/slot/port* **| linkagg** *agg_id***]**

no dhcpv6-snooping binding vlan *vlan_id* **link-local** *ipv6_address*

Syntax Definitions

vlan_id	The VLAN ID on which the DHCPv6 client is configured.
link-local	The clients link-local IPV6 address.
global-address	The IPV6 global unicast address assigned by the DHCPv6 lease server.
mac-address	The clients MAC address.
port | linkagg	The port or link aggregate used to reach the DHCPv6 client.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- When a new binding entry is added or an existing entry is modified using this command, the entry's lease lifetime is changed to indefinite.
- While adding a new binding entry the values for all the parameters must be specified. Else, the binding entry will not be added.
- When a VLAN is deleted, all binding entries on the VLAN including the manually added binding entry is also removed.

Examples

```
-> dhcpv6-snooping binding vlan 1 link-local fe80::eae7:32ff:fea4:6321 global-
address 2001:db8:1000::2b0:d0ff:fe86:880e mac-address 00:00:01:1d:4f:7d linkagg 1
-> no dhcpv6-snooping binding vlan 1 link-local fe80::eae7:32ff:fea4:6321
```

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping global admin-state	Enables or disables DHCPv6 Snooping globally on the switch.
dhcpv6-snooping vlan admin-state	Enables or disables DHCPv6 Snooping on a per-VLAN basis.
show dhcpv6-snooping binding	Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaiDHCPv6BindingTable
   alaDHCPv6SnoopingInterfaceIndex
   alaDHCPv6BindingLinkLocalAddress
   alaDHCPv6BindingGlobalAddress
   alaDHCPv6BindingPhysAddress
   alaDHCPv6BindingPortIfIndex
```

dhcpv6-snooping binding timeout

Configures the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch.

dhcpv6-snooping binding timeout *seconds*

Syntax Definitions

seconds	The time interval in seconds between automatic save of the DHCPv6 Snooping binding table to file on the switch. The time interval range is 1 to 600 seconds.

Defaults

The default value is 1 second.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

The timeout value is only valid if the DHCPv6 Snooping binding table functionality is enabled.

Examples

```
-> dhcpv6-snooping binding timeout 5
```

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping binding	Configures a static entry in the binding table.
show dhcpv6-snooping binding	Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaDHCPV6BindingConfig
   alaDHCPv6BindingTimeout
```

dhcpv6-snooping binding action

Allows to manually purge, renew or save the DHCPv6 Snooping binding table.

dhcpv6-snooping binding action {purge | renew | save}

Syntax Definitions

purge	Clears the content of the DHCPv6 binding table.
renew	Restores the DHCPv6 binding table entries with the previously saved values in the permanent storage.
save	Saves the DHCPv6 binding table entries to permanent storage.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- The DHCPv6 Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the file on the switch. Use the purge, renew, and save options available with this command to sync the binding table contents with the contents of the file.
- While using binding table action commands ensure the binding timeout interval is set greater than 10 seconds from the default interval 1 second to avoid quick timeout.

Examples

```
-> dhcpv6-snooping binding action purge
-> dhcpv6-snooping binding action renew
-> dhcpv6-snooping binding action save
```

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping binding	Configures a static entry in the binding table.
show dhcpv6-snooping binding	Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaDHCPV6BindingConfig
   alaDHCPv6BindingAction
```

dhcpv6-snooping binding persistency

Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

dhcpv6-snooping binding persistency {enable | disable}

Syntax Definitions

enable	Enables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be retained even if the MAC address is deleted from the switch's MAC cache.
disable	Disables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be deleted if the MAC address is deleted from the switch's MAC cache.

Defaults

By default, DHCPv6 snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is enabled, all entries will be added to the binding table, even if the MAC address is not in the switch's MAC cache.
- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is disabled, only entries for which there is a corresponding entry in the switch's MAC cache will be restored.
- The binding entries will get deleted upon lease time expiry and also during link down or MAC address deletion unless persistency is enabled on the switch.

Examples

```
-> dhcpv6-snooping binding persistency enable
-> dhcpv6-snooping binding persistency disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

show dhcpv6-snooping binding Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaDHCPV6BindingConfig
   alaDHCPv6BindingPersistency
```

dhcpv6-snooping ipv6-source-filter

Enables or disables the IPv6 source filtering capability for a port, link aggregate, or VLAN using the DHCPv6 Snooping binding table.

dhcpv6-snooping ipv6-source-filter {vlan *vlan_id***[-***vlan_id2***] | port** *chassis/slot1/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	The VLAN ID on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of VLAN IDs (10-15).
*chassis/slot1/port***[-***port2***]**	The port number on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of ports (1/1/3-8).
*agg_id***[-***agg_id2***]**	The linkagg ID on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of IDs (1-5).
enable	Enables IPv6 source filtering for the specified port, link aggregation, or VLAN.
disable	Disables IPv6 source filtering for the specified port, link aggregation, or VLAN level.

Defaults

By default, IPv6 source filtering is disabled on port, link aggregation, or VLAN level.

Platforms Supported

OmniSwitch 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- DHCPv6 Snooping must be enabled for IPv6 source filtering to be enabled.
- IPv6 source filtering can be enabled per-VLAN or per-port (linkagg).
- If DHCPv6 Snooping is enabled on switch level, then IPv6 source filtering can be enabled on any port, linkagg or VLAN.
- If DHCPv6 Snooping is enabled on VLAN, then IPv6 source filtering can only be enabled on ports which are part of that VLAN, or on the same VLAN.
- If a static host is connected to IPv6 source filtering enabled port or VLAN, then all the packets coming from this host are dropped. A static binding entry must be created to allow the packets coming from this host to pass.
- To support IPv6 source filtering on an OmniSwitch 6560, use the **capability profile tcam mode** command to set the TCAM mode to source IPv6 filtering. After the TCAM mode is changed, reboot the switch to activate the source IPv6 filtering mode.

Examples

```
-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state enable
-> dhcpv6-snooping ipv6-source-filter vlan 10-15 admin-state enable
-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state enable
-> dhcpv6-snooping ipv6-source-filter port 1/1/3-8 admin-state enable
-> dhcpv6-snooping ipv6-source-filter linkagg 6 admin-state enable
-> dhcpv6-snooping ipv6-source-filter linkagg 1-5 admin-state enable

-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state disable
-> dhcpv6-snooping ipv6-source-filter vlan 10-15 admin-state disable
-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state disable
-> dhcpv6-snooping ipv6-source-filter port 1/1/3-8 admin-state disable
-> dhcpv6-snooping ipv6-source-filter linkagg 6 admin-state disable
-> dhcpv6-snooping ipv6-source-filter linkagg 1-5 admin-state disable
```

Release History

Release 8.5R3; command introduced.
Release 8.6R2; VLAN, port, and link aggregate range added.

Related Commands

dhcpv6-snooping vlan admin-state	Enables or disables DHCPv6 Snooping on a per-VLAN basis.
dhcpv6-snooping global admin-state	Enables or disables DHCPv6 Snooping globally on the switch.
show dhcpv6-snooping ipv6-source-filter	Displays the port, VLAN or link aggregation on which IPv6 Source Filter (ISF) is configured.

MIB Objects

```
alaDHCPV6SourceFilterInterfaceTable
   alaDHCPv6SourceFilterVlanId
   alaDHCPv6SourceFilterInterfaceIfIndex
   alaDHCPv6SourceFilterInterfaceRowStatus
   alaDHCPv6SourceFilterVlanRowStatus
```

ipv6 dhcp guard

Enables or disables DHCPv6 Guard on a VLAN. If enabled (the default), DHCPv6 server messages are discarded unless the messages are received on trusted ports. This command also includes an option to enable DHCPv6 Guard for client messages.

ipv6 dhcp guard vlan *vlan_id* **[client {enable | disable}] [admin-state {enable | disable}]**

no ipv6 dhcp guard vlan *vlan_id*

Syntax Definitions

vlan_id	The VLAN ID on which the DHCPv6 Guard is configured.
client enable	Enables DHCPv6 Guard for client messages. Multicast client-originated messages are sent out only on trusted ports. If there are no configured trusted ports, the client messages are dropped.
client disable	Disables DHCPv6 Guard for client messages. Client-originated messages are not checked.
admin-state enable	Enables DHCPv6 guard for server messages. DHCPv6 server messages that are not received on configured trusted ports are dropped. Enabling DHCPv6 Guard helps to prevent access from rogue DHCPv6 servers.
admin-state disable	Disables DHCPv6 Guard. Server messages are not checked.

Defaults

parameter	default
client enable | disable	disable
admin-state enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Trusted source ports serve as a filtering mechanism and are identified using the **ipv6 dhcp guard trusted** command.
  - Only DHCPv6 server messages received on trusted ports are allowed.
  - Client multicast messages are sent out only on trusted ports rather than flooded out on all ports in the VLAN.
- Enabling DHCPv6 Guard without configuring any trusted ports helps to prevent unwanted DHCPv6 traffic flow. For example:
  - DHCPv6 server messages are discarded, which helps to prevent messages from reaching clients on the VLAN.
  - If the client option is also enabled, then DHCPv6 multicast client messages are also discarded. This helps to prevent DHCPv6 traffic from getting past the switch. If there are no client messages sent out, then there are no responses sent from the DHCPv6 server.

- Use the **no** form of this command to remove the DHCPv6 Guard configuration, which includes removing any configured trusted ports for the VLAN.

Examples

```
-> ipv6 dhcp guard vlan 200 admin-state enable
-> ipv6 dhcp guard vlan 200 admin-state disable
-> ipv6 dhcp guard vlan 200 client enable
-> ipv6 dhcp guard vlan 200 client disable
-> no ipv6 dhcp guard vlan 200
```

Release History

Release 8.5R2; command introduced.
Release 8.6R1; **vlan** and **client** parameters added, *if_name* parameter deprecated.

Related Commands

ipv6 dhcp guard trusted	Configures the DHCPv6 Guard trusted source ports.
show ipv6 dhcp guard	Displays the DHCPv6 Guard configuration.

MIB Objects

```
alaDHCPv6GuardInterfaceTable
   alaDHCPv6GuardInterfaceEntry
   alaDHCPv6GuardInterfaceAdminStatus
   alaDHCPv6GuardInterfaceClient
   alaDHCPv6GuardInterfaceRowStatus
```

ipv6 dhcp guard trusted

Configures the DHCPv6 Guard trusted source ports.

ipv6 dhcp guard vlan *vlan_id* **trusted [port** *chassis/slot/port* **| linkagg** *agg_id***]**

no ipv6 dhcp guard vlan *vlan_id* **trusted [port** *chassis/slot/port* **| linkagg** *agg_id***]**

Syntax Definitions

vlan_id	The VLAN ID on which DHCPv6 Guard is configured.
chassis/slot/port	The *chassis/slot/port* on which the DHCPv6 server messages must be allowed. Make sure the port is a member of the specified VLAN.
agg_id	The link aggregate ID on which the DHCPv6 server messages must be allowed. Make sure the link aggregate ID is a member of the specified VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- When DHCPv6 Guard is enabled, trusted source ports serve as a filtering mechanism.
  - Only DHCPv6 server messages received on trusted ports are allowed. This functionality helps to prevent access from rogue DHCPv6 servers.
  - Client multicast messages are sent out only on trusted ports rather than flooded out on all ports in the VLAN.
- Enabling DHCPv6 Guard without configuring any trusted ports helps to prevent unwanted DHCPv6 traffic flow. For example:
  - DHCPv6 server messages are discarded, which helps to prevent messages from reaching clients on the VLAN.
  - DHCPv6 multicast client messages are also discarded, which helps to prevent DHCPv6 traffic from getting past the switch. If there are no client messages sent out, then there are no responses sent from the DHCPv6 server.
- Use the **no** form of the command to remove the DHCPv6 Guard trusted source.

Examples

```
-> ipv6 dhcp guard vlan 200 trusted port 2/1/11
-> ipv6 dhcp guard vlan 200 trusted linkagg 10
-> no ipv6 dhcp guard vlan 200 trusted port 2/1/11
```

Release History

Release 8.5R2; command introduced.
Release 8.6R1; **vlan** parameter added, *if_name* parameter deprecated.

Related Commands

ipv6 dhcp guard	Enables or disables the DHCPv6 Guard on a VLAN.
show ipv6 dhcp guard	Displays the DHCPv6 Guard configuration.

MIB Objects

alaDHCPv6GuardTrustedSourceTable
   alaDHCPv6GuardTrustedSourceIfIndex
   alaDHCPv6GuardTrustedSourceRowStatus
```

show dhcpv6-snooping

Displays the global DHCPv6 Snooping configuration.

show dhcpv6-snooping

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-snooping
DHCPv6 Snooping       = Global,
Binding timeout (sec) = 1,
Binding persistency   = Disabled
```

output definitions

DHCPv6 Snooping	Displays if the DHCPv6 Snooping is enabled globally or Per-VLAN mode.
Binding timeout	Displays the binding table automatic save timeout.
Binding persistency	Displays the configured DHCPv6 Relay destination(s) for the interface.

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping vlan admin-state	Enables or disables DHCPv6 Snooping on a per-VLAN basis.
dhcpv6-snooping global admin-state	Enables or disables DHCPv6 Snooping globally on the switch.
dhcpv6-snooping binding timeout	Configures the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch.
dhcpv6-snooping binding persistency	Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

MIB Objects

```
alaDHCPv6SnoopingInterfaceAdminStatus
alaDHCPv6BindingTimeout
alaDHCPv6BindingPersistency
```

show dhcpv6-snooping interfaces

Displays the DHCPv6 Snooping configuration status per-VLAN.

show dhcpv6-snooping interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-snooping interfaces
Interface                 Admin Status
--------------------------+----------------
VLAN 11                   Enabled
VLAN 99                   Disabled
```

output definitions

Interface	Displays the VLAN on which DHCPv6 Snooping is configured.
Admin Status	Displays the operational status of DHCPv6 Snooping on the VLAN interface.

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping vlan admin-state	Enables or disables DHCPv6 Snooping on a per-VLAN basis.

show dhcpv6-snooping binding

Displays the DHCPv6 Snooping binding table information.

show dhcpv6-snooping binding [global-address *ipv6_address***] [port** *chassis/slot/port* **| linkagg** *agg_id***]**

Syntax Definitions

ipv6_address	The IPV6 global unicast address for which binding table entries are displayed.
chassis/slot/port	The chassis, slot, and port number for which binding table entries are displayed.
agg_id	The link aggregate ID for which binding table entries are displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

```

output definitions

Total Number of Binding Entries	The total number of binding entries in the switch.
Link-Local Address	The link-local address of the client.
Global Address	The global IPv6 address obtained through the DHCPv6 lease.
Lifetime	The lifetime of the DHCPv6 lease. The lifetime is displayed in seconds. The lifetime is displayed as **indefinite** for the leases with indefinite lifetime. The lifetime is displayed as **static** if the time is manually configured.
Interface	The VLAN on which the client exists.
Port	The physical port or link aggregation used to communicate with the client.
MAC Address	The MAC address of the client.

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping binding	Configures a static entry in the binding table.
dhcpv6-snooping binding timeout	Allows to configure the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch.
dhcpv6-snooping binding action	Allows to manually purge, renew or save the DHCPv6 Snooping binding table.

MIB Objects

```

```

show dhcpv6-snooping ipv6-source-filter

Displays the port, VLAN or link aggregation on which IPv6 Source Filter (ISF) is configured.

show dhcpv6-snooping ipv6-source-filter

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-snooping ipv6-source-filter

Mode: Vlan based ISF

VLAN ID
---------------
  10-15
  20

-> show dhcpv6-snooping ipv6-source-filter

Mode: Port based ISF

PORT
---------------
 1/1/10
 1/1/15-20
 0/2
```

output definitions

VLAN ID	Displays the VLAN on which the ISF is enabled.
PORT	Displays the port or link aggregation on which the ISF is enabled.

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping ipv6-source-filter	Enables or disables the IPv6 source filtering capability at a port, link aggregation, or VLAN level using the DHCPv6 Snooping binding table.

MIB Objects

```
alaDHCPv6SourceFilterVlanId
alaDHCPv6SourceFilterInterfaceIfIndex
```

show ipv6 dhcp guard

Displays the DHCPv6 Guard configuration.

show ipv6 dhcp guard [vlan *vlan_id***]**

Syntax Definitions

vlan_id	Displays the DHCPv6 Guard configuration for the specified VLAN.

Defaults

By default, a summary table of information about all VLANs on which DHCPv6 Guard is configured is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

Specify the **vlan** *vlan_id* option to view the DHCPv6 Guard configuration for a specific VLAN.

Examples

```
-> show ipv6 dhcp guard
Interface                       Status   Client   Trusted Ports
--------------------------------+--------+--------+--------------------------------
VLAN 200                        Enabled  Disabled 1/1/9, 1/1/10, 1/1/11, 1/1/12+
VLAN 250                        Enabled  Disabled
VLAN 300                        Enabled  Enabled  agg 10, 1/4/20
```

output definitions

Interface	Displays the VLAN on which the DHCPv6 Guard is configured.
Status	Displays the status of DHCPv6 Guard (**Enabled** or **Disabled**).
Client	Displays the status of DHCPv6 Guard for client messages (**Enabled** or **Disabled**).
Trusted Ports	Displays the DHCPv6 Guard trusted sources. A '+' will appear at the end of the list to indicate that there are more trusted sources configured which cannot be displayed in a single line. To view the full list of configured trusted sources, specify the VLAN ID in the show command.

```
-> show ipv6 dhcp guard vlan 200
DHCPv6 Guard = Enabled
Client Guard = Disabled
Trusted ports:
  1/1/9
  1/1/10
  1/1/11
  1/1/12
  1/1/20
```

```
-> show ipv6 dhcp guard vlan 250
DHCPv6 Guard = Enabled
Client Guard = Disabled

-> show ipv6 dhcp guard vlan 300
DHCPv6 Guard = Enabled
Client Guard = Enabled
Trusted ports:
  linkagg 10
  1/4/20
```

output definitions

DHCPv6 Guard	Displays the status of DHCPv6 Guard on the VLAN.
Client Guard	Displays the status of DHCPv6 Guard for client messages.
Trusted ports	Displays the DHCPv6 Guard trusted sources, if any. Ports are displayed as *chassis/slot/port*. Link aggregates are displayed as linkagg ID.

Release History

Release 8.5R2; command introduced.
Release 8.561; **vlan** parameter added.

Related Commands

ipv6 dhcp guard	Enables or disables the DHCPv6 Guard on a VLAN.
ipv6 dhcp guard trusted	Configures DHCPv6 Guard trusted source ports.

MIB Objects

```

25 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the IPv4 or IPv6 VRRP routers on the LAN. The VRRP router that controls the IPv4 or IPv6 address associated with a virtual router is called the master router and is responsible for forwarding packets to that IPv4 or IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The OmniSwitch implementation of VRRP also supports the collective management of virtual routers on a switch.

The VRRP commands comply with RFC 3768 for VRRP version 2 (IPv4) and RFC 5798 for VRRP version 3 (IPv4 and IPv6).

MIB information is as follows:

Filename: VRRP-MIB.mib
Module: vrrpMIB

Filename: VRRPV3-MIB.mib
Module: vrrpv3MIB

Filename: ALCATEL-IND1-VRRP-MIB.mib
Module: alcatelIND1VRRPMIB

Filename: ALCATEL-IND1-VRRP3-MIB.mib
Module: alcatelIND1VRRP3MIB

A summary of the available VRRP commands is listed here:

vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

{ip | ipv6} vrrp *vrid* **interface** *if_name* **admin-state [enable | disable] [priority** *priority***] [preempt | no preempt] [accept | no accept] [interval** *centiseconds***] [version {v2 | v3}**

no {ip | ipv6} *vrid* **interface** *if_name*

Syntax Definitions

ip	Configures an IPv4 virtual router.
ipv6	Configures an IPv6 virtual router.
vrid	The virtual router ID. The valid range is 1–255.
if_name	The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
enable	Enables the virtual router. An IPv4 virtual router may only be enabled if an IP address is configured for the virtual router (not required to enable an IPv6 virtual router).
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
priority	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router. However, the virtual router's actual IP address owner will always preempt another master router regardless of whether preempt is enabled.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
accept	Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version 3 and IPv6 virtual routers.*
no accept	Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version 3 and IPv6 virtual routers.*
centiseconds	The interval in centiseconds after which the master router will send VRRP advertisements. The advertising interval must be the same for all VRRP routers configured with the same VRID. The range is 1–4095 centiseconds in increments of 10 (for example, 10, 20, 30).
v2	Converts an IPv4 VRRP router to a version 2 virtual router. *This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.*

v3	Converts an IPv4 VRRP router to a version 3 virtual router. *This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.*

Defaults

parameter	default
enable | disable	**disable**
priority	100
preempt | no preempt	**preempt**
accept | no accept	**accept**
centiseconds	100
v2 | v3	**v2**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **ip vrrp address** command to configure an IPv4 address for the virtual router. This must be done before the IPv4 virtual router can be enabled (not required to enable an IPv6 virtual router).
- To disable the virtual router, rather than remove it, use the **admin-state disable** option. Note that this option cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- A priority value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.
- The maximum number of virtual routers supported is based on the 100 centisecond advertising interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval for IPv4 and IPv6 virtual routers
- The advertising interval for IPv4 and IPv6 virtual routers cannot be less than 10 centiseconds and must increment by 10 (for example, 10, 20, 30) up to the maximum allowed.

Examples

```
-> ip vrrp 23 interface ipv4-100 priority 75
-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 admin-state enable

-> ip vrrp 23 interface ipv4-100 admin-state disable
-> ip vrrp 23 interface ipv4-100 priority 255
-> ip vrrp 23 interface ipv4-100 admin-state enable

-> no ip vrrp 23 interface ipv4-100

-> ipv6 vrrp 33 interface ipv6-200 priority 75
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable

-> ipv6 vrrp 33 interface ipv6-200 admin-state disable
-> ipv6 vrrp 33 interface ipv6-200 priority 50
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable

-> no ipv6 vrrp 33 interface ipv6-200
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; **interface** and **version** parameter added; *vlan_id* parameter deprecated.

Related Commands

vrrp address	Configures an IPv4 or an IPv6 address for a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
vrrpv3OperationsTable
   vrrpv3OperationsPriority
   vrrpv3OperationsPreemptMode
   vrrpv3OperationsAcceptMode
   vrrpv3OperationsAdvInterval
   vrrpv3OperationsRowStatus
alaVrrpv3OperationsExTable
   alaVrrpv3OperVersion
```

vrrp address

Configures an IPv4 or IPv6 address for a VRRP virtual router.

{ip | ipv6} vrrp *vrid* **interface** *if_name* **address {***ipv4_address* **|** *ipv6_address***}**

{ip | ipv6} vrrp *vrid* **interface** *if_name* **no address {***ipv4_address* **|** *ipv6_address***}**

Syntax Definitions

ip	Configures an IPv4 address for a virtual router.
ipv6	Configures an IPv6 address for a virtual router.
vrid	The virtual router ID. The valid range is 1–255.
if_name	The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
ipv4_address	The virtual IPv4 address to associate with the specified virtual router.
ipv6_address	The virtual IPv6 address to associate with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An IPv4 address must be configured for an IPv4 virtual router before the virtual router can be enabled (not required to enable an IPv6 virtual router).

Examples

```
-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 address 192.168.173.2
-> ip vrrp 23 interface ipv4-100 no address 192.168.173.1

-> ipv6 vrrp 33 interface ipv6-200 213:100:1::56
-> ipv6 vrrp 33 interface ipv6-200 213:100:1::57
-> ipv6 vrrp 33 interface ipv6-200 no address 213:100:1::56
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; **interface** parameter added; *vlan_id* and optional **ip** parameter deprecated.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router
show vrrp statistics	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
vrrpv3AssociatedIpAddrTable
   vrrpv3AssociatedIpAddrRowStatus
```

vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

ip vrrp track *track_id* **[admin-state [enable | disable] | priority** *priority* **| ipv4-interface** *if_name* | **ipv6-interface** *if_name* **| port** *chassis/slot/port* **| address** *ip_address* **[bfd-state {enable | disable} | delay** *seconds***]]**

no ip vrrp track *track_id*

Syntax Definitions

track_id	The ID of the tracking policy. The valid range is 1–255.
admin-state enable	Enables the tracking policy.
admin-state disable	Disables the tracking policy.
priority	The decrement priority value. A virtual router monitoring this tracking policy will have its priority decremented by this value when the conditional state of the tracking policy entity is down. The valid range is 0–255.
if_name	The name of the IPv4 or IPv6 interface that this policy will track.
chassis	The chassis identifier.
slot/port	The slot/port number that this policy will track.
ip_address	The remote IPv4 or IPv6 address that this policy will track.
bfd-state enable	Enables Bidirectional Forwarding Detection (BFD) for an address tracking policy.*This parameter is not supported on the OmniSwitch 6560*.
bfd-state disable	Disables BFD for an address tracking policy. *This parameter is not supported on the OmniSwitch 6560*.
seconds	The amount of time to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value. The valid range is 0–60 seconds.

Defaults

parameter	default
admin-state enable | disable	**enable**
priority	25
bfd-state enable | disable	**disable**
seconds	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **admin-state disable** option to disable the tracking policy, rather than removing it from the switch.
- Registering VRRP with BFD is required at the protocol level before VRRP can interact with BFD. Once VRRP is a registered protocol with BFD, then BFD can be enabled for a specific VRRP address tracking policy.
- Enabling BFD for an address tracking policy requires a Loopback0 interface on the local switch. The IP address of this interface will serve as the source IP address of BFD packets. For more information about configuring a Loopback0 interface, see the "IP Commands" or "IPv6 Commands" chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- Configuring the delay time for an IPv4 address or IPv6 address tracking policy helps to prevent the loss of device connectivity that may occur before a virtual router prematurely becomes the master. For example, configuring a delay time allows the switch routing tables to stabilize before the master router resumes the master role.

Examples

```
-> ip vrrp track 2 admin-state enable priority 50 ipv4-interface Marketing
-> ip vrrp track 3 admin-state enable priority 60 ipv6-interface Sales
-> ip vrrp track 2 address 10.1.1.1 bfd-state enable
-> ip vrrp track 3 address 10.1.1.2 delay 30
-> ip vrrp track 4 address 20.1.1.2 bfd-state enable delay 45
-> ip vrrp track 5 address 213:100:1::56 bfd-state enable
-> ip vrrp track 2 address 10.1.1.1 bfd-state disable
-> ip vrrp track 5 address 213:100:1::56 bfd-state disable
-> ip vrrp track 3 admin-state disable
-> no ip vrrp track 2
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **delay** parameter added.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
vrrp bfd-state	Enables or disables the BFD protocol for VRRP.
show vrrp track	Displays information about tracking policies on the switch.

MIB Objects

```
alaVRRPTrackTable
   alaVrrpTrackId
   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddrType
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityIpv6Interface
   alaVrrpTrackEntityInterface
   alaVrrpTrackBfdStatus
   alaVrrpTrackDelay
   alaVrrpTrackRowStatus
```

vrrp bfd-state

Enables or disables the registration of VRRP with the BFD protocol.

ip vrrp bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for VRRP.
disable	Disables BFD for VRRP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD interaction with VRRP is supported only for VRRP tracking policies that track a remote IP address.
- BFD must be globally enabled for the switch *and* VRRP must be registered with BFD at the protocol level before VRRP can interact with BFD.

Examples

```
-> ip bfd admin-state enable
-> ip vrrp bfd-state enable
-> ip vrrp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp track	Configures an address tracking policy.
ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router

MIB Objects

```
alaVrrpConfig
   alaVrrpBfdStatus
```

vrrp track-association

Associates an IPv4 or IPv6 VRRP tracking policy with a virtual router.

{ip | ipv6} vrrp *vrid* **interface** *if_name* **track-association** *track_id*

{ip | ipv6} vrrp *vrid* **interface** *if_name* **no track-association** *track_id*

Syntax Definitions

ip	Associates a tracking policy with an IPv4 virtual router.
ipv6	Associates a tracking policy with an IPv6 virtual router.
vrid	The virtual router ID. The valid range is 1–255.
if_name	The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
track_id	The ID of the tracking policy to associate with the virtual router. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- The tracking policy ID must already exist in the switch configuration. Use the **vrrp track** command to create a tracking policy.

Examples

```
-> ip vrrp 23 interface ipv4-100 track-association 1
-> ip vrrp 23 interface ipv4-100 no track-association 1

-> ipv6 vrrp 33 interface ipv6-200 track-association 1
-> ipv6 vrrp 33 interface ipv6-200 no track-association 1
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; **interface** parameter added; *vlan_id* parameter deprecated.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp track	Configures a VRRP or VRRP3 tracking policy.
show vrrp track-association	Displays the tracking policies associated with virtual routers.

MIB Objects

```
alaVrrp3AssoTrackTable
   alaVrrp3AssoTrackId
   alaVrrp3TrackRowStatus
```

vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

ip vrrp delay *seconds*

Syntax Definitions

seconds	The amount of time after a reboot that virtual routers will wait before they go active. The valid range is 0–180 seconds.

Defaults

parameter	default
seconds	45 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

Examples

```
-> ip vrrp delay 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPConfig
   alaVRRPStartDelay
```

vrrp version

Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch. The VRRP version for IPv6 virtual routers is not configurable (IPv6 virtual routers support only version 3).

ip vrrp version [v2 | v3]

Syntax Definitions

v2	Assigns version 2 by default to IPv4 virtual routers.
v3	Assigns version 3 by default to IPv4 virtual routers.

Defaults

parameter	default
v2 | v3	**v2**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default VRRP version will affect the version assigned by default to any new IPv4 virtual routers that are created.
- To apply the new default value to the existing IPv4 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set version** command and enable the virtual routers again.
- If any of the IPv4 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set version** command with the **override** option and enable the virtual routers again.
- There is no interoperability between VRRP version 2 and 3. A version 3 virtual router will not acknowledge version 2 advertisements.

Examples

```
-> ip vrrp version v3
-> ip vrrp version v2

-> ip vrrp admin-state disable
-> ip vrrp set version
-> ip vrrp set version override
-> ip vrrp admin-state enable
```

Release History

Release 8.5R2; command introduced.

Related Commands

vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4DefaultVersion
```

vrrp interval

Modifies the default advertising interval value assigned to the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp interval *centiseconds*

Syntax Definitions

ip	Modifies the default advertising interval value assigned to IPv4 virtual routers.
ipv6	Modifies the default advertising interval value assigned to IPv6 virtual routers.
centiseconds	The default advertising interval for IPv4 or IPv6 virtual routers. The valid range is 1–4095 *centiseconds*.

Defaults

parameter	default
centiseconds	100

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp interval 50
-> ip vrrp admin-state disable
-> ip vrrp set interval
-> ip vrrp set interval override
-> ip vrrp admin-state enable

-> ipv6 vrrp interval 75
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4DefaultInterval
alaVRRPv3IPv6Config
   alaVRRPv3IPv6DefaultInterval
```

vrrp priority

Modifies the default priority value assigned to the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp priority *priority*

Syntax Definitions

ip	Modifies the default priority value assigned to IPv4 virtual routers.
ipv6	Modifies the default priority value assigned to IPv6 virtual routers.
priority	The default priority value for the IPv4 or IPv6 virtual routers. The valid range is 1–255.

Defaults

parameter	default
priority	100

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set priority** or **ipv6 vrrp set priority** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set priority** or **ipv6 vrrp set priority** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp priority 50
-> ip vrrp admin-state disable
-> ip vrrp set priority
-> ip vrrp set priority override
-> ip vrrp admin-state enable

-> ipv6 vrrp priority 75
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set priority
-> ipv6 vrrp set priority override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4DefaultPriority
alaVRRPv3IPv6Config
   alaVRRPv3IPv6DefaultPriority
```

vrrp preempt

Modifies the default preempt mode assigned to the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp [preempt | no preempt]

Syntax Definitions

ip	Modifies the default preempt mode assigned to IPv4 virtual routers.
ipv6	Modifies the default preempt mode assigned to IPv6 virtual routers.
preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
preempt | no preempt	**preempt**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set preempt** or **ipv6 vrrp set preempt** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set preempt** or **ipv6 vrrp set preempt** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp preempt
-> ip vrrp no preempt

-> ip vrrp admin-state disable
-> ip vrrp set preempt
-> ip vrrp set preempt override
-> ip vrrp admin-state enable

-> ipv6 vrrp preempt
-> ipv6 vrrp no preempt
```

```
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set preempt
-> ipv6 vrrp set preempt override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4DefaultPreemptMode
alaVRRPv3IPv6Config
   alaVRRPv3IPv6DefaultPreemptMode
```

vrrp accept

Modifies the default accept mode assigned to the IPv4 (version 3) or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp [accept | no accept]

Syntax Definitions

ip	Modifies the default accept mode assigned to IPv4 virtual routers.
ipv6	Modifies the default accept mode assigned to IPv6 virtual routers.
accept	Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own.
no accept	Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own.

Defaults

parameter	default
accept | no accept	**accept**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default accept mode will affect the mode assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default accept mode value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set accept** or **ipv6 vrrp set accept** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set accept** or **ipv6 vrrp set accept** command with the **override** option and enable the virtual routers again.
- The accept mode is not a configurable option for IPv4 virtual routers running VRRP version 2; this command only applies to IPv4 virtual routers running VRRP version 3 and IPv6 virtual routers.

Examples

```
-> ip vrrp accept
-> ip vrrp no accept

-> ip vrrp admin-state disable
-> ip vrrp set accept
-> ip vrrp set accept override
-> ip vrrp admin-state enable
```

```
-> ipv6 vrrp accept
-> ipv6 vrrp no accept

-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set accept
-> ipv6 vrrp set accept override
-> ipv6 vrrp admin-state enable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4DefaultAcceptMode
alaVRRPv3IPv6Config
   alaVRRPv3IPv6DefaultAcceptMode
```

vrrp admin-state

Changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp admin-state [disable | enable | enable-all]

Syntax Definitions

ip	Changes the administrative status of all IPv4 virtual routers.
ipv6	Changes the administrative status of all IPv6 virtual routers.
disable	Disables all the IPv4 or IPv6 virtual routers on the switch.
enable	Enables the IPv4 or IPv6 virtual routers that have not previously been disabled individually or collectively through the **ip vrrp group all** or **ipv6 vrrp group all** command.
enable-all	Enables all the IPv4 or IPv6 virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the **ip vrrp group all** or **ipv6 vrrp group all** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

Examples

```
-> ip vrrp admin-state disable
-> ip vrrp admin-state enable
-> ip vrrp admin-state enable-all

-> ipv6 vrrp admin-state disable
-> ipv6 vrrp admin-state enable
-> ipv6 vrrp admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

vrrp version	Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch.
vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp accept	Modifies the default accept mode assigned to the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4AdminState
alaVRRPv3IPv6Config
   alaVRRPv3IPv6AdminState
```

vrrp set

Applies the global default parameter values to IPv4 or IPv6 virtual routers on the switch. When this command is used, IPv4 or IPv6 virtual routers revert to using the default parameter values.

{ip | ipv6} vrrp set {interval | priority | preempt | accept | version | all | none} [override]

Syntax Definitions

ip	Applies the default parameter values to IPv4 virtual routers.
ipv6	Applies the default parameter values to IPv6 virtual routers.
interval	Sets the VRRP advertisement interval value to the default value.
priority	Sets the priority value to the default value.
preempt	Sets the preempt mode to the default mode.
accept	Sets the accept mode to the default mode.
version	Sets the VRRP version for IPv4 virtual routers to the default value.
all	Sets all the parameters value to the new default value.
none	Resets all the parameter values to their default values.
override	Overrides the specified parameters configured value with the new default value.

Defaults

parameter	default
interval | priority | preempt | accept | version | all	**all**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All the IPv4 or IPv6 virtual routers must be disabled before using this command.
- When a new IPv4 or IPv6 virtual router is created, pre-defined default values for the advertising interval, priority, preempt mode, accept mode, and version (IPv4 only) parameters are applied to the new virtual router. These default parameter values are configurable. For example, the **ip vrrp interval** or **ipv6 vrrp interval** command is used to change the default interval value that is applied to IPv4 or IPv6 virtual routers.
- When a default parameter value is changed, however, it is not automatically applied to *existing* virtual routers. To apply default values that have changed to existing virtual routers, do the following:

  1. Administratively disable all the virtual routers.
  2. Use the **ip vrrp set** or **ipv6 vrrp set** command to apply the changed parameter value.
  3. Administratively enable all the virtual routers.

- If any of the IPv4 or IPv6 virtual routers are running with their own individually configured value or group value, then that value takes priority over the default parameter value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set** or **ipv6 vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp admin-state disable

-> ip vrrp set priority
-> ip vrrp set priority override

-> ip vrrp admin-state enable

-> ipv6 vrrp admin-state disable

-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override

-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

vrrp version	Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch.
vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp accept	Modifies the default accept mode assigned to the virtual routers on the switch.
vrrp admin-state	Changes the administrative status of all the virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config
   alaVRRPv3IPv4SetParam
   alaVRRPv3IPv4Override
alaVRRPv3IPv6Config
   alaVRRPv3IPv6SetParam
   alaVRRPv3IPv6Override
```

vrrp group

Creates a new IPv4 or IPv6 virtual router group or modifies the configuration parameters of an existing IPv4 or IPv6 virtual router group.

{ip | ipv6} vrrp group *vrgid* **[interval** *centiseconds***] [priority** *priority***] [preempt | no preempt] [accept | no accept] [version {v2 | v3}**

no {ip | ipv6} vrrp group *vrgid*

Syntax Definitions

ip	Configures an IPv4 virtual router group.
ipv6	Configures an IPv6 virtual router group.
vrgid	The virtual router group ID. The valid range is 1–255.
centiseconds	The interval in centiseconds after which the master router will send VRRP advertisements. The valid range is 1–4095 centiseconds.
priority	The default priority value for the virtual router group. The valid range is 1–255.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.
accept	Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version3 and IPv6 virtual routers.*
no accept	Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version3 and IPv6 virtual routers.*
v2	Converts an IPv4 VRRP router as a version 2 virtual router. *This parameter applies only to IPv4 virtual routers.*
v3	Converts an IPv4 VRRP router to a version 3 virtual router. *This parameter applies only to IPv4 virtual routers.*

Defaults

parameter	default
centiseconds	100
priority	100
preempt | no preempt	**preempt**
accept | no accept	**accept**
v2 | v3	**v2**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default values to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **ip vrrp group set** or **ipv6 vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their individually configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **ip vrrp group set** or **ipv6 vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

```
-> ip vrrp group 25 interval 50 priority 50 no preempt version v3
-> no ip vrrp group 25

-> ipv6 vrrp group 30 interval 200 priority 75 preempt no accept
-> no ipv6 vrrp group 30
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

vrrp group admin-state	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
vrrp group-association	Adds a virtual router to a virtual router group.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpv3GroupTable
   alaVrrpv3GroupId
   alaVrrpv3GroupInterval
   alaVrrpv3GroupPriority
   alaVrrpv3GroupPreemptMode
   alaVrrpv3GroupAcceptMode
   alaVrrpv3GroupVersion
   alaVrrpv3GroupRowStatus
```

vrrp group admin-state

Changes the administrative status of all the IPv4 or IPv6 virtual routers in an IPv4 or IPv6 virtual router group using a single command.

{ip | ipv6} vrrp group *vrgid* **admin-state [disable | enable | enable-all]**

Syntax Definitions

ip	Changes the administrative status of all IPv4 virtual routers in the IPv4 group.
ipv6	Changes the administrative status of all IPv6 virtual routers in the IPv6 group.
vrgid	The virtual router group ID. The valid range is 1–255.
disable	Disables all the virtual routers in the group.
enable	Enables those virtual routers that have not previously been disabled individually in the group.
enable-all	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an IPv4 or IPv6 virtual router in a group is disabled on an individual basis, it can only be re-enabled by using the **enable-all** option in this command.
- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

Examples

```
-> ip vrrp group 25 admin-state disable
-> ip vrrp group 25 admin-state enable
-> ip vrrp group 25 admin-state enable-all

-> ipv6 vrrp group 30 admin-state disable
-> ipv6 vrrp group 30 admin-state enable
-> ipv6 vrrp group 30 admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpv3GroupTable
   alaVrrpv3GroupAdminState
```

vrrp group set

Applies the group default parameter values to all virtual routers in an IPv4 or IPv6 virtual router group. When this command is used, IPv4 or IPv6 virtual routers revert to using the group default parameter values.

{ip | ipv6} vrrp group *vrgid* **set [interval | priority | preempt | accept | version | all] [override]**

Syntax Definitions

ip	Applies the default parameter values to IPv4 virtual routers.
ipv6	Applies the default parameter values to IPv6 virtual routers.
vrgid	The virtual router group ID, in the range from 1–255.
interval	Sets the VRRP advertisement interval value to the default value.
priority	Sets the priority value to the default value.
preempt	Sets the preempt mode to the default mode.
accept	Sets the accept mode to the default mode.
version	Sets the VRRP version for IPv4 virtual routers to the default value.
all	Sets all the parameters' value to the new default value.
override	Overrides the parameter's configured value with the group default value.

Defaults

parameter	default
interval | priority | preempt | accept | version | all	**all**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All the virtual routers in an IPv4 or IPv6 group must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, first disable the virtual router group, then apply the group default value using the **ip vrrp group set** or **ipv6 vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, first disable the virtual router group, then override the configured value by using the **ip vrrp group set** or **ipv6 vrrp group set** command with the **override** option and enable the virtual router group again.

Examples

```
-> ip vrrp group 10 admin-state disable
-> ip vrrp group 10 set priority
-> ip vrrp group 10 set priority override
-> ip vrrp group 10 admin-state disable

-> ipv6 vrrp group 20 admin-state disable
-> ipv6 vrrp group 20 set interval
-> ipv6 vrrp group 20 set interval override
-> ipv6 vrrp group 20 admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group admin-state	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

vrrp group-association

Adds an IPv4 or IPv6 virtual router to an IPv4 or IPv6 virtual router group.

{ip | ipv6} vrrp *vrid* **interface** *if_name* **group-association** *vrgid*

{ip | ipv6} vrrp *vrid* **interface** *if_name* **no group-association** *vrgid*

Syntax Definitions

ip	Adds an IPv4 virtual router to an IPv4 virtual router group.
ipv6	Adds an IPv6 virtual router to an IPv6 virtual router group.
vrid	The virtual router ID. The valid range is 1–255.
if_name	The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
vrgid	An existing virtual router group ID. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IPv4 or IPv6 virtual router from the virtual router group.
- It is not necessary to disable an IPv4 or IPv6 virtual router before adding the virtual router to a group. However, the virtual router will not adopt the group's default parameter values until it is re-enabled.
- It is not necessary to disable an IPv4 or IPv6 virtual router before removing the virtual router from a group.
- Create separate groups for each combination of protocol and version. For example, if IPv4 group 10 specifies VRRP version 2, then only assign IPv4 version 2 virtual routers to group 10.
  - The first virtual router assigned to the group will determine the protocol and version of the group.
  - IPv6 virtual router groups will always be version 3.
  - IPv4 version 3 virtual routers cannot be assigned to a version 2 group and vice versa. However, the version for an IPv4 group can be changed.

Examples

```
-> ip vrrp 25 interface ipv4-100 group-association 10
-> ip vrrp 25 interface ipv4-100 no group-association 10

-> ipv6 vrrp 30 interface ipv6-200 group-association 20
-> ipv6 vrrp 30 interface ipv6-200 no group-association 20
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support and **interface** parameter added; *vlan_id* parameter deprecated.

Related Commands

show vrrp group-association Displays the virtual routers that are associated with a group.

MIB Objects

```
alaVrrpv3AssoGroupTable
   alaVrrpv3AssoGroupRowStatus
```

show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show {ip | ipv6} vrrp [*vrid***]**

Syntax Definitions

ip	Displays the IPv4 virtual router configuration.
ipv6	Displays the IPv6 virtual router configuration.
vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show ip vrrp** command to display information about configuration parameters, which may be set through the **ip vrrp** command. Use the **show ip vrrp statistics** command to get information about IPv4 VRRP packets.
- Use the **show ipv6 vrrp** command to display information about configuration parameters, which may be set through the **ipv6 vrrp** command. Use the **show ipv6 vrrp statistics** command to get information about IPv6 VRRP packets.

    fe80::200:5eff:fe00:203
```

output definitions

VRRP default advertisement interval	The default advertising interval for all virtual routers on the switch. Configured through the **vrrp interval** command.
VRRP default priority	The default priority value for all virtual routers on the switch. Configured through the **vrrp priority** command.
VRRP default preempt	The default preempt mode for all virtual routers on the switch. Configured through the **vrrp preempt** command.
VRRP default accept	The default accept mode for all virtual routers on the switch. Configured through the **vrrp accept** command.
VRRP default version	The default VRRP version assigned to all IPv4 virtual routers. IPv6 virtual routers support only version 3. Configured through the **vrrp version** command.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the **vrrp delay** command.
VRRP BFD-STATUS	Indicates whether or not (**Enabled** or **Disabled**) VRRP is registered to interact with the Bidirectional Forwarding Detection (BFD) protocol. Configured through the **vrrp bfd-state** command.

output definitions (continued)

VRID	Virtual router identifier. Configured through the **vrrp** command.
Interface Name	The IPv4 or IPv6 interface associated with the VRRP instance. Configured through the **vrrp** command.
IPv4 Address(es) **IPv6 Address(es)**	The assigned IPv4 or IPv6 addresses. Configured through the **vrrp address** command.
Version	The VRRP version assigned to the virtual router (**V2** or **V3**). Configured for IPv4 virtual routers through the **vrrp** command. This value is always set to **V3** for IPv6 virtual routers.
Admin Status	The administrative status of this virtual router instance (**Enabled** allows the virtual router instance to operate; **Disabled** disables the virtual router instance without deleting it). Configured through the **vrrp** command.
Priority	Indicates the VRRP router's priority for the virtual router. Configured through the **vrrp** command.
Preempt	Indicates whether or not (**Yes** or **No**) a higher priority virtual router will preempt a lower priority master router: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available. Configured through the **vrrp** command.
Accept	Indicates whether or not (**Yes** or **No**) a master router that is not the IP address owner will accept packets addressed to the IP address owner as its own. Configured through the **vrrp** command. *This parameter applies only to IPv4 version 3 and IPv6 virtual routers.*
Adv. Interval	Indicates the time interval (in centiseconds) between sending advertisement messages. Only the master router sends advertisements. Configured through the **vrrp** command.
Virtual MAC	Displays the virtual MAC address for the virtual router. • The first 5 bytes for IPv4 and IPv6 version 3 virtual routers is always 00-00-5E-00-02. • The first 5 bytes for IPv4 version 2 virtual routers is always 00-00-5E-00-01. • The last byte indicates the VRID.

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; "VLAN" field replaced with "Interface Name" field; "Accept" and "Version" fields added.

Related Commands

show vrrp statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

show vrrp statistics

Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

show {ip | ipv6} [*vrid*] statistics

Syntax Definitions

ip	Displays VRRP packet statistics for IPv4 virtual routers.
ipv6	Displays VRRP packet statistics for IPv6 virtual routers.
vrid	The virtual router ID. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show ip vrrp statistics** command to display information about IPv4 VRRP packets. Use the **show ip vrrp** command to display information about the IPv4 virtual router configuration.
- Use the **show ipv6 vrrp statistics** command to display information about IPv6 VRRP packets. Use the **show ipv6 vrrp** command to display information about the IPv6 virtual router configuration.

Examples

```
-> show ip vrrp statistics

```

output definitions

Checksum Errors	The total number of VRRP packets received with an invalid checksum value.
Version Errors	The total number of VRRP packets received with an invalid version number.
VRID Errors	The total number of VRRP packets received with invalid VRIDs.
VRID	The virtual router identifier.
Interface Name	The name of the IPv4 or IPv6 interface associated with the VRRP instance.
State	The operational state of the VRRP router instance: • **initialize—**the interface is either disabled or down, or the startup delay timer has not expired. • **backup**—this instance is monitoring the availability and state of the master router. • **master**—this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become Master	The total number of times this virtual router's state has transitioned from backup to master.
Adv. Rcvd	The total number of VRRP advertisements received by this instance.

```
-> show ip vrrp 1 statistics
Virtual Router VRID = 1 on INTERFACE = ipv4-100,

```

output definitions

VRID	The virtual router identifier.
INTERFACE	The name of the IPv4 or IPv6 interface associated with the VRRP instance.
State	The operational state of the VRRP router instance: • **initialize—**the interface is either disabled or down, or the startup delay timer has not expired. • **backup**—this instance is monitoring the availability of the master router. • **master**—this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become master	The total number of times this virtual router's state has transitioned from backup to master.
Advertisements received	The total number of VRRP advertisement packets received by this instance.
Type errors	The total number of VRRP packets received with an invalid value in the VRRP type field.
Advertisement interval errors	The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.
IP TTL errors	The total number of VRRP packets received with a TTL (Time-To-Live) value other than 255.
IP address list errors	The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.
Packet length errors	The total number of VRRP packets received with a length less than the length of the VRRP header.
Zero priority advertisements sent	The total number of VRRP advertisements with a priority of 0 sent by the virtual router.
Zero priority advertisements received	The total number of VRRP advertisements with a priority of 0 received by the virtual router.
New Master Reason	The reason the virtual router transitioned to master state. A value of 0 indicates that the virtual router never transitioned to a master state.
Protocol Error Reason	The reason for the last protocol error. A value of 0 indicates that no protocol errors have occurred.
Discontinuity Time	Indicates what the system up time value was when one or more of the statistics counters experienced a discontinuity. A value of 0 indicates that no discontinuities have occurred since the last reboot.
Refresh Rate (milliseconds)	The minimum polling time interval required to update statistics counters.

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; “VLAN” field replaced with “Interface Name” field; “New Master Reason”, “Protocol Error Reason”, “Discontinuity Time”, and “Refresh Rate” fields added.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp track

Displays information about tracking policies on the switch.

show ip vrrp track [*track_id***]**

Syntax Definitions

track_id	The ID of the tracking policy to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

Examples

```
-> show ip vrrp track
Track                                          Admin    Oper          BFD
 ID                  Policy                    State    State  Pri   Status
-----+-----------------------------------+----------+------+-----+---------
   1    PORT 1/1/1                        Enabled    Up      25   Enabled
   2    192.10.150.42                     Enabled    Down    25   Disabled
   3    INTF02-01                         Enabled    Up      25   Enabled

-> show ip vrrp track 2
Tracking Policy TRACKID = 2
  Policy        = 192.10.150.42
  Dec. Priority = 25
  Admin. Status = Enabled
  Oper. Status  = Down
  BFD  Status   = Disabled
  Delay: 0
```

output definitions

Track ID	The ID of the tracking policy.
Policy	The IP interface, chassis/slot/port, or IP address tracked by the policy.
Dec. Priority	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down.
Admin. Status	Whether the tracking policy is administratively **Enabled** or **Disabled**.
Oper. Status	Indicates whether the operating state of the tracking policy is **Up** or **Down**.

output definitions

BFD Status	The status (**Enabled** or **Disabled**) of Bidirectional Forwarding Detection (BFD) interaction with the VRRP tracking policy.
Delay	The amount of time, in seconds, to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **Delay** field added.

Related Commands

vrrp track	Creates a new tracking policy or modifies an existing tracking policy.
show vrrp track-association	Displays the tracking policies associated with virtual routers

MIB Objects

show vrrp track-association

Displays the tracking policies associated with virtual routers.

show {ip | ipv6} [*vrid***] track-association [***track_id***]**

Syntax Definitions

ip	Displays the tracking policies associated with IPv4 virtual routers.
ipv6	Displays the tracking policies associated with IPv6 virtual routers.
vrid	The virtual router ID. The valid range is 1–255.
track_id	The ID of the tracking policy to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show ip vrrp track-association

```

output definitions

VRID	The virtual router identifier.
Interface Name	The name of the IPv4 or IPv6 interface associated with the virtual router.
Conf Pri	The priority configured for the virtual router.
Cur Pri	The current priority for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise, the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The IPv4 interface, IPv6 interface, port, IPv4 address, or IPv6 address that this policy is tracking.
Admin State	The administrative status (**Enabled** or **Disabled**) of the tracking policy.
Oper State	The operational status (**Up** or **Down**) of the tracking policy.
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; “VLAN” field replaced with “Interface Name” field.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
vrrp track	Creates a new tracking policy or modifies an existing tracking policy.
show vrrp track	Displays information about tracking policies on the switch
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

show {ip | ipv6} vrrp group [*vrgid***]**

Syntax Definitions

ip	Displays the IPv4 virtual routers that belong to a group.
ipv6	Displays the IPv6 virtual routers that belong to a group.
vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, the default parameter values are displayed for all the virtual router groups.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

Examples

```
-> show ip vrrp group
Group   Adv               Preempt   Accept
 ID   Interval  Priority    Mode     Mode   Version
-----+--------+----------+--------+--------+-------
  10    200        75       Yes      No       V3
  20    150        75       Yes      No       V2

-> show ip vrrp group 20
Virtual Router Group GROUPID = 20
  Interval = 150
  Priority = 75
  Preempt Mode = Yes
  Accept Mode = No
  Version = V2
  2 Associated Virtual Routers

-> show ipv6 vrrp group
Group   Adv               Preempt   Accept
 ID   Interval  Priority    Mode     Mode   Version
-----+--------+----------+--------+--------+-------
  30    100        75       Yes      No       V3
  40    125        75       Yes      Yes      V3

-> show ipv6 vrrp group 30
Virtual Router Group GROUPID = 30
  Interval = 100
  Priority = 75
```

```
Preempt Mode = Yes
Accept Mode = No
Version = V3
2 Associated Virtual Routers
```

output definitions

Group ID	The virtual router group identifier.
Adv Interval	The default advertisement time interval, in centiseconds, for the VRRP group. Only the master router sends advertisements.
Priority	The default priority value for the VRRP group.
Preempt Mode	The default preempt mode (**Yes** or **No**) for the VRRP group.
Accept Mode	The default accept mode (**Yes** or **No**) for the VRRP group.
Version	The default VRRP version (**V2** or **V3**) for an IPv4 VRRP group. IPv6 virtual routers support only version 3, so IPv6 VRRP groups are automatically set to V3.

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; “Accept Mode” and “Version” parameters added.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group admin-state	Changes the administrative status of all the virtual routers in a virtual router group using a single command.

MIB Objects

```

   alaVrrpv3GroupAcceptMode
   alaVrrpv3GroupVersion
```

show vrrp group-association

Displays the virtual routers that are associated with a virtual router group.

show {ip | ipv6} vrrp group-association [*vrgid***]**

Syntax Definitions

ip	Displays the IPv4 virtual routers that belong to a group.
ipv6	Displays the IPv6 virtual routers that belong to a group.
vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, all virtual router group associations are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vrgid* parameter with this command to display the association details of a specific virtual router group.

Examples

```
-> show ip vrrp group-association
                        Interface
GROUPID VRID              Name                Version
-------+----+--------------------------------+-------
   10     5  ipv4-100                           V2
          6  ipv4-200                           V2
   20    21  ipv4-300                           V3
         22  ipv4-400                           V3

-> show ip vrrp group-association 20
                        Interface
GROUPID VRID              Name                Version

   30    31  ipv6-500                           V3
         32  ipv6-600                           V3
   40    41  ipv6-700                           V3
         42  ipv6-800                           V3
```

```
-> show ipv6 vrrp group-association 30
                         Interface
GROUPID VRID               Name                 Version
-------+----+---------------------------------+-------
   30    31  ipv6-500                             V3
         32  ipv6-600                             V3
```

output definitions

GROUPID	The virtual router group identifier.
VRID	The virtual router identifier.
Interface Name	The IPv4 or IPv6 interface associated with the VRRP instance.
Version	The VRRP version for the group (**V2** or **V3**)

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; “Interface Name” and “Version” fields added; “VLAN” field deprecated.

26 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *are*a. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-OSPF-MIB.mib
Module: alcatelIND1OSPFMIB

Filename: OSPF-MIB.mib
Module: OSPF

The following is a list of the commands for configuring OSPF:

Global OSPF Commands	**ip load ospf** **ip ospf admin-state** **ip ospf asbr** **ip ospf exit-overflow-interval** **ip ospf extlsdb-limit** **ip ospf host** **ip ospf mtu-checking** **ip ospf default-originate** **ip ospf route-tag** **ip ospf spf-timer** **ip ospf virtual-link** **ip ospf neighbor** **show ip ospf** **show ip ospf border-routers** **show ip ospf ext-lsdb** **show ip ospf host** **show ip ospf lsdb** **show ip ospf neighbor** **show ip ospf routes** **show ip ospf virtual-link** **show ip ospf virtual-neighbor**
OSPF Area Commands	**ip ospf area** **ip ospf area default-metric** **ip ospf area range** **show ip ospf area** **show ip ospf area range** **show ip ospf area stub**
OSPF Interface Commands	**ip ospf interface** **ip ospf interface admin-state** **ip ospf interface area** **ip ospf interface auth-key** **ip ospf interface auth-type** **ip ospf interface dead-interval** **ip ospf interface hello-interval** **ip ospf interface md5** **ip ospf interface md5 key** **ip ospf interface type** **ip ospf interface cost** **ip ospf interface poll-interval** **ip ospf interface priority** **ip ospf interface retrans-interval** **ip ospf interface transit-delay** **show ip ospf interface** **show ip ospf interface auth-info**
OSPF BFD Commands	**ip ospf bfd-state** **ip ospf bfd-state all-interfaces** **ip ospf interface bfd-state** **ip ospf interface bfd-state drs-only** **ip ospf interface bfd-state all-neighbors**
OSPF Graceful Restart Commands	**ip ospf restart-support** **ip ospf restart-interval** **ip ospf restart-helper admin-state** **ip ospf restart-helper strict-lsa-checking admin-state** **ip ospf restart initiate** **show ip ospf restart**

ip load ospf

Loads the OSPF software on the router.

ip load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> ip load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaVrConfigTable
   alaVrConfigOspfStatus
```

ip ospf admin-state

Enables or disables the administration status of OSPF on the router.

ip ospf admin-state {enable | disable}

Syntax Definitions

enable	Enables OSPF.
disable	Disables OSPF.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

Examples

```
-> ip ospf admin-state enable
-> ip ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfAdminStat
```

ip ospf asbr

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR.

ip ospf asbr

no ip ospf asbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The **no** variant of this command removes the ASBR classification of the selected router.

Examples

```
-> ip ospf asbr
-> no ip ospf asbr
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfAsBdRtr
```

ip ospf exit-overflow-interval

This command sets the overflow interval value.

ip ospf exit-overflow-interval *seconds*

Syntax Definitions

seconds	The number of seconds the router waits before attempting to leave the overflow state.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router's arrival into this state.
- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

Example

```
-> ip ospf exit-overflow-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExitOverflowInterval
```

ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

ip ospf extlsdb-limit *limit*

Syntax Definitions

limit	The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

Defaults

parameter	default
limit	-1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

Example

```
-> ip ospf extlsdb-limit 25
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExtLsdbLimit
```

ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

ip ospf host *ip_address* **tos** *tos* **[metric** *metric***]**

no ip ospf host *ip_address* **tos** *tos*

Syntax Definitions

ip_address	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
tos	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
metric	The cost metric value assigned to the specified host. The valid range is 0 and up.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination.A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.

Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10
-> no ip ospf host 172.22.2.115 tos 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf host	Displays information on configured OSPF hosts.

MIB Objects

```
ospfHostTable
   ospfHostStatus
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
```

ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking

no ip ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ip ospf mtu-checking
-> no ip ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfMTUCheck
```

ip ospf default-originate

Configures a default external route into the OSPF routing domain.

ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric *value***]**

no ip ospf default-originate

Syntax Definitions

only	Advertises only when there is a default route in the routing table**.**
always	Advertises the default route regardless of whether the routing table has a default route.
type1	Sets the external route as type1.
type2	Sets the external route as type2.
value	The metric value.The valid range is 1-65535.

Defaults

parameter	default
type1 | type2	**type2**
value	1

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfDefaultOriginate
   alaOspfDefaultOriginateMetricType
   alaOspfDefaultOriginateMetric
```

ip ospf route-tag

Configures a tag value that is applied to internal routes for potential redistribution.

ip ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2147483647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

A 32-bit value tagged to each OSPF internal route that is redistributed into other routing protocol domains. The lower 16-bits typically indicate the autonomous system number.

Example

```
-> ip ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfRedistRouteTag
```

ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ip ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Example

```
-> ip ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfTimerSpfDelay
   alaOspfTimerSpfHold
```

ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

ip ospf virtual-link *area_id router_id* **[auth-type {none | simple | md5}] [auth-key** *key_string***] [dead-interval** *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ip ospf virtual-link *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
none	Sets the virtual link authorization type to no authentication.
simple	Sets the virtual link authorization type to simple authentication. If **simple** is selected, a key must be specified as well.
md5	Sets the virtual link authorization type to MD5 authentication.
key_string	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
none | simple | md5	**none**
key_string	null string
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf virtual-link	Displays the virtual link information.

   ospfVirtIfAuthType
   ospfVirtIfRtrDeadInterval
   ospfVirtIfHelloInterval
   ospfVirtIfRetransInterval
   ospfVirtIfTransitDelay
```

ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

ip ospf neighbor *neighbor_id* **{eligible | ineligible}**

no ip ospf neighbor *neighbor_id*

Syntax Definitions

neighbor_id	A unique 32-bit IP address identical to the neighbor's interface address.
eligible	Sets this router as eligible to be the DR.
non-eligible	Sets this router as not eligible to be the DR.

Defaults

parameter	default
eligible | ineligible	**eligible**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

Examples

```
-> ip ospf neighbor 1.1.1.1 ineligible
-> no ip ospf neighbor 1.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface type	Configures the OSPF interface type.
show ip ospf neighbor	Displays information on OSPF non-virtual neighbor routers.

MIB Objects

```
ospfNbrTable
   ospfNbrPriority
   ospfNbmaNbrStatus
```

ip ospf area

Assigns an OSPF interface to a specified area.

ip ospf area *area_id* **[summary {enable | disable}] | [type {normal | stub | nssa}]**

no ip ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
enable	Enables summarization.
disable	Disables summarization.
normal	Sets the area as a regular OSPF area. *This parameter is not supported on an OmniSwitch 6560.*
stub	Configures an OSPF area as a stub area.
nssa	Configures an OSPF area as a Not So Stubby Area (NSSA). *This parameter is not supported on an OmniSwitch 6560.*

Defaults

parameter	default
enable | disable	**enable**
normal | stub | nssa	**normal**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.
- Consider the following when configuring an OSPF area ID on an OmniSwitch 6560:
  - Only one non-zero stub area is supported (configuring a 0.0.0.0 area ID is not allowed).
  - Only two IP OSPF interfaces can be associated with the area.

Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area default-metric	Creates or deletes an OSPF default metric.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfAreaTable
   ospfImportAsExtern
   ospfAreaSummary
   ospfAreaId
```

ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

ip ospf area *area_id* **default-metric** *tos* **[[cost** *cost***] | [type {ospf | type 1 | type 2}]**

no ip ospf area *area_id* **default-metric** *tos*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
tos	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
cost	The numerical cost of this area and ToS. Only 0 is supported in the current release.
ospf	Advertises external routes as OSPF autonomous system external (ASE) routes.
type1	Advertises external routes as a Type 1 (non-OSPF) metric.
type2	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

Defaults

parameter	default
tos	0
ospf | type 1 | type 2	**ospf**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS.To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubStatus
   ospfStubMetric
   ospfStubMetricType
```

ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask* **[effect {admatching | noMatching}]**

no ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Advertises the address range as a summary link state advertisement (LSA).
nssa	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement. *This parameter is not supported on an OmniSwitch 6560.*
ip_address	A 32-bit IP address for the range's area.
subnet_mask	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
admatching	Determines that routes specified falling within the specified range will be advertised.
noMatching	Determines that any route falling within the specified range will not be advertised.

Defaults

parameter	default
summary | nssa	**summary**
admatching | noMatching	**admatching**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.
- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.

- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area default-metric	Creates or deletes an OSPF default metric.
show ip ospf area range	Displays all or specified route summaries in a given area.

MIB Objects

```
ospfAreaAggregateTable
   ospfAreaAggregateAreaId
   ospfAreaAggregateLsdbType
   ospfAreaAggregateNet
   ospfAreaAggregateMask
   ospfAreaAggregateEffect
   ospfAreaAggregateStatus
```

ip ospf interface

Creates and deletes an OSPF interface.

ip ospf interface {*interface_name***}**

no ip ospf interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfIpAddress
alaOspfIfAugTable
   alaOspfIfIntfName
```

ip ospf interface admin-state

Enables or disables the administrative status on an OSPF interface.

ip ospf interface {*interface_name***} admin-state {enable | disable}**

no ip ospf interface {*interface_name***} admin-state {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

Examples

```
-> ip ospf interface vlan-101 admin-state enable
-> ip ospf interface vlan-101 admin-state disable
-> no ip ospf interface vlan-101 admin-state enable
-> no ip ospf interface vlan-101 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAdminStat
```

ip ospf interface area

Configures an OSPF area identifier for this interface.

ip ospf interface {*interface_name***} area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf area	Displays either all the OSPF areas, or a specified OSPF area.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAreaId
```

ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

ip ospf interface {*interface_name***} auth-key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_string	An authentication key (8 characters maximum).

Defaults

The default for the authentication key string is a null string.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on page 26-30, set to **simple**.

Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the authentication type.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
  ospfIfAuthKey
```

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

ip ospf interface {*interface_name***} auth-type {none | simple | md5 | key-chain** *key-chain-id***}**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication.
simple	Simple, clear text authentication.
md5	MD5 encrypted authentication.
key-chain-id	The configured keychain ID.

Defaults

parameter	default
none | simple | md5 | key-chain	**none**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on page 26-29.
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conduction with the commands described on page 26-34 and page 26-36. One command enables MD5 and the other sets the key identification number.
- Use **keychain** to configure a keychain authentication type for an interface. When the OSPF interface receives a packet, the authentication information is carried in the hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines must have the same active current key ID and same authentication type. Use **ip ospf interface auth-type none** to disassociate the keychain from the interface.

Examples

```
-> ip ospf interface vlan-101 auth-type simple
-> ip ospf interface vlan-101 auth-type key-chain 1
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip ospf interface auth-key	Sets the password for simple authentication.
show ip ospf interface	Displays the status and statistics of an OSPF interface.
show ip ospf interface auth-info	Displays authentication information for the interface.

MIB Objects

```
ospfIfTable
   ospfIfAuthType
   alaOspfIfKeyChainId
```

ip ospf interface dead-interval

Configures the OSPF interface dead interval.

ip ospf interface {*interface_name***} dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multipoint)	120

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface hello-interval	Configures the OSPF interface hello interval.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrDeadInterval
```

ip ospf interface hello-interval

Configures the OSPF interface hello interval.

ip ospf interface {*interface_name***} hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multipoint)	30

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfHelloInterval
```

ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

ip ospf interface {*interface_name***} md5** *key_id* **[enable | disable]**

Syntax Definitions

interface_name	The name of the interface.
key_id	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
enable	Enables the interface key.
disable	Disables the interface key.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on page 26-30 and page 26-36.
- The **no** variant deletes the key ID number.

Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5 key	Configures the OSPF key ID and key.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
```

ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

ip ospf interface {*interface_name***} md5** *key_id* **key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_id	The key ID. The valid range is 1–255.
key_string	A key string.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with the commands described above on page 26-30 and page 26-34.
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
   alaOspfIfMd5Key
```

ip ospf interface type

Configures the OSPF interface type.

ip ospf interface {*interface_name***} type {point-to-point | point-to-multipoint | broadcast | non-broadcast}**

Syntax Definitions

interface_name	The name of the interface.
point-to-point	Sets the interface to be a point-to-point OSPF interface.
point-to-multipoint	Sets the interface to be a point-to-multipoint OSPF interface.
broadcast	Sets the interface to be a broadcast OSPF interface.
non-broadcast	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

Defaults

parameter	default
broadcast | non-broadcast | point-to-point| point-to-multipoint	**broadcast**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfType
```

ip ospf interface cost

Configures the OSPF interface cost.

ip ospf interface {*interface_name***} cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

```
-> ip ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfMetricTable
   ospfIfMetricIpAddress
   ospfIfMetricValue
```

ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

ip ospf interface {*interface_name***} poll-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The poll interval, in seconds. The valid range is 1–2147483647.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfPollInterval
```

ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface {*interface_name***} priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface priority. The valid range is 0–255.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ip ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrPriority
```

ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

ip ospf interface {*interface_name***} retrans-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRetransInterval
```

ip ospf interface transit-delay

Configures the OSPF interface transit delay.

ip ospf interface {*interface_name***} transit-delay** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfTransitDelay
```

ip ospf bfd-state

Enables or disables the registration of OSPF with the BFD protocol.

ip ospf bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for OSPF.
disable	Disables BFD for OSPF.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and OSPF must be registered with BFD at the protocol level before OSPF can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPF with the BFD protocol:

```
-> ip ospf bfd-state enable
-> ip ospf bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolospf
   alaOspfBfdStatus
```

ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

ip ospf bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enables BFD for all the OSPF interfaces.
disable	Disables BFD for all the OSPF interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf bfd-state all-interfaces enable
-> ip ospf bfd-state all-interfaces disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ip ospf interface	Displays configuration information for an OSPF interface.

MIB Objects

```
alaProtocolospf
   alaOspfBfdAllInterfaces
```

ip ospf interface bfd-state

Enables or disables BFD for a specific OSPF interface.

ip ospf interface *if_name* **bfd-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing OSPF interface.
enable	Enables BFD for the OSPF interface.
disable	Disables BFD for the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state enable
-> ip ospf interface int2 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ip ospf interface	Displays configuration information for an OSPF interface.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdStatus
```

ip ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ip ospf interface *if_name* **bfd-state drs-only**

Syntax Definitions

if_name	The name of an existing OSPF interface.

Defaults

parameter	default
drs-only	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state drs-only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ip ospf interface	Displays configuration information for an OSPF interface.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ip ospf interface *if_name* **bfd-state all-neighbors {enable | disable}**

Syntax Definitions

if_name	The name of an existing OSPF interface.
enable	Enables BFD sessions with all neighbors.
disable	Disables BFD sessions with all neighbors.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state all-neighbors enable
-> ip ospf interface int1 bfd-state all-neighbors disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
show ip ospf interface	Displays configuration information for an OSPF interface.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

ip ospf restart-support {planned-unplanned | planned-only}

no ip ospf restart-support

Syntax Definitions

planned-unplanned	Specifies support for planned and unplanned restarts.
planned-only	This parameter is currently not supported.

Defaults

Graceful restart is disabled be default.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartSupport
```

ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

ip ospf restart-interval [*seconds***]**

Syntax Definitions

seconds	The hitless restart timeout interval. The valid range is 0–1800 seconds.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Example

```
-> ip ospf restart-interval 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInterval
```

ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

ip ospf restart-helper [admin-state {enable | disable}]

Syntax Definitions

enable	Enables the capability of an OSPF router to operate in helper mode.
disable	Disables the capability of an OSPF router to operate in helper mode.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper strict-lsa-checking admin-state	Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}

Syntax Definitions

enable	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
disable	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable
-> ip ospf restart-helper strict-lsa-checking admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper admin-state	Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart initiate

Initiates a planned graceful restart.

ip ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Example

```
-> ip ospf restart initiate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInitiate
```

show ip ospf

Displays the OSPF status and general configuration parameters.

show ip ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command is used to display the general configuration parameters of the OSPF router. See the Related Commands section below for commands that are used to modify the displayed parameters.

Examples

```
-> show ip ospf
Router Id                       = 10.255.11.242,
OSPF Version Number             = 2,
Admin Status                    = Enabled,
Area Border Router ?            = No,
AS Border Router Status         = Enabled,
Route Tag                       = 0,
SPF Hold  Time (in seconds)     = 10,
SPF Delay  Time (in seconds)    = 5,
MTU Checking                    = Disabled,
# of Routes                     = 124,
# of AS-External LSAs           = 60,
# of self-originated LSAs       = 1,
# of LSAs received              = 118,
External LSDB Limit             = -1,
Exit Overflow Interval          = 0,
# of SPF calculations done      = 38395,
# of Incr SPF calculations done  = 0,
# of Init State Nbrs            = 0,
# of 2-Way State Nbrs           = 0,
# of Exchange State Nbrs        = 0,
# of Full State Nbrs            = 1,
# of attached areas             = 1,
# of Active areas               = 1,
# of Transit areas              = 0,
# of attached NSSAs             = 0,
Default Route Origination       = none,
Default Route Metric-Type/Metric = type2 / 1,
BFD Status                      = Disabled
Opaque Transit Capability       = Enabled
```

output definitions

Router Id	The unique identification for the router.
OSPF Version Number	The version of OSPF the router is running.
Admin Status	Whether OSPF is currently enabled or disabled on the router.
Area Border Router?	Whether the router status is an area router or not.
AS Border Router Status	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
Route Tag	Shows the route tag for this router.
SPF Hold Time	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
SPF Delay Time	Shows the time in seconds between consecutive SPF calculations.
MTU Checking	Shows whether Maximum Transfer Unit checking is enabled or disabled.
# of Routes	The total number of OSPF routes known to this router.
# of AS-External LSAs	The number of external routes learned from outside the router's Autonomous System (AS).
# of self-originated LSAs	The number of times a new Link State Advertisement has been sent from this router.
# of LSAs received	The number of times a new Link State Advertisement has been received by this router.
External LSDB Limit	The maximum number of entries allowed in the external Link State Database.
Exit Overflow Interval	The number of seconds the router remains in the overflow state before attempting to leave it.
# of SPF calculations done	The number of SPF calculations that have occurred.
# of Incr SPF calculations done	The number of incremental SPF calculations done.
# of Init State Nbrs	The number of neighbors in the initialization state.
# of 2-Way State Nbrs	The number of OSPF 2-way state neighbors on this router.
# of Exchange State Nbrs	The number of neighbors in the exchange state.
# of Full State Nbrs	The number of neighbors in the full state.
# of attached areas	The number of areas that are configured on the router.
# of Active areas	The number of areas that are active.
# of Transit areas	The number of transit areas that are configured on the router.
# of attached NSSAs	The number of Not So Stubby Areas that are configured on the router.
Default Route Origination	Whether route redistribution is enabled or disabled on the router.
Default Route Metric-Type/ Metric	The default metric for stub or Not So Stubby Area (NSSA) areas. Specifies the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).
BFD Status	Whether BFD monitoring is enabled or disabled for OSPF.
Opaque Transit Capability	Whether the opaque LSA accept and retransmit capability for OSPF is enabled or disabled.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip router router-id	Configures the router ID for the router.
ip ospf admin-state	Enables or disables the administration of OSPF on the router.
ip ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip ospf spf-timer	Configures timers for SPF calculation.
ip ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
ip ospf exit-overflow-interval	This command sets the overflow interval value.
ip ospf default-originate	Enables or disables OSPF redistribution
ip ospf area default-metric	Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas.
ip ospf bfd-state	Enables or disables the registration of OSPF with the BFD protocol.

show ip ospf border-routers

Displays information regarding all or specified border routers.

show ip ospf border-routers [*area_id***] [***router_id***] [***tos***] [***gateway***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
tos	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
gateway	The 32-bit IP address of the gateway for the border router being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

Examples

```
-> show ip ospf border-routers 10.0.0.0

Router Id              Area Id            Gateway         TOS    Metric
-----------------+-----------------+--------------------+------+--------
10.0.0.0           1.0.0.1            143.209.92.71       1       1
```

output definitions

Router ID	The unique identification for the router.
Area ID	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Gateway	The next hop interface on which the border router has been learned.
ToS	The Type of Service. Only ToS value 0 is supported at this time.
Metric	The cost to the border router.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

```

show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

show ip ospf ext-lsdb [linkstate-id *ls_id***] [router-id** *router_id***]**

Syntax Definitions

ls_id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf ext-lsdb

      LS Id         Orig Router-Id     SeqNo      Age     Protocol
-----------------+-----------------+----------+--------+----------
  198.168.100.100    198.168.100.100      10      100     STATIC
```

output definitions

LS Id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.
SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
Protocol	The type of protocol, if any.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

MIB Objects

```
ospfExtLsdbTable
   ospfExtLsdbLsid
   ospfExtLsdbRouterId
   ospfExtLsdbSequence
   ospfExtLsdbAge
   ospfExtLsdbType
```

show ip ospf host

Displays information on the configured OSPF hosts.

show ip ospf host [*ip_address***]**

Syntax Definitions

ip_address	A 32-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf host 172.22.2.115

   Host Address     TOS     Metric     Status       AreaId
-----------------+-------+----------+--------+-----------------
 143.209.92.12       1            0      Up     0.0.0.0
```

output definitions

Host Address	A 32-bit IP address for a directly attached host. This can be set using the **ip ospf host** command.
ToS	The Type of Service traffic from the host is labeled as. ToS is set using the **ip ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ip ospf host** command.
Status	Whether the host is enabled or disabled.
AreaId	The area identification for the host's area.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf host	Creates and deletes an OSPF entry for directly attached hosts.

MIB Objects

```
ospfHostTable
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
   ospfHostStatus
   ospfHostAreaID
```

show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

show ip ospf lsdb [*area_id*] **[rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

Examples

```
-> show ip ospf lsdb
    Area Id       Type        LS Id        Orig Router-Id     SeqNo      Age
----------------+-------+---------------+---------------+------------+-----
0.0.0.1          OSPF   198.168.100.100  198.168.100.100     1        100
```

output definitions

Area Id	The area identification for the area to which the record belongs.
Type	The protocol type from where the route was learned.
LS Id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.

output definitions (continued)

SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

show ip ospf neighbor [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address of the neighboring router.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf neighbor
                                                  Domain   Domain
  IP Address        Area Id          Router Id      Name     ID      State  Type
----------------+---------------+--------------+--------+--------+-------+------
12.1.1.2         0.0.0.1          2.2.2.2         Vlan     12       Full    Dynamic
10.1.1.1         0.0.0.0          1.1.1.1         Tunnel   NA       Full    Dynamic
13.1.1.2         0.0.0.1          3.3.3.3         Service  1200     Full    Dynamic
```

output definitions

IP Address	The IP address of the neighbor.
Area Id	A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
Router Id	The unique identification for the neighboring router.
Domain Name	The domain on which the neighbor is reachable (**VLAN**, **Service**, or **Tunnel**).
Domain ID	The VLAN ID or service ID on which the neighbor is reachable. This field displays “NA” for IP tunnels.
State	The state of the OSPF neighbor adjacency.
Type	What type of neighbor, either **Dynamic** (learned) or **Static**.

```
-> show ip ospf neighbor 12.1.1.2
Neighbor's IP Address                = 12.1.1.2,
Neighbor's Router Id                 = 2.2.2.2,

```

output definitions

Neighbor's IP Address	The IP address of the neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
Neighbor's Domain Name	The domain on which the neighbor is reachable (**VLAN**, **Service**, or **Tunnel**).
Neighbor's Domain ID	The VLAN ID or service ID on which the neighbor is reachable. This field displays "NA" for IP tunnels.
Neighbor's DR Address	The address of the neighbors Designated Router.
Neighbor's BDR Address	The address of the neighbors Backup Designated Router.
Neighbor's Priority	The priority value for this neighbor becoming the DR.
Neighbor's State	The condition of the OSPF neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this neighbor is suppressed.
Neighbor's type	What type of neighbor this is, either **dynamic** or **static**.
DR Eligible	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this neighbor and the local router.
Mode	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of Outstanding LS Requests	The number of Link State requests to this neighbor that have not received a response from this neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.
# of Outstanding LS Retransmissions	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.

output definitions (continued)

Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.
Opaque LSA Capability	Whether the opaque LSA accept and retransmit capability for OSPF is enabled or disabled.

Release History

Release 7.1.1; command was introduced.
Release 8.6R1; “Domain Name”, “Domain ID”, “Neighbor’s Domain Name”, and “Neighbor’s Domain ID” fields added.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

show ip ospf routes

Displays the OSPF routes known to the router.

show ip ospf routes [*ip_address mask tos gateway***]**

Syntax Definitions

ip_address	A 32-bit IP address of the route destination in dotted decimal format.
mask	The IP subnet mask of the route destination.
tos	The Type of Service of the route.
gateway	The next hop IP address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ip ospf routes
                                                Domain  Domain
 Destination/Mask          Gateway       Metric   Name     ID          Type
--------------------+-----------------+--------+--------+--------+----------
2.2.2.2/32           12.1.1.2          1        Vlan     12        Intra

```

output definitions

Destination/Mask	The destination address of the route. This can also display the destination IP address mask if it is known.
Gateway	The gateway address of the route.
Metric	The cost of the route.
Domain Name	The domain on which the gateway can be routed (**VLAN**, **Service**, or **Tunnel**).
Domain ID	The VLAN ID or service ID on which the gateway can be routed. This field displays “NA” for IP tunnels.
Type	The type of OSPF route.

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; “Domain Name” and “Domain ID” fields added.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

```

show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

show ip ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-link
                                        State
 Transit AreaId      Router-id    Link / Adjacency  AuthType   OperStatus
----------------+----------------+----------------+----------+------------
1.1.1.1           172.17.1.1     P2P  / Full       none        up
```

output definitions

Transit AreaId	The area identification for the area assigned to the virtual link.
Router-Id	The destination router identification for the virtual link.
State Link	The state of the virtual link with regards to the local router.
State Adjacency	The state of the virtual link adjacency.
AuthType	The type of authorization employed by the virtual link.
OperStatus	Displays whether the virtual link is enabled or disabled.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf virtual-link	Creates or deletes a virtual link.
show ip ospf virtual-neighbor	Displays OSPF virtual neighbors.

MIB Objects

```

   ospfVirtIfAreaId
   ospfVirtIfNeighbor
   ospfVirtIfState
   ospfVirtIfAuthType
```

show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

show ip ospf virtual-neighbor *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1

     AreaId           RouterId     Priority Events RxmtQLen LastHello  State
-----------------+----------------+--------+------+--------+---------+-------
 0.0.0.0           10.0.0.0           1        10     100      323     INIT
```

output definitions

AreaId	The area identification for the area of which the virtual neighbor is a part.
RouterId	The router identification of the virtual neighbor.
Priority	The number used to determine whether the virtual neighbor will become the designated router for its area.
Events	The number of OSPF control message sent by the neighbor to the router.
RxmtQlen	The length (in number of packets) of the retransmit queue.
LastHello	The last Hello message sent by the neighbor
State	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

```
-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address               = 2.0.0.254,
Neighbor's Router Id                = 2.0.0.254,
Neighbor's Area Id                  = 0.0.0.1,
Neighbor's DR Address               = 2.0.0.1,
Neighbor's BDR Address              = 2.0.0.254,
Neighbor's Priority                 = 1,
Neighbor's State                    = Full,
Hello Suppressed ?                  = No,
Neighbor's type                     = Dynamic,
# of State Events                   = 6,

# of Outstanding LS Requests        = 0,
# of Outstanding LS Acknowledgements= 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status               = Not Restarting,
Restart Age (in seconds)            = 0 sec,
Last Restart Helper Exit Reason     = None
```

output definitions

Neighbor's IP Address	The IP address of the virtual neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
Neighbor's DR Address	The address of the virtual neighbor's Designated Router.
Neighbor's BDR Address	The address of the virtual neighbor's Backup Designated Router.
Neighbor's Priority	The priority value for this virtual neighbor becoming the DR.
Neighbor's State	The condition of the OSPF virtual neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this virtual neighbor is suppressed.
Neighbor's type	What type of virtual neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this virtual neighbor and the local router.
Mode	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
Last DD I_M_MS	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

output definitions (continued)

# of Outstanding LS Requests	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
# of Outstanding LS Retransmissions	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

Release History

Release 7.1.1; command was introduced.

show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

show ip ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area

    Area Id      AdminStatus      Type       OperStatus
---------------+-------------+-------------+------------
1.1.1.1           disabled     normal       down
0.0.0.1           disabled     normal       down

-> show ip ospf area 0.0.0.0

Area Identifier                          = 1.1.1.1,
Admin Status                             = Disabled,
Operational Status                       = Down,
Area Type                                = normal,
Area Summary                             = Enabled,
Time since last SPF Run                  = 00h:00m:27s,
# of Area Border Routers known           = 0,

# of LSAs in area                        = 0,
# of SPF Calculations done               = 0,
# of Incremental SPF Calculations done   = 0,
# of Neighbors in Init State             = 0,
# of Neighbors in 2-Way State            = 0,
# of Neighbors in Exchange State         = 0,
# of Neighbors in Full State             = 0,
# of Interfaces attached                 = 0
Attached Interfaces                      = vlan-213
```

output definitions

Area Identifier	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
Admin Status	Whether the area is enabled or disabled.
Operational Status	Whether the area is active.
Area Type	The area type. This field will be **normal**, **stub**, or **NSSA**.
Area Summary	Whether Area Summary is enabled or disabled.
Time since last SPF Run	The last time the Shortest Path First calculation was performed.
# of Area Border Routers known	The number of Area Border Routers in the area.
# of AS Border Routers known	The number of Autonomous System Border Routers in the area.
# of LSAs	The total number of Link State Advertisements for the Area.
# of SPF Calculations	The number of times the area has calculated the Shortest Path.
# of Incremental SPF Calculations	The number of incremental Shortest Path First calculations that have been performed in the area.
# of Neighbors in Init State	The number of OSPF neighbors that are in initialization.
# of Neighbors in 2-Way State	The number of OSPF 2-way state neighbors in this area.
# of Neighbors in Exchange State	The number of OSPF neighbors that are currently establishing their status.
# of Neighbors in Full State	The number of OSPF neighbors.
# of Interfaces attached	The number of OSPF interfaces.
Attached Interfaces	The names of the OSPF interfaces attached to this area.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area, assigning default metric, cost, and type.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf interface	Displays OSPF interface information.

MIB Objects

```
ospfAreaTable
   ospfAreaId
   ospfImportAsExtern
   ospfSpfRuns
   ospfAreaBdrRtrCount
   ospfAsBdrRtrCount
   ospfAreaLsaCount
   ospfAreaSummary
   ospfAreaStatus
alaOspfIfAugTable
   alaOspfIfIntfName
```

show ip ospf area range

Displays all or specified route summaries in a given area.

show ip ospf area *area_id* **range [{summary | nssa}** *ip_address ip_mask***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Specifies that routes are summarized.
nssa	Specifies the Not So Stubby Area (NSSA) routers are summarized. *This parameter is not supported on an OmniSwitch 6560.*
ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area 0.0.0.0 range

     AreaId        Type     Destination        Advertise
---------------+---------+-----------------+-----------
0.0.0.0          Summary   192.168.12.1/24   Matching
0.0.0.0          NSSA      143.209.92.71/24  noMatching
```

output definitions

AreaId	The area identification for the area range.
Type	The type of area the range is associated with.
Destination	The destination address of the range.
Advertise	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area range	Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

MIB Objects

```
ospfAreaRangeTable
   ospfAreaRangeAreaId
   ospfAreaRangeNet
   ospfAreaRangeMask
   ospfAreaRangeStatus
   ospfAreaRangeEffect
```

show ip ospf area stub

Displays stub default area metrics, if configured.

show ip ospf area *area_id* **stub**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip ospf area 0.0.0.1 stub

    Area Id       TOS     Metric    MetricType
---------------+-------+----------+------------
0.0.0.1           1          1        ospf
```

output definitions

Area Id	The identification number of the stub area.
TOS	The Type of Service assignment.
Metric	The metric assignment of the default router in the stub area.
MetricType	The metric type of the stub area. It will be either **ospf**, **type1**, or **type2**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubMetric
   ospfStubStatus
   ospfStubMetricType
```

show ip ospf interface

Displays OSPF interface information.

show ip ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

Examples

No interface name is specified:

```
-> show ip ospf interface
    Interface           DR           Backup DR      Admin    Oper           BFD
      Name           Address         Address       Status   Status  State  Status
------------------+--------------+--------------+--------+------+-------+--------
vlan-213          100.10.10.88    100.10.10.2     enabled  up     BDR     disabled
vlan-215          101.10.10.2     0.0.0.0         enabled  up     DR      enabled
vlan-220          10.10.20.1      0.0.0.0         enabled  up     DR      disabled
service-1200      13.1.1.1        13.1.1.2        enabled  UP     BDR     enabled
tunnel-1          10.1.1.2        0.0.0.0         enabled  UP     DR      enabled
```

output definitions

Interface Name	The name of the interface.
DR Address	The designated router IP address on this network segment.
Backup DR Address	The IP address of the backup designated router.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Oper Status	Whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
BFD Status	The current status of BFD for the OSPF interface.

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-213
Interface IP Name                    = vlan-213
Interface IP Address                 = 100.10.10.2,
```

```
Interface IP Mask                     = 255.255.255.0,
Domain Name                           = Vlan,
Domain ID                             = 213,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = BDR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.2,
Designated Router IP Address          = 100.10.10.88,
Designated Router RouterId            = 100.10.10.88,
Backup Designated Router IP Address   = 100.10.10.2,
Backup Designated Router RouterId     = 192.169.1.2,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,
Transit Delay (seconds)               = 1,
Retrans Interval (seconds)            = 5,
Dead Interval (seconds)               = 40,
Poll Interval (seconds)               = 120,
Link Type                             = Broadcast,
Authentication Type                   = md5,
# of Events                           = 2,
# of Init State Neighbors             = 0,
# of 2-Way State Neighbors            = 0,
# of Exchange State Neighbors         = 0,
# of Full State Neighbors             = 1
BFD status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-215
Interface IP Name                     = vlan-215
Interface IP Address                  = 101.10.10.2,
Interface IP Mask                     = 255.255.255.0,
Domain Name                           = Vlan,
Domain ID                             = 215,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = DR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.2,
Designated Router IP Address          = 101.10.10.2,
Designated Router RouterId            = 192.169.1.2,
Backup Designated Router IP Address   = 0.0.0.0,
Backup Designated Router RouterId     = 0.0.0.0,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,
Transit Delay (seconds)               = 1,
Retrans Interval (seconds)            = 5,
Dead Interval (seconds)               = 40,
Poll Interval (seconds)               = 120,
Link Type                             = Broadcast,
Authentication Type                   = simple,
Authentication Key                    = Set,
# of Events                           = 3,
```

```
# of Init State Neighbors             = 0,
# of Exchange State Neighbors         = 0,
# of 2-Way State Neighbors            = 0,
# of Full State Neighbors             = 0
BFD Status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

The following is an example of keychain authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-220
Interface IP Name                     = vlan-220,
Interface IP Address                  = 10.10.20.1,
Interface IP Mask                     = 255.255.255.0,
Domain Name                           = Vlan,
Domain ID                             = 220,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = DR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.0,
Designated Router IP Address          = 10.10.20.1,
Designated Router RouterId            = 10.10.10.1,
Backup Designated Router IP Address   = 0.0.0.0,
Backup Designated Router RouterId     = 0.0.0.0,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,
Transit Delay (seconds)               = 1,
Retrans Interval (seconds)            = 5,
Dead Interval (seconds)               = 40,
Poll Interval (seconds)               = 120,
Link Type                             = Broadcast,
Authentication Type                   = Keychain(1),
# of Events                           = 2,
# of Init State Neighbors             = 0,
# of 2-Way State Neighbors            = 0,
# of Exchange State Neighbors         = 0,
# of Full State Neighbors             = 0,
# of type-9 LSAs on this interface    = 0,
BFD status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

The following are examples of an OSPF interface configured for an IP interface that is bound to a service and configured for an IP interface that is bound to a tunnel (an interface name is used in each example):

```
-> show ip ospf interface service-1200
Interface IP Name                     = service-1200,
Interface IP Address                  = 13.1.1.2,
Interface IP Mask                     = 255.255.255.0,
Domain Name                           = Service,
Domain ID                             = 1200,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = BDR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.1,
Designated Router IP Address          = 13.1.1.1,
Designated Router RouterId            = 172.28.4.133,
Backup Designated Router IP Address   = 13.1.1.2,
```

```
Backup Designated Router RouterId     = 2.2.2.2,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,

DR-Only Option for BFD                = Disabled
```

Output fields when an interface name is specified are described below:

output definitions

Interface IP Name	The name of the IP interface on which OSPF is configured.
Interface IP Address	The IP address assigned to the interface.
Interface IP Mask	The IP mask associated with the IP address assigned to the interface.
Domain Name	The domain on which the IP interface was configured (**VLAN**, **Service**, or **Tunnel**).
Domain ID	The VLAN ID or service ID on which the IP interface was configured. This field displays "NA" for IP tunnels.
Admin Status	The current administration status of the interface (**enabled** or **disabled**).
Operational Status	Whether the interface is an active OSPF interface.
OSPF Interface State	The current state of the OSPF interface (**down**, **up**, **dp**, **dr**, or **other**).
Interface Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Area Id	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Designated Router IP Address	The designated router IP address.
Designated Router RouterId	The identification number of the designated router.
Backup Designated Router IP Address	The IP address of the backup designated router.
Backup Designated Router RouterId	The identification number of the backup designated router.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
Metric Cost	The cost added to routes learned on this interface.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Retrans Interval	The number of seconds the interface waits before resending hello messages.
Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Poll Interval	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
Link Type	The IP interface type (**broadcast** or **non broadcast**).
Authentication Type	The type of authentication used by this interface (**None**, **Simple**, **MD5**, or **Keychain**).
#	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)

output definitions (continued)

Id	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
Key	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
Status	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
StartAccept	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StopAccept	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StartGen	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
StopGen	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
Authentication Key	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
# of Events	The number of interface state machine events.
# of Init State Neighbors	The number of OSPF neighbors in the initialization state.
# of 2-Way State Neighbors	The number of OSPF 2-way state neighbors on this interface.
# of Exchange State Neighbors	The number of OSPF neighbors in the exchange state.
# of Full State Neighbors	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.
# of type-9 LSAs on this interface	Number of type-9 LSA on this interface. (This field is only displayed for keychain authentication.)
BFD Status	The status of BFD on this interface.
DR-Only Option for BFD	The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; “Domain Name” and “Domain ID” fields added.

Related Commands

ip ospf interface	Creates and deletes an OSPF interface.
ip ospf interface auth-key	Configures an OSPF authentication key for simple authentication on an interface.
ip ospf interface dead-interval	Configures the OSPF interface dead interval.
ip ospf interface hello-interval	Configures the OSPF interface hello interval.

ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
ip ospf interface md5 key	Configures the OSPF key string.
ip ospf interface cost	Configures the OSPF interface cost.
ip ospf interface poll-interval	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
ip ospf interface priority	Configures the OSPF interface priority.
ip ospf interface retrans-interval	Configures the OSPF interface retransmit interval.
ip ospf interface transit-delay	Configures the OSPF interface transit delay.
ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface area	Configures an OSPF interface area.
ip ospf interface type	Configures the OSPF interface type.
ip ospf interface admin-state	Enables or disables the administration status on an OSPF interface.
ip ospf interface bfd-state	Enables or disables the status of BFD for an OSPF interface.
ip ospf interface bfd-state drs-only	Configures whether BFD sessions are only established with neighbors that are in the full state.

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Not specifying an interface name displays all known interfaces for the OSPF router.
- When keychain authentication type is used for the interface, only the keychain ID is displayed. To view the keys associated with the keychain, use the keychain commands. For more information keychain management commands, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.

Examples

```
-> show ip ospf interface auth-info
Interface Name        Key-chain    KeyId     Key       Status        AuthMode
--------------------+------------+------+----------+------------+----------------
vlan-30-int             1           --       --       Enabled       keychain
vlan-20-int             --          10       Set      Enabled       Keyed-MD5
```

output definitions

Interface Name	The name of the interface.
Key-chain	The keychain associated with the interface.
KeyId	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
Key	Indicates whether the key has been set or not.
Status	The current administration status of the interface, either **enabled** or **disabled**.
AuthMode	The type of authentication used by this interface.

Release History

Release 8.4.1; command introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

MIB Objects

N/A

show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

show ip ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> show ip ospf restart
Restart Support                     = Enabled,
Restart Interval (in seconds)       = 120,
Restart Status                      = Not Restarting,
Restart Age (in seconds)            = 0,
Last Restart Exit Reason            = None,
Restart Helper Support              = Enabled,
Restart Helper Strict Checking      = Enabled,
Restart Helper Mode                 = NotHelping
```

output definitions

Restart Support	The administrative status of OSPF graceful restart, which can be **Enabled** or **Disabled**.
Restart Interval	The configured OSPF hitless restart timeout interval, in seconds. Use the **ip ospf restart-interval** command to modify this parameter.
Restart Status	The current status of OSPF graceful restart, which can be **Not Restarting**, **Unplanned Restart** (after a CMM takeover), or **Planned Restart** (before CMM takeover).
Restart Age	The remaining time, in seconds, for the current OSPF graceful restart interval.
Last Restart Exit Reason	The outcome of the last attempt at a graceful restart. If the value is **None**, then no restart has yet been attempted. If the value is **In Progress**, then a restart attempt is currently underway. Other possible values include **Completed** (successfully completed), **Timed Out** (timed out), and **Topology Changed** (aborted due to topology change).

output definitions (continued)

Restart Helper Support	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper admin-state** command to modify this parameter.
Restart Helper Strict Checking	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper strict-lsa-checking admin-state** command to modify this parameter.
Restart Helper Mode	Whether this OSPF router is operating as a helper to a restarting router.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support	Configures support for the graceful restart feature on an OSPF router.
ip ospf restart initiate	Initiates a planned graceful restart.

MIB Objects

N/A

27 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *are*a. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-OSPF3-MIB.mib
Module: alcatelIND1OSPF3MIB

Filename: OSPFV3-MIB.mib
Module: ospfv3MIB

The following is a list of the commands for configuring OSPFv3:

Global OSPFv3 Commands	**ipv6 load ospf** **ipv6 ospf admin-state** **ipv6 ospf host** **ipv6 ospf mtu-checking** **ipv6 ospf route-tag** **ipv6 ospf spf-timer** **ipv6 ospf virtual-link** **show ipv6 ospf** **show ipv6 ospf border-routers** **show ipv6 ospf host** **show ipv6 ospf lsdb** **show ipv6 ospf neighbor** **show ipv6 ospf routes** **show ipv6 ospf virtual-link**
OSPFv3 Area Commands	**ipv6 ospf area** **ipv6 ospf area area-summary** **ipv6 ospf area nssa-translator-role** **ipv6 ospf area nssa-translator-stab-interval** **ipv6 ospf area nssa-summarize** **show ipv6 ospf area**
OSPFv3 Interface Commands	**ipv6 ospf interface** **ipv6 ospf interface admin-state** **ipv6 ospf interface suppress-link-lsa** **ipv6 ospf interface type** **ipv6 ospf neighbor** **ipv6 ospf interface area** **ipv6 ospf interface dead-interval** **ipv6 ospf interface hello-interval** **ipv6 ospf interface cost** **ipv6 ospf interface priority** **ipv6 ospf interface retrans-interval** **ipv6 ospf interface transit-delay** **show ipv6 ospf interface**
OSPFv3 BFD Commands	**ipv6 ospf bfd-state** **ipv6 ospf bfd-state all-interfaces** **ipv6 ospf interface bfd-state** **ipv6 ospf interface bfd-state drs-only** **ipv6 ospf interface bfd-state all-neighbors**
OSPFv3 Graceful Restart Commands	**ipv6 ospf restart** **ipv6 ospf restart initiate** **ipv6 ospf restart interval** **ipv6 ospf restart-helper** **ipv6 ospf restart-helper strict-lsa-check** **show ipv6 ospf restart**

ipv6 load ospf

Loads the OSPFv3 software on the router.

ipv6 load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> ipv6 load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaVrConfigTable
   alaVrConfigOspf3Status
```

ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

ipv6 ospf admin-state {enable | disable}

Syntax Definitions

enable	Enables OSPFv3.
disable	Disables OSPFv3.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3GeneralGroup
   ospfv3AdminStat
```

ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

ipv6 ospf host *ipv6_address* **[area** *area_id***] [metric** *metric***]**

no ipv6 ospf host *ipv6_address* **area** *area_id*

Syntax Definitions

ipv6_address	The 128-bit IP address of the OSPFv3 host.
area_id	Area to which the host route belongs.
metric	The cost metric value assigned to the specified host. The valid range is 0–65535.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

Examples

```
-> ipv6 ospf host 2001::1/64 metric 10
-> no ipv6 ospf host 2001::1/64 metric 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf host	Displays information on the configured OSPFv3 hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostStatus
   ospfv3HostAreaID
   ospfv3HostAddress
   ospfv3HostMetric
```

ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ipv6 ospf mtu-checking

no ipv6 ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ipv6 ospf mtu-checking
-> no ipv6 ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3MTUCheck
```

ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPFv3 router. The tag value allows for quick identification.
- OSPFv3 ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

```
-> ipv6 ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3RedistRouteTag
```

ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ipv6 ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPFv3 topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3TimerSpfDelay
   alaOspf3TimerSpfHold
```

ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

ipv6 ospf virtual-link area *area_id* **router** *router_id* **[dead-interval** *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ipv6 ospf virtual-link area *area_id* **router** *router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPFv3 hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPFv3 packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPFv3 packets over this link. The valid range is 0–3600.

Defaults

parameter	default
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a

virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.

- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf virtual-link	Displays the virtual link information.

MIB Objects

```
ospfv3VirtIfTable
   ospfv3VirtIfAreaId
   ospfv3VirtIfNeighbor
   ospfv3VirtIfStatus
   ospfv3VirtIfRtrDeadInterval
   ospfv3VirtIfHelloInterval
   ospfv3VirtIfRetransInterval
   ospfv3VirtIfTransitDelay
```

ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

ipv6 ospf area *area_id* [**type** {**normal** | **stub** [**default-metric** *metric*] | **nssa** [**default-metric** *metric*]}] | [**summarize** [**filter**]

no ipv6 ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format or a unique identification number in the range 0 to 4294967295.
normal	Sets the area as a regular OSPFv3 area.
stub	Configures an OSPFv3 area as a stub area.
nssa	Configures an OSPFv3 area as a NSSA (Not-So-Stubby Area).
metric	Defines the metric to be used for default routes injected into the stub or NSSA. The range is 0 to 4294967295.
summarize	Configures the inter-area route summarization. Prefixes that fall within the summary range can be shared with another area through the summary prefix.
filter	Configure to filter the routes specified in the summarization range. These filtered routes are not advertised into another area.

Defaults

parameter	default
normal | stub | nssa	**normal**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- To change the area type, first delete the area, and then recreate it with the new type.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub or NSSA.

Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub default-metric 15
-> ipv6 ospf area 0.0.0.1 type normal
-> ipv6 ospf area 0.0.0.1 type nssa
-> ipv6 ospf area 0.0.0.1 summarize 2001:1::/64
-> no ipv6 ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **nssa** keyword added.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaTable
   ospfv3ImportAsExtern
   ospfv3AreaSummary
   ospfv3StubMetric
   ospfv3AreaId
   ospfv3AreaImportAsExtern
```

ipv6 ospf area area-summary

Configures whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.

ipv6 ospf area *area_id* [**area-summary** {**noareasummary** | **sendareasummary**}]

Syntax Definitions

area_id	The area ID configured for a stub or NSSA.
noareasummary	When set to this option, inter-area LSAs will neither originate or propagate into the NSSA. Only a default route will be advertised into the NSSA.
sendareasummary	When set to this option, inter-area LSAs will be summarized and propagated into the NSSA.

Defaults

parameter	default
noareasummary | sendareasummary	**sendareasummary**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 0.0.0.1 area-summary noAreaSummary
```

Release History

Release 8.4.1; command introduced.

Related Commands

ipv6 ospf area	Assigns an OSPFv3 interface to a specified area.
show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaSummary
```

ipv6 ospf area nssa-translator-role

Configures whether or not an NSSA border router will unconditionally translate Type-7 LSAs into Type-5 LSAs.

ipv6 ospf area *area_id* [**nssa-translator-role {always | candidate}]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
always	When set to this option, NSSA border router always translates Type-7 LSAs into Type-5 LSAs regardless of the translator state of other NSSA border routers.
candidate	When set to this option, NSSA border router participates in the translator election process.

Defaults

parameter	default
always | candidate	**candidate**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When translator role is set to **candidate**, NSSA border router invokes a translator election process. The translator is then established by the NSSA border router whose router LSA has the greatest router ID.

Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator role always
```

Release History

Release 8.4.1; command introduced.

Related Commands

ipv6 ospf area	Assigns an OSPFv3 interface to a specified area.
show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaNssaTranslatorRole
```

ipv6 ospf area nssa-translator-stab-interval

Configures the duration for which a Type-7 translator will continue in the translator role after another NSSA border router translator has assumed the role.

ipv6 ospf area *area_id* [**nssa-translator-stab-interval** *interval*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
interval	NSSA translator stability interval value in seconds. The range is 0 to 4294967295.

Defaults

The default value is 40 seconds.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator-stab-interval 60
```

Release History

Release 8.4.1; command introduced.

Related Commands

ipv6 ospf area	Assigns an OSPFv3 interface to a specified area.
show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaNssaTranslatorStabInterval
```

ipv6 ospf area nssa-summarize

Configures an NSSA summary of IPv6 prefix in the given area. Any NSSA LSAs within the area subsumed by IPv6 prefix will be summarized into other areas as an external LSA with a prefix of IPv6 prefix.

ipv6 ospf area *area_id* **nssa-summarize** *ipv6_address_prefix* [**filter**]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
ipv6_address_prefix	The 128-bit IPv6 address in hexadecimal format.
filter	Use filter option to suppress the external LSA.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 2 nssa-summarize c000::/64
```

Release History

Release 8.4.1 R03; command introduced.

Related Commands

ipv6 ospf area	Assigns an OSPFv3 interface to a specified area.
show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaAggregateTable
```

ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface *interface_name*

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

```
-> ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
```

ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

ipv6 ospf interface *interface_name* **admin-state {enable | disable}**

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPFv3 interface.
disable	Disables the OSPFv3 interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAdminStat
```

ipv6 ospf interface suppress-link-lsa

Allows to suppress the announcements of the Link State Advertisements (LSAs).

ipv6 ospf interface *interface_name* **suppress-link-lsa**

no ipv6 ospf interface *interface_name* **suppress-link-lsa**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to disable LSA suppression.

Examples

```
-> ipv6 ospf interface vlan-101 suppress-link-lsa
-> no ipv6 ospf interface vlan-101 suppress-link-lsa
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   alaOspf3SuppressLinkLsa
```

ipv6 ospf interface type

Allows to configure the type of OSPFv3 interface.

ipv6 ospf interface *interface_name* **type {broadcast | point-to-point | point-to-multipoint | nbma}**

Syntax Definitions

interface_name	The name of the interface.
broadcast	The interface is a broadcast interface.
point-to-point	The interface is a point-to-point interface.
point-to-multipoint	The interface is a point-to-multipoint interface.
nbma	The interface is a NBMA interface.

Defaults

parameter	default
broadcast | point-to-point | point-to-multipoint | nbma	**broadcast**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 type nbma
-> ipv6 ospf interface vlan-101 type point-to-point
-> ipv6 ospf interface vlan-101 type point-to-multipoint
-> ipv6 ospf interface vlan-101 type broadcast
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfStatus
   ospfv3IfType
```

ipv6 ospf neighbor

Allows to configure OSPFv3 neighbor on non-broadcast interface type. The neighbor configuration is required on NBMA and point-to-multipoint interface to run OSPFv3.

ipv6 ospf neighbor *nbr_ipv6_address* **interface** *interface_name* **{eligible | ineligible}**

no ipv6 ospf neighbor *nbr_ipv6_address*

Syntax Definitions

nbr_ipv6_address	Link-local address of the neighbor to be linked.
interface_name	The name of the interface on which the neighbor is reachable.
eligible	Indicates the neighbor is eligible to become the designated router.
ineligible	Indicates the neighbor is ineligible to become the designated router.

Defaults

parameter	default
eligible | ineligible	**eligible**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the neighbor configuration.
- The OSPFv3 interface must be configured before configuring the OSPFv3 neighbor.
- This command is not applicable for broadcast interface type and is optional for point-to-point interface type.

Examples

```
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 eligible
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 ineligible
-> no ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.
ipv6 ospf interface admin-state	Allows to configure the type of OSPFv3 interface.

MIB Objects

```
ospfv3NbrTable
   ospfv3NbrPriority
   ospfv3NbmaNbrStatus
```

ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

ipv6 ospf interface *interface_name* **area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAreaId
```

ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

ipv6 ospf interface *interface_name* **dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multipoint)	120

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrDeadInterval
```

ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

ipv6 ospf interface *interface_name* **hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPFv3 interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multipoint)	30

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfHelloInterval
```

ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

ipv6 ospf interface *interface_name* **cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfMetricValue
```

ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface priority. The valid range is 0–255.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrPriority
```

ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

ipv6 ospf interface *interface_name* **retrans-interval** *interval*

Syntax Definitions

interface_name	The name of the interface.
seconds	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
interval	5

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRetransInterval
```

ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

ipv6 ospf interface *interface_name* **transit-delay** *delay*

Syntax Definitions

interface_name	The name of the interface.
delay	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfTransitDelay
```

ipv6 ospf bfd-state

Enables or disables the registration of OSPFv3 with the BFD protocol.

ipv6 ospf bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for OSPFv3.
disable	Disables BFD for OSPFv3.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and OSPFv3 must be registered with BFD at the protocol level before OSPFv3 can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPFv3 protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPFv3 will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPFv3 with the BFD protocol:

```
-> ipv6 ospf bfd-state enable
-> ipv6 ospf bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ipv6 ospf bfd-state all-interfaces	Enables or disables BFD for all OSPFv3 interfaces configured.
ipv6 ospf interface bfd-state	Enables or disables BFD for a specific OSPFv3 interface.
ipv6 ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ipv6 ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3BfdStatus
```

ipv6 ospf bfd-state all-interfaces

Enables or disables BFD for all OSPFv3 interfaces in the switch configuration.

ipv6 ospf bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enables BFD for all the OSPFv3 interfaces.
disable	Disables BFD for all the OSPFv3 interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf bfd-state all-interfaces enable
-> ipv6 ospf bfd-state all-interfaces disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 ospf bfd-state	Enables or disables the BFD status for the OSPFv3 protocol.
ipv6 ospf interface bfd-state	Enables or disables BFD for a specific OSPFv3 interface.
ipv6 ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ipv6 ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ipv6 ospf interface	Displays configuration information for an OSPFv3 interface.

MIB Objects

```
alaProtocolOspf3
   alaOspf3BfdAllInterfaceStatus
```

ipv6 ospf interface bfd-state

Enables or disables BFD for a specific OSPFv3 interface.

ipv6 ospf interface *if_name* **bfd-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing OSPFv3 interface.
enable	Enables BFD for the OSPFv3 interface.
disable	Disables BFD for the OSPFv3 interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf interface int1 bfd-state enable
-> ipv6 ospf interface int2 bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 ospf bfd-state	Enables or disables the BFD status for the OSPFv3 protocol.
ipv6 ospf bfd-state all-interfaces	Enables or disables BFD for all OSPFv3 interfaces configured.
ipv6 ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ipv6 ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.
show ipv6 ospf interface	Displays configuration information for an OSPFv3 interface.

MIB Objects

```
alaOspf3IfAugTable
   alaOspf3IfBfdStatus
```

ipv6 ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ipv6 ospf interface *if_name* **bfd-state drs-only**

Syntax Definitions

if_name	The name of an existing OSPFv3 interface.

Defaults

parameter	default
drs-only	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPFv3 interface must be enabled to interact with BFD.
- The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf interface int1 bfd-state drs-only
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

```

ipv6 ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ipv6 ospf interface *if_name* **bfd-state all-neighbors {enable | disable}**

Syntax Definitions

if_name	The name of an existing OSPFv3 interface.
enable	Enables BFD sessions with all neighbors.
disable	Disables BFD sessions with all neighbors.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPFv3 interface must be enabled to interact with BFD.
- The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf interface int1 bfd-state all-neighbors enable
-> ipv6 ospf interface int1 bfd-state all-neighbors disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 ospf bfd-state	Enables or disables the BFD status for OSPFv3 protocol.

ipv6 ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
show ipv6 ospf interface	Displays configuration information for an OSPFv3 interface.

MIB Objects

```
alaOspf3IfAugTable
   alaOspf3IfDrsOnly
```

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

show ipv6 ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used to display the general configuration parameters of the OSPFv3 router. See the Related Commands section below for commands that are used to modify the displayed parameters.

Examples

```
-> show ipv6 ospf
Status                          = Enabled,
Router ID                       = 30.1.1.2,
# Areas                         = 1,
# Interfaces                    = 3,
Area Border Router              = No,
AS Border Router                = No,
External Route Tag              = 0,
SPF Hold (seconds)              = 10,
SPF Delay (seconds)             = 5,
MTU checking                    = Enabled,
BFD Status                      = Disabled,
# SPF calculations performed    = 34,
Last SPF run (seconds ago)      = N/A,
# of routes                     = 1,
# of AS external LSAs           = 0,
# of neighbors that are in:
  Full state                    = 1,
  Loading state                 = 0,
  Exchange state                = 0,
  Exstart state                 = 0,
  2way state                    = 0,
  Init state                    = 0,
  Attempt state                 = 0,
  Down state                    = 0,
Restart Support                 = Enabled,
Restart Status                  = Restating,
Restart Helper Support          = Enabled,
Restart Helper Status           = NotHelping
```

output definitions

Status	Displays whether OSPFv3 is currently enabled or disabled on the router.
Router Id	The unique identification for the router.
# Areas	Number of areas to which the router belongs.
# Interface	Number of interfaces participating in OSPFv3.
Area Border Router	Displays whether the router status is an area router or not.
AS Border Router	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
External Route Tag	Displays the route tag for this router.
SPF Hold (seconds)	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
SPF Delay (seconds)	Displays the time in seconds between consecutive SPF calculations.
MTU Checking	Displays whether Maximum Transfer Unit checking is enabled or disabled.
BFD Status	Displays whether BFD monitoring is enabled or disabled for OSPF.
# SPF calculations performed	Displays the number of SPF calculation performed.
Last SPF run (seconds ago)	N/A
# of routes	The total number of OSPFv3 routes known to this router.
# of AS external LSAs	The number of external routes learned from outside the router's Autonomous System (AS).
# of neighbors that are in:	
Full state	Displays the number of neighbor routers that are in Full state.
Loading state	Displays the number of neighbor routers that are in Loading state.
Exchange state	Displays the number of neighbor routers that are in Exchange state.
Exstart state	Displays the number of neighbor routers that are in Exstart state.
2way state	Displays the number of neighbor routers that are in 2way state.
Init state	Displays the number of neighbor routers that are in Init state.
Attempt state	Displays the number of neighbor routers that are in Attempt state.
Down state	Displays the number of neighbor routers that are in Down state.
Restart Support	Indicates if graceful restart feature is enabled or disabled on an OSPFv3 router.
Restart Status	Displays the OSPFv3 graceful restart status.
Restart Helper Support	Indicates whether the router is acting as a restart helper for the neighbor.
Restart Helper Status	Displays the OSPFv3 graceful restart helper status.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1: OSPFv3 graceful restart fields added.

Related Commands

ipv6 ospf admin-state	Enables or disables the administration of OSPFv3 on the router.
ip router router-id	Configures the router ID for the router.
ipv6 ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ipv6 ospf spf-timer	Configures timers for SPF calculation.
ipv6 ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ipv6 ospf bfd-state	Enables or disables the registration of OSPFv3 with the BFD protocol.
ipv6 ospf restart	Configures graceful restart feature on an OSPFv3 router.
ipv6 ospf restart-helper	Enables the graceful restart helper functionality.

```

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [area *area_id***] [router** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

Examples

```
-> show ipv6 ospf border-routers

Router ID          Area           Metric   Type
---------------+---------------+--------+---------
6.6.6.6            0.0.0.0          2      INTRA
6.6.6.6            0.0.0.1          2      INTRA
        fe80::2d0:95ff:fee2:6bda -> pseudo1
        fe80::2d0:95ff:fee2:6bda -> pseudo2
```

output definitions

Router ID	The unique identification for the router.
Area	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Metric	The metric used by the routes.
Type	The type of routes specified (intra or inter).

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

show ipv6 ospf host [*ipv6_address***]**

Syntax Definitions

ipv6_address	A 128-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf host

Area             Metric   Address
---------------+-------+-----------
0.0.0.1            1      2001::1/64
```

output definitions

Area	A 32-bit IP address for a directly attached host. This can be set using the **ipv6 ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ipv6 ospf host** command.
Address	IPV6 address of the host.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf host	Creates or deletes an OSPFv3 entry for directly attached hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostIpAddress
   ospfv3HostMetric
   ospfHostStatus
   ospfv3HostAreaID
```

show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

show ipv6 ospf lsdb [area *area_id***] [rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the LSDB of the OSPFv3 router. It can be used for OSPFv3 debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

Examples

```
-> show ipv6 ospf lsdb

Area             Type       Link ID      Advertising Rtr  Sequence #   Age

----------------+----------+------------+-----------------+----------+----------
0.0.0.0          Router     0            1.1.1.1           8000020f     1117
0.0.0.0          Router     0            3.3.3.3           80000208     1121
0.0.0.0          Router     0            5.5.5.5           800001f1     1117
```

```
0.0.0.0          Router     0            30.30.30.30       800000da     1115
```

output definitions

Area	The identification of the area to which the router belongs.
Type	The protocol type from where the route was learned.
Link Id	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
Advertising Rtr	The ID of the router that advertises the routes.
Sequence #	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf admin-state	Displays the OSPFv3 status and general configuration parameters.

```

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [router *ipv4_address***][interface** *interface_name***]**

Syntax Definitions

ipv4_address	A 32-bit router ID of the neighboring router.
interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPFv3 router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf neighbor
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+---------------------------------
1.1.1.1          0.0.0.0              FULL  vlan-2071
3.3.3.3          0.0.0.0              FULL  vlan-2071
5.5.5.5          0.0.0.0              FULL  vlan-2071
23.23.23.23      0.0.0.1              FULL  vlan-2055
23.23.23.23      0.0.0.1              FULL  vlan-2056
24.24.24.24      0.0.0.1              FULL  vlan-2065
24.24.24.24      0.0.0.1              FULL  vlan-2066
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPFv3 neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 24.24.24.24
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+--------------
24.24.24.24      0.0.0.1              FULL  vlan-2070
24.24.24.24      0.0.0.1              FULL  vlan-2073
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPFv3 neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 1.1.1.1 interface v14
Details for Neighbor 1.1.1.1
State                            = FULL,
Type                             = Dynamic,
Interface                        = v14,

Neighbor is reporting DR as      = 30.1.1.2,
Neighbor is reporting BDR as     = 1.1.1.1,
Neighbor is Master/Slave         = Master,
Seconds since last Hello seen    = 8,
# of LSAs on retransmit list     = 0,
# of LSAs on request list        = 0,
# of State Changes               = 6,
Restart Helper Status            = NotHelping,
Restart Age                      = 0 sec,
Last Restart Helper Exit Reason  = None
Neighbor options:
                                 V6 bit is set
                                 E bit is set
                                 MC bit is not set
                                 N bit is not set
                                 R bit is set
                                 DC bit is not set
```

output definitions

State	The state of the OSPFv3 neighbor adjacency.
Type	Specifies the type of neighbor.
Interface	The name of the interface.
Neighbor i/f index	The unique value assigned to the neighbor.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Address	The IPv6 address of the host.
Neighbor is reporting DR as	The address of the neighbors designated router.
Neighbor is reporting BDR as	The address of the neighbors Backup Designated Router.
Neighbor is Master/Slave	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
Seconds since last Hello seen	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of LSAs on retransmit list	The number of Link State updates to the neighbor that need to be retransmitted by the OSPFv3 router.
# of LSAs on request list	The number of Link State requests to this neighbor that have not received a response from this neighbor.

output definitions (continued)

# of State Changes	The number of times this OSPFv3 interface has changed its state.
Restart Helper Status	Indicates whether the router is acting as a restart helper for the neighbor.
Restart Age	The remaining time, in seconds, for the current OSPFv3 restart interval if the router is acting as a restart helper for the neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a restart helper for the neighbor.
Neighbor options	If set: V6 - V6 support R - If clear, a node can participate in OSPFv3 topology distribution without being used to forward transit traffic N - Type 7 LSA support MC - Multicast support E - External routes support DC - Demand circuit support

Release History

Release 7.1.1; command was introduced.
Release 8.4.1: OSPFv3 graceful restart fields added.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```

   ospfv3VirtNbrRestartHelperAge
   ospfv3VirtNbrRestartHelperExitReason
```

show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

show ipv6 ospf routes [prefix *ipv6_address_prefix***][gateway** *gateway***]**

Syntax Definitions

ipv6_address_prefix	The 128-bit IPv6 address of the route destination in hexadecimal format.
gateway	The next hop IPv6 address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ipv6 ospf routes
                                                          Metric
Prefix                                    Path Type       1 : 2
------------------------------------------+----------+-------------------
::/ 0                                       INTER        2 : -
         fe80::2d0:95ff:fee0:710c -> vlan-2071
2051::/64                                   INTRA        2 : -
         fe80::2d0:95ff:feac:a59f -> vlan-2055
         fe80::2d0:95ff:feac:a59f -> vlan-2056
         fe80::2d0:95ff:fed7:747e -> vlan-2065
         fe80::2d0:95ff:fed7:747e -> vlan-2066
```

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
Path Type	The type of routes specified (intra or inter).
Metric	The cost of the route.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf admin-state	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

show ipv6 ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf virtual-link
                                      Intf   Nbr
Transit Area     Peer Router ID    State  State   Cost
----------------+----------------+------+-------+------+
0.0.0.1          6.6.6.6           P2P     FULL    2
```

output definitions

Transit Area	The area identification for the area assigned to the virtual link.
Peer Router ID	The destination router identification for the virtual link.
Intf State	The state of the virtual link with regards to the local router.
Nbr State	The state of the virtual link adjacency.
Cost	The cost metric of the route.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf virtual-link	Creates or deletes a virtual link.

MIB Objects

```
ospfv3VirtIfTable
   ospfv3VirtIfAreaId
   ospfv3VirtIfNeighbor
   ospfv3VirtIfState
```

show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

show ipv6 ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPFv3 area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ipv6 ospf area
                          Stub     Number of
 Area ID          Type    Metric    Interfaces

NSSA Translator Role                     = Candidate
NSSA Translator State                    = Elected
# NSSA Translator State Changes          = 1,
```

output definitions

Area Type	The area type. This field will be **normal**, **stub**, or **NSSA**.
Area Stub Metric	Indicates whether the area is enabled or disabled.
# Router LSAs	The total number of Link State Advertisements for the Area.
# Network LSAs	The total number of inter-area Link State Advertisements.
# of SPF calculations	The number of times the area has calculated the Shortest Path.
# Interfaces	The number of OSPFv3 interfaces.
# Intra-area-prefix LSAs	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
# Inter-area-prefix LSAs	The number of inter-area-prefix LSAs.Corresponds to Type 3 summary-LSA of OSPFv3.

output definitions (continued)

# Inter-area-router LSAs	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPFv3.
# hosts	The number of directly attached hosts.
# ABRs	Number of Area Border Routers in the area.
# ASBRs	Number of Autonomous System Border Routers in the area.
Summarization ranges	The range of prefixes summarized in to the area.
Import Area Summaries	Specifies whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.
NSSA Translator Role	Specifies the NSSA translator role: **Candidate** or **Always**
NSSA Translator State	Indicates if and how an NSSA border router is performing NSSA translation (**ipv6 ospf area nssa-translator-role**) of NSSA-LSAs into AS-External-LSAs: Enabled, Elected, Disabled. **Enabled** indicates that the NSSA border router's translator role has been set to 'always'. **Elected** indicates that a candidate NSSA border router is translating NSSA-LSAs into AS-External-LSAs. **Disabled** indicates that a candidate NSSA Border router is not translating NSSA-LSAs into AS-External-LSAs.
# NSSA Translator State Changes	Indicates the number of translator state changes that have occurred since the last start-up of the OSPFv3 routing process.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; NSSA related fields added.

Related Commands

ipv6 ospf area	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
show ipv6 ospf interface	Displays OSPFv3 interface information.

MIB Objects

```

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

```
-> show ipv6 ospf interface
                                                  IPv6
                                        Admin     Intf     Intf    Intf       BFD
 Name      DR Router ID  BDR Router ID  Status    Status   Type    State     Status
----------+-------------+--------------+---------+------+------+---------+----------
vlan-2071    5.5.5.5       0.0.0.0      Enabled    Up     BCAST   DR       Enabled
vlan-2055    7.7.7.7       5.5.5.5      Enabled    Up     BCAST   BDR      Enabled
vlan-2056    7.7.7.7       5.5.5.5      Enabled    Up     BCAST   BDR      Disabled
```

output definitions

Name	The name of the interface.
DR Router ID	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, "VLAN Management Commands," for more information.)
BDR Router ID	The IP address of the backup designated router.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
IPv6 Intf Status	Indicates whether the interface is an active OSPFv3 interface.
Intf Type	Whether the interface is assigned to a VLAN or tunnel.
Intf State	The current state of the OSPFv3 interface. It will be **DR, BDR, other.**
BFD Status	The current status of BFD for the OSPFv3 interface.

```
-> show ipv6 ospf interface vlan-2071
Details for Intf 'vlan-2071'

Name                            = vlan-2071,

```

Output fields when an IP address or interface name is specified are described below:

output definitions

Type	The OSPFv3 interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Admin Status	The current administrative status of the interface, either **enabled** or **disabled**.
IPv6 Interface Status	The current administrative status of the IPv6 interface, either **up** or **down**.
Oper Status	Indicates whether the interface is an active OSPFv3 interface.
State	The current state of the OSPFv3 interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
Area	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Cost	The cost added to routes learned on this interface.
Designated Router	The identification number of the designated router.
Backup Designated Router	The identification number of the backup designated router.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Router Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.

output definitions (continued)

Retransmit Interval	The number of seconds the interface waits before resending hello messages.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Ifindex	The unique value assigned to an interface.
IPv6 'ifindex'	The unique value assigned to an IPv6 interface.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
Link LSA suppression	Whether or not (enabled or disabled) link LSA origination is suppressed for broadcast or NBMA interface types.
BFD Status	The status of BFD on this interface.
# of attached neighbors	The number of OSPFv3 neighbors in the initialization state.
# of state changes	The number of times this OSPFv3 interface has changed its state.
Link-local address	A globally unique IPv6 address.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; **bfd status** field added.

Related Commands

ipv6 ospf interface	Creates and deletes an OSPFv3 interface.
ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
ipv6 ospf interface cost	Configures the OSPFv3 interface cost.
ipv6 ospf interface priority	Configures the OSPFv3 interface priority.
ipv6 ospf interface retrans-interval	Configures the OSPFv3 interface retransmit interval.
ipv6 ospf interface transit-delay	Configures the OSPFv3 interface transit delay.
ipv6 ospf interface area	Configures an OSPFv3 interface area.
ipv6 ospf interface admin-state	Enables or disables the administration status on an OSPFv3 interface.
ipv6 ospf interface suppress-link-lsa	Configures whether or not link LSA origination is suppressed for broadcast or NBMA interface types.
ipv6 ospf interface bfd-state	Enables or disables the status of BFD for an OSPFv3 interface.

ipv6 ospf restart

Configures graceful restart feature on an OSPFv3 router.

ipv6 ospf restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPFv3 router.
- The minimum hardware configuration for this command is a dual CMM configuration. The chassis based products (OmniSwitch 9900) running in a standalone or VC-1 mode must have dual CMMs. Stackable switches (OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900) or chassis based switches running with single CMM must have two or more chassis in the VC.
- This command enables both planned and unplanned restarts.

Examples

```
-> ipv6 ospf restart
-> no ipv6 ospf restart
```

Release History

Release 8.4.1; command introduced

Related Commands

show ipv6 ospf restart	Displays the OSPFv3 graceful restart related configuration and status.
show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.
show ipv6 ospf neighbor	Displays information on OSPFv3 non-virtual neighbors.

MIB Objects

```
ospfv3RestartSupport
ospfv3RestartStatus
ospfv3RestartAge
ospfv3RestartExitReason
ospfv3RestartTime
```

ipv6 ospf restart initiate

Initiates a planned OSPFv3 graceful restart.

ipv6 ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be executed before executing the **takeover** or **vctakeover** command.

Example

```
-> ipv6 ospf restart initiate
```

Release History

Release 8.4.1; command introduced

Related Commands

show ipv6 ospf restart	Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

```
alaOspf3RestartInitiate
```

ipv6 ospf restart interval

Configures the grace period for achieving a graceful OSPFv3 restart.

ipv6 ospf restart interval [*seconds***]**

Syntax Definitions

seconds	Restart timeout interval. The valid range is 1–1800 seconds.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Restart interval must be configured based on the databases size, number of neighbors, and number of OSPFv3 areas of the restarting router. If this is configured too low, there is a chance that graceful restart may fail prematurely.

Example

```
-> ipv6 ospf restart interval 180
-> no ipv6 ospf restart interval
```

Release History

Release 8.4.1; command introduced

Related Commands

ipv6 ospf restart	Configures graceful restart feature on an OSPFv3 router.
show ipv6 ospf restart	Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

```
ospfv3RestartInterval
```

ipv6 ospf restart-helper

Enables the graceful restart helper functionality.

ipv6 ospf restart-helper

Syntax Definitions

N/A

Defaults

By default, graceful restart helper functionality is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable restart helper functionality.
- A router that has configured as a helper may reject helping or stop helping in the half way if there is any topology change in the OSPFv3 network.
- The graceful restart helper does not have a requirement of having dual CMMs.

Examples

```
-> ipv6 ospf restart-helper
-> no ipv6 ospf restart-helper
```

Release History

Release 8.4.1; command introduced

Related Commands

ipv6 ospf restart	Configures graceful restart feature on an OSPFv3 router.
ipv6 ospf restart-helper strict-lsa-check	Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
show ipv6 ospf restart	Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

```
alaOspf3RestartHelperSupport
alaOspf3RestartHelperStatus
ospfv3NbrRestartHelperStatus
ospfv3NbrRestartHelperAge
ospfv3NbrRestartHelperExitReason
ospfv3VirtNbrRestartHelperStatus
ospfv3VirtNbrRestartHelperAge
ospfv3VirtNbrRestartHelperExitReason
```

ipv6 ospf restart-helper strict-lsa-check

Enables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ipv6 ospf restart-helper strict-lsa-check

Syntax Definitions

N/A

Defaults

By default, strict-lsa-checking is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of the command to disable this functionality.
- Disabling this functionality may create sub-optimal or black hole routes during the graceful restart period.
- This functionality does not have a requirement of having dual CMMs.

Examples

```
-> ipv6 ospf restart-helper strict-lsa-check
-> no ipv6 ospf restart-helper strict-lsa-check
```

Release History

Release 8.4.1; command introduced

Related Commands

ipv6 ospf restart	Configures graceful restart feature on an OSPFv3 router.
ipv6 ospf restart-helper	Administratively enables the capability of an OSPFv3 router to operate in helper mode in response to a router performing a graceful restart.

```

show ipv6 ospf restart

Displays the OSPFv3 graceful restart related configuration and status.

show ipv6 ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf restart
Restart Support                 = Enabled (planned-unplanned),
Restart Status                  = Not Restarting,
Restart Interval                = 120,
Restart Age                     = 0,
Last Restart Exit Reason        = None,
Restart Helper Support          = Enabled,
Restart Helper Strict Checking  = Enabled,
Restart Helper Status           = NotHelping,
Time Since Exit Reason Updated  = 21:09:58
```

output definitions

Restart Support	The administrative status of OSPFv3 graceful restart.
Restart Status	The current status of OSPFv3 graceful restart, which can be **Not Restarting**, **Unplanned Restart** (after a CMM takeover), or **Planned Restart** (before CMM takeover).
Restart Interval	The configured OSPFv3 restart timeout interval, in seconds.
Restart Age	The remaining time, in seconds, for the current OSPFv3 graceful restart interval.
Last Restart Exit Reason	The outcome of the last attempt at a graceful restart. If the value is **None**, then no restart has yet been attempted. If the value is **In Progress**, then a restart attempt is currently underway. Other possible values include **Completed** (successfully completed), **Timed Out** (timed out), and **Topology Changed** (aborted due to topology change).
Restart Helper Support	The administrative status of the capability of an OSPFv3 router to operate in helper mode in response to a router performing a graceful restart.

output definitions (continued)

Restart Helper Strict Checking	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
Restart Helper Status	Indicates whether the router is acting as a graceful restart helper for the neighbor.
Time Since Exit Reason Updated	The value of system up time on the most recent occasion at which the last restart exit reason was updated.

```

28 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

The OmniSwitch version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-ISIS-MIB.mib
Module: timetraIsisMIBModule

Filename: ISIS-MIB.mib
Module: isisMIB

A summary of the available commands is listed here:

Global IS-IS Commands	**ip load isis** **ip isis admin-state** **ip isis area-id** **ip isis level-capability** **ip isis auth-check** **ip isis auth-type** **ip isis csnp-auth** **ip isis hello-auth** **ip isis psnp-auth** **ip isis lsp-lifetime** **ip isis lsp-wait** **ip isis spf-wait** **ip isis summary-address** **ip isis overload** **ip isis overload-on-boot** **ip isis graceful-restart** **ip isis graceful-restart helper** **ip isis strict-adjacency-check** **ip isis level auth-type** **ip isis level hello-auth** **ip isis level csnp-auth** **ip isis level psnp-auth** **ip isis level wide-metrics-only**
IPv4 and IPv6 Commands	**ip isis activate-ipv6|ipv4** **ip isis vlan** **ip isis vlan admin-state** **ip isis vlan interface-type** **ip isis vlan csnp-interval** **ip isis vlan hello-auth-type** **ip isis vlan level-capability** **ip isis vlan lsp-pacing-interval** **ip isis vlan passive** **ip isis vlan retransmit-interval** **ip isis vlan default-type** **ip isis vlan level hello-auth-type** **ip isis vlan level hello-interval** **ip isis vlan level hello-multiplier** **ip isis vlan level metric** **ip isis vlan level passive** **ip isis vlan level priority** **ip isis summary-address6**
IS-IS BFD Commands	**ip isis bfd-state** **ip isis bfd-state all-vlans** **ip isis vlan bfd-state**

Show Commands	**show ip isis adjacency** **show ip isis database** **show ip isis hostname** **show ip isis routes** **show ip isis routes6** **show ip isis spf** **show ip isis spf-log** **show ip isis statistics** **show ip isis status** **show ip isis summary-address** **show ip isis vlan** **show ip isis summary-address6**
Clear Commands	**clear ip isis adjacency** **clear ip isis lsp-database** **clear ip isis spf-log** **clear ip isis statistics**
M-ISIS (Multi Topology) Commands	**ip isis multi-topology**

ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

Examples

```
-> ip load isis
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip protocols	Displays switch routing protocol information and status.

MIB Objects

```
alaVrConfigTable
   alaVrConfigIsisStatus
```

ip isis admin-state

Enables or disables the administrative status of IS-IS on the switch.

ip isis admin-state {enable | disable}

Syntax Definitions

enable	Enables IS-IS.
disable	Disables IS-IS.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis admin-state enable
-> ip isis admin-state disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysAdminState
```

ip isis area-id

Configures the area ID for the switch.

ip isis area-id *area address*

no ip isis area-id *area address*

Syntax Definitions

area address	A 1–13 byte variable length integer, which specifies the area address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

Examples

```
-> ip isis area-id 49.0001
-> no ip isis area-id 49.0001
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisManAreaAddrTable
   isisManAreaAddrExistState
```

ip isis level-capability

Configures the router level of the IS-IS protocol globally.

ip isis level-capability {level-1 | level-2 | level-1/2}

Syntax Definitions

level-1	Specifies that the router can operate at Level-1 only.
level-2	Specifies that the router can operate at Level-2 only.
level-1/2	Specifies that the router can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | level-2 | level-1/2	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- Configuring the level capability at the IS-IS circuit level is also possible.

Examples

```
-> ip isis level-capability level-1
-> ip isis level-capability level-2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan level-capability	Configures the IS-IS level on the specified circuit.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysType
```

ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

enable	Enables authentication check for IS-IS PDUs.
disable	Disables authentication check for IS-IS PDUs.

Defaults

By default, authentication check is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

Release History

Release 7.3.3; command was introduced;

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthCheck
```

ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

ip isis auth-type {simple {key *key* **| encrypt-key** *encrypt_key***} | md5 {key** *key* | **encrypt-key** *encrypt_key***} | key-chain** *key-chain-id* **| none}**

Syntax Definitions

simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt_key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
key-chain-id	The configured keychain ID.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **key-chain** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.
- By default, the authentication is disabled and no authentication type is configured.
- If a keychain is applied globally, the authentication algorithm of its active key will be used for adjacency formation with all peers. Use **ip isis auth-type none** to remove the keychain from IS-IS adjacency configurations.

Examples

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis auth-type key-chain 2
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthType
   vRtrIsisAuthKey
   vRtrIsisAuthKeyChainId
```

ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

ip isis csnp-auth

no ip isis csnp-auth

Syntax Definitions

N/A

Defaults

CSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

Examples

```
-> ip isis csnp-auth
-> no ip isis csnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level csnp-auth	Configures CSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisCsnpAuthentication
```

ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

ip isis hello-auth

no ip isis hello-auth

Syntax Definitions

N/A

Defaults

Authentication check of Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

Examples

```
-> ip isis hello-auth
-> no ip isis hello-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level hello-auth	Enables or disables the authentication of Hello PDUs for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisHelloAuthentication
```

ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

ip isis psnp-auth

no ip isis psnp-auth

Syntax Definitions

N/A

Defaults

PSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

Examples

```
-> ip isis psnp-auth
-> no ip isis psnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level psnp-auth	Configures the PSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisPsnpAuthentication
```

ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

ip isis lsp-lifetime *seconds*

no ip isis lsp-lifetime

Syntax Definitions

seconds	Validity interval in seconds.The valid range is 350–65535.

Defaults

parameter	default
seconds	1200

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default value.

Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan lsp-pacing-interval	Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
show ip isis status	Displays the IS-IS status.
show ip isis database	Displays IS-IS LSP database information of the adjacent routers.

MIB Objects

```
vRtrIsisTable
  vRtrIsisLspLifetime
```

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

ip isis lsp-wait {max-wait | initial-wait | second-wait} *seconds*

no ip isis lsp-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
initial-wait	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
second-wait	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
seconds	Specifies the time interval.

Defaults

parameter	default
seconds **(max-wait)**	5
seconds **(initial-wait)**	0
seconds **(second-wait)**	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan lsp-pacing-interval	Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisLspInitialWait
   vRtrIsisLspSecondWait
   vRtrIsisLspMaxWait
```

ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

ip isis spf-wait {max-wait *seconds* **| initial-wait** *milliseconds*| **second-wait** *milliseconds***}**

no ip isis spf-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait *seconds*	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.
initial-wait *milliseconds*	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
second-wait *milliseconds*	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

Defaults

parameter	default
max-wait *seconds*	10
initial-wait *milliseconds*	1000
second-wait *milliseconds*	1000

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```

   vRtrIsisSpfWait
   vRtrIsisSpfInitialWait
   vRtrIsisSpfSecondWait
```

ip isis summary-address

Adds or deletes the summary address.

ip isis summary-address {*ip_prefix/mask* **|** *ip_prefix* **[**/*netmask***]} {level-1 | level-2 | level-1/2}**

no ip isis summary-address {*ip_prefix/mask* **|** *ip_prefix* **[**/*netmask***]}**

Syntax Definitions

ip_prefix/mask	Specifies the IP prefix in dotted decimal notation and the mask length.
ip_prefix	Specifies the IP prefix in dotted decimal notation.
/netmask	Specifies the subnet mask in dotted decimal notation.
level-1	Specifies the IS-IS level as Level-1.
level-2	Specifies the IS-IS level as Level-2.
level-1/2	Specifies the IS-IS level as Level-1/2.

Defaults

parameter	default
level-1 | level-2 | level-1/2	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis summary-address	Displays the IS-IS summary address database.

MIB Objects

```
vRtrIsisSummaryTable
   vRtrIsisSummRowStatus
```

ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

ip isis overload [timeout *seconds***]**

no ip isis overload [timeout]

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis overload-on-boot	Configures the IS-IS router to be in the overload state during bootup for a specified time period.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysSetOverload
vRtrIsisTable
   vRtrIsisOverloadTimeout
```

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

ip isis overload-on-boot [timeout *seconds***]**

no ip isis overload-on-boot [timeout *seconds***]**

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
timeout *seconds*	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis overload	Sets the IS-IS router to operate in the overload state.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisOverloadOnBoot
   vRtrIsisOverloadOnBootTimeout
```

ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

ip isis graceful-restart

no ip isis graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is disabled on the router by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

Examples

```
-> ip isis graceful-restart
-> no ip isis graceful-restart
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis graceful-restart helper	Configures the helper mode of routers for graceful restart.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGracefulRestart
```

ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the router.
disable	Disables the helper mode on the router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```
-> ip isis graceful-restart helper disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis graceful-restart	Configures graceful restart on the router.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGRHelperMode
```

ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

ip isis strict-adjacency-check {enable | disable}

Syntax Definitions

enable	Enables the adjacency check configuration on the router.
disable	Disables the adjacency check configuration on the router.

Defaults

By default, the adjacency check configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

Examples

```
-> ip isis strict-adjacency-check enable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisStrictAdjacencyCheck
```

ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

ip isis level {1 | 2} auth-type {simple {key *key* | **encrypt-key** *encrypt_key***} | md5 {key** *key* | **encrypt-key** *encrypt_key***} | key-chain** *key-chain-id* **| none}**

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt_key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
key-chain-id	The configured keychain ID.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **key-chain** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the **key** parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- Use **key-chain** parameter to apply a keychain to IS-IS adjacency at the capability level. Use **ip isis level auth-type none** to remove the capability level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis level 2 auth-type key-chain 1
-> ip isis level 2 auth-type none
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type for the IS-IS protocol globally.
show ip isis status	Displays the IS-IS status.

ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

ip isis level {1 | 2} hello-auth

no ip isis level {1 | 2} hello-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

Authentication check of Level Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

Examples

```
-> ip isis level 1 hello-auth
-> no ip isis level 1 hello-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis hello-auth	Enables or disables the authentication of Hello PDUs globally.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelHelloAuthentication
```

ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} csnp-auth

no ip isis level {1 | 2} csnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis csnp-auth	Enables or disables the authentication of CSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```

```

ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} psnp-auth

no ip isis level {1 | 2} psnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

Examples

```
-> ip isis level 1 psnp-auth
-> no ip isis level 1 psnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis psnp-auth	Enables or disables the authentication of PSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelPsnpAuthentication

ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

ip isis level {1 | 2} wide-metrics-only

no ip isis level {1 | 2} wide-metrics-only

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, wide metrics is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

Examples

```
-> ip isis level 1 wide-metrics-only
-> no ip isis level 1 wide-metrics-only
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   VrtrIsisLevelWideMetricsOnly
```

ip isis activate-ipv6|ipv4

Configures the IPv6 or IPv4 routing in IS-IS.

ip isis {activate-ipv6 | activate-ipv4}

no ip isis {activate-ipv6 | activate-ipv4}

Syntax Definitions

activate-ipv6	Enables IPv6 routing in IS-IS.
activate-ipv4	Enables IPv4 routing in IS-IS.

Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command disables the IPv4/IPv6 routing in IS-IS.

Examples

```
-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisActivateIPV4
vRtrIsisActivateIPV6
```

ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

ip isis vlan *vlan_id* **[address-family {v4 | v6 | v4v6}]**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN on which IS-IS is to be enabled.
v4 | v6 | v4v6	The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension.

Defaults

By default, both address families (IPv4 and IPv6) are disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

Examples

```
-> ip isis vlan 10
-> ip isis vlan 10 address-family v6
-> no ip isis vlan 10 address-family v6
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfRowStatus
```

ip isis vlan admin-state

Enables or disables IS-IS on a circuit.

ip isis vlan *vlan_id* **admin-state {enable | disable}**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
enable	Administratively enables IS-IS on the VLAN.
disable	Administratively disables IS-IS on the VLAN.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis vlan 10 admin-state enable
-> ip isis vlan 10 admin-state disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircAdminState
```

ip isis vlan interface-type

Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

ip isis vlan *vlan_id* **interface-type {broadcast | point-to-point}**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
broadcast	Sets the interface (circuit) type as a broadcast IS-IS interface.
point-to-point	Sets the interface (circuit) type as a point-to-point IS-IS interface.

Defaults

parameter	default
broadcast | point-to-point	**broadcast**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 interface-type broadcast
-> ip isis vlan 10 interface-type point-to-point
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan default-type	Sets the interface type to default, that is, broadcast.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircType
```

ip isis vlan csnp-interval

Configures the time interval in seconds to send Complete Sequence Number PDUs (CSNP) PDUs from the specified VLAN circuit.

ip isis vlan *vlan_id* **csnp-interval** *seconds*

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
seconds	The time interval in seconds between successive CSNP PDUs sent on an interface after which IS-IS must generate a CSNP PDU on the specified circuit. The valid range is 1–65535.

Defaults

parameter	default
seconds	Broadcast interface: 10 seconds Point-to-Point interface: 5 seconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command reverts the time interval to the default value.

Examples

```
-> ip isis vlan 10 csnp-interval 10
-> no ip isis vlan 10 csnp-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisIfCsnpInterval
```

ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

ip isis vlan *vlan_id* **hello-auth-type {simple {key** *key* **| encrypt-key** *encrypt_key***} | md5 {key** *key* **| encrypt-key** *encrypt_key***} | key-chain** *key-chain-id* **| none}**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt_key	The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
key-chain-id	The configured keychain ID.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **key-chain** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt_key. The Configuration snapshot always displays the password in the encrypted form. You must use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt_key.

- Use **key-chain** parameter to apply a keychain at a circuit level. Use **ip isis vlan hello-auth-type none** to remove the circuit level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno
-> ip isis vlan 10 hello-auth-type simple key sdsdff
-> ip isis vlan 100 hello-auth-type key-chain 1
-> ip isis vlan 100 hello-auth-type none
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip isis vlan level hello-auth-type	Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfHelloAuthKey
vRtrIsisIfHelloAuthType
vRtrIsisIfHelloAuthKeyChainId
```

ip isis vlan level-capability

Configures the IS-IS level on the specified circuit.

ip isis vlan *vlan_id* **level-capability [level-1 | level-2 | level-1/2]**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
level-1	Specifies that the interface can operate at Level-1 only.
level-2	Specifies that the interface can operate at Level-2 only.
level-1/2	Specifies that the interface can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | **level-2** | **level-1/2**	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

Examples

```
-> ip isis vlan 10 level-capability level-1
-> ip isis vlan 10 level-capability level-1/2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level-capability	Configures the router level of the IS-IS protocol globally.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircLevel
```

ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

ip isis vlan *vlan_id* **lsp-pacing-interval** *milliseconds*

no ip isis vlan *vlan_id* **lsp-pacing-interval**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
milliseconds	The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

Defaults

parameter	default
milliseconds	100

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

```
-> ip isis vlan 10 lsp-pacing-interval 1000
-> no ip isis vlan 10 lsp-pacing-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis lsp-lifetime	Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.
ip isis lsp-wait	Configures the time interval between successively generated LSPs.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfLspPacingInterval
```

ip isis vlan passive

Configures the IS-IS circuit as passive.

ip isis vlan *vlan_id* **passive**

no ip isis vlan *vlan_id* **passive**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.

Defaults

By default, the interface is not passive.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS PDUs (Protocol Data Unit) and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 passive
-> no ip isis vlan 10 passive
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan level passive	Configures the IS-IS circuit as passive at the specified IS-IS level.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircPassiveCircuit
```

ip isis vlan retransmit-interval

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

ip isis vlan *vlan_id* **retransmit-interval** *seconds*

no ip isis vlan *vlan_id* **retransmit-interval**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
seconds	The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

Examples

```
-> ip isis vlan 10 retransmit-interval 130
-> no ip isis vlan 10 retransmit-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTbale
   vRtrIsisIfRetransmitInterval
```

ip isis vlan default-type

Sets the interface type to default, that is, broadcast.

ip isis vlan *vlan_id* **default-type**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 default-type
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan interface-type	Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfTypeDefault
```

ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

ip isis vlan *vlan_id* **level {1 | 2} hello-auth-type {simple {key** *key* | **encrypt-key** *encrypt_key***} | md5 {key** *key* **| encrypt-key** *encrypt_key***} | key-chain** *key-chain-id* **| none}**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt_key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
key-chain-id	The configured keychain ID.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **key-chain** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.
- Use **key-chain** parameter to apply a keychain at the capability level per circuit. Use **ip isis vlan level hello-auth-type none** to remove the capability level keychain authentication per circuit.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123
-> ip isis vlan 10 level 2 hello-auth-type none
-> ip isis vlan 100 level 2 hello-auth-type key-chain 1
-> ip isis vlan 100 level 2 hello-auth-type none
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip isis vlan hello-auth-type	Configures the authentication settings for the hello protocol at a circuit level.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloAuthType
   vRtrIsisIfLevelHelloAuthKey
   vRtrIsisIfLevel
   vRtrIsisIfLevelHelloAuthKeyChainId
```

ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

ip isis vlan *vlan_id* **level {1 | 2} hello-interval** *seconds*

no ip isis vlan *vlan_id* **level {1 | 2} hello-interval**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
seconds	The hello interval, in seconds. The valid range is 1–20000.

Defaults

parameter	default
seconds (designated routers)	3
seconds (non-designated routers)	9

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-interval 50
-> no isis vlan 10 level 2 hello-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloTimer
```

ip isis vlan level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

ip isis vlan *vlan_id* **level {1 | 2} hello-multiplier** *number*

no ip isis vlan *vlan_id* **level {1 | 2} hello-multiplier**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The multiplier (2–100) of the hello interval.

Defaults

parameter	default
number	3

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircLevelTable
   isisCircLevelHelloMultiplier
```

ip isis vlan level metric

Configures the metric value of the specified IS-IS level of the circuit.

ip isis vlan *vlan_id* **level {1 | 2} metric** *number*

no ip isis vlan *vlan_id* **level {1 | 2} metric**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The metric value (1–16777215) assigned for the specified level of the circuit.

Defaults

parameter	default
number	10

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

Examples

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelAdminMetric
```

ip isis vlan level passive

Configures the IS-IS circuit as passive at the specified IS-IS level.

ip isis vlan *vlan_id* **level {1 | 2} passive**

no ip isis vlan *vlan_id* **level {1 | 2} passive**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, the interface level passive configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 level 1 passive
-> no ip isis vlan 10 level 1 passive
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan passive	Configures the IS-IS circuit as passive.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelPassive
```

ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

ip isis vlan *vlan_id* **level [1 | 2] priority** *number*

no ip isis vlan *vlan_id* **level [1 | 2] priority**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The priority value of the IS-IS circuit at this level. The valid range is 0–127.

Defaults

parameter	default
number	64

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

Examples

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelISPriority
```

ip isis summary-address6

Configures the IPv6 summary address.

ip isis summary-address6 {*ipv6_prefix/prefix_length* **|** *ipv6_address***} {level-1 | level-2 | level-1/2}**

no ip isis summary-address6 {*ipv6_prefix/prefix_length* **|** *ipv6_address***} {level-1 | level-2 | level-1/2}**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix and prefix length.
ipv6_address	IPv6 address.
level-1	Specifies that the routes can be summarized at Level-1 only.
level-2	Specifies that the routes can be summarized at Level-2 only.
level-1/2	Specifies that the routes can be summarized at both Level-1 and Level-2.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove an already configured summary address.

Examples

```
-> ip isis summary-address6 4001::/16 level-1
-> no ip isis summary-address6 4001::/16
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis summary-address6 Displays the IS-IS IPv6 summary address database.

MIB Objects

```
vRtrIsisInetSummLevel
vRtrIsisInetSummRowStatus
```

ip isis bfd-state

Enables or disables the registration of IS-IS with the BFD protocol.

ip isis bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for IS-IS.
disable	Disables BFD for IS-IS.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and IS-IS must be registered with BFD at the protocol level before IS-IS can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and IS-IS acts based upon the BFD message.
- Whenever a neighbor goes down, IS-IS will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of IS-IS with the BFD protocol:

```
-> ip isis bfd-state enable
-> ip isis bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ip isis bfd-state all-vlans	Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.
ip isis vlan bfd-state	Enables or disables BFD monitoring on a specific PIM interface.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisBfdStatus
```

ip isis bfd-state all-vlans

Enables or disables BFD monitoring for all IS-IS VLANs in the switch configuration.

ip isis bfd-state all-vlans {enable | disable}

Syntax Definitions

enable	Enables BFD for all the IS-IS VLANs.
disable	Disables BFD for all the IS-IS VLANs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for IS-IS must be enabled before IS-IS can interact with BFD.

Examples

```
-> ip isis bfd-state all-vlans enable
-> ip isis bfd-state all-vlans disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ip isis bfd-state	Enables or disables the registration of IS-IS with the BFD protocol.
ip isis vlan bfd-state	Enables or disables BFD monitoring on a specific IS-IS VLAN.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisTable
   vRtrIsisBfdAllVlanStatus
```

ip isis vlan bfd-state

Enables or disables BFD monitoring for a specific IS-IS VLAN.

ip isis vlan *vlan_id* **bfd-state {enable | disable}**

Syntax Definitions

vlan_id	The VLAN ID of a given VLAN.
enable	Enables BFD for the specified IS-IS VLAN.
disable	Disables BFD for the specified IS-IS VLAN.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering IS-IS with BFD is required at the protocol level before IS-IS can interact with BFD.
- When BFD is enabled on the specified IS-IS VLAN, BFD is applied to all IPv4 and IPv6 interfaces configured for the VLAN.
- A single IS-IS adjacency covers both IPv4 and IPv6 interfaces, but the interfaces are treated independently within the adjacency. If an IS-IS adjacency has both interface types, there will be two BFD sessions (one for each interface). When one interface goes down, only the routes learned through that interface are removed.

Examples

```
-> ip isis vlan 10 bfd-state enable
-> ip isis vlan 10 bfd-state disable
```

Release History

Release 8.4.3.R03; command was introduced.

Related Commands

ip isis bfd-state	Enables or disables the registration of IS-IS with the BFD protocol.
ip isis bfd-state all-vlans	Enables or disables BFD monitoring for all IS-IS interfaces in the switch configuration.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfBfdStatus
```

show ip isis adjacency

Displays information about IS-IS adjacent routers.

show ip isis adjacency [{system-id *nbr_sys_id* **| vlan** *vlan_id***}] [detail]**

Syntax Definitions

nbr_sys_id	The system ID of the neighbor router.
vlan_id	The VLAN ID of a given VLAN.

Defaults

By default adjacency information for all the neighbor routers are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use *the nbr_sys_id* or *vlan_id* parameter with this command to view the adjacency information for a specific neighbor.

Examples

```
-> show ip isis adjacency
================================================================================
ISIS Adjacency
================================================================================
System ID          Type     State    Hold       VlanID    MT IDs    Hostname
--------------------------------------------------------------------------------
0000.0000.0001     L1        UP        25        20       0, 2      Router-A
0000.0000.0002     L2        UP        21        30       None      Router-B
--------------------------------------------------------------------------------
Adjacency : 2
================================================================================
```

output definitions

System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Type	The level (**LI, L2,** or **L1/L2**) of the adjacent router.
State	The state of the adjacent router (**Up** or **Down**).
Hold	The Hold time of the adjacent router.
VlanID	The VLAN ID of the adjacent router.
MT IDs	MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour.

output definitions

Hostname	The host name of the adjacent router.
Adjacencies	The total number of adjacent routers.

output definitions

SystemID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
VLAN	The Vlan ID in which the adjacency is present.
MT IDs	MT IDs sent by MT enabled ISIS neighbor. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbor.
NLPIDs	The IP address families supported by IS-IS neighbor: IPv4 or IPv6
State	The state of the adjacent router (**Up** or **Down**).
Adj Level	The adjacency level (**L1** or **L2**) of the router.
Nbr Sys Type	The type of the neighboring router(**L1, L2** or **L1L2**)
Hold Time	The Hold time of the adjacent router.

output definitions

IPv4 Neighbor	The 32-bit IP address of the neighbor.
IPv6 Neighbor	The 32-bit IPv6 address of the neighbor
Restart Support	Indicates if graceful restart is **enabled** or **disabled**.
Restart Status	Indicates whether the router is currently helping an adjacent router to restart.
Restart Suppressed	Indicates whether the advertisement of LSPs are suppressed (**enabled**) or not (**disabled**) as per the request of adjacent router.
SNPA	The SNPA address of the adjacent router.
Up Time	Indicates the time period in seconds, during which the router was in the adjacency.
Priority	The priority of the adjacent router.
Host-name	The host name of the adjacent router.
L. CircType	Indicates the level circuit type (**L1, L2** or **L1L2**) of the adjacent router.
Max Hold	Indicates the maximum Hold time of the adjacent router.

Release History

Release 7.3.3; command was introduced.

Related Commands

clear ip isis adjacency	Clears and resets the IS-IS adjacency database.

show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

show ip isis database [{system_id *system_id* **| lsp_id** *lsp_id***}] [detail] [level {1 | 2}]**

Syntax Definitions

system_id	The system ID of the router.
lsp_id	The LSP ID.
detail	Indicates that the output is displayed in a detailed manner.
level	Indicates the IS-IS level, either **1** or **2**.

Defaults

By default, the entire LSP database is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use *system_id* or *lsp_id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

Examples

```
-> show ip isis database
Legends : P            =  The Partition repair bit is set

=================================================================
```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Attributes	The level capability of the router.
LSP Count	The number of LSPs in the Link State Database.

================================================================
```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Version	The version of the IS-IS protocol that has generated the LSP.
Pkt Type	The IS-IS PDU type number derived from the PDU header, which can be **18** or **20**. The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
Pkt Ver	The version of the IS-IS protocol that has generated the packet.
Attributes	The level capability of the router.
Max Area	The Maximum number of areas supported by the originating router of the LSP.
SysID Len	The length of the system-id as used by the originating router.
Used Len	The length used by the LSP.
Alloc Len	The length allocated for the LSP to be stored.
Area Address	The area ID of the router.
Supp protocols	The network layer protocols that are supported.
IS-Host Name	The host name of the router.
System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
IS Neighbors	The list of reachable IS-IS neighbors.
IPv4 Internal Reach	The list of IS-IS internal routes.
IPv6 Reach	The list of IS-IS IPv6 internal routes.
IP Prefix	The IP address and subnet mask of the destination.
Metrics	The metric value to reach the destination.
IPv4 External Reach	The list of external IS-IS routes.
IPv6 Reach	The list of external IS-IS IPv6 routes.
level-1 LSP Count	The number of Level-1 LSPs.
level-2 LSP Count	The number of Level-2 LSPs.

Release History

Release 7.3.3; command was introduced.

Related Commands

--------------------------------------------------------------------------------
Log Entries : 1
```

output definitions

When	The date on which the SPF calculation was completed.
Duration	The time duration of the event.
L1-Nodes	The number of Level-1 nodes.
L2-Nodes	The number of Level-2 nodes.
Event-Count	The number of SPF calculations.
Log Entries	The total number of log entries.

```
-> show ip isis spf-log detail

Unknown   0           0         0       0          0
```

output definitions

ISIS Instance	The number of IS-IS instances.
SPF Runs	The number of SPF calculations that have been performed.
Purge Initiated	The number of purges that the system initiated. A purge is initiated if the router decides that a link-state PDU must be removed from the database.
LSP Regens	The number of LSPs that have been regenerated. An LSP is regenerated when it nears the end of its lifetime and has not changed.
Requests	The number of CSNP requests received.

output definitions (continued)

Request Drops	The number of CSNP requests that are dropped.
Paths Found	The number of paths found.
Paths Not Found	The number of paths not found.
PDU Type	The type of PDU.
Received	The number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	The number of PDUs that are processed (number of PDUs received less the number dropped).
Dropped	The number of PDUs that are dropped.
Sent	The number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Retransmitted	The number of PDUs that are retransmitted.

Release History

Release 7.3.3; command was introduced.

```

output definitions

System Id	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Admin State	The state of the router (**Up** or **Down**).
Protocols Enabled	The protocol enabled on the router: IPv4 or IPv6
Last Enabled	The date and time when the router is enabled.
Level Capability	The level capability of the router **(L1, L2,** or **L1L2**).
Authentication Check	Indicates the status of the authentication (**true** or **false**).
Authentication Type	The type of authentication (**simple**, **md5, keychain, none**).
Graceful Restart	Indicates if graceful restart is **Enabled** or **Disabled**.
GR helper-mode	Indicates if the helper mode of graceful restart is **Enabled** or **Disabled**.
LSP Lifetime	The Lifetime of the LSP (in seconds).
LSP Wait	The Wait time of the LSP (in seconds).
Adjacency Check	The adjacency check configuration on the router
L1 Auth Type	The authentication type (**simple**, **md5, keychain, none**) for Level-1 adjacency.
L2 Auth Type	The authentication type (**simple**, **md5, keychain, none**) for Level-2 adjacency.
L1 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-1 adjacency.
L2 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-1 adjacency.
L2 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSPs	The number of LSPs for Level-1 adjacency.
L2 LSPs	The number of LSPs for Level-2 adjacency.
Last SPF	The date and duration of the last SPF calculation.
SPF Wait	The Wait time for the SPF calculation.
Hello-Auth Check	Indicates the status of global Hello authentication check (**Enabled** or **Disabled**).
Csnp-Auth Check	Indicates the status of global CSNP authentication check (**Enabled** or **Disabled**).

output definitions (continued)

Psnp-Auth Check	Indicates the status of global PSNP authentication check (**Enabled** or **Disabled**).
L1 Hello-Auth Check	Indicates the status of L1 Hello authentication check (**Enabled** or **Disabled**).
L1 Csnp-Auth Check	Indicates the status of L1 CSNP authentication check (**Enabled** or **Disabled**).
L1 Psnp-Auth Check	Indicates the status of L1 PSNP authentication check (**Enabled** or **Disabled**).
L2 Hello-Auth Check	Indicates the status of L2 Hello authentication check (**Enabled** or **Disabled**).
L2 Csnp-Auth Check	Indicates the status of L2 CSNP authentication check (**Enabled** or **Disabled**).
L2 Psnp-Auth Check	Indicates the status of L2 PSNP authentication check (**Enabled** or **Disabled**).
Auto-Configuration	Indicates the status of auto-configuration for ISIS. (**Enabled** or **Disabled**)
Area Address	The area address of the router.
BFD Status	Indicates the status of IS-IS registration with BFD. (**Enabled** or **Disabled**).

Release History

Release 7.3.3; command introduced.
Release 7.3.4; **Auto-Configuration** field added.
Release 8.4.1.R03; **BFD Status** field added.

Related Commands

show ip isis statistics	Displays statistics for the IS-IS configuration.

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [*ip_address* **[***/mask***]]**

Syntax Definitions

ip_address	The 32-bit IP address.
/mask	The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ip_address* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address
================================================================================
ISIS Summary Address
=====================================================
Address                     Level
--------------------------------------------------------------------------------
1.0.0.0/8                   L1
2.1.0.0/24                  L1L2
3.1.2.3/32                  L2
--------------------------------------------------------------------------------

Summary Address : 3
```

output definitions

Address	The summary address for a range of IPv4 addresses.
Level	The capability level of the router.
Summary Address	The number of summarized addresses.

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis summary-address	Adds or deletes the summary address.

MIB Objects

```

   vRtrIsisSummPefix
   vRtrIsisSummMask
   vRtrIsisSummLevel
```

show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

show ip isis vlan [*vlan_id***] [detail]**

Syntax Definitions

vlan_id	The VLAN ID.
detail	Indicates that the output is displayed in a detailed manner.

Defaults

By default, the interface information for all the interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vlan_id* parameter with this command to view information for a specific VLAN.

Examples

```
-> show ip isis vlan
================================================================================
ISIS VLan
================================================================================
Interface   Address-family  Level  VlanID  Oper-state   Admin-state  L1/L2-Metric
--------------------------------------------------------------------------------
ospf       ipv4           L1L2   11      DOWN       UP          10/10
vlan11      ipv6            L1L2    11      DOWN        UP           10/10
--------------------------------------------------------------------------------
Vlans : 2
================================================================================
```

output definitions

Interface	The name of the IS-IS interface.
Address-family	The address family extension: IPv4 or IPv6
Level	The level capability of the interface.
VlanID	The VLAN ID of the interface.
Oper-state	The operational state of the interface (**up** or **down**).
Admin-state	The administrative state of the interface (**up** or **down**).
L1/L2 -Metric	The metric value of the router for the corresponding capability level.
Vlans	The total number of VLANs.

```
-> show ip isis vlan detail

================================================================================
```

output definitions

VlanId	The VLAN ID.
Level Capability	The level capability of the interface.
Oper State	The operational state of the interface (**up** or **down**).
Admin State	The administrative state of the interface (**up** or **down**).
Auth Type	Indicates the authentication type (**simple**, **MD5, keychain, none**) of the interface.
Address Families	The address family extension: IPv4 or IPv6
Circuit Id	The circuit ID of the interface.
RetransmitInt	Specifies the minimal interval of time, in seconds, between retransmission of an LSP on the point-to-point interface.
Type	The type of interface: **Broadcast** or **Pt-to-Pt** (point to point).

output definitions (continued)

LSP Pacing Int	The LSP Pacing interval.
Mesh Group	The status of the mesh group (**Active** or **Inactive**).
BFD Status	The status of BFD on the IS-IS VLAN interface (**Enabled** or **Disabled**).
CSNP Int	The CSNP interval.
Level	Indicates the IS-IS level of the neighbor (**L1, L2**, or **L1L2**).
Adjacencies	The number of adjacencies formed.
Desg IS	The ID of the LAN Designated Intermediate System on this circuit at this level.
Auth Type	Indicates the authentication type (**simple**, **MD5, keychain, none**) for the specified level.
Metric	The metric value of this circuit for a specific level.
Hello Timer	Indicates the Hello timer value.
Hello Mult	Indicates the Hello multiplier value.
Priority	The priority value of the interface.
Passive	Indicates whether the interface is configured as a passive interface (**Yes** or **No**).
Vlans	The total number of VLANs.

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan	Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN.

show ip isis summary-address6

Displays the IS-IS IPv6 summary address database.

show ip isis summary-address6 [*ip_address* **[/***mask***]]**

Syntax Definitions

ip_address	The 32-bit IP address.
/mask	The netmask value. The valid range is 1–32.

Defaults

By default, summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ip_address* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address6
============================================================
ISISv6 Summary Address
============================================================
Address                                     Level

------------------------------------------------------------
Summary Address : 1
============================================================
```

output definitions

Address	The summary address for a range of IPv6 addresses.
Level	The capability level of the router.
Summary Address	The number of summarized addresses.

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis summary-address6	Configures the IPv6 summary address.

MIB Objects

N/A

clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

clear ip isis adjacency [system-id *nbr_sys_id***]**

Syntax Definitions

nbr_sys_id	The system ID of the neighbor router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the *nbr_sys_id* parameter is specified, only the entries specific to that system ID are removed from the database.

Examples

```
-> clear ip isis adjacency system-id 1122.3344.5566
```

Release History

Release 7.3.3; command was introduced.

Related Commands

```

ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

ip isis multi-topology

no ip isis multi-topology

Syntax Definitions

N/A

Defaults

By default, multi-topology is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of the IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

Examples

```
-> ip isis multi-topology
-> no ip isis multi-topology
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.
show ip isis adjacency	Displays information about IS-IS adjacent routers.

MIB Objects

```
vRtrIsisEntry
   vRtrIsisMTEnabled
```

29 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The OmniSwitch implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545.

Note. In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-BGP-MIB.mib
Module: alcatelIND1BGPMIB

Filename: BGP4-MIB.mib
Module: bgp

The following table summarizes the available commands:

Global BGP Commands	**ip load bgp** **ip bgp admin-state** **ip bgp autonomous-system** **ip bgp bestpath as-path ignore** **ip bgp cluster-id** **ip bgp default local-preference** **ip bgp fast-external-failover** **ip bgp always-compare-med** **ip bgp bestpath med missing-as-worst** **ip bgp client-to-client reflection** **ip bgp as-origin-interval** **ip bgp synchronization** **ip bgp confederation identifier** **ip bgp maximum-paths** **ip bgp log-neighbor-changes** **ip bgp dampening** **ip bgp dampening clear** **ip bgp asn-format** **ip bgp unicast** **show ip bgp** **show ip bgp statistics** **show ip bgp dampening** **show ip bgp dampening-stats** **show ip bgp path** **show ip bgp routes**
Aggregate Configuration	**ip bgp aggregate-address admin-state** **ip bgp aggregate-address as-set** **ip bgp aggregate-address community** **ip bgp aggregate-address local-preference** **ip bgp aggregate-address metric** **ip bgp aggregate-address summary-only** **show ip bgp aggregate-address**
Network (local route) Configurations	**ip bgp network** **ip bgp network admin-state** **ip bgp network community** **ip bgp network local-preference** **ip bgp network metric** **show ip bgp network**

ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the **ip bgp admin-state** to start the BGP protocol.

Examples

```
-> ip load bgp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous system number for this BGP router.
ip bgp admin-state	Administratively enables or disables BGP.

MIB Objects

```
alaVrConfigTable
   alaVrConfigBgpStatus
```

ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

ip bgp admin-state {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You must first load the BGP software into running memory using the **ip load bgp** command before initiating this command.
- Many BGP commands require that the protocol be disabled (**ip bgp admin-state**) before issuing them.

Examples

```
-> ip bgp admin-state enable
-> ip bgp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip load bgp	Loads the BGP software.

MIB Objects

```
alaBgpGlobal
   alaBgpProtoStatus
```

ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

ip bgp autonomous-system *value*

Syntax Definitions

value	The AS number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp autonomous-system 64724

The following examples show how to configure the local BGP ASN as 65535 in the
three different formats:
-> ip bgp autonomous-system 65535        (asplain format)
-> ip bgp autonomous-system 0.65535      (asdot+ format)
-> ip bgp autonomous-system 65535        (asdot format)

The following examples show how to configure the local BGP ASN as 65538 in the
three different formats:
-> ip bgp autonomous-system 65538              (asplain format
-> ip bgp autonomous-system 1.2                (asdot+ format)
-> ip bgp autonomous-system 1.2                (asdot format)
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.3; support for 4-octet ASN was added.

Related Commands

ip bgp admin-state	Enables and disables the BGP protocol.
ip bgp neighbor remote-as	Assigns an AS number to this BGP peer.

MIB Objects

```
alaBgpGlobal
   alaBgpAutonomousSystemNumber
```

ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore

no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath as-path ignore
-> no ip bgp bestpath as-path ignore
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address as-set	Specifies whether AS path aggregation is to be performed or not.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp default local-preference	Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

```
alaBgpGlobal
   alaBgpAsPathCompare
```

ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

ip bgp cluster-id *ip_address*

Syntax Definitions

ip_address	32-bit IP address that is the Cluster ID of the router acting as a route reflector.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

Examples

```
-> ip bgp cluster-id 1.2.3.4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state	Enables and disables BGP.
ip bgp client-to-client reflection	Enables route reflection and sets this speaker as the route reflector.

MIB Objects

```
alaBgpGlobal
   alaBgpClusterId
```

ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

ip bgp default local-preference *value*

Syntax Definitions

value	The default local preference value for this router. The valid range is 0–4294967295.

Defaults

parameter	default
value	100

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp default local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address local-preference	Sets the local preference for a BGP aggregate.
ip bgp network local-preference	Sets the local preference for a BGP network.

MIB Objects

```
alaBgpGlobal
   alaBgpDefaultLocalPref
```

ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

ip bgp fast-external-failover

no ip bgp fast-external-failover

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp fast-external-failover
-> no ip bgp fast-external-failover
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts a BGP peer.
ip bgp neighbor auto-restart	Enables or disables BGP peer automatic restart.
ip bgp neighbor timers	Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

MIB Objects

```
alaBgpFastExternalFailOver
```

ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

ip bgp always-compare-med

no ip bgp always-compare-med

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst	Configures the MED parameter when it is missing in a BGP path.

MIB Objects

```
alaBgpGlobal
   alaBgpMedAlways
```

ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst

no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst (2^{32}-1) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp always-compare-med	Forces BGP to consider MED values from external routes.

MIB Objects

```
alaBgpGlobal
   alaBgpMissingMed
```

ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state	Administratively disables BGP in this router.
ip bgp neighbor route-reflector-client	Configures a BGP peer to be a client to the this route reflector.

MIB Objects

```
alaBgpGlobal
   alaBgpRouteReflection
```

ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

ip bgp as-origin-interval *seconds*

no ip bgp as-origin-interval

Syntax Definitions

seconds	The update interval in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

Examples

```
-> ip bgp as-origin-interval 15
-> no ip bgp as-origin-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor advertisement-interval	Set the route advertisement interval for external peers.

MIB Objects

```
alaBgpGlobal
   alaBgpAsOriginInterval
```

ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

ip bgp synchronization

no ip bgp synchronization

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpIgpSynchStatus
```

ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

ip bgp confederation identifier *value*

Syntax Definitions

value	The confederation identification value. The valid range is 0–65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

Examples

```
-> ip bgp confederation identifier 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Sets the AS number for this router.
ip bgp confederation neighbor	Specifies peers that are members of a confederation.

MIB Objects

```
alaBgpGlobal
   alaBgpConfedId
```

ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiPath
```

ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

ip bgp log-neighbor-changes

no ip bgp log-neighbor-changes

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state	Disables BGP within the router.

MIB Objects

```
alaBgpGlobal
   alaBgpPeerChanges
```

ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

ip bgp dampening [half-life *half_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max_suppress_time***]**

no ip bgp dampening

Syntax Definitions

half_life	The half-life duration, in seconds. The valid range is 0–65535.
reuse	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
suppress	The dampening cutoff value. The valid range is 1–9999.
max_suppress_time	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

Defaults

parameter	value
half_life	300
reuse	200
suppress	300
max_suppress_time	1800

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening clear	Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.
show ip bgp dampening	Displays the BGP route dampening settings.
show ip bgp dampening-stats	Displays BGP dampening statistics.

MIB Objects

```
alaBgpGlobal
   alaBgpDampening
   alaBgpDampMaxFlapHistory
   alaBgpDampHalfLifeReach
   alaBgpDampReuse
   alaBgpDampCutOff
```

ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

ip bgp dampening clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

Examples

```
-> ip bgp dampening clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables or disables route dampening.

MIB Objects

```
alaBgpGlobal
   alaBgpDampeningClear
```

ip bgp asn-format

Configures the display format to be used when displaying 4-octet ASNs.

ip bgp asn-format {asdot | asplain}

Syntax Definitions

asdot	A mixture of asplain and asdot+.
asplain	Simple decimal notation.

Defaults

The default is **asplain**.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

Examples

```
-> ip bgp asn-format asdot
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous System (AS) number for this router.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpAsnFormat
```

ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

ip bgp aggregate-address *ip_address ip_mask*
[admin-state {enable | disable}]
[as-set]
[community *string***]**
[local-preference *value***]**
[metric *metric***]**
[summary-only]

no ip bgp aggregate-address *ip_address ip_mask*

Syntax Definitions

ip_address	32-bit IP address to be used as the aggregate address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address summary-only	Enables or disables aggregate summarization, which suppresses more-specific routes.

MIB Objects

```
alaBgpAggrAddr
alaBgpAggrSet
alaBgpAggrCommunity
alaBgpAggrLocalPref
alaBgpAggrMetric
alaBgpAggrSummarize
alaBgpAggrMask
```

ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

ip bgp aggregate-address *ip_address ip_mask* **admin-state {enable | disable}**

Syntax Definitions

ip_address	32-bit IP address for this aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the network address denote the network number.
enable	Enables this aggregate route.
disable	Disables this aggregate route.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the **ip bgp asn-format** command to configure individual aggregate parameters.
- The **show ip bgp path** command displays every aggregate currently defined.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format	Creates an aggregate route.
show ip bgp path	Displays aggregate routes.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
```

ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

ip bgp aggregate-address *ip_address ip_mask* **as-set**

no ip bgp aggregate-address *ip_address ip_mask* **as-set**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrSet
```

ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

ip bgp aggregate-address *ip_address ip_mask* **community {none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

Syntax Definitions

ip_address	32-bit IP address of the aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the aggregate community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp asn-format	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrCommunity
```

ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

ip bgp aggregate-address *ip_address ip_mask* **local-preference** *value*

no ip bgp aggregate-address *ip_address ip_mask* **local-preference** *value*

Syntax Definitions

ip_address	An IP address for the aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	The local preference attribute. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp default local-preference Sets the default local preference value for this AS.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrLocalPref
```

ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

ip bgp aggregate-address *ip_address ip_mask* **metric** *value*

no ip bgp aggregate-address *ip_address ip_mask* **metric** *value*

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	The MED attribute. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst	Configures the MED for paths that do not contain a MED value.
ip bgp always-compare-med	Forces BGP to use the MED for comparison of external routes.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrMetric
```

ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which supresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

ip bgp aggregate-address *ip_address ip_mask* **summary-only**

no ip bgp aggregate-address *ip_address ip_mask* **summary-only**

Syntax Definitions

ip_address	IP address for the aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrSummarize
```

ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

ip bgp network *ip_address ip_mask*
[community *string***]**
[local-preference *value***]**
[metric *metric***]**
[admin-state {enable | disable}]

no ip bgp network *ip_address ip_mask*

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0
-> no ip bgp network 172.22.2.115 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network admin-state Enables a BGP network.

MIB Objects

alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetwrokMetric
   alaBgpNetworkLocalPref
   alaBgpNetworkCommunity
   alaBgpNetworkMask
```

ip bgp network admin-state

Enables or disables a BGP network.

ip bgp network *ip_address ip_mask* **admin-state {enable | disable}**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
enable	Enables this network.
disable	Disables this network.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up 200 network entries. The **show ip bgp path** command displays every network currently defined.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network	Create a BGP network.
show ip bgp path	Display currently defined BGP networks.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
```

ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

ip bgp network *ip_address ip_mask* **community {none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

Syntax Definitions

ip_address	32-bit IP address of the network.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the network community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp network	Creates or deletes a BGP network

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetworkCommunity
```

ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ip bgp network *ip_address ip_mask* **local-preference** *value*

no ip bgp network *ip_address ip_mask* **local-preference** *value*

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network	Creates or deletes a BGP network.
ip bgp default local-preference	Sets the default local preference for this AS.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetworkLocalPref
```

ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

ip bgp network *ip_address ip_mask* **metric** *value*

no ip bgp network *ip_address ip_mask* **metric** *value*

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	A MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network	Creates or deletes a BGP network.
ip bgp bestpath med missing-as-worst	Specifies the MED value when it is missing.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetwrokMetric
```

ip bgp neighbor

Creates or deletes a BGP peer.

ip bgp neighbor *ip_address*

no ip bgp neighbor *ip_address*

Syntax Definitions

ip_address	32-bit IP address of the new BGP peer.

Defaults

No peers configured.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

Examples

```
-> ip bgp neighbor 172.22.2.115
-> no ip bgp neighbor 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor admin-state	Enable or disable a BGP peer.
ip bgp neighbor remote-as	Configure the AS number for the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
```

ip bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

ip bgp neighbor *ip_address* **ttl-security** *num*

ip bgp neighbor *ip_address* **no ttl-security**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
num	The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

Defaults

By default GTSM is disabled for communication with the peer.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vise-versa.
- Use the **no** form of this command to disable GTSM.

Examples

```
-> ip bgp neighbor 172.22.2.115 ttl-security 6
-> ip bgp neighbor 172.22.2.115 no ttl-security
```

Release History

Release 8.4.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays the configured IPv4 BGP peers.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerTTLSecurityHops
```

ip bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

ip bgp neighbor *ip_address* **[activate-ipv4]**

no ip bgp neighbor i*p_address* **[activate-ipv4]**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
activate-ipv4	Enable the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv4 BGP peer.

Examples

```
-> ip bgp neighbor 172.22.2.115 activate-ipv4
-> no ip bgp neighbor 172.22.2.115 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerActivateIpv4
```

ip bgp neighbor admin-state

Enables or disables a BGP peer.

ip bgp neighbor *ip_address* **admin-state {enable | disable}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
enable	Enables this peer.
disable	Disables this peer.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates a BGP peer.
show ip bgp neighbors	Displays peer parameters.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
```

ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

ip bgp neighbor *ip_address* **advertisement-interval** *value*

Syntax Definitions

ip_address	32-bit IP address of the neighbor.
value	An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

parameter	default
value	30

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the **ip bgp autonomous-system** command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerMinRouteAdvertisementTinterval
```

ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

ip bgp neighbor *ip_address* **clear**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - **ip bgp neighbor remote-as**
  - **ip bgp neighbor md5 key**
  - **ip bgp neighbor passive**
  - **ip bgp neighbor ebgp-multihop**
  - **ip bgp neighbor maximum-prefix**
  - **ip bgp neighbor update-source**
  - **ip bgp neighbor next-hop-self**
  - **ip bgp neighbor soft-reconfiguration**
  - **ip bgp neighbor route-reflector-client**
  - **ip bgp confederation neighbor**
  - **ip bgp neighbor remove-private-as**
  - **ip bgp neighbor update-source**.
- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart	Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerRestart
```

ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

ip bgp neighbor *ip_address* **route-reflector-client**

no ip bgp neighbor *ip_address* **route-reflector-client**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector take responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-reflector-client
-> no ip bgp neighbor 172.22.2.115 route-reflector-client
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp client-to-client reflection Configures the local BGP speaker as a route reflector

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerClientStatus
```

ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

ip bgp neighbor *ip_address* **default-originate**

no ip bgp neighbor *ip_address* **default-originate**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

Examples

```
-> ip bgp neighbor 172.22.2.115 default-originate
-> no ip bgp neighbor 172.22.2.115 default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerDefaultOriginate
```

ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

ip bgp neighbor *ip_address* **timers** *keepalive holdtime*

Syntax Definitions

ip_address	32-bit IP address for the BGP peer.
keepalive	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
holdtime	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

Defaults

parameter	default
keepalive	30
holdtime	90

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor conn-retry-interval	The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerHoldTimeConfigured
   bgpPeerKeepAliveConfigured
```

ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

ip bgp neighbor *ip_address* **conn-retry-interval** *seconds*

Syntax Definitions

ip_address	32-bit IP address for the neighbor.
seconds	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the **ip bgp neighbor auto-restart** command).
- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart	Enable automatic session restart after a session termination.
ip bgp neighbor clear	Restarts the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerConnectRetryInterval
```

ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

ip bgp neighbor *ip_address* **auto-restart**

Syntax Definitions

ip_address	32-bit IP address for the neighbor.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates a BGP peer.
ip bgp neighbor admin-state	Enables a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerAutoRestart
```

ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

ip bgp neighbor *ip_address* **maximum-prefix** *maximum* **[warning-only]**

Syntax Definitions

ip_address	32-bit IP address for the BGP peer.
maximum	The maximum number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
threshold	5000

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts the BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMaxPrefixWarnOnly
   alaBgpPeerMaxPrefix
```

ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

ip bgp neighbor *ip_address* **md5 key {***string* **| none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	The MD5 public key. Maximum character length is 200.
none	Removes the MD5 public key.

Defaults

parameter	default
string	no password

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

  ip bgp neighbor *ip_address* **md5 key-encrypt** *encrypted_string*

  However, you should not use this syntax to actually set an MD5 password; it will not work.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts the BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMD5Key
```

ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

ip bgp neighbor *ip_address* **ebgp-multihop [***ttl***]**

no ip bgp neighbor *ip_address* **ebgp-multihop**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
ttl	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

parameter	default
ttl	255

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vise-versa.

Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.
ip bgp neighbor next-hop-self	Sets the BGP peer to use next hop processing behavior.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMultiHop
```

ip bgp neighbor description

Configures the BGP peer name.

ip bgp neighbor *ip_address* **description** *string*

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Peer name (1–20 characters).

Defaults

parameter	default
string	peer(ip_address)

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ip bgp neighbor 172.22.2.115 description “peer for building 3”
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Sets the IP address for the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerName
```

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

ip bgp neighbor *ip_address* **next-hop-self**

no ip bgp neighbor *ip_address* **next-hop-self**

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerNextHopSelf
```

ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ip bgp neighbor *ip_address* **passive**

no ip bgp neighbor *ip_address* **passive**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 passive
-> no ip bgp neighbor 172.22.2.115 passive
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerPassive
```

ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

ip bgp neighbor *ip_address* **remote-as** *value*

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
value	Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is consider external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100

The following examples show how to configure the BGP neighbor ASN as 65535 in the
three different formats:
-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asplain format)
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535      (asdot+ format)
-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asdot format)
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.3; support for 4-octet ASN was added.

Related Commands

ip bgp autonomous-system	Set the AS for the local BGP speaker.
ip bgp neighbor	Create a BGP peer.
ip bgp neighbor admin-state enable	Enables a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerAS
```

ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ip bgp neighbor *ip_address* **remove-private-as**

no ip bgp neighbor *ip_address* **remove-private-as**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling his command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor remote-as	Configures the AS number for this peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerRemovePrivateAs
```

ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ip bgp neighbor *ip_address* **soft-reconfiguration**

no ip bgp neighbor *ip_address* **soft-reconfiguration**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ip bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts this BGP peer.
ip bgp neighbor clear soft	Invokes an inbound or outbound policy reconfiguration for a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerSoftReconfig
```

ip bgp neighbor stats-clear

Clears the statistics for a peer.

ip bgp neighbor *ip_address* **stats-clear**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through **show ip bgp neighbors statistics**.

Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp neighbors statistics	Displays peer statistics.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerClearCounter
```

ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor *ip_address*

no ip bgp confederation neighbor *ip_address*

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp confederation neighbor 172.22.2.115
-> no ip bgp confederation neighbor 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp confederation identifier	Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerConfedStatus
```

ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

ip bgp neighbor *ip_address* **update-source [***interface_name***]**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
interface_name	The name of the interface.

Defaults

parameter	default
interface_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the **ip bgp neighbor** command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117
-> ip bgp neighbor 172.22.5.115 update-source vlan-22
-> ip bgp neighbor 172.22.5.115 update-source
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Sets the router identification for a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerLocalAddr
   alaBgpPeerLocalIntfName
```

ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

ip bgp neighbor *ip_address* **in-aspathlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Inbound AS path list (0 to 70 characters). This name is case sensitive.
none	Removes this AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name *(***InboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAspathListIn
```

ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

ip bgp neighbor *ip_address* **in-communitylist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Input community list (0 to 70 characters. This name is case sensitive.
none	Removes this community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of "**none**."

Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommlist
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerCommunityListIn
```

ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

ip bgp neighbor *ip_address* **in-prefixlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Input prefix filter list (0 to 70 characters). This name is case sensitive.
none	Removes this prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of "**none.**"

Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefixListIn
```

ip bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

ip bgp neighbor *ip_address* **in-prefix6list {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
none	Removes this prefix6 list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the **ip bgp policy prefix6-list** command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of "**none.**"

Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefix6list InboundPrefix6
-> ip bgp neighbor 172.22.2.115 in-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefix6ListIn
```

ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-aspathlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAspathListOut
```

ip bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-communitylist {***string* **| none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Outbound community list (0 - 70 characters).
none	Removes the community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- To deassign an output community filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-communitylist OutboundCommlist
-> ip bgp neighbor 172.22.2.115 out-communitylist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerCommunityListOut
```

ip bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-prefixlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Output prefix filter list (0 - 70 characters).
none	Removes the prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- To deassign an output prefix filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefixlist OutboundPrefix
-> ip bgp neighbor 172.22.2.115 out-prefixlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefixListOut
```

ip bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-prefix6list {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Output prefix6 filter list (0 - 70 characters).
none	Removes the prefix6 list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the **ip bgp policy prefix6-list** command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefix6list OutboundPrefix6
-> ip bgp neighbor 172.22.2.115 out-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefix6ListOut
```

ip bgp neighbor route-map

Assigns a policy map (inbound or outbound) to a BGP peer.

ip bgp neighbor *ip_address* **route-map {***string* **| none} {in | out}**

no ip bgp neighbor *ip_address* **route-map {in | out}**

Syntax Definitions

ip_address	32-bit IP address of the peer.
string	Policy map name (0 to 70 characters). This name is case sensitive.
none	Deletes the route map if entered rather than a text string.
in	Designates this route map policy as an inbound policy.
out	Designates this route map policy as an outbound policy.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no f**orm of this command to deassign an inbound or an outbound policy.
- The policy route map name (**InboundRoute** in the example below) is created using the **ip bgp policy route-map** command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- The policy route map name (**OutboundRoute** in the example below) is created using the **ip bgp policy route-map** command. Any outbound routes for the BGP peer must match this route map filter before being advertised or passed to outbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerRouteMapOut
   alaBgpPeerRouteMapIn
```

ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

ip bgp neighbor *ip_address* **clear soft {in | out}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
in	Applies reconfiguration to the inbound policies.
out	Applies reconfiguration to the outbound policies.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor soft-reconfiguration	Enables or disables BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerReconfigureInBound
   alaBgpPeerReconfigureOutBound
```

ip bgp bfd-state

Enables or disables the registration of BGP with the BFD protocol.

ip bgp bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for BGP.
disable	Disables BFD for BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and BGP must be registered with BFD at the protocol level before BGP can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of BGP with the BFD protocol:

```
-> ip bgp bfd-state enable
-> ip bgp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ip bgp bfd-state all-neighbors	Enables or disables BFD for all BGP neighbors.
ip|ipv6 bgp neighbor bfd-state	Enables or disables BFD for a specific neighbor.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdStatus
```

ip bgp bfd-state all-neighbors

Enables or disables BFD for all BGP neighbors.

ip bgp bfd-state all-neighbors {enable | disable}

Syntax Definitions

enable	Enables BFD for all the BGP neighbors.
disable	Disables BFD for all the BGP neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp bfd-state all-neighbors enable
-> ip bgp bfd-state all-neighbors disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bfd-state	Enables or disables BGP with BFD protocol.
ip|ipv6 bgp neighbor bfd-state	Enables or disables the BFD for a specific BGP neighbor.
show ip bgp neighbors	Displays the configured IPv4 BGP peers.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdAllNeighbors
```

ip|ipv6 bgp neighbor bfd-state

Enables or disables BFD for a specific IPv4 or IPv6 BGP neighbor.

{ip | ipv6} bgp neighbor {*ipv4_address* **|** *ipv6_address***} bfd-state {enable | disable}**

Syntax Definitions

ipv4_address	The IPv4 address of the BGP neighbor.
ipv6_address	The IPv6 address of the BGP neighbor.
enable	Enables BGP neighbor.
disable	Disables BGP neighbor.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp neighbor 135.10.10.2 bfd-state enable
-> ip bgp neighbor 135.10.10.2 bfd-state disable

-> ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 bfd-state enable
-> ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip bgp bfd-state	Enables or disables BGP with BFD protocol.
ip bgp bfd-state all-neighbors	Enables or disables BFD for all BGP neighbors.
show ip bgp neighbors	Displays the configured IPv4 BGP peers.

MIB Objects

```
alaBgpPeerEntry
   alaBgpPeerName
   alaBgpPeerBfdStatus
alaBgpGlobal
   alaBgpBfdAllNeighbors
```

ip bgp policy aspath-list

Creates or removes an AS path list.

ip bgp policy aspath-list *name* **"***regular_expression***"**

no ip bgp policy aspath-list *name* **"***regular_expression***"**

Syntax Definitions

name	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	Regular expression, for example, "^100 200$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

Defaults

No IP BGP peer policy AS path-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Valid regular expression characters (metacharacters) are shown in the table below. See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(	Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.
|	Separates AS numbers in an alternation sequence.

Symbol	Description
)	Ends an alternation sequence of AS numbers
[	Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-aspathlist**, **ip bgp neighbor out-aspathlist**, **ipv6 bgp neighbor in-aspathlist**, and **ipv6 bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.
ipv6 bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-aspathlist	Assigns an outbound AS path filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListRowStatus
```

ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

ip bgp policy aspath-list *name* **“***regular_expression***” action {permit | deny}**

Syntax Definitions

name	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	Regular expression, e.g., “^100 200$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	permit

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Refer to **ip bgp policy aspath-list** on page 29-108 for a table of valid regular expression characters (metacharacters). See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer’s inbound and outbound routes configured through the **ip bgp neighbor in-aspathlist**, **ip bgp neighbor out-aspathlist**, **ipv6 bgp neighbor in-aspathlist,** and **ipv6 bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath “^100 200$” action permit
-> ip bgp policy aspath-list OutboundAspath “^300 400$” action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.
ipv6 bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-aspathlist	Assigns an outbound AS path filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListAction
```

ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

ip bgp policy aspath-list *name* **"***regular_expression***" priority** *value*

Syntax Definitions

name	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	Regular expression, e.g., "^100 200$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
value	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Refer to **ip bgp policy aspath-list** on page 29-108 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured through the **ip bgp neighbor in-aspathlist**, **ip bgp neighbor out-aspathlist**, **ipv6 bgp neighbor in-aspathlist**, and **ipv6 bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp policy aspath-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
ipv6 bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-aspathlist	Assigns an outbound AS path filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListPriority
```

ip bgp policy community-list

Creates or deletes a community list.

ip bgp policy community-list *name* **{***num:num* | *num.num:num* | *num***}**

no ip bgp policy community-list *name* **{***num:num* | *num.num:num* | *num***}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
num:num	The community number, given in the form of the AS number in the asplain format and the community number, separated by a colon.
num.num:num	The community number, given in the form of the AS number in the asdot or asdot+ format and the community number, separated by a colon.

Defaults

No IP BGP peer policy community-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist**, **ip bgp neighbor out-communitylist**, **ipv6 bgp neighbor in-communitylist** and **ipv6 bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp policy community-list** command.

Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> no ip bgp policy community-list CommListAIn 40:40
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.
ipv6 bgp neighbor in-communitylist	Assigns an inbound community list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListRowStatus
```

ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} action {permit | deny}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, this command allows routes that match the criteria specified in the community list to pass.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.
ipv6 bgp neighbor in-communitylist	Assigns an inbound community list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListAction
```

ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} match-type {exact | occur}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
exact	Checks for an exact match of the community string and the community attribute.
occur	Checks for an occurrence of the community string anywhere in the community attribute.

Defaults

parameter	default
exact | **occur**	exact

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.
ipv6 bgp neighbor in-communitylist	Assigns an inbound community list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListType
```

ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} priority** *value*

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
value	Priority value in the range 0 - 255.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with community string list.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListPriority
```

ip bgp policy prefix-list

Creates or deletes a prefix match list.

ip bgp policy prefix-list *name ip_address ip_mask*

no ip bgp policy prefix-list *name ip_address ip_mask*

Syntax Definitions

name	Prefix list name.
ip_address	IP address for the prefix list.
ip_mask	Mask for the prefix list.

Defaults

No IP BGP policy prefix-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefixlist**, **ip bgp neighbor out-prefixlist**, **ipv6 bgp neighbor in-prefixlist** and **ipv6 bgp neighbor out-prefixlist** commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the **show ip bgp policy prefix-list** command.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-prefixlist	Assigns an inbound prefix filter list to a BGP peer.
ip bgp neighbor out-prefixlist	Assigns an outbound prefix filter list to a BGP peer.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.
ipv6 bgp neighbor in-prefixlist	Assigns an inbound prefix filter list to an IPv6 BGP peer.
ipv6 bgp neighbor out-prefixlist	Assigns an outbound prefix filter list to an IPv6 BGP peer.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListRowStatus
```

ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

ip bgp policy prefix-list *name ip_address ip_mask* **action {permit | deny}**

Syntax Definitions

name	Prefix list name.
ip_address	IP address for the prefix list.
ip_mask	Mask for the prefix list.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	permit

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListAction
```

ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask* **ge** *value*

Syntax Definitions

name	Prefix list name.
ip_address	IP address for the prefix list.
ip_mask	Mask for the prefix list.
value	The lower limit value in the range 0 –32.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the **ip bgp policy prefix-list le** command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListGE
```

ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask* **le** *value*

Syntax Definitions

name	Prefix list name.
ip_address	Prefix list IP address for the prefix list.
ip_mask	Prefix list mask for the prefix list.
value	The upper limit value in the range of 0 to 32.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListLE
```

ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

ip bgp policy prefix6-list *pfx_list_name prefix6/pfx_length* **[action {permit | deny}] [admin-state {enable | disable}] [ge [**{*masklength*}**]] [le [**{*masklength*}**]]**

no ip bgp policy prefix6-list *pfx_list_name prefix6/pfx_length* **[action {permit | deny}] [admin-state {enable | disable}] [ge [**{*mask_length*}**]] [le [**{*mask_length*}**]]**

Syntax Definitions

pfx_list_name	Prefix list name.
prefix6	Prefix list IPv6 address for the prefix list.
pfx_length	Prefix length. Prefix length should be in the range of 0 to 128.
value	The upper limit value in the range of 0 to 32.
permit | **deny**	Action to be taken which can be either permit or deny.
enable | **disable**	Row Status can be either enabled or disabled.
mask_length	Minimum length of the prefix to be matched. The valid range is 0–32.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- This command creates prefix6 lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefix6list**, **ip bgp neighbor out-prefix6list**, **ipv6 bgp neighbor in-prefix6list** and **ipv6 bgp neighbor out-prefix6list**.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp policy prefix6-list	Displays prefix6 list parameters.
show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.
ip bgp neighbor in-prefix6list	Assigns an inbound prefix6 list to a BGP peer.
ip bgp neighbor out-prefix6list	Assigns an outbound prefix6 list to a BGP peer.
ipv6 bgp neighbor in-prefix6list	Assigns an inbound prefix6 list to an IPv6 BGP peer.
ipv6 bgp neighbor out-prefix6list	Assigns an outbound prefix6 list to an IPv6 BGP peer.

MIB Objects

```
alaBgpPrefix6MatchListTable
   alaBgpPrefix6MatchListId
   alaBgpPrefix6MatchListAddr
   alaBgpPrefix6MatchListAddrLength
   alaBgpPrefix6MatchListAction
   alaBgpPrefix6MatchListRowStatus
   alaBgpPrefix6MatchListGE
   alaBgpPrefix6MatchListLE
```

ip bgp policy route-map

Creates or deletes a policy route map.

ip bgp policy route-map *name sequence_number*

Syntax Definitions

name	Route map name. Case-sensitive.
sequence_number	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. **ip bgp policy route-map aspath-list**
  2. **ip bgp policy route-map prefix-list**
  3. **ip bgp policy route-map prefix6-list**
  4. **ip bgp policy route-map community-list**
  5. **ip bgp policy route-map match-regexp**
  6. **ip bgp policy route-map match-prefix**
  7. **ip bgp policy route-map match-mask**
  8. **ip bgp policy route-map match-prefix6**
  9. **ip bgp policy route-map match-community**
- The route maps which apply to a specific address family (IPv4 or IPv6) are only applied to routes of the same address family. In other words, the prefix-list filter and match-prefix/match-mask route-maps are only applied to IPv4 routes and are ignored for IPv6 routes. The prefix6-list filter and match-prefix6 route-maps are only applied to IPv6 routes and are ignored for IPv4 routes.

- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - **ip bgp policy route-map community**
  - **ip bgp policy route-map community-mode**
  - **ip bgp policy route-map lpref**
  - **ip bgp policy route-map lpref-mode**
  - **ip bgp policy route-map med**
  - **ip bgp policy route-map med-mode**
  - **ip bgp policy route-map origin**
  - **ip bgp policy route-map weight**
- Route maps can be referenced as a filtering mechanism for displaying paths using the **show ip bgp path** command. They are also referenced in filtering inbound and outbound routes for BGP peers using the **ip bgp neighbor route-map** commands.

Examples

```
-> ip bgp policy route-map routemap1 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map action Configures action to be taken for a route when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapRowStatus
```

ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

ip bgp policy route-map *name sequence_number* **action {permit | deny}**

Syntax Definitions

name	A route map name.
sequence_number	A route map sequence number. The valid range is 1–255.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

Defaultst

parameter	default
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAction
```

ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

ip bgp policy route-map *name sequence_number* **aspath-list** *as_name*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
as_name	The AS path list name or “none”.

Defaults

parameter	default
as_name	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1
-> ip bgp policy route-map routemap1 1 aspath-list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAsPathMatchListId
```

ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

ip bgp policy route-map *name sequence_number* **asprepend** *path*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
path	The AS path to prepend or “none**”**. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

Defaults

parameter	default
path	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none**”**.

Examples

```
-> ip bgp policy route-map routemap1 1 asprepend “700 800 900”
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAsPrepend
```

ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

ip bgp policy route-map *name sequence_number* **community [none | no-export | no-advertise | no-export-subconfed |** *num***:***num***]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to "**none**".
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.
ip bgp policy route-map community-mode	Configures the action to be taken for a community string when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunity
```

ip bgp policy route-map community-list

Assigns a community matching list to the route map.

ip bgp policy route-map *name sequence_number* **community-list [***list_name* | **none]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
list_name	The community list name.
none	No community list name is specified.

Defaults

parameter	default
list_name | **none**	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
-> ip bgp policy route-map routemap1 1 community-list none
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax **none** added to **community-list** string.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunityMatchListId
```

ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

ip bgp policy route-map *name sequence_number* **community-mode {add | replace}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
add	Adds the community string specified in the command **ip bgp policy route-map community**.
replace	Replaces the community string specified in the command **ip bgp policy route-map community**.

Defaults

parameter	default
add | replace	**add**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.
ip bgp policy route-map community	Configures the action to be taken on the community attribute when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapSetComunityMode
```

ip bgp policy route-map lpref

Configures the local preference value for the route map.

ip bgp policy route-map *name sequence_number* **lpref** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The local preference value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref-mode**. The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.
ip bgp policy route-map lpref-mode	Configures the action to be taken when setting local preference attribute for a local matching route.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapLocalPref
```

ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

ip bgp policy route-map *name sequence_number* **lpref-mode {none | inc | dec | rep}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Do not set the local preference attribute.
inc	Increment the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no local preference attribute is found in the matching route.
dec	Decrement the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no local preference attribute is found in the matching route.
rep	Replace the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command even if no local preference attribute is found in the matching route.

Defaults

parameter	default
none | inc | dec | rep	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.
ip bgp policy route-map lpref	Configures the local preference value for the route map.
ip bgp policy route-map med	Configures the Multi-Exit Discriminator (MED) value for a route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapLocalPrefMode
```

ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

ip bgp policy route-map *name sequence_number* **match-community [none | no-export | no-advertise | no-export-subconfed |** *num:num***]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Removes the community match from the route-map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes matching the community restricting advertisement to any peer.
no-export-subconfed	Routes matching the community restricting advertisement to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching community string primitive to be placed directly in the route map.
- By default, no community string is specified. The default behavior can be reset by changing the value to **none**.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchCommunity
```

ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-mask** *ip_address*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
ip_address	The 32-bit IP address of the matching mask or “none”.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the **ip bgp policy route-map match-prefix** command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.
ip bgp policy route-map match-prefix	Configures a matching prefix primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchMask
```

ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-prefix** *ip_address*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
ip_address	The 32-bit IP address of the matching prefix.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to "**none**".
- The example on the next line shows usage combined with the **ip bgp policy route-map match-mask** command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map match-mask	Configures a matching prefix primitive in the route map.
ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchPrefix
```

ip bgp policy route-map match-prefix6

Configures a matching prefix6 primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-prefix6** *ipv6_address/mask_length*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
ipv6_address/mask_length	The 128-bit IPv6 address of the matching prefix. The length in bits of the IPv6 prefix to be matched in the Route Map.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command allows a matching prefix6 primitive to be placed directly in the route map. By default, no prefix6 primitive is assigned to the route map. The default behavior can be reset by changing the value to "**none**".

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix6 2001:1218:103::/64
-> ip bgp policy route-map routemap1 1 match-prefix6 none
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchPrefix6
   alaBgpRouteMapMatchMaskLength6
```

ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-regexp "***regular_expression***"**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
regular_expression	Regular expression or "none". The regular expression must be enclosed by quotation marks.

Defaults

parameter	default
regular_expression	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in **ip bgp policy aspath-list** on page 29-108.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to "**none**".
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchAsRegExp
```

ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

ip bgp policy route-map *name sequence_number* **med** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The MED value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med-mode** command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map med-mode	Configures Multi-Exit Discriminator (MED) value for a route map.
ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMed
```

ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

ip bgp policy route-map *name sequence_number* **med-mode {none | inc | dec | rep}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The MED value. The valid range is 0–4294967295.
none	Do not set the MED.
inc	Increment the MED in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no MED is found in the matching route.
dec	Decrement the MED in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no MED is found in the matching route.
rep	Replace the MED in the matching route by the value specified in the **ip bgp policy route-map med** command even if no MED is found in the matching route.

Defaults

parameter	default
none | inc | dec | rep	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med**. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map med	Configures action to take when setting Multi-Exit Discriminator (MED) attribute for a matching route.
ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMedMode
```

ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

ip bgp policy route-map *name sequence_number* **origin {igp | egp| incomplete | none}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
igp	Sets the origin attribute to remote internal BGP (IGP).
egp	Sets the origin attribute to local external BGP (EGP).
incomplete	Sets the origin attribute to incomplete, meaning the origin is unknown.
none	Sets the origin attribute to “none”.

Defaults

parameter	default
igp | egp| incomplete | none	**none**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map origin	Configures action to take on origin attribute when a match is found.
ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapOrgin
```

ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

ip bgp policy route-map *name sequence_number* **prefix-list** *prefix_name*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
prefix_name	The prefix list name or “none”.

Defaults

parameter	default
prefix_name	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The **ip bgp policy prefix-list**, **ip bgp policy prefix-list action**, **ip bgp policy prefix-list ge**, and **ip bgp policy prefix-list le** commands are used to create and set permit/deny actions for a prefix path list.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Assigns a prefix matching list to the route map.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapPrefixMatchListId
```

ip bgp policy route-map prefix6-list

Assigns a prefix6 matching list to the route map, which identifies the matching criteria list of IPv6 prefixes.

ip bgp policy route-map *name sequence_number* **prefix6-list** *prefix6_name*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
prefix_name	The prefix6 list name or “none”.

Defaults

parameter	default
prefix6_name	none

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6-list policy name is created using the **ip bgp policy prefix6-list** command.
- By default, no prefix6 list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix6-list listB
-> ip bgp policy route-map routemap1 1 prefix6-list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapPrefix6MatchListId
```

ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

ip bgp policy route-map *name sequence_number* **weight** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The weight value. The valid range is 0–65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapWeight
```

ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

ip bgp policy route-map *name sequence_number* **community-strip** *community_list*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
community_list	The community list name.

Defaults

No IP BGP policy route-map community list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

Examples

```
-> ip bgp policy route-map routemap1 1 commmunity_strip communitylist
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunityStrip
```

show ip bgp

Displays the current global settings for the local BGP speaker.

show ip bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

Examples

```
-> show ip bgp
Admin Status                         = disabled,
Operational Status                   = up,
Autonomous system Number             = 1,
BGP Router Id                        = 111.1.1.1,
Confederation Identifier             = 0,
IGP Synchronization Status           = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference             = 100,
Route Reflection                     = disabled,
Cluster Id                           = 0.0.0.0,
Missing MED Status                   = Best,
Aspath Comparison                    = enabled,
Always Compare MED                  = disabled,
Fast External Fail Over              = disabled,
Log Neighbor Changes                = disabled,
Multiple path                        = disabled,
Graceful Restart                     = enabled,
Graceful Restart Status              = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast                         = enabled,
IPv6 Unicast                         = disabled,
BFD Status                           = disabled,
ASN Output Format                    = asplain
```

output definitions

Admin Status	Indicates whether the BGP protocol has been enabled or disabled through the **ip bgp admin-state** command.
Operational Status	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.
Autonomous system Number	The AS assigned to the local BGP speaker through the **ip bgp autonomous-system** command.
BGP Router Id	The IP address for the local BGP speaker.
Confederation Id	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the **ip bgp confederation identifier** command.
IGP Synchronization Status	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). Configured through the **ip bgp synchronization** command.
Minimum AS origin interval	The frequency, in seconds, at which routes local to the autonomous system are advertised. Configured through the **ip bgp as-origin-interval** command.
Default Local Preference	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the **ip bgp default local-preference** command.
Route Reflection	Indicates whether the local BGP speaker is acting as a route reflector for its AS. Configured through the **ip bgp client-to-client reflection** command.
Cluster Id	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. Configured through the **ip bgp cluster-id** command.
Missing MED Status	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value (2^{32}-1) or the best possible value (0). This value is set using the **ip bgp bestpath med missing-as-worst** command. By default, missing MED values are treated as **best**.
Aspath Comparison	Indicates whether the AS path will be in used in determining the best route. Configured through the **ip bgp bestpath as-path ignore** command.
Always Compare MED	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. Configured through the **ip bgp always-compare-med** command.
Fast External Fail Over	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. Configured through the **ip bgp fast-external-failover** command.
Log Neighbor Changes	Indicates whether logging of peer state changes is enabled or disabled. Configured through the **ip bgp log-neighbor-changes** command.
Multi path	Indicates whether support for multiple equal cost paths is enabled or disabled. Configured through the **ip bgp maximum-paths** command.

output definitions (continued)

Graceful Restart	Indicates whether graceful restart is enabled or disabled.
Graceful Restart Status	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Configured Graceful Restart Interval	Indicates the timer for achieving a graceful restart.
IPv4 Unicast	Indicates whether IPv4 unicast is enabled or disabled.
IPv6 Unicast	Indicates whether IPv6 unicast is enabled or disabled.
BFD Status	Indicates whether BFD is enabled or disabled for the BGP protocol. Configured through the **ip bgp bfd-state** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp unicast	Enables or disables unicast IPv4 updates for the BGP routing process.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process
show ip bgp statistics	Displays BGP global statistics.

show ip bgp statistics

Displays BGP global statistics.

show ip bgp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

Examples

```
-> show ip bgp statistics
# of Active Prefixes Known                = 0,
# of EBGP Neighbors in Established State  = 0,
# of IBGP Neighbors in Established State  = 0,
# of Feasible Paths                       = 0,
# of Dampened Paths                       = 0,
# of Unsynchronized Paths                 = 0,
# of Policy unfeasible paths              = 0,
Total Number of Paths                     = 0
```

output definitions

# of Active Prefixes Known	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
# of EBGP Neighbors in Established State	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
# of IBGP Neighbors in Established State	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
# of Feasible Paths	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
# of Dampened Paths	The number of route paths that are not active because they have violated dampening parameters.
# of Unsynchronized Paths	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

output definitions (continued)

# of Unfeasible Paths	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
Total Number of Paths	The total number of paths known to the speaker, active or not.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpStatsTable
```

show ip bgp dampening

Displays the BGP route dampening settings.

show ip bgp dampening

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

Examples

```
-> show ip bgp dampening
Admin Status                    = disabled,
Half life value (seconds)       = 300,
Reuse value                     = 200
Suppress value                  = 300,
Max suppress time (seconds)     = 1800,
```

output definitions

Admin Status	Indicates whether route dampening is enabled or disabled. This value is configured through the **ip bgp dampening** command.
Half life value	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the **ip bgp dampening** command.
Reuse value	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the **ip bgp dampening** command.
Suppress value	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the **ip bgp dampening** command.
Max Suppress time	The maximum time (in seconds) that a route will be suppressed. This value is configured through the **ip bgp dampening** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables or disables BGP route dampening or the suppression of unstable routes.

   alaBgpDampReuse
   alaBgpDampening
   alaBgpDampeningClear
```

show ip bgp dampening-stats

Displays BGP dampening statistics.

show ip bgp dampening-stats [*ip_address ip_mask*] [*peer_address*]

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
peer_address	A 32-bit IP address of peer (neighbor).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

Examples

```
-> show ip bgp dampening-stats
Network         Mask            From            Flaps Duration    FOM
--------------+---------------+---------------+-----+-----------+-----
155.132.44.73   255.255.255.255 192.40.4.121    8     00h:00m:35s 175
```

output definitions

Network	The IP address for the local BGP speaker that is responsible for route dampening in this router.
Mask	The mask for the local BGP speaker that is responsible for route dampening in this router.
From	The IP address for the route that is flapping.
Flaps	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.
Duration	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
FOM	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in **ip bgp dampening**), then this route will no longer be advertised.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables and disables route dampening.

MIB Objects

N/A

show ip bgp path

Displays BGP paths.

show ip bgp path
[ip-addr *ip_address ip_mask***]**
[aspath-list *aspathlist_name***]**
[community-list *community_list_name***]**
[prefix-list *prefix_name***]**
[route-map *routemap_name***]**
[cidr-only]
[community *community_number***]**
[neighbor-rcv *recv_peer_address***]**
[neighbor-adv *adv_peer_addr***]**
[regexp "*regular_expression***"]**
[best]
[detail]

Syntax Definitions

ip_address	A 32-bit IP address of the path.
ip_mask	A 32-bit subnet mask of the path.
aspathlist_name	AS path on which to filter.
community_list_name	Community name on which to filter.
prefix_name	Prefix on which to filter.
routemap_name	Route map on which to filter.
cidr-only	Filter out everything except CIDR routes.
community_number	Community number on which to filter.
recv_peer_address	Filter all except paths received from this path.
adv_peer_addr	Filter all except paths sent to this path.
regular_expression	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, "$100".
best	Show only the best path.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.
- 'Detail' option displays the AS Path details for a specific route.

Examples

```
-> show ip bgp path
Legends: Sta     = Path state
         >       = best, F = feasible
         P       = policy changing, U = un-synchronized

```

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Network	The IP address for this route path. This is the destination of the route.
Mask	The mask for this route path.
Nbr address	The IP or IPv6 address of the BGP peer that is advertising this path.
Next Hop	The next hop along the route path.

output definitions (continued)

(0)	The origin attribute of this route path. A question mark (**?**) indicates incomplete, and **i** indicates IGP, and an **e** indicates EGP.
degPref	The local preference value assigned to this route path.

```
-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
BGP Path parameters
Path address  = 192.40.6.72
Path mask     = 255.255.255.248
Path protocol = ebgp
Path peer     = 192.40.4.29
  Path nextHop            = 192.40.4.29,
  Path origin             = igp,
  Path local preference   = -1,
  Path state              = active,
  Path weight             = 0,
  Path preference degree  = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED                = -1,
  Path atomic             = no,
  Path AS aggregator      = <none>,
  Path IPaddr aggregator  = <none>,
  Path community          = <none>,
  Path unknown attribute  = <none>
```

output definitions

Path address	The IP address for route path.
Path mask	The mask for this route path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: **local**, **static**, **directhost**, **rip**, **ospf**, **isis**, **ibgp**, **ebgp**, and **other**.
Path peer	The IP address of the peer that is advertising this route path.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be **igp**, **egp**, **incomplete**, and **none**. The origin attribute is considered during the route decision process.
Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the **-1** in the above display) indicates that the local preference value is missing for this route path.
Path state	Path state indicates the state of the path.The possible states are **best**, **feasible**, **policy-wait**, **un-synchronized**, **dampened**, or **none**. When path state is **none**, it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.
Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the **ip bgp default local-preference**).

output definitions (continued)

Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the **-1** in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read **yes**), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of **<none>** indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of **<none>** indicates that this is not an aggregate route.
Path community	Indicates the community to which this route path belongs, if applicable. A value of **<none>** indicates that this route does not belong to a community.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; ‘detail’ keyword added.

Related Commands

show ip bgp routes	Displays BGP route details.

MIB Objects

```
alaBgpPathTable
   alaBgpPathEntry
```

show ip bgp routes

Displays BGP route details.

show ip bgp routes [*ip_address ip_mask*]

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all the routes in the routing table with details.

Examples

```
-> show ip bgp routes
Legends: ECL = EBGP change list, ICC = IBGP client change list
         ICL = IBGP change list, LCL = local change list
         AGG = Aggregation, AGC = Aggregation contribution
         AGL = Aggregation list, GDL = Deletion list
         AGW = Aggregation waiting, AGH = Aggregation hidden
         DMP = Dampening, ACT = Active route
Address         Mask            ECL ICC ICL LCL AGG AGC AGL AGW AGH GDL DMP ACT

192.40.6.144    255.255.255.248 No  No  No  No  No  No  No  No  No  No  No  Yes
```

output definitions

Address	The route destination network address.
Mask	The route destination network mask.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

Release History

Release 7.1.1; command was introduced.

Related Commands

alaBgpRouteTable
   alaBgpRouteEntry
```

show ip bgp aggregate-address

Displays aggregate route status.

show ip bgp aggregate-address [*ip_address ip mask*]

Syntax Definitions

ip_address	A 32-bit IP address of the aggregate address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

Examples

```
-> show ip bgp aggregate-address
Network         Mask            Summarize As-Set   Admin state Oper state
--------------+---------------+---------+--------+-----------+----------
155.132.44.73   255.255.255.255 disabled  disabled disabled    not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled    not_active

-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address          = 192.40.6.0,
Aggregate mask             = 255.255.255.255,
Aggregate admin state      = disabled,
Aggregate oper state       = not_active,
Aggregate as-set           = disabled,
Aggregate summarize        = disabled,
Aggregate metric           = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

output definitions

Network or **Aggregate address**	The IP address for this aggregate route. This value is configured through the **ip bgp aggregate-address** command.
Mask or **Aggregate mask**	The mask for this aggregate route. This value is configured through the **ip bgp aggregate-address** command.
Summarize or **Aggregate summarize**	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the **ip bgp aggregate-address summary-only** command.

output definitions (continued)

As-Set or **Aggregate as-set**	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the **ip bgp aggregate-address as-set** command.
Admin State or **Aggregate admin state**	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the **ip bgp aggregate-address admin-state** command.
Oper State or **Aggregate oper state**	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
Aggregate metric	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the **ip bgp aggregate-address metric** command.
Aggregate local preference	The local preference value for this aggregate route. This value is configured through the **ip bgp aggregate-address local-preference** command.
Aggregate community string	The community string value for this aggregate route. This value is configured through the **ip bgp aggregate-address community** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates and deletes a BGP aggregate route.

show ip bgp network

Displays currently defined network configurations.

show ip bgp network [*ip_address ip_mask*]

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all the configured networks, or a single network.

Examples

```
-> show ip bgp network
Network         Mask            Admin state Oper state
--------------+---------------+-----------+----------
155.132.1.2     255.255.255.255 disabled    not_active
155.132.1.3     255.255.255.255 disabled    not_active

-> show ip bgp network 155.132.1.2 255.255.255.255
Network address          = 155.132.1.2,
Network mask             = 255.255.255.255,
Network admin state      = disabled,
Network oper state       = not_active,
Network metric           = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

output definitions

Network or **Network address**	The IP address configured for this local BGP network. This value is configured through the **ip bgp network** command.
Mask or **Network mask**	The mask configured for this local BGP network. This value is configured through the **ip bgp network** command.
Admin state or **Network admin state**	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the **ip bgp network admin-state** command.

output definitions (continued)

Oper state or **Network oper state**	Indicates whether this BGP local network is operationally active or inactive.
Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the **ip bgp network metric** command.
Network local preference	The local preference value for this local BGP network. This value is configured through the **ip bgp network local-preference** command.
Network community string	The community string value for this local BGP network. This value is configured through the **ip bgp network community** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network	Configures a local BGP network.

MIB Objects

```
alabgpMIBNetworkGroup
   alaBgpNetworkEntry
```

show ip bgp neighbors

Displays the configured IPv4 BGP peers.

show ip bgp neighbors [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

There are two output options for this command. If you specify show ip bgp peer without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

Examples

```
-> show ip bgp neighbors
Legends:Nbr = Neighbor
         As = Autonomous System
Nbr address   As        Admin state Oper state BGP Id       Up/Down      BFD Status
--------------+---------+-----------+----------+------------+------------+----------
192.40.4.29   3         enabled     estab      192.40.4.29  00h:14m:48s  disabled
192.40.4.121  5         disabled    idle       0.0.0.0      00h:00m:00s  enabled
```

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Admin state	Indicates whether this peer has been enabled or disabled through the **ip bgp neighbor admin-state** command.
Oper state	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
BgpId	The unique BGP identifier of the peer. This value is configured through the **ip bgp neighbor update-source** command.

output definitions

Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
BFD Status	Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the **ip|ipv6 bgp neighbor bfd-state** command.

```
-> show ip bgp neighbors 0.0.0.1
Neighbor address                  = 0.0.0.1,
Neighbor autonomous system        = 1,
Neighbor Admin state              = enabled,
Neighbor Oper state               = connect,
Neighbor passive status           = disabled,
Neighbor name                     = peer(0.0.0.1),
Neighbor local address            = vlan-215,
Neighbor EBGP multiHop            = enabled,
Neighbor next hop self            = disabled,
Neighbor TTL security             = 6,
Neighbor Route Refresh            = enabled,
Neighbor Ipv4 unicast             = enabled,
Neighbor Ipv4 multicast           = disabled,
Neighbor type                     = internal,
Neighbor auto-restart             = enabled,
Neighbor route-reflector-client   = disabled,
Neighbor confederation status     = disabled,
Neighbor remove private AS        = disabled,
Neighbor default originate        = disabled,
Neighbor maximum prefixes         = 5000,
Neighbor max prefixes warning     = enabled,
# of prefixes received            = 0,
Neighbor MD5 key                  = <none>,
Neighbor local port               = 0,
Neighbor TCP window size          = 32768
Graceful Restart State            = None,
Advertised Restart Interval       = 0s,
Forwarding State during restart   = NotPreserved,
Activate IPv6 unicast             = enabled,
Configured IPv6 NextHop Address   = ::,
Neighbor Ipv6 unicast             = advertised
BFD Status                        = Disabled,
Activate IPv4 unicast             = enabled,
BFD Status                        = disabled,
Activate IPv4 unicast             = enabled
```

output definitions

Neighbor address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
Neighbor autonomous system	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Neighbor Admin state	Indicates whether this peer has been enabled or disabled through the **ip bgp neighbor admin-state** command.

output definitions (continued)

Neighbor Oper state	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the **ip bgp neighbor passive** command.
Neighbor name	The name assigned to this peer through the **ip bgp neighbor description** command.
Neighbor local address	The interface assigned to this peer. This value is configured through the **ip bgp neighbor update-source** command.
Neighbor EBGP multihop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the **ip bgp neighbor ebgp-multihop** command.
Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the **ip bgp neighbor next-hop-self** command.
Neighbor TTL security	Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
Neighbor Ipv4 multicast	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
Neighbor type	Indicates whether this peer is internal or external to the router.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the **ip bgp neighbor auto-restart** command.
Neighbor route-reflector-client	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the **ip bgp neighbor route-reflector-client** command.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation. This value is configured through the **ip bgp confederation neighbor** command.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the **ip bgp neighbor remove-private-as** command.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the **ip bgp neighbor default-originate** command.

output definitions (continued)

Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the **ip bgp neighbor maximum-prefix** command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the **ip bgp neighbor update-source** command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key [32- 47]	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the **ip bgp neighbor md5 key** command.
Neighbor local port	The TCP port used for the session with this peer.
Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Advertised Restart Interval	Indicates the restart interval in seconds.
Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates if the IPv6 unicast updates are enabled or not. Options include **enabled** or **disabled**.
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the **ipv6 bgp neighbor ipv6-nexthop** command.
Neighbor Ipv6 unicast	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.
BFD Status	Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the **ip|ipv6 bgp neighbor bfd-state** command.
Activate IPv4 unicast	Indicates if the IPv4 unicast updates are enabled or not for this peer.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; BFD Status and Activate IPv4 unicast output fields added.
Release 8.4.1; ‘Neighbor TTL security’ output field added.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.
ip bgp neighbor ttl-security	Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer.

show ip bgp neighbors policy

Displays BGP peer policy information.

show ip bgp neighbors policy [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all of the configured policies for the router, or the polices configured for a specific peer.

Examples

```
-> show ip bgp neighbors policy
Neighbor address  =  0.0.0.0,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,
  Neighbor input aspath-list name     = <none>,
  Neighbor output prefix-list name    = <none>,
  Neighbor input prefix-list name     = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
  Neighbor output prefix6-list name   = <none>,
  Neighbor input prefix6-list name    = <none>
Neighbor address  =  0.0.0.1,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,

  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
  Neighbor output prefix6-list name   = <none>,
  Neighbor input prefix6-list name    = <none>
```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the **ip bgp neighbor remote-as** command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor out-aspathlist** command.
Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor in-aspathlist** command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor out-prefixlist** command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor in-prefixlist** command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor out-communitylist** command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor in-communitylist** command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the **ip bgp neighbor soft-reconfiguration** command.
Neighbor output prefix6-list name	The outbound prefix6 list policy for the peer. This can be assigned by using the **ip bgp neighbor out-prefix6list** command.
Neighbor input prefix6-list name	The inbound prefix6 list policy for the peer. This can be assigned by using the **ip bgp neighbor in-prefix6list** command.

show ip bgp neighbors timer

Displays BGP peer timer statistics.

show ip bgp neighbors timer [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

Examples

```
-> show ip bgp neighbors timer
Legends: Nbr     = Neighbor
         As      = Autonomous System
         RtAdv   = Route Advertisement
         Kalive  = Keep Alive (actual)
         Ka(C)   = Configured Keep Alive
Nbr address     As    Hold  Hold(C) RtAdv Retry Kalive Ka(C)
---------------+-----+-----+-------+-----+-----+------+-----
192.40.4.29     3     90    90      30    120   30     30
192.40.4.121    5     0     90      30    120   0      30
```

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Hold	The current count for the holdtime value.
Hold(C)	The holdtime value configured through the **ip bgp neighbor timers** command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the **ip bgp neighbor advertisement-interval** command.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the **ip bgp neighbor timers** command.

output definitions (continued)

Kalive	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka(C)	The keepalive interval as configured through the **ip bgp neighbor timers** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

N/A

show ip bgp neighbors statistics

Displays BGP peer message statistics.

show ip bgp neighbors statistics [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

Examples

```
-> show ip bgp neighbors statistics
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
         RUPDS = number of Update messages received,
         SUPDS = number of Update messages sent,
         RNOFY = number of Notify messages received,
         SNOFY = number of Notify messages sent
         RPFXS = number of prefixes received
         UPTNS = number of UP transitions
         DNTNS = number of DOWN transitions

 Nbr address    As    RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
---------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
192.40.4.29     3     110   123   5     0     0     1     8     2     2
192.40.4.121    5     0     0     0     0     0     0     0     0     0
```

output definitions

Nbr address	The IP address for this peer. This value is configured through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. This value is configured through the **ip bgp neighbor remote-as** command.
RMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	The number of unique route prefixes received by this peer.
UPTNS	The number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```
-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address                  = 0.0.0.1,
# of UP transitions               = 0,
Time of last UP transition        = 00h:00m:00s,
# of DOWN transitions             = 0,
Time of last DOWN transition      = 00h:00m:00s,
Last DOWN reason                  = none,
# of msgs rcvd                    = 0,
# of Update msgs rcvd             = 0,
# of prefixes rcvd                = 0,
# of Route Refresh msgs rcvd      = 0,
# of Notification msgs rcvd       = 0,
Last rcvd Notification reason     = none [none]
Time last msg was rcvd            = 00h:00m:00s,
# of msgs sent                    = 0,
# of Update msgs sent             = 0,
# of Route Refresh msgs sent      = 0
# of Notification msgs sent       = 0,
Last sent Notification reason     = none [none]
Time last msg was sent            = 00h:00m:00s,
```

output definitions

Neighbor address	The IP address for this peer. This value is configured through the **ip bgp neighbor** command.
# of UP transitions	The number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of prefixes rcvd	The number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	The number of route refresh requests this peer has received. Route refresh requests all routes learned be a peer.
# of Notification msgs rcvd	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons: message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgs sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgs sent	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgs sent	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgs sent	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the **Peer last received notification reason** field above.
Time last msg was sent	The duration since a message was sent to this peer.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

N/A

show ip bgp policy aspath-list

Displays AS path list parameters.

show ip bgp policy aspath-list [*name***] [***"regular_expression"***]**

Syntax Definitions

name	An AS path name.
regular_expression	A regular expression. The regular expression must be enclosed by quotation marks.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the **ip bgp policy aspath-list** command on page 29-108.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

Examples

```
-> show ip bgp policy aspath-list
Aspath List Name          Aspath regular expression
------------------------+-------------------------------------------------
aspl1                     (500 | 400) ? 300$
aspl2                     (500 | 400)

-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp    = (500 | 400) ? 300$
  Admin state      = disabled,
  Priority         = 1,
  Action           = deny,
  Primary index    = 0,
```

output definitions

Aspath List name	The name of the AS path list. This is defined using the **ip bgp policy aspath-list** command.
Aspath regular expression	The regular expression that defines the AS path list. This is defined using the **ip bgp policy aspath-list** command.

output definitions (continued)

Admin state	The administration state of the AS path policy. It is either enable or disable.
Priority	The AS path list priority. This is defined using the **ip bgp policy aspath-list priority** command.
Action	The AS path list action, either permit or deny. This is defined using the **ip bgp policy aspath-list action** command.
Primary index	The instance identifier for the AS path list. This value is not configurable.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alabgpMIBAspathListGroup
   alaBgpAspathMatchListId
   alaBgpAspathMatchListRegExp
   alaBgpAspathMatchListPriority
   alaBgpAspathMatchListAction
   alaBgpAspathMatchListRowStatus
```

show ip bgp policy community-list

Displays community list parameters.

show ip bgp policy community-list [*name***] [***string***]**

Syntax Definitions

name	Community name.
string	A regular expression. The regular expression must be enclosed by quotation marks.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

Examples

```
-> show ip bgp policy community-list
Community list name       Community string
--------------------------+--------------------------------------------------
adfasdf                   0:0

-> show ip bgp policy community-list coml1
Community List name = coml1
Community string    = 600:1
  Admin state               = disabled,
  Match type                = exact,
  Priority                  = 1,
  Action                    = deny,
  Primary index             = 0
```

output definitions

Community List name	The community list name. This is defined using the **ip bgp policy community-list** command.
Community string	The community list definition. This is defined using the **ip bgp policy community-list** command.
Admin state	The administration state of the community list policy, either enabled or disabled.
Match type	The match type of the community list. This is defined using the **ip bgp policy community-list match-type** command.

output definitions (continued)

Priority	The community list priority. This is defined using the **ip bgp policy community-list priority** command.
Action	The community list action. This is defined using the **ip bgp policy community-list action** command.
Primary index	The instance identifier for the community list. This value is not configurable.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

show ip bgp policy prefix-list

Displays prefix list parameters.

show ip bgp policy prefix-list [*name***] [***ip_address ip_mask***]**

Syntax Definitions

name	A prefix list name.
ip_address	A prefix list IP address.
ip_mask	An IP address mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

Examples

```
-> show ip bgp policy prefix-list
Prefix List name          Prefix address  Prefix mask
-------------------------+---------------+--------------
pfxl1                     155.132.33.0    255.255.255.0
pfxl2                     155.148.32.0    255.255.255.0

-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask             = 255.255.255.0
  Admin state        = disabled,
  Match Mask >= (GE) = 0,
  Match Mask <= (LE) = 0,
  Action             = deny
```

output definitions

Prefix List name	The name of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Address	The IP address of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Mask	The mask of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Admin state	The administrative state of the prefix list, either enabled or disabled.

output definitions (continued)

Match Mask >= (GE)	The GE match mask of the prefix list. This is defined using the **ip bgp policy prefix-list ge** command.
Match Mask <= (LE)	The GE match mask of the prefix list. This is defined using the **ip bgp policy prefix-list le** command.
Action	The action of the prefix list. This is defined using the **ip bgp policy prefix-list action** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

   alaBgpPrefixMatchListRowStatus
```

show ip bgp policy prefix6-list

Displays prefix6 list parameters.

show ip bgp policy prefix6-list [*name***] [***ipv6_address/prefixLength***]**

Syntax Definitions

name	A prefix6 list name.
ip_address	A prefix6 list IPv6 address.
prefixLength	A prefix6 list prefix length.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the list of prefix6-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address.

Examples

```
-> show ip bgp policy prefix6-list
Prefix6 List name      Prefix6 address/Prefix length
---------------------+------------------------------
p62                    ::/0
p63                    4001:1::/32

-> show ip bgp policy prefix6-list p63
Prefix6 List name = p63
Prefix          = 4001:1::
Prefix Length   = 32
Admin state        = enabled,
Match MaskLength >= (GE) = 32,
Match MaskLength <= (LE) = 0,
Action             = permit
```

output definitions

Prefix6 List name	The name of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command.
Prefix	The IPv6 address of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command.
Prefix Length	The prefix length of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command.
Admin state	The administrative state of the prefix6 list, either enabled or disabled.

output definitions (continued)

Match MaskLength >= (GE)	The GE match masklength of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command.
Match MaskLength <= (LE)	The LE match masklength of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command
Action	The action of the prefix6 list. This is defined using the **ip bgp policy prefix6-list** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a prefix6 match list.

MIB Objects

```

show ip bgp policy route-map

Displays policy route map parameters.

show ip bgp policy route-map [*name***] [***sequence_number***]**

Syntax Definitions

name	Route map name.
sequence_number	A sequence number. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

Examples

```
-> show ip bgp policy route-map
RouteMap name             Instance
--------------------------+--------
rmap1                     1
rmap1                     2
rmap2                     1

-> show ip bgp policy route-map rmap1
RouteMap name     = rmap1
RouteMap instance = 1
  Admin state               = disabled,
  Local pref (mode/value)   = <none> / 0,
  Route map action          = permit,
  Origin                    = <none>,
  MED (mode/value)          = <none> / 0,
  Weight                    = 0,
  Aspath-List name          = aspl1,
  Aspath prepend            = <none>,
  Aspath match primitive    = 500 .* 400$,
  Prefix-List name          = <none>,
  Prefix match primitive    = 0.0.0.0 0.0.0.0,
  Prefix6-List name         = <none>,
  Prefix6 match primitive   = ::/0,
  Prefix6-List name         = <none>,
  Prefix6 match primitive   = ::/0,
  Community-List name       = coml2,
  Community match primitive = <none>,
  Community string [mode]   =  [Additive]
```

output definitions

RouteMap name	The name of the route map policy. This is determined using the **ip bgp policy prefix6-list** command.
RouteMap instance	The instance of the route map policy. This is determined using the **ip bgp policy prefix6-list** command.
Admin state	The administrative state of the route map policy, either enabled or disabled.
Local pref (mode/value)	The local preference of the route map policy. This is determined using the **ip bgp policy route-map lpref** command.
Route map action	The action of the route map policy. This is determined using the **ip bgp policy route-map action** command.
Origin	The origin of the route map policy. This is determined using the **ip bgp policy route-map origin** command.
MED (mode/value)	The MED of the route map policy. This is determined using the **ip bgp policy route-map med** command.
Weight	The weight of the route map policy. This is determined using the **ip bgp policy route-map weight** command.
Aspath-List name	The name of the AS path list attached to this route map.This is set using the **show ip bgp policy aspath-list** command.
Aspath prepend	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
Aspath match primitive	The regular expression used to match AS Path for this route map.
Prefix-List name	The name of the prefix list attached to this route map. This is set using the **show ip bgp policy prefix-list** command.
Prefix match primitive	The prefix to match for this route map.
Prefix6-List name	The name of the prefix6 list attached to this route map.
Prefix6 match primitive	The prefix6 to match for this route map.
Community-List name	The name of the community list attached to this route map. This is set using the **show ip bgp policy community-list** command.
Community match primitive	The community string to match for this route map.
Community string [mode]	The name of the community mode attached to this route map. This is set using the **ip bgp policy route-map community-mode** command.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; Prefix6-List name and Prefix6 match primitive output fields added.

Related Commands

ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

ip bgp graceful-restart

no ip bgp graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful restart
-> no ip bgp graceful restart
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpGracefulRestart
   alaBgpRestartInterval
```

ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

ip bgp graceful-restart restart-interval [*seconds***]**

Syntax Definitions

seconds	The hitless restart timeout interval, in seconds. The valid range is 1–3600.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful-restart restart-interval 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpGracefulRestart
   alaBgpRestartInterval
```

ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

ip bgp unicast

no ip bgp unicast

Syntax Definitions

N/A

Defaults

By default, BGP IPv4 advertisements are enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

Examples

```
-> ip bgp unicast
-> no ip bgp unicast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiProtocolIpv4
```

ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

ipv6 bgp unicast

no ipv6 bgp unicast

Syntax Definitions

N/A

Defaults

By default, IPv6 BGP advertisements are disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

Examples

```
-> ipv6 bgp unicast
-> no ipv6 bgp unicast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp unicast	Enables or disables unicast IPv4 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiProtocolIpv6
```

ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **activate-ipv6**

no ip bgp neighbor i*p_address* **activate-ipv6**

Syntax Definitions

ip_address	The 32-bit IPv4 address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerIpv6Unicast
```

ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **ipv6-nexthop** *ipv6_address*

Syntax Definitions

ip_address	The 32-bit IPv4 address of the neighbor.
ipv6_address	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

Defaults

By default, the IPv6 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerIpv6NextHop
```

show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

show ipv6 bgp path [ipv6-addr *ipv6_address/prefix_length***] [detail]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_address/prefix_length* parameter to display the IPv6 BGP paths for a specified route.
- 'Detail' option when used displays the AS Path details of each route.

Examples

```
-> show ipv6 bgp path
Legends: Sta     = Path state
         >       = best, F = feasible, S = stale
         U       = un-synchronized

```

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Prefix	The destination address of the IPv6 route in the hexadecimal format.
Nbr Address	The IP or IPv6 address of the BGP peer that advertises this path.
(0)	The origin attribute of this route path. A question mark (**?**) indicates incomplete, and **i** indicates IGP, and an **e** indicates EGP.
degPref	The local preference value assigned to this route path.

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
BGP Path parameters
Path address   = 2020:100:200:1::
Path Length    = 64
Path protocol  = ibgp
Path neighbor  = peer(2001:100:3:4::1)
  Path nextHop            = 2001:100:3:4::1,
  Path origin             = igp,
  Path local preference   = 100,
  Path state              = active,
  Path weight             = 0,
  Path preference degree  = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED                = <none>,
  Path atomic             = no,
  Path AS aggregator      = <none>,
  Path IPaddr aggregator  = <none>,
  Path community          = <none>,
  Path Originator Id      = <none>,
  Path Cluster List       = <none>,
  Path unknown attribute  = <none>
```

output definitions

Path address	The IPv6 address for route path.
Path Length	The prefix length of the IPv6 path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: **local**, **static**, **directhost**, **rip**, **ospf**, **isis**, **ibgp**, **ebgp**, and **other**.
Path neighbor	The IPv6 address of the BGP peer.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be **igp**, **egp**, **incomplete**, and **none**. The origin attribute is considered during the route decision process.

output definitions (continued)

Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the **-1** in the above display) indicates that the local preference value is missing for this route path.
Path state	Indicates the state of the path.The possible states are **best**, **feasible**, **policy-wait**, **un-synchronized**, **dampened**, or **none**. When path state is **none**, it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.
Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the **ip bgp default local-preference**).
Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the **-1** in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read **yes**), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of **<none>** indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of **<none>** indicates that this is not an aggregate route.
Path community	Indicates the community to which this route path belongs, if applicable. A value of **<none>** indicates that this route does not belong to a community.
Path Originator Id	The Router Id of the BGP4 speaker that performed route reflection
Path Cluster List	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; ‘detail’ keyword added.

Related Commands

show ipv6 bgp routes	Displays the known IPv6 BGP routes.

 2525:2525:5::/48                No  No  No  No  No  No  No  No  No  No  No  Yes
```

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp path	Displays the known IPv6 BGP paths for all the routes or a specific route.

ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

ipv6 bgp network *ipv6_address/prefix_length*

no ipv6 bgp network *ipv6_address/prefix_length*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network admin-state	Enables or disables a BGP network.
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
```

ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

ipv6 bgp network *ipv6_address/prefix_length* **[community {none | no-export | no-advertise | no-export-subconfed |** *num* **|** *num:num***}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128
none	Removes a prefix from a community.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num	The community attribute number.
num:num	Community attribute in the AS:NN format. AS indicates the autonomous system and NN indicates the community number.

Defaults

By default, a route is not assigned to a community.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6Community
```

ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ipv6 bgp network *ipv6_address/prefix_length* **[local-preference** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).
num	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6LocalPref
```

ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

ipv6 bgp network *ipv6_address/prefix_length* **[metric** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).
num	The MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.

   alaBgpNetwork6Metric
```

ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

ipv6 bgp network *ipv6_address/prefix_length* **[admin-state {enable | disable}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).
enable	Enables the BGP network.
disable	Disables the BGP network.

Defaults

By default, the BGP network is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6RowStatus
```

show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

show ipv6 bgp network [*ipv6_address/prefix_length***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

By default, all IPv6 BGP networks and their status will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address/prefix_length* parameter to display the status of a specific IPv6 BGP network.

Examples

```
show ipv6 bgp network
 Network                            Admin state Oper state
-----------------------------------+-----------+----------
2525:500:600::/64                   enabled     active

show ipv6 bgp network 2525:500:600::/64
Network address          = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

output definitions

Network or **Network address**	The IPv6 address configured for this local BGP network. This value is configured through the **ipv6 bgp network** command.
Admin state or **Network admin state**	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the **ipv6 bgp network admin-state** command.
Oper state or **Network oper state**	Indicates whether this BGP local network is operationally active or inactive.

output definitions (continued)

Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the **ipv6 bgp network metric** command.
Network local preference	The local preference value for this local BGP network. This value is configured through the **ipv6 bgp network local-preference** command.
Network community string	The community string value for this local BGP network. This value is configured through the **ipv6 bgp network community** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network	.Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

   alaBgpNetwork6RowStatus
```

ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor *ipv6_address*

no ipv6 bgp neighbor *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the new BGP peer.

Defaults

By default, no BGP peers are configured in the BGP network.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

Examples

```
-> ipv6 bgp neighbor 2001::1
-> no ipv6 bgp neighbor 2001::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor admin-state	Enables or disables the BGP peer status.
ipv6 bgp neighbor remote-as	Assigns an AS number to the BGP peer.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
```

ipv6 bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

ipv6 bgp neighbor *ipv6_address* **ttl-security** *num*

ipv6 bgp neighbor *ipv6_address* **no ttl-security**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
num	The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

Defaults

By default GTSM is disabled for communication with the peer.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vise-versa.
- Use the **no** form of this command to disable GTSM.

Examples

```
-> ipv6 bgp neighbor 2001::1 ttl-security 6
-> ipv6 bgp neighbor 2001::1 no ttl-security
```

Release History

Release 8.4.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6TTLSecurityHops
```

ipv6 bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

ipv6 bgp neighbor *ipv6_address* **[activate-ipv4]**

no ipv6 bgp neighbor i*pv6_address* **[activate-ipv4]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the new BGP peer.
activate-ipv4	Enable the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv6 BGP peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 activate-ipv4
-> no ipv6 bgp neighbor 2001::1 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ActivateIpv4
```

ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[activate-ipv6]**

no ipv6 bgp neighbor i*pv6_address* **[activate-ipv6]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ActivateIpv6
```

ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[ipv6-nexthop** *ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the next hop router.

Defaults

By default, the IPv6 next hop address is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeerIpv6NextHop
```

ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[admin-state {enable | disable}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the new BGP peer.
enable	Enables the BGP peer.
disable	Disables the BGP peer.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the **ipv6 bgp neighbor** command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6RowStatus
```

ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer. The peer will be unavailable during this restart.

ipv6 bgp neighbor *ipv6_address* **clear**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - **ipv6 bgp neighbor remote-as**
  - **ipv6 bgp neighbor md5 key**
  - **ipv6 bgp neighbor passive**
  - **ipv6 bgp neighbor ebgp-multihop**
  - **ipv6 bgp neighbor maximum-prefix**
  - **ipv6 bgp neighbor update-source**
  - **ipv6 bgp neighbor next-hop-self**
  - **ipv6 bgp neighbor soft-reconfiguration**
  - **ipv6 bgp neighbor route-reflector-client**
  - **ip bgp confederation neighbor6**
  - **ipv6 bgp neighbor remove-private-as**
  - **ipv6 bgp neighbor update-source-address**
- You do not need to issue the **ipv6 bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor auto-restart	Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Restart
```

ipv6 bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this IPv6 peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

ipv6 bgp neighbor *ipv6_address* **auto-restart**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the neighbor.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

Examples

```
-> ipv6 bgp neighbor 2001::1 auto-restart
-> no ipv6 bgp neighbor 2001::1 auto-restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.
ipv6 bgp neighbor admin-state	Enables or disables the BGP peer status.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6AutoRestart
```

ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

ipv6 bgp neighbor *ipv6_address* **[remote-as** *value***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
value	Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; modified the command.

Related Commands

ip bgp autonomous-system	Sets the AS for the local BGP speaker.

MIB Objects

```

   alaBgpPeer6Addr
   alaBgpPeer6AS
```

ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

ipv6 bgp neighbor *ipv6_address* **[timers** *num num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
num	The KEEPALIVE message interval in seconds.
num	The hold time interval in seconds.

Defaults

parameter	default
num (keepalive)	30 seconds
num (holdtime)	90 seconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor conn-retry-interval	The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6HoldTime
   alaBgpPeer6KeepAlive
```

ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

ipv6 bgp neighbor *ipv6_address* **[maximum-prefix** *num* **[warning-only]]**

no ipv6 bgp neighbor *ipv6_address* **[maximum-prefix** *num* **[warning-only]]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
num	The number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
num	5000

By default, **warning-only** is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

   alaBgpPeer6Addr
   alaBgpPeer6MaxPrefix
   alaBgpPeer6MaxPrefixWarnOnly
```

ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

ipv6 bgp neighbor *ipv6_address* **[next-hop-self]**

no ipv6 bgp neighbor *ipv6_address* **[next-hop-self]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6NextHopSelf
```

ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

ipv6 bgp neighbor *ipv6_address* **[conn-retry-interval** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP neighbor.
num	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
num	120

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ConnRetryInterval
```

ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

ipv6 bgp neighbor *ipv6_address* **[default-originate]**

no ipv6 bgp neighbor *ipv6_address* **[default-originate]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the neighbor.

Defaults

This **default-originate** parameter is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate
-> no ipv6 bgp neighbor 2001::1 default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6DefaultOriginate
```

ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

ipv6 bgp neighbor *ipv6_address* **[update-source** *interface_name***]**

no ipv6 bgp neighbor *ipv6_address* **[update-source** *interface_name***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
interface_name	The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.
ipv6 interface	Configures an IPv6 interface on a VLAN or IPv6 tunnel.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6LocalIntfName
```

ipv6 bgp neighbor ipv4-nexthop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[ipv4-nexthop** *ip_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
ip_address	The 32-bit IP address of the next hop.

Defaults

By default, the IPv4 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 172.22.2.115
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 0.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors .Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6Ipv4NextHop
```

ipv6 bgp neighbor advertisement-interval

Configures the time interval for updates between external IPv6 BGP peers.

ipv6 bgp neighbor *ipv6_address* **advertisement-interval** *value*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the neighbor.
value	An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

parameter	default
value	30

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the **ip bgp autonomous-system**command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external IPv6 BGP peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 advertisement-interval 60
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ipv6 bgp neighbors	.Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6MinRouteAdvertisementInterval
```

ipv6 bgp neighbor description

Configures the IPv6 BGP Peer name.

ipv6 bgp neighbor *ipv6_address* **description** *string*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the neighbor.
string	Peer name (1 - 20 characters).

Defaults

parameter	default
string	peer (ipv6_address)

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format "peer(ipv6-address)" where ipv6-address is the IPv6 address of the BGP peer. For example, the default name of an IPv6 BGP peer at address 2001::1 would be “peer(2001::1)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ipv6 bgp neighbor 2001::1 description "peer6 for building 3"
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6Name
```

ipv6 bgp neighbor ebgp-multihop

Allows external IPV6 BGP peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the IPv6 BGP peers to speak to each other despite the non-BGP router that sits between them.

ipv6 bgp neighbor *ipv6_address* **ebgp-multihop [***ttl***]**

no ipv6 bgp neighbor *ipv6_address* **ebgp-multihop**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
ttl	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

parameter	default
ttl	255

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external IPv6 BGP peer is on a directly connected subnet. This command allows you to configure an external IPv6 BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vise-versa.

Examples

```
-> ipv6 bgp neighbor 2001::1 ebgp-multihop
-> ipv6 bgp neighbor 2001::1 ebg-multihop 50
-> no ipv6 bgp neighbor 2001::1 ebgp-multihop
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.
ipv6 bgp neighbor next-hop-self	Configures router to advertise its peering address as the next hop address for the specified neighbor.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6MultiHop
```

ipv6 bgp neighbor update-source-address

Configures the local IPv6 address from which a BGP peer will be connected if the peer is configured with its link-local address. This local IPv6 address can be configured for internal and external BGP peers.

ipv6 bgp neighbor *ipv6_address* **update-source-address** *ipv6_address*

no ipv6 bgp neighbor *ipv6_address* **update-source-address** *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Defaults

By default, the update-source-address value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The default is restored by using the **no** form of the command or by entering an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2001::1 update-source-address 2401::1
-> no ipv6 bgp neighbor 2001::1 update-source-address
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor update-source	Configures the local IPv6 interface from which a BGP peer will be connected.
show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgPeer6LocalAddr
```

ipv6 bgp neighbor passive

Configures the local IPv6 BGP speaker to wait for this IPv6 BGP peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ipv6 bgp neighbor *ipv6_address* **passive**

no ipv6 bgp neighbor *ipv6_address* **passive**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default, BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 passive
-> no ipv6 bgp neighbor 2001::1 passive
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6Passive
```

ipv6 bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ipv6 bgp neighbor *ipv6_address* **remove-private-as**

no ipv6 bgp neighbor *ipv6_address* **remove-private-as**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default, all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they are intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remove-private-as
-> no ipv6 bgp neighbor 2001::1 remove-private-as
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor remote-as	Assigns an AS number to the BGP peer.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgPeer6RemovePrivateAs
```

ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ipv6 bgp neighbor *ipv6_address* **soft-reconfiguration**

no ipv6 bgp neighbor *ipv6_address* **soft-reconfiguration**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ipv6 bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 soft-reconfiguration
-> no ipv6 bgp neighbor 2001::1 soft-reconfiguration
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor clear	Restarts the IPv6 BGP peer.
ipv6 bgp neighbor clear soft	Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6SoftReconfig
```

ipv6 bgp neighbor stats-clear

Clears the statistics for a peer.

ipv6 bgp neighbor *ipv6_address* **stats-clear**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through **show ipv6 bgp neighbors statistics**.

Examples

```
-> ipv6 bgp neighbor 2001::2 stats-clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors statistics	Displays the neighbor statistics of the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ClearCounter
```

ip bgp confederation neighbor6

Configures this IPv6 BGP peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor6 *ipv6_address*

no ip bgp confederation neighbor6 *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.

Examples

```
-> ip bgp confederation neighbor6 2001::1
-> no ip bgp confederation neighbor6 2001::1
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp confederation identifier	Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeerAddr
   alaBgPeer6ConfedStatus
```

ipv6 bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **in-aspathlist {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Inbound AS path list (0 to 70 characters). This name is case sensitive.
none	Removes this AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name *(***InboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to an inbound policy.
- Use **none** to deassign an AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-aspathlist InBoundASpath
-> ipv6 bgp neighbor 2001::1 in-aspathlist none
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6AspathListIn
```

ipv6 bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **in-communitylist {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Input community list (0 to 70 characters). This name is case sensitive.
none	Removes this community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input community filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-communitylist InboundCommlist
-> ipv6 bgp neighbor 2001::1 in-communitylist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6CommunityListIn
```

ipv6 bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **in-prefixlist {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Input prefix filter list (0 to 70 characters). This name is case sensitive.
none	Removes the prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any inbound IPv4 routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input prefix filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-prefixlist InboundPrefix
-> ipv6 bgp neighbor 2001::1 in-prefixlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6PrefixListIn
```

ipv6 bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **in-prefix6list {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
none	Removes the prefix6 list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the **ip bgp policy prefix6-list** command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of "**none.**"

Examples

```
-> ipv6 bgp neighbor 2001::2 in-prefix6list InboundPrefix6
-> ipv6 bgp neighbor 2001::2 in-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Prefix6ListIn
```

ipv6 bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **out-aspathlist {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- Use **none** to deassign an output AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-aspathlist OutboundASpath
-> ipv6 bgp neighbor 2001::1 out-aspathlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6AspathListOut
```

ipv6 bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **out-communitylist {***string* **| none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Outbound AS path list (0 - 70 characters).
none	Removes the community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- Use **none** to deassign an output community filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-communitylist OutboundCommlist
-> ipv6 bgp neighbor 2001::1 out-communitylist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6CommunityListOut
```

ipv6 bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **out-prefixlist {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Outbound prefix filter list (0 - 70 characters).
none	Removes the prefix filter list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to an outbound policy.
- Use **none** to deassign an output prefix filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-prefixlist OutboundPrefix
-> ipv6 bgp neighbor 2001::1 out-prefixlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6PrefixListOut
```

ipv6 bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

ipv6 bgp neighbor *ipv6_address* **out-prefix6list {***string* | **none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
string	Outbound prefix6 filter list (0 - 70 characters).
none	Removes the prefix6 filter list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the **ip bgp policy prefix6-list** command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of "**none**".

Examples

```
-> ipv6 bgp neighbor 2001::2 out-prefix6list OutboundPrefix6
-> ipv6 bgp neighbor 2001::2 out-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Prefix6ListOut
```

ipv6 bgp neighbor route-map

Assigns a policy map to an IPv6 BGP peer.

ipv6 bgp neighbor *ipv6_address* **route-map {***string* **| none} {in | out}**

no ipv6 bgp neighbor *ipv6_address* **route-map {in | out}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the peer.
string	Policy map name (0 to 70 characters). This name is case sensitive.
none	Deletes the route map if entered rather than a text string.
in	Designates this route map policy as an inbound policy.
out	Designates this route map policy as an outbound policy.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no f**orm of this command to deassign a policy map.
- The policy route map name (**InboundRoute** and **OutboundRoute** in the example below) is created using the **ip bgp policy route-map** command. Any routes from the BGP peer must match this route map filter before being accepted or passed to a policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-map InboundRoute in
-> ipv6 bgp neighbor 2001::1 route-map OutboundRoute out
-> ipv6 bgp neighbor 2001::1 route-map none in
-> no ipv6 bgp neighbor 2001::1 route-map in
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6RouteMapIn
   alaBgpPeer6RouteMapOut
```

ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

ipv6 bgp neighbor *ipv6_address* **clear soft {in | out}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
in	Applies reconfiguration to the inbound policies.
out	Applies reconfiguration to the outbound policies.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in
-> ipv6 bgp neighbor 2001::1 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor soft-reconfiguration	Enables or disables IPv6 BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6ReconfigureInBound
   alaBgpPeer6ReconfigureOutBound
```

ipv6 bgp neighbor route-reflector-client

Configures this IPv6 BGP peer as one of the clients to the local route reflector.

ipv6 bgp neighbor *ipv6_address* **route-reflector-client**

no ipv6 bgp neighbor *ipv6_address* **route-reflector-client**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the command is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of this command to disable IPv6 BGP peer as a client to the local route reflector.
- The IPv6 BGP peers configured using this command become part of the client group. The remaining peers become the members of the non-client group for the local route reflector.
- When IPv6 BGP Peer is configured as route reflector client, all internal BGP speakers in an autonomous system need not be fully meshed. Instead, this route reflector takes the responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-reflector-client
-> no ipv6 bgp neighbor 2001::1 route-reflector-client
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ipv6 bgp neighbors .Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ClientStatus
```

ipv6 bgp neighbor md5 key

Configures an encrypted MD5 signature for TCP sessions with this IPv6 peer.

ipv6 bgp neighbor *ipv6_address* **md5 key {***string* **| none}**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
string	The MD5 public key. The maximum character length is 80.
none	Remove the password and disable authentication.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The password you specified in this command is encrypted before it appears in a saved snapshot file. However, if you view this command in a snapshot file or **boot.cfg** file, the command is displayed in a different syntax as given below:

  ipv6 bgp neighbor *ipv6_address* **md5 key-encrypt** *encrypted_string*

Note. This MD5 password will not work, if this syntax is used to set it.

Examples

```
-> ipv6 bgp neighbor 2001::1 md5 key openpeer2
-> ipv6 bgp neighbor 2001::1 md5 key none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6MD5Key
```

show ipv6 bgp neighbors

Displays the configured IPv6 BGP peers.

show ipv6 bgp neighbors [*ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP neighbor.

Defaults

By default, all the configured IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the details of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors
Legends: Nbr = Neighbor
         As  = Autonomous System
Nbr address              As   Admin state Oper state  BGP Id   Up/Down      BFD

Activate IPv4 unicast             = enabled
```

output definitions

Nbr address or **Neighbor address**	The IPv6 address for this BGP peer. Assign this address through the **ipv6 bgp neighbor** command.
As or **Neighbor autonomous system**	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ipv6 bgp neighbor remote-as** command.
Admin state or **Neighbor Admin state**	Indicates whether this peer has been enabled or disabled through the **ipv6 bgp neighbor admin-state** command.
Oper state or **Neighbor Oper state**	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
BGP Id	The unique BGP identifier of the peer.
Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
Neighbor name	The name assigned to this peer.
Neighbor local address	The interface assigned to this peer. This value is configured through the **ipv6 bgp neighbor update-source** command.
Neighbor EBGP multiHop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the **ipv6 bgp neighbor next-hop-self** command.
Neighbor TTL security	Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multiprotocol IPv4 unicast capable.

output definitions (continued)

Neighbor Ipv4 multicast	Indicates whether this peer is multiprotocol IPv4 multicast capable.
Neighbor type	Indicates whether this peer is internal or external to the AS.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled.
Neighbor route-reflector-client	Indicates whether this peer is a client to the local route reflector, if configured.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the **ipv6 bgp neighbor default-originate** command.
Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the **ipv6 bgp neighbor maximum-prefix** command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the **ipv6 bgp neighbor update-source** command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
Neighbor local port	The TCP port used for the session with this peer.
Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
Advertised Restart Interval	Indicates the restart interval in seconds.
Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates whether or not IPv6 unicast advertisements are enabled. Options include **enabled** or **disabled**.
Configured IPv4 NextHop Address	Specifies the IPv4 nexthop address. This is specified using the **ipv6 bgp neighbor ipv4-nexthop** command.
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the **ipv6 bgp neighbor ipv6-nexthop** command.
Neighbor Ipv6 unicast	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include **enabled** or **disabled**.
BFD Status	Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the **ip|ipv6 bgp neighbor bfd-state** command.
Activate IPv4 unicast	Indicates whether or not IPv4 unicast capability is advertised between the peers. Options include **enabled** or **disabled**.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; ‘Activate IPv4 unicast’ output field added.
Release 8.4.1; ‘Neighbor TTL security’ output field added.

Related Commands

ipv6 bgp neighbor	Creates or deletes a BGP peer relationship using IPv6 addresses
ipv6 bgp neighbor admin-state	Enables or disables the BGP peer status.
ipv6 bgp neighbor ttl-security	Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer.

show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

show ipv6 bgp neighbors statistics [*ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors statistics
Legends: Nbr   = Neighbor
         As    = Autonomous System
         RMSGS = # of received messages
         SMSGS = # of sent messages
         RUPDS = # of Update messages received
         SUPDS = # of Update messages sent
         RNOFY = # of Notify messages received
         SNOFY = # of Notify messages sent
         RPFXS = # of prefixes received
         UPTNS = # of UP transitions
         DNTNS = # of DOWN transitions

Nbr address             As    RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
------------------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1         30    225   260   2     3     0     0     10    1     1
```

output definitions

Nbr address	The IPv6 address for this peer. This value is configured using the **ipv6 bgp neighbor** command.
As	The autonomous system to which this peer belongs. This value is configured using the **ipv6 bgp neighbor remote-as** command.
RMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	Number of unique route prefixes received by this peer.
UPTNS	Number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```
-> show ipv6 bgp neighbors statistics 2001:100:3:4::1
Neighbor address                  = 2001:100:3:4::1,

# of Route Refresh msgs sent      = 0
# of Notification msgs sent       = 0,
Last sent Notification reason     = none [none]
Time last msg was sent            = 00h:00m:18s,
```

output definitions

Neighbor address	The IPv6 address for this peer. This value is configured using the **ipv6 bgp neighbor** command.
# of UP transitions	Number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# **of prefixes rcvd**	Number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	Number of route refresh requests this peer has received. Route refresh requests all routes learned be a peer.
# **of Notification msgs rcvd**	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons: message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgs sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgs sent	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgs sent	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgs sent	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the **Peer last received notification reason** field above.
Time last msg was sent	The duration since a message was sent to this peer.

Release History

Release 7.1.1; command was introduced.

show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

show ipv6 bgp neighbors policy *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all of the configured policies for the router, or the polices configured for a specific BGP IPv6 peer.

Examples

```
-> show ipv6 bgp neighbors policy
Neighbor address  =  2001::1,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,
  Neighbor input aspath-list name     = <none>,
  Neighbor output prefix-list name    = <none>,
  Neighbor input prefix-list name     = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
  Neighbor output prefix6-list name   = <none>,
  Neighbor input prefix6-list name    = <none>
```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the **ipv6 bgp neighbor remote-as** command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the **ipv6 bgp neighbor route-map** command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the **ipv6 bgp neighbor route-map** command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor out-aspathlist** command.

output definitions (continued)

Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor in-aspathlist** command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor out-prefixlist** command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor in-prefixlist** command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor out-communitylist** command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the **ipv6 bgp neighbor in-communitylist** command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the **ipv6 bgp neighbor soft-reconfiguration** command.
Neighbor output prefix6-list name	The outbound prefix6-list policy for the peer. This is configured using the **ipv6 bgp neighbor out-prefix6list** command.
Neighbor input prefix6-list name	The inbound prefix6-list policy for the peer. This is configured using the **ipv6 bgp neighbor in-prefix6list** command.

Release History

Release 7.1.1; command was introduced.

show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

show ipv6 bgp neighbors timers [*ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the timer value for a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors timers
Legends: Nbr     = Neighbor
         As      = Autonomous System
         RtAdv   = Route Advertisement
         Kalive  = Keep Alive (actual)
         Ka(C)   = Configured Keep Alive
Nbr address                        As    Hold  Hold(C) RtAdv Retry Kalive Ka(C)
-----------------------------------+-----+-----+-------+-----+-----+------+-----
2001:100:3:4::1                     30    90    90      30    120   30     30
```

output definitions

Nbr address	The IPv6 address for this BGP peer. Assign this address using the **ipv6 bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned using the **ipv6 bgp neighbor remote-as** command.
Hold	The actual negotiated hold time value.
Hold (C)	The hold time value. This value is configured using the **ipv6 bgp neighbor timers** command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the **ipv6 bgp neighbor timers** command.

output definitions (continued)

Kalive	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka (C)	The KEEPALIVE interval as configured using the **ipv6 bgp neighbor timers** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp statistics	Displays BGP global statistics.

   alaBgpPeer6ConnRetryInterval
   alaBgpPeer6MinRouteAdvertisementInterval
   alaBgpPeer6HoldTime
```

30 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

Filename ALCATEL-IND1-SLB-MIB.mib
Module: alcatelIND1SLBMIB

A summary of available commands is listed here:

Global SLB Commands	**ip slb admin-state** **ip slb reset statistics** **show ip slb**
SLB Cluster Commands	**ip slb cluster** **ip slb cluster admin-state** **ip slb cluster ping period** **ip slb cluster ping timeout** **ip slb cluster ping retries** **ip slb cluster probe** **show ip slb clusters** **show ip slb cluster**
SLB Server Commands	**ip slb server ip cluster** **ip slb server ip cluster probe** **show ip slb cluster server** **show ip slb servers**
SLB Probe Commands	**ip slb probe** **ip slb probe timeout** **ip slb probe period** **ip slb probe port** **ip slb probe retries** **ip slb probe username** **ip slb probe password** **ip slb probe url** **ip slb probe status** **ip slb probe send** **ip slb probe expect** **show ip slb probes**

ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

ip slb admin-state {enable | disable}

Syntax Definitions

enable	Enables the administrative status for Server Load Balancing on a switch.
disable	Disables the administrative status for Server Load Balancing on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

Examples

```
-> ip slb admin-state enable
-> ip slb admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb	Displays the status of Server Load Balancing on a switch.
ip slb cluster	Configures a Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbFeatureGroup
   slbAdminStatus
```

ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

ip slb reset statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

Examples

```
-> ip slb reset statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

MIB Objects

```
slbFeatureGroup
   slbResetStatistics
```

ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *name* **{vip** *ip_address* **| condition** *string***} [l3 | l2]**

no ip slb cluster *name*

Syntax Definitions

name	The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).
ip_address	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
string	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
l3	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
l2	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the **condition** parameter.

Defaults

parameter	default
l3 | l2	**l3**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers. In addition, do not specify a VIP address that is already in use by an MCLAG VIP interface. The SLB VIP and MCLAG VIP both provide a common IP address but for different entities and should not share the same IP address.
- Specifying the **l3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

Note. It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond l2
-> ip slb cluster cluster_2 condition slb_cond l3
-> no ip slb cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterName
   slbClusterVIP
   slbClusterRowStatus
   slbClusterPackets
   slbClusterCondition
   slbClusterType
```

ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *cluster_name* **admin-state {enable | disable}**

Syntax Definitions

cluster_name	The name of an existing Server Load Balancing cluster.
enable	Administratively enables a Server Load Balancing cluster on a switch.
disable	Administratively disables a Server Load Balancing cluster on a switch.

Defaults

By default, a cluster is administratively enabled when the cluster is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster	Configures Server Load Balancing clusters.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterAdminStatus
```

ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping period** *seconds*

Syntax Definitions

cluster_name	The name of the Server Load Balancing cluster.
seconds	The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the **ip slb cluster ping timeout** command to modify the ping timeout value.

Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping timeout	Modifies the ping timeout value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable
   slbClusterPingPeriod
```

ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

ip slb cluster *cluster_name* **ping timeout** *milliseconds*

Syntax Definitions

cluster_name	The name of the Server Load Balancing cluster.
milliseconds	The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

Defaults

parameter	default
milliseconds	3000

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **ip slb cluster ping period** command to modify the ping period value.

Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping period	Modifies the ping period value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable
   slbClusterPingTimeout
```

ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping retries** *count*

Syntax Definitions

cluster_name	The name of the Server Load Balancing cluster.
count	The number of ping retries.

Defaults

parameter	default
count	3

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping period	Modifies the ping period value.
ip slb cluster ping timeout	Modifies the ping timeout value.

MIB Objects

```
slbClusterTable
   slbClusterPingRetries
```

ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **probe** *probe_name*

Syntax Definitions

cluster_name	The name of the Server Load Balancing cluster.
probe_name	The name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

You must create the probe with the **ip slb probe** before you can use this command.

Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
ip slb probe	Configures and deletes SLB probes.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterProbeName
```

ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

ip slb server ip *ip_address* **cluster** *cluster_name* **[admin-state {enable | disable}] [weight** *weight***]**

no ip slb server ip *ip_address* **cluster** *cluster_name*

Syntax Definitions

ip_address	The IP address for the physical server.
cluster_name	The name of an existing Server Load Balancing cluster.
enable	Enables a server.
disable	Disables a server.
weight	Specifies the weight of the server.

Defaults

parameter	default
enable | disable	**enable**
weight	**1**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the weight parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable
   slbServerRowStatus
   slbServerAdminStatus
   slbServerAdminWeight
```

ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

ip slb server ip *ip_address* **cluster** *cluster_name* **probe** *probe_name*

Syntax Definitions

ip_address	The IP address for the physical server.
cluster_name	The name of the Server Load Balancing cluster.
probe_name	The name of the Server Load Balancing probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

You must create the probe with the **ip slb probe** before you can use this command.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb probe	Configures and deletes SLB probes.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable
   slbServerProbeName
```

ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}**

no ip slb probe *probe_name*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **no** form of this command to delete an SLB probe.

Examples

```
-> ip slb probe mail_server_probe smtp
-> no ip slb probe mail_server_probe
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
```

ip slb probe timeout

Configures the amount of time to wait for Server Load Balancing (SLB) probe answers.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} timeout** *seconds*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
seconds	Specifies the timeout in seconds.

Defaults

parameter	default
seconds	3000

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe mail_server smtp timeout 12000
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeTimeout
```

ip slb probe period

Configures the length of time between each SLB probe to check the health of the servers.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} period** *seconds*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
seconds	Specifies the length of time for the SLB probe period.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http period 120
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbePeriod
```

ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} port** *port_number*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
port_number	Specifies the TDP/UDP port number.

Defaults

parameter	default
port_number	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe mis_server udp port 200
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbePort
```

ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} retries** *retries*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
retries	Specifies the number of retries.

Defaults

parameter	default
retries	3

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe mail_server smtp retries 5
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeRetries
```

ip slb probe username

Configures a user name that is sent to a server as credentials for an HTTP GET operation to verify the health of the server.

ip slb probe *probe_name* **{http | https} username** *user_name*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
user_name	Specifies user name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http username subnet1
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpUsername
```

ip slb probe password

Configures a password that is sent to a server as credentials for an HTTP GET to verify the health of the server.

ip slb probe *probe_name* **{http | https} password** *password*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
password	Specifies the password.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The password is encrypted in the configuration file so that it is not readable.

Examples

```
-> ip slb probe web_server http password h1f45xc
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpPassword
```

ip slb probe url

Configures a URL that is sent to a server for an HTTP GET to verify the health of the server.

ip slb probe *probe_name* **{http | https} url** *url*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
url	Specifies the URL of the server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http url pub/index.html
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpUrl
```

ip slb probe status

Configures the expected status returned from an HTTP GET to verify the health of a server.

ip slb probe *probe_name* **{http | https} status** *status_value*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
status_value	Specifies the expected status returned.

Defaults

parameter	default
status_value	200

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http status 404
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbePeriod
   slbProbeHttpStatus
```

ip slb probe send

Configures an ASCII string that is sent to a server to invoke a server response and verify the health of the server.

ip slb probe *probe_name* **{tcp | udp} send** *send_string*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
send_string	Specifies the ASCII string sent to a server to invoke a response.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

NA

Examples

```
-> ip slb probe web_server tcp send test
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeSend
```

ip slb probe expect

Configures an ASCII string used to compare a response from a server to verify the health of the server.

ip slb probe *probe_name* **{http | https | tcp | udp} expect** *expect_string*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
expect_string	Specifies the ASCII string used to compare a response from a server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http expect test
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeExpect
```

show ip slb

Displays the status of Server Load Balancing on a switch.

show ip slb

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ip slb

Admin status                    : Enabled,
Operational status              : In Service,
Number of clusters              = 3
```

Output fields are described here:

output definitions

Admin status	The current administrative status of Server Load Balancing (SLB) on this switch (**Enabled** or **Disabled**).
Operational status	The current operational status of Server Load Balancing (SLB) on this switch, which is either **In service** (at least one SLB cluster is in service) or **Out of service** (all SLB clusters are out of service).
Number of clusters	The total number of Server Load Balancing (SLB) clusters on this switch.

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb servers	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.
show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
show ip slb cluster server	Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

MIB Objects

```
slbFeature
   slbAdminStatus
   slbOperStatus
   slbClustersCount
```

show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

show ip slb clusters [statistics]

Syntax Definitions

statistics	Displays SLB statistics for QoS policy condition clusters.

Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

Examples

```
-> show ip slb clusters
                                Admin    Operational         #     %
Cluster Name     VIP/COND       Status   Status              Srv   Avail
-----------------+--------------+--------+-------------------+-----+---------
WorldWideWeb     128.241.130.204  Enabled  In Service          3     95
Intranet         128.241.130.205  Enabled  In Service          2     100
FileTransfer     128.241.130.206  Enabled  Out of Service      2     50
```

Output fields are described here:

output definitions

Cluster Name	The name of the SLB cluster.
VIP/COND	The virtual IP (VIP) address or the policy condition name for the SLB cluster.
Admin Status	The administrative status of the SLB cluster (**Enabled** or **Disabled**).
Operational Status	The operational status of the SLB cluster; **In Service** (at least one physical server is operational in the cluster) or **Out of Service**.
# Srv	The total number of physical servers that belong to the SLB cluster.
% Avail	The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.

```
-> show ip slb clusters statistics

                         Admin    Operational
Cluster Name             Status   Status               Count
-----------------------+--------+--------------------+--------
Cluster1                Enabled  In Service           4 Servers
Cluster2                Enabled  In Service           4 Servers

Dst IP 101.113.113.1/255.255.255.255             4503911
Src IP 202.202.1.0/255.255.255.0                 6527831
Src Port 2/49
```

output definitions

Cluster Name	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
Admin Status	The administrative state of this physical server (**Enabled** or **Disabled)**.
Operational Status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Count	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.
Dst	The destination Virtual IP address assigned to the cluster.
Src	Source IP address assigned to the cluster.
Src Port	Source slot and port number of the SLB cluster.

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb reset statistics	Resets SLB statistics for all clusters.
show ip slb cluster	Displays detailed status and configuration information for a single SLB cluster.
show ip slb servers	Displays the status of all physical servers belonging to each SLB cluster on a switch.
show ip slb cluster server	Displays detailed status and configuration information for a single physical server in an SLB cluster.

MIB Objects

```

show ip slb cluster

Displays detailed statistics and configuration information and operational status for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

show ip slb cluster *name* **[statistics]**

Syntax Definitions

name	Specifies the name of the SLB cluster.
statistics	Displays SLB statistics for the specified cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

Examples

```
-> show ip slb cluster Intranet

Cluster Intranet
  VIP                           : 128.241.130.204,

  Admin status                  : Enabled,
  Operational status            : In Service,
  Ping period (seconds)         = 60,
  Ping timeout (milliseconds)   = 3000,
  Ping retries                  = 3,
  Probe                         = None,
  Number of packets             = 25346,
  Number of servers             = 3
    Server 128.241.130.107
      Admin status = Enabled, Operational status = In Service,
      Weight = 4, Availability (%) =   0
    Server 128.241.130.117
      Admin status = Enabled, Operational status = Discovery,
      Weight = 6, Availability (%) =   0
    Server 128.241.130.127
      Admin status = Enabled, Operational status = Discovery,
      Weight = 1, Availability (%) =   0
```

output definitions

Cluster	The name of this Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Type	The classifier for the hypothetical packet, which can be **L2** or **L3**.
Admin status	The current administrative status of this Server Load Balancing (SLB) cluster (**Enabled** or **Disabled**).
Operational status	The current operational status of this Server Load Balancing (SLB) cluster, which is **In Service** (at least one physical server is operational in the cluster) or **Out of Service**.
Ping period (seconds)	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
Ping timeout (milliseconds)	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
Ping retries	The number of ping retries that this Server Load Balancing (SLB) cluster executes before switching the status to **No answer**.
Probe	The probe configured for this cluster.
Number of packets	The number of packets balanced for this Server Load Balancing (SLB) cluster.
Number of servers	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin Status	The administrative state of this physical server (**Enabled** or **Disabled)**.
Operational Status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Availability (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.

show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

show ip slb cluster *name* **server** *ip_address*

Syntax Definitions

name	Specifies the name of the SLB cluster.
ip_address	Specifies the IP address for the physical server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specifying a value for the *name* and *ip_address* parameters is required.

Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster cl1
  VIP 128.220.40.205
    Server 128.220.40.4
      Admin status                              : Enabled,
      Oper status                               : In Service,
      Probe                                     = phttp,
      Availability time (%)                     = 95,
      Ping failures                             = 0,
      Last ping round trip time (milliseconds) = 20,
      Probe status                              = ,
```

Output fields are described here:

output definitions

Cluster	The name of the Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin status	The current administrative status of this physical server (**Enabled** or **Disabled**).

output definitions (continued)

Oper status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Probe	The name of the probe configured for this server.
Availability time (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.
Ping failures	The total number of pings that have failed on this physical server.
Last ping round trip time (milliseconds)	The total amount of time (in milliseconds) measured for the last valid ping to this physical server to make a round trip.
Probe status	The status of the probe configured for this server.

Release History

Release 7.1.1; command introduced.

Related Commands

128.220.40.7         FileTransfer   Disabled  Disabled        ---
128.220.40.1         WorldWideWeb   Enabled   In Service      100
128.220.40.2         WorldWideWeb   Enabled   Discovery       50
128.220.40.3         WorldWideWeb   Enabled   Link Down       75
```

Output fields are described here:

output definitions

IP addr	The IP address for this physical server.
Cluster Name	The name of the Server Load Balancing (SLB) cluster to which this physical server belongs.
Admin Status	The current administrative status of this physical server (**Enabled** or **Disabled**).

output definitions (continued)

Operational Status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
% Avail	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb cluster server	Displays the detailed status and configuration of a single physical server in a Server Load Balancing cluster.
show ip slb clusters	Displays detailed status and configuration information for all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster.

show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

show ip slb probes [*probe_name***]**

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

Examples

No probe name is specified:

```
-> show ip slb probes

Probe Name              Period  Retries Timeout Method
------------------------+-------+-------+--------+------
web_server                60000       3   12000   HTTP
mail_server               60000       3    3000   SMTP
mis_servers             3600000       5   24000   Ping
```

Output fields are described here:

output definitions

Probe Name	The user-specified name of the probe.
Period	The period (in seconds) to check the health of servers.
Retries	The number of probe retries before deciding that a server is out of service.
Timeout	The timeout (in seconds) used to wait for probe answers.
Method	The type of probe.

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server

Probe mail_server
  Type                          = SMTP,
  Period (seconds)              = 60,
  Timeout (milliseconds)        = 3000,
  Retries                       = 3,
  Port                          = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp

Probe phttp
  Type                          = HTTP,
  Period (seconds)              = 60,
  Timeout (milliseconds)        = 3000,
  Retries                       = 3,
  Port                          = 0,
  Username                      = ,
  Password                      = ,
  Expect                        = ,
  Status                        = 200,
  URL                           = /,
```

Output fields are described here:

output definitions

Probe	The user-specified name of the probe.
Type	The type of probe.
Period	The period (in seconds) to check the health of servers.
Timeout	The timeout (in seconds) used to wait for probe answers.
Retries	The number of probe retries before deciding that a server is out of service.
Port	The TCP/UDP port on which the probe is sent.
Username	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
Password	The configured password for the probe.
Expect	The configured ASCII string used to compare a response from a server to verify the health of the server.
Status	The expected status returned from an HTTP GET to verify the health of a server.
URL	The configured URL sent to a server for an HTTP GET to verify the health of the server.

31 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

The OmniSwitch IPMS software is compatible with the following RFCs:

RFC 1112 — Host Extensions for IP Multicasting
RFC 2236 — Internet Group Management Protocol, Version 2
RFC 2933 — Internet Group Management Protocol MIB
RFC 3376 — Internet Group Management Protocol, Version 3

The OmniSwitch IPv6MS software is compatible with the following RFCs:

RFC 2710 — Multicast Listener Discovery for IPv6
RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS and IPv6MS commands is as follows:

Filename: ALCATEL-IND1-IPMS-MIB.mib
Module: alcatelIND1IpmsMIB

The following table summarizes the available IP and IPv6 multicast commands:

ip multicast admin-state	**ipv6 multicast admin-state**
ip multicast flood-unknown	**ipv6 multicast flood-unknown**
ip multicast version	**ipv6 multicast version**
ip multicast port max-group	**ipv6 multicast port max-group**
ip multicast max-group	**ipv6 multicast max-group**
ip multicast static-neighbor	**ipv6 multicast static-neighbor**
ip multicast static-querier	**ipv6 multicast static-querier**
ip multicast static-group	**ipv6 multicast static-group**
ip multicast query-interval	**ipv6 multicast query-interval**
ip multicast last-member-query-interval	**ipv6 multicast last-member-query-interval**

ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] admin-state [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] admin-state**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IP Multicast Switching.
disable	Disable IP Multicast Switching.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration of an IP multicast routing protocol on an IP interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IP Multicast routing protocol already running on the switch, then the **ip multicast admin-state** or the **ipv6 multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If IPMS is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

  Note. Globally enabling the IPMS status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPMS must be explicitly enabled or disabled for each SPB service. However, globally disabling IPMS for all SPB services is supported.

- Use the **no** form of this command to restore the IP Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> no ip multicast admin-state
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 3-5 admin-state disable
-> no ip multicast vlan 2 admin-state
-> no ip multicast vlan 3-5 admin-state
-> ip multicast service 10 admin-state enable
-> ip multicast service 11-15 admin-state disable
-> no ip multicast service 10 admin-state
-> no ip multicast service 11-15 admin-state
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

```

ip multicast flood-unknown

Enables or disables the flooding unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port. there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] flood-unknown [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] flood-unknown**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable flooding of unknown traffic until it is learned.
disable	Disable flooding of unknown traffic.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- If the flooding of unknown traffic is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- On an OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900:
  - The flood unknown behavior configured for any VLAN is enforced only on that VLAN. However, when the behavior is configured with the IPv6 multicast version of this command (**ipv6 multicast flood-unknown**) for any VLAN, the flood unknown behavior is enforced globally across all VLANs.
  - IPv4 multicast snooping for VLANs does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded IPv4 addresses.
  - When IPv4 multicast snooping is enabled for any service, the flooding of unknown multicast traffic

is unconditionally enforced for all snooping services; this is the only supported flood unknown behavior for services.

– IPv4 multicast snooping for services does not snoop MAC addresses that fall within the range of 01:00:5e:00:00:00/40 and 33:33:00:00:00:00/40 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded MAC addresses.

- On an OmniSwitch 9900, IPv4 multicast snooping for VLANs or services does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to these excluded IPv4 addresses.
- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable
-> no ip multicast flood-unknown
-> ip multicast vlan 100 flood-unknown enable
-> ip multicast vlan 101-105 flood-unknown enable
-> ip multicast vlan 100 flood-unknown disable
-> no ip multicast vlan 100 flood-unknown
-> no ip multicast vlan 101-105 flood-unknown
-> ip multicast service 10 flood-unknown enable
-> ip multicast service 11-15 flood-unknown enable
-> ip multicast service 10 flood-unknown disable
-> no ip multicast service 10 flood-unknown
-> no ip multicast service 11-15 flood-unknown
```

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigFloodUnknown
```

ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] version [***version***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] version**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
version	Default IGMP protocol version to run. Valid range is 1–3.

Defaults

parameter	default
version	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs or SPB services.
- If the default IGMP protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- Use the **no** form of this command to restore the IGMP multicast version back to the default value (version 2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast version 0).

Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> no ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 3-5 version 3
-> ip multicast vlan 2 version 0
-> no ip multicast vlan 2 version
```

```
-> no ip multicast vlan 3-5 version
-> ip multicast service 2 version 3
-> ip multicast service 3-5 version 3
-> ip multicast service 2 version 0
-> no ip multicast service 2 version
-> no ip multicast service 3-5 version
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigVersion
```

ip multicast port max-group

Configures the maximum group limit learned per port or per Service Access Point (SAP) port. The group limit is applicable to all VLAN instances associated with the specified port or all Shortest Path Bridging (SPB) service instances associated with the specified SAP port.

ip multicast {port *chassis/slot/port* **| sap port** *sap_id***} max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

chassis	The chassis identifier.
slot|port	The slot and port number (3/1).
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
num	The maximum IGMP group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

Defaults

By default, the maximum group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
  - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
  - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast sap port 1/1/23:10 max-group 10 action drop**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is set to drop.
- Configuring a maximum group limit is allowed even when the IP multicast status is disabled.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

Examples

```
-> ip multicast port 1/1/12 max-group 10 action drop
-> ip multicast port 1/1/14 max-group 20 action replace
-> ip multicast port 1/1/14 max-group

-> ip multicast sap port 1/1/23:10 max-group 10 action drop
-> ip multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ip multicast sap port 1/1/16:20.200 max-group
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.
show ip multicast port	Displays the maximum group configuration for VLAN ports or SPB service SAP ports.

MIB Objects

```
alaIpmsIntfTable
   alaIpmsIntfConfigType
   alaIpmsIntfAddressType
   alaIpmsIntfMaxGroupLimit
   alaIpmsIntfMaxGroupExceedAction
```

ip multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

ip multicast [vlan *vlan_id***[-***vlan_id2***]** | **service** *service_id***[-***service_id2***]] max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
num	The maximum IGMP group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the maximum group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per SAP port on a service. The limit is applied to each SAP port that is a member of the given SPB service.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or SAP port/SPB service instance
- If the *num* and **action** parameters are not specified, then the limit is removed.

- The maximum group configuration on a VLAN or SPB service will override the global configuration.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is to drop incoming membership requests.

Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 20 max-group action drop
-> ip multicast vlan 11-15 max-group 10 action replace
-> ip multicast vlan 10 max-group
-> ip multicast vlan 11-15 max-group
-> ip multicast service 5 max-group 10 action drop
-> ip multicast service 20 max-group action drop
-> ip multicast service 10-15 max-group 10 action replace
-> ip multicast service 5 max-group
-> ip multicast service 10-15 max-group
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.
show ip multicast group	Displays the maximum group configuration for all port or VLAN instances of a given port or all ports.

   alaIpmsConfigMaxGroupExceedAction
```

ip multicast static-neighbor

Creates a static IGMP neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-neighbor vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ip multicast static-neighbor service *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ip multicast static-neighbor vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ip multicast static-neighbor service *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

vlan_id	VLAN to include as a static IGMP neighbor.
chassis	The chassis identifier.
slot|*port*	The slot and port number to configure as a static IGMP neighbor.
agg_id	The link aggregate ID number to configure as a static IGMP neighbor.
service_id	SPB service ID to include as a static IGMP neighbor. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic *and* IPv4 multicast traffic.
- To create an IGMP static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-neighbor vlan 2 linkagg 7** or ip **multicast static-neighbor service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-neighbor service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/5
-> no ip multicast static-neighbor vlan 4 port 1/1/5
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7

-> ip multicast static-neighbor service 10 sap port 1/1/2:100
-> no ip multicast static-neighbor service 10 sap port 1/1/2:100
-> ip multicast static-neighbor service 10 sap linkagg 10:100
-> no ip multicast static-neighbor service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was introduced.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

show ip multicast neighbor	Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

   alaIpmsStaticNeighborRowStatus
```

ip multicast static-querier

Creates a static IGMP querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-querier vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ip multicast static-querier service *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ip multicast static-querier vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ip multicast static-querier service *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

vlan_id	VLAN to include as a static IGMP querier.
chassis	The chassis identifier.
slot|*port*	The slot and port number to configure as a static IGMP querier.
agg_id	The link aggregate ID number to configure as a static IGMP querier.
service_id	SPB service ID to include as a static IGMP querier. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic.
- To create an IGMP static querier entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-querier vlan 2 linkagg 7** or **ip multicast static-querier service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-querier service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ip multicast static-querier vlan 4 port 1/1/2
-> no ip multicast static-querier vlan 4 port 1/1/2
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7

-> ip multicast static-querier service 10 sap port 1/1/2:100
-> no ip multicast static-querier service 10 sap port 1/1/2:100
-> ip multicast static-querier service 10 sap linkagg 10:100
-> no ip multicast static-querier service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

show ip multicast querier	Displays the IGMP querier table entries of IP Multicast Switching and Routing.

MIB Objects

```
alaIpmsStaticQuerierTable
   alaIpmsStaticQuerierConfigType
   alaIpmsStaticQuerierAddressType

   alaIpmsStaticQuerierIfIndex
   alaIpmsStaticQuerierSubValue
   alaIpmsStaticQuerierRowStatus
```

ip multicast static-group

Creates a static IGMP group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-group *ip_address* **vlan** *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ip multicast static-group *ip_address* **service** *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ip multicast static-group *ip_address* **vlan** *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ip multicast static-group *ip_address* **service** *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

ip_address	The IP address of the multicast group.
vlan_id	VLAN to include as a static IGMP group.
chassis	The chassis identifier.
slot|port	The slot and port number to configure as a static IGMP group.
agg_id	The link aggregate ID number to configure as a static IGMP group.
service_id	SPB service ID to include as a static IGMP group. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- To create an IGMP static group entry on a link aggregate, use the **linkagg** parameter (for example, ip multicast static-group 225.0.0.1 vlan 2 linkagg 7 or ip multicast static-group 225.0.0.1 service 10 sap linkagg 10:100).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7

-> ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

show ip multicast group	Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

MIB Objects

```

   alaIpmsStaticMemberConfigType
   alaIpmsStaticMemberAddressType
   alaIpmsStaticMemberValue
   alaIpmsStaticMemberIfIndex
   alaIpmsStaticMemberSubValue
   alaIpmsStaticMemberGroupAddress
   alaIpmsStaticMemberRowStatus
```

ip multicast query-interval

Sets the IGMP query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***] query-interval [***seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***] query-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	IGMP query interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	125

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP query interval to use.
- Use the **no** form of this command to restore the IGMP query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast query-interval 0**).

Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> no ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
```

```
-> ip multicast vlan 3-5 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> no ip multicast vlan 2 query-interval
-> no ip multicast vlan 3-5 query-interval
-> ip multicast service 2 query-interval 100
-> ip multicast service 3-5 query-interval 100
-> ip multicast service 2 query-interval 0
-> no ip multicast service 2 query-interval
-> no ip multicast service 3-5 query-interval
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

```

ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] last-member-query-interval [***tenths_of_seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] last-member-query-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
tenths_of_seconds	IGMP last member query interval in tenths of seconds. The valid range is 1–65535.

Defaults

parameter	default
tenths_of_seconds	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- Use the **no** form of this command to restore the IGMP last member query interval back to the default value (10 tenth-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast last-member-query-interval 0**).

Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> no ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
```

```
-> ip multicast vlan 3-5 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> no ip multicast vlan 2 last-member-query-interval
-> no ip multicast vlan 3-5 last-member-query-interval
-> ip multicast service 2 last-member-query-interval 22
-> ip multicast service 3-5 last-member-query-interval 22
-> ip multicast service 2 last-member-query-interval 0
-> no ip multicast service 2 last-member-query-interval
-> no ip multicast service 3-5 last-member-query-interval
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

```

ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] query-response-interval [***tenths_of_seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] query-response-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
tenths_of_seconds	IGMP query response interval in tenths of seconds. The valid range is 1–65535.

Defaults

parameter	default
tenths_of_seconds	100

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- Use the **no** form of this command to restore the IGMP query response interval back to the default value (100 tenths-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip **multicast query-response-interval 0**).

Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> no ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 3-5 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
```

```
-> no ip multicast vlan 2 query-response-interval
-> no ip multicast vlan 3-5 query-response-interval
-> ip multicast service 2 query-response-interval 300
-> ip multicast service 3-5 query-response-interval 300
-> ip multicast service 2 query-response-interval 0
-> no ip multicast service 2 query-response-interval
-> no ip multicast service 3-5 query-response-interval
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

```

ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] unsolicited-report-interval [***seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] unsolicited-report-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	IGMP unsolicited report interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- Use the **no** form of this command to restore the IGMP unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast unsolicited-report-interval 0**).

Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> no ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 3-5 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
```

```
-> no ip multicast vlan 2 unsolicited-report-interval
-> no ip multicast vlan 3-5 unsolicited-report-interval
-> ip multicast service 2 unsolicited-report-interval 300
-> ip multicast service 3-5 unsolicited-report-interval 300
-> ip multicast service 2 unsolicited-report-interval 0
-> no ip multicast service 2 unsolicited-report-interval
-> no ip multicast service 3-5 unsolicited-report-interval
```

Release History

ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] router-timeout [***seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] router-timeout**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	IGMP router timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP router timeout back to the default value (90 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast router-timeout 0**).

Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> no ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 3-5 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> no ip multicast vlan 2 router-timeout
-> no ip multicast vlan 3-5 router-timeout
-> ip multicast service 2 router-timeout 100
-> ip multicast service 3-5 router-timeout 100
```

```
-> ip multicast service 2 router-timeout 0
-> no ip multicast service 2 router-timeout
-> no ip multicast servicee 3-5 router-timeout
```

Release History

```

ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] source-timeout [***seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] source-timeout**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	IGMP source timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast source-timeout 0**).

Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> no ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 3-5 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> no ip multicast vlan 2 source-timeout
-> no ip multicast vlan 3-5 source-timeout 100
-> ip multicast service 2 source-timeout 100
-> ip multicast service 3-5 source-timeout 100
```

```
-> ip multicast service 2 source-timeout 0
-> no ip multicast service 2 source-timeout
-> no ip multicast service 3-5 source-timeout
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

```

ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] querying {enable | disable} [static-source-ip** *ip_address***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***]] querying [static-source-ip]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
enable	Enable IGMP querying.
disable	Disable IGMP querying.
ip_address	A static source IPv4 address to use for IGMP querying. *This parameter is currently not supported.*

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- Use the **no** form of this command to restore the IGMP querying status to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> no ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 3-5 querying disable
-> no ip multicast vlan 2 querying
-> no ip multicast vlan 3-5 querying
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1.R02; **static-source-ip** parameter added.

   alaIpmsConfigQueryingStaticSourceAddress
```

ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] robustness [***robustness***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] robustness**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
robustness	IGMP robustness variable. Valid range is 1–7.

Defaults

parameter	default
robustness	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs or SPB services.
- If the IGMP robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP robustness variable to use.
- Use the **no** form of this command to restore the IGMP robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast robustness 0).

Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> no ip multicast robustness
-> ip multicast vlan 2 robustness 3
```

```
-> ip multicast vlan 3-5 robustness 3
-> ip multicast vlan 2 robustness 0
-> no ip multicast vlan 2 robustness
-> no ip multicast vlan 3-5 robustness
-> ip multicast service 2 robustness 3
-> ip multicast service 3-5 robustness 3
-> ip multicast service 2 robustness 0
-> no ip multicast service 2 robustness
-> no ip multicast service 3-5 robustness
```

Release History

```

ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing {enable | disable}**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, OmniSwitch 6900-V72.*
enable	Enable IGMP spoofing.
disable	Disable IGMP spoofing.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, the source IP address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IP address using the **ip multicast spoofing static-source-ip** command to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> no ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
```

```
-> ip multicast vlan 3-5 spoofing disable
-> no ip multicast vlan 2 spoofing
-> no ip multicast vlan 3-5 spoofing
-> ip multicast service 2 spoofing enable
-> ip multicast service 3-5 spoofing disable
-> no ip multicast service 2 spoofing
-> no ip multicast service 3-5 spoofing
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

```

ip multicast spoofing static-source-ip

Configures an IGMP static spoofing address on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing static-source-ip** *ip_address*

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing static-source-ip**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
ip_address	A static source IPv4 address to use for spoofing.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, a source IP address is not specified when spoofing is enabled. As a result, the switch will automatically use the address of the IP interface associated with the LAN. If there is no IP interface address to use, the switch will then use the Loopback0 interface address associated with the current VRF instance.
- Use this command to optionally configure a static source IP address to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

Examples

```
-> ip multicast spoofing static-source-ip 10.2.2.1
-> no ip multicast spoofing static-source-ip
-> ip multicast vlan 2 spoofing static-source-ip 10.2.2.1
-> ip multicast vlan 3-5 spoofing static-source-ip 10.2.2.1
-> no ip multicast vlan 2 spoofing static-source-ip
-> no ip multicast vlan 3-5 spoofing static-source-ip
-> ip multicast service 2 spoofing static-source-ip 11.2.2.1
```

```
-> no ip multicast service 2 spoofing static-source-ip
-> ip multicast service 3-5 spoofing static-source-ip 11.2.2.1
-> no ip multicast service 3-5 spoofing static-source-ip
```

Release History

Release 8.3.1.R02; command was added.
Release 8.4.1.R02; **service** parameter added.

ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] zapping [{enable | disable}]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zapping**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IGMP zapping.
disable	Disable IGMP zapping.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the IGMP zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> no ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 3-5 zapping disable
-> no ip multicast vlan 2 zapping
-> no ip multicast vlan 3-5 zapping
-> ip multicast service 2 zapping enable
```

```
-> ip multicast service 3-5 zapping disable
-> no ip multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

Release History

ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] querier-forwarding [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] querier-forwarding**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IGMP querier forwarding.
disable	Disable IGMP querier forwarding.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the IGMP querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> no ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 3-5 querier-forwarding disable
-> no ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 3-5 querier-forwarding
-> ip multicast service 2 querier-forwarding enable
```

```
-> ip multicast service 3-5 querier-forwarding disable
-> no ip multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```

```

ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] proxying [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] proxying**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IGMP proxying.
disable	Disable IGMP proxying.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported IGMP packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported IGMP packets will be sent using 0.0.0.0 for the IPv4 source address.
- Use the **no** form of this command to restore the IGMP proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> no ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 3-5 proxying disable
-> no ip multicast vlan 2 proxying
-> no ip multicast vlan 3-5 proxying
-> ip multicast service 2 proxying enable
-> ip multicast service 3-5 proxying disable
-> no ip multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```

ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host Reports and Leave messages are sent.

ip multicast [vlan *vlan_id***[-***vlan_id2***] helper-address** *ip_address*

no ip multicast [vlan *vlan_id***[-***vlan_id2***] helper-address**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
ip_address	The IP address of the relay host.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- An operational IPv4 interface is required for the receiving LAN before any IGMP Reports and Leave messages can be relayed.
- Configuring a destination IP helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (IP address 0.0.0.0) on the system. When the IP address is set to 0.0.0.0, the IPMS reporting feature is disabled.

Examples

```
-> ip multicast helper-address 10.1.1.198
-> no ip multicast helper-address
-> ip multicast vlan 2 helper-address 10.1.1.198
-> ip multicast vlan 3-5 helper-address 10.1.1.198
-> no ip multicast vlan 2 helper-address
-> no ip multicast vlan 3-5 helper-address
```

Release History

```

ip multicast zero-based-query

Configures the use of an all-zero source IPv4 address for IGMP query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zero-based-query [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zero-based-query**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IGMP zero-based querying.
disable	Disable IGMP zero-based querying.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The IGMP zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the IGMP zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast zero-based-query enable
-> ip multicast zero-based-query disable
-> no ip multicast zero-based-query
-> ip multicast vlan 2 zero-based-query enable
-> ip multicast vlan 3-5 zero-based-query disable
-> no ip multicast vlan 2 zero-based-query
-> no ip multicast vlan 3-5 zero-based-query
-> ip multicast service 10 zero-based-query enable
-> ip multicast service 10-15 zero-based-query disable
-> no ip multicast service 10 zero-based-query
```

```
-> no ip multicast service 10-15 zero-based-query disable
```

Release History

Release 8.3.1; command introduced.
Release 8.4.1; **service** parameter added.

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigZeroBasedQuery
```

ip multicast forward-mode

Configures the Layer 2 forwarding mode for IPv4 Multicast Switching (does not apply to IPv4 Multicast Routing).The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] forward-mode {asm | ssm | mac | auto}**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] forward-mode**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
asm	Sets the IPMS forwarding mode to ASM (the bridge lookup is based on the packet group destination IP address). *This parameter is supported only in the VLAN domain; service domain is not supported.*
ssm	Sets the IPMS forwarding mode to SSM (the bridge lookup is based on the packet source IP as well as the group destination IP). *This parameter is supported only in the VLAN domain; service domain is not supported*
mac	Sets the IPMS forwarding mode to MAC address (the bridge lookup is based on the MAC destination address).
auto	Automatically determines the IPMS forwarding mode based on the current IGMP protocol version and the existing protocol state.

Defaults

By default, the forwarding mode is set to automatic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
  - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
  - Multicast routing is not supported on the OmniSwitch 6560.

  - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast forward-mode auto
-> ip multicast forward-mode asm
-> ip multicast forward-mode ssm
-> ip multicast forward-mode mac
-> no ip multicast forward-mode
-> ip multicast vlan 100 forward-mode auto
-> ip multicast vlan 101-104 forward-mode asm
-> ip multicast vlan 100 forward-mode ssm
-> ip multicast vlan 101-104 forward-mode mac
-> no ip multicast vlan 100 forward-mode
-> no ip multicast vlan 101-104 forward-mode
-> ip multicast service 10 forward-mode mac
-> ip multicast service 11-15 forward-mode mac

```

ip multicast update-delay-interval

Sets the amount of time to delay IPv4 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] update-delay-interval** *milliseconds*

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] update-delay-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
milliseconds	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast update-delay-interval 10
-> no ip multicast update-delay-interval
-> ip multicast vlan 100 update-delay-interval 20
-> ip multicast vlan 101-105 update-delay-interval 20
-> no ip multicast vlan 100 update-delay-interval
-> no ip multicast vlan 101-105 update-delay-interval
-> ip multicast service 20 update-delay-interval 20
-> ip multicast service 21-25 update-delay-interval 20
-> no ip multicast service 20 update-delay-interval
-> no ip multicast service 21-25 update-delay-interval
```

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigUpdateDelayInterval
```

ip multicast fast-join

Configures whether or not IP Multicast Switching will automatically create the forwarding entries in hardware as soon as the IGMP memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] fast-join [enable | disable]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] fast-join**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. *This parameter is supported only on the OmniSwitch 9900.*
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6900-C32 or OmniSwitch 6900-V72.*
enable	Enable the IGMP fast join functionality.
disable	Disable the IGMP fast join functionality.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to IPv4 Multicast Switching. If IP Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IP Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IP Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IP Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IP Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast fast-join enable
-> ip multicast fast-join disable
-> no ip multicast fast-join
-> ip multicast service 10 fast-join enable
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

Release History

Release 8.3.1.R02; command introduced.
Release 8.4.1.R02; **vlan** and **service** parameters added.

Related Commands

show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```

ip multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

ip multicast host-list *host_list_name ip_address* **[***ip_address***]**

no ip multicast host-list *host_list_name* **[***ip_address***]**

Syntax Definitions

host_list_name	A name to assign to the host list (up to 20 characters).
ip_address	The IP address to add to the host list. Multiple IP addresses can be entered on the same command line.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

Examples

```
-> ip multicast host-list group-map1 10.1.1.198
-> ip multicast host-list ssm-map1 20.0.0.1
-> ip multicast host-list ssm-map2 30.0.0.1 30.0.0.2 30.0.0.3
-> no ip multicast host-list ssm-map2 30.0.0.2
-> no ip multicast host-list group-map1
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip multicast host-list	Displays the IP multicast host address list configuration for the switch.

MIB Objects

```
alaIpmsHostListTable
   alaIpmsHostListName
   alaIpmsHostListAddressType
   alaIpmsHostListAddress
```

ip multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id***] ssm-map {***group_address/prefixLen host_list_name* | **admin-state {enable | disable}}**

no ip multicast [vlan *vlan_id***] ssm-map** *group_address/prefixLen*

Syntax Definitions

vlan_id	VLAN on which to apply the mapping configuration.
*group_address***[***/prefixLen***]**	The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 32 is used.
host_list_name	The name of a host list to use for SSM mapping.
enable	Enables the SSM mapping.
disable	Disables the SSM mapping.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration from the system or the specified VLAN.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ip multicast ssm-map 229.10.10.10 hostList1
-> ip multicast ssm-map admin-state enable
-> ip multicast vlan 200 ssm-map 225.11.11.11 hostList2
-> ip multicast vlan 200 ssm-map admin-state enable
-> no ip multicast ssm-map 229.10.10.10
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip multicast ssm-map	Displays the SSM mapping configuration.
show ip multicast	Displays the IP Multicast Switching and Routing status and general configuration parameters, such as the SSM mapping setting.

MIB Objects

```
alaIpmsSsmMapTable
   alaIpmsSsmMapConfigType
   alaIpmsSsmMapConfigAddressType
   alaIpmsSsmMapConfigValue
   alaIpmsSsmMapGroupAddress
   alaIpmsSsmMapGroupPrefixLength
   alaIpmsSsmMapSourceListName
```

ip multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv4 multicast flows on the specified VLAN or globally on the switch.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
enable	Enable the initial packet buffering globally on the switch.
disable	Disable the initial packet buffering globally on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
  - The maximum number of initial packets buffered per IPv4 multicast flow. Use the **ip multicast initial-packet-buffer max-packet** command to set this value.
  - The maximum number of IPv4 multicast flows that can be buffered. Use the **ip multicast initial-packet-buffer max-flow** command to set this value.
  - The maximum amount of time buffered packets are held if they are not sent out. Use the **ip multicast initial-packet-buffer timeout** command to set this value.
  - The minimum amount of time packets are held before delivery begins. Use the **ip multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer admin-state disable
-> ip multicast vlan 2 initial-packet-buffer admin-state enable
-> ip multicast vlan 3-5 initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBuffer
```

ip multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv4 multicast flow on the specified VLAN or globally on the switch.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer max-packet [***num***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
num	The maximum number of packets allowed to buffer per IPv4 multicast flow. Valid range is 1–10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer max-packet 4
-> ip multicast vlan 2 initial-packet-buffer max-packet 10
-> ip multicast vlan 3-5 initial-packet-buffer max-packet 10
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMaxPacket
```

ip multicast initial-packet-buffer max-flow

Configures the maximum number of IPv4 multicast flows that can be buffered on the specified VLAN or globally on the switch.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer max-flow [***num***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
num	The maximum number of IPv4 multicast flows allowed for initial packet buffering. Valid range is 1–32.

Defaults

parameter	default
num	32

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer max-flow 32
-> ip multicast vlan 2 initial-packet-buffer max-flow 32
-> ip multicast vlan 3-5 initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMaxFlow
```

ip multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv4 initial multicast packets on the specified VLAN or globally on the switch.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer timeout [***seconds***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
seconds	The timeout value for the initial buffered IPv4 multicast packets in seconds. Valid range is 1–10.

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer timeout 2
-> ip multicast vlan 2 initial-packet-buffer timeout 5
-> ip multicast vlan 3-5 initial-packet-buffer timeout t
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferTimeout
```

ip multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

ip multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer min-delay [***milliseconds***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
milliseconds	The minimum delay value to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Valid range is 0–1000.

Defaults

parameter	default
milliseconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer min-delay 200
-> ip multicast vlan 2 initial-packet-buffer min-delay 200
-> ip multicast vlan 3-5 initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMinDelay
```

ip multicast display-interface-names

Sets the display output of the **show** commands listed below. When enabled, the display outputs for these commands will show the IP interface name for each VLAN associated with the IP multicast table entry.

ip multicast display-interface-names

no ip multicast display-interface-names

Syntax Definitions

N/A

Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IP multicast source and forward flows.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IP interface or the IP interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IP interfaces.
- Enabling the display interface names option applies to the following **show** commands:

  show ip multicast forward
  show ip multicast neighbor
  show ip multicast querier
  show ip multicast group
  show ip multicast source
  show ip multicast tunnel

- The command examples provided display the **show ip multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

Examples

```
-> ip multicast display-interface-name
-> show ip multicast source

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip multicast source	Displays the IP Multicast Switching and Routing source table entries.
show ip multicast forward	Displays the IP Multicast Switching and Routing forwarding table entries.

MIB Objects

```
alaIpmsGlobalConfigTable
   alaIpmsGlobalConfigAddressType
   alaIpmsGlobalConfigDisplayInterfaceNames
```

ip multicast inherit-default-vrf-config

Configures whether or not the global IPMS configuration defined in the default VRF instance is applied to all VRF instances.

ip multicast inherit-default-vrf-config

no ip multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMS configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMS configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled (the default), additional VRF instances will inherit the global IPMS configuration defined in the default VRF instance.
- A global IPMS configuration defined for a specific non-default VRF instance takes precedence over the global IPMS configuration defined for the default VRF.
- Note that any per-VLAN IPMS configuration defined in a non-default VRF instance will show up as part of the default VRF instance in the configuration snapshot file. However, the functionality is still applied within the context of VRF instance in which the per-VLAN configuration was originally defined.

Examples

```
-> ip multicast inherit-default-vrf-config
-> no ip multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsGlobalConfigTable
   alaIpmsGlobalConfigAddressType
   alaIpmsGlobalConfigInheritDefaultVrfConfig
```

ip multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ip multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a "default" profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

ip multicast profile *profile_name*
[admin-state {enable | disable}]
[flood-unknown {enable | disable}]
[version *version***]**
[robustness *robustness***]**
[querying {enable | disable}]
[query-interval [*seconds***]]**

no ip multicast profile *profile_name* **[admin-state | flood-unknown | version | robustness | ...]**

Syntax Definitions

profile_name The name to associate with the IPMS profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ip multicast profile ipms-1 admin-state**, **ip multicast profile ipms-1 query-interval 100**, or **ip multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

Port Template Parameter	Explicit Port Configuration Command
[admin-state {enable | disable}]	**ip multicast admin-state**
[flood-unknown {enable | disable}]	**ip multicast flood-unknown**
[version *version***]**	**ip multicast version**
[robustness *robustness***]**	**ip multicast robustness**
[querying {enable | disable}]	**ip multicast querying**
[query-interval [*seconds***]]**	**ip multicast query-interval**
[query-response-interval [*tenths-of-seconds***]]**	**ip multicast query-response-interval**
[last-member-query-interval [*tenths-of-seconds***]]**	**ip multicast last-member-query-interval**
[unsolicited-report-interval [*seconds***]]**	**ip multicast unsolicited-report-interval**
[proxying {enable | disable}]	**ip multicast proxying**
[spoofing {enable | disable}]	**ip multicast spoofing**
[spoofing static-source-ip *ip_address***]**	**ip multicast spoofing static-source-ip**
[zapping {enable | disable}]	**ip multicast zapping**
[querier-forwarding {enable | disable}]	**ip multicast querier-forwarding**
[router-timeout [*seconds***]]**	**ip multicast router-timeout**
[source-timeout [*seconds***]]**	**ip multicast source-timeout**
[max-group [*num***] [action {none | drop | replace}]]**	**ip multicast max-group**

Port Template Parameter	Explicit Port Configuration Command
[helper-address [*ip_address***]]**	**ip multicast helper-address**
[zero-based-query {enable | disable}]	**ip multicast zero-based-query**
[forward-mode {asm | ssm | mac | auto}	**ip multicast forward-mode**
[update-delay-interval *milliseconds***]**	**ip multicast update-delay-interval**
[fast-join {enable | disable}]	**ip multicast fast-join**
[initial-packet-buffer admin-state {enable | disable}]	**ip multicast initial-packet-buffer admin-state**
[initial-packet-buffer max-flow [*num***]]**	**ip multicast initial-packet-buffer max-flow**
[initial-packet-buffer max-packet [*num***]]**	**ip multicast initial-packet-buffer max-packet**
[initial-packet-buffer timeout [*seconds***]**	**ip multicast initial-packet-buffer timeout**
[initial-packet-buffer min-delay [milliseconds]	**ip multicast initial-packet-buffer min-delay**

Examples

```
-> ip multicast profile “IGMPv3 with Zapping”
-> ip multicast profile “IGMPv3 with Zapping” admin-state enable
-> ip multicast profile “IGMPv3 with Zapping” zapping enable version 3
-> ip multicast profile “IGMPv3 with Zapping” fast-join enable proxying enable
-> no ip multicast profile “IGMPv3 with Zapping” proxying
-> no ip multicast profile “IGMPv3 with Zapping”
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

ip multicast apply-profile	Assigns an IPMS configuration profile globally for the switch or to a specific VLAN or service instance.
show ip multicast	Displays the profile assignment for the IPMS instance.
show ip multicast profile	Displays the IPMS profile configuration.

 alaIpmsProfileTable
   alaIpmsProfileAddressType
   alaIpmsProfileName
   alaIpmsProfileIndex
   alaIpmsProfileRowStatus
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigProfileName
```

ip multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] apply-profile** *profile_name*

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] appy-profile**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
profile_name	The name to associate with the IPMS profile.

Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

Examples

```
-> ip multicast apply-profile “IGMPv3 with Zapping”
-> ip multicast vlan 20 apply-profile “IGMPv3 with Zapping”
-> ip multicast vlan 20-25 apply-profile “IGMPv3 with Zapping”
-> ip multicast service 10 apply-profile “IGMPv3 with Zapping”
-> ip multicast service 10-15 apply-profile “IGMPv3 with Zapping”
-> no ip multicast apply-profile
-> no ip multicast vlan 20 apply-profile
-> no ip multicast vlan 20-15 apply-profile
-> no ip multicast service 10 apply-profile
-> no ip multicast service 10-15 apply-profile
```

Release History

Release 8.4.1.R02; command was introduced.

```

ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] admin-state [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] admin-state**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable IPv6 Multicast Switching and Routing.
disable	Disable IPv6 Multicast Switching and Routing.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration of an IPv6 multicast routing protocol on an IPv6 interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IPv6 Multicast routing protocol already running on the switch, then the **ipv6 multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

Note. Globally enabling the IPv6 Multicast Switching and Routing status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPv6 Multicast Switching and Routing must be explicitly enabled or disabled for each SPB service. However, globally disabling IPMS for all SPB services is supported.

- Use the **no** form of this command to restore the IPv6 Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> no ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 3-5 admin-state disable
-> no ipv6 multicast vlan 2 admin-state
-> no ipv6 multicast vlan 3-5 admin-state
-> ipv6 multicast service 10 admin-state enable
-> ipv6 multicast service 11-15 admin-state disable
-> no ipv6 multicast service 10 admin-state
-> no ipv6 multicast service 11-15 admin-state
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigStatus
```

ipv6 multicast flood-unknown

Enables or disables the flooding of initial unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port. there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] flood-unknown [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] flood-unknown**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32,* or *OmniSwitch 6900-V72.*
enable	Enable flooding of unknown traffic until it is learned.
disable	Disable flooding of unknown traffic.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- On an OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900:
  - Configuring the flood unknown status for any VLAN enforces the flood unknown behavior globally across all VLANs. The IPv4 multicast version of this command (**ip multicast flood-unknown**), however, enforces the flood unknown behavior at the per-VLAN level.
  - IPv6 multicast snooping for VLANs does not snoop ff02::/64 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded IPv6 addresses.
  - When IPv6 multicast snooping is enabled for any service, the flooding of unknown multicast traffic is unconditionally enforced for all snooping services; this is the only supported flood unknown behavior for services.
  - IPv6 multicast snooping for services does not snoop MAC addresses that fall within the range of 01:00:5e:00:00:00/40 and 33:33:00:00:00:00/40 and the traffic is allowed to flood even if the

flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded MAC addresses.

- On an OmniSwitch 9900, IPv6 multicast snooping for VLANs or services does not snoop ff02::/120 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to these excluded IPv6 addresses.
- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system.

Examples

```
-> ipv6 multicast flood-unknown enable
-> ipv6 multicast flood-unknown disable
-> no ipv6 multicast flood-unknown
-> ipv6 multicast vlan 100 flood-unknown enable
-> ipv6 multicast vlan 101-105 flood-unknown enable
-> ipv6 multicast vlan 100 flood-unknown disable
-> no ipv6 multicast vlan 100 flood-unknown
-> no ipv6 multicast vlan 101-105 flood-unknown
-> ipv6 multicast service 10 flood-unknown enable
-> ipv6 multicast service 11-15 flood-unknown enable
-> ipv6 multicast service 10 flood-unknown disable
-> no ipv6 multicast service 10 flood-unknown
-> no ipv6 multicast service 11-15 flood-unknown
```

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02; **vlan** and **service** parameter added.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigFloodUnknown
```

ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] version [***version***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] version**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
version	Default MLD protocol version to run. Valid entries are 1 or 2.

Defaults

parameter	default
version	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs. or SPB services.
- If the default MLD protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- Use the **no** form of this command to restore the MLD multicast version back to the default value (version 1) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ipv6 multicast version 0).

Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> no ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 3-5 version 2
-> ipv6 multicast vlan 2 version 0
-> no ipv6 multicast vlan 2 version
```

```
-> no ipv6 multicast vlan 3-5 version
-> ipv6 multicast service 2 version 3
-> ipv6 multicast service 3-5 version 3
-> ipv6 multicast service 2 version 0
-> no ipv6 multicast service 2 version
-> no ipv6 multicast service 3-5 version
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigVersion
```

ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances or all SPB service instances of the port.

ipv6 multicast {port *chassis/slot/port* **| sap port** *sap_id***} max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

chassis	The chassis identifier.
slot|port	The slot and port number (3/1).
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
num	The maximum MLD group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.A leave is not sent to the router for the replaced group.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
  - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
  - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- The configuration is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast sap port 1/1/23:10 max-group 10 action drop, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.
- The maximum group configuration on a port will override the VLAN, SPB service, or global configuration.
- MLD zapping must be enabled when the maximum group limit is enabled and the action is dropped.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

Examples

```
-> ipv6 multicast port 1/1/12 max-group 10 action drop
-> ipv6 multicast port 1/1/14 max-group action replace
-> ipv6 multicast port 1/1/14 max-group
-> ipv6 multicast sap port 1/1/23:10 max-group 10 action drop
-> ipv6 multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ipv6 multicast sap port 1/1/16:20.200 max-group
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.
show ipv6 multicast port	Displays the maximum group configuration for VLAN ports or SPB service SAP ports.

MIB Objects

```
alaIpmsIntfTable
   alaIpmsIntfConfigType
   alaIpmsIntfAddressType
   alaIpmsIntfMaxGroupLimit
   alaIpmsIntfMaxGroupExceedAction
```

ipv6 multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]** | **service** *service_id***[-***service_id2***]] max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
num	The maximum MLD group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per port on an SPB service. The limit is applied to each port that is a member of the given SPB service.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or port/SPB service instance
- The configuration of a maximum group limit is allowed even when the IP multicast status is disabled.

- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a VLAN or SPB service will override the global configuration.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 20 max-group action drop
-> ipv6 multicast vlan 11-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group 10 action drop
-> ipv6 multicast service 20 max-group action drop
-> ipv6 multicast service 10-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group
-> ipv6 multicast service 10-15 max-group
```

Release History

   alaIpmsConfigMaxGroupLimit
   alaIpmsConfigMaxGroupExceedAction
```

ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-neighbor vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ipv6 multicast static-neighbor service *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ipv6 multicast static-neighbor vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ipv6 multicast static-neighbor service *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

vlan_id	VLAN to include as a static MLD neighbor.
chassis	The chassis identifier.
slot|*port*	The slot and port number to configure as a static MLD neighbor.
agg_id	The link aggregate to configure as a static MLD neighbor.
service_id	SPB service ID to include as a static MLD neighbor. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic *and* IPv6 multicast traffic.
- To create an MLD static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, ipv6 multicast static-neighbor vlan 2 linkagg 7 or ipv6 multicast static-neighbor service 10 sap linkagg 10:100).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ipv6 multicast static-neighbor service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7

-> ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> no ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> ipv6 multicast static-neighbor service 10 sap linkagg 10:100
-> no ipv6 multicast static-neighbor service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

```

ipv6 multicast static-querier

Creates a static MLD querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-querier vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ipv6 multicast static-querier service *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ipv6 multicast static-querier vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ipv6 multicast static-querier service *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

vlan_id	VLAN to include as a static MLD querier.
chassis	The chassis identifier.
slot|*port*	The slot and port number to configure as a static MLD querier.
agg_id	The link aggregate to configure as a static MLD querier.
service_id	SPB service ID to include as a static MLD querier. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic.
- To create an MLD static querier entry on a link aggregate, use the **linkagg** parameter (for example, ipv6 multicast static-querier vlan 2 linkagg 7 or ipv6 multicast static-querier service 10 sap linkagg 10:100).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ipv6 multicast static-neighbor service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7

-> ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> no ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> ipv6 multicast static-querier service 10 sap linkagg 10:100
-> no ipv6 multicast static-querier service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

   alaIpmsStaticQuerierRowStatus
```

ipv6 multicast static-group

Creates a static MLD group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-group *ipv6_address* **vlan** *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

ipv6 multicast static-group *ipv6_address* **service** *service_id* **sap {port** | **linkagg} {***sap_id***}**

no ipv6 multicast static-group *ipv6_address* **vlan** *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}**

no ipv6 multicast static-group *ipv6_address* **service** *service_id* **sap {port** | **linkagg} {***sap_id***}**

Syntax Definitions

ipv6_address	IPv6 multicast group address.
vlan_id	VLAN to include as a static MLD group.
chassis	The chassis identifier.
slot|port	The slot and port number to configure as a static MLD group.
agg_id	The link aggregate to configure as a static MLD group.
service_id	SPB service ID to include as a static MLD group. The valid range is 1–32767. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive MLD traffic addressed to the specified IP multicast group address.
- To create an MLD static group entry on a link aggregate, use the **linkagg** parameter (for example, ipv6 multicast static-group 225.0.0.1 vlan 2 linkagg 7 or ipv6 multicast static-group 225.0.0.1 service 10 sap linkagg 10:100).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ipv6 multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, "Service Manager Commands," for more information.

Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7

-> ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

   alaIpmsStaticMemberIfIndex
   alaIpmsStaticMemberSubValue
   alaIpmsStaticMemberGroupAddress
   alaIpmsStaticMemberRowStatus
```

ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***] query-interval [***seconds***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***] query-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	MLD query interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	125

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs or SPB services.
- If the MLD query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD query interval to use.
- Use the **no** form of this command to restore the MLD query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-interval 0**).

Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> no ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
```

```
-> ipv6 multicast vlan 3-5 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> no ipv6 multicast vlan 2 query-interval
-> no ipv6 multicast vlan 3-5 query-interval
-> ipv6 multicast service 2 query-interval 100
-> ipv6 multicast service 3-5 query-interval 100
-> ipv6 multicast service 2 query-interval 0
-> no ipv6 multicast service 2 query-interval
-> no ipv6 multicast service 3-5 query-interval
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

```

ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] last-member-query-interval [***milliseconds***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] last-member-query-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
milliseconds	MLD last member query interval in milliseconds. Valid range is 1–65535.

Defaults

parameter	default
milliseconds	1000

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- Use the **no** form of this command to restore the MLD last member query interval back to the default value (1000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast last-member-query-interval 0**).

Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> no ipv6 multicast last-member-query-interval
```

```
-> ipv6 multicast vlan 4 last-member-query-interval 2200
-> ipv6 multicast vlan 3-5 last-member-query-interval 2200
-> ipv6 multicast vlan 4 last-member-query-interval 0
-> no ipv6 multicast vlan 4 last-member-query-interval
-> no ipv6 multicast vlan 3-5 last-member-query-interval
-> ipv6 multicast service 2 last-member-query-interval 2200
-> ipv6 multicast service 3-5 last-member-query-interval 2200
-> ipv6 multicast service 2 last-member-query-interval 0
-> no ipv6 multicast service 2 last-member-query-interval
-> no ipv6 multicast service 3-5 last-member-query-interval
```

Release History

ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] query-response-interval [***milliseconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] query-response-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
milliseconds	MLD query response interval in milliseconds. Valid range is 1–65535.

Defaults

parameter	default
milliseconds	10000

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- Use the **no** form of this command to restore the MLD query response interval back to the default value (10000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-response-interval 0**).

Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> no ipv6 multicast query-response-interval
-> ipv6 multicast vlan 2 query-response-interval 20000
-> ipv6 multicast vlan 3-5 query-response-interval 20000
-> ipv6 multicast vlan 2 query-response-interval 0
-> no ipv6 multicast vlan 2 query-response-interval
```

```
-> no ipv6 multicast vlan 3-5 query-response-interval
-> ipv6 multicast service 2 query-response-interval 300
-> ipv6 multicast service 3-5 query-response-interval 300
-> ipv6 multicast service 2 query-response-interval 0
-> no ipv6 multicast service 2 query-response-interval
-> no ipv6 multicast service 3-5 query-response-interval
```

ipv6 multicast unsolicited-report-interval

Sets the value of the MLD unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] unsolicited-report-interval [***seconds***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] unsolicited-report-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	MLD unsolicited report interval in seconds. Valid range is 1–65535, where 0 represents the default setting.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- Use the **no** form of this command to restore the MLD unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast unsolicited-report-interval 0**).

Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> no ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
```

```
-> ipv6 multicast vlan 3-5 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> no ipv6 multicast vlan 2 unsolicited-report-interval
-> no ipv6 multicast vlan 3-5 unsolicited-report-interval
-> ipv6 multicast service 2 unsolicited-report-interval 300
-> ipv6 multicast service 3-5 unsolicited-report-interval 300
-> ipv6 multicast service 2 unsolicited-report-interval 0
-> no ipv6 multicast service 2 unsolicited-report-interval
-> no ipv6 multicast service 3-5 unsolicited-report-interval
```

```

ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] router-timeout [***seconds***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] router-timeout**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	MLD router timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the MLD router timeout back to the default value (90 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast router-timeout 0**).

Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> no ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 3-5 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> no ipv6 multicast vlan 2 router-timeout
-> no ipv6 multicast vlan 3-5 router-timeout
-> ipv6 multicast service 2 router-timeout 100
-> ipv6 multicast service 3-5 router-timeout 100
```

```
-> ipv6 multicast service 2 router-timeout 0
-> no ipv6 multicast service 2 router-timeout
-> no ipv6 multicast servicee 3-5 router-timeout
```

Release History

ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] source-timeout [***seconds***]**

no ip multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] source-timeout**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
seconds	MLD source timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the MLD source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast source-timeout 0**).

Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> no ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> no ipv6 multicast vlan 2 source-timeout
-> no ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 100
-> ipv6 multicast service 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 0
```

```
-> no ipv6 multicast service 2 source-timeout
-> no ipv6 multicast service 3-5 source-timeout
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R02; service parameter added.

Related Commands

alaIpmsConfigTable
   alaIpmsConfigSourceTimeout
```

ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] querying [{enable | disable}] [static-source-ip** *ipv6_address***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] querying [static-source-ip]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
enable	Enable MLD querying.
disable	Disable MLD querying.
ipv6_address	A static source IPv6 address to use for MLD querying. *This parameter is currently not supported.*

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- Use the **no** form of this command to restore the MLD querying status to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> no ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 3-5 querying disable
-> no ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 3-5 querying
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1.R02; **static-source-ip** parameter added.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

MIB Objects

ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] robustness [***robustness***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] robustness**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
robustness	MLD robustness variable. Valid range is 1–7.

Defaults

parameter	default
robustness	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs or SPB services.
- If the MLD robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD robustness variable to use.
- Use the **no** form of this command to restore the MLD robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast robustness 0**).

Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> no ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
```

```
-> ipv6 multicast vlan 3-5 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> no ipv6 multicast vlan 2 robustness
-> no ipv6 multicast vlan 3-5 robustness
-> ipv6 multicast service 2 robustness 3
-> ipv6 multicast service 3-5 robustness 3
-> ipv6 multicast service 2 robustness 0
-> ipv6 multicast service 2 robustness
-> no ipv6 multicast service 3-5 robustness
```

Release History

```

ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing {enable | disable}**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***] spoofing**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable MLD spoofing.
disable	Disable MLD spoofing.

Defaults

parameter	defaults
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.
- Use the **no** form of this command to remove an MLD spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.

Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> no ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
```

```
-> ipv6 multicast vlan 3-5 spoofing disable
-> no ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 3-5 spoofing
-> ipv6 multicast service 2 spoofing enable
-> ipv6 multicast service 3-5 spoofing disable
-> no ipv6 multicast service 2 spoofing
-> no ipv6 multicast service 3-5 spoofing
```

ipv6 multicast spoofing static-source-ip

Enables or disables MLD static spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing static-source-ip** *ipv6_address*

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] spoofing static-source-ip**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
ipv6_address	A static source IPv6 address to use for spoofing.

Defaults

parameter	defaults
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.

Examples

```
-> ipv6 multicast spoofing static-source-ip 3333::1
-> no ipv6 ip multicast spoofing static-source-ip
-> ipv6 multicast vlan 2 spoofing static-source-ip 3333::1
-> ipv6 multicast vlan 3-5 spoofing static-source-ip 3333::1
-> no ipv6 ip multicast vlan 2 spoofing static-source-ip
-> no ipv6 multicast vlan 3-5 spoofing static-source-ip
-> ipv6 multicast service 2 spoofing static-source-ip 3333::1
-> no ipv6 multicast service 2 spoofing static-source-ip
-> ipv6 multicast service 3-5 spoofing static-source-ip 3333::1
```

```
-> no ipv6 multicast service 3-5 spoofing static-source-ip
```

Release History

Release 8.3.1.R02; command was added.
Release 8.4.1.R02; **service** parameter added.

ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zapping [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zapping**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable MLD zapping.
disable	Disable MLD zapping.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the MLD zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> no ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 3-5 zapping disable
-> no ipv6 multicast vlan 2 zapping
-> no ipv6 multicast vlan 3-5 zapping
-> ipv6 multicast service 2 zapping enable
```

```
-> ipv6 multicast service 3-5 zapping disable
-> no ipv6 multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

Release History

```

ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] querier-forwarding [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] querier-forwarding**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable MLD querier forwarding.
disable	Disable MLD querier forwarding.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the MLD querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> no ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 3-5 querier-forwarding disable
-> no ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 3-5 querier-forwarding
-> ipv6 multicast service 2 querier-forwarding enable
```

```
-> ipv6 multicast service 3-5 querier-forwarding disable
-> no ipv6 multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

```

ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] proxying [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] proxying**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable MLD proxying.
disable	Disable MLD proxying.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported MLD packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported MLD packets will be sent using "::" for the IPv6 source address.
- Use the **no** form of this command to restore the MLD proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> no ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 3-5 proxying disable
-> no ipv6 multicast vlan 2 proxying
-> no ipv6 multicast vlan 3-5 proxying
-> ipv6 multicast service 2 proxying enable
-> ipv6 multicast service 3-5 proxying disable
-> no ipv6 multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **service** parameter added.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```

ipv6 multicast helper-address

Specifies the destination IPv6 address of a relay host where MLD host Reports and Leave messages are sent.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] helper-address [***ipv6_address***]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] helper-address**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
ipv6_address	The IPv6 address of the relay host.

Defaults

By default, no destination IPv6 address is set.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- After the destination IPv6 address is specified, the IPMS reporting feature is enabled.
- An operational IPv6 interface is required for the receiving LAN before any MLD Reports and Leave messages can be relayed.
- Configuring a destination IPv6 helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (no IPv6 helper address) on the system. When there is no IPv6 helper address set, the IPMS reporting feature is disabled.

Examples

```
-> ipv6 multicast helper-address 3333::2
-> no ipv6 multicast helper-address
-> ipv6 multicast vlan 2 helper-address 3333::2
-> ipv6 multicast vlan 3-5 helper-address 3333::2
-> no ipv6 multicast vlan 2 helper-address
-> no ipv6 multicast vlan 3-5 helper-address
```

Release History

Release 8.4.1; command was introduced.
Release 8.4.1.R02; **vlan** parameter added.

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigHelperAddress
```

ipv6 multicast zero-based-query

Configures the use of an all-zero source IPv6 address for MLD query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zero-based-query [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] zero-based-query**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
enable	Enable MLD zero-based querying.
disable	Disable MLD zero-based querying.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The MLD zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the MLD zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast zero-based-query enable
-> ipv6 multicast zero-based-query disable
-> no ipv6 multicast zero-based-query
-> ipv6 multicast vlan 2 zero-based-query enable
-> ipv6 multicast vlan 3-5 zero-based-query disable
-> no ipv6 multicast vlan 2 zero-based-query
-> no ipv6 multicast vlan 3-5 zero-based-query
-> ipv6 multicast service 10 zero-based-query enable
-> ipv6 multicast service 11-15 zero-based-query disable
-> no ipv6 multicast service 10 zero-based-query
```

```
-> no ipv6 multicast service 11-15 zero-based-query disable
```

Release History

Release 8.3.1; command introduced.
Release 8.4.1; **service** parameter added.

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigZeroBasedQuery
```

ipv6 multicast forward-mode

Configures the Layer 2 forwarding mode for IPv6 Multicast Switching (does not apply to IPv6 Multicast Routing).The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] forward-mode {asm | ssm | mac | auto}**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] forward-mode**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
asm	Sets the IPMSv6 forwarding mode to ASM (the bridge lookup is based on the packet group destination IPv6 address). *This parameter is supported only in the VLAN domain; service domain is not supported.*
ssm	Sets the IPMSv6 forwarding mode to SSM (the bridge lookup is based on the packet source IPv6 as well as the group destination IPv6). *This parameter is supported only in the VLAN domain; service domain is not supported.*
mac	Sets the IPMSv6 forwarding mode to MAC address (the bridge lookup is based on the MAC destination address).
auto	Automatically determines the IPMSv6 forwarding mode based on the current MLD protocol version and the existing protocol state.

Defaults

By default, the forwarding mode is set to automatic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
  - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
  - Multicast routing is not supported on the OmniSwitch 6560.
  - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting

and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system, the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast forward-mode auto
-> ipv6 multicast forward-mode asm
-> ipv6 multicast forward-mode ssm
-> ipv6 multicast forward-mode mac
-> no ipv6 multicast forward-mode
-> ipv6 multicast vlan 100 forward-mode auto
-> ipv6 multicast vlan 101-104 forward-mode asm
-> ipv6 multicast vlan 100 forward-mode ssm
-> ipv6 multicast vlan 101-104 forward-mode mac
-> no ipv6 multicast vlan 100 forward-mode
-> no ipv6 multicast vlan 101-104 forward-mode
-> ipv6 multicast service 10 forward-mode mac
-> ipv6 multicast service 11-15 forward-mode mac
-> no ipv6 multicast service 10 forward-mode
-> no ipv6 multicast service 11-15 forward-mode
```

Release History

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigForwardMode
```

ipv6 multicast update-delay-interval

Sets the amount of time to delay IPv6 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] update-delay-interval** *milliseconds*

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] update-delay-interval**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
milliseconds	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast update-delay-interval 10
-> no ipv6 multicast update-delay-interval
-> ipv6 multicast vlan 100 update-delay-interval 20
-> ipv6 multicast vlan 101-105 update-delay-interval 20
-> no ipv6 multicast vlan 100 update-delay-interval 20
-> no iv6p multicast vlan 101-105 update-delay-interval
-> ipv6 multicast service 20 update-delay-interval 20
-> ipv6 multicast service 21-25 update-delay-interval 20
-> no ipv6 multicast service 20 update-delay-interval
-> no ipv6 multicast service 21-25 update-delay-interval
```

Release History

```

ipv6 multicast fast-join

Configures whether or not IPv6 Multicast Switching will automatically create the forwarding entries in hardware as soon as the MLD memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] fast-join [enable | disable]**

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] fast-join**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. *This parameter is supported only on the OmniSwitch 9900.*
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6900-C32 or OmniSwitch 6900-V72.*
enable	Enable the MLD fast join functionality.
disable	Disable the MLD fast join functionality.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to IPv6 Multicast Switching. If IPv6 Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IPv6 Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IPv6 Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IPv6 Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IPv6 Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast fast-join enable
-> ipv6 multicast fast-join disable
-> no ipv6 multicast fast-join
-> ip multicast service 10 fast-join enable
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

Release History

Release 8.3.1.R02; command introduced.
Release 8.4.1.R02; **vlan** and **service** parameters added.

Related Commands

show ip multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigFastJoin
```

ipv6 multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

ipv6 multicast host-list *host_list_name ipv6_address* **[***ipv6_address***]**

no ipv6 multicast host-list *host_list_name* **[***ipv6_address***]**

Syntax Definitions

host_list_name	A name to assign to the host list (up to 20 characters).
ipv6_address	The IPv6 address to add to the host list. Multiple IPv6 addresses can be entered on the same command line.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove an IPv6 address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

Examples

```
-> ipv6 multicast host-list group-map1 4444::2
-> ipv6 multicast host-list ssm-map1 4444::3
-> ipv6 multicast host-list ssm-map2 3333::2 3333::3 3333::4
-> no ipv6 multicast host-list ssm-map2 3333::3
-> no ipv6 multicast host-list group-map1
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast host-list	Displays the IPv6 multicast host address list configuration.

MIB Objects

```
alaIpmsHostListTable
   alaIpmsHostListName
   alaIpmsHostListAddressType
   alaIpmsHostListAddress
```

ipv6 multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id***] ssm-map {***group_address***[***/prefixLen***]** *host_list_name* | **admin-state {enable | disable}}**

no ipv6 multicast ssm-map *group_address***[***/prefixLen***]**

Syntax Definitions

vlan_id	VLAN on which to apply the mapping configuration.
*group_address***[***/prefixLen***]**	The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 128 is used.
host_list_name	The name of a host list to use for SSM mapping.
enable	Enables the SSM mapping.
disable	Disables the SSM mapping.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ipv6 multicast ssm-map ff05::5 hostList1
-> ipv6 multicast ssm-map admin-state enable
-> ipv6 multicast vlan 200 ssm-map ff05::6 hostList2
-> ipv6 multicast vlan 200 ssm-map admin-state enable
-> no ipv6 multicast ssm-map ff05::5
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast ssm-map	Displays the SSM mapping configuration.
show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters, such as the global SSM mapping setting.

MIB Objects

```
alaIpmsSsmMapTable
   alaIpmsSsmMapConfigType
   alaIpmsSsmMapConfigAddressType
   alaIpmsSsmMapConfigValue
   alaIpmsSsmMapGroupAddress
   alaIpmsSsmMapGroupPrefixLength
   alaIpmsSsmMapSourceListName
```

ipv6 multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv6 multicast flows on the specified VLAN or globally on the switch.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
enable	Enable the initial packet buffering globally on the switch for IPv6 multicast flow.
disable	Disable the initial packet buffering globally on the switch for IPv6 multicast flow.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
  - The maximum number of initial packets buffered per IPv6 multicast flow. Use the **ipv6 multicast initial-packet-buffer max-packet** command to set this value.
  - The maximum number of IPv6 multicast flows that can be buffered. Use the **ipv6 multicast initial-packet-buffer max-flow** command to set this value.
  - The maximum amount of time buffered packets are held if they are not sent out. Use the **ipv6 multicast initial-packet-buffer timeout** command to set this value.
  - The minimum amount of time packets are held before delivery begins. Use the **ipv6 multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer admin-state disable
-> ipv6 multicast initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 2 initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 3-5 initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

show ipv6 multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBuffer
```

ipv6 multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv6 multicast flow on the specified VLAN or globally on the switch.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer max-packet [***num***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
num	The maximum number of packets allowed to buffer per IPv6 multicast flow. Valid range is 1 to 10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer max-packet 4
-> ipv6 multicast vlan 2 initial-packet-buffer max-packet 10
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-packet 10
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ipv6 multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMaxPacket
```

ipv6 multicast initial-packet-buffer max-flow

Configures the maximum number of IPv6 multicast flows that can be buffered on the specified VLAN or globally on the switch.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer max-flow [***num***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
num	The maximum number of IPv6 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

Defaults

parameter	default
num	32

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 2 initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMaxFlow
```

ipv6 multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv6 initial multicast packets on the specified VLAN or globally on the switch.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer timeout [***seconds***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
seconds	The timeout value for the initial buffered IPv6 multicast packets in seconds. Valid range is 1 to 10.

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer timeout 2
-> ipv6 multicast vlan 2 initial-packet-buffer timeout 5
-> ipv6 multicast vlan 3-5 initial-packet-buffer timeout t
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

MIB Objects

```
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferTimeout
```

ipv6 multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***]] initial-packet-buffer min-delay [***milliseconds***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
milliseconds	The minimum delay value to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Valid range is 0 to 1000.

Defaults

parameter	default
milliseconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 2 initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 3-5 initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigInitialPacketBufferMinDelay
```

ipv6 multicast display-interface-names

Sets the display output of the **show** commands listed below.When enabled, the display outputs for these commands will show the IPv6 interface name for each VLAN associated with the IPv6 multicast table entry.

ipv6 multicast display-interface-names

no ipv6 multicast display-interface-names

Syntax Definitions

N/A

Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IPv6 multicast source and forward flows.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IPv6 interface or the IPv6 interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IPv6 interfaces.
- Enabling the display interface names option applies to the following **show** commands:

  show ipv6 multicast forward
  show ipv6 multicast neighbor
  show ipv6 multicast querier
  show ipv6 multicast group
  show ipv6 multicast source
  show ipv6 multicast tunnel

- The command examples provided display the **show ipv6 multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

Examples

```
-> ipv6 multicast display-interface-name

-> show ipv6 multicast source

```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast source	Displays the IPv6 Multicast Switching and Routing source table entries.
show ipv6 multicast forward	Displays the IPv6 Multicast Switching and Routing forwarding table entries.

MIB Objects

```
alaIpmsGlobalConfigTable
   alaIpmsGlobalConfigAddressType
   alaIpmsGlobalConfigDisplayInterfaceNames
```

ipv6 multicast inherit-default-vrf-config

Configures whether or not the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances.

ipv6 multicast inherit-default-vrf-config

no ipv6 multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMSv6 configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled, additional VRF instances will inherit the global IPMSv6 configuration defined in the default VRF instance.
- A global IPMSv6 configuration defined for a specific non-default VRF instance takes precedence over the global IPMSv6 configuration defined for the default VRF.

Examples

```
-> ipv6 multicast inherit-default-vrf-config
-> no ipv6 multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

MIB Objects

```
alaIpmsGlobalConfigTable
   alaIpmsGlobalConfigAddressType
   alaIpmsGlobalConfigInheritDefaultVrfConfig
```

ipv6 multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ipv6 multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a "default" profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

ipv6 multicast profile *profile_name*
[admin-state {enable | disable}]
[flood-unknown {enable | disable}]
[version *version***]**
[robustness *robustness***]**
[querying {enable | disable}]
[query-interval [*seconds***]]**
[query-response-interval [*milliseconds***]]**
[last-member-query-interval [*milliseconds***]]**
[unsolicited-report-interval [*seconds***]]**
[proxying {enable | disable}]
[spoofing {enable | disable}]
[spoofing static-source-ip *ipv6_address***]**
[zapping {enable | disable}]
[querier-forwarding {enable | disable}]
[router-timeout [*seconds***]]**
[source-timeout [*seconds***]]**
[max-group [*num***] [action {none | drop | replace}]]**
[helper-address [*ipv6_address***]]**
[zero-based-query {enable | disable}]
[forward-mode {asm | ssm | mac | auto}
[update-delay-interval *milliseconds***]**
[fast-join {enable | disable}]
[initial-packet-buffer admin-state {enable | disable}]
[initial-packet-buffer max-flow [*num***]]**
[initial-packet-buffer max-packet [*num***]]**
[initial-packet-buffer timeout [*seconds***]**
[initial-packet-buffer min-delay [*milliseconds***]**

no ipv6 multicast profile *profile_name* **[admin-state | flood-unknown | version | robustness | ...]**

Syntax Definitions

profile_name The name to associate with the IPMS profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ipv6 multicast profile ipms-1 admin-state**, **ipv6 multicast profile ipms-1 query-interval 100**, or **ipv6 multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

Port Template Parameter	Explicit Port Configuration Command
[admin-state {enable | disable}]	**ipv6 multicast admin-state**
[flood-unknown {enable | disable}]	**ipv6 multicast flood-unknown**
[version *version***]**	**ipv6 multicast version**
[robustness *robustness***]**	**ipv6 multicast robustness**
[querying {enable | disable}]	**ipv6 multicast querying**
[query-interval [*seconds***]]**	**ipv6 multicast query-interval**
[query-response-interval [*milliseconds***]]**	**ipv6 multicast query-response-interval**
[last-member-query-interval [*milliseconds***]]**	**ipv6 multicast last-member-query-interval**
[unsolicited-report-interval [*seconds***]]**	**ipv6 multicast unsolicited-report-interval**
[proxying {enable | disable}]	**ipv6 multicast proxying**
[spoofing {enable | disable}]	**ipv6 multicast spoofing**
[spoofing static-source-ip *ipv6_address***]**	**ipv6 multicast spoofing static-source-ip**
[zapping {enable | disable}]	**ipv6 multicast zapping**
[querier-forwarding {enable | disable}]	**ipv6 multicast querier-forwarding**
[router-timeout [*seconds***]]**	**ipv6 multicast router-timeout**
[source-timeout [*seconds***]]**	**ipv6 multicast source-timeout**
[max-group [*num***] [action {none | drop | replace}]]**	**ipv6 multicast max-group**

Port Template Parameter	Explicit Port Configuration Command
[helper-address [*ipv6_address***]]**	**ipv6 multicast helper-address**
[zero-based-query {enable | disable}]	**ipv6 multicast zero-based-query**
[forward-mode {asm | ssm | mac | auto}	**ipv6 multicast forward-mode**
[update-delay-interval *milliseconds***]**	**ipv6 multicast update-delay-interval**
[fast-join {enable | disable}]	**ipv6 multicast fast-join**
[initial-packet-buffer admin-state {enable | disable}]	**ipv6 multicast initial-packet-buffer admin-state**
[initial-packet-buffer max-flow [*num***]]**	**ipv6 multicast initial-packet-buffer max-flow**
[initial-packet-buffer max-packet [*num***]]**	**ipv6 multicast initial-packet-buffer max-packet**
[initial-packet-buffer timeout [*seconds***]**	**ipv6 multicast initial-packet-buffer timeout**
[initial-packet-buffer min-delay [*milliseconds***]**	**ipv6 multicast initial-packet-buffer min-delay**

Examples

```
-> ipv6 multicast profile “MLDv2 with Zapping”
-> ipv6 multicast profile “MLDv2 with Zapping” admin-state enable
-> ipv6 multicast profile “MLDv2 with Zapping” zapping enable version 2
-> ipv6 multicast profile “MLDv2 with Zapping” fast-join enable proxying enable
-> no ipv6 multicast profile “MLDv2 with Zapping” proxying
-> no ipv6 multicast profile “MLDv2 with Zapping”
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

ipv6 multicast apply-profile	Assigns an IPMS configuration profile globally for the switch or to a specific VLAN or service instance.
show ipv6 multicast	Displays the profile assignment for the IPMS instance.
show ipv6 multicast profile	Displays the IPMS profile configuration.

MIB Objects

```
 alaIpmsProfileTable
   alaIpmsProfileAddressType
   alaIpmsProfileName
   alaIpmsProfileIndex
   alaIpmsProfileRowStatus
alaIpmsConfigTable
   alaIpmsConfigType
   alaIpmsConfigAddressType
   alaIpmsConfigValue
   alaIpmsConfigProfileName
```

ipv6 multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] apply-profile** *profile_name*

no ipv6 multicast [vlan *vlan_id***[-***vlan_id2***] | service** *service_id***[-***service_id2***]] appy-profile**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
*service_id***[-***service_id2***]**	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
profile_name	The name to associate with the IPMS profile.

Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

Examples

```
-> ipv6 multicast apply-profile “MLDv2 with Zapping”
-> ipv6 multicast vlan 20 apply-profile “MLDv2 with Zapping”
-> ipv6 multicast vlan 20-25 apply-profile “MLDv2 with Zapping”
-> ipv6 multicast service 10 apply-profile “MLDv2 with Zapping”
-> ipv6 multicast service 10-15 apply-profile “MLDv2 with Zapping”
-> no ipv6 multicast apply-profile
-> no ipv6 multicast vlan 20 apply-profile
-> no ipv6 multicast vlan 20-15 apply-profile
-> no ipv6 multicast service 10 apply-profile
-> no ipv6 multicast service 10-15 apply-profile
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

ipv6 multicast profile	Defines an IPMS profile that is used to apply a pre-defined IPMS configuration.
show ipv6 multicast	Displays the profile assignment for the IPMS instance.
show ipv6 multicast profile	Displays the IPMS profile configuration.

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

show ip multicast [vlan *vlan_id* **| service** *service_id***]**

Syntax Definitions

vlan_id	VLAN ID number (1–4094).
service_id	SPB service ID number (1–32767). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

By default the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

Examples

```
-> show ip multicast

Profile                                          = default,
Status                                           = disabled,

```

output definitions

Profile	The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the **ip multicast profile** command.
Status	Whether IP Multicast Switching and Routing is **Enabled** or **Disabled** (the default status). Configured through the **ip multicast admin-state** command.
Flood Unknown	Whether the flooding of initial unknown multicast traffic is **Enabled** or **Disabled** (the default status). Configured through the **ip multicast flood-unknown** command.
Version	Displays the default IGMP version, which can be **1, 2** or **3**. Configured through the **ip multicast version** command.
Robustness	Displays the IGMP robustness value, ranging from **1** to **7.** (The default value is 2). Configured through the **ip multicast robustness** command.
Querying	Whether IGMP querying is **Enabled** or **Disabled** (the default status). Configured through the **ip multicast querying** command.
Query Interval (seconds)	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). Configured through the **ip multicast query-interval** command.
Query Response Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). Configured through the **ip multicast query-response-interval** command.
Last Member Query Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the **ip multicast last-member-query-interval** command.
Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). Configured through the **ip multicast unsolicited-report-interval** command.

output definitions

Proxying	Whether IGMP proxying on the system is **enabled** or **disabled** (the default status)**.** Configured through the **ip multicast proxying** command.
Spoofing	Whether IGMP spoofing on the system is **enabled** or **disabled** (the default status)**.** Configured through the **ip multicast spoofing** command.
Zapping	Whether IGMP zapping on the system is **enabled** or **disabled** (the default status)**.** Configured through the **ip multicast zapping** command.
Querier Forwarding	Whether IGMP querier forwarding on the system is **enabled** or **disabled** (the default status)**.** Configured through the **ip multicast querier-forwarding** command.
Router Timeout (seconds)	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) Configured through the **ip multicast router-timeout** command.
Source Timeout (seconds)	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) Configured through the **ip multicast source-timeout** command.
Max-group	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0, which means no limit is imposed). Configured through the **ip multicast max-group** command.
Max-group action	Displays the action taken when the maximum group limit has been exceeded (**none**, **drop** or **replace**). Configured through the **ip multicast max-group** command.
Helper-address	Displays the destination IP address of a relay host, where IGMP host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) Configured through the **ip multicast helper-address** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Static Querier Address	The Static Source IP Address to be used when querying. (The default value of 0.0.0.0 indicates that this is not configured.) *This function is currently not supported.*
Static Spoofing Address	The Static Source IP Address to be used when spoofing. (The default value of 0.0.0.0 indicates that this is not configured.) Configured through the **ip multicast spoofing static-source-ip** command.
Zero-based Query	Whether Zero-based Querying is **disabled** or **enabled** (the default status). Configured through the **ip multicast zero-based-query** command.
Forward Mode	Displays the current IPv4 Forwarding mode (**asm**, **ssm**, **mac**, or **auto**). Configured through the **ip multicast forward-mode** command.
Update Delay Interval (milliseconds)	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the **ip multicast update-delay-interval** command.

output definitions

SSM Mapping	Whether Source Specific Multicast (SSM) mapping is **enabled** or **disabled** (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the **ip multicast ssm-map** command. *This function is currently not supported.*
Fast Join	Whether the IP Multicast Switching fast join functionality is **enabled** or **disabled** (the default). When enabled, forwarding entries are automatically created in hardware as soon as IGMP memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the **ip multicast fast-join** command.
Initial Packet Buffering	The current state of Initial Packet Buffering, which can be **enabled** or **disabled** (the default status). Configured through the **ip multicast initial-packet-buffer admin-state** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Max Flows	The maximum number of IPv4 multicast flows buffered for initial packet. Configured through the **ip multicast initial-packet-buffer max-flow** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Max Packets Per Flow	The maximum number of initial packets buffered per IPv4 multicast flow. Configured through the **ip multicast initial-packet-buffer max-packet** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Buffer Timeout (seconds)	The timeout value for the initial buffered IPv4 multicast packets. Configured through the **ip multicast initial-packet-buffer timeout** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Min Delay (milliseconds)	The minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Configured through the **ip multicast initial-packet-buffer min-delay** command. *This function is supported only in the VLAN domain; service domain is not supported.*

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; display fields added.
Release 8.4.1; **service** parameter added.

Related Commands

ip multicast admin-state	Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

show ip multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance is also displayed.

show ip multicast {port [*chassis/slot/port***] | sap port** [*sap_id*]}

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
sap_id	The SAP ID (chassis/slot/port:encapsulation). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a port number to display the configuration information for a specific switch port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

Examples

```

```

output definitions

Interface	The VLAN port or the SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the SPB service.
Vlan/Service	The VLAN or SPB service ID associated with the IP multicast interface.
Current Groups	The current groups associated with the IP multicast interface.
Interface Max-group	The maximum group count allowed on the port or SAP port. This limit is applicable on the given port for all VLAN or service instances of the port.
Interface Action	The action to be taken when the group membership limit is exceeded (**none**, **drop**, or **replace**).

output definitions

Interface-Instance Max-group	The maximum group limit learned per port for the given VLAN or per SAP port for the given SPB service. This limit is applied to each port that is a member of the given VLAN or each SAP port that is a member of the given service.
Interface-Instance Action	The action to be taken when the group membership limit is exceeded (**none**, **drop**, or **replace**).

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

ip multicast port max-group	Configures the maximum group limit learned per port.
ip multicast port max-group	Configures the maximum group limit learned per port for the specified VLAN, SPB service, or on the system if no VLAN or SPB service is specified.

```

show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

show ip multicast forward [*ip_address***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ip_address	IP multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display forwarding table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display forwarding table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display forwarding table entries for all of the VRF instances.

Defaults

By default, forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- Forwarding entries are derived by applying the state from the source table to the state in the group, neighbor, and querier tables.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch. To view the multicast forwarding database on an OS6465 or OS6560 see the **show ip multicast bridge** and **show ip multicast bridge-forward** commands.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” and “Egress Vlan/Service” fields instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast forward

```

output definitions

Group Address	IP group address of the IP multicast forward.
Host Address	IP host address of the IP multicast forward.
Tunnel Address	IP source tunnel address of the IP multicast forward.
Ingress Vlan/Service	The ingress VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the ingress interface name associated with the IP multicast forward is displayed.

output definitions (continued)

Egress Vlan/Service	The egress VLAN or SPB service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the egress interface name associated with the IP multicast forward is displayed. The egress interface (port) will also be included in the forward entry with both output formats.
Interface	The VLAN port or SPB virtual port of the IP multicast forward.

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **all-vrf** parameter added.
Release 8.4.1; **domain** parameter added.
Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ip multicast static-group	Creates a static IGMP group entry on a specified port on a specified VLAN.

MIB Objects

```
alaIpmsForwardTable
   alaIpmsForwardConfigType
   alaIpmsForwardAddressType
   alaIpmsForwardValue
   alaIpmsForwardGroupAddress
   alaIpmsForwardHostAddress
   alaIpmsForwardDestAddress

   alaIpmsForwardNextType
```

show ip multicast neighbor

Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

show ip multicast neighbor [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Display IGMP neighbor table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display IGMP neighbor table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display IGMP neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the neighbor table entries that exist in all of the VRF instances on the switch.
- Interfaces with neighbors receive all IPv4 multicast, including all IGMP traffic.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast neighbor

```

show ip multicast querier

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

show ip multicast querier [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Display IGMP querier table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display IGMP querier table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display IGMP querier table entries for all of the VRF instances.

Defaults

By default, only IGMP querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the IGMP querier table entries that exist in all of the VRF instances on the switch.
- Interfaces with queriers receive all IGMP traffic, and if querier forwarding is enabled, these interfaces will also receive all IPv4 multicast traffic.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast querier

```

show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast group [*ip_address***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ip_address	IP multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display group membership entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display group membership entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display group membership entries for all of the VRF instances.

Defaults

By default, all IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IGMP group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast group

Total 8 Groups

```

output definitions

Group Address	IP address of the IP multicast group.
Source Address	IP address of the IP multicast source.
Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv4 multicast group. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast group is displayed.
Interface	The VLAN port or the SPB virtual port on which the group membership was learned.
Mode	IGMP source filter mode.

output definitions

Static	Whether it is a static multicast group or not.
Count	Number of IGMP membership requests made.
Life	Life time of the IGMP group membership.

Release History

Release 7.1.1; command was introduced
Release 8.3.1; **all-vrf** parameter added.
Release 8.4.1; **domain** parameter added.
Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands.

ip multicast static-group	Creates a static IGMP group entry on a specified port for the specified VLAN or on the specified SPB virtual port for the specified SPB service.

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast source [*ip_address***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***] [all-vrf]**

Syntax Definitions

ip_address	IP multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Displays source table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays source table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display source table entries for all of the VRF instances.

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display source entries for a specific multicast group.
- In the service domain, only the first flow that is used to learn the source is displayed. Use the **extended** parameter to display other possible multicast IP addresses matching the same multicast MAC address. In this case, an asterisk (*) in the “Host Address” field represents the other multicast IP addresses.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch. To view the multicast forwarding database on an OS6465 or OS6560 see the **show ip multicast bridge** and **show ip multicast bridge-forward** commands.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast source

show ip multicast tunnel

Displays the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

show ip multicast tunnel [*ip_address***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ip_address	IP multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Displays tunneling table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays tunneling table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display the tunneling table entries for all of the VRF instances.

Defaults

By default, all tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IP multicast tunnel entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast tunnel

Total 3 Tunnels
                                  Destination      Ingress
Group Address   Host Address    Tunnel Address  Vlan/Service
--------------+---------------+---------------+-------------
225.0.1.0       21.20.20.2      10.10.10.51     vlan 20

show ip multicast host-list

Displays the IP multicast host address list configuration for the switch.

show ip multicast host-list [*host_list_name***]**

Syntax Definitions

host_list_name	The name of an existing IP multicast host list.

Defaults

By default, all host lists configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the *host_list_name* parameter to display information for a specific host list.

Examples

```
-> show ip multicast host-list

Total 2 Lists

Host List Name                   Addresses
---------------------------------+---------------
group-map1                       10.2.2.1

   alaIpmsHostListName
   alaIpmsHostListAddressType
   alaIpmsHostListAddress
```

show ip multicast ssm-map

Displays the Source Specific Multicast (SSM) mapping configuration for the switch.

show ip multicast ssm-map [vlan *vlan_id***]**

Syntax Definitions

vlan_id	VLAN for which to display the configuration.

Defaults

By default, all SSM mappings configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ip multicast ssm-map
Type    Id    Group Address/Prefix  Source List Name
-------+-----+---------------------+--------------------------------
global  0     225.20.1.1/32         h-list1
vlan    200   229.30.1.1/32         h-list2

-> show ip multicast ssm-map vlan 200
Type    Id    Group Address/Prefix  Source List Name
-------+-----+---------------------+--------------------------------
vlan    200   229.30.1.1/32         h-list2
```

Release History

Release 8.3.1.R02; command introduced.

   alaIpmsSsmMapSourceListName
```

show ip multicast bridge

Displays the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

show ip multicast bridge [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***] |** *ip_address* **|** *mac_address***] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465 and OmniSwitch 6560.*
ip_address	IP multicast group address.
mac_address	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ip_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
  - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge

Total 2 Bridge Entries

Vlan/Service   Type      Group Address     Host Address Action      UpTime
--------------+---------+-----------------+------------+-----------+---------------
vlan 1         asm       224.1.2.3                      forwarding  00d:00h:00m
vlan 10        mac       01-00-5e-09-08-07              forwarding  00d:00h:00m

-> show ip multicast bridge vlan 10

Total 1 Bridge Entries

Vlan/Service   Type      Group Address     Host Address Action      UpTime
--------------+---------+-----------------+------------+-----------+---------------
vlan 10        mac       01-00-5e-09-08-07              forwarding  00d:00h:00m
```

output definitions

Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
Type	The bridge entry type (**asm**, **ssm**, **mac**). Configured through the **ip multicast forward-mode** command.
Group Address	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
Host Address	The source IP host address (only applies to SSM bridge entries, otherwise this field is blank).
Action	The current action taken for the bridge entry (**forwarding** or **filtering**).
UpTime	The amount of time that has elapsed since the bridge entry was created.

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02: **service** parameter added.

Related Commands

```

show ip multicast bridge-forward

Displays the forwarding state of the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

show ip multicast bridge-forward [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***] |** *ip_address* **|** *mac_address***] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465 and OmniSwitch 6560.*
ip_address	IP multicast group address.
mac_address	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ip_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
  - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge-forward

Total 2 Bridge Entries

Vlan/Service  Type    Group Address     Host Address Next Interface UpTime
------------+-------+-----------------+-----------+--------------+--------------
vlan 1        asm     224.1.2.3                     1/4/12         00h:00m:01s
vlan 10       mac     01-00-5e-09-08-07             1/4/12         00h:00m:05s

-> show ip multicast bridge-forward vlan 10

Total 1 Bridge Entries

Vlan/Service  Type    Group Address     Host Address Next Interface UpTime
------------+-------+-----------------+-----------+--------------+--------------
vlan 10       mac     01-00-5e-09-08-07             1/4/12         00h:00m:05s
```

output definitions

Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
Type	The bridge entry type (**asm**, **ssm**, **mac**). Configured through the **ip multicast forward-mode** command.
Group Address	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
Host Address	The source IP host address (only applies to SSM bridge entries, otherwise this field is blank).
Next Interface	The destination interface for the bridge forwarding entry.
UpTime	The amount of time that has elapsed since the bridge forward entry was created.

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02: **service** parameter added.

show ip multicast bidir-forward

Displays the IP multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

show ip multicast bidir-forward [*ip_address***] [all-vrf]**

Syntax Definitions

ip_address	IP multicast group address.
all-vrf	Display forwarding table entries for all of the virtual routing and forwarding (VRF) instances.

Defaults

By default, BIDIR-PIM forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the *ip_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.

Examples

```
-> vrf vrf-1 show ip multicast bidir-forward

VRF:vrf-1  Total 2 Forwards

                  Egress
Group Address   Vlan/Service  Interface
---------------+-------------+-----------
225.0.1.0       vlan 30       1/2/1
                vlan 30       1/2/2

-> show ip multicast bidir-forward all-vrf

VRF:default  Total 3 Forwards

                  Egress
Group Address   Vlan/Service  Interface
---------------+-------------+-----------
225.0.1.0       vlan 20       1/1/1
                vlan 20       1/1/2
225.0.1.1       vlan 21       1/1/2
```

```
VRF:vrf-1  Total 2 Forwards

                  Egress
Group Address   Vlan/Service  Interface
--------------+-------------+-----------
225.0.1.0       vlan 30       1/2/1
                vlan 30       1/2/2
```

output definitions

VRF	The VRF instance for the BIDIR route.
Group Address	IP group address for the BIDIR route.
Egress VLAN/Service	The destination VLAN or Shortest Path Bridging (SPB) service for the BIDIR route.
Interface	Destination VLAN port or SPB virtual port for the BIDIR route.

Release History

show ip multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

show ip multicast profile [*profile_name***]**

Syntax Definitions

profile_name	The name of an existing IPMS profile.

Defaults

By default, a list of available profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The specified profile name must already exist in the switch configuration.

Examples

```
-> show ip multicast profile

Total 2 Profiles

Profile Name
--------------------------------
default
IGMPv3 with Zapping

-> show ip multicast profile "IGMPv3 with Zapping"

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

show ipv6 multicast [vlan *vlan_id* **| service** *service_id***]**

Syntax Definitions

vlan_id	VLAN for which to display the configuration.
service_id	SPB service ID number (1–32767). *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

By default, the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

Examples

```
-> show ipv6 multicast

Profile                                          = default,

Zero-based Query                                 = disabled,
Forward Mode                                     = mac,
Update Delay Interval (milliseconds)             = 0,
SSM Mapping                                      = disabled,
Fast Join                                        = disabled,
Initial Packet Buffering                         = disabled,
    Max Flows                                    = 32,
    Max Packets Per Flow                         = 32,
    Buffer Timeout (seconds)                     = 10,
    Min Delay (milliseconds)                     = 0
```

output definitions

Profile	The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the **ipv6 multicast profile** command.
Status	Whether the IPv6 Multicast Switching and Routing is **Enabled** or **Disabled** (the default status).Configured through the **ipv6 multicast admin-state** command.
Flood Unknown	Whether the flooding of initial unknown multicast traffic is **Enabled** or **Disabled** (the default status). Configured through the **ipv6 multicast flood-unknown** command.
Version	Displays the default MLD version, which can be **1** or **2**. Configured through the **ipv6 multicast version** command.
Robustness	Displays the MLD robustness value, ranging from **1** to **7.** (The default value is 2). Configured through the **ipv6 multicast robustness** command.
Querying	Whether MLD querying is **Enabled** or **Disabled** (the default status). Configured through the **ipv6 multicast querying** command.
Query Interval (seconds)	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). Configured through the **ipv6 multicast query-interval** command.
Query Response Interval (milliseconds)	Displays the time (in milliseconds) taken to reply to an MLD query message. (The default value is 100 tenths-of-seconds). Configured through the **ipv6 multicast query-response-interval** command.
Last Member Query Interval (milliseconds)	Displays the time (in milliseconds) taken to reply to an MLD query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the **ipv6 multicast last-member-query-interval** command.
Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). Configured through the **ipv6 multicast unsolicited-report-interval** command.

output definitions

Proxying	Whether MLD proxying on the system is **Enabled** or **Disabled** (the default status)**.** Configured through the **ipv6 multicast proxying** command.
Spoofing	Whether MLD spoofing on the system is **Enabled** or **Disabled** (the default status)**.** Configured through the **ipv6 multicast spoofing** command.
Zapping	Whether MLD zapping on the system is **Enabled** or **Disabled** (the default status)**.** Configured through the **ipv6 multicast zapping** command.
Querier Forwarding	Whether MLD querier forwarding on the system is **Enabled** or **Disabled** (the default status)**.** Configured through the **ipv6 multicast querier-forwarding** command.
Router Timeout (seconds)	Displays the MLD router timeout in seconds. (The default value is 90 seconds.) Configured through the **ipv6 multicast router-timeout** command.
Source Timeout (seconds)	Displays the MLD source timeout in seconds. (The default value is 30 seconds.) Configured through the **ipv6 multicast source-timeout** command.
Max-group	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0 which means no limit is imposed). Configured through the **ipv6 multicast max-group** command.
Max-group action	Displays the action taken when the maximum group limit has been exceeded, which can be **none**, **drop** or **replace**. Configured through the **ipv6 multicast max-group** command.
Helper-address	Displays the destination IPv6 address of a relay host, where MLD host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) *This function is supported only in the VLAN domain; service domain is not supported.*
Static Querier Address	The Static Source IPv6 Address to be used when querying. (The default value of "::" indicates that this is not configured.) *This function is currently not supported.*
Static Spoofing Address	The Static Source IPv6 Address to be used when spoofing. (The default value of "::" indicates that this is not configured.) Configured through the **ipv6 multicast spoofing static-source-ip** command.
Zero-based Query	The current state of Zero-based Querying, which can be **disabled** or **enabled** (the default status). Configured through the **ipv6 multicast zero-based-query** command.
Forward Mode	Displays the current IPv6 Forwarding mode (**asm**, **ssm**, **mac**, or **auto**). Configured through the **ipv6 multicast forward-mode** command.
Update Delay Interval (milliseconds)	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the **ipv6 multicast update-delay-interval** command.

output definitions

SSM Mapping	Whether Source Specific Multicast (SSM) mapping is **enabled** or **disabled** (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the **ipv6 multicast ssm-map** command. *This function is currently not supported.*
Fast Join	Whether the IP Multicast Switching fast join functionality is **enabled** or **disabled** (the default). When enabled, forwarding entries are automatically created in hardware as soon as group memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the **ipv6 multicast fast-join** command.
Initial Packet Buffering	Whether Initial Packet Buffering is **enabled** or **disabled** (the default status). Configured through the **ipv6 multicast initial-packet-buffer admin-state** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Max Flows	The maximum number of IPv6 multicast flows buffered for initial packet. Configured through the **ipv6 multicast initial-packet-buffer max-flow** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Max Packets Per Flow	The maximum number of initial packets buffered per IPv6 multicast flow. Configured through the **ipv6 multicast initial-packet-buffer max-packet** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Buffer Timeout (seconds)	The timeout value for the initial buffered IPv6 multicast packets. Configured through the **ipv6 multicast initial-packet-buffer timeout** command. *This function is supported only in the VLAN domain; service domain is not supported.*
Min Delay (milliseconds)	The minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Configured through the **ipv6 multicast initial-packet-buffer min-delay** command. *This function is supported only in the VLAN domain; service domain is not supported.*

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; display fields added.
Release 8.4.1; **service** parameter added.

Related Commands

ipv6 multicast admin-state	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance is also displayed.

show ipv6 multicast {port [*chassis/slot/port***] | sap port** [*sap_id*]}

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
sap_id	The SAP ID (chassis/slot/port:encapsulation).*This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a port number to display the configuration information for a specific port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

Examples

```

```

output definitions

Interface	The VLAN port or the SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the SPB service.
Vlan/Service	The VLAN or SPB service ID associated with the IPv6 multicast interface.
Current Groups	The current groups associated with the IPv6 multicast interface.
Interface Max-group	The maximum group count allowed on the port or SAP port. This limit is applicable on the given port for all VLAN or service instances of the port.
Interface Action	The action to be taken when the group membership limit is exceeded (**none**, **drop**, or **replace**).

output definitions

Interface-Instance Max-group	The maximum group limit learned per port for the given VLAN or per SAP port for the given SPB service. This limit is applied to each port that is a member of the given VLAN or each SAP port that is a member of the given service.
Interface-Instance Action	The action to be taken when the group membership limit is exceeded (**none**, **drop**, or **replace**).

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

ipv6 multicast port max-group	Configures the maximum group limit learned per port.
ipv6 multicast max-group	Configures the maximum group limit learned per port for the specified VLAN, SPB service, or on the system if no VLAN or SPB service is specified.

```

show ipv6 multicast forward

Display the IPv6 Multicast Switching and Routing forwarding table entries for the specified IPv6 multicast group address or all entries if no IPv6 multicast address is specified.

show ipv6 multicast forward [*ipv6_ddress***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ipv6_address	IPv6 multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display forwarding table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display forwarding table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display forwarding table entries for all of the VRF instances.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_address* parameter to display forwarding entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- Forwarding entries are derived by applying the state from the source table to the state in the group, neighbor, and querier tables.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch. To view the multicast forwarding database on an OS6465 or OS6560 see the **show ipv6 multicast bridge** and **show ipv6 multicast bridge-forward** commands.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Ingress Vlan/Service” and “Egress Vlan/Service” fields instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast forward

ff06::1         ::              ::               VlanToCore   VlanToDist   1/1/2
```

output definitions

Group Address	IPv6 group address of the IPv6 multicast forward.
Host Address	IPv6 host address of the IPv6 multicast forward.
Tunnel Address	IPv6 source tunnel address of the IPv6 multicast forward.

output definitions (continued)

Ingress VLAN/Service	The ingress VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast forward. If the global display interface names option is enabled, then the ingress interface name associated with the IPv6 multicast forward is displayed.
Egress VLAN/Service	The egress VLAN or SPB service ID associated with the IPv6 multicast forward. If the global display interface names option is enabled, then the egress interface name associated with the IPv6 multicast forward is displayed. The egress interface (port) will also be included in the forward entry with both output formats.
Interface	The VLAN port or SPB virtual port of the IPv6 multicast forward.

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **all-vrf** parameter added.
Release 8.4.1; **domain** parameter added.
Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ipv6 multicast static-group	Creates a static MLD group entry on a specified port on a specified VLAN.

MIB Objects

show ipv6 multicast neighbor

Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast neighbor [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Display MLD neighbor table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display MLD neighbor table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display MLD neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the IPv6 neighbor table entries that exist in all of the VRF instances on the switch.
- Interfaces with neighbors receive all IPv6 multicast, including all MLD traffic.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```

fe80::2a0:ccff:fed3:2853   vlan 20        1/1/2                no      1      6
::                         vlan 20        1/1/13               yes     0      0
```

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
-> show ipv6 multicast neighbor vlan

Total 2 Neighbors

Host Address               Vlan/Service   Interface            Static  Count  Life
-------------------------+--------------+--------------------+-------+------+-----
fe80::2a0:ccff:fed3:2853   VlanToLab      1/1/2                no      1      6
::                         VlanToLab      1/1/13               yes     0      0
```

output definitions

Host Address	The IPv6 address of the IPv6 multicast neighbor.
VLAN/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast neighbor. If the global display interface names option is enabled, then the interface name associated with the IP multicast neighbor is displayed.
Interface	The VLAN port or the SPB virtual port of the IPv6 multicast neighbor.
Static	Whether it is a static MLD neighbor or not.
Count	Displays the count of the IPv6 multicast neighbor.
Life	The life time of the IPv6 multicast neighbor.

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **all-vrf** parameter added.
Release 8.4.1; **domain** parameter added.
Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ipv6 multicast static-neighbor	Creates a static MLD neighbor entry on a specified port on a specified VLAN.

show ipv6 multicast querier

Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast querier [vlan [*vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Display MLD querier table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display MLD querier table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display querier table entries for all of the VRF instances.

Defaults

By default, only MLD querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the MLD querier table entries that exist in all of the VRF instances on the switch.
- Interfaces with queriers receive all MLD traffic, and if querier forwarding is enabled, these interfaces will also receive all IPv6 multicast traffic.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast querier

Total 4 Queriers

Host Address               Vlan/Service   Interface           Static  Count  Life
--------------------------+--------------+-------------------+-------+------+-----

show ipv6 multicast group

Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast group [*ipv6_ddress***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ipv6_ddress	IPv6 multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display MLD group membership entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display MLD group membership entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display group membership entries for all of the VRF instances.

Defaults

By default, all IPv6 multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_ddress* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast group ff05::5

Group Address   Source Address Vlan/Service Interface Mode     Static Count  Life
---------------+--------------+------------+----------+--------+------+------+-----
ff05::5         ::             vlan 21      1/1/19     exclude  no     1      145
ff05::5         ::             service 20   SAP:1/5:10 exclude  no     5520   172
```

```
-> show ipv6 multicast group service

ff05::9         ::               VlanToDist   1/1/21    exclude  yes    0      0
```

output definitions

Group Address	IPv6 address of the IPv6 multicast group.
Source Address	IPv6 address of the IPv6 multicast source.
Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast group. If the global display interface names option is enabled, then the IPv6 interface name associated with the IPv6 multicast group is displayed.
Interface	The VLAN port or the SPB virtual port on which the group membership was learned.
Mode	MLD source filter mode.
Static	Whether it is a static MLD group or not.
Count	Number of MLD membership requests made.
Life	Life time of the MLD group membership.

Release History

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast source [*ipv6_ddress***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ipv6_address	IPv6 multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display source table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display source table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Displays source table entries for all of the VRF instances.

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_ddress* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD source table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch. To view the multicast forwarding database on an OS6465 or OS6560 see the **show ip multicast bridge** and **show ip multicast bridge-forward** commands.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast source

show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

show ipv6 multicast tunnel [*ipv6_address***] [vlan [***vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***]] [all-vrf]**

Syntax Definitions

ipv6_address	IPv6 multicast group address.
vlan [*vlan_id***[-***vlan_id2***]**	Display tunneling table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Display tunneling table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
all-vrf	Display the IPv6 tunneling table entries for all of the VRF instances.

Defaults

By default, all IPv6 tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IPv6 multicast tunnel entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast tunnel

Group Address   Host Address    Tunnel Address  Vlan/Service
---------------+---------------+---------------+---------------
ff05::6         4444::2         5555::3         vlan 21
ff05::7         4444::2         5555::3         vlan 21
```

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
-> show ipv6 multicast tunnel vlan

Total 2 Tunnels

                                  Destination      Ingress
Group Address   Host Address    Tunnel Address  Vlan/Service
---------------+---------------+---------------+---------------
ff05::6         4444::2         5555::3         VlanToLab
ff05::7         4444::2         5555::3         VlanToLab
```

output definitions

Group Address	IPv6 group address of the IPv6 multicast tunnel.
Host Address	IPv6 host address of the IPv6 multicast tunnel.
DestinationTunnel Address	IPv6 source tunnel address of the IPv6 multicast tunnel.
Ingress Vlan/Service	VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast tunnel. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast tunnel is displayed.

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **all-vrf** parameter added.
Release 8.4.1.R02; **vlan** and **service** parameters added.

Related Commands

show ipv6 multicast source	Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

MIB Objects

   alaIpmsTunnelDestAddress
   alaIpmsTunnelOrigAddress
   alaIpmsTunnelType
   alaIpmsTunnelNextDestAddress
   alaIpmsTunnelNextType
```

show ipv6 multicast host-list

Displays the IPv6 multicast host address list configuration for the switch.

show ipv6 multicast host-list [*host_list_name***]**

Syntax Definitions

host_list_name	The name of an existing IPv6 multicast host list.

Defaults

By default, all host lists configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the *host_list_name* parameter to display information for a specific host list.

Examples

```
-> show ipv6 multicast host-list

Total 2 Lists

Host List Name                   Addresses
---------------------------------+---------------
group-map1                       3333::2
                                 3333::3
                                 3333::4
ssm-map1                         4444::2
                                 4444::3
                                 4444::4

-> show ipv6 multicast host-list ssm-map1

Host List Name                   Addresses
---------------------------------+---------------
ssm-map1                         4444::2
                                 4444::3
                                 4444::4
```

Release History

Release 8.3.1.R02; command introduced.

Related Commands

ipv6 multicast host-list	Configures a list of host IPv6 addresses that is used for IPv6 multicast group maps and SSM maps.

MIB Objects

```
alaIpmsHostListTable
   alaIpmsHostListName
   alaIpmsHostListAddressType
   alaIpmsHostListAddress
```

show ipv6 multicast ssm-map

Displays the IPv6 Source Specific Multicast (SSM) mapping configuration for the switch.

show ipv6 multicast ssm-map [vlan *vlan_id***]**

Syntax Definitions

vlan_id	VLAN for which to display the configuration.

Defaults

By default, all IPv6 multicast SSM mappings configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ipv6 multicast ssm-map
Type    Id    Group Address/Prefix  Source List Name
-------+-----+---------------------+-------------------------------
global  0     ff05::5/128           h-list1
vlan    200   ff05::6/128           h-list2

-> show ipv6 multicast ssm-map vlan 200
Type    Id    Group Address/Prefix  Source List Name
-------+-----+---------------------+-------------------------------
vlan    200   ff05::6/128           h-list2
```

Release History

Release 8.3.1.R02; command introduced.

Related Commands

ipv6 multicast ssm-map	Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

MIB Objects

```
alaIpmsSsmMapTable
   alaIpmsSsmMapConfigType
   alaIpmsSsmMapConfigAddressType

   alaIpmsSsmMapSourceListName
```

show ipv6 multicast bridge

Displays the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

show ipv6 multicast bridge [vlan *vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***] |** *ipv6_address* **|** *mac_address***] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465 or OmniSwitch 6560*
ipv6_address	IPv6 multicast group address.
mac_address	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service-id*, *ipv6_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
  - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge vlan 130

Total 2 Bridge Entries

Vlan/Service   Type         Group Address     Host Address  Action      UpTime
--------------+------------+-----------------+-------------+-----------+-----------
vlan 130       asm          ff05::6                         forwarding  00h:00m:04s
service 10     mac          33-33-00-01-01-01               flooding    00h:00m:05s
```

output definitions

Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
Type	The bridge type for the IPv6 multicast bridge entry (**asm**, **ssm**, **mac**). Configured through the **ipv6 multicast forward-mode** command.
Group Address	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
Host Address	The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank).
Action	The current action taken for the bridge entry (**forwarding** or **filtering**).
UpTime	The amount of time that has elapsed since the bridge entry was created.

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

show ipv6 multicast bridge-forward	Displays the forwarding state of the IPv6 multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeTable
   alaIpmsBridgeConfigType
   alaIpmsBridgeAddressType
   alaIpmsBridgeValue
   alaIpmsBridgeType
   alaIpmsBridgeGroupAddress
   alaIpmsBridgeHostAddress
   alaIpmsBridgeUpTime
   alaIpmsBridgeAction
```

show ipv6 multicast bridge-forward

Displays the forwarding state of the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

show ipv6 multicast bridge-forward [vlan *vlan_id***[-***vlan_id2***] | service [***service_id***[-***service_id2***] |** *ipv6_address* **|** *mac_address***] [all-vrf]**

Syntax Definitions

vlan [*vlan_id***[-***vlan_id2***]**	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
service [*service_id***[-***service_id2***]**	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465 and OmniSwitch 6560.*
ipv6_address	IPv6 multicast group address.
mac_address	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ipv6_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
  - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge-forward vlan 130

Total 2 Bridge Forwarding Entries

Vlan/Service  Type        Group Address    Host Address Next Interface UpTime
------------+-----------+----------------+-----------+--------------+-----------
vlan 1        asm-partial ::1.1.2.3                     1/4/12         00h:00m:10s
vlan 130      asm         33-33-ff-ff-ff-ff             1/4/12         00h:00m:07s

-> ipv6 multicast vlan 130 forward-mode mac
-> show ipv6 multicast bridge-forward vlan 130

Total 1 Bridge Forwarding Entries

Vlan/Service  Type        Group Address    Host Address Next Interface UpTime
------------+-----------+----------------+-----------+--------------+-----------
vlan 130      mac         33-33-ff-ff-ff-ff             1/3/25         00h:00m:07s
```

output definitions

Vlan/Service	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
Type	The bridge entry type (**asm**, **ssm**, **mac**). Configured through the **ipv6 multicast forward-mode** command.
Group Address	If the bridge entry type is ASM or SSM, this field displays the destination IPv6 group address; if the bridge entry type is MAC, this field displays the destination MAC address.
Host Address	The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank).
Next Interface	The destination interface for the bridge forwarding entry.
UpTime	The amount of time that has elapsed since the bridge forward entry was created.

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

show ipv6 multicast bridge	Displays the IPv6 multicast bridge table entries.

MIB Objects

```

```

show ipv6 multicast bidir-forward

Displays the IPv6 multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IPv6 multicast group address or all the entries if no IPv6 multicast group address is specified.

show ipv6 multicast bidir-forward [*ipv6_address***] [all-vrf]**

Syntax Definitions

ipv6_address	IPv6 multicast group address.
all-vrf	Display forwarding table entries for all of the VRF instances.

Defaults

By default, BIDIR-PIM forwarding entries for all of the IPv6 multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the *ipv6_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> vrf vrf-1 show ipv6 multicast bidir-forward

VRF:vrf-1   Total 3 Forwards

                  Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         vlan 30        1/2/1
                vlan 30        1/2/2
ff05::8         vlan 31        1/2/2
```

```
-> show ipv6 multicast bidir-forward all-vrf

VRF:default   Total 3 Forwards

                  Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         vlan 20        1/1/1
                vlan 20        1/1/2
ff05::8         vlan 21        1/1/2

VRF:vrf-1   Total 3 Forwards

                  Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         vlan 30        1/2/1
                vlan 30        1/2/2
ff05::8         vlan 31        1/2/2
```

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
-> vrf vrf-1 show ipv6 multicast bidir-forward

VRF:vrf-1   Total 3 Forwards

                  Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         IPv6ToCore2    1/2/1
                IPv6ToCore2    1/2/2
ff05::8         IPv6ToLab2     1/2/2

-> show ipv6 multicast bidir-forward all-vrf

VRF:default   Total 3 Forwards

                  Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         vlanToCore     1/1/1
                vlanToCore1    1/1/2
ff05::8         vlanToLab1     1/1/2

VRF:vrf-1   Total 3 Forwards

                    Egress
Group Address   Vlan/Service   Interface
---------------+--------------+-----------
ff05::6         IPv6ToCore2    1/2/1
                IPv6ToCore2    1/2/2
ff05::8         IPv6ToLab2     1/2/2
```

output definitions

VRF	The VRF instance for the BIDIR route.
Group Address	IPv6 group address for the BIDIR route.

output definitions (continued)

Egress VLAN/Service	The destination VLAN or Shortest Path Bridging (SPB) service for the BIDIR route. If the global display interface names option is enabled, then the IPv6 interface name associated with the BIDIR route is displayed.
Interface	Destination VLAN port or SPB virtual port for the BIDIR route.

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast bridge-forward	Displays the forwarding state of the IPv6 multicast bridge table entries.

   alaIpmsForwardNextType
```

show ipv6 multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

show ipv6 multicast profile [*profile_name***]**

Syntax Definitions

profile_name	The name of an existing IPMS profile.

Defaults

By default, a list of available profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The specified profile name must already exist in the switch configuration.

Examples

```
-> show ipv6 multicast profile

Total 2 Profiles

Profile Name
--------------------------------
default
IGMPv3 with Zapping

-> show ip multicast profile "IGMPv3 with Zapping"

32 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-DVMRP-MIB.mib
Module: alcatelIND1DVMRPMIB

Filename: DVMRP-STD-MIB.mib
Module: dvmrpStdMIB

A summary of the available commands is listed here:

ip load dvmrp

Dynamically loads DVMRP to memory.

ip load dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the **ip dvmrp admin-state** command on page 32-3.

Examples

```
-> ip load dvmrp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables DVMRP protocol on the switch.

MIB Objects

```
alaVrConfigTable
   alaVrConfigDvmrpStatus
```

ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

ip dvmrp admin-state {enable | disable}

Syntax Definitions

enable	Administratively enables DVMRP on the switch.
disable	Administratively disables DVMRP on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the **ip load dvmrp** command on page 32-2.
- To enable or disable DVMRP for a particular interface, refer to the **ip dvmrp interface** command on page 32-6.

Examples

```
-> ip dvmrp admin-state enable
-> ip dvmrp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
ip load dvmrp	Dynamically loads DVMRP to memory.
show ip dvmrp	Displays global DVMRP parameters, including current status.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpAdminStatus
```

ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

ip dvmrp flash-interval *seconds*

Syntax Definitions

seconds	Specifies the interval value, in seconds (5–86400).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

Examples

```
-> ip dvmrp flash-interval 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpFlashUpdateInterval
```

ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

ip dvmrp graft-timeout *seconds*

Syntax Definitions

seconds	Specifies the graft message retransmission value, in seconds (5–86400).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp graft-timeout 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpGraftRetransmission
```

ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

ip dvmrp interface {*interface_name***}**

no ip dvmrp interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Use the **no** form of this command to delete an interface.

Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables the DVMRP protocol on the switch.
ip dvmrp interface metric	Configures the distance metric for an interface, which is used to calculate distance vectors.
show ip dvmrp interface	Displays information for all multicast-capable interfaces.

MIB Objects

```
dvmrpInterfaceTable
   dvmrpInterfaceLocalAddress
   dvmrpInterfaceStatus
```

ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

ip dvmrp interface *interface_name* **metric** *value*

Syntax Definitions

interface_name	The name of the interface.
value	Specifies the metric value (1–31).

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
show ip dvmrp interface	Displays the DVMRP interface table.

MIB Objects

```
dvmrpInterfaceTable
   dvmrpInterfaceLocalAddress
   dvmrpInterfaceMetric
```

ip dvmrp interface mbr-default-information

Configures a DVMRP interface to advertise the default route for the interface. This command only applies when the local switch is operating in the Multicast Border Router (MBR) mode.

ip dvmrp interface *interface_name* **mbr-default-information {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Enables advertisement of the default route on the specified interface.
disable	Disables advertisement of the default route on the specified interface.

Defaults

By default, advertising the default route is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Advertising a default route on the DVMRP interface provides a method for ensuring that sources inside the PIM domain can reach all routers inside the DVMRP domain.
- Make sure that the default route is not advertised on the MBONE.

Examples

```
-> ip dvmrp interface mbr-default-information enable
-> ip dvmrp interface mbr-default-information disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
show ip dvmrp interface	Displays the DVMRP interface table.

MIB Objects

```
alaDvmrpIfAugTable
   alaDvmrpIfMbrDefaultInfoStatus
```

ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

ip dvmrp neighbor-interval *seconds*

Syntax Definitions

seconds	Specifies the probe interval time, in seconds (5–30).

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-timeout	Configures the neighbor timeout.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpNeighborProbeInterval
```

ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

ip dvmrp neighbor-timeout *seconds*

Syntax Definitions

seconds	Specifies the neighbor timeout, in seconds (5–86400).

Defaults

parameter	default
seconds	35

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-timeout 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-interval	Configures the neighbor probe interval time.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpNeighborTimeout
```

ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

ip dvmrp prune-lifetime *seconds*

Syntax Definitions

seconds	Specifies the prune lifetime, in seconds (180–86400).

Defaults

parameter	default
seconds	7200

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-lifetime 7200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp prune-timeout	Configures the prune packet retransmission value.
show ip dvmrp prune	Displays DVMRP prune entries, including the router's upstream prune state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpPruneLifetime
```

ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

ip dvmrp prune-timeout *seconds*

Syntax Definitions

seconds	Specifies retransmission time, in seconds (30–86400).

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-timeout 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
show ip dvmrp prune	Displays DVMRP prune entries, including the router's upstream prune state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpPruneRetransmission
```

ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

ip dvmrp report-interval *seconds*

Syntax Definitions

seconds	Specifies the report interval, in seconds (10–2000).

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp report-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp route	Displays the DVMRP routes that are being advertised to other routers.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteReportInterval
```

ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

ip dvmrp route-holddown *seconds*

Syntax Definitions

seconds	Specifies the holddown time, in seconds (1–86400).

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-holddown 120
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp route-timeout	Configures the route expiration timeout value.
show ip dvmrp	Displays the global DVMRP parameters.
show ip dvmrp route	Displays the DVMRP routes that are being advertised to other routers.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteHoldDown
```

ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

ip dvmrp route-timeout *seconds*

Syntax Definitions

seconds	Specifies the timeout value, in seconds (20–4000).

Defaults

parameter	default
seconds	140

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-timeout 140
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteExpirationTimeout
```

ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

ip dvmrp subord-default {true | false}

Syntax Definitions

true	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
false	DVMRP neighbors are *not* assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

Defaults

parameter	default
true | false	**true**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a suboridinate be changed to false.
- To view the current subordinate neighbor status, use the **show ip dvmrp** command.

Examples

```
-> ip dvmrp subord-default false
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpInitNbrAsSubord
```

show ip dvmrp

Displays the global DVMRP parameters configuration.

show ip dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> show ip dvmrp
DVMRP Admin Status          = enabled,
Flash Interval              = 5,
Graft Timeout               = 5,
Neighbor Interval           = 10,
Neighbor Timeout            = 35,
Prune Lifetime              = 7200,
Prune Timeout               = 30,
Report Interval             = 60,
Route Holddown              = 120,
Route Timeout               = 140,
Subord Default              = true,
BFD status                  = disabled,
MBR Operational Status      = enabled,

Number of Routes            = 3,
Number of Reachable Routes  = 3
```

output definitions

DVMRP Admin Status	The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, use the **ip dvmrp admin-state** command.
Flash Interval	The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

output definitions (continued)

Graft Timeout	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Valid range from 5–86400. The default value is 5.
Neighbor Interval	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Valid range from 5–30. The default value is 10.
Neighbor Timeout	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Valid range from 5–86400. The default value is 35.
Prune Lifetime	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Valid range from 180–86400. The default value is 7200.
Prune Timeout	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Valid range from 30–86400. The default value is 30.
Report Interval	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Valid range from 10–2000. The default value is 60.
Route Holddown	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Valid range from 1–120. The default value is 120.
Route Timeout	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Valid range from 20–4000. The default value is 140.
Subord Default	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, use the **ip dvmrp subord-default** command. Options include **true** and **false**. The default value is true.
BFD Status	Not supported in the current release.
MBR Operational Status	Indicates whether or not DVMRP interaction with PIM is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

output definitions (continued)

Number of Routes	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
Number of Reachable Routes	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR Operational Status** field added.

Related Commands

ip dvmrp admin-state	Globally enables or disables DVMRP protocol on the switch.
ip dvmrp flash-interval	Configures the minimum flash update interval value.
ip dvmrp graft-timeout	Configures the graft message retransmission value.
ip dvmrp neighbor-timeout	Configures the neighbor timeout.
ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
ip dvmrp prune-timeout	Configures the prune packet retransmission value.
ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.
ip dvmrp subord-default	Configures the neighbor probe interval time.

show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

show ip dvmrp interface [*ip_address* **|** *interface_name* **| enabled | disabled]**

Syntax Definitions

ip_address	Specifies a particular interface IP address.
interface_name	The name of the interface.
enabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently *enabled*.
disabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently *disabled*.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as **enabled** in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

Examples

```
-> show ip dvmrp interface

Total 4 Interfaces

Interface Name      Vlan  Metric  Admin-Status  Oper-Status  BFD-Status MBR-Default
------------------+-----+------+-------------+------------+----------+-----------
vlan-4                4       1   Disabled      Disabled      Disabled   Disabled
vlan-6                6       1    Enabled       Enabled      Disabled    Enabled
```

```
-> show ip dvmrp interface enabled

Total 1 Interfaces

Interface Name      Vlan  Metric  Admin-Status  Oper-Status  BFD-Status MBR-Default
------------------+-----+------+-------------+-------------+----------+-----------
vlan-6                 6       1   Enabled       Enabled       Disabled   Enabled
```

output definitions

Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Tunnel	Indicates whether there is a DVMRP tunnel currently configured on the interface.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Admin-Status	The current administrative status of the corresponding interface. Options include **Enabled** or **Disabled**. An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the **ip dvmrp interface** command.
Oper-Status	The current operational status of the corresponding multicast-capable interface. Options include **Enabled** or **Disabled**. For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the **ip dvmrp admin-state** command.
BFD-Status	Not supported in the current release.
MBR-Default	Whether or not the DVMRP interface will advertise a default route when the interface is configured on a Multicast Border Router. Options include **Enabled** or **Disabled**. Configured through the **ip dvmrp interface mbr-default-information** command.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR-Default** field added.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.

show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

show ip dvmrp neighbor [*ip_address***]**

Syntax Definitions

ip_address	Specifies a particular IP address for a neighboring DVMRP router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

Examples

```
-> show ip dvmrp neighbor

Neighbor Address   Intf Name     Uptime      Expires     GenID     Vers  State
----------------+------------+-----------+-----------+----------+------+-------
143.209.92.214    vlan-2      00h:09m:12s 00h:00m:06s 546947509 3.255  active
```

output definitions

Neighbor Address	The 32-bit IP address of the DVMRP neighbor's router interface.
Itnf Name	The interface name of the neighbor's router.
Uptime	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
Expires	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
GenID	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
Version	The DVMRP version number for the neighbor.
State	The current state of the DVMRP neighbor. Options include **active** and **down**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-interval	Configures the neighbor probe interval time.
ip dvmrp neighbor-timeout	Configures the neighbor timeout.

MIB Objects

```
dvmrpNeighborTable
   dvmrpNeighborAddress
   dvmrpNeighborIfIndex

   dvmrpNeighborGenerationId
   dvmrpNeighborMajorVersion
   dvmrpNeighborMinorVersion
   dvmrpNeighborState
```

show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

show ip dvmrp nexthop [*ip_address ip_mask***]**

Syntax Definitions

ip_address	Specifies a source IP address for which DVMRP next hop entries will be displayed.
ip_mask	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0

Src Address/Mask       Interface Name     Vlan    Hop Type
-------------------+-------------------+-------+----------

     172.22.2.115/24  vlan-2               2      branch
```

output definitions

Src Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Hop Type	The hop type of the associated entry. Options include **leaf** or **branch**. If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as **branch**.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

show ip dvmrp prune [*group_address source_address source_mask***]**

Syntax Definitions

group_address	Specifies a pruned group address.
source_address	Specifies a source IP address.
source_mask	Specifies a source IP mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

Examples

```
-> show ip dvmrp prune

Group Address     Source Address/Mask    Expires
-----------------+---------------------+-------------
225.0.0.4           143.209.92.14/24    00h:00m:30s
```

output definitions

Group Address	The 32-bit multicast group address.
Source Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Expires	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
ip dvmrp prune-timeout	Configures the prune packet retransmission value.

MIB Objects

```

```

show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

show ip dvmrp route [*ip_address ip_mask***]**

Syntax Definitions

ip_address	The 32-bit source IP address representing route(s).
ip_mask	A 32-bit number that determines the subnet mask for the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid

       22.0.0.0/8     44.0.0.4           2    00h:33m:14s  02m:15s    R
       44.0.0.0/8           -            1    05h:24m:59s     -       L
       55.0.0.0/8           -            1    05h:24m:59s     -       L
       66.0.0.0/8     44.0.0.4           2    00h:03m:11s  02m:15s    R
```

output definitions

Address/Mask	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals / 16; 255.255.255.0 equals /24, etc.
Gateway	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Age	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

output definitions (continued)

Expires	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
Flags	The flag type of a particular DVMRP route. Options include **L** (Local), **R** (Remote), **F** (Flash), **H** (Holddown), and **I** (Invalid).

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.

MIB Objects

```
dvmrpRouteTable
   dvmrpRouteSource
   dvmrpRouteSourceMask
   dvmrpRouteMetric
   dvmrpRouteExpiryTime
   dvmrpRouteUpTime
```

show ip dvmrp tunnel

Displays DVMRP tunnel entries.

show ip dvmrp tunnel [*local_address remote_address***]**

Syntax Definitions

local_address	The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.
remote_mask	The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

Examples

```
-> show ip dvmrp tunnel

Interface Name       Local Address     Remote Address    TTL    Status
-------------------+-----------------+-----------------+-----+----------
vlan-2              143.209.92.203   12.0.0.1          255    Enabled
```

output definitions

Interface Name	The interface name.
Local Address	The 32-bit local IP address for the DVMRP tunnel.
Remote Address	The 32-bit remote IP address for the DVMRP tunnel.
TTL	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Valid range from 0–255.
Status	The corresponding interface status. Options include **Enabled** or **Disabled**. If the interface specified by the local address has been configured and is operationally enabled, the status is **Enabled**. If the interface is down, the value displayed is **Disabled**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip interface tunnel	Adds or deletes a DVMRP tunnel.
show ip dvmrp	Configures the TTL value for the tunnel defined for the specified local address and remote address.

MIB Objects

```
tunnelIfTable
   tunnelIfLocalAddress
   tunnelIfRemoteAddress
   tunnelIfHopLimit
dvmrpInterfaceGroup
   dvmrpInterfaceStatus
```

33 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs).

PIM-SIM builds unidirectional shared trees that are rooted at a Rendezvous Point (RP) multicast router. Bidirectional PIM (BIDIR-PIM) is a variant of PIM-SM that builds bidirectional shared trees also rooted at an RP. However, BIDIR-PIM forwards packets from the source to the RP without the overhead of encapsulation or source-specific states.

PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

The OmniSwitch implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

ip load pim

Dynamically loads PIM to memory.

ip load pim

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip load pim
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim sparse admin-state	Globally enables or disables the PIM-SM protocol on the switch.
ip pim bidir admin-state	Globally enables or disables the BIDIR-PIM protocol on the switch.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
ip pim dense admin-state	Globally enables or disables PIM-DM protocol on the switch.
show ip pim dense	Displays the status of the various global parameters for the PIM Dense mode.
ipv6 pim sparse admin-state	Enables or disables IPv6 PIM-SM (sparse mode) globally for IPv6.
ipv6 pim bidir admin-state	Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
ipv6 pim dense admin-state	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaVrConfigTable
   alaVrConfigPimStatus
```

ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

ip pim sparse admin-state {enable | disable}

Syntax Definitions

enable	Globally enables PIM-SM on the switch.
disable	Globally disables PIM-SM on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim sparse admin-state enable
-> ip pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip load pim	Dynamically loads PIM to memory.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmAdminStatus
```

ip pim bidir admin-state

Globally enables or disables the BIDIR-PIM protocol on the switch.

ip pim bidir admin-state {enable | disable}

Syntax Definitions

enable	Globally enables BIDIR-PIM on the switch.
disable	Globally disables BIDIR-PIM on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.
- BIDIR-PIM is a variant of PIM-SM, which means that PIM-SM must also be globally enabled on the switch.

Examples

```
-> ip pim bidir admin-state enable
-> ip pim bidir admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip load pim	Dynamically loads PIM to memory.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmBidirStatus
```

ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

ip pim dense admin-state {enable | disable}

Syntax Definitions

enable	Globally enables PIM-DM on the switch.
disable	Globally disables PIM-DM on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim dense admin-state enable
-> ip pim dense admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip load pim	Dynamically loads PIM to memory.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
   alaPimdmAdminStatus
```

ip pim rp-hash admin-state

Configures the version of the hashing algorithm that the Rendezvous Point (RP) hashing function will use to select an RP.

ip pim rp-hash admin-state {enable | disable}

Syntax Definitions

enable	Applies the newer version of the hashing algorithm.
disable	Applies the legacy version of the hashing algorithm.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The RP hashing function is applied when selecting an RP from two or more equal group-range-to-RP mappings.
- To maintain interoperability between PIM routers, make sure all routers have the same setting for the RP hash function. For example, this function is enabled for all PIM routers or this function is disabled for all PIM routers.

Examples

```
-> ip pim rp-hash admin-state enable
-> ip pin rp-hash admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmRPHashStatus
```

ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

ip pim ssm group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ip pim ssm group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
priority	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

Examples

```
-> ip pim ssm group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim ssm group	Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
pimStaticRPTable
   pimStaticRPGrpAddress
   pimStaticRPGrpPrefixLength
   pimStaticRPPimMode
   pimStaticRPPrecedence
   pimStaticRPOverrideDynamic
   pimStaticRPRowStatus
```

ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

ip pim dense group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ip pim dense group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
override	Specifies that this static Dense mode mapping configuration should override the dynamically learned group mapping information for the specified group(s).
priority	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ip pim dense group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ip pim dense group	Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
alaPimdmDenseGroupTable
   alaPimdmDenseGroupGrpAddress
   alaPimdmDenseGroupGrpPrefixLength
   alaPimdmDenseGroupOverrideDynamic
   alaPimdmDenseGroupPrecedence
   alaPimdmDenseGroupRowStatus
```

ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ip pim cbsr *ip_address* **[priority** *priority***] [mask-length** *bits***]**

no ip pim cbsr *ip_address*

Syntax Definitions

ip_address	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
priority	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0–255.
bits	Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).Values may range from 1–32.

Defaults

parameter	default
priority	64
bits	30

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim cbsr	Displays the Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```
pimBsrCandidateBSRTable
   pimBsrCandidateBSRAddress
   pimBsrCandidateBSRPriority
   pimBsrCandidateBSRHashMaskLength
   pimBsrCandidateBSRRowStatus
```

ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

ip pim static-rp *group_address/prefix_length rp_address* **[[no] bidir] [[no] override] [priority** *priority***]**

no ip pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
rp_address	Specifies a 32-bit Rendezvous Point (RP) address.
bidir	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
priority	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

- To view current static RP configuration settings, use the **show ip pim static-rp** command.

Examples

```
-> ip pim static-rp 225.0.0.0/24 10.1.1.1 priority 10
-> ip pin static-rp 225.0.0.0/24 10.1.1.1 bidir overide
-> no ip pin static-rp 225.0.0.0/24 10.1.1.1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** parameter added.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim static-rp	Displays the PIM static RP table for ASM mode, which includes the group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
pimStaticRPTable
   pimStaticRPGrpAddress
   pimStaticRPGrpPrefixLength
   pimStaticRPRPAddress
   pimStaticRPPimMode
   pimStaticRPOverrideDynamic
   pimStaticRPPrecedence
   pimStaticRPRowStatus
```

ip pim anycast-rp

Configures the anycast RP set, which is the set of all routers that would act as the RP.

ip pim anycast-rp *anycast_rp_address rp_address*

no ip pim anycast-rp *anycast_rp_address rp_address*

Syntax Definitions

anycast-rp-address	Specifies the anycast RP address.
rp_address	Specifies a 32-bit Rendezvous Point (RP) address of a router that is a member of the anycast RP set.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of this command to delete an anycast RP configuration.
- The RP specified by anycast-RP-address is the RP in the anycast RP set. This address must be the same as the RP address in the Static-RP configuration used with the '**ip pim static-rp**' command if static RP configuration is being used.
- It is recommended not to use Loopback0 as the anycast RP address since Loopback0 is often used as the Router ID by default with the unicast routing protocols. Hence, it is recommended. to use one of the additional LoopbackX interfaces for the anycast RP address, but it is not mandatory to be a LoopbackX address.
- The RP specified by rp-address defines the IP address of the prospective RP. This address must be different than the anycast RP address and is used in communication between the different RPs in the anycast RP set. This configuration must be the same on all routers in the Anycast-RP set.
- There must be a separate entry for each of the RPs participating in anycast RP set, including an entry for the local router.This configuration defining the anycast RP set must be the same on all routers participating in anycast RP.
- It is recommended to configure PIM register rate limiting (see **ip pim register-rate-limit**) to limit the sending of PIM register messages with Anycast RP.
- Ensure SPT is enabled (see **ip pim spt admin-state**) when using Anycast RP. If SPT is globally disabled, and Anycast RP configuration is added, this configuration will be ignored for all groups that are operating in Anycast-RP mode.

Examples

```
-> ip pim static-rp 224.0.0.0/4 10.10.10.1
-> ip pim anycast-rp 10.10.10.1 10.1.1.1
```

```
-> ip pim anycast-rp 10.10.10.1 10.1.1.2

-> no ip pim anycast-rp 10.10.10.1 10.1.1.2
```

Release History

Release 8.6R2; command introduced.

Related Commands

ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).
show ip pim anycast-rp	Displays the anycast RP table, which includes the anycast RP address, the RP address, if its the local router, and the current status of the anycast RP configuration

MIB Objects

```
pimAnycastRPSetTable
   pimAnycastRPSetAddressType
   pimAnycastRPSetAnycastAddress
   pimAnycastRPSetRouterAddress
   pimAnycastRPSetRowStatus
```

ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

ip pim candidate-rp *rp_address group-address/prefix_length* **[[no] bidir] [priority** *priority***] [interval** *seconds***]**

no ip pim candidate-rp *rp_address group-address/prefix_length*

Syntax Definitions

rp_address	Specifies a 32-bit address that will be advertised as a Candidate-RP.
group_address	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
/prefix_length	Specifies the prefix length of the multicast group.
bidir	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
priority	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
seconds	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
[no] bidir	**no bidir**
priority	192
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple C-RP entries are defined, they must specify the same *rp-address.*
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the C-RP entries.

- This command is supported only in the sparse mode.

Examples

```
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 priority 100 interval 100
-> ip pin candidate-rp 50.1.1.1 225.0.0.0/24 bidir priority 100 interval 100
-> no ip pim candidate-rp 50.1.1.1 225.0.0.0/24
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** parameter added.

Related Commands

show ip pim candidate-rp	Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

MIB Objects

   pimBsrCandidateRPPriority
   pimBsrCandidateRPAdvInterval
   pimBsrCandidateRPRowStatus
```

ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

ip pim rp-threshold *bps*

Syntax Definitions

bps	The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

Defaults

parameter	default
bps	1

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the **show ip pim sparse** command.

Examples

```
-> ip pim rp-threshold 131072
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the global parameters for PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmRPThreshold
```

ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

ip pim keepalive-period *seconds*

Syntax Definitions

seconds	Specifies the timeout value, in seconds (0-65535).

Defaults

parameter	default
seconds	210

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

Examples

```
-> ip pim keepalive-period 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
pim
   pimKeepalivePeriod
```

ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

ip pim max-rps *number*

Syntax Definitions

number	The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

Defaults

parameter	default
number	32

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the **ip pim sparse admin-state** command on page 33-5.

Examples

```
-> ip pim max-rps 32
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim sparse admin-state	Globally enables or disables the PIM-SM protocol on the switch.
ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmMaxRPs
```

ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

ip pim probe-time *seconds*

Syntax Definitions

seconds	The probe time, in seconds (1–300).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim probe-time 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmProbeTime
```

ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

ip pim register checksum {header | full}

Syntax Definitions

header	Specifies that the checksum for registers is done only on the PIM header.
full	Specifies that the checksum is done over the entire PIM register message.

Defaults

parameter	default
header | full	**header**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmOldRegisterMessageSupport
```

ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

ip pim register-suppress-timeout *seconds*

Syntax Definitions

seconds	The timeout value, in seconds (0–65535).

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-suppress-timeout 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
pim
   pimRegisterSuppressionTime
```

ip pim register-rate-limit

Configures the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.

ip pim register-rate-limit *pps*

Syntax Definitions

pps	The per (S,G) register rate limit in packets per second (0–65535).

Defaults

By default, the register rate limit is set to zero (no rate-limiting is applied to outgoing PIM Register messages).

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Setting the register rate limit to zero (the default) disables register rate limiting.
- Rate limiting is applied on a per (S,G) flow basis.
- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-rate-limit 100
-> ip pim register-rate-limit 0
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfigTable
   alaPimsmRegisterRateLimit
```

ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

ip pim spt admin-state {enable | disable}

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the **show ip pim sparse** command.

Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmAdminSPTConfig
```

ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

ip pim state-refresh-interval *seconds*

Syntax Definitions

seconds	The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-interval 80
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
pim
   pimRefreshInterval
```

ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

ip pim state-refresh- limit *ticks*

Syntax Definitions

ticks	The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

Defaults

parameter	default
ticks	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

Examples

```
-> ip pim state-refresh-limit 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
   alaPimdmStateRefreshLimitInterval
```

ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

ip pim state-refresh- ttl *num*

Syntax Definitions

num	The Time to Live to be used. Values may range from 0 to 255.

Defaults

parameter	default
num	16

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-ttl 122
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.

   alaPimdmStateRefreshTimeToLive
```

ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

ip pim interface *if_name*
[hello-interval *seconds***]**
[triggered-hello *seconds***]**
[joinprune-interval *seconds***]**
[hello-holdtime *seconds***]**
[joinprune-holdtime *seconds***]**
[prune-delay *milliseconds***]**
[override-interval *milliseconds***]**
[dr-priority *priority***]**
[prune-limit-interval *seconds***]**
[graft-retry-interval *seconds***]**
[df-election-robustness *messages***]**
[[no] stub]
[joinprune-mtu *bytes***]**
[joinprune-delay *milliseconds***]**

no ip pim interface *if_name*

Syntax Definitions

if_name	The interface name on which PIM is being enabled or disabled.
hello-interval *seconds*	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values range from 0 to 18000.
triggered-hello *seconds*	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values range from 0 to 60.
joinprune-interval *seconds*	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values range from 0 to 18000.
hello-holdtime *seconds*	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values range from 0 to 65535.
joinprune-holdtime *seconds*	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds.Values range from 0 to 65535.
prune-delay *milliseconds*	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values range from 0 to 32767.
override-interval *milliseconds*	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in *milliseconds.* Values range from 0 to 65535.

dr-priority *priority*	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.
prune-limit-interval *seconds*	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values range from 0 to 65535.
graft-retry-interval *seconds*	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values range from 0 to 65535.
df-election-robustness *messages*	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values range from 1–65535. This value is used only by BIDIR-PIM
stub	Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets.
joinprune-mtu *bytes*	Specifies the maximum size used for PIM Join/Prune packets sent out of the interface. Values range from 0 to 9198. *Supported only on the OmniSwitch 6860 and OmniSwitch 6900.*
joinprune-delay *milliseconds*	Specifies the Join/Prune delay interval in milliseconds. Values range from 0 to 32767. *Supported only on the OmniSwitch 6860 and OmniSwitch 6900.*

Defaults

parameter	default
hello-interval *seconds*	30
triggered-hello *seconds*	5
joinprune-interval *seconds*	60
hello-holdtime *seconds*	105
joinprune-holdtime *seconds*	210
prune-delay *milliseconds*	500
override-interval *milliseconds*	2500
dr-priority *priority*	1
prune-limit-interval *seconds*	60
graft-retry-interval *seconds*	3
df-election-robustness *messages*	3
stub	Disabled
joinprune-mtu *bytes*	0
joinprune-delay *milliseconds*	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the **ip pim sparse admin-state** command on page 33-5. To enable or disable PIM-DM on the switch, refer to the **ip pim dense admin-state** command on page 33-7.
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.
- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.
- If the IP interface on which PIM is enabled is bound to an SPB service, then PIM can operate over an SPB L3 VPN in-line routing configuration (supported only on the OmniSwitch 9900).
- By default, **joinprune-mtu** value is ‘0’ and the configured interface MTU value will be used in determining the maximum packet size that can be used in sending the packed messages. However, if the Join/Prune MTU configuration is specified, the actual maximum size used for PIM Join/Prune messages will be the smaller of the IP MTU value of the interface and the configured interface Join/Prune MTU value.
- The **joinprune-delay** interval is used to delay the sending of triggered Join/Prune messages and may be desirable to allow the packing of triggered Join.Prune messages due to bursts of protocol messages, which may result in subsequent bursts of triggered Join/Prune packets. The default value of ‘0’ implies no deferred processing and will result in no packing of triggered Join/Prune packets.

Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval
100 hello-holdtime 350 joinprune-holdtime 400
-> no ip pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **df-election-robustness** parameter added.
Release 8.6R1; **joinprune-mtu**, **joinprune-delay** parameters added.

Related Commands

ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

ip pim neighbor-loss-notification-period *seconds*

Syntax Definitions

seconds	Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim neighbor-loss-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
pim
   pimNeighborLossNotificationPeriod
```

ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

ip pim invalid-register-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim invalid-register-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
pim
   pimInvalidRegisterNotificationPeriod
```

ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

ip pim invalid-joinprune-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim invalid-joinprune-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

   pimInvalidJoinPruneNotificationPeriod
```

ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

ip pim rp-mapping-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim rp-mapping-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
pim
   pimRPMappingNotificationPeriod
```

ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

ip pim interface-election-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim interface-election-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
pim
   pimInterfaceElectionNotificationPeriod
```

ip pim nonbidir-hello-notification-period

Specifies the minimum time that must elapse between notifications that a Bidirectional PIM (BIDIR-PIM) router transmits whenever the router receives a PIM Hello message that *does not* contain the Bidirectional Capable option.

ip pim nonbidir-hello-notification-period *seconds*

Syntax Definitions

seconds	The minimum time value that must elapse between notifications, in seconds. The valid range is 10–65535.

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. This type of notification is never sent when this value is set to infinite time.
- The default minimum time is set to a non-zero value to provide resilience against the propagation of denial-of-service (DoS) attacks from the control plane to the network management plane.
- The Bidirectional Capable option indicates that a router is capable of participating as a BIDIR-PIM neighbor.
- This value is used with both IPv4 and IPv6 PIM.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim nonbidir-hello-notification-period 1000
-> ip pin nonbidir-hello-notification-period 65535
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim df-abort	Configures whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

alaPimsmGlobalConfig
   alaPimsmNonBidirHelloPeriod
```

ip pim df-abort

Configures whether or not the Designated Forwarder (DF) election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

ip pim df-abort {enable | disable}

Syntax Definitions

enable	Administratively enables the DF abort operation (DF election is stopped).
disable	Administratively disables the DF abort operation (DF election is not stopped).

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The DF election process occurs between PIM routers that support BIDIR-PIM. When the DF abort option is disabled, this election process continues between the BIDIR-PIM routers.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim df-abort enable
-> ip pin df-abort disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim nonbidir-hello-notification-period	Specifies the minimum time between notifications that a BIDIR-PIM router transmits when the router receives a Hello message from a neighbor that does not contain the Bidirectional Capable option.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmBidirDFAbort
```

ip pim mbr all-sources

Configures whether or not PIM notifies DVMRP about the routes to all multicast sources learned. This command applies only when the local switch is operating as a Multicast Border Router (MBR).

ip pim mbr all-sources

no ip pim mbr all-sources

Syntax Definitions

N/A

Defaults

By default, PIM only notifies DVMRP about the routes for subnets directly connected to PIM interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable notification of all route sources learned.
- This command applies to both PIM-SM and PIM-DM. Note that PIM-SSM does not support MBR functionality.
- DVMRP advertises the routes received from PIM within the DVMRP domain using standard DVMRP mechanisms.

Examples

```
-> ip pim mbr all-sources
-> no ip pim mbr all-sources
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
ip mroute mbr	Configures the switch to operate as a Multicast Border Router to provide interoperability between PIM and DVMRP.
ip dvmrp interface mbr-default-information	Configures whether or not the DVMRP interface on a Multicast Border Router advertises a default route.

MIB Objects

```
alaPimGlobalConfig
   alaPimMbrAllSourcesStatus
```

ip pim df-periodic-interval

Sets the interval at which the Designated Forwarder (DF) for each Rendezvous Point Address (RPA) periodically announces its status in a Winner message.

ip pim df-periodic-interval *seconds*

Syntax Definitions

seconds	The time interval between successive Winner messages, in seconds. The valid range is 0–2000.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the value for this interval is set to zero, no messages are sent.
- This value is used with both IPv4 BIRDIR-PIM and IPv6 BIRDIR-PIM.
- Setting this interval value provides an additional degree of safety to ensure that two routers do not both consider themselves to be the DF for the same link.
- The periodic Winner messages will only occur for RPAs that have active groups, thus avoiding the periodic control traffic in areas of the network without senders or receivers for a particular RPA.

Examples

```
-> ip pim df-periodic-interval 80
-> ip pin df-periodic-interval 0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmBidirPeriodicInterval
```

ip pim bfd-state

Enables or disables the registration of PIM with the BFD protocol.

ip pim bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for PIM.
disable	Disables BFD for PIM.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and PIM must be registered with BFD at the protocol level before PIM can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and PIM acts based upon the BFD message.
- Whenever a neighbor goes down, PIM will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of PIM with the BFD protocol:

```
-> ip pim bfd-state enable
-> ip pim bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ip pim bfd-state all-interfaces	Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.
ip pim interface bfd-state	Enables or disables BFD monitoring on a specific PIM interface.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.

MIB Objects

```
alaPimGlobal
   alaPimBfdStatus
```

ip pim bfd-state all-interfaces

Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.

ip pim bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enables BFD for all the PIM interfaces.
disable	Disables BFD for all the PIM interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for PIM must be enabled before PIM can interact with BFD.

Examples

```
-> ip pim bfd-state all-interfaces enable
-> ip pim bfd-state all-interfaces disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim bfd-state	Enables or disables the registration of PIM with the BFD protocol.
ip pim interface bfd-state	Enables or disables BFD monitoring on a specific PIM interface.
show ip pim interface	Displays detailed PIM settings for a specific interface.

MIB Objects

```
alaPimGlobalConfig
   alaPimBfdAllInterfaceStatus
```

ip pim interface bfd-state

Enables or disables BFD monitoring for a specific PIM interface.

ip pim interface *if_name* **bfd-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing PIM interface.
enable	Enables BFD for the specified PIM interface.
disable	Disables BFD for the specified PIM interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering PIM with BFD is required at the protocol level before PIM can interact with BFD.
- When BFD is enabled on the specified PIM interface, BFD monitors the connectivity to all neighbors known through the specified interface.

Examples

```
-> ip pim interface pimInt1 bfd-state enable
-> ip pim interface pimInt1 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim bfd-state	Enables or disables the registration of PIM with the BFD protocol.
ip pim bfd-state all-interfaces	Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.
show ip pim interface	Displays detailed PIM settings for a specific interface.

MIB Objects

```
alaPimInterfaceAugTable
   alaPimBfdStatus
```

ip pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, a BIDIR-PIM router will support receiving IGMPv3 SSM joins and process them as a (*,G) join.

ip pim bidir ssm-compat {enable | disable}

Syntax Definitions

enable	Administratively enables BIDIR/SSM compatibility mode.
disable	Administratively disables BIDIR/SSM compatibility mode.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the SSM compatibility mode is disabled, SSM joins are ignored by the BIDIR-PIM router.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim bidir ssm-compat enable
-> ip pim bidir ssm-compat disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmBidirSsmCompat
```

ip pim bidir fast-join

Configures whether or not a BIDIR-PIM router will automatically create (*,G) routes in the hardware as soon as BIDIR (*,G) routes are learned.

ip pim bidir fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the BIDIR-PIM fast join functionality.
disable	Administratively disables the BIDIR-PIM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only applicable if BIDIR-PIM is globally enabled for the switch.
- When the BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ip pim bidir fast-join enable
-> ip pim bidir fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmBidirFastJoin
```

ip pim sparse asm-fast-join

Configures whether or not a PIM Sparse router will automatically create (*,G) routes in the hardware as soon as the (*,G) routes are learned.

ip pim sparse asm-fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the PIM Sparse ASM fast join functionality.
disable	Administratively disables the PIM Sparse ASM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

Examples

```
-> ip pim sparse asm-fast-join enable
-> ip pim sparse asm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmAsmFastJoin
```

ip pim sparse ssm-fast-join

Configures whether or not a PIM Sparse router will automatically create both PIM Sparse and SSM (S,G) routes in the hardware as soon as the (S,G) routes are learned.

ip pim sparse ssm-fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the PIM Sparse SSM fast join functionality.
disable	Administratively disables the PIM Sparse SSM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (S,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ip pim sparse ssm-fast-join enable
-> ip pim sparse ssm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig

```

ip pim joinprune-packing

Enable or disable PIM Join/Prune message packing.

ip pim joinprune-packing {enable | disable}

Syntax Definitions

enable	Enable the PIM Join/Prune message packing.
disable	Disable the PIM Join/Prune message packing

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6900

Usage Guidelines

When this feature is disabled, Join/Prune messages are not packed.

Examples

```
-> ip pim joinprune-packing enable
-> ip pim joinprune-packing disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

BIDIR SSM Compatibility    = enabled,
Register Rate Limit        = 100,
Join/Prune Message Packing = enable
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-SM. Options include **enabled** and **disabled**.
Keepalive Period	The duration of the Keepalive timer. The default value is 210.

output definitions (continued)

Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.
Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Checksum	The current application of the checksum function on register messages in the domain. Options include **header** and **full**. The default setting is **header**.
Register Suppress Timeout	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
RP Threshold	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
SPT Status	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include **enabled** (the default) and **disabled**.
BIDIR Status	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include **enabled** and **disabled** (the default).
BIDIR Periodic Interval	The amount of time, in seconds, between Winner messages the Designated Forwarder (DF) sends out to announce its status. The valid range is 0–2000. The default is 60 seconds.
BIDIR DF Abort Status	Indicates whether or not the DF election process is stopped when a BIDIR-PIM router receives a Hello message that does not contain the Bidirectional Capable option. When **enabled** DF election is stopped; when **disabled** (the default) DF election continues.
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for the PIM router.
MoFRR Status **MoFRR All Routes Status**	Not supported in the current release.
MBR All Sources Status	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include **enabled** (routes to all sources) or **disabled** (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

output definitions (continued)

RP Hash Algorithm	The status of the RP hashing algorithm. When **enabled**, a newer version of the algorithm is in use; when **disabled** (the default), a legacy version of the algorithm is in use.
ASM Fast Join	*PIM Sparse fast join is not supported.*
SSM Fast Join	*PIM Sparse fast join is not supported.*
BIDIR Fast Join	*BIDIR-PIM fast join is not supported.*
BIDIR SSM Compatibility	The status of the SSM compatibility mode. When **enabled**, a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when **disabled** (the default), SSM joins are ignored.
Register Rate Limit	The per (S,G) register rate limit in packets per second.
Join/Prune Message Packing	The current status of PIM Join/Prune message packing. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.
Release 7.3.4; BIDIR fields added, **RP Hash Algorithm** field added.
Release 8.2.1.R02: **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.
Release 8.4.1.R02; **Register Rate Limit** field added.
Release 8.6R1; **Join/Prune Message Packing** field added.

Related Commands

ip pim sparse admin-state	Globally enables or disables PIM-SM protocol on the switch.
ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register checksum	Configures the application of the checksum function on sent and received register messages in the domain.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
ip pim register-rate-limit	Specifies the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.

ip pim rp-threshold	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
ip pim spt admin-state	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.
ip pim bidir admin-state	Globally enables or disables BIDIR-PIM protocol on the switch.
ip pim df-periodic-interval	Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
ip pim df-abort	Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
ip pim bfd-state	Enables or disables the registration of PIM with the BFD protocol.
ip pim mbr all-sources	Configures PIM to notify DVMRP of all learned routes to sources. This command only applies when the switch is operating in the Multicast Border Router mode.
ip pim rp-hash admin-state	Globally enables or disables the RP hashing algorithm version for the switch.
ip pim bidir ssm-compat	Configures the SSM compatibility mode for a BIDIR-PIM router.
ip pim joinprune-packing	Enable or disable PIM Join/Prune message packing.

show ip pim dense

Displays the status of the various global parameters for the PIM dense mode.

show ip pim dense

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip pim dense
Status                       = enabled,
Source Lifetime              = 210,
State Refresh Interval       = 60,
State Refresh Limit Interval = 0,
State Refresh TTL            = 16,

MoFRR Status                 = disabled,
MBR All Sources Status       = disabled,
MBR Operational Status       = enabled
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-DM. Options include **enabled** and **disabled**.
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for the PIM router.
MoFRR Status	Not supported in the current release.

output definitions (continued)

MBR All Sources Status	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include **enabled** (routes to all sources) or **disabled** (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

Related Commands

show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

show ip pim ssm group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

Examples

```
-> show ip pim ssm group
Group Address/Prefix RP Address      Mode  Override Precedence Status
--------------------+---------------+-----+--------+----------+-------
225.0.0.0/24         0.0.0.0         ssm   false    none       enabled
```

output definitions

Group Address/Prefix	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
RP Address	A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix.
Mode	The PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, or **dm**.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim ssm group	Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

show ip pim dense group

Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).

show ip pim dense group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only on PIM dense mode.

Examples

```
-> show ip pim dense group
Group Address/Prefix RP Address      Mode  Override Precedence Status
--------------------+---------------+-----+--------+----------+-------
225.0.0.0/24         0.0.0.0         dm    false    none       enabled
```

output definitions

Group Address/Prefix	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
Mode	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
RP Address	A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim dense group	Creates and manages the static configuration of dense mode (DM) group mappings.
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
alaPimdmDenseGroupTable
   alaPimdmDenseGroupGrpAddress
   alaPimdmDenseGroupGrpPrefixLength
   alaPimdmDenseGroupOverrideDynamic
   alaPimdmDenseGroupPrecedence
   alaPimdmDenseGroupRowStatus
```

show ip pim neighbor

Displays a list of active PIM neighbors.

show ip pim neighbor [*ip_address***]**

Syntax Definitions

ip_address	The 32-bit IP address for the PIM neighbor.

Defaults

If a neighbor's IP address is not specified, the entire PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IP address in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ip pim neighbor
Neighbor Address     Interface Name       Uptime      Expires    DR Priority
-----------------+-------------------+-----------+-----------+-------------
212.61.20.250          vlan-2            01h:07m:07s 00h:01m:38s 100
212.61.60.200          vlan-6            01h:07m:07s 00h:01m:38s 100
214.28.4.254           vlan-26           01h:07m:07s 00h:01m:38s 100
```

If a specific neighbor IP address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ip pim neighbor 212.61.30.7
Neighbor IP Address        = 212.61.30.7,
Interface Name             = vlan-30,
Uptime                     = 00h:04m:14s,
Expires                    = 00h:01m:31s,
Lan Prune Delay Present    = true,
Propagation Delay          = 500,
Override Interval          = 2500,
TBit field                 = false,
Gen ID Present             = true,
Gen ID Value               = 0x79ca868e,
BiDir Capable              = false,
DR Priority Present        = true,
DR Priority                = 1,
State Refresh Capable      = true
```

output definitions

Neighbor (IP) Address	The 32-bit IP address of the active PIM neighbor.
Interface Name	The name of the interface used to reach this PIM neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expiry time	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
Lan Prune Delay Present	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
Propagation Delay	The expected propagation delay between PIM routers on this network.
DR Priority Present	Evaluates to TRUE if the neighbor is using the DR Priority option.
DR Priority	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
TBit field	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Generation ID Present	Evaluates to TRUE if this neighbor is using the Generation ID option.
Generation ID Value	The value of the Generation ID from the last PIM Hello message received from the neighbor.
BiDir Capable	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include **true** or **false**.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

show ip pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip pim candidate-rp
RP Address       Group Address       Priority  Interval  Mode  Status
---------------+------------------+---------+---------+-----+---------
40.1.50.25       225.0.0.0/8         192       60        bidir enabled
```

output definitions

RP Address	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash character (/). This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Mode	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **Mode** field added.

Related Commands

ip pim candidate-rp	Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

MIB Objects

```
pimBsrCandidateRPTable
   pimBsrCandidateRPAddressType
   pimBsrCandidateRPAddress
   pimBsrCandidateRPGroupAddress
   pimBsrCandidateRPGroupPrefixLength
   pimBsrCandidateRPBidir
   pimBsrCandidateRPAdvTimer
   pimBsrCandidateRPPriority
   pimBsrCandidateRPAdvInterval
   pimBsrCandidateRPHoldtime
   pimBsrCandidateRPStatus
   pimBsrCandidateRPStorageType
```

show ip pim group-map

Displays the PIM group mapping table.

show ip pim group-map [bsr | static-rp | ssm | dense]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ip pim group-map
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       225.0.0.0/24                172.21.63.11  asm   192
BSR       225.0.0.0/24                214.0.0.7     asm   192
BSR       225.0.0.0/8                 40.1.50.25    bidir 192
Static RP 226.0.0.0/8                 10.11.203.8   bidir none
Static RP 232.0.0.0/8                               ssm

-> show ip pim group-map bsr
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       225.0.0.0/24                172.21.63.11  asm   192
BSR       225.0.0.0/24                214.0.0.7     asm   192
BSR       225.0.0.0/8                 40.1.50.25    bidir 192
```

```
-> show ip pim group-map static-rp
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
--------+--------------------------+------------+-----+-----------
Static RP 226.0.0.0/8                 10.11.203.8   bidir none
Static RP 232.0.0.0/8                               ssm
```

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
RP Address	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
Mode	The PIM mode to be used for groups in this prefix.
Mapping Precedence	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** mode support added.

Related Commands

ip pim ssm group	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
ip pim dense group	Creates and manages the static configuration of dense mode (DM) group mappings.
ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

   pimGroupMappingPrecedence
```

show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

show ip pim interface [*if_name***]**

Syntax Definitions

if_name	The interface name.

Defaults

By default, displays a summary list of IP PIM interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ip pim interface

Total 1 Interfaces

Interface Name       IP Address    Designated   Hello    J/P      Oper     BFD
                                   Router       Interval Interval Status   Status
------------------+-------------+-------------+--------+--------+--------+--------
vlan-203           11.12.203.8   11.12.203.8   30       60       disabled disabled

-> show ip pim interface vlan-203
Interface Name              = vlan-203,

Operational Status          = disabled,
BFD Status                  = disabled,
Join/Prune MTU              = 1000,
Join/Prune Triggered Delay  = 100
```

output definitions

Interface Name	The name of the interface on which PIM is enabled.
IP address	Specifies the IP address of the specified interface.
Designated Router	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
Propagation (Prune) Delay	The expected propagation delay between PIM routers on this network.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
Generation ID	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.

output definitions (continued)

DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
Lan Delay Enabled	Options include **true** and **false**. The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3.
State Refresh Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
BiDir Capable	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM.
DF Election Robustness	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM.
Operational Status	The current operational status of the corresponding interface. Options include **enabled** and **disabled**. This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is **disabled**. To globally enable or disable PIM on the switch, use the **ip pim sparse admin-state** and **ip pim dense admin-state** commands.
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for the PIM interface. Configured through the **ip pim interface bfd-state** command**.**
Join/Prune MTU	The configured PIM Join/Prune packet MTU for this interface.
Join/Prune Triggered Delay	The triggered Join/Prune delay.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.
Release 8.6R1; **Join/Prune MTU** and **Join/Prune Triggered** Delay fields added.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.

show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

show ip pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ip pim static-rp
Group Address/Pref Length   RP Address    Mode  Override Precedence Status
----------------------------+-------------+-----+--------+----------+--------
225.0.0.0/24                172.21.63.11  asm   false    none       enabled
226.0.0.0/8                 10.11.203.8   bidir false    none       enabled
```

output definitions

Group Address/Pref Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the **ip pim static-rp** command on page 33-15.
RP Address	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the **ip pim static-rp** command on page 33-15.
Mode	The PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, or **bidir**.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).

output definitions

Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether static RP configuration is currently enabled or disabled. Options include **enabled** and **disabled**. To change the current status, refer to the **ip pim static-rp** command.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4: **bidir** mode support added.

Related Commands

ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

MIB Objects

```

show ip pim anycast-rp

Displays the anycast RP table, which includes the anycast RP address, the RP address, if its the local router, and the current status of the anycast RP configuration.

show ip pim anycast-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ip pim anycast-rp
Anycast RP Address      Router Address     Local    Status
--------------------+------------------+--------+---------
10.10.10.1               10.1.1.2          true    enabled
10.10.10.1               10.1.2.2          false   enabled
```

output definitions

Anycast RP Address	The anycast RP address.
Router Address	The router IP address that is a member of the anycast RP set.
Local	Displays whether this entry corresponds to the local router. The value will display true if this entry corresponds to the local router and false if it does not correspond to the local router.
Status	Displays whether the anycast RP configuration is currently enabled or disabled. To change the current status, refer to the **ip pim anycast-rp** command.

Release History

Release 8.6R2; command introduced.

Related Commands

ip pim anycast-rp	Configures the anycast RP set, which is the set of all routers that would act as the RP.

MIB Objects

```

   pimAnycastRPSetRouterAddress
   pimAnycastRPSetLocalRouter
   pimAnycastRPSetRowStatus
```

show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

show ip pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip pim cbsr
CBSR Address             = 214.0.0.7,
Status                   = enabled,
CBSR Priority            = 0,
Hash Mask Length         = 30,
Elected BSR              = False,
Timer                    = 00h:00m:00s
```

output definitions

CBSR Address	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```
pimBSrCandidateBSRTable
   pimBsrCandidateBSRZoneIndex
   pimBsrCandidateBSRAddressType
   pimBsrCandidateBSRAddress

BSR Priority             = 192,
Hash Mask Length         = 30,
Expiry Time              = 00h:01m:35s
```

output definitions

BSR Address	The 32-bit address of the elected BSR.
BSR Priority	The priority value of the elected BSR. The higher the value, the higher the priority.
Hash Mask Length	The 32-bit mask length that is advertised in the bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).
Expiry Time	The minimum time remaining before the elected BSR will be declared down.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

show ip pim notifications

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

show ip pim notifications

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The outputs from this command includes both IPv4 and IPv6 information.

Examples

```
-> show ip pim notifications
Neighbor Loss Notifications
  Period       = 0
  Count        = 0
Invalid Register Notifications
  Period       = 65535
  Msgs Rcvd    = 0
  Origin       = None
  Group        = None
  RP           = None
Invalid Join Prune Notifications
  Period       = 65535
  Msgs Rcvd    = 0
  Origin       = None
  Group        = None
  RP           = None
RP Mapping Notifications
  Period       = 65535
  Count        = 0
Interface Election Notifications
  Period       = 65535
  Count        = 0
Non Bidir Hello Notifications
  Period      = 65535
  Msgs Rcvd   = 0
  Origin      = None
```

output definitions

Neighbor Loss Notification	**Period:** Minimum time interval that must elapse between the PIM neighbor loss notification originated by the device. **Count:** The number of neighbor loss events that have occurred. This counter is incremented whenever a neighbor loss notification is generated.
Invalid Register Notification	**Period:** Minimum time interval that must elapse between the PIM invalid register notifications originated by the device. **Msgs Rcvd:** The number of invalid PIM register notification messages that have been received by the device. **Group:** The multicast group address to which the last unexpected Register message received by the device was addressed. **RP:** The RP address to which the last unexpected Register message received by the device was delivered. **Origin**: The source address of the last unexpected Register message received by the device.
Invalid Join/Prune Notification	**Period:** Minimum time that must elapse between PIM invalid joinprune notifications originated by the device. **Msgs Rcvd:** The number of invalid PIM join/prune messages that have been received by the device. **Origin**: The source address of the last unexpected join/prune message received by the device. **Group**: The multicast group address carried in the last unexpected joinprune message received by the device. **RP**: The RP address carried in the last unexpected join/prune message received by the device.
RP Mapping Notifications	**Period**: Minimum time that must elapse between PIM RP mapping change notifications originated by the device. **Count**: The number of changes to active RP mappings on this device.
Interface Election Notifications	**Period**: Minimum time that must elapse between PIM Interface Election traps originated by the router. **Count:** The number of times this device has been elected DR on any interface.
Non Bidir Hello Notifications	**Period:** Minimum time that must elapse between notifications that the Bidirectional PIM (BIDIR-PIM) router has received a PIM Hello message from a router that is *not* a BIDIR-PIM router. **Msgs Rcvd:** The number of this type of PIM Hello messages that have been received by the router. **Origin**: The source address of the last PIM Hello message received by the device from a router that is not a BIDIR-PIM router.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **Non Bidir Hello Notifications** field added.

show ip pim groute

Displays (*,G) routing table entries for IPv4 PIM.

show ip pim groute [*group_address***]**

Syntax Definitions

group_address	A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Defaults

By default, the entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ip pim groute

Total 1 (*,G)

output definitions

Group-address	The IPv4 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
UpTime	The time since this entry was created.
Mode	Whether this entry represents an **asm** (Any Source Multicast) or **bidir** (Bidirectional PIM) group.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.

output definitions (continued)

Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
RPF Next Hop	The address of the RPF next hop towards the RP.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.
Local Membership	Whether the local router has (*,G) local membership on this interface.
Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner, or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; Mode field added, **bidir** mode support added

Related Commands

show ip pim sgroute

Displays (S,G) routing table entries for IPv4 PIM.

show ip pim sgroute [*source_address group_address***]**

Syntax Definitions

source_address	The 32-bit IP address for a specific multicast source.
group_address	A 32-bit multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ip pim sgroute
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
               L = Local, R = RPT, T = SPT, F = Register,
               P = Pruned, O = Originator

```

output definitions

Source-address	The IPv4 Source address.
Group-address	The IPv4 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

output definitions (continued)

Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.
RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFIfIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.

output definitions (continued)

Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

show ip pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ip pim df-election [*rp_address* | *if_name***]**

Syntax Definitions

rp_address	A 32-bit RP address.
if_name	The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

```
-> show ip pim df-election
RP Address  Interface Name DF State Winner Address Uptime      Metric  Metric Expires
                                                               Pref
-----------+--------------+--------+-------------+-----------+-------+------+----------
10.11.203.8 vlan-13        Win      10.11.126.3    00h:06m:31s 1       1     00h:00m:24s
            vlan-200       Win      10.11.200.1    00h:06m:31s 1       1     00h:00m:24s
            vlan-204       Win      10.11.204.8    00h:06m:31s 1       1     00h:00m:24s
            vlan-210       Win      10.5.5.8       00h:06m:31s 1       1     00h:00m:24s
40.1.50.25  vlan-203       Lose     10.11.203.27   00h:00m:22s 1       1     00h:00m:00s
            vlan-13        Win      10.11.126.3    00h:06m:31s 110     2     00h:00m:32s
            vlan-200       Win      10.11.200.1    00h:06m:31s 110     2     00h:00m:32s
            vlan-204       Lose     10.11.204.27   00h:00m:22s 1       1     00h:00m:00s
            vlan-210       Win      10.5.5.8       00h:06m:31s 110     2     00h:00m:32s

-> show ip pim df-election 40.1.50.25
RP Address  Interface Name DF State Winner Address Uptime      Metric  Metric Expires
                                                               Pref
-----------+--------------+--------+-------------+-----------+-------+------+----------
40.1.50.25  vlan-203       Lose     10.11.203.27   00h:00m:22s 1       1     00h:00m:00s

```

output definitions

RP Address	The IPv4 address of the Rendezvous Point (RP).
Interface Name	The name of the IPv4 interface.
DF State	The state of the DF election process (**Offer**, **Lose**, **Win**, or **Backoff**).
Winner Address	The primary IPv4 address of the winner of the DF election process.
UpTime	The amount of time since the current winner was last elected the DF for the RP.
Metric Pref	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
Metric	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
Expires	The minimum time remaining before the local router expires the current DF state.

Release History

ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

ipv6 pim sparse admin-state {enable | disable}

Syntax Definitions

enable	Enables PIM-SM globally for IPv6.
disable	Disables PIM-SM globally for IPv6.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.

Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim interface	Enables or disables the PIM protocol on a specific interface.
ip load pim	Dynamically loads PIM to memory.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

ipv6 pim bidir admin-state

Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.

ipv6 pim bidir admin-state {enable | disable}

Syntax Definitions

enable	Enables BIDIR-PIM globally for IPv6.
disable	Disables BIDIR-PIM globally for IPv6.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.

Examples

```
-> ipv6 pim bidir admin-state enable
-> ipv6 pim bidir admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 pim dense admin-state

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

ipv6 pim dense admin-state {enable | disable}

Syntax Definitions

enable	Enables PIM-DM globally for IPv6.
disable	Disables PIM-DM globally for IPv6.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 33-3 for more information.

Examples

```
-> ipv6 pim dense admin-state enable
-> ipv6 pim dense admin-state disable
```

ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

ipv6 pim ssm group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ipv6 pim ssm group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
priority	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim group-map	Displays the IPv6 PIM group mapping table.
show ipv6 pim ssm group	Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

MIB Objects

```
pimStaticRPTable
   pimStaticRPGrpAddress
   pimStaticRPGrpPrefixLength
   pimStaticRPPimMode
   pimStaticRPPrecedence
   pimStaticRPOverrideDynamic
   pimStaticRPRowStatus
```

ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

ipv6 pim dense group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ipv6 pim dense group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group.
override	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
priority	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50
-> no ipv6 pim dense group ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim group-map	Displays the IPv6 PIM group mapping table.
show ipv6 pim dense group	Displays the static configuration of IPv6 multicast group mappings for PIM Dense Mode (DM).

MIB Objects

```
alaPimdmDenseGroupTable
   alaPimdmDenseGroupGrpAddress
   alaPimdmDenseGroupGrpPrefixLength
   alaPimdmDenseGroupOverrideDynamic
   alaPimdmDenseGroupPrecedence
   alaPimdmDenseGroupRowStatus
```

ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ipv6 pim cbsr *ipv6_address* **[priority** *priority***] [mask-length** *bits***]**

no ipv6 pim cbsr *ipv6_address*

Syntax Definitions

ipv6_address	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address.
priority	The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255.
bits	The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.

Defaults

parameter	default
priority	64
bits	126

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4
-> no ipv6 pim cbsr 2000::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim cbsr	Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```
pimBsrCandidateBSRTable
   pimBsrCandidateBSRAddress
   pimBsrCandidateBSRPriority
   pimBsrCandidateBSRHashMaskLength
   pimBsrCandidateBSRRowStatus
```

ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

ipv6 pim static-rp *group_address/prefix_length rp_address* **[[no] bidir] [[no] override] [priority** *priority***]**

no ipv6 pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group.
rp_address	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
bidir	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
override	Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s).
priority	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined a value of 65535 can be used to unset the priority

- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> ipv6 pin static-rp ff0e::1234/128 2000::1 bidir overide
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** parameter added.

Related Commands

show ipv6 pim group-map	Displays the IPv6 PIM group mapping table.
show ipv6 pim static-rp	Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

MIB Objects

```
pimStaticRPTable
   pimStaticRPGrpAddress
   pimStaticRPGrpPrefixLength
   pimStaticRPRPAddress
   pimStaticRPPimMode
   pimStaticRPOverrideDynamic
   pimStaticRPPrecedence
   pimStaticRPRowStatus
```

ipv6 pim anycast-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

ipv6 pim anycast-rp *anycast_rp_address rp_address*

no ipv6 pim anycast-rp *anycast_rp_address rp_address*

Syntax Definitions

anycast-rp-address	Specifies the anycast RP address.
rp_address	Specifies the IPv6 unicast address of the Rendezvous Point (RP) address of a router that is a member of the anycast RP set.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of this command to delete an anycast RP configuration.
- The RP specified by anycast-RP-address is the RP in the anycast RP set. This address must be the same as the RP address in the Static-RP configuration used with the **ipv6 pim static-rp** command if static RP configuration is being used.
- It is recommended not to use Loopback0 as the anycast RP address since Loopback0 is often used as the Router ID by default with the unicast routing protocols. Hence, it is recommended. to use one of the additional LoopbackX interfaces for the anycast RP address, but it is not mandatory to be a LoopbackX address.
- The RP specified by rp-address defines the IP address of the prospective RP. This address must be different than the anycast RP address and is used in communication between the different RPs in the anycast RP set. This configuration must be the same on all routers in the Anycast-RP set.
- There must be a separate entry for each of the RPs participating in anycast RP set, including an entry for the local router.This configuration defining the anycast RP set must be the same on all routers participating in anycast RP.
- It is recommended to configure PIM register rate limiting (see **ipv6 pim register-rate-limit**) to limit the sending of PIM register messages with Anycast RP.
- Ensure SPT is enabled (see **ipv6 pim spt admin-state**) when using Anycast RP. If SPT is globally disabled, and Anycast RP configuration is added, this configuration will be ignored for all groups that are operating in Anycast-RP mode.

Examples

```
-> ipv6 pim static-rp ff00::/8 2001:1::1
```

```
-> ipv6 pim anycast-rp 2001:1::1 3001:1::1
-> ipv6 pim anycast-rp 2001:1::1 3001:1::2
-> no ipv6 pim anycast-rp 2001:1::1 3001:1::2
```

Release History

Release 8.6R2; command introduced.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
show ipv6 pim anycast-rp	Displays the anycast RP table, which includes the anycast RP address, the RP address, if its the local router, and the current status of the anycast RP configuration.

pimAnycastRPSetTable
   pimAnycastRPSetAddressType
   pimAnycastRPSetAnycastAddress
   pimAnycastRPSetRouterAddress
   pimAnycastRPSetRowStatus
```

ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

ipv6 pim candidate-rp *rp_address group_address/prefix_length* **[[no] bidir] [priority** *priority***] [interval** *seconds***]**

no ipv6 pim candidate-rp *rp_address group_address/prefix_length*

Syntax Definitions

rp_address	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
group_address	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
/prefix_length	Specifies the prefix length of the specified IPv6 multicast group address.
bidir	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
priority	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
seconds	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
[no] bidir	no bidir
priority	192
seconds	60

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address.*
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 bidir priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** parameter added.

Related Commands

show ipv6 pim candidate-rp	Displays the IPv6 multicast groups for which the local router will advertise itself as a Candidate-RP.

MIB Objects

   pimBsrCandidateRPBidir
   pimBSrCandidateRPPriority
   pimBsrCandidateRPAdvInterval
   pimBsrCandidateRPRowStatus
```

ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

ipv6 pim rp-switchover {enable | disable}

Syntax Definitions

enable	Enables the RP to switch to native forwarding.
disable	Disables the RP from switching to native forwarding.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim rp-switchover enable
-> ipv6 pim rp-switchover disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmV6RPSwitchover
```

ipv6 pim register-rate-limit

Configures the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.

ipv6 pim register-rate-limit *pps*

Syntax Definitions

pps	The per (S,G) register rate limit in packets per second (0–65535).

Defaults

By default, the register rate limit is set to zero.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Setting the register rate limit to zero (the default) disables register rate limiting.
- Rate limiting is applied on a per (S,G) flow basis.
- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim register-rate-limit 100
-> ipv6 pim register-rate-limit 0
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfigTable
   alaPimsmV6RegisterRateLimit
```

ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

ipv6 pim spt admin-state {enable | disable}

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

Examples

```
-> ipv6 pim spt admin-state enable
-> ipv6 pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

ipv6 pim interface *if_name*
[hello-interval *seconds***]**
[triggered-hello *seconds***]**
[joinprune-interval *seconds***]**
[hello-holdtime *seconds***]**
[joinprune-holdtime *seconds***]**
[prune-delay *milliseconds***]**
[override-interval *milliseconds***]**
[dr-priority *priority***]**
[prune-limit-interval *seconds***]**
[graft-retry-interval *seconds***]**
[df-election-robustness *messages***]**
[[no] stub]
[joinprune-mtu *bytes***]**
[joinprune-delay *milliseconds***]**

no ipv6 pim interface *if_name*

Syntax Definitions

if_name	The interface name on which the IPv6 PIM is being enabled or disabled.
hello-interval *seconds*	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
triggered-hello *seconds*	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
joinprune-interval *seconds*	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
hello-holdtime *seconds*	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
joinprune-holdtime *seconds*	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds.Values may range from 0 to 65535.
prune-delay *milliseconds*	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
override-interval *milliseconds*	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in *milliseconds.* Values may range from 0 to 65535.

dr-priority *priority*	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
prune-limit-interval *seconds*	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
graft-retry-interval *seconds*	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
df-election-robustness *messages*	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM.
stub	Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets.
joinprune-mtu *bytes*	Specifies the maximum size used for PIM Join/Prune packets getting sent out this interface. Values may range from 0 to 9198.
joinprune-delay *milliseconds*	Specifies the Join/Prune delay interval in milliseconds. Values may range from 0 to 32767.

Defaults

parameter	default
hello-interval *seconds*	30
triggered-hello *seconds*	5
joinprune-interval *seconds*	60
hello-holdtime *seconds*	105
joinprune-holdtime *seconds*	210
prune-delay *milliseconds*	500
override-interval *milliseconds*	2500
dr-priority *priority*	1
prune-limit-interval *seconds*	60
graft-retry-interval *seconds*	3
df-election-robustness *messages*	3
stub	Disabled
joinprune-mtu *bytes*	0
joinprune-delay *milliseconds*	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.

- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the **ipv6 pim sparse admin-state** command on page 33-106. To enable or disable IPv6 PIM-DM on the switch, refer to the **ipv6 pim dense admin-state** command on page 33-108.
- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a joinprune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.
- If the IPv6 interface on which PIM is enabled is bound to an SPB service, then PIM can operate over an SPB L3 VPN in-line routing configuration (supported only on the OmniSwitch 9900).
- By default, **joinprune-mtu** value is ‘0’ and the configured interface MTU value will be used in determining the maximum packet size that can be used in sending the packed messages. However, if the Join/Prune MTU configuration is specified, the actual maximum size used for PIM Join/Prune messages will be the smaller of the IP MTU value of the interface and the configured interface Join/ Prune MTU value.
- The **joinprune-delay** interval is used to delay the sending of triggered Join/Prune messages and may be desirable to allow the packing of triggered Join.Prune messages due to bursts of protocol messages, which may result in subsequent bursts of triggered Join/Prune packets. The default value of ‘0’ implies no deferred processing and will result in no packing of triggered Join/Prune packets.

Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-
interval 100 hello-holdtime 350 joinprune-holdtime 400
-> no ipv6 pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4: **df-election robustness** parameter added.
Release 8.6R1; **joinprune-mtu**, **joinprune-delay** parameters added.

Related Command

```

ipv6 pim bfd-state

Enables or disables the registration of IPv6 PIM with the BFD protocol.

ipv6 pim bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for IPv6 PIM.
disable	Disables BFD for IPv6 PIM.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and PIM must be registered with BFD at the protocol level before PIM can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and PIM acts based upon the BFD message.
- Whenever a neighbor goes down, PIM will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of IPv6 PIM with the BFD protocol:

```
-> ipv6 pim bfd-state enable
-> ipv6 pim bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ip bfd admin-state	Enables or disables the global BFD protocol status for the switch.
ipv6 pim bfd-state all-interfaces	Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.
ipv6 pim interface bfd-state	Enables or disables BFD monitoring on a specific PIM interface.
show ipv6 pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim dense	Displays the status of the various global parameters for the PIM dense mode.

MIB Objects

```
alaPimGlobal
   alaPimBfdStatus
```

ipv6 pim bfd-state all-interfaces

Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.

ipv6 pim bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enables BFD for all the IPv6 PIM interfaces.
disable	Disables BFD for all the IPv6 PIM interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for PIM must be enabled before PIM can interact with BFD.

Examples

```
-> ipv6 pim bfd-state all-interfaces enable
-> ipv6 pim bfd-state all-interfaces disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 pim bfd-state	Enables or disables the registration of PIM with the BFD protocol.
ipv6 pim interface bfd-state	Enables or disables BFD monitoring on a specific PIM interface.
show ipv6 pim interface	Displays detailed PIM settings for a specific interface.

MIB Objects

```
alaPimGlobalConfig
   alaPimBfdAllInterfaceStatus
```

ipv6 pim interface bfd-state

Enables or disables BFD monitoring for a specific PIM interface.

ipv6 pim interface *if_name* **bfd-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing IPv6 PIM interface.
enable	Enables BFD for the specified PIM interface.
disable	Disables BFD for the specified PIM interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering PIM with BFD is required at the protocol level before PIM can interact with BFD.
- When BFD is enabled on the specified PIM interface, BFD monitors the connectivity to all neighbors known through the specified interface.

Examples

```
-> ipv6 pim interface pimInt1 bfd-state enable
-> ipv6 pim interface pimInt1 bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 pim bfd-state	Enables or disables the registration of PIM with the BFD protocol.

MIB Objects

```
alaPimInterfaceAugTable
   alaPimBfdStatus
```

ipv6 pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, an IPv6 BIDIR-PIM router will support receiving MLDv2 SSM joins and process them as a (*,G) join.

ipv6 pim bidir ssm-compat {enable | disable}

Syntax Definitions

enable	Administratively enables the IPv6 BIDIR/SSM compatibility mode.
disable	Administratively disables IPv6 BIDIR/SSM compatibility mode.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the SSM compatibility mode is disabled, MLDv2 SSM joins are ignored by the IPv6 BIDIR-PIM router.
- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ipv6 pim bidir ssm-compat enable
-> ipv6 pim bidir ssm-compat disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmV6BidirSsmCompat
```

ipv6 pim bidir fast-join

Configures whether or not an IPv6 BIDIR-PIM router will automatically create (*,G) routes in the hardware as soon as IPv6 BIDIR (*,G) routes are learned.

ipv6 pim bidir fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the IPv6 BIDIR-PIM fast join functionality.
disable	Administratively disables the IPv6 BIDIR-PIM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.
- When the IPv6 BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ipv6 pim bidir fast-join enable
-> ipv6 pim bidir fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmV6BidirFastJoin
```

ipv6 pim sparse asm-fast-join

Configures whether or not an IPv6 PIM Sparse router will automatically create (*,G) routes in the hardware as soon as the IPv6 (*,G) routes are learned.

ipv6 pim sparse asm-fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the IPv6 PIM Sparse ASM fast join functionality.
disable	Administratively disables the IPv6 PIM Sparse ASM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the IPv6 PIM Sparse mode.
- When the IPv6 PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of IPv6 PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the IPv6 ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

Examples

```
-> ipv6 pim sparse asm-fast-join enable
-> ipv6 pim sparse asm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmV6AsmFastJoin
```

ipv6 pim sparse ssm-fast-join

Configures whether or not an IPv6 PIM Sparse router will automatically create both IPv6 PIM Sparse and SSM (S,G) routes in the hardware as soon as the IPv6 (S,G) routes are learned.

ipv6 pim sparse ssm-fast-join {enable | disable}

Syntax Definitions

enable	Administratively enables the IPv6 PIM SSM fast join functionality.
disable	Administratively disables the IPv6 PIM SSM fast join functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the IPv6 PIM Sparse mode.
- When the IPv6 PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (S,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ipv6 pim sparse ssm-fast-join enable
-> ipv6 pim sparse ssm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```

   alaPimsmV6SsmFastJoin
```

ipv6 pim joinprune-packing

Enable or disable PIM Join/Prune message packing.

ipv6 pim joinprune-packing {enable | disable}

Syntax Definitions

enable	Enable the PIM Join/Prune message packing.
disable	Disable the PIM Join/Prune message packing

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6900

Usage Guidelines

The value of disable can be used to disable this feature and return to the original operation of PIM where Join/Prune messages are not packed.

Examples

```
-> ipv6 pim joinprune-packing enable
-> ipv6 pim joinprune-packing disable
```

Release History

Release 8.6R1; command introduced.

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim sparse
Status                     = disabled,
Keepalive Period           = 210,
Max RPs                    = 32,
Probe Time                 = 5,
Register Suppress Timeout  = 60,
RP Switchover              = enabled,
SPT Status                 = enabled,
BIDIR Status               = disabled,
BIDIR Periodic Interval    = 60,
BIDIR DF Abort Status      = disabled,
BFD Status                 = disabled,
ASM Fast Join              = disabled,
SSM Fast Join              = disabled,
BIDIR Fast Join            = disabled,
BIDIR SSM Compatibility    = disabled,
Register Rate Limit        = 100,
Join/Prune Message Packing = enabled
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include **enabled** and **disabled**.
Keepalive Period	The duration of the Keepalive timer. The default value is 210.
Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.

output definitions

Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the RP. This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Suppress Timeout	The amount of time, in seconds, the DR will stop sending registers to the RP once a Register-Stop is received (1–300). The default value is 60.
RP switchover	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include **enabled** and **disabled**. The default setting is **enabled**.
SPT Status	The current status of last hop DR switching to the SPT. Options include **enabled** and **disabled**. The default setting is **enabled**.
BIDIR Status	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include **enabled** and **disabled** (the default).
BIDIR Periodic Interval	The amount of time, in seconds, between Winner messages the DF sends out to announce its status. The valid range is 0–2000. The default is 60 seconds.
BIDIR DF Abort Status	Indicates whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message is received from a non-Bidirectional PIM (BIDIR-PIM) capable router. Options include **enabled** and **disabled** (the default).
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for the PIM router.
ASM Fast Join	The status of the PIM Sparse fast join operation for ASM routes. When **enabled**, PIM ASM (*,G) routes are automatically created in hardware when the routes are initially learned; when **disabled** (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
SSM Fast Join	The status of the PIM Sparse fast join operation for PIM Sparse and SSM routes. When **enabled**, PIM Sparse and SSM (S,G) routes are automatically created in hardware when the routes are initially learned; when **disabled** (the default), the (S,G) routes are not created in hardware until multicast traffic reaches the switch.
BIDIR Fast Join	The status of the BIDIR-PIM fast join operation. When **enabled**, BIDIR-PIM (*,G) routes are automatically created in hardware when the routes are initially learned; when **disabled** (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
BIDIR SSM Compatibility	The status of the SSM compatibility mode. When **enabled**, a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when **disabled** (the default), SSM joins are ignored.
Register Rate Limit	The per (S,G) register rate limit in packets per second.
Join/Prune Message Packing	The current status of PIM Join/Prune message packing. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; BIDIR fields added.
Release 8.3.1.R02; **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.
Release 8.4.1.R02; **Register Rate Limit** field added.
Release 8.6R1; **Join/Prune Message Packing** field added.

Related Commands

ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
ipv6 pim rp-switchover	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
ipv6 pim register-rate-limit	Specifies the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.
ipv6 pim spt admin-state	Enables or disables last hop DR switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
ipv6 pim bidir admin-state	Globally enables or disables BIDIR-PIM protocol on the switch.
ip pim df-periodic-interval	Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
ip pim df-abort	Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
ipv6 pim interface	Enables IPv6 PIM and configures statistics on the interface.
ipv6 pim bfd-state	Enables or disables BFD for the PIM router.
ipv6 pim sparse asm-fast-join	Configures the status of the PIM Sparse fast join operation for ASM routes.
ipv6 pim sparse ssm-fast-join	Configures the status of the PIM Sparse fast join operation for both PIM Sparse and SSM routes.
ipv6 pim bidir fast-join	Configures the status of the BIDIR-PIM fast join operation.

ipv6 pim bidir ssm-compat	Configures the SSM compatibility mode for a BIDIR-PIM router.
ipv6 pim joinprune-packing	Enable or disable PIM Join/Prune message packing.

Displays the status of the various global parameters for the IPv6 PIM dense mode.

show ipv6 pim dense

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim dense
Status                       = enabled,
Source Lifetime              = 210,
State Refresh Interval       = 60,
State Refresh Limit Interval = 0,
State Refresh TTL            = 16
BFD Status                   = enabled
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include **enabled** and **disabled**.
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for PIM router.

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim ssm group

Group Address/Prefix RP Address      Mode  Override Precedence Status
--------------------+---------------+-----+--------+----------+-------
ff00::/8             ::              ssm   false    none       enabled
ff34::/32            ::              ssm   false    none       enabled
```

output definitions

Group Address/Prefix	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix
Mode	The IPv6 PIM mode that is used for the groups in this prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	The precedence value that can be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim ssm group	Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

MIB Objects

```

```

show ipv6 pim dense group

Displays the static configuration of IPv6 multicast group mappings for PIM Dense Mode (DM).

show ipv6 pim dense group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim dense group
Group Address/Prefix RP Address      Mode  Override Precedence Status
--------------------+---------------+-----+--------+----------+-------
ff00::/8             ::              dm    false    none       enabled
ff34::/32            ::              dm    false    none       enabled
```

output definitions

Group Address/Pref	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix
Mode	The IPv6 PIM mode that is used for the groups in this prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	The precedence value that can be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim dense group	Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

MIB Objects

```

show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

show ipv6 pim interface [*if_name***]**

Syntax Definitions

if_name	The name of the interface.

Defaults

By default, a summary list of all IPv6 PIM interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ipv6 pim interface

Total 0 Interfaces

Interface Name      Designated                  Hello    J/P      Oper     BFD
                    Router                      Interval Interval Status   Status
--------------------+---------------------------+--------+--------+--------+--------
vlan-5              fe80::2d0:95ff:feac:a537    30       60       enabled  disabled
vlan-30             fe80::2d0:95ff:feac:a537    30       60       disabled disabled

Operational Status          = enabled,
BFD Status                  = disabled,
Join/Prune MTU              = 1000,
Join/Prune Triggered Delay  = 100
```

output definitions

Interface Name	The name of the IPv6 PIM interface.
IPv6 address	Specifies the IPv6 address of the specified interface.
Designated Router	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
Propagation Delay	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
Generation ID Option	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.

output definitions (continued)

DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
Lan Delay Enabled	Options include **true** and **false**. The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.
DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
SR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
BiDir Capable	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM.
DF Election Robustness	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM.
Operational Status	The current operational status of the corresponding interface. Options include **enabled** and **disabled**. This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is **disabled**. To enable or disable PIM on an interface, refer to the **ipv6 pim interface** command on page 33-124. To globally enable or disable PIM on the switch, refer to the **ipv6 pim sparse admin-state** command on page 33-106 and **ipv6 pim dense admin-state** command on page 33-108.
BFD Status	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is **enabled** or **disabled** (the default) for the PIM interface. Configured through the **ipv6 pim interface bfd-state** command.
Join/Prune MTU	The configured PIM Join/Prune packet MTU for this interface.
Join/Prune Triggered Delay	The triggered Join/Prune delay.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.
Release 8.6R1; **Join/Prune MTU** and **Join/Prune Triggered** Delay fields added.

show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

show ipv6 pim neighbor [*ipv6_address***] [***if_name***]**

Syntax Definitions

ipv6_address	The IPv6 address for the PIM neighbor.
if_name	The name of the interface.

Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ipv6 pim neighbor
Neighbor Address               Interface Name       Uptime      Expires     DR Pri
------------------------------+--------------------+-----------+-----------+------
fe80::2d0:95ff:feac:a537       vlan-30               02h:56m:51s 00h:01m:28s 1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
  Neighbor IPv6 Address        = fe80::2d0:95ff:feac:a537,
  Uptime                       = 02h:57m:09s,
  Expires                      = 00h:01m:40s,
  Lan Prune Delay Present      = True,
  Propagation Delay            = 500,
  Override Interval            = 2500,
  TBit Field                   = True,
  Gen ID Present               = True,
  Gen ID Value                 = 0x7720c123,
  BiDir Capable                = False,
  DR Priority Present          = True,
  DR Priority                  = 1,
  State Refresh Capable        = True,
  Secondary Addresses:
    3000::11
```

```
vlan-40
  Neighbor IPv6 Address        = fe80::2d0:95ff:feac:a537,
  Uptime                       = 03h:57m:03s,
  Expires                      = 00h:01m:20s,
  Lan Prune Delay Present            = True,
  Propagation Delay            = 500,
  Override Interval            = 2500,
  TBit Field                   = True,
  Gen ID Present               = True,
  Gen ID Value                 = 0x7720c123,
  BiDir Capable                = False,
  DR Priority Present          = True,
  DR Priority                  = 1,
  State Refresh Capable        = True,
  Secondary Addresses:
    4000::11
```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```
-> show IPv6 pim neighbor vlan-30
vlan-30
  Neighbor IPv6 Address        = fe80::2d0:95ff:feac:a537,
  Uptime                       = 02h:57m:09s,
  Expires                      = 00h:01m:40s,
  Lan Prune Delay Present            = True,
  Propagation Delay            = 500,
  Override Interval            = 2500,
  TBit Field                   = True,
  Gen ID Present               = True,
  Gen ID Value                 = 0x7720c123,
  BiDir Capable                = False,
  DR Priority Present          = True,
  DR Priority                  = 1,
  State Refresh Capable        = True,
  Secondary Addresses:
    3000::11
```

output definitions

Neighbor IPv6 Address	The IPv6 address of the active PIM neighbor.
Interface Name	The name of the IPv6 PIM interface that is used to reach the neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expires	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
LAN Prune Delay present	Specifies whether this neighbor is using the LAN Prune Delay option. Options include **true** or **false**.
Propagation Delay	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

output definitions (continued)

Override Interval	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
TBit field	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Gen ID present	Specifies whether this neighbor is using Generation ID option. Options include **true** or **false**.
Gen ID Value	The value of the Generation ID in the last PIM Hello message received from this neighbor.
BiDir Capable	Specifies whether this neighbor is using the Bidirectional-PIM Capable option.
DR Priority Present	Displays whether the neighbor is using the Designated Router option. Options include **true** or **false**.
DR priority	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include **true** or **false**.
Secondary Addresses	The secondary IPv6 address of this PIM neighbor.

Release History

Release 7.1.1; command was introduced.

show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

show ipv6 pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim static-rp

Group Address/Pref Length   RP Address    Mode  Override Precedence Status
----------------------------+-------------+-----+--------+----------+--------
ff00::/8                    3000::11      asm   false    none       enabled
ff08::/32                   2100::8       bidir false    none       enabled
```

output definitions

Group Address/Pref Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
Mode	The PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, **dm**, or **bidir**.
Override	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s).
Precedence	The precedence value that is used for this static RP configuration.
Status	Displays whether the static RP configuration is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** mode support added.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

MIB Objects

```
pimStaticRPTable
   pimStaticRPAddressType
   pimStaticRPGrpAddress
   pimStaticRPGrpPrefixLength
   pimStaticRPRPAddress
   pimStaticRPPimMode
   pimStaticRPOverrideDynamic

   pimStaticRPStorageType
```

show ipv6 pim anycast-rp

Displays the anycast RP table, which includes the anycast RP address, the RP address, if its the local router, and the current status of the anycast RP configuration.

show ipv6 pim anycast-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim anycast-rp
Anycast RP Address      Router Address      Local    Status
--------------------+------------------+---------+---------
2001:1::1               3001:1::1         true     enabled
2001:1::1               3001:1::2         false    enabled
```

output definitions

Anycast RP Address	The anycast RP address.
Router Address	The router IPv6 address that is a member of the anycast RP set.
Local	Displays whether this entry corresponds to the local router. The value will display true if this entry corresponds to the local router and false if it does not correspond to the local router.
Status	Displays whether the anycast RP configuration is currently enabled or disabled. To change the current status, refer to the ipv6 pim anycast-rp command.

Release History

Release 8.6R2; command introduced.

Related Commands

ipv6 pim anycast-rp	Configures the anycast RP set, which is the set of all routers that would act as the RP.

MIB Objects

```
pimAnycastRPSetTable
   pimAnycastRPSetAddressType
   pimAnycastRPSetAnycastAddress
   pimAnycastRPSetRouterAddress
   pimAnycastRPSetLocalRouter
   pimAnycastRPSetRowStatus
```

show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

show ipv6 pim group-map [bsr | static-rp | ssm | dense]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ipv6 pim group-map
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       ff00::/8                   2000::8       bidir 192
BSR       ff00::/8                   3000::11      asm   192
BSR       ff00::/8                   4000::7       asm   192
SSM       ff33::/32                                ssm

-> show ipv6 pim group-map bsr
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       ff00::/8                   2000::8       bidir 192
BSR       ff00::/8                   3000::11      asm   192
BSR       ff00::/8                   4000::7       asm   192

-> show ipv6 pim group-map ssm
Origin     Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
SSM       ff33::/32                                ssm
```

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
Mode	The IPv6 PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, **dm**, or **bidir**.
Mapping Precedence	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** mode support added.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
ipv6 pim ssm group	Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).
ipv6 pim dense group	Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

```

show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

show ipv6 pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim candidate-rp
RP Address       Group Address       Priority  Interval  Mode  Status
----------------+-------------------+---------+---------+-----+---------
2000::8          ff00::/8            192       60        bidir enabled
```

output definitions

RP Address	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Mode	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **Mode** field added.

Related Commands

ipv6 pim candidate-rp	Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

```

show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

show ipv6 pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim cbsr
CBSR Address             = 3000::7,
Status                   = enabled,
CBSR Priority            = 0,
Hash Mask Length         = 126,
Elected BSR              = False,
Timer                    = 00h:00m:00s
```

output definitions

CBSR Address	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group)
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

```

show ipv6 pim bsr

Displays information about the elected IPv6 BSR.

show ipv6 pim bsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim bsr
BSR Address              = 3000::7,
BSR Priority             = 192,
Hash Mask Length         = 126,
Expiry Time              = 00h:01m:35s
```

output definitions

BSR Address	The IPv6 unicast address of the elected BSR.
BSR Priority	The priority value of the elected BSR. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length that is advertised in the Bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
Expiry Time	The minimum time remaining before the elected BSR will be declared down.

Release History

Release 7.1.1; command was introduced.

show ipv6 pim groute

Displays (*,G) routing table entries for IPv6 PIM.

show ipv6 pim groute [*group_address***]**

Syntax Definitions

group_address	The IPv6 address of the Multicast Group.

Defaults

By default, entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ipv6 pim groute
Total 1 (*,G)

Group Address        RP Address        RPF Interface           UpTime       Mode

    Assert State              = No Info,
    Assert Timer              = 00h:00m:00s,
```

output definitions

Group-address	The IPv6 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
UpTime	The time since this entry was created.
Mode	Whether this entry represents an **asm**, (Any Source Multicast) or **bidir** (Bidirectional PIM) group.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.
Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
RPF Next Hop	The address of the RPF next hop towards the RP.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.

output definitions (continued)

Local Membership	Whether the local router has (*,G) local membership on this interface.
Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; Mode field added, **bidir** mode support added

Related Commands

show ipv6 pim sgroute

Displays (S,G) routing table entries for IPv6 PIM.

show ipv6 pim sgroute [*source_address group_address***]**

Syntax Definitions

source_address	The IPv6 address for a specific multicast source.
group_address	A IPv6 multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ipv6 pim sgroute

Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
               L = Local, R = RPT, T = SPT, F = Register,
               P = Pruned, O = Originator

  Assert Timer              = 00h:00m:00s,
```

output definitions

Source-address	The IPv6 Source address.
Group-address	The IPv6 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.

output definitions (continued)

RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFIfIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.
Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

show ipv6 pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ipv6 pim df-election [*rp_address* | *if_name***]**

Syntax Definitions

rp_address	An IPv6 RP address.
if_name	The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

```
-> show ipv6 pim df-election
RP Address Interface Name DF State Winner Address          Uptime      Metric Metric Expires
                                                                       Pref

```

output definitions

RP Address	The IPv6 address of the Rendezvous Point (RP).
Interface Name	The name of the IPv6 interface.
DF State	The state of the DF election process (**Offer**, **Lose**, **Win**, or **Backoff**).
Winner Address	The primary IPv6 address of the winner of the DF election process.
UpTime	The amount of time since the current winner was last elected the DF for the RP.
Metric Pref	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
Metric	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
Expires	The minimum time remaining before the local router expires the current DF state.

34 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for multicast routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

Filename: ALCATEL-IND1-IPMRM-MIB.mib
Module: alcatelIND1IPMRMMIB

Filename: IPMCAST-MIB.mib
Module: ipMcastMIB

A summary of the available commands is listed here:

ip mroute-boundary
ip mroute-boundary extended
ip mroute interface ttl
ip mroute mbr
show ip mroute-boundary
show ip mroute
show ip mroute interface
show ip mroute-nexthop
show ip mroute mbr
ipv6 mroute interface ttl
show ipv6 mroute
show ipv6 mroute interface
show ipv6 mroute-nexthop

ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the "Configuring Multicast Address Boundaries" chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary *if_name scoped_address mask*

no ip mroute-boundary *if_name scoped_address mask*

Syntax Definitions

if_name	The interface name on which the boundary is being assigned.
scoped_address	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
mask	A corresponding Class A, B, or C mask address (e.g., 255.0.0.0).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute-boundary	Displays scoped multicast address boundaries for the switch's router interfaces.

MIB Objects

```
ipMcastBoundaryTable
   ipMcastBoundaryIfIndex
   ipMcastBoundaryAddressType
   ipMcastBoundaryAddress
   ipMcastBoundaryAddressPrefixLength
```

ip mroute-boundary extended

Enables or disables the multicast route boundary expansion feature. On enabling the multicast route boundary is extended to all the multicast groups (that is, the non-scoped address, 224.0.0.0 to 239.255.255.255). All multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the "Configuring Multicast Address Boundaries" chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary extended {enable | disable}

Syntax Definitions

enable	The multicast route boundary is extended to all the multicast cast address groups (224.0.0.0 through 239.255.255.255).
disable	The multicast route boundary is limited to administratively scoped multicast address (239.0.0.0 through 239.255.255.255).

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip mroute-boundary extended enable
-> ip mroute-boundary extended disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip mroute-boundary	Displays multicast address boundaries for the switch's router interfaces.

MIB Objects

```
alaIpmrmGlobalConfig
   alaIpmrmExtendedBoundaryStatus
```

ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ip mroute interface *if_ name* **ttl** *threshold*

Syntax Definitions

if_name	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
threshold	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
threshold	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute interface	Displays IP multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
```

ip mroute mbr

Configures the switch to serve as a Multicast Border Router (MBR) that will provide interoperability between DVMRP and PIM domains.

ip mroute mbr admin-state {enable | disable}

Syntax Definitions

enable	Enables MBR functionality on the switch.
disable	Disables MBR functionality on the switch.

Defaults

MBR functionality is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To configure the switch to operate as an MBR, first configure the DVMRP and PIM protocols for the switch then enable MBR functionality.
- The MBR functionality is operationally enabled only when there is at lease one PIM interface and one DVMRP interface enabled and both interfaces are operationally active on the switch.
- The MBR feature only supports interoperability between DVMRP and PIM (includes PIM-DM and PIM-SM) domains; no other routing protocols are supported.
- The following is *not* supported by the MBR feature in the current release:
  - PIM-SSM
  - Interoperability between multiple PIM domains
  - IPv6 (only IPv4)

Examples

```
-> ip mroute mbr admin-state enable
-> ip mroute mbr admin-state disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show ip mroute mbr	Displays MBR configuration information.

MIB Objects

`alaIpmrmMbrStatus`

ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ipv6 mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

if_name	The name of the IPv6 interface.
threshold	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
threshold	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 mroute interface	Displays IPv6 multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
```

show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

show ip mroute-boundary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip mroute-boundary
Extended Boundary Address Range: enabled

Interface Name  Interface Address  Boundary Address
--------------+------------------+------------------
vlan-4           214.0.0.7          239.1.1.1/32
vlan-2           170.2.0.1          224.2.2.2/24
```

output definitions

Extended Boundary Address Range	Displays the status of extended multicast route boundary on the interface.
Interface Name	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
Interface Address	The IP address of this interface where the boundary is assigned.
Boundary Address	The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

Release History

Release 7.1.1; command was introduced.
Release 8.2.1; **Extended Boundary Address Range** output filed added.

Related Commands

ip mroute-boundary	Adds or deletes a router's scoped multicast address boundaries.
ip mroute interface ttl	Enables or disables the multicast route boundary expansion feature.
show ip mroute interface	Displays IP multicast interface information.

MIB Objects

```
ipMcastBoundaryTable
   ipMcastBoundaryIfIndex
   ipMcastBoundaryAddressType
   ipMcastBoundaryAddress
   ipMcastBoundaryAddressPrefixLength
   ipMcastBoundaryStatus
alaIpmrmGlobalConfig
   alaIpmrmExtendedBoundaryStatus
```

show ip mroute

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

show ip mroute

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip mroute

Total 2 Mroutes
Group Address   Src Address      Upstream Nbr    Route Address      Proto
--------------+---------------+---------------+----------------+----------
225.0.0.0       214.0.0.2/32      0.0.0.0       214.0.0.0/24        PIM-SM
225.0.0.1       214.0.0.2/32      0.0.0.0       214.0.0.0/24        PIM-DM
```

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address which identifies the source for this entry.
Upstream Nbr	The address of the upstream neighbor from which IP datagrams from these sources to this multicast address are received.
Route Address	The address portion of the route used to find the upstream or parent interface for this multicast forwarding entry.
Proto	The multicast routing protocol through which this multicast forwarding entry was learned (i.e., DVMRP, PIM-SM or PIM-DM).

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute interface	Displays IP multicast interface information.
show ip mroute-nexthop	Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

MIB Objects

```
alaIpMcastRouteTable
   alaIpMcastRouteGroup
   alaIpMcastRouteSource
   alaIpMcastRouteInIfIndex
   alaIpMcastRouteUpstreamNeighbor
   alaIpMcastRouteRtAddress
   alaIpMcastRouteRtPrefixLength
   alaIpMcastRouteProtocol
```

show ipv6 mroute

Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.

show ipv6 mroute

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 mroute
Total 2 Mroutes
Group Address Source Address Interface Upstream Neighbor Route Addr/PrefixLen Proto
------------+---------------+---------+----------------------+--------------+-----
ff06:7777::1 2600::7         vlan-30  fe80::2d0:95ff:feac:a537 2600::/64     PIM-SM
ff06:7777::2 2600::7         vlan-30  fe80::2d0:95ff:feac:a537 2600::/64     PIM-SM
```

output definitions

Group Address	The IPv6 multicast group address for this entry.
Source Address	The IPv6 multicast address, which identifies the source for this entry.
Interface	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
Upstream Neighbor	The IPv6 address of the upstream neighbor from which the datagrams from these sources to this multicast address are received.
Route Addr/Prefix len	The IPv6 address portion of the route used to find the upstream or parent interface for this IPv6 multicast forwarding entry.
Proto	The IPv6 multicast routing protocol through which this IPv6 multicast forwarding entry was learned.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 mroute interface	Displays IPv6 multicast interface information.
show ipv6 mroute-nexthop	Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

MIB Objects

```
alaIpMcastRouteTable
   alaIpMcastRouteGroup
   alaIpMcastRouteSource
   alaIpMcastRouteInIfIndex
   alaIpMcastRouteUpstreamNeighbor
   alaIpMcastRouteRtAddress
   alaIpMcastRouteRtPrefixLength
   alaIpMcastRouteProtocol
```

show ip mroute interface

Displays IP multicast interface information.

show ip mroute interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

Examples

```
-> show ip mroute interface

Interface Name     IP Address     TTL   Multicast Protocol
---------------+---------------+------+--------------------
vlan-4             214.0.0.7       0        PIM
vlan-26            172.21.63.7     0        PIM
vlan-11            212.61.11.7     0        PIM
```

output definitions

Interface Name	The name configured for the interface.
IP Address	The IP address of this interface entry.
TTL	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that *all* multicast packets are forwarded out of the interface.
Multicast Protocol	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute	Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.
show ip mroute-nexthop	Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
   alaIpMcastInterfaceProtocol
```

show ipv6 mroute interface

Displays IPv6 multicast interface information.

show ipv6 mroute interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known IPv6 multicast interfaces information.

Examples

```
-> show ipv6 mroute interface

Interface Name     IP Address     TTL   Multicast Protocol
---------------+---------------+------+--------------------
vlan-4             2000::1      0        PIM
vlan-26            2000::2      0        PIM
vlan-11            2000::3      0        PIM
```

output definitions

Interface Name	The name configured for the IPv6 interface.
IP Address	The IPv6 address of this interface entry.
TTL	The datagram TTL threshold for the interface. Any IPv6 multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that *all* multicast packets are forwarded out of the interface.
Multicast Protocol	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 mroute	Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.
show ipv6 mroute-nexthop	Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
   alaIpMcastInterfaceProtocol
```

show ip mroute-nexthop

Displays next-hop information on outgoing interfaces for routing IP multicast datagrams.

show ip mroute-nexthop

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip mroute-nexthop

Total 10 Nexthops

Group Address  Src Address   Interface Name    Next Hop     Protocol
                                               Address
-------------+-------------+----------------+-------------+----------
225.0.0.0     214.0.0.2/32      vlan-26        225.0.0.0    PIM-SM
225.0.0.1     214.0.0.2/32      vlan-26        225.0.0.1    PIM-SM
225.0.0.2     214.0.0.2/32      vlan-26        225.0.0.2    PIM-SM
225.0.0.3     214.0.0.2/32      vlan-26        225.0.0.3    PIM-SM
225.0.0.4     214.0.0.2/32      vlan-26        225.0.0.4    PIM-SM
225.0.0.5     214.0.0.2/32      vlan-26        225.0.0.5    PIM-SM
225.0.0.6     214.0.0.2/32      vlan-26        225.0.0.6    PIM-SM
225.0.0.7     214.0.0.2/32      vlan-26        225.0.0.7    PIM-SM
225.0.0.8     214.0.0.2/32      vlan-26        225.0.0.8    PIM-SM
225.0.0.9     214.0.0.2/32      vlan-26        225.0.0.9    PIM-SM
```

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address, which identifies the source for this entry.
Interface Name	Generally, this is the name configured for the interface.
Next Hop Address	The address of the next-hop that is specific to this entry.
Protocol	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute	Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.
show ip mroute interface	Displays IP multicast interface information.

MIB Objects

```
alaIpMcastRouteNextHopTable
   alaIpMcastRouteNextHopGroup
   alaIpMcastRouteNextHopSource
   alaIpMcastRouteNextHopIfIndex
   alaIpMcastRouteNextHopAddress
   alaIpMcastRouteNextHopProtocol
```

show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

show ipv6 mroute-nexthop

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 mroute-nexthop
Total 2 Nexthops
Group Address   Source Address    Interface    Next Hop Address        Protocol
---------------+-----------------+-----------+-----------------------+---------
ff06:7777::1    2600::7           vlan-40      ff06:7777::1            PIM-SM
ff06:7777::2    2600::7           vlan-40      ff06:7777::2            PIM-SM
```

output definitions

Group Address	The IPv6 multicast group address for this entry.
Src Address	The IPv6 multicast address, which identifies the source for this entry.
Interface Name	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
Next Hop Address	The IPv6 address of the next-hop that is specific to this entry.
Protocol	The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 mroute	Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.
show ipv6 mroute interface	Displays IPv6 multicast interface information.

MIB Objects

```
alaIpMcastRouteNextHopTable
   alaIpMcastRouteNextHopGroup
   alaIpMcastRouteNextHopSource
   alaIpMcastRouteNextHopIfIndex
   alaIpMcastRouteNextHopAddress
   alaIpMcastRouteNextHopProtocol
```

show ip mroute mbr

Displays the MBR status for the switch.

show ip mroute mbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The MBR feature only supports interoperability between DVMRP and PIM. Both of these multicast protocols must be configured and operationally active on the switch.

Examples

```
-> show ip mroute mbr
MBR Status                      = enabled,
Protocols Registered            = DVMRP PIM
```

output definitions

MBR Status	The administrative status (**enabled** or **disabled**) of MBR functionality on the switch.
Protocols Registered	The operationally active multicast protocols (**DVMRP**, **PIM**) to which MBR functionality is applied.

Release History

Release 7.3.2; command was introduced.

Related Commands

ip mroute mbr	Configures the administrative status of Multicast Border Router functionality.

MIB Objects

```
alaIpmrmGlobalConfig
   alaIpmrmMbrStatus
   alaIpmrmMbrProtocolApps
```

35 QoS Commands

The OmniSwitch QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to Chapter 44, "QoS Policy Commands," for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB.mib
Module alaQoSMIB

Filename: ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB.mib
Module alcatelIND1VfcMIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS commands are listed here:

Global commands	**qos** **qos trust-ports** **qos forward log** **qos log console** **qos log lines** **qos log level** **qos stats interval** **qos phones** **qos quarantine mac-group** **qos user-port** **qos dei** **debug qos** **debug qos internal** **clear qos log** **qos apply** **qos revert** **qos flush** **qos reset** **qos stats reset** **qos switch-group** **show qos slice** **show qos log** **show qos config** **show qos statistics**

Port and Slice commands	**qos port** **qos port reset** **qos port trusted** **qos port maximum egress-bandwidth** **qos port maximum ingress-bandwidth** **qos port maximum depth** **qos port default 802.1p** **qos port default dscp** **qos port default classification** **qos port dei** **show qos port**
Queue Management commands	**qos qsp import** **qos qsp qp** **qos qsi qsp** **qos qsp system-default** **qos qsi stats** **show qos qsi summary** **show qos qsp** **show qos wrp** **show qos qsi** **show qos qsi stats** **show qos qsi wred-stats** **show qos qsp system-default** **clear qos qsi stats**
Data Center Bridging commands	**qos qsp dcb import** **qos qsp dcb tc** **qos qsp dcb tc-numbering** **qos qsi qsp dcb** **qos qsi dcb dcbx version** **qos qsi dcb dcbx admin-state** **qos qsi dcb dcbx ets** **qos qsi dcb dcbx pfc** **show qos qsi summary** **show qos qsp dcb** **show qos qsi dcb dcbx** **show qos qsi dcb ets** **show qos qsi dcbx pfc** **show qos pfc-lossless-usage** **show qos qsi dcb pfc stats** **show qos qsi stats** **clear qos qsi stats** **clear qos qsi dcb pfc stats**

qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of this option, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

qos {enable | disable}
[trust-ports]
[forward log]
[log console]
[log lines *lines***]**
[log level *level***]**
[stats interval *seconds***]**
[phones [priority *priority_value* **| trusted]]**
[user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcpserver | dns-reply}]

Syntax Definitions

enable	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The **enable** setting may be used alone or in conjunction with optional command keywords.
disable	Disables QoS. Flows coming into the switch are not matched to policies. The **disable** setting cannot be used with any other command keyword.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

Examples

```
-> qos disable
-> qos enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy rule	Configures a policy rule on the switch.
show policy rule	Displays information for policy rules configured on the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigEnable
   alaQoSConfigTrustedPorts
   alaQoSConfigForwardLog
   alaQoSConfigLogLines
   alaQoSConfigLogLevel
   alaQoSConfigLogConsolealaQoSConfigStatsInterval
   alaQoSConfigAutoPhones
   alaQoSConfigUserportFilter
   alaQoSConfigAppliedUserportFilter
   alaQoSConfigUserportShutdown
   alaQoSConfigAppliedUserportShutdown
```

qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See page 35-35 for more information about this command.

qos trust-ports

qos no trust-ports

Syntax Definitions

N/A

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

Examples

```
-> qos trust-ports
-> qos no trust-ports
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port trusted	Configures whether or not a particular port is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigTrustedPorts
```

qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

qos forward log

qos no forward log

Syntax Definitions

N/A

Defaults

By default, logged events are not sent to the policy server software in the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

Examples

```
-> qos forward log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigForwardLog
```

qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

qos log console

qos no log console

Syntax Definitions

N/A

Defaults

QoS log messages are not sent to the switch logging utility by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

Examples

```
-> qos log console
-> qos no log console
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
swlog output	Enables or disables switch logging output to the console, file, or data socket (remote session).
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogConsole
```

qos log lines

Configures the number of lines in the QoS log.

qos log lines *lines*

Syntax Definitions

lines	The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–10240.

Defaults

parameter	default
lines	10240

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

Examples

```
-> qos log lines 5
-> qos log lines 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogLines
```

qos log level

Configures the level of log detail.

qos log level *level*

qos no log level

Syntax Definitions

level	The level of log detail, ranging from 1 (least detail) to 8 (most detail).

Defaults

parameter	default
level	5

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **debug qos** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **debug qos** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- Note that a high log level value will impact the performance of the switch.

Examples

```
-> qos log level 4
-> qos log level 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogLevel
```

qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

qos stats interval *seconds*

Syntax Definitions

seconds	The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

Defaults

parameter	default
seconds	60

Platforms Supported

Not supported in this release.

Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

Examples

```
-> qos stats interval 30
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated, interval set to 5 seconds.

Related Commands

show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigStatsInterval
```

qos phones

Enables or disables the automatic prioritization of IP phone traffic.

qos phones [priority *priority_value* **| trusted]**

qos no phones

Syntax Definitions

priority_value	The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).
trusted	Trusts IP phone traffic; priority value of the IP phone packet is used.

Defaults

parameter	default
priority_value **| trusted**	trusted

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:

MAC Address Range	Description
00:80:9f:00:00:00—00:80:9f:ff:ff:ff	Enterprise IP Phones Range
78:81:02:00:00:00—78:81:02:ff:ff:ff	Communications IP Phones Range
00:13:fa:00:00:00—00:13:fa:ff:ff:ff	Lifesize IP Phones Range
48:7a:55:00:00:00—48:7a:55:ff:ff:ff	ALE 8008 IP Phone MAC Range

- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.
- On the OmniSwitch 6860, consider the following:
  - When automatic prioritization of QoS IP phone traffic is enabled, a rule is configured in the FFP (Fast Filtering Processor) with the source MAC address as 00:80:9F:00:00:00 and the mask FF:FF:FF:00:00:00 and 00-13-FA-xx-xx-xx and mask FF:FF:FF:00:00:00.
  - The QoS IP phone prioritization and SIP Snooping features are mutually exclusive. If one of these features is enabled when an attempt is made to enable the other feature, an error message is displayed. To enable QoS IP phone prioritization, first use the **sip-snooping admin-state disable**

command to disable SIP Snooping. To enable the SIP Snooping feature, first use the **qos no phones** command to disable QoS IP phone prioritization.

Note. Note. QoS IP phone prioritization is configured, by default, on initialization

Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; additional IP phone MAC ranges added.

Related Commands

show qos config	Displays the QoS configuration for the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigAutoPhones
```

qos quarantine mac-group

Configures the name of the Quarantine MAC address group. The OmniVista Quarantine Manager application identifies source MAC addresses to quarantine and adds these addresses to the Quarantine MAC group.

qos quarantine mac-group *mac_group*

qos no quarantine mac-group

Syntax Definitions

mac_group	The name of the Quarantine MAC group (up to 31 alphanumeric characters).

Defaults

By default, the quarantine MAC group is not configured on the switch.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of the command to reset the default MAC group name back to “Quarantined”.
- The *mac_group* name specified with this command must match the group name specified with the OmniVista Quarantine Manager application.
- Each switch can have a different Quarantine MAC group name as long as each switch matches the OmniVista Quarantine Manager MAC group name for that switch. Note that there is only one such MAC group per switch.
- Do not use the Quarantine MAC group name in regular QoS policies.
- This group is also used by the switch Quarantine Manager and Remediation (QMR) application to restrict or restore network access to quarantined MACs.
- Note that QMR is not available if VLAN Stacking services or QoS VLAN Stacking inner VLAN and 802.1p policies are configured on the switch.
- QMR is considered active when there are MAC addresses in the Quarantine MAC address group. Use the **show quarantine mac group** command to display the contents of this group. In addition, the **show mac-learning** command output display identifies quarantined MAC addresses.

Examples

```
-> qos quarantine mac-group mac_group1
-> no quarantine mac-group
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
show quarantine mac group	Displays information about the Quarantine MAC group.
show qmr	Displays the QMR configuration for the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigQuarantineMacGroupName
```

qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

qos user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}

qos no user-port {filter | shutdown}

Syntax Definitions

filter	Filters the specified type of traffic when it is received on UserPort ports.
shutdown	Administratively disables UserPort ports that receive the specified type of traffic.
spoof	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
bgp	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
bpdu	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
rip	Filters RIP protocol packets.
ospf	Filters OSPF protocol packets.
vrrp	Filters VRRP protocol packets.
dvmrp	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
pim	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
isis	Filters IS-IS protocol packets.
dhcp-server	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
dns-reply	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

Defaults

parameter	default
filter	spoof
shutdown	none

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spoof bgp ospf**).
- The **filter** option is applied only to ingress traffic on ports that are members of the UserPorts group. However, the switch will still process the filtered packets to determine if an egress update is sent on the same port. For example, if RIP traffic is filtered, the switch will still send RIP peer updates on that port.
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spoof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.
- To enforce anti-spoofing, a VLAN must have an IP address associated with it. If there is no IP address associated with the VLAN, no packets will be dropped.

Examples

```
-> qos user-port filter spoof bpdu
-> qos user-port shutdown spoof bgp ospf
-> qos no user-port shutdown
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; OmniSwitch 6560 support for **BPDU shutdown** added.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
show qos config	Displays QoS configuration information.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigUserportFilter
   alaQoSConfigAppliedUserportFilter
   alaQoSConfigUserportShutdown
   alaQoSConfigAppliedUserportShutdown
```

qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) or other rate limiting mechanisms.

qos dei {ingress | egress}

qos no dei {ingress | egress}

Syntax Definitions

ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic. *DEI mapping is not supported on the OmniSwitch 6465.*
egress	Marks the DEI/CFI bit for egress packets if the packets were marked yellow as a result of the rate limiting process.

Defaults

By default, no DEI bit marking or mapping is done.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI bit set and ingress DEI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.
- DEI bit mapping is not supported on the OmniSwitch 6465. As a result, packets are processed as follows on that switch:
  - When packets are received on a trusted port, the DEI bit is retained only if the packets were not subject to a meter. If the port is untrusted, however, the DEI bit is always reset.
  - When a meter is set and DEI egress is configured on a trusted port, the DEI bit is reset to 0 for green packets. Yellow–red packets egress with the DEI bit set to 1.

Examples

```
-> qos dei ingress
-> qos dei egress
```

```
-> qos no dei ingress
-> qos no dei egress
```

Release History

Release 7.2.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port dei	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
policy action cir	Configures a Tri-Color Marking policy action.
show qos config	Displays global information about the QoS configuration.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigDEIMapping
   alaQoSConfigDEIMarking
```

debug qos

Configures the type of QoS events that will be displayed in the QoS log.

debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]

debug no qos

debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]

Syntax Definitions

info	Logs basic information about the switch.
config	Logs information about the global configuration.
rule	Logs events for rules configured on the switch.
main	Logs information about basic program interfaces.
port	Logs events related to QoS ports.
msg	Logs QoS messages.
sl	Logs information about source learning.
mem	Logs information about memory.
mapper	Logs information about mapping queues.
slot	Logs events related to slots.
l2	Logs Layer 2 QoS events on the switch.
l3	Logs Layer 3 QoS events on the switch.
classifier	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
nat	*Not supported in this release.*
sem	Logs information about semaphore, process locking.
pm	Logs events related to the Policy Manager.
ingress	Logs information about packets arriving on the switch.
egress	Logs information about packets leaving the switch.

Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.

- Use this command to troubleshoot QoS events on the switch.

Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos forward log	Enables the switch to send events to the PolicyView application in real time.
qos log lines	Configures the number of lines in the QoS log.
qos log level	Configures the level of log detail.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigDebug
```

debug qos internal

Displays debugging information for QoS internal to the switch.

debug qos internal [slice *slot/slice***] [flow] [queue] [port] [l2tree] [l3tree] [vector] [pending] [verbose] [mapper] [pool] [log] [pingonly | nopingonly]**

Syntax Definitions

slot/slice	The slot number and slice to view debugging information. A *slice* is a logical section of hardware that corresponds to particular ports on a network interface module.
flow	Displays information about QoS flows.
queue	Displays information about QoS queues.
port	Displays information about QoS ports.
l2tree	Displays information about Layer 2 flows.
l3tree	Displays information about Layer 3 flows.
vector	Displays information about vectors.
pending	Displays information about pending QoS objects.
verbose	Sets the output to verbose mode for more detailed information.
mapper	Displays information about QoS mapping flows to queues.
pool	Displays information about the buffer pool.
log	Displays information about QoS information that is logged.
pingonly	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
nopingonly	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

Defaults

Debugging is disabled by default.

parameter	default
pingonly | nopingonly	**nopingonly**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **debug qos** command to configure the type of QoS events that will be displayed in the QoS log.
- Use the **qos log level** command to set the level of log detail in the QoS log.

Examples

```
-> debug qos internal "verbose log"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

debug qos	Configures the type of QoS events that will be displayed in the QoS log.
qos log level	Configures the level of log detail.

MIB Objects

N/A

clear qos log

Clears messages in the current QoS log.

clear qos log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

Examples

```
-> clear qos log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigClearLog
```

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

qos apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

Examples

```
-> qos apply
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos revert	Removes any policies configured through policy rule but not applied to the current configuration through the **qos apply** command.
qos reset	Resets the QoS configuration to its default values.
qos flush	Deletes all pending policy information.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigApply
```

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos revert

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

Examples

```
-> qos revert
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
qos apply	Applies all QoS settings configured on the switch to the current configuration.
qos reset	Resets the QoS configuration to its defaults.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigRevert
```

qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

qos flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration.*

Note. Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

base commands	
policy rule	**policy mac group**
policy network group	**policy port group**
policy service	**policy condition**
policy service group	**policy action**

Examples

```
-> qos flush
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos revert	Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
policy server flush	Removes all cached LDAP policy data from the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigFlush
```

qos reset

Resets the QoS configuration to its defaults.

qos reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

Examples

```
-> qos reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies all QoS settings configured on the switch to the current configuration.
qos revert	Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigReset
```

qos stats reset

Resets QoS statistic counters to zero.

qos stats reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

Examples

```
-> qos stats reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigStatsReset
```

qos switch-group

Changes how the switch handles IP addresses configured on the switch to help reduce the number of hardware entries required for QoS policies that use an IP address configured on the switch.

qos switch-group {expanded | compact}

Syntax Definitions

expanded	Uses the expanded method for populating the hardware routing table. This method requires a hardware entry for each individual IP interface belonging to either the built-in 'Switch' or 'Switch6' network groups.
compact	Uses the compact method for populating the hardware routing table by programming a single next hop entry for all IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups.

Defaults

parameter	default
expanded | compact	**expanded**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The **expanded** method can be used to reduce the hardware entries required and allow for a single hardware entry to be programmed for all the IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups instead of a hardware entry for each individual IP address.
- The built-in policy network group 'Switch' contains all the IPv4 interfaces configured on the switch.
- The built-in policy network group 'Switch6' contains all the IPv6 interfaces configured on the switch.
- It is required to reboot the switch for the switch group setting to take effect. The current setting will always be shown, with the modified setting in parentheses in the **show qos config** command.

Examples

```
-> qos switch-group compact
-> qos switch-group expanded
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

show qos config	Displays global information about the QoS configuration.

MIB Objects

```
alaQoSConfig
   alaQoSConfigSwitchGroup
```

qos port reset

Resets all QoS port configuration to the default values.

qos port *chassis/slot/port***[**-*port2***] reset**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The QoS port configuration parameters that are reset include:

parameter	default
default queues	8
trusted	not trusted

Examples

```
-> qos port 3/1 reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortReset
```

qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

qos port *chassis/slot/port***[**-*port2***]**
[trusted]
[maximum egress-bandwidth *bps***]**
[maximum ingress-bandwidth *bps***]**
[maximum depth *bps***]**
[default 802.1p *value***]**
[default dscp *value***]**
[default classification {802.1p | tos | dscp}]

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port trusted	Configures whether the default mode for QoS ports is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortTrusted
   alaQoSPortMaximumBandwidth
   alaQoSPortMaximumBandwidthStatus
   alaQoSPortMaximumIngBandwidth
   alaQoSPortMaximumIngBandwidthStatus
   alaQoSPortMaximumDefaultDepth
   alaQoSPortMaximumDefaultDepthStatus
   alaQoSPortDefault8021p
   alaQoSPortDefaultDSCPalaQoSPortDefaultClassification
```

qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

qos port *chassis/slot/port***[**-*port2***] trusted**

qos port *chassis/slot/port* **no trusted**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **qos trust-ports** command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
qos trust-ports	Configures the global trust mode for QoS ports.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortTrusted
```

qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

qos port *chassis/slot/port***[**-*port2***] maximum egress-bandwidth** *bps***[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum egress-bandwidth**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000
-> qos port 4/1-8 maximum egress-bandwidth 10m
-> qos port 3/1 no maximum egress-bandwidth
-> qos port 4/1-8 no maximum egress-bandwidth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port maximum ingress-bandwidth	Configures the rate at which traffic is received on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumBandwidth
   alaQoSPortMaximumBandwidthStatus
```

qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

qos port *chassis/slot/port***[**-*port2***] maximum ingress-bandwidth** *bps***[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum ingress-bandwidth**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000
-> qos port 4/1-8 maximum ingress-bandwidth 10m
-> qos port 3/1 no maximum ingress-bandwidth
-> qos port 4/1-8 no maximum ingress-bandwidth
```

Release History

Release 7.1.1; command introduced.

Related Commands

qos port maximum egress-bandwidth	Configures the rate at which traffic is sent on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumIngBandwidth
   alaQoSPortMaximumIngBandwidthStatus
```

qos port maximum depth

Configures the maximum queue depth or bucket size assigned to this action, in bytes, used for traffic metering. The queue depth or bucket size determines the amount of buffer allocated to each queue. When the queue depth or bucket size is reached, the switch starts dropping packets.

qos port *chassis/slot/port***[**-*port2***] maximum {ingress | egress}-depth** *bytes* **[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum {ingress | egress}-depth**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports.
*bytes***[k | m | g | t]**	The maximum bucket size, in bytes. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

parameter	default
k | m | g | t	**k**
bytes	**0**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in Kbytes by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **1M** is specified, the maximum depth value applied is 1 Mbyte.
- Modifying the maximum depth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum ingress-depth 100
-> qos port 4/1-8 maximum egress-depth 10m
-> qos port 3/1 no maximum ingress-depth
-> qos port 4/1-8 no maximum egress-depth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumDefaultDepth
```

qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port***[**-*port2***]** **default 802.1p** *value*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
value	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

Examples

```
-> qos port 3/1 default 802.1p 5
-> qos port 4/1-8 default 802.1p 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefault8021p
```

qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port***[**-*port2***]** **default dscp** *value*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
value	The ToS/DSCP value. The range is 0–63.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

Examples

```
-> qos port 3/1 default dscp 63
-> qos port 4/1-8 default dscp 33
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefaultDSCP
```

qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

qos port *chassis/slot/port***[**-*port2***] default classification {tos | 802.1p | dscp}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
tos	Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port.
802.1p	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
dscp	Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port.

Defaults

parameter	default
tos | 802.1p | dscp	dscp

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

Examples

```
-> qos port 8/24 default classification dscp
-> qos port 4/1-8 default classification dscp
-> qos port 7/1 default classification 802.1p
-> qos port 5/1-8 default classification 802.1p
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefaultClassification
```

qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) or other rate limiting mechanisms.

qos port *chassis/slot/port* **dei {ingress | egress}**

qos port *chassis/slot/port* **no dei {ingress | egress}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1/5).
ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic. *DEI mapping is not supported on the OmniSwitch 6465.*
egress	Marks the DEI/CFI bit for egress packets if the packets were marked yellow as a result of the rate limiting process.

Defaults

By default, no DEI/CFI bit mapping or marking is done.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI bit set and ingress DEI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.
- DEI bit mapping is not supported on the OmniSwitch 6465. As a result, packets are processed as follows on that switch:
  - When packets are received on a trusted port, the DEI bit is retained only if the packets were not subject to a meter. If the port is untrusted, however, the DEI bit is always reset.
  - When a meter is set and DEI egress is configured on a trusted port, the DEI bit is reset to 0 for green packets. Yellow–red packets egress with the DEI bit set to 1.

Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

Release History

Release 7.2.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos dei	Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.
policy action cir	Configures a Tri-Color Marking policy action.
show qos config	Displays global information about the QoS configuration.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDEIMapping
   alaQoSPortDEIMarking
```

qos qsp import

Imports a predefined QSet profile (QSP) to a new or previous custom profile.

qos qsp {*qsp_id* **|** *qsp_name***} import qsp {***import_qsp_id* **|** *import_qsp_name***}**

no qos qsp {*qsp_id* **|** *qsp_name***}**

Syntax Definitions

qsp_id	A QSet custom profile ID. The valid custom profile ID range is 6–16.
qsp_name	The QSet profile name.
import_qsp_id	The ID of the QSet profile to import (1 or 5).
import_dcp_name	The name of the QSet profile to import (QSP-1 or QSP-5).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- The new QSet profile must be unique and not contain the same name and ID of an existing QSet profile.
- Use the **no** form of the command to remove an existing custom QSet profile from the switch configuration.
- The predefined QSet profiles 1 and 5 cannot be removed from the switch configuration.
- A custom profile can be assigned to any port or link aggregate, but not to a VFL link.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.

Examples

```
-> qos qsp 12 import qsp 1
-> qos qsp qsp-16 import qsp 5
-> no qsp 12
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

qos qsi qsp	Configures the QSet profile association for the QSet instance.
show qos qsp	Displays the QSet profile attributes.

MIB Objects

```
alaVfcQsetProfileTable
   alaVfcQSPId
   alaVfcQSPName
   alaVfcQSPTemplateId
   alaVfcQSPTemplateName
   alaVfcQSPRowStatus
```

qos qsp qp

Modifies the Peak Information Rate (PIR), WFQ weight, and WFQ scheduler mode attributes for an individual queue profile (QP) associated with a custom QSet profile (QSP).

qos qsp {*qsp_id* **|** *qsp_name***} qp** *qp_id* **{pir** *%* | **weight** *weight* **| scheduler {sp | wrr | wrr2}}**

Syntax Definitions

qsp_id	A QSet custom profile ID. The valid custom profile ID range is 6–16.
qsp_name	The QSet custom profile name.
qp_id	The queue profile number in the QSet custom profile.
%	The PIR rate limit to apply to queue traffic.
weight	The queue weight that is used to determine the amount of shared bandwidth allocated for queue traffic. The valid range is 0–127.
sp	Selects the Strict Priority scheduler.
wrr	Selects the Weighted Round Robin scheduler.
wrr2	Selects a second Weighted Round Robin scheduler that is available on the OmniSwitch 9900.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- The queue weight value is only used when WRR is the scheduler for the queue.
- The **pir**, **weight**, and **scheduler** attributes are only configurable for individual queues that are associated with a custom QSet profile.
- When a custom profile is modified, the changes are applied to all ports that are associated with that custom profile. To apply specific changes to a single port (QSet instance), import a custom or default profile into a new custom profile, make the necessary changes, then apply the new custom profile to the port.

Examples

```
-> qos qsp 6 qp 1 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 2 scheduler wrr weight 1 pir 100
-> qos qsp 6 qp 3 scheduler wrr weight 3 pir 100
-> qos qsp 6 qp 4 scheduler wrr weight 4 pir 100
-> qos qsp 6 qp 5 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 6 scheduler sp pir 50
-> qos qsp 6 qp 7 scheduler wrr2 weight 2 pir 100
-> qos qsp 6 qp 8 scheduler wrr2 weight 2 pir 100
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

qos qsp import	Creates a custom QSet profile.
show qos qsp	Displays the QSet profile attributes.

MIB Objects

```

   alaVfcQPPIRBandwidthLimitValue
   alaVfcQPWfqWeight
   alaVfcQPWfqMode
```

qos qsi qsp

Configures the QSet profile (QSP) association for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port, link aggregate, and virtual fabric link (VFL).

qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***] | vf-link** *vfl_id***} qsp {***qsp_id* **|** *qsp_name***}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
vfl_id	The VFL link ID (1/0). *This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.*
qsp_id	An existing QSet profile (QSP) ID number to assign to this instance. • OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900 support predefined QSP IDs 1 and 5; profiles 2, 3, and 4 are not supported. Custom profiles QSP IDs 6 through 16 are supported. • OmniSwitch 6900-C32 and OmniSwitch 6900-V72 support predefined QSP ID 1; custom profiles are not supported. • OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900 support predefined QSP IDs 1, 2, 3, and 4; custom profiles are not supported.
qsp_name	An existing QSet profile name (for example, qsp-1) to assign to this instance.

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- There is only one QSI for each port, link aggregate, and VFL and only one QSP associated with each QSI.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.
- On an OmniSwitch 6860 or OmniSwitch 6865, changing the QSP assignment for one VFL instance automatically changes the QSP assignment for all other VFL instances to the same QSP. For example, if QSP 2 is assigned to VFL 1/0, then the QSP assignment for VFL 2/0 is also changed to QSP 2. It is not necessary to configure the QSP assignment separately for each VFL on the switch.

Examples

```
-> qos qsi port 1/2 qsp 2
-> qos qsi port 2/1-10 qsp 3
-> qos qsi slot 3 qsp 4
-> qos qsi linkagg 10 qsp 2

The following command examples show that when the QSP assignment for VFL 1 is
changed to QSP 2, the QSP for VFL 2 is automatically changed as well:

-> qos qsi vf-link 1/0 qsp 2
WARNING: configuration change applied to all VFLs in the system

-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.

           Profile

----------+---+------------+----+------
vfl-2/0    2   qsp-2        NDCB vfl-2/0
```

Release History

Release 7.2.1.R02; command introduced.
Release 8.3.1; **vf-link** parameter added.

Related Commands

qos qsp import	Imports a predefined QSet profile (QSP) to a new or previous custom profile.
qos qsi stats	Configures statistics collection for the QSet instance.
show qos qsi	Displays the QSet instance configuration.
show qos qsp	Displays the QSet profile attributes.

MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
   alaVfcQsetId
   alaVfcQsetQSPId
   alaVfcQsetQSPName
```

qos qsp system-default

Changes the default QSet profile (QSP) that is assigned to each port, link aggregate ID, and virtual fabric link (VFL).

qos qsp system-default {*qsp_id* **|** *qsp_name***}**

Syntax Definitions

qsp_id	An existing QSet profile (QSP) ID number to use as the default QSP. The valid range is 1–4.
qsp_name	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to use as the default QSP.

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- When this command is used, the specified QSP is assigned to all ports, link aggregates, and VFLs on the switch.
- Changing the system default profile is only allowed when the switch is running in the non-Data Center Bridging (NDCB) mode. This mode is active by default when there is no OmniSwitch Data Center software license installed on the switch.
- A QSP assigned through the **qos qsi qsp** command overrides the system default QSP assignment. For example, if the system default QSP is set to 1 and the **qos qsi qsp** command is used to change the QSP to 2 on port 1/1/20, the QSP 2 settings are applied to port 1/1/20.

Examples

```
-> qos qsp system-default 2
-> qos qsp system-default qsp-4
```

Release History

Release 8.3.1; command introduced.

Related Commands

qos qsi qsp	Configures the QSet profile association for the QSet instance.
show qos qsp system-default	Displays the name and ID of the default QSP for the switch.

MIB Objects

```
alcatelIND1VfcMIB
   alaVfcSystemDefaultQsetQSPName
   alaVfcSystemDefaultQsetQSPId
```

qos qsi stats

Configures the administrative status and interval for statistics collection for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

qos qsi {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} stats {admin-state {enable | disable} | interval** *interval_time***}]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
*agg_id***[-***agg_id2***]**	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
enable	Enables statistics collection for the instance.
disable	Disables statistics collection for the instance.
interval_time	The time interval for statistics gathering. The valid range is 10–300 seconds.

Defaults

By default, statistics collection is disabled and the time interval is set to 10 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSet profile (QSP) or DCB profile (DCP) associated with the QSI.
- Changing the statistics collection status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.

Examples

```
-> qos qsi port 1/2 stats admin-state enable
-> qos qsi port 1/2 stats interval 30
-> qos qsi port 2/1-10 stats admin-state enable
-> qos qsi linkagg 10 stats admin-state enable interval 120
```

Release History

Release 7.2.1.R02; command introduced.

Related Commands

qos qsi qsp	Configures the QSet profile association for the QSet instance.
show qos qsi	Displays the QSet instance configuration.
show qos qsi stats	Displays statistics for one or more QSet instances.

MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
   alaVfcQsetQSPId
   alaVfcQsetQSPName
   alaVfcQsetStatsAdmin
   alaVfcQsetStatsInterval
```

show qos port

Displays information about all QoS ports or a particular port.

show qos port [*chassis/slot/port***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

character	definition
+	Indicates that the port is manually configured as trusted through the **qos port trusted** command; the port setting takes precedence over the global trust setting configured through the **qos trust-ports** command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the **qos trust-ports** command. (Applies to mobile ports and ports configured for 802.1Q.)

Examples

```
-> show qos port
Slot/              Default    Default                Bandwidth       DEI

```

output definitions

Slot/Port	The slot and physical port number.
Active	Whether or not the port is sending/receiving QoS traffic.
Trust	Whether the port is trusted or not trusted. Configured through the **qos port trusted** command.
Default P	The default 802.1p setting for the port. Configured through the **qos port default 802.1p** command.
Default DSCP	The default ToS/DSCP setting for the port. Configured through the **qos port default dscp** command.
Default Classification	The default classification setting for the port (**802.1p, ToS,** or **DSCP**). Configured through the **qos port default classification** command.
Physical Bandwidth	The amount of physical bandwidth available on the port.
Ingress Bandwidth	The amount of ingress bandwidth configured for the port. Configured through the **qos port maximum ingress-bandwidth** command.
Egress Bandwidth	The amount of egress bandwidth configured for the port. Configured through the **qos port maximum egress-bandwidth** command.
DEI Map/Mark	The Drop Eligible Indicator (DEI) bit mapping and marking setting for the port. Configured through the **qos port dei** command.
Type	The interface type, **ethernet** or **wan**.

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.

```

show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

show qos slice [*slot/slice***]**

Syntax Definitions

slot/slice	The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.
- On the following switch platforms, use the **show tcam utilization** command instead of the **show qos slice** command:
  - OmniSwitch 6465
  - OmniSwitch 6560
  - OmniSwitch 6900-V72, 6900-C32
  - OmniSwitch 9900

Examples

```
-> show qos slice
Slot/                    Ranges          Rules          Counters         Meters
Unit            Type Total/Free  CAM Total/Free      Total/Free      Total/Free
 1/1/(0)        IFP    24/24       0   256/252          256/252         256/256
                                   1   256/255          256/255         256/256
                                   2   256/256          256/256         256/256
                                   3   256/256          256/256         256/256

                                  13   256/256          256/256         256/256
                                  14   256/255          256/254         256/254
```

```
                                    15   256/255          256/256          256/256
1/1/(0)          EFP      0/0       0   256/256          256/256          256/256
                                    1   256/256          256/256          256/256
                                    2   256/256          256/256          256/256
                                    3   256/256          256/256          256/256
```

output definitions

Slot/Unit	The slot and slice number.
Type	The type of slice.
Ranges Total	The total number of TCP/UDP port ranges supported per slot/slice.
Ranges Free	The number of TCP/UDP port ranges that are still available for use.
CAM	The CAM number.
Rules Total	The total number of rules supported per CAM.
Rules Free	The number of rules that are still available for use. On startup, the switch uses 27 rules.
Counters Total	The total number of counters supported per CAM.
Counter Free	The number of counters that are still available for use.
Meters Total	The total number of meters supported per CAM.
Meters Free	The number of meters that are still available for use.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

N/A

show qos log

Displays the log of QoS events.

show qos log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display the current QoS log. To clear the log, use the **clear qos log** command.

Examples

```
-> show qos log
**QOS Log**
Insert rule 0
Rule index at 0
Insert rule 1
Rule index at 1
Insert rule 2
Rule index at 2
Enable rule r1 (1) 1,1

MIB Objects

N/A

show qos config

Displays global information about the QoS configuration.

show qos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

Examples

```
-> show qos config
QoS Configuration
  Admin                         = enable,
  Switch Group                  = expanded,
  Trust ports                   = no,
  Phones                        = trusted,
  Log lines                     = 10240,
  Log level                     = 5,
  Log console                   = no,
  Forward log                   = no,
  Stats interval                = 60,
  User-port filter              = spoof,
  User-port shutdown            = none,
  Debug                         = info,
  DEI Mapping                   = Disabled,
  DEI Marking                   = Disabled,
  Pending changes               = none
```

output definitions

Admin	Whether or not QoS is enabled or disabled. Configured through the **qos** command.
Switch Group	Whether the expanded or compact method is used to populate the hardware routing table. Configured through the **qos switch-group** command.
Trust Ports	The default trusted mode for switch ports. Configured through the **qos trust-ports** command.

output definitions (continued)

Phones	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the **qos phones** command.
Log lines	The number of lines included in the QoS log. Configured through the **qos log lines** command.
Log level	The level of log detail. Configured through the **qos log level** command.
Log console	Whether or not log messages are sent to the console. Configured through the **qos log console** command.
Forward log	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the **qos forward log** command.
Stats interval	How often the switch polls network interfaces for statistics about QoS events. Configured through the **qos stats interval** command.
User-port filter	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the **qos user-port** command.
User-port shutdown	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the **qos user-port** command.
Debug	The type of information that will be displayed in the QoS log. A value of **info** indicates the default debugging type.
DEI Mapping	The status (enabled or disabled) of Drop Eligible Indicator (DEI) bit mapping for ingress traffic. Configured through the **qos dei** command.
DEI Marking	The status (enabled or disabled) of DEI bit marking for egress traffic. Configured through the **qos dei** command.
Pending changes	QoS changes not yet applied to the configuration.

Release History

Release 7.1.1; command was introduced.

Related Commands

qos	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.
show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

show qos statistics

Displays statistics about the QoS configuration.

show qos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays statistics about the global QoS configuration. Use the **show qos config** command to display information about configurable global parameters.

Examples

```
-> show qos statistics
QoS stats
                          Events   Matches     Drops

output definitions

Events	The number of Layer 2 or Layer 3 flows transmitted on the switch.
Matches	The number of Layer 2 or Layer 3 flows that match policies.
Drops	The number of Layer 2 or Layer 3 flows that were dropped.
L2	The number of Layer 2 events, matches, and drops.
L3 Ingress	The number of Layer 3 ingress events, matches, and drops.
L3 Egress	The number of Layer 3 egress events, matches, and drops
IGMP join	The number of multicast events, matches, and drops.
Fragments	The number of fragments dropped.
Bad Fragments	The number of fragments received with an offset of 1.
Unknown Fragments	The number of out-of-order fragments received.
Sent NI messages	The number of messages sent to network interfaces.
Received NI messages	The number of messages received by network interfaces.
Failed NI messages	The number of failed message attempts to network interfaces.
Load balanced flows	The number of Server Load Balance flow entries.
Reflexive flows	The number of reflexive flows.
Reflexive correction	The number of reflexive flow corrections.
Flow lookups	The number of flow table lookups.
Flow hits	The number of flow table lookup hits.
Max PTree nodes	The highest number of nodes in the classifier tree.
Max Ptree depth	The length of the longest path in the classifier tree.
Spoofed Events	The number of spoofed events.
Nonspoofed Events	The number of non-spoofed events.
DropServices	The number of TCP/UDP flows dropped.

Release History

Release 7.1.1; command was introduced.

Related Commands

qos stats reset	Resets QoS statistic counters to zero.

show qos qsi summary

Displays a list of switch ports showing the QoS or DCB profile assigned to each port.

show qos qsi [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] summary**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

By default, a summary of all ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter a port or link aggregate ID with this command to display information for a specific port or link aggregate.

Examples

```
-> show qos qsi summary
Legends: * indicates port is misconfigured.

           Profile
Port       #   Name         Mode Parent
----------+---+------------+----+------
1/1/1      1   qsp-1        NDCB 1/1/1
1/1/2      1   qsp-1        NDCB 1/1/2
1/1/3      1   qsp-1        NDCB 1/1/3
1/1/4      1   qsp-1        NDCB 1/1/4
1/1/5      7   qsp-7        NDCB 1/1/5
1/1/6      1   qsp-1        NDCB 1/1/6

-> show qos qsi port 1/1-5 summary
Legends: * indicates port is misconfigured.

           Profile
Port       #   Name         Mode Parent
----------+---+------------+----+------
1/1/1      1   qsp-1        NDCB 1/1/1
1/1/2      1   qsp-1        NDCB 1/1/2
1/1/3      1   qsp-1        NDCB 1/1/3
1/1/4      1   qsp-1        NDCB 1/1/4
1/1/5      7   qsp-7        NDCB 1/1/5
```

output definitions

Port	Configured DCB ports.
Profile #	Identifies the DCB profile assigned to the port.
Profile Name	Name of the DCB profile assigned to the port.
Mode	Indicates if the port is DCB or NDCB.
Parent	Lists the parent of the port.

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsi dcb dcbx	Displays the configured ports in the system and the related DCBX information.
qos qsi qsp dcb	Assigns a DCB profile to a port or link aggregate.

MIB Objects

```
alaVfcQsetInstanceTable
   alaVfcQsetId
   alaVfcQsetQSPId
   alaVfcQsetQSPName
   alaDcbxPortInstanceTable
   alaVfcQsapParent
```

show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

show qos qsp [*qsp_id* **|** *qsp_name***] [brief | detail [port** *chassis/slot/port***[-***port2***]] | linkagg** *agg_id***[-***agg_id2***]]]**

Syntax Definitions

qsp_id	A QSet profile (QSP) ID number. • OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900 support predefined QSP IDs 1 and 5; profiles 2, 3, and 4 are not supported. QSP IDs 6 through 16 refer to custom profiles that are also supported. • OmniSwitch 6900-C32 and OmniSwitch 6900-V72 support predefined QSP ID 1; custom profiles are not supported. • OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900 support predefined QSP IDs 1, 2, 3, and 4; custom profiles are not supported.
qsp_name	The name of a QSP profile.
brief	Displays a summary of the QSP configuration.
detail	Displays QSP configuration details for a specific profile, port, slot, or link aggregate.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[-***agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

By default, displays the configuration for all of the QSet profiles.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *qsp_id* or the *qsp_name* parameter to display information for a specific profile.
- Use the **detail** parameter in combination with the **port** *slot/port* and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates.
- Configuring a QSP assignment for a virtual fabric link (VFL) is supported only on the OmniSwitch 6860 and OmniSwitch 6865.

Examples

```

output definitions

QSP	The QSet profile (QSP) ID number and name.
#Ports	The number of ports to which this profile is attached.
#Queues	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
BW%	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.

output definitions (continued)

WRP	*Not supported in this release.*
Name	*Not supported in this release.*
Scheduler	The type of scheduler, such as queue specific priority (Qspec) or strict priority.
Type	Whether the QSP is static or dynamic. Currently there are predefined, static profiles on each switch. User-configured, dynamic profiles are only supported on the OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900.
QP 1...8	The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4.

```
-> show qos qsp brief
Profile  Name          #Ports  #Queues  BW(%)  Type      Base Profile
--------+-------------+-------+--------+------+---------+-------------
1        qsp-1         58      8        100    Static    qsp-1
5        qsp-5         0       8        100    Static    qsp-5
6        qsp-6         0       8        100    Dynamic   qsp-5
```

output definitions

Profile	The QSet profile (QSP) ID number.
Name	The QSP name.
#Ports	The number of ports to which this profile is attached.
#Queues	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
BW%	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.
Type	Whether the QSP is static or dynamic. Currently there are predefined, static profiles on each switch. User-configured, dynamic profiles are only supported on the OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900.
Base Profile	The profile on which the QSP is based. The profile number will differ for user-configured profiles.

output definitions

QSAP Port	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
QSAP Type	The type of QSAP port; Phy = physical (slot/port), Log = logical (linkagg ID or VFL ID).
dQSI	The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port, link aggregate, and VFL.
ID	The QSet profile (QSP) ID number.
Name	The QSP name.
QSAP Parent	The QSAP parent ID number. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or a VFL.
BW (%) Admin	The administrative bandwidth percentage for the QSet. The administrative percentage is not configurable at this time.
BW (%) Oper	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
Type	Whether the QSP is static or dynamic. Currently there are predefined, static profiles on each switch. User-configured, dynamic profiles are only supported on the OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900.

Release History

Release 7.2.1; command was introduced.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.
show qos qsi	Displays the QSet instance configuration.

MIB Objects

show qos wrp

Displays the Weighted Random Early Detection (WRED) profile (WRP) configuration for the switch.

show qos wrp [*wrp_id* **|** *wrp_name***] [detail [port** *chassis/slot/port***[-***port2***]] | slot** *slot* **| linkagg** *agg_id***[-***agg_id2***]]]**

Syntax Definitions

wrp_id	A WRED profile (WRP) ID number. The valid range is 1.
wrp_name	A WRED profile name.
detail	Displays WRED profile configuration details for a port, slot, or link aggregate.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
slot	A slot number. Displays information for all non-DCB ports on the slot.
*agg_id***[-***agg_id2***]**	The link aggregate ID for a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the *wrp_id* or the *wrp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

Examples

```
-> show qos wrp
WRP  1 (wrp-1)
  #Ports:  480, MTU:  1540
    Red
      Min-Th:  10, Max-Th:  50, Max-Pb:  36, Gain:  9
    Yellow
      Min-Th:  50, Max-Th:  90, Max-Pb:  30, Gain:  9
    Green
```

```
      Min-Th:  90, Max-Th: 100, Max-Pb:  24, Gain:  9
```

output definitions

WRP	The WRED profile (WRP) ID number and name.
#Ports	The number of ports to which this profile is attached.
MTU	The MTU size.
Min-Th	The minimum queue threshold percentage for red, green, and yellow packets.
Max-Th	The maximum queue threshold percentage for red, green, and yellow packets.
Max-Pb	The maximum drop probability percentage for red, green, and yellow packets.
Gain	The gain value to smooth out the queue (1–15).

```

output definitions

Port	The physical slot and port number (or link aggregate ID for a logical port).
QSAP	The QSet attachment point (QSAP). This is a logical entity used internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
Parent	The QSAP ID for the parent QSAP, if any.
WRP Name Admin	The WRED profile (WRP) ID number, name, and administrative status.
QSI	The switch port associated with the QSet instance (QSI).
QSP Name Admin	The QSet profile (QSP) ID number, name, and administrative status.
QI 1...8	The WRP information for each of the QSet queues.

Release History

Release 7.2.1; command was introduced.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.
show qos qsi	Displays the QSet instance configuration.

show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight egress queues associated with each port, link aggregate (LAG) ID, and virtual fabric link (VFL).

show qos qsi [port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***] | vf-link** *vfl_id***] [detail | summary]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[-***agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
vfl_id	The VFL ID (1/0). *This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.*
detail	Displays additional queue information for the instance.
summary	Displays summary information for the instance.

Defaults

By default, displays the entire QSI configuration for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **port** *slot/port*, **slot** *slot*, **linkagg** *agg_id,* and **vf-link** *vfl_id* parameters to display the QSI information associated with specific ports, link aggregates, or VFLs. These parameters can also be combined with the **detail** or **summary** parameters.

output definitions

QSAP	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
Parent	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.
QSI	The QSet instance (QSI) ID number, internally generated by the switch.
QSP, Name	The QSet profile (QSP) ID number and name associated with the QSI.
WRP, Name, Admin, Oper	*Not supported in this release.*
Stats, Admin, Oper, Interval	The QSI administrative status, operational status, and time interval for statistics collection.
BW Admin (%)	The administrative percentage of bandwidth (currently not user-configurable).
BW Oper (%)	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
QI 1–8	The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the QSet profiles (QSP 1–4) is associated with the QSI.

```

----------+---+------------+----+------
vfl-1/0    2   qsp-2        NDCB vfl-1/0
```

output definitions

Port	The physical slot and port number (or link aggregate ID or VFL ID for a logical port).
Profile #, Name	The QSet profile (QSP) ID number and name associated with the QSI.
Mode	The QSI operating mode (**NDCB** or **DCB**). This mode determines whether Data Center Bridging (DCB) profiles or QSet profiles (non-DCB) are applied to the QSI instance. DCB and QSet profiles are mutually exclusive in that if the OmniSwitch Data Center software license is installed, only DCB profiles are applied.
Parent	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.

Release History

Release 7.1.1; command was introduced.
Release 7.2.1; output display modified for the OmniSwitch 6900.
Release 7.2.1.R02; output display modified for the OmniSwitch 6900.
Release 8.3.1; **vf-link** and **summary** parameters added.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.
show qos qsi stats	Displays packet count statistics collected for a specific QSet instance.

show qos qsi stats

Displays statistics for the QSet instance (QSI) queues that are associated with non-DCB (NDCB) ports.

show qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} stats [bytes | rate [bytes]]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
bytes	Displays the total number of bytes (instead of packets) that flow through the QSI queues. This parameter is not supported on the
rate	Displays the number of packets-per-second that flow through the QSI queues.

Defaults

parameter	default
bytes | rate	**bytes**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The specified port or link aggregate must have statistics collection enabled.
- Use the **port** *slot/port* or **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- It is possible to combine the **bytes** parameter with the **rate** parameter to display the number of bytes-per-second that flow through the QSI queues. For example, **show qos qsi port 1/20 stats rate bytes**.
- Statistics are displayed on a per-queue basis for each port. There are eight queues associated with a single QSet instance. Each queue is identified with a queue ID (1–8). Each port and link aggregate is associated with one QSet instance.

Examples

```
-> show qos qsi port 1/20 stats
              Total                Total
Port        Q  Tx                   Drop

1/20        3  0                    0
1/20        4  0                    0
1/20        5  0                    0
1/20        6  0                    0
1/20        7  0                    0
1/20        8  694                  0
```

output definitions

Port	The slot and port number.
Q	The QSet queue ID number (1–8) associated with the QoS (non-DCB) port.
Total Tx	Total packets or bytes transmitted.
Total Drop	Total packets or bytes dropped.

Release History

Release 7.3.1; command was introduced.

Related Commands

qos qsi stats	Enables or disables statistics collection for a DCB or non-DCB port.
clear qos qsi stats	Clears statistics collected for one or more QSet instances.

MIB Objects

   alaVfcQInstanceBytesEnqueued
   alaVfcQInstancePacketsDropped
   alaVfcQInstanceBytesDropped
```

show qos qsi wred-stats

Displays the Weighted Random Early Detection (WRED) statistics for the QSet instance.

show qos qsi {port *chassis/slot/port***[**-*port2***] | slot** *slot* **| linkagg** *agg_id***[**-*agg_id2***]} wred-stats [rate | bytes]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).
rate	Displays the number of packets per second.
bytes	Displays the total number of bytes.

Defaults

By default, displays the total number of packets for all the QSI queues.

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- This command displays the total number of packets or bytes.

Examples

```
-> show qos qsi port 1/2 wred-stats
* OS6900  WRED Per Q stats not supported, Tx stats not supported
             Green                Yellow                Red
Port        Q Drop                 Drop                  Drop
----------+-+--------------------+--------------------+--------------------
Port 1/2    - 0                   0                    0

-> show qos qsi port 1/1 wred-stats rate
* OS6900  WRED Per Q stats not supported, Tx stats not supported
              Green                Yellow               Red
Port        Q  Drop/s               Drop/s               Drop/s
----------+--+--------------------+--------------------+--------------------
1/1         -  0                   0                    0
```

```
-> show qos qsi port 1/1 wred-stats bytes
* OS6900  WRED Per Q stats not supported, Tx stats not supported
              Green               Yellow              Red
Port        Q  Drop                Drop                Drop
-----------+--+-------------------+-------------------+-------------------
1/1         -  0                   0                   0
```

output definitions

Port	The switch port.
Q	The egress queue ID (1–8) associated with the port.
Green TX, Green Drop	The number of green packets or bytes transmitted and dropped.
Yellow TX, Yellow Drop	The number of yellow packets or bytes transmitted and dropped.
Red TX, Red Drop	The number of red packets or bytes transmitted and dropped.

Release History

Release 7.2.1.R01; WRED per Q stats not supported; Tx stats not supported.

Related Commands

show qos qsi	Displays the QSet instance configuration.
clear qos qsi stats	Clears statistics collected for one or more QSet instances.

MIB Objects

```
alcatelIND1VfcMIB
 alaVfcQInstanceTable
   alaVfcQInstanceQId
   alaVfcQInstanceGreenPacketsAccepted
   alaVfcQInstanceGreenBytesAccepted
   alaVfcQInstanceGreenPacketsDropped
   alaVfcQInstanceGreenBytesDropped
   alaVfcQInstanceYellowPacketsAccepted
   alaVfcQInstanceYellowBytesAccepted

   alaVfcQInstanceYellowBytesDropped
   alaVfcQInstanceRedPacketsAccepted
   alaVfcQInstanceRedBytesAccepted
   alaVfcQInstanceRedPacketsDropped
   alaVfcQInstanceRedBytesDropped
```

show qos qsp system-default

Displays the name and ID of the QSet profile (QSP) that serves as the default system QSP. when the switch is running in the non-DCB (NDCB) mode.

show qos qsp system-default

Syntax Definitions

N/A

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- The switch is operating in the NDCB mode when the OmniSwitch Data Center software license is *not* installed on the switch.
- The switch is operating in the Data Center Bridging (DCB) mode when the OmniSwitch Data Center software license is installed on the switch. Configuring the system default profile is not supported in the DCB mode.

Examples

```
-> show qos qsp system-default
NDCB Default QSP profile          : 1   (qsp-1)
```

Release History

Release 8.3.1; command introduced.

Related Commands

   alaVfcSystemDefaultQsetQSPId
```

clear qos qsi stats

Clears QSet instance (QSI) statistics.

clear qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} stats**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1\5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** *slot/port* and **linkagg** *agg_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- QSI statistics can only be cleared on ports or link aggregates that have statistics collection enabled.

Examples

```
-> clear qos qsi port 1/1/2 stats
-> clear qos qsi port 1/1/10-15 stats
-> clear qos qsi linkagg 5 stats
-> clear qos qsi linkagg 10-15 stats
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

qos qsp dcb import

Imports a Data Center Bridging profile (DCP) to a new or previous custom profile.

qos qsp dcb {*dcp_id* **|** *dcp_name***} import qsp dcb {***import_dcp_id* **|** *import_dcp_name***} [802.3x-pause]**

no qos qsp dcb {*dcp_id* **|** *dcp_name***}**

Syntax Definitions

dcp_id	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
dcp_name	The DCB profile name.
import_dcp_id	The ID of the DCB profile to import. The valid profile ID range is 1–11 to specify a predefined profile and 12–128 to specify a custom profile.
import_dcp_name	The name of the DCB profile to import.
802.3x-pause	Makes the profile pause-ready. When enabled, the Priority based Flow Control (PFC) is lossy for all traffic classes in the profile and they cannot be changed to lossless.

Defaults

By default the **802.3x-pause** flag is disabled.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The new DCB profile must be unique and not contain the same name and ID of an existing DCB profile.
- On an OmniSwitch 6900-Q32, only import DCB profile 8 to create a custom profile. Do not use any of the other pre-defined profiles to create a custom profile.
- Use the **no** form of the command to remove an existing custom DCB profile from the switch configuration.
- The pre-defined DCB profiles from 1 to 11 cannot be removed from the switch configuration.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.
- Use the **802.3x-pause** tag to enable pause-ready on the profile. When enabled, the PFC is lossy for all traffic classes in the profile and they cannot be changed to lossless. This type of custom profile is created to support legacy PAUSE frames on ports to which the profile is applied. However, before applying the custom profile to a port, disable PFC TLV and PFC willing on the port.

Examples

```
-> qos qsp dcb 33 import qsp dcb 8
-> qos qsp dcb lossyETS import qsp 10
```

```
-> qos qsp dcb 34 import qsp dcb 7 802.3x-pause
-> no qsp dcb 33
```

Release History

Release 7.3.1; command was introduced.

```

qos qsp dcb tc

Modifies the Data Center Bridging (DCB) traffic class attributes of a DCB profile.

qos qsp dcb {*dcp_id* **|** *dcp_name***} tc** *tc_num* **{pfc flow-type { ll | nll} | pfc link-delay** *allowance* **| min-bw** *%* | **max-bw** *%* | **recommended bw** *%***}**

Syntax Definitions

dcp_id	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
dcp_name	The DCB custom profile name.
tc_num	The traffic class number in the DCB profile.
ll	Designates traffic class as lossless.
nll	Designates traffic class as non-lossless (lossy).
allowance	Link delay allowance value for PFC.
min-bw *%*	Sets the minimum bandwidth guaranteed for the Enhanced Transmission Selection (ETS) traffic class.
max-bw *%*	Sets the maximum bandwidth guaranteed for the Strict Priority (SP) traffic class.
recommended bw *%*	Sets the recommended minimum bandwidth for the traffic class.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The **pfc flow-type** option is used to change a traffic class from lossless (ll) to lossy (nll) or from lossy (nll) to lossless (ll).
- The **pfc link-delay** option sets the actual headroom for the traffic class. An incorrect setting can result in traffic loss.
- The **min-bw** option sets the minimum bandwidth guaranteed for the ETS traffic class.
- The **max-bw** option sets the maximum bandwidth guaranteed for the SP traffic class.
- The **recommended bw** option sets the recommended minimum bandwidth for the traffic class.

Examples

```
-> qos qsp dcb 11 tc 0 min-bw 3
-> qos qsp dcb lossyETS tc 1 min-bw 12
-> qos qsp dcb lossyETS tc 2 pfc flow-type ll
-> qos qsp dcb 11 tc 0 recommended bw 3
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

qos qsp dcb tc-numbering

Modifies the traffic class (TC) numbering for custom profiles.

qos qsp dcb {*dcp_id* | *dcp_name***} tc-numbering** *tc_num*

Syntax Definitions

dcp_id	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
dcp_name	The DCB custom profile name.
tc_num	Enter the traffic class numbering sequence for the DCB profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The command can be used to modify the traffic class numbering for the custom profiles.
- The numbering must be assigned in ascending order. For example, a profile with TCs numbered 0, 1, 2, can be changed to 1, 5, 7.
- The number of TCs specified must match the number of TCs in the profile.

Examples

```
-> qos qsp dcb 11 tc-numbering 1 5 7 9
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsp dcb	Displays the configured DCB profiles and the traffic classes associated to the DCB profile.

   alaDcbxDCPTCDCPName
   alaDcbxDCPTCsPresent
```

qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} qsp dcb {***dcp_id* **|** *dcb_name***}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
dcp_id	DCB profile ID. DCB profile ID 11 through 128 refers to the custom profiles. DCB profile ID 1 through 10 refers to the predefined profiles.
dcp_name	DCB profile name.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When a DCB profile is assigned to a link aggregate, the profile is applied to all the ports associated with the linkagg.
- Avoid configuring different profiles for each port of the link aggregate.
- The command will not work if the link aggregate is associated with 1Gig port. Different combination of ports (10G and 40G) are allowed in a link aggregate.

Examples

```
-> qos qsi port 1/11 qsp dcb lossyETS
-> qos qsi port 1/11 qsp dcb 7
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsp dcb	Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

MIB Objects

```
alaDcbxPortInstanceEntry
   alaDcbxPIAdminDCPId
   alaDcbxPIAdminDCPName
```

qos qsi dcb dcbx version

Selects the version of the DCB Exchange protocol (DCBX) to apply to the specified DCB port.

qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} dcb dcbx version {ieee | cee | auto}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
ieee	Selects IEEE 802.1Qaz DCBX.
cee	Selects Converged Enhanced Ethernet DCBX 1.01.
auto	Automatically detects the DCBX version used by the peer switch.

Defaults

By default, the DCB port is configured to automatically use the DCBX version detected from the peer.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Initially, the IEEE version of DCBX is run on the port until the switch detects the peer is running the CEE version. At that point, the switch will stop IEEE DCBX and start to run the CEE version.

Examples

```
-> qos qsi port 1/10 dcb dcbx version ieee
-> qos qsi port 1/10 dcb dcbx version cee
-> qos qsi port 1/11 dcb dcbx version auto
```

Release History

Release 7.3.3; command was introduced.

Related Commands

alaDcbxPortInstanceEntry
   alaDcbxPIDCBXVersion
```

qos qsi dcb dcbx admin-state

Enables or disables DCB exchange protocol (DCBX) functionality on a per port basis.

qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} dcb dcbx admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
enable	Enables the DCBX functionality on the port.
disable	Disables the DCBX functionality on the port.

Defaults

parameter	default
dcbx admin-state	enable

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

The DCBX admin-state, enables or disables DBCX TLVs and negotiation on a port.

Examples

```
-> qos qsi port 1/10 dcb dcbx admin-state enable
-> qos qsi port 1/10 dcb dcbx admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

qos qsi dcb dcbx ets	Enables or disables application Type, Length, Value (TLV) transmission on a per port basis.
qos qsi dcb dcbx pfc	Enables or disables config-TLV, defense mode, and willing bit for PFC on a per port basis.
show qos qsi dcb dcbx	Displays the configured ports in the system and the related DCBX information.

MIB Objects

```
alaDcbxPortInstanceEntry
   alaDcbxPIIfIndex
   alaDcbxPIDCBXAdmin
```

qos qsi dcb dcbx ets

Enables or disables config-TLV, recommended-TLV, and the willing bit for ETS on a per-port basis.

qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} dcb dcbx ets [config-tlv {enable | disable} | recommend-tlv {enable | disable} | willing {yes | no}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-port2]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
config-tlv enable	Enables the transmission of ETS configuration TLVs.
config-tlv disable	Disables the transmission of ETS configuration TLVs.
recommend-tlv enable	Enables the transmission of ETS recommended TLVs.
recommend-tlv disable	Disables the transmission of ETS recommended TLVs.
yes	Sets the willing bit to on in the TLVs.
no	Sets the willing bit to off in the TLVs.

Defaults

parameter	default
config-tlv {enable | disable}	enable
ets recommend-tlv {enable | disable}	enable
willing {yes | no}	yes

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the option **ets config-tlv** to enable or disable the transmission of ETS configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets recommended-tlv** to enable or disable the transmission of ETS recommended TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to set the willing bit on the TLVs. This option is used when the DCBX is enabled on the port and the ETS configuration TLV is sent on the port.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx ets config-tlv disable
-> qos qsi port 1/11 dcb dcbx ets recommended-tlv disable
-> qos qsi linkagg 5 dcb dcbx ets willing no
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

qos qsi dcb dcbx pfc

Enables or disables config-TLV, defense mode, and willing for PFC on a per port basis.

qos qsi {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} dcb dcbx pfc [config-tlv {enable | disable} | defense {enable | disable} | willing {yes | no}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-port2]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[-***agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
config-tlv enable	Enables the transmission of PFC configuration TLVs.
config-tlv disable	Disables the transmission of PFC configuration TLVs.
defense enable	Enables the defense mode for the PFC.
defense disable	Disables the defense mode for the PFC.
willing yes	Allows the PFC to negotiate with the network.
willing no	Stops the PFC from negotiating with the network.

Defaults

parameter	default
pfc config-tlv	enable
pfc defense	enable
pfc willing	yes

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the option **pfc config-tlv** to enable or disable the transmission of PFC configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to allow the PFC to negotiate with the network.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx pfc config-tlv disable
-> qos qsi port 1/11 dcb dcbx pfc defense disable
-> qos qsi linkagg 5 dcb dcbx pfc willing no
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsp dcb

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

show qos qsp dcb [*dcp_id* **|** *dcp_name***] [tc** *tc_num***]**

Syntax Definitions

dcp_id	DCB profile ID. DCB profile ID 11–128 refers to the custom profiles. DCB profile ID 1–0 refers to the predefined profiles.
dcp_name	DCB profile name.
tc_num	The traffic class associated to the DCB profile. The valid range is 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command displays the details of the configured DCB profile.
- Use the **tc** option to display the traffic classes associated to the DCB profile.

Examples

```
-> show qos qsp dcb

Legends: Prio TC Map:
            Represents the priority to traffic class mapping;
            begins with priority 0 on the left and displays the

show qos qsi dcb dcbx

Displays the DCBX port configuration and status.

show qos qsi [port *chassis/slot/port***[**-*port2*****] | linkagg** *agg_id***[**-*agg_id2*****]] dcb dcbx [status]**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
status	Displays the DCBX operational status for the port.

Defaults

By default, the DCBX configuration is displayed for all ports.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *agg_id*, parameters to display information for a specific port or link aggregate.
- Use the **status** option to display the status information of the DCBX related to the port.

Examples

```
-> show qos qsi port 1/1-5 dcb dcbx

```

output definitions

Port	The DCB slot and port number or link aggregate ID.
DCP	The DCB profile ID assigned to the port.
Name	The name of the DCB profile assigned to the port.
DCBX Ver	The version of DCBX running on the port (**CEE**, **IEEE**, or **AUTO**).
DCBX Admin	Indicates the administrative status of DCBX on the port.
Stats Admin	Indicates if statistics collection is enabled or disabled on the port.

output definitions (continued)

PFC Defense	Indicates the status of PFC defense (**Ena** or **Dis**). Applies when PFC negotiation fails. If enabled then PFC becomes disabled but traffic still flows. If disabled then the PFC local configuration remains on the port.
PFC TLV	Indicates whether the IEEE 802.1 organizationally defined PFC TLV transmission is allowed on a given LLDP transmission capable port.
PFC Will	Indicates whether or not the port is willing to accept the PFC configuration from a remote peer.
Cfg TLV	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
Reco TLV	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
ETS Will	Indicates whether or not the port is willing to accept the recommended ETS configuration from a remote peer.

1/5      Dis  No      AUTO  -      No                         -
```

output definitions

Port	The DCB slot and port number or link aggregate ID.
DCBX Oper	Indicates the operational status of DCBX on the port.
Local Oper Changed	Identifies if the local configuration is different from the configuration imported from the DCB profile applied to the port.
Error	Indicates if there is an error condition.
Local Oper Ver	The version of DCBX running on the local port (**CEE**, **IEEE**, or **AUTO**).
Remote Oper Ver	The version of DCBX running on the remote port (**CEE**, **IEEE**, or **AUTO**).
Action	Indicates the action taken as a result of the status.

Release History

Release 7.3.1; command was introduced.
Release 7.3.3; fields added to display the version of DCBX (IEEE or CEE).

show qos qsi dcb ets

Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

show qos qsi {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} dcb ets [tc [***tc_num***]]**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[-***agg_id2***]**	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
tc_num	Enter the traffic class for which the information needs to be displayed. The valid range is 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *tc_num* option to display the DCBX ETS information for a specific traffic class.

Examples

```
-> show qos qsi port 1/1 dcb ets
Legends: Prio TC Map:
            Represents the priority to traffic class mapping;
            begins with priority 0 on the left and displays the
            traffic class it belongs to.
          * indicates port oper status is different than the configured status

```

output definitions

Port	Configured DCB ports.
Loc-Adm Prio TC Map	Indicates the traffic class to which the priority is to be assigned.
Loc-Adm Max TC	Indicates the number of traffic classes supported.
Loc-Adm CBS	Indicates the status of the credit-based shaper traffic support.
Loc-Adm Will	Indicates if the local system is willing to accept the ETS configuration recommended by the remote system.
Loc-Oper Prio TC Map	Indicates the traffic class the priority belongs to.

output definitions (continued)

Loc-Oper Max TC	Indicates the number of traffic classes supported in the local system.
Loc-Oper CBS	Indicates if the credit-based shaper traffic is supported on the local system.
Loc-Oper Will	Indicates if the credit-based shaper traffic selection is supported on the local system.
Rem-Oper Prio TC Map	Indicates the priority that is assigned to a traffic class.
Rem-Oper Max TC	Indicates the number of traffic classes supported in the remote system.
Rem-Oper CBS	Indicates if the credit-based shaper traffic selection is supported on the remote system.
Rem-Oper Will	Indicates if the remote system is willing to accept the ETS configuration recommended by the remote system.

```

show qos qsi dcbx pfc

Displays the configured ports in the system and the related DCBX PFC information.

show qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} dcb pfc**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

If there is no PFC TLV received from the remote end, then the remote information will be blank.

Examples

```
-> show qos qsi port 4/1-2 dcb pfc

Legends: * indicates port oper status is different than the configured status

               Loc-Adm  Loc-Adm       Loc-Oper Loc-Oper       Rem-Oper Rem-Oper

show qos pfc-lossless-usage

Displays the usage of the PFC lossless traffic class on the switch.

show qos pfc-lossless-usage

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

This command displays the PFC lossless traffic class usage on the switch.

Examples

```
-> show qos pfc-lossless-usage
Lossless Priorities in use     : 55,
Lossless Priorities reserved   : 60,
Lossless Priorities available  : 73
```

output definitions

Lossless Priorities in use	Indicates the number of PFC lossless priorities in use in the system.
Lossless Priorities reserved	Indicates the number of PFC lossless priorities in reserve in the system.
Lossless Priorities available	Indicates the number of priorities available to be configured as PFC lossless.

Release History

Release 7.3.1; command was introduced.

show qos qsi dcb pfc stats

Displays the Priority Flow Control (PFC) statistics for the specified DCB port.

show qos qsi [port *chassis/slot/port***[-***port2***] dcb pfc stats**

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Statistics are displayed on a per-traffic class (TC) basis.

Examples

```
-> show qos qsi port 1/11 dcb pfc stats

Legends: displays packet count

              PFC                  PFC
Port    Q  TC TX (req)             RX (ind)
-------+--+--+--------------------+-------------------
1/11    0  0  0                    0
1/11    1  0  0                    0
1/11    2  0  0                    0
1/11    3  0  0                    0
1/11    4  1  0                    0
1/11    5  1  0                    0
1/11    6  2  0                    0
1/11    7  2  0                    0
```

output definitions

Port	The DCB port number.
Q	The 802.1p priority number (0–7). This number is mapped to a traffic class (TC) based on the DCB profile assigned to the port.
TC	Indicates the traffic class to which the priority belongs.
Priority	Indicates the priority of the DCB port.
PFC TX (req)	Total count of PFC packets transmitted.
PFC RX (ind)	Total count of PFC packets received.

Release History

Release 7.3.1; command was introduced.

Related Commands

```

36 QoS Policy Commands

This chapter describes the CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

Note. Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

Refer to Chapter 35, "QoS Commands," for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB.mib
Module alaQoSMIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS Policy commands are listed here:

Policy commands	**policy rule** **policy validity-period** **policy list** **policy list rules** **policy condition** **policy action** **show policy action** **show policy condition** **show active policy rule** **show policy rule** **show policy validity period** **show active policy list** **show policy list** **show policy ipv4-summary** **show policy ipv6-summary**

Group commands	**policy network group** **policy service** **policy service group** **policy mac group** **policy port group** **policy map group** **show policy network group** **show policy mac group** **show policy port group** **show policy map group** **show policy service** **show policy service group**
Condition commands	**policy condition** **policy condition source ip** **policy condition source ipv6** **policy condition destination ip** **policy condition destination ipv6** **policy condition multicast ip** **policy condition source network group** **policy condition destination network group** **policy condition multicast network group** **policy condition source ip-port** **policy condition destination ip-port** **policy condition source tcp-port** **policy condition destination tcp-port** **policy condition source udp-port** **policy condition destination udp-port** **policy condition ethertype** **policy condition established** **policy condition tcpflags** **policy condition service** **policy condition service group** **policy condition icmptype** **policy condition icmpcode** **policy condition ip-protocol** **policy condition ipv6** **policy condition flow-label** **policy condition tos** **policy condition dscp** **policy condition source mac** **policy condition destination mac** **policy condition source mac group** **policy condition destination mac group** **policy condition source vlan** **policy condition inner source-vlan** **policy condition destination vlan** **policy condition 802.1p** **policy condition inner 802.1p** **policy condition source port** **policy condition destination port** **policy condition source port group** **policy condition destination port group** **policy condition vrf** **policy condition fragments** **policy condition appfp-group**

Action commands	**policy action** **policy action disposition** **policy action shared** **policy action priority** **policy action maximum bandwidth** **policy action maximum depth** **policy action cir** **policy action cpu priority** **policy action tos** **policy action 802.1p** **policy action dscp** **policy action map** **policy action permanent gateway-ip** **policy action permanent gateway-ipv6** **policy action port-disable** **policy action redirect port** **policy action redirect linkagg** **policy action no-cache** **policy action mirror**

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

Access Control Lists	**policy condition** **policy action disposition** **policy rule**
Traffic prioritization/shaping	**policy action shared** **policy action priority** **policy action maximum bandwidth** **policy rule**
802.1p/ToS/DSCP tagging or mapping	**policy condition tos** **policy condition dscp** **policy condition 802.1p** **policy action tos** **policy action 802.1p** **policy action dscp** **policy action map** **policy rule**
Policy based port mirroring	**policy action mirror**
VLAN Stacking	**policy condition inner source-vlan** **policy condition inner 802.1p**
VXLAN Snooping	**policy condition vxlan** **policy condition vxlan inner source mac** **policy condition vxlan inner source mac-group** **policy condition vxlan inner source ip** **policy condition vxlan inner source ipv6** **policy condition vxlan inner ip-protocol** **policy condition vxlan inner l4-port** **policy condition vxlan vxlan-port**

policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

policy rule *rule_name* **[enable | disable] [precedence** *precedence***] [condition** *condition***] [action** *action***] [validity-period** *name***] [save] [log [log-interval** *seconds***]] [count {packets | bytes}] [trap] [default-list]**

policy rule *rule_name* **no {validity-period | save | log | trap | default-list}**

no policy rule *rule_name*

Syntax Definitions

rule_name	The name of the policy rule, any alphanumeric string.
enable	Enables the policy rule.
disable	Disables the policy rule.
precedence	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
condition	The condition name that is associated with this rule. Conditions are configured through the **policy condition** command.
action	The name of the action that is associated with this rule. Actions are configured through the **policy action** command.
name	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the **policy validity period** command.
save	Marks the policy rule so that it may be captured as part of the switch configuration.
log	Configures the switch to log messages about specific flows coming into the switch that match this policy rule. *This parameter is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
seconds	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
packets	Counts the number of packets that match the rule.
bytes	Counts the number of bytes that match the rule.
trap	Enables or disables traps for the rule.
default-list	Adds the rule to the QoS default policy list.

Defaults

parameter	default
enable | disable	enable
precedence	0
log	no
seconds	60
packets | bytes	packets
trap	enable
default-list	adds rule to the default list

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

  from {cli | ldap | blt}

  This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.
- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

policy validity-period *name* **[days** *days***] [months** *months***] [hours** *hh:mm* **to** *hh:mm***] [interval** *mm:dd:yy hh:mm* **to** *mm:dd:yy hh:mm***]**

policy validity-period *name* **no {hours** | **interval}**

no policy validity-period *name*

Syntax Definitions

name	The name of the validity period (up to 31 alphanumeric characters).
days	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., **monday**, **tuesday**, **wednesday**, etc.).
months	The month(s) in which the validity period is active. Enter the actual month (e.g., **january**, **february**, **march**, etc.).
hh:mm	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
mm:dd:yy hh:mm	An interval of time during which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:17 12:01 to 11:02:17 12:01).

Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
days	no restriction
months	no restriction
hh:mm	no specific time
mm:dd:yyyy hh:mm	no interval

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.

- Use the **policy rule** command to associate a validity period with a rule.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **configuration snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

Release History

```

policy list

Configures a QoS policy list. There are four types of lists available: a Universal Network Profile (UNP) policy list, an egress policy list, an Application Fingerprinting policy list, and a default policy list.

policy list *list_name* **type {unp | egress | appfp | empacl} [enable | disable]**

no policy list *list_name*

Syntax Definitions

list_name	The name to assign to the policy list. Note that the list name is case sensitive.
unp	Applies the list of policy rules to traffic classified into the User Network Profile to which the list is assigned
egress	Applies the list of policy rules to traffic egressing on switch ports. *This parameter is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
appfp	Applies the list of policy rules to an Application Fingerprinting interface. *This parameter is supported only on the OmniSwitch 6900.*
empacl	*This parameter is not supported.*
enable	Enables the policy list.
disable	Disables the policy list.

Defaults

A default policy list is available when the switch boots up; all policy rules belong to this list unless otherwise specified (see the **policy list rules** and **policy rule** commands for more information).

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration.
- Once a policy list is created, use the **policy list rules** command to add rules to the list.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **configuration snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

  from {cli | ldap | blt}

This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy list unp1 type unp
-> policy list unp1 disable
-> policy list unp1 enable
-> no policy list unp1
```

Release History

Release 7.2.1; command was introduced.
Release 8.4.1; **egress** parameter added.

```

policy list rules

Assigns existing QoS policy rules to the specified QoS policy list.

policy list *list_name* **rules** *rule_name* **[***rule_name2***...]**

policy list *list_name* **no rules** *rule_name* **[***rule_name2***...]**

Syntax Definitions

list_name	The name of an existing QoS policy list. Note that the list name is case sensitive.
rule_name	The name of an existing QoS policy rule to include in the policy list.
rule_name2	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.

Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a policy rule from an existing list.
- The QoS policy list and rule names specified with this command must already exist in the switch configuration.
- A rule may belong to a Universal Network Profile (UNP) list, the default list, and an egress policy list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a policy rule is disabled, then the rule is disabled for all lists even if a list to which the policy rule belongs is enabled.
- If a policy rule is going to be assigned to a UNP policy list, make sure the rule was created using the **no default-list** option of the **policy rule** command. This will ensure that the rule will take precedence over other default list rules when the UNP policy list is applied to device traffic.
- A QoS policy list that is assigned to an Application Fingerprinting interface must contain policy rules with the **appfp-group** condition.
- Only those rules that are assigned to an egress policy list are applied to egress traffic. When configuring egress policy lists, consider the following:

  - Egress policy lists are not supported on the OmniSwitch 6465 or OmniSwitch 6560.
  - Only one egress policy list per switch is supported, to which IPv4 and IPv6 rules can be added.
  - Applying egress policy lists to SPB or VXLAN SAP ports is not supported.
  - Only the following policy conditions and actions are supported when creating rules for an egress policy list:

policy conditions	policy actions
Destination port Destination VLAN Source IPv4 address Source IPv6 address IPv6 (qualifier for traffic types)	Disposition (drop/accept)

- Using policy lists that contain rules with a source port condition are not supported when applied to 10G ports on an OmniSwitch 6560.
- On the OmniSwitch 6465, policy rules containing the following conditions are not supported in a UNP policy list:
  - Source port group
  - Source IPv6 address
  - IPv6 flow label
- On the OmniSwitch 6560 and OmniSwitch 9900, only policy rules with the following conditions can be assigned to a UNP policy list:
  - Destination MAC
  - EtherType
  - Source VLAN
  - SIP
  - DIP / DIPv6
  - Layer 4 Protocol
  - Layer 4 source port
  - Layer 4 destination port
  - Source port
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.

Examples

```
-> policy list unp1 rules r1 r2 r3
-> policy list unp1 no rules r2
```

Release History

Release 7.2.1; command was introduced.

policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

policy network group *net_group ip_address* **[mask** *net_mask***] [***ip_address2* **[mask** *net_mask2***]...]**

no policy network group *net_group*

policy network group *net_group* **no** *ip_address* **[mask** *netmask***] [***ip_address2* **[mask** *net_mask2***]...]**

Syntax Definitions

net_group	The name of the network group (up to 31 alphanumeric characters).
ip_address	An IPv4 or IPv6 address included in the network group.
net_mask	The mask for the IPv4 or IPv6 address. If no mask is entered, the address is assumed to be a host address.
ip_address2	Optional. Another IPv4 or IPv6 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
net_mask2	Optional mask for the IPv4 or IPv6 address. If no mask is entered, the natural mask for the address will be used.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure a group of IP addresses to which you want to apply QoS rules. Rather than create a condition for each IP address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration, or to remove an IP address from a network group.
- If the **configuration snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

  from {cli | ldap | blt}

  This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1

-> policy network group webgroup2 2001:db8:4132:86::19a 2002:c633:6489::35
-> policy network group webgroup2 no 2002:c633:6489::35
-> no policy network group webgroup2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Configures a policy condition. A network group may be configured as part of a policy condition.

policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

policy service group *service_group service_name1* **[***service_name2...***]**

no policy service group *service_group*

policy service group *service_group* **no** *service_name1* **[***service_name2...***]**

Syntax Definitions

service_group	The name of the service group (up to 31 alphanumeric characters).
service_name1	The service name is configured through the **policy service** command and includes information about protocol, source port, and destination port.
service_name2...	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- If the **configuration snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

  from {cli | ldap | blt}

  This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy service	Configures a service that may be used as part of a policy service group.

```

policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

policy mac group *mac_group mac_address* **[mask** *mac_mask***] [***mac_address2* **[mask** *mac_mask2***]...]**

no policy mac group *mac_group*

policy mac group *mac_group* **no** *mac_address* **[mask** *mac_mask***] [***mac_address2* **[mask** *mac_mask2***]...]**

Syntax Definitions

mac_group	The name of the MAC group (up to 31 alphanumeric characters).
mac_address	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
mac_mask	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
mac_address2	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
mac_mask2	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the **qos phones** command for more information.
- If the **configuration snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

from {cli | ldap | blt}

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Configures a policy condition. A MAC group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy mac group	Displays information about policy MAC groups.

   alaQoSAppliedMACGroupMacMask
```

policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

policy port group *group_name* **{***chassis//slot/port***[-***port2***]** | *agg_id***[-***agg_id2***]} [***chassis//slot/port***[-***port2***]** | *agg_id***[-***agg_id2***]]**

no policy port group *group_name*

policy port group *group_name* **no {***chassis//slot/port***[-***port2***]** | *agg_id***[-***agg_id2***]} [***chassis//slot/port***[-***port2***]** | *agg_id***[-***agg_id2***]]**

Syntax Definitions

group_name	The name of the port group (up to 31 alphanumeric characters).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port (or port range) to be included in the group. At least one slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.
*agg_id***[-***agg_id2***]**	A link aggregate ID to be included in the group. Use a hyphen to specify a range of IDs (10-15). Additional combinations may be included in the group; each combination should be separated by a space. *This parameter is not supported on the OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 9900.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure a group of ports or link aggregates to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Configuring ports and link aggregates in the same port group is allowed.
- Adding link aggregate member ports to a QoS port group is not recommended; doing so may cause undesired results when the port group is used in a QoS policy, particularly if only a subset of member ports is added to the port group.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *chassis/slot/port-port2* (that is, 1/2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.

- If a range of link aggregates is specified using the syntax *agg_id***[**-*agg_id2* (that is, 10-15), a single aggregate within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.
- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and applies to both bridged and routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- Adding ports to the **UserPorts** group is not supported on the OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 9900.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.
- If the **configuration snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

  from {cli | ldap | blt}

  This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy port group port_group4 3/1/1-2 4/3/1 5/4/1
-> policy port group port_group4 no 3/1/1-2
-> policy port group UserPorts 4/1/1-8 5/1/1-8
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; *agg_id* parameter added.

Related Commands

policy condition	Configures a policy condition. A port group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy action maximum bandwidth	Configures a maximum bandwidth value for a policy action.
show policy port group	Displays information about policy port groups.

MIB Objects

```
alaQoSPortGroupsTable
   alaQoSPortGroupsName
   alaQoSPortGroupSlot
   alaQoSPortGroupPort
   alaQoSPortGroupPortEnd
alaQoSAppliedPortGroupsTable
   alaQoSAppliedPortGroupsName
   alaQoSAppliedPortGroupSlot
   alaQoSAppliedPortGroupPort
   alaQoSAppliedPortGroupPortEnd
```

policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

policy map group *map_group* **{***value1***:***value2***...}**

no policy map group *map_group*

policy map group no {*value1***:***value2***...}**

Syntax Definitions

map_group	The name of the map group (up to 31 alphanumeric characters).
value1	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, **1-2**).
value2...	The 802.1p, ToS, or DSCP value to be used in place of *value1*. Additional mapping pairs may be included.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **configuration snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

  from {cli | ldap | blt}

  This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6
-> policy map group tosGroup no 7:6
-> no policy map group tosGroup
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

policy service *service_name*
[protocol *protocol***]**
[source ip-port *port***[-***port***]]**
[destination ip-port *port***[-***port***]]**
[source tcp-port *port***[-***port***]]**
[destination tcp-port *port***[-***port***]]**
[source udp-port *port***[-***port***]]**
[destination udp-port *port***[-***port***]]**

no policy service *service_name*

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
protocol	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for **source ip-port** or **destination ip-port**; it cannot be specified for **source tcp-port**, **destination tcp-port**, **source udp-port**, or **destination udp-port**.
port	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	**protocol** **source ip-port** **destination ip-port**	*The protocol must be specified with at least one source or destination port.*
TCP ports for a service	**source tcp-port** **destination tcp-port**	*Keywords may be used in combination.*
UDP ports for a service	**source udp-port** **destination udp-port**	*Keywords may be used in combination.*

- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip-port 23
-> policy service telnet3 destination tcp-port 23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **protocol** *protocol* **{[source ip-port** *port***[-***port***]] [destination ip-port** *port***[-***port***]]}**

no policy service *service_name*

policy service *service_name* **no {source ip-port | destination ip-port}**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
protocol	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
port	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp-port**, **policy service destination tcp-port**, **policy service source udp-port**, and **policy service destination udp-port**.
- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service telnet2 protocol 6 destination ip-port 23 source ip-port 22
-> policy service telnet2 no source ip-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```
alaQoSServiceTable

```

policy service source tcp-port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source tcp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no source tcp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp-port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_5 source tcp-port 21-22
-> policy service serv_5 no source tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```
alaQoSServiceTable
   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceSourceTcpPort
   alaQoSServiceSourceTcpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedSourceTcpPort
   alaQoSAppliedSourceTcpPortEnd
```

policy service destination tcp-port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination tcp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no destination tcp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination tcp-port 23
-> policy service service4 no destination tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```
alaQoSServiceTable
   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceDestinationTcpPort
   alaQoSServiceDestinationTcpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedServiceDestinationTcpPort
   alaQoSAppliedServiceDestinationTcpPortEnd
```

policy service source udp-port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source udp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no source udp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired UDP service. Specify a port range with a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp-port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_a source udp-port 1000
-> no policy service serv_a source udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceSourceUdpPort
   alaQoSServiceSourceUdpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedSourceUdpPort
   alaQoSAppliedSourceUdpPortEnd
```

policy service destination udp-port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination udp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no destination udp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, **137-138**).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **configuration snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination udp-port 137
-> policy service service4 no destination udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedServiceDestinationUdpPort
   alaQoSAppliedServiceDestinationUdpPortEnd
```

policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

policy condition *condition_name*
[source ip *ip_address* **[mask** *netmask***]]**
[source ipv6 {any | *ipv6_address* **[mask** *netmask***]}**
[destination ip *ip_address* **[mask** *netmask***]]**
[destination ipv6 {any | *ipv6_address* **[mask** *netmask***]}**
[multicast ip *ip_address* **[mask** *netmask***]]**
[source network group *network_group***]**
[destination network group *network_group***]**
[multicast network group *multicast_group***]**
[source ip-port *port***[-***port***]]**
[destination ip-port *port***[-***port***]]**
[source tcp-port *port***[-***port***]]**
[destination tcp-port *port***[-***port***]]**
[source udp-port *port***[-***port***]]**
[destination udp-port *port***[-***port***]]**
[ethertype *etype***]**
[established]
[tcpflags {any | all} *flag* **[mask** *flag***]**
[service *service***]**
[service group *service_group***]**
[icmptype *type***]**
[icmpcode *code***]**
[ip-rotocol *protocol***]**
[ipv6]
[flow-label *flow_label_value***]**
[tos *tos_value tos_mask***]**
[dscp {*dscp_value***[-***value***} [***dscp_mask***]]**
[source mac *mac_address* **[mask** *mac_mask***]]**
[destination mac *mac_address* **[mask** *mac_mask***]]**
[source mac group *group_name***]**
[destination mac group *mac_group***]**
[source vlan *vlan_id***]**
[destination vlan *vlan_id***]**
[802.1p *802.1p_value***]**
[source port *chassis/slot/port***[-***port2***]]**

[source port group *group_name***}**
[destination port *chassis/slot/port***[-***port2***]]**
[destination port group *group_name***]**
[vrf {*vrf_name* | **default}]**
[fragments]
[appfp-group *group_name***]**

no policy condition *condition_name*

Syntax Definitions

condition_name	The name of the condition. Any alphanumeric string.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the **policy rule** command.
- Use the **qos apply** command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **configuration snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

  from {cli | ldap | blt}

  This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

Examples

```
-> policy condition cond4 source port 3/1/1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Configures a policy action.
policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSource
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSource
```

policy condition source ip

Configures a source IP address for a policy condition.

policy condition *condition_name* **source ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no source ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The source IP address of the Layer 3 flow.
netmask	The mask for the source IP address.

Defaults

parameter	default
netmask	IP address class

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpAddr
   alaQoSConditionSourceIpMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpAddr
   alaQoSAppliedConditionSourceIpMask
```

policy condition source ipv6

Configures a source IPv6 address for a policy condition.

policy condition *condition_name* **source ipv6 {any |** *ipv6_address* **[mask** *netmask***]}**

policy condition *condition_name* **no source ipv6**

Syntax Definitions

condition_name	The name of the condition.
any	Any source IPv6 address.
ipv6_address	A specific source IPv6 address.
netmask	The mask for the source IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.
- On the OmniSwitch 6560 and OmniSwitch 9900, a source IPv6 address policy condition is supported only for *egress* IPv6 ACLs.

Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpv6Addr
   alaQoSConditionSourceIpv6AddrStatus
   alaQoSConditionSourceIpv6Mask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpv6Addr
   alaQoSAppliedConditionSourceIpv6AddrStatus
   alaQoSAppliedConditionSourceIpMask
```

policy condition destination ip

Configures a destination IP address for a policy condition.

policy condition *condition_name* **destination ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no destination ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The source IP address of the Layer 3 flow.
netmask	The mask for the source IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationIpAddr
   alaQoSConditionDestinationIpMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpAddr
   alaQoSAppliedConditionDestinationIpMask
```

policy condition destination ipv6

Configures a destination IPv6 address for a policy condition.

policy condition *condition_name* **destination ipv6 {any |** *ipv6_address* **[mask** *netmask***]}**

policy condition *condition_name* **no destination ipv6**

Syntax Definitions

condition_name	The name of the condition.
any	Any destination IPv6 address.
ipv6_address	A specific destination IPv6 address.
netmask	The mask for the destination IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a destination IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.
- On the OmniSwitch 6560 and OmniSwitch 9900, a destination IPv6 address policy condition is supported only for *ingress* IPv6 ACLs.

Examples

```
-> policy condition cond3 destination ipv6 ::1234:531f:bcd2:f34a
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpv6Addr
   alaQoSAppliedConditionDestinationIpv6AddrStatus
   alaQoSAppliedConditionDestinationIpMask
```

policy condition multicast ip

Configures a multicast IP address for a policy condition.

policy condition *condition_name* **multicast ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no multicast ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The multicast IP address.
netmask	Optional. The mask for the multicast IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 multicast ip 224.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

   alaQoSAppliedMulticastIpMask
```

policy condition source network group

Associates a source network group with a policy condition.

policy condition *condition_name* **source network group** *network_group*

policy condition *condition_name* **no source network group**

Syntax Definitions

condition_name	The name of the condition.
network_group	The name of the source network group. Network groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.
- On the OmniSwitch 6560 and OmniSwitch 9900, a source network group policy condition with an IPv6 address (includes user-configured and the built-in “Switch6” group) is supported only for *egress* IPv6 ACLs,

Examples

```
-> policy condition cond5 source network group webgroup1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
show policy condition	Shows information about policy conditions configured on the switch.
show policy network group	Displays information about policy network groups.

MIB Objects

alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceNetworkGroup
```

policy condition destination network group

Associates a destination network group with a policy condition.

policy condition *condition_name* **destination network group** *network_group*

policy condition *condition_name* **no destination network group**

Syntax Definitions

condition_name	The name of the condition.
network_group	The name of the destination network group. Network groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination network group from a condition; however, at least one classification parameter must be associated with a condition.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- On the OmniSwitch 6560 and OmniSwitch 9900, a destination network group policy condition with an IPv6 address is supported only for *ingress* IPv6 ACLs,

Examples

```
-> policy condition cond6 destination network group webgroup1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.
show policy network group	Displays information about policy network groups.

alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationNetworkGroup
```

policy condition multicast network group

Associates a multicast group with a policy condition.

policy condition *condition_name* **multicast network group** *multicast_group*

policy condition *condition_name* **no multicast network group**

Syntax Definitions

condition_name	The name of the condition.
multicast_group	The multicast group name. Multicast groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a multicast group from a condition; however, at least one classification parameter must be associated with a condition.
- A multicast address and a multicast network group cannot be specified in the same condition.

Examples

```
-> policy condition cond3 multicast group video2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
show policy condition	Shows information about policy conditions configured on the switch.

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionMulticastNetworkGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionMulticastNetworkGroup
```

policy condition source ip-port

Configures a source IP port number for a policy condition.

policy condition *condition_name* **source ip-port** *port***[-***port***]**

policy condition *condition_name* **no source ip-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip-protocol** keyword. See the **policy condition ip-protocol** command.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

Examples

```
-> policy condition cond1 ip-protocol 6 source ip-port 137
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpPort
   alaQoSConditionSourceIpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpPort
   alaQoSAppliedConditionSourceIpPortEnd
```

policy condition destination ip-port

Configures a destination IP port number for a policy condition.

policy condition *condition_name* **destination ip-port** *port***[-***port***]**

policy condition *condition_name* **no destination ip-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip-protocol** keyword. See the **policy condition ip-protocol** command.
- The same condition cannot specify a destination IP port with a service or service group.

Examples

```
-> policy condition cond2 ip-protocol 6 destination ip-port 137-138
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationIpPort
   alaQoSConditionDestinationIpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpPort
   alaQoSAppliedConditionDestinationIpPortEnd
```

policy condition source tcp-port

Configures a source TCP port number for a policy condition.

policy condition *condition_name* **source tcp-port** *port***[-***port***]**

policy condition *condition_name* **no source tcp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip-protocol**, use **source tcp-port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond3 source tcp-port 137
-> policy condition cond4 ipv6 source tcp-port 21
-> policy condition cond3 no source tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

   alaQoSConditionName
   alaQoSConditionSourceTcpPort
   alaQoSConditionSourceTcpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceTcpPort
   alaQoSAppliedConditionSourceTcpPortEnd
```

policy condition destination tcp-port

Configures a destination TCP port number for a policy condition.

policy condition *condition_name* **destination tcp-port** *port***[-***port***]**

policy condition *condition_name* **no destination tcp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip-protocol**, use **destination tcp-port**.
- The same condition cannot specify a destination TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination tcp-port 137-138
-> policy condition cond5 ipv6 destination tcp-port 140
-> policy condition cond4 no destination tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationTcpPort
   alaQoSConditionDestinationTcpPortEnd

   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationTcpPort
   alaQoSAppliedConditionDestinationTcpPortEnd
```

policy condition source udp-port

Configures a source UDP port number for a policy condition.

policy condition *condition_name* **source udp-port** *port***[-***port***]**

policy condition *condition_name* **no source udp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip-protocol**, use **source udp-port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond5 source udp-port 1200-1400
-> policy condition cond6 ipv6 source udp-port 1000
-> policy condition cond5 no source udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceUdpPort
   alaQoSConditionSourceUdpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceUdpPort
   alaQoSAppliedConditionSourceUdpPortEnd
```

policy condition destination udp-port

Configures a destination UDP port number for a policy condition.

policy condition *condition_name* **destination udp-port** *port***[-***port***]**

policy condition *condition_name* **no destination udp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip-protocol**, use **destination udp-port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination udp-port 137-138
-> policy condition cond5 ipv6 destination udp-port 140
-> policy condition cond4 no destination udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationTcpPort
   alaQoSConditionDestinationTcpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationTcpPort
   alaQoSAppliedConditionDestinationTcpPortEnd
```

policy condition ethertype

Configures an ethertype value to use for traffic classification.

policy condition *condition_name* **ethertype** *etype*

policy condition *condition_name* **no ethertype**

Syntax Definitions

condition_name	The name of the condition.
etype	The ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.
- On the OmniSwitch 6465, an ethertype value is not supported in policy conditions for IPv6 packets.

Examples

```
-> policy condition cond12 ethertype 8137
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionEthertype
   alaQoSConditionEthertypeStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionEthertype
   alaQoSAppliedConditionEthertypeStatus
```

policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

policy condition *condition_name* **established**

policy condition *condition_name* **no established**

Syntax Definitions

condition_name	The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip, destination ip**, **source port**, **destination port**, **source tcp-port**, or **destination tcp-port** conditions.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionTcpEstablished
alaQoSAppliedConditionTable
   alaQoSAppliedConditionTcpEstablished
```

policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

policy condition *condition_name* **tcpflags [any | all] {f | s | r | p | a | u | e | w} mask {f | s | r | p | a | u | e | w}**

policy condition *condition_name* **no tcpflags**

Syntax Definitions

condition_name	The name of the condition.
any	Match on any of the specified TCP flags.
all	Match all specified TCP flags.
f | s | r | p | a | u | e | w	TCP flag value to match (**f**=fin, **s**=syn, **r**=rst, **p**=psh, **a**=ack, **u**=urg, **e**=ecn, and **w**=cwr). *The **e** and **w** flags are currently not supported*.

Defaults

parameter	default
any | **all**	all

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip, destination ip**, **source port**, **destination port**, **source tcp-port**, or **destination tcp-port** conditions.
- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.
- Use **tcpflags** in combination with the IPv6 condition to configure an IPv6 TCP flag policy (for example, **policy condition ipv6 tcpflags**). *Note that IPv6 TCP flag conditions are not supported on the*

OmniSwitch 6560.

Examples

```
-> policy condition tcp-flag tcpflags all f s mask f s a
-> policy condition tcp-flag-ar tcpflags any a r mask a r
-> policy condition tcp-flag-f destination network group Allowed_Resources source
tcp-port 1982 tcpflags any f mask f ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

   alaQoSAppliedConditionTcpFlagsMaskStatus,
```

policy condition service

Configures a service for a policy condition.

policy condition *condition_name* **service** *service_name*

policy condition *condition_name* **no service**

Syntax Definitions

condition_name	The name of the condition.
service_name	The service name, configured through the **policy service** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service serv2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service	Configures a service that may be used as part of a policy service group.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy service	Displays information about all particular policy services or a particular policy service configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionService
alaQoSAppliedConditionTable
   alaQoSAppliedConditionService
```

policy condition service group

Associates a policy service group with a policy condition.

policy condition *condition_name* **service group** *service_group*

policy condition *condition_name* **no service group**

Syntax Definitions

condition_name	The name of the condition.
service_group	The service group name. Service groups are configured through the **policy service group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service group servgroup2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a service group and its associated services.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionServiceGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionServiceGroup
```

policy condition icmptype

Configures an ICMP type value to use for traffic classification.

policy condition *condition_name* **icmptype** *type*

policy condition *condition_name* **no icmptype**

Syntax Definitions

condition_name	The name of the condition.
type	The ICMP type value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmptype 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition icmpcode	Configures an ICMP code value for traffic classification.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIcmpType
   alaQoSConditionIcmpTypeStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIcmpType
   alaQoSAppliedConditionIcmpTypeStatus
```

policy condition icmpcode

Configures an ICMP code value to use for traffic classification.

policy condition *condition_name* **icmpcode** *code*

policy condition *condition_name* **no icmpcode**

Syntax Definitions

condition_name	The name of the condition.
code	The ICMP code value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmpcode 150
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition icmptype	Configures an ICMP type value for traffic classification.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIcmpCode
   alaQoSConditionIcmpCodeStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIcmpCode
   alaQoSAppliedConditionIcmpCodeStatus
```

policy condition ip-protocol

Configures an IP protocol for a policy condition.

policy condition *condition_name* **ip-protocol** *protocol*

policy condition *condition_name* **no ip-protocol**

Syntax Definitions

condition_name	The name of the condition.
protocol	The protocol associated with the flow. The range is 0–255.

Defaults

parameter	default
protocol	6

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip-port** or **policy condition destination ip-port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

Examples

```
-> policy condition cond4 ip-protocol 6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition source ip-port	Configures a source IP port number for a policy condition.
policy condition destination ip-port	Configures a destination IP port number for a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpProtocol
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpProtocol
```

policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

policy condition *condition_name* **ipv6**

policy condition *condition_name* **no ipv6**

Syntax Definitions

condition_name	The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1/1
-> policy condition cond7 ipv6 source tcp-port 21
-> policy condition cond8 ipv6 source tcp-port 0-1024
-> policy condition cond6 no ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpv6Traffic
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpv6Traffic
```

policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

policy condition *condition_name* **flow-label** *flow_label_value*

policy condition *condition_name* **no flow-label**

Syntax Definitions

condition_name	The name of the condition.
flow_label_value	The flow-label value (0–1048575).

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpv6FlowLabel
   alaQoSConditionIpv6FlowLabelStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpv6FlowLabel
   alaQoSAppliedConditionIpv6FlowLabelStatus
```

policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

policy condition *condition_name* **tos** *tos_value* **[mask** *tos_mask***]**

policy condition *condition_name* **no tos**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
tos_value	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
tos_mask	The mask for the ToS bits, in the range 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

Examples

```
-> policy condition cond2 tos 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionTos
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionTos
```

policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

policy condition *condition_name* **dscp {***dscp_value***[-***value***]} [mask** *dscp_mask***]**

policy condition *condition_name* **no dscp**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
dscp_value[-*value*]	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
dscp_mask	The mask for the DiffServ Code Point, in the range 0–63. *Specifying a DSCP mask for a policy condition is not supported on an OmniSwitch 6465.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.
- When a DSCP policy condition is configured on one of these switches, QoS automatically calculates the appropriate mask value.

Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDscp
   alaQoSConditionDscpMask
   alaQoSConditionDscpEnd
   alaQoSConditionDscpStatus
alaQosAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDscp
   alaQoSAppliedConditionDscpMask
   alaQoSAppliedConditionDscpEnd
   alaQoSAppliedConditionDscpStatus
```

policy condition source mac

Configures a source MAC address for a policy condition.

policy condition *condition_name* **source mac** *mac_address* **[mask** *mac_mask***]**

policy condition *condition_name* **no source mac**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
mac_address	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
mac_mask	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.
- On the OmniSwitch 6465, a source MAC address is not supported in policy conditions for IPv6 packets.

Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceMacAddr
   alaQoSConditionSourceMacMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceMacAddr
   alaQoSAppliedConditionSourceMacMask
```

policy condition destination mac

Configures a destination MAC address for a policy condition.

Note. Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

policy condition *condition_name* **destination mac** *mac_address* **[mask** *mac_mask***]**

policy condition *condition_name* **no destination mac**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
mac_address	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
mac_mask	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.
- On the OmniSwitch 6465, a destination MAC address is not supported in policy conditions for IPv6 packets.

Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSource
   alaQoSConditionDestinationMacAddr
   alaQoSConditionDestinationMacMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSource
   alaQoSAppliedConditionDestinationMacAddr
   alaQoSAppliedConditionDestinationMacMask
```

policy condition source mac group

Associates a source MAC group with a policy condition.

policy condition *condition_name* **source mac group** *group_name*

policy condition *condition_name* **no source mac group**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
group_name	The name of the source MAC group, configured through the **policy mac group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.
- On the OmniSwitch 6465, a source MAC group is not supported in policy conditions for IPv6 packets.

Examples

```
-> policy condition cond4 source mac group mac_group1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy mac group	Configures a MAC group and its associated MAC addresses.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceMacGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceMacGroup
```

policy condition destination mac group

Associates a destination MAC group with a policy condition.

policy condition *condition_name* **destination mac group** *mac_group*

policy condition *condition_name* **no destination**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
mac_group	The name of the destination MAC group, configured through the **policy mac group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination MAC group from a policy condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.
- On the OmniSwitch 6465, a source MAC group is not supported in policy conditions for IPv6 packets.

Examples

```
-> policy condition cond5 destination mac group mac_group1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy mac group	Configures a MAC group and its associated MAC addresses.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationMacGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationMacGroup
```

policy condition source vlan

Configures a source VLAN for a policy condition.

policy condition *condition_name* **source vlan** *vlan_id*

policy condition *condition_name* **no source vlan**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
vlan_id	The source VLAN ID for the flow.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove a source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond5 source vlan 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceVlan
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceVlan
```

policy condition inner source-vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

policy condition *condition_name* **inner source-vlan** *vlan_id*

policy condition *condition_name* **no inner source-vlan**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
vlan_id	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond5 inner source-vlan 3
-> policy condition cond5 no inner source-vlan
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionInnerSourceVlan
   alaQoSConditionInnerSourceVlanStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionInnerSourceVlan
   alaQoSAppliedConditionInnerSourceVlanStatus
```

policy condition destination vlan

Configures a destination VLAN (multicast only) for a policy condition. Use the **no** form of the command to remove a destination VLAN from a condition.

policy condition *condition_name* **destination vlan** *vlan_id*

policy condition *condition_name* **no destination vlan**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
vlan_id	The destination VLAN ID for the flow.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a destination VLAN from a condition; however, at least one classification parameter must be associated with a condition.
- Note that this condition is supported for multicast only policies.

Examples

```
-> policy condition cond4 destination vlan 3 multicast ip any
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationVlan
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationVlan
```

policy condition 802.1p

Configures the 802.1p value for a policy condition.

policy condition *condition_name* **802.1p** *802.1p_value*

policy condition *condition_name* **no 802.1p**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
802.1p_value	The 802.1p value in the 802.1Q VLAN tag for the flow. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond3 802.1p 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSCondition8021p
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedCondition8021p
```

policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

policy condition *condition_name* **inner 802.1p** *802.1p_value*

policy condition *condition_name* **no inner 802.1p**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
802.1p_value	The inner 802.1p value of the inner 802.1Q VLAN tag (customer VLAN) to match on double-tagged packets. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond3 inner 802.1p 7
-> policy condition cond3 no inner 802.1p
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionInner8021p
   alaQoSConditionInner8021pStatus

   alaQoSAppliedConditionName
   alaQoSAppliedConditionInner8021p
   alaQoSAppliedConditionInner8021pStatus
```

policy condition source port

Configures a source port number for a policy condition. Use the **no** form of the command to remove a source port number from a condition.

policy condition *condition_name* **source {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

policy condition *condition_name* **no source {port | linkagg}**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number on which the frame is received. Use a hyphen to specify a range of ports (1/5-10). *Specifying a range of ports for a policy condition is not supported on an OmniSwitch 6465.*
*agg_id***[**-*agg_id2***]**	The link aggregate ID on which the frame is received. Use a hyphen to specify a range of IDs (10-15). *A link aggregate policy condition is not supported on the OmniSwitch 6560, OmniSwitch 6900-V72, 6900-C32, and OmniSwitch 9900.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond2 source port 3/1/1
-> policy condition cond3 source port 3/2/1-4
-> policy condition cond3 no source port
-> policy condition cond3 source linkagg 10
-> policy condition cond3 source linkagg 15-20
-> policy condition cond3 no source linkagg
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **linkagg** parameter added.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceSlot
   alaQoSConditionSourcePort
   alaQoSConditionSourcePortEnd
   alaQoSConditionSourceChassis

   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceSlot
   alaQoSAppliedConditionSourcePort
   alaQoSAppliedConditionSourcePortEnd
   alaQoSAppliedConditionSourceChassis
```

policy condition destination port

Configures a destination port number for a policy condition.

policy condition *condition_name* **destination {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

policy condition *condition_name* **no destination {port | linkagg}**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number for which the frame is destined. Use a hyphen to specify a range of ports (1/5-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID for which the frame is destined. Use a hyphen to specify a range of IDs (10-15). *A link aggregate policy condition is not supported on the OmniSwitch 6560, OmniSwitch 6900-V72, 6900-C32, and OmniSwitch 9900.*

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition does not apply to routed traffic. Only bridged unicast traffic is supported (bridged multicast and broadcast traffic is not supported).

Examples

```
-> policy condition cond3 destination port 4/2/1
-> policy condition cond4 destination port 4/3/1-4
-> policy condition cond4 no destination port
-> policy condition cond4 destination linkagg 10
-> policy condition cond4 destination linkagg 15-20
-> policy condition cond4 no destination linkagg
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **linkagg** parameter added.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationSlot
   alaQoSAppliedConditionDestinationPort
   alaQoSAppliedConditionDestinationPortEnd
   alaQoSAppliedConditionDestinationChassis
```

policy condition source port group

Associates a source port group with a policy condition. Use the **no** form of the command to remove a source port group from a condition.

policy condition *condition_name* **source port group** *group_name*

policy condition *condition_name* **no source port group**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
group_name	The name of the source port group. Port groups are configured through the **policy port group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 source port group portgr4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```

   alaQoSConditionName
   alaQoSConditionSourcePortGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourcePortGroup
```

policy condition destination port group

Associates a destination port group with a policy condition. Use the **no** form of the command to remove a destination port group from a condition.

policy condition *condition_name* **destination port group** *group_name*

policy condition *condition_name* **no destination port**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
group_name	The name of the destination port group. Port groups are configured through the **policy port group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove a destination port group from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 destination port group portgr4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```

   alaQoSConditionName
   alaQoSConditionDestinationPortGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationPortGroup
```

policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

policy condition *condition_name* **vrf {***vrf_name* | **default}**

policy condition *condition_name* **no vrf**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
vrf_name	The name of the VRF instance to which the QoS policy condition applies.
default	Specifies the default VRF instance.

Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

   alaQoSAppliedConditionName
   alaQoSAppliedConditionVrfName
   alaQoSAppliedConditionVrfNameStatus
```

policy condition fragments

Associates TCP packet fragments with a policy condition.

policy condition *condition_name* **fragments**

policy condition *condition_name* **no fragments**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove TCP packet fragments from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 fragments
-> policy condition cond7 no fragments
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```

   alaQoSAppliedConditionName
   alaQoSAppliedConditionFragments
```

policy condition appfp-group

Associates an Application Fingerprinting (AFP) application signature group with a policy condition.

policy condition *condition_name* **appfp-group** *group_name*

policy condition *condition_name* **no appfp-group**

Syntax Definitions

condition_name	The name of the condition. May be an existing condition name or a new condition.
group_name	The name of the AFP application group to which the QoS policy condition applies.

Defaults

N/A.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove an AFP group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **appfp-group** policy condition is used in rules associated with QoS policy lists that are applied to AFP ports running in either the QoS or UNP mode.

Examples

```
-> policy condition cond6 appfp-group my-p2p
-> policy condition cond6 no appfp-group
```

Release History

Release 7.3.2; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionAppFpGroup
   alaQoSConditionAppFpGroupStatus
```

policy condition vxlan

Creates a VXLAN Snooping policy condition to determine the parameters the switch uses to classify incoming encapsulated Virtual eXtensible Local Area Network (VXLAN) packets. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

policy condition *condition_name* **vxlan vni** *vxlan_id*
[inner source mac *mac_address* **[mask** *mac_mask***]]**
[inner source mac-group *mac_group***]**
[inner source ip *ip_address* **[mask** *netmask***]]**
[inner source ipv6 *ip6_address* **[mask** *netmask***]]**
[inner ip-protocol *protocol***]**
[inner l4-port {src *src_port* | **dest** *dest_port***}]**
[vxlan-port *udp_port***]**

no policy condition *condition_name*

Syntax Definitions

condition_name	The name of the VXLAN condition. Any alphanumeric string.
vxlan_id	A 24-bit numerical value that identifies traffic for a VXLAN segment. The valid range is 1– 2147483647.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the **policy rule** command.
- Use the **qos apply** command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from the switch configuration.
- The **vni** (VXLAN Network Identifier) parameter is required to configure a VM Snooping policy condition. The VXLAN header contains the VNI that is associated with the source MAC address of the Ethernet frame that is encapsulated in a VXLAN packet. The VNI represents the VXLAN segment ID to which the packet belongs.

- The **vxlan-port** condition parameter applies only to the outer header of an encapsulated VXLAN packet. All other **inner** condition parameters apply only to the inner header of the Ethernet frame that was encapsulated in a VXLAN packet.
- When a VXLAN Snooping policy condition is used in a policy rule, the rule is then applied only to traffic on ports that have the VM Snooping feature enabled.
- All existing policy actions are supported in combination with VXLAN Snooping policy conditions; there are no specific policy actions required for policy rules containing VXLAN Snooping policy conditions. Policy actions are applied to the outer header of an encapsulated VXLAN packet.
- See the "Configuring VXLAN Snooping" chapter in the *OmniSwitch AOS Release 8 Data Center Switching Guide* for more information about using VXLAN Snooping policy rules.

Examples

```
-> policy condition cond4 vxlan vni 23000
```

The following is an example of using VM Snooping policy conditions in a policy rule that is added to a UNP policy list:

```
-> policy condition c1 vxlan vni 1234 udp-port 4789
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c1 vxlan inner source ip 10.10.10.10
-> policy action a1 disposition dscp 45
-> policy rule r1 condition c1 action a1 no default-list
-> policy list list1 type UNP
-> policy list list1 rule r1
-> qos apply
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Configures a policy action.
policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
show policy condition	Shows information about policy conditions configured on the switch.

```

policy condition vxlan inner source mac

Configures a source MAC address as a policy condition for a VM Snooping policy rule. This type of condition applies to the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source mac** *mac_address* **[mask** *mac_mask***]**

policy condition *condition_name* **vxlan no source mac**

Syntax Definitions

condition_name	The name of an existing policy condition.
mac_address	The source MAC address of a VM (inner MAC address of an encapsulated VXLAN frame).
mac_mask	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the VM source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VM Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c2 vxlan inner source mac 00:20:da:05:f6:23 mask
ff:ff:ff:ff:ff:ff
-> policy condition c2 vxlan no source mac
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVmSourceMacAddr
   alaQoSConditionVmSourceMacAddrStatus
   alaQoSConditionVmSourceMacMask
```

policy condition vxlan inner source mac-group

Configures a source MAC address group as a policy condition for a VXLAN Snooping policy rule. This type of condition checks to see if the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet matches any of the MAC addresses specified in the MAC address group.

policy condition *condition_name* **vxlan inner source mac-group** *group_name*

policy condition *condition_name* **vxlan no source mac-group**

Syntax Definitions

condition_name	The name of an existing policy condition.
group_name	The name of the source MAC group, configured through the **policy mac group** command.

Defaults

N/A.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the source MAC address group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source mac-group vm-macs
-> policy condition c1 vxlan no source mac-group
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVmSourceMacGroup
   alaQoSConditionVmSourceMacGroupStatus
```

policy condition vxlan inner source ip

Configures a source IPv4 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **vxlan no source ip**

Syntax Definitions

condition_name	The name of an existing policy condition.
ip_address	A specific source IP address.
netmask	The network mask for the source IP address (for example, 255.0.0.0, 255.255.0.0).

Defaults

parameter	default
netmask	IP address class

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the source IP address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source ip 10.1.1.2
-> policy condition c2 vxlan inner source ip 10.1.1.3 mask 255.0.0.0
-> policy condition c1 vxlan no source ip
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVmSourceIpAddr
   alaQoSConditionVmSourceIpAddrStatus
   alaQoSConditionVmSourceIpMask
```

policy condition vxlan inner source ipv6

Configures a source IPv6 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source ipv6** *ipv6_address* **[mask** *netmask***]**

policy condition *condition_name* **vxlan no source ipv6**

Syntax Definitions

condition_name	The name of an existing policy condition.
ipv6_address	A specific source IPv6 address.
netmask	The network mask for the source IPv6 address.

Defaults

parameter	default
netmask	IPv6 address class

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source ipv6 ::1234:531F:BCD2:F34A
-> policy condition c1 vxlan no source ipv6
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN Snooping policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVmSourceIpv6IpAddr
   alaQoSConditionVmSourceIpv6IpAddrStatus
   alaQoSConditionVmSourceIpv6IpMask
```

policy condition vxlan inner ip-protocol

Configures a an IP protocol number as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the IP protocol of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner ip-protocol** *protocol*

policy condition *condition_name* **vxlan no ip-protocol**

Syntax Definitions

condition_name	The name of an existing policy condition.
protocol	The IP protocol number. The range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the IP protocol number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner ip-protocol 6
-> policy condition c1 vxlan no ip-protocol
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN Snooping policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVmIpProtocol
   alaQoSConditionVmIpProtocolStatus
```

policy condition vxlan inner l4-port

Configures a Layer 4 (UDP or TCP) source port and/or destination port as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the Layer 4 port of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner l4-port {src** *src_port* **| dest** *dest_port***}**

policy condition *condition_name* **vxlan no l4-port**

Syntax Definitions

condition_name	The name of an existing policy condition.
src_port	The source port number. The valid range is 0–65535
dest_port	The destination port number. The valid range is 0–65535

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the Layer 4 port number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner l4-port dest 9445
-> policy condition c1 vxlan inner l4-port src 4000
-> policy condition c2 vxlan inner l4-port dest 8100 inner l4-port src 3000
-> policy condition c1 vxlan no l4-port
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN Snooping policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQosConditionVmL4SourcePort
   alaQosConditionVmL4SourcePortStatus
   alaQosConditionVmL4DestPort
   alaQosConditionVmL4DestPortStatus
```

policy condition vxlan vxlan-port

Configures a UDP destination port number as a policy condition for a VXLAN Snooping policy rule. This number is found in the outer IP header of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan vxlan-port** *udp_port*

policy condition *condition_name* **vxlan no vxlan-port**

Syntax Definitions

condition_name	The name of an existing policy condition.
udp_port	The UDP destination port number of the VXLAN packet. The valid range is 0–65535

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of the command to remove the VXLAN port number from a condition; however, at least one classification parameter must be associated with a condition.
- VXLAN packets use the well-known UDP destination port 4789 by default.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan vxlan-port 6000
-> policy condition c1 vxlan 7000
-> policy condition c1 vxlan no vxlan-port
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN Snooping policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionVxlanPort
   alaQoSConditionVxlanPortStatus
```

policy action

Configures or deletes a QoS action. A QoS action describes how traffic that matches a particular QoS condition should be treated. It may specify a particular set of bandwidth and queue parameters, or it may simply specify whether the flow is allowed or denied on the switch.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove the parameter from the action.

Note that some action parameters may not be supported depending on the platform you are using. Also some action parameters may not be supported with some conditions. See the condition in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

policy action *action_name*
[disposition {accept | drop | deny}]
[shared]
[priority *priority_value***]**
[maximum bandwidth *bps***]**
[maximum depth *bytes***]**
[cir *bps* **[cbs** *bytes***] [pir** *bps***] [pbs** *bytes***] [color-only]**
[cpu priority *priority***]**
[tos *tos_value***]**
[802.1p *802.1p_value***]**
[dcsp *dcsp_value***]**
[map {802.1p | tos | dscp} to {802.1p | tos| dscp} using *map_group***]**
[permanent gateway ip *ip_address***]**
[permanent gateway ipv6 *ipv6_address***]**
[port-disable]
[redirect port *chassis/slot/port***]**
[redirect linkagg *link_agg***]**
[no-cache]
[{ingress | egress | ingress egress | no} mirror {*chassis/slot/port* **| session** *session_id***}**

policy no action *action_name*

Syntax Definitions

action_name	A name for the action, any alphanumeric string.

Defaults

By default, no drop algorithm is configured for the action, and any queues created by the action are not shared.

parameter	default
accept | drop | deny	accept

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **configuration snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

  from {cli | ldap | blt}

  This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

Examples

```
-> policy action action1 accept
```

Release History

Release 7.1.1; command was introduced.
Release 8.6R1; **session** keyword added.

Related Commands

policy condition	Configures a condition associated with the action.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionSource
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionSource
```

policy action disposition

Configures a disposition for a policy action.

policy action *action_name* **disposition {accept | drop | deny}**

policy action *action_name* **no disposition**

Syntax Definitions

action_name	The name of the action.
accept	Specifies that the switch should accept the flow.
drop	Specifies that the switch should silently drop the flow.
deny	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as **drop**; that is, the flow is silently dropped.

Defaults

parameter	default
accept | drop | deny	accept

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove a disposition from an action.

Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

```

policy action shared

Enables bandwidth sharing among multiple QoS rules that use the same maximum bandwidth action.

policy action *action_name* **shared**

policy action *action_name* **no shared**

Syntax Definitions

action_name	The name of the action.

Defaults

By default, queues created by an action are *not* shared.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the **shared** policy action is not specified, then each bandwidth rule will implement a separate instance of the specified bandwidth allocation.
- Use the **no** form of the command to disable sharing.

Example

```
-> policy action action5 maximum bandwidth 10m shared
-> policy action action6 maximum bandwidth 10m shared
-> policy action action5 no shared
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action maximum bandwidth	Creates a maximum bandwidth policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionShared
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionShared
```

policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

policy action *action_name* **priority** *priority_value*

policy action *action_name* **no priority**

Syntax Definitions

action_name	The name of the action.
priority_value	The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- This priority value is independent of 802.1Q, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

Examples

```
-> policy action action1 priority 1
-> policy action action1 no priority
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionPriority
   alaQoSActionPriorityStatus
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPriority
   alaQoSAppliedActionPriorityStatus
```

policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

policy action *action_name* **maximum bandwidth** *bps***[k | m | g | t]**

policy action *action_name* **no maximum bandwidth**

Syntax Definitions

action_name	The name of the action.
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- If the maximum bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- Use the **shared** policy action to enabling sharing of bandwidth across policy rules that specify the same maximum bandwidth action.

Examples

```
-> policy action action3 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k shared
-> policy action action5 maximum bandwidth 10k shared
-> policy action action4 no maximum bandwidth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

   alaQoSActionName
   alaQoSActionMaximumBandwidth
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionMaximumBandwidth
```

policy action maximum depth

Configures the maximum queue depth or bucket size assigned to this action, in bytes. The queue depth or bucket size determines the amount of buffer allocated to each queue. When the queue depth or bucket size is reached, the switch starts dropping packets.

policy action *action_name* **maximum depth** *bytes* **[K (kilo)| M (mega) | G (giga) | T (tera)]**

policy action *action_name* **no maximum depth**

Syntax Definitions

action_name	The name of the action.
bytes **[K | M | G | T]**	The maximum queue depth in bytes. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g**). If the value is entered as an integer, the switch uses the default unit of **K(kilo)**.

Defaults

parameter	default
K | M | G | T	**K**
bytes	**0**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in Kbytes by default. For example, if the number **10** is specified, **10K** bytes is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10G** bytes.
- A maximum depth action is used in combination with a maximum bandwidth action.

Examples

```
-> policy action action2 maximum depth 100
-> policy action action2 no maximum depth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

   alaQoSActionName
   alaQoSActionMaximumDepth
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionMaximumDepth
```

policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action includes parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), and Peak Burst Size (PBS). The TCM policier meters and marks packets red, green, or yellow based on the parameter values of this policy action.

policy action *action_name* **cir** *bps* **[cbs** *bytes***] [pir** *bps***] [pbs** *bytes***] [color-only]**

policy action *action_name* **no cir**

policy action *action_name* **no pir**

Syntax Definitions

action_name	The name of the action.
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).
bytes	The desired value for maximum bucket size, in bytes.
color-only	Disables TCM rate limiting based on the metering results. Packets are only marked the specific color that applies to the level of packet conformance.

Defaults

parameter	default
cir pir *bps*	0
cbs pbs *bytes*	10K
k | m | g | t	**k**

By default, this action enables rate limiting based on TCM marking and metering.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.
- If the **color-only** parameter is specified with this command, the TCM action will only mark packet color; packets are not rate limited based on the metering results. In this case, packets are then subject to any rate limiting specifications as defined in the queue management configuration for the switch.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.

- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action. If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.
- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule** command. These statistics are only shown for those rules that are configured with a TCM policy action.

Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k color-only
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M color-only
-> policy action A7 no cir
```

Release History

Release 7.1.1; command was introduced.

```

policy action cpu priority

Configures a CPU priority policy action.

policy action *action_name* **cpu priority** *priority*

policy action *action_name* **no cpu priority**

Syntax Definitions

action_name	The name of the action.
priority	The CPU queue on which packets destined for the CPU are received. The valid range is 0–31.

Defaults

By default, the CPU priority is set to zero.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Use the **no** form of this command to remove the CPU priority parameter value.

Examples

```
-> policy action A7 cpu priority 15
-> policy action A8 cpu priority 31
-> policy action A7 no cpu priority
```

Release History

Release 7.1.1; command was introduced.

Related Commands

   alaQoSAppliedActionCPUPriority
   alaQoSAppliedActionCPUPriorityStatus
```

policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

policy action *action_name* **tos** *tos_value*

policy action *action_name* **no tos**

Syntax Definitions

action_name	The name of the action.
tos_value	The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action3 tos 4
-> policy action action3 no tos
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionTos
```

policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

policy action *action_name* **802.1p** *802.1p_value*

policy action *action_name* **no 802.1p**

Syntax Definitions

action_name	The name of the action.
802.1p_value	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.

alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedAction8021p
```

policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

policy action *action_name* **dscp** *dscp_value*

policy action *action_name* **no dscp**

Syntax Definitions

action_name	The name of the action.
dscp_value	The DSCP value to be set, in the range 0–63.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionDscp

   alaQoSAppliedActionName
   alaQoSAppliedActionDscp
```

policy action map

Configures a mapping group for a policy action.

policy action map {802.1p | tos | dscp} to {802.1p | tos | dscp} using *map_group*

policy action no map

Syntax Definitions

action_name	The name of the action.
802.1p	Indicates that an 802.1p value should be mapped.
tos	Indicates that a ToS value should be mapped.
dscp	Indicates that a DSCP value should be mapped.
map_group	The name of the map group, configured through the **policy map group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

  If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will determine the outgoing 802.1p and ToS based on whether or not the port is trusted or untrusted).
- Use the **no** form of the command to delete the map group from the configuration.

Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy map group	Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

```

policy action permanent gateway-ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

policy action *action_name* **permanent gateway-ip** *ip_address*

policy action *action_name* **no permanent gateway-ip**

Syntax Definitions

action_name	The name of the action.
ip_address	The destination IP address to which packets will be routed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

Examples

```
-> policy action pbr2 permanent gateway-ip 10.10.2.1
-> policy action pbr2 no permanent gateway-ip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPermanentGatewayIpAddr
```

policy action permanent gateway-ipv6

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IPv6 address specified in the action regardless of whether or not a route already exists in the switch routing table.

policy action *action_name* **permanent gateway-ipv6** *ipv6_address*

policy action *action_name* **no permanent gateway-ipv6**

Syntax Definitions

action_name	The name of the action.
ipv6_address	The destination IPv6 address to which packets will be routed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of the command to remove a gateway IPv6 address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

Examples

```
-> policy action pbr2 permanent gateway-ipv6 2607:f0d0:2001:000a:0000:0000:0010
-> policy action pbr2 no permanent gateway-ipv6
```

Release History

Release 7.1.1; command was introduced.

   alaQoSAppliedActionName
   alaQoSAppliedActionPermanentGatewayIpV6Addr
```

policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

policy action *action_name* **port-disable**

policy action *action_name* **no port-disable**

Syntax Definitions

action_name	The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a UserPorts shutdown function.
- To enable a port disabled by this action, use the **interfaces** or **interfaces fec** command to administratively enable the port, or physically disconnect and reconnect the port cable.

Examples

```
-> policy action pd01 port-disable
-> policy action pb02 no port-disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.
interfaces	Administratively enables or disables a port.
interfaces wait-to-restore	Administratively clears the violation that disabled the port or link aggregate and restores the port to enabled status.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionPortdisable
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPortdisable
```

policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

policy action *action_name* **redirect port** *chassis/slot/port*

policy action *action_name* **no redirect port**

Syntax Definitions

action_name	The name of the action.
chassis	The chassis identifier.
slot/port	The slot and port number that will receive the redirected traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect port 1/12/1
-> policy action rp01 no redirect port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

   alaQoSActionRedirectPort
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionRedirectSlot
   alaQoSAppliedActionRedirectPort
```

policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

policy action *action_name* **redirect linkagg** *agg_id*

policy action *action_name* **no redirect linkagg**

Syntax Definitions

action_name	The name of the action.
agg_id	The link aggregate ID number (0–32) to assign to the specified VLAN. See the "Link Aggregation Commands" chapter in this guide.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is "blackholed". As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect linkagg 2
-> policy action rp01 no redirect linkagg 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy action no-cache

Disables logging of rule entries to the hardware cache.

policy action *action_name* **no-cache**

policy action *action_name* **no no-cache**

Syntax Definitions

action_name	The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove **no-cache** from the policy action.
- Recommended for use when applied to traffic going to the switch.

Examples

```
-> policy action nc01 no-cache
-> policy action nc01 no no-cache
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

policy action *action_name* **[ingress | egress | ingress egress] mirror {***chassis/slot/port* | **session** *session_id***}**

policy action *action_name* **no mirror** {*chassis/slot/port* | **session** *session_id*}

Syntax Definitions

action_name	The name of the action.
ingress	Mirrors ingress packets.
egress	Mirrors egress packets.
ingress egress	Mirrors ingress and egress packets.
chassis	The chassis identifier.
slot/port	The slot and port number that will receive the mirrored traffic.
session_id	Mirroring session identifier. *This parameter is supported only on the OmniSwitch 9900.*

Defaults

parameter	default
ingress | egress | ingress egress	**ingress**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) and mirror-to-session action used for policy based mirroring.
- Only one policy-based MTP session is supported at any given time either port-based policy mirroring or session-based policy mirroring. As a result, all mirroring policies must specify the same destination port or same port mirroring session ID.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

Examples

```
-> policy action a1 mirror 1/7/1 (default ingress)
-> policy action a1 ingress mirror 1/7/1
-> policy action a1 egress mirror 1/7/1
-> policy action a1 ingress egress mirror 1/7/1
```

```
-> policy action a1 no mirror
-> policy action a1 mirror session 1
```

Release History

Release 7.1.1; command was introduced.
Release 8.6R1; **session** keyword introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

   alaQoSActionName
   alaQoSActionMirrorSlot
   alaQosActionMirrorPort
   alaQosActionMirrorMode
   alaQosActionMirrorModeStatus
```

show policy network group

Displays information about pending and applied policy network groups.

show [applied] policy network group [*network_group***]**

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
network_group	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Information for all policy network groups displays unless *network_group* is specified.

Examples

```
-> show policy network group
Group Name                      : netg1
  State                         = new,
  Entries                       = 198.206.10.1

-> show policy network group
Group Name                      : group1
  Entries                       = 203.185.129.0 mask 255.255.255.0,
                                  203.185.131.192 mask 255.255.255.192,
                                  203.185.132.0 mask 255.255.252.0,
                                  204.226.0.0 mask 255.255.0.0
```

output definitions

Group Name	The name of the port group, configured through the **policy network group** command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Entries	The IP addresses associated with the network group.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy network group	Configures policy network groups.

MIB Objects

show policy service

Displays information about pending and applied policy services.

show [applied] policy service [*service_name***]**

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
service_name	The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Information about all policy services is displayed unless *service_name* is specified.

Examples

```
-> show policy service
Service name                    : s1
  State                         = new,
  Destination UDP port          = 1001-2004
```

output definitions

Service Name	The name of the port group, configured through the **policy service** command.
State	This field appears if the service was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
IPProto	The IP protocol associated with the service.
ScrPort	A source port associated with the service.
DstPort	A destination port associated with the service.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service	Configures a service that may be used as part of a policy service group.

show policy mac group

Displays information about pending and applied MAC groups.

show [applied] policy mac group [*mac_group***]**

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
mac_group	The name of the MAC group for which you want to display information; or a wildcard sequence of characters for displaying information about MAC groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Information for all policy MAC groups displays unless *mac_group* is specified.

Examples

```
-> show policy mac group
Group Name                      : mg1
  State                         = new,
  Entries                       = 00:02:9A:44:5E:10 mask 00:00:00:FF:FF:FF,
                                  00:11:01:00:00:01 mask 00:00:00:FF:FF:FF
                                  00:02:9A:44:5E:20
```

output definitions

Group Name	The name of the port group, configured through the **policy mac group** command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Entries	The MAC addresses associated with the group.

Release History

Release 7.1.1; command was introduced.

```

show policy action

Displays information about pending and applied policy actions configured on the switch.

show [applied] policy action [*action_name***]**

Syntax Definitions

applied	Displays only actions that have been applied to the QoS configuration for the switch.
action_name	The name of the action for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all policy actions displays unless *action_name* is specified.
- When the optional **applied** parameter is used, pending QoS actions are not displayed.

Examples

```
-> show policy action
Action name                     : a1
  Commited Information Rate     = 10.0M,
  Commited Burst size           = 5.00M,
  Peak Information Rate         = 20.0M,
  Peak Burst size               = 5.00M

Action name                     : a2
  State                         = new,
  Disposition                   = deny

Action name                     : a3
  State                         = new,
  Priority                      = 7,

-> show applied policy action
Action name                     : a1
  Commited Information Rate     = 10.0M,
  Commited Burst size           = 5.00M,
  Peak Information Rate         = 20.0M,
  Peak Burst size               = 5.00M
```

output definitions

Action Name	The name of the action, configured through the **policy action** command.
State	This field appears if the action was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Policy Action Parameters	Displays the configured policy action parameters.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy action	Creates a policy action. A QoS action is a particular set of bandwidth and queue parameters that may be applied to a flow matching particular QoS conditions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionSource
   alaQoSActionDisposition
   alaQoSActionShared
   alaQoSActionMinimumBandwidth

   alaQoSAppliedActionMaximumBandwidth
   alaQoSAppliedActionMaximumDepth
```

show policy condition

Displays information about pending and applied policy conditions.

show [applied] policy condition [*condition_name***]**

Syntax Definitions

applied	Displays only conditions that have been applied to the QoS configuration for the switch.
condition_name	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all policy conditions displays unless *condition_name* is specified.
- When the optional **applied** parameter is used, pending QoS conditions are not displayed.

Examples

```
-> show policy condition
Condition name                  : c1
  Source VLAN                   = 1001

Condition name                  : c2
  State                         = new,
  Source IP                     = 10.2.2.1,
  Destination UDP port          = 17

-> show applied policy condition
Condition name                  : c1
  Source VLAN                   = 1001
```

output definitions

Condition Name	The name of the condition, configured through the **policy condition** command.
State	This field appears if the condition was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Policy Condition Parameters	Displays the configured policy condition parameters.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition. The condition determines what parameters the switch uses to classify incoming flows.

MIB Objects

```

show active policy rule

Displays information about pending and applied policy rules that are active (enabled) on the switch.

show active policy rule [*rule_name***]**

Syntax Definitions

rule_name	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rules is displayed unless *rule_name* is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.

Examples

```
-> show active policy rule
Rule name                       : r1
  Condition name                = c1,
  Action name                   = a1,
  Packets                       = 4166772,
  Bytes                         = 266665728
```

output definitions

Rule name	The name of the policy rule, configured through the **policy rule** command.
Condition name	The name of the condition configured for this rule.
Action name	The name of the action configured for this rule.
Packets	The number of packets that match this rule.
Bytes	The number of bytes that match this rule.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

```
alaQoSRuleTable
   alaQoSRuleName
   alaQoSRuleEnabled

   alaQoSRuleAction
```

show policy rule

Displays information about pending and applied policy rules.

show [applied] policy rule [*rule_name***]**

Syntax Definitions

applied	Indicates that only policy rules that have been applied should be displayed.
rule_name	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all rules is displayed unless *rule_name* is specified.
- Use the **show active policy rule** command to display only active rules that are currently being enforced on the switch.

Examples

```
-> show policy rule
Rule name                       : r1
  Condition name                = c1,
  Action name                   = a1

Rule name                       : r2
  State                         = new,
  Condition name                = c2,
  Action name                   = a1

Rule name                       : r3
  State                         = new,
  Condition name                = c2,
  Action name                   = a2

-> show applied policy rule
Rule name                       : r1
  Condition name                = c1,
  Action name                   = a1
```

output definitions

Rule name	The name of the policy rule, configured through the **policy rule** command.
State	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Condition name	The name of the condition configured for this rule.
Action name	The name of the action configured for this rule.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

show policy validity period

Displays information about policy validity periods.

show policy validity period [*name***]**

Syntax Definitions

name	The name of the validity period.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all validity periods is displayed unless *name* is specified.
- Use the **show policy rule** command to display the validity period that is associated with a policy rule.

Examples

```
-> show policy validity-period
Validity period name             = tuesday
  State                          = new,
  Days                           = tuesday

Validity period name             = february
  Months                         = february

-> show applied policy validity-period
Validity period name             = february
  Months                         = february
```

output definitions

Validity period name	The name of the policy validity period, configured through the **policy validity-period** command.
State	This field appears if the validity period was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Days	The days of the week the validity period is active, configured through the **policy validity-period** command. If this field does not appear, then the validity period is not restricted to specific days.
Months	The months during which the validity period is active, configured through the **policy validity-period** command. If this field does not appear, then the validity period is not restricted to specific months.

output definitions

Hours	The time of day the validity period begins and ends, configured through the **policy validity-period** command. If this field does not appear, then the validity period is not restricted to a specific time.
Interval	The date and time a validity period interval begins and ends, configured through the **policy validity-period** command. If this field does not appear, then the validity period is not restricted to a specific date and time interval.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy validity-period	Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.

```

show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

show active policy list [*list_name***]**

Syntax Definitions

list_name	The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all active rules is displayed unless a *list_name* is specified.
- Use the **show policy list** command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last **qos apply**.
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/ applied lists.

Examples

```
-> show active policy list
 Group Name                       From  Type    Enabled  Entries
 ---------------------------------+-----+-------+--------+-------------------------
 list1                            cli   unp     Yes      r1
                                                         r2

 +list2                           cli   unp     Yes      r3

 egress_list1                     cli   egress  Yes      r1
                                                         r2
                                                         r3
```

output definitions

Group Name	The name of the policy list. Configured through the **policy list** command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last **qos apply**.
From	Where the list originated.
Type	The type of rule (**unp**, **egress**, **appfp**). Configured through the **policy list** command. Note that the default policy list is not shown. Use the **show policy rule** command to display rules that are members of the default policy list.
Enabled	Whether or not the rule is enabled. Configured through the **policy list** command.
Entries	The QoS policy rules that are grouped together in this policy list. Configured through the **policy list** command.

Release History

Release 7.2.1; command was introduced.

Related Commands

show policy list	Displays information about pending and applied policy lists.
show policy rule	Displays information about pending and applied policy rules

show policy list

Displays information about pending and applied policy lists.

show [applied] policy list [*list_name***]**

Syntax Definitions

applied	Displays only those policy lists that have been applied to the switch configuration.
list_name	The name of the list to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Information for all rules is displayed unless a *list_name* is specified.
- Use the **show active policy list** command to display only active policy lists that are currently enforced on the switch.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last **qos apply**.
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/ applied lists.

Examples

```
-> show policy list
 Group Name                       From  Type    Enabled  Entries
 ---------------------------------+-----+-------+--------+--------------------------
 list1                            cli   unp     Yes      r1
                                                         r2

 +list2                           cli   unp     Yes      r3
```

```
-> show applied policy list
 Group Name                       From  Type    Enabled  Entries
 ---------------------------------+-----+-------+--------+--------------------------
 list1                            cli   unp     Yes      r1
                                                         r2
```

output definitions

Group Name	The name of the policy list. Configured through the **policy list** command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last **qos apply**.
From	Where the list originated.
Type	The type of rule (**unp**, **egress**, **appfp**). Configured through the **policy list** command. Note that the default policy list is not shown. Use the **show policy rule** command to display rules that are members of the default policy list.
Enabled	Whether or not the rule is enabled. Configured through the **policy list** command.
Entries	The QoS policy rules that are grouped together in this policy list. Configured through the **policy list** command.

Release History

Release 7.2.1; command was introduced.

Related Commands

show policy ipv4-summary

Displays all the IPv4 networks that are currently matched by ACLs on the system.

show policy ipv4-summary [rule *rule_name***]**

Syntax Definitions

rule_name	The name of the policy rule.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specifying the rule name displays the detailed summary for the corresponding rule. If no rule name is specified, then the summary for each rule is displayed in a tabular form.
- If there is an explicit default rule that is set to deny, the same is displayed in the output.

Examples

```
-> show policy ipv4-summary
Legends:
P= Protocol
Act= Action (d = deny, a = accept)

Rule          P     Source IP/          Destination IP/     VRF Name  Act    Hit Count
                    Source Group        Destination Group
------------+----+----------------+----------------------+--------+-------+----------
rle-rule3    IP    224.0.0.0/4          224.0.0.0/4          default   a      30129
rle-rule4    UDP   0.0.0.0/0            0.0.0.0/0            default   d      10202020
rle-rule1    IP    192.168.10.0/*       192.168.20.0/24      guest     a      458723011
rle-rule2    IP    192.168.30.0/24      192.168.10.0/24      enterpr*  a      458723011

-> show policy ipv4-summary rule rle-rule2
Rule name                       : rle-rule2,
Protocol                        : IP,
Source IP                       : 192.168.30.0/24,
Destination IP                  : 192.168.10.0/24,
VRF Name                        : enterprise,
Action                          : Accept,
Hit Count                       : 458723011
```

output definitions

Rule	Name of the rule.
P	The associated IP protocol.
Source IP/ Source Group	The IPv4 address of the source or source group.

output definitions

Destination IP/Destination Group	The IPv4 address of the destination or destination group.
VRF Name	The name of the VRF.
Act	The name of the action.
Hit Count	The sum of packet counts from all NIs matching the corresponding rule.

Release History

Release 8.3.1.R02; command introduced.
Release 8.4.1.R02; OmniSwitch 6860 and 6865 support added.

Related Commands

show active policy list	Displays only those policy lists that are currently being enforced on the switch.
show policy rule	Displays information about pending and applied policy rules

MIB Objects

N/A

show policy ipv6-summary

Displays all the IPv6 networks that are currently matched by ACLs on the system.

show policy ipv6-summary [rule *rule_name***]**

Syntax Definitions

rule_name	The name of the policy rule.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specifying the rule name displays the detailed summary for the corresponding rule. If no rule name is specified, then the summary for each rule is displayed in a tabular form.
- If there is an explicit default rule that is set to deny, the same is displayed in the output.

Examples

```
-> show policy ipv6-summary
Legends:
P= Protocol

37 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules can be created on an attached server through the PolicyView GUI application. Policy rules can also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See Chapter 35, "QoS Commands," for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

Filename: ALCATEL-IND1-POLICY-MIB.mib
Module: alcatelIND1PolicyMIB

The policy server commands are summarized here:

policy server load
policy server flush
policy server
show policy server
show policy server long
show policy server statistics
show policy server rules
show policy server events

policy server load

Downloads policies from an LDAP server. These policies are created through the PolicyView management application.

policy server load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

Examples

```
-> policy server load
```

Release History

Release 7.1.1; command introduced.

Related Commands

policy server flush	Removes all cached LDAP policy data from the switch.

MIB Objects

```
serverPolicyDecision
```

policy server flush

Removes all cached LDAP policy data from the switch.

policy server flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

Examples

```
-> policy server flush
```

Release History

Release 7.1.1; command introduced.

Related Commands

policy server load	Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```
serverPolicyDecision
```

policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

policy server *ip_address* **[port** *port_number***] [admin-state {enable | disable}] [preference** *preference***] [user** *user_name* **password** *password***] [searchbase** *search_string***] [ssl | no ssl]**

no policy server *ip_address* **[port** *port_number***]**

Syntax Definitions

ip_address	The IP address of the LDAP-enabled directory server.
port_number	The TCP/IP port number used by the switch to connect to the directory server.
enable	Enables the specified policy server to download rules to the switch.The policy servers are **up** by default.
disable	Prevents the specified policy server from downloading rules to the switch.
preference	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
user_name	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: (e.g. “Directory Manager”).
password	The password associated with the user name. The password must match the password defined on the directory server.
search_string	The root of the directory required for searching the policy information. Typically, the *search_string* includes **o=***organization* and **c=***country*. For example, **o=company** and **c=country**.
ssl	Enables a Secure Socket Layer between the switch and the policy server.
no ssl	Disables a Secure Socket Layer between the switch and the policy server.

Defaults

parameter	default
admin	**up**
port_number	389 (SSL disabled) 636 (SSL enabled)
preference	0
ssl | no ssl	**no ssl**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If you change the port number, another entry is added to the policy server table; the existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase
ou=qos,o=company,c=country
```

Release History

Release 7.1.1; command introduced.

Related Commands

show policy server	Displays information about policies downloaded from an LDAP server.

MIB Objects

```
DIRECTORYSERVERTABLE
   directoryServerAddress
   directoryServerPort
   directoryServerAdminStatus
   directoryServerPreference
   directoryServerUserId
   directoryServerAuthenticationType
   directoryServerPassword
   directoryServerSearchbase
   directoryServerEnableSSL
```

show policy server

Displays information about servers from which policies can be downloaded to the switch.

show policy server

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

Examples

```
-> show policy server

Server   IP Address    port   enabled  status   primary
------+--------------+-----+---------+--------+--------
   1   208.19.33.112  389      Yes      Up        X
   2   208.19.33.66   400      No       Down      -
```

output definitions

Server	The index number corresponding to the LDAP server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
enabled	Whether or not the policy server is enabled.
status	The state of the policy server, **Unkn**, **Up** or **Down**.
primary	Indicates whether the server is the primary server; this server can be used for the next download of policies; only one server is a primary server.

Release History

Release 7.1.1; command introduced.

Related Commands

policy server	Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

```
directoryServerTable
   directoryServerAddress
   directoryServerPort
   directoryServerAdminState
```

show policy server long

Displays more detailed information about an LDAP policy server.

show policy server long

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

Examples

```
-> show policy server long
LDAP server 0
  IP address           : 155.132.44.98,
  TCP port             : 16652,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 99,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : ou:4.1, cn=policyRoot, o=company.fr
  Last load time       : 09/13/01 16:38:18
LDAP server 1
  IP address           : 155.132.48.27,,
  TCP port             : 21890,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 50,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : o=company.fr
  Last load time       : 00/00/00 00:00:00
```

output definitions

IP address	The IP address of the policy server.
TCP port	The TCP/IP port number used by the switch to connect to the policy server.

output definitions (continued)

Enabled	Displays whether the policy server is enabled through the PolicyView application.
Operational status	The state of the policy server, **Up** or **Down**.
Preference	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
Authentication	Displays **password** if a user name and password was specified for the server through the **policy server** command. Displays **anonymous** if a user name and password are not configured.
login DN	The directory user name.
searchbase	The searchbase name, which is the root of the directory that can be searched for policy download information.
Last load time	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

Release History

Release 7.1.1; command introduced.

MIB Objects

```
directoryServerTable
   directoryServerAddress
   directoryServerPort
   directoryServerPreference
   directoryServerAuthenticationType
   directoryServerSearchbase
   directoryServerUserId
   directoryServerPassword
   directoryServerCacheChange
   directoryServerLastChange
   directoryServerAdminStatus
   directoryServerOperStatus
```

show policy server statistics

Displays statistics about policy directory servers.

show policy server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

Examples

```
-> show policy server statistics
Server   IP Address     port   accesses  delta   successes delta  errors  delta
------+--------------+-------+---------+-------+----------+-----+-------+------
   1     155.132.44.98  16652      793     793       295     295       0     0
   2     155.132.48.27  21890        0       0         0       0       0     0
```

output definitions

Server	The index number corresponding to the server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
accesses	The number of times the server was polled by the switch to download policies.
delta	The change in the number of accesses since the last time the policy server was accessed.
successes	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
delta	The change in the number of successful policy downloads since the last time the policy server was accessed.
errors	The number of errors returned by the server.
delta	The change in the number of errors returned by the server since the last time the policy server was accessed.

Release History

Release 7.1.1; command introduced.

Related Commands

policy server	Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

```
policyStatsTable
   policyStatsAddress
   policyStatsServerPort
   policyStatsAccessCount
   policyStatsSuccessAccessCount
   policyStatsNotFoundCount
```

show policy server rules

Displays the names of policies originating from a directory server, that have been downloaded to the switch.

show policy server rules

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command displays information about policies created on directory servers only. Chapter 35, "QoS Commands," for information about configuring and displaying policies directly on the switch.

Examples

```
-> show policy server rules
Num       name           prio        scope       status
---+------------------+-------+-------------+------------
1             QoSRule1    0      Provisioned    Active
2             QoSrule2    0      Provisioned    Active
```

Fields are defined here:

output definitions

Num	An index number corresponding to the policy rule.
name	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
prio	The priority or preference of the rule. Indicates the order in which rules can be checked to match to the incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
scope	The type of rule. **Provisioned** is the only type valid for the current release.
status	The status of the rule: **Active** indicates that the rule is available in the QoS software on the switch and is available to be applied to the traffic; **notInService** means the rule can be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); **notReady** indicates that the rule can never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

Release History

Release 7.1.1; command introduced.

Related Commands

policy server load	Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```
policyRuleNamesTable
   policyRuleNamesIndex
   policyRuleNamesName
   policyRuleOperStatus
```

show policy server events

Displays any events related to a directory server on which policies are stored.

show policy server events

Syntax Definitions

N/A

Defaults

The display is limited to 50 events.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

The Policy Manager initialization event is always the first event logged.

Examples

```
-> show policy server events
 Event Time                      event description
-----------------+-------------------------------------------
09/13/01 16:38:15 Policy manager log init

38 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- Authenticated Switch Access. Authenticates users into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, LDAP or information may be stored locally in the switch user database.
- Local user database. User information may be configured for Authenticated Switch Access. For functional management access, users may be allowed to access specific command families or domains.

MIB information for the AAA commands is as follows:

Filename: ALCATEL-IND1-AAA-MIB.mib
Module: alcatelIND1AAAMIB

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

A summary of the available commands is listed here:

Authentication servers	**aaa radius-server** **aaa radius-server health-check** **aaa radius unp-profile-precedence** **aaa test-radius-server** **aaa tacacs+-server** **aaa tacacs command-authorization** **aaa ldap-server** **show aaa server** **show aaa server statistics** **aaa radius-server clear-statistics**
Federal Information Processing Standards (FIPS)	**system fips admin-state** **show system fips**
Authenticated Switch Access	**aaa authentication** **aaa console admin-only** **aaa authentication default** **aaa accounting session** **aaa accounting command** **show aaa authentication** **show aaa accounting**

Port-based Network Access Control (Access Guardian)	**aaa device-authentication** **aaa accounting** **aaa accounting radius calling-station-id** **aaa 802.1x re-authentication** **aaa interim-interval** **aaa session-timeout** **aaa session console** **aaa inactivity-logout** **aaa radius nas-port-id** **aaa radius nas-identifier** **aaa radius nas-ip-address** **aaa radius mac-format** **aaa profile** **show aaa device-authentication** **show aaa accounting** **show aaa config** **show aaa radius config** **show aaa radius health-check-config** **show aaa profile** **show aaa session console config**
Local User Database and Partitioned Management	**user** **password** **user password-size min** **user password-expiration** **show user** **show aaa priv hexa**
Password Policy	**user password-size min** **user password-expiration** **user password-policy cannot-contain-username** **user password-policy min-uppercase** **user password-policy min-lowercase** **user password-policy min-digit** **user password-policy min-nonalpha** **user password-history** **user password-size min** **user password-min-age** **user password-expiration** **show user** **show user password-policy**
User Lockout Settings	**user lockout-window** **user lockout-threshold** **user lockout-duration** **user lockout unlock** **show user** **show user lockout-setting**

Authenticated Switch Access - Enhanced Mode	**aaa switch-access mode** **aaa switch-access ip-lockout-threshold** **aaa switch-access banned-ip release** **aaa switch-access priv-mask** **aaa switch-access management-stations admin-state** **aaa switch-access management-stations** **show aaa switch-access mode** **show aaa switch-access ip-lockout-threshold** **show aaa switch-access banned-ip** **show aaa switch-access priv-mask** **show aaa switch-access management-stations** **show aaa switch-access hardware-self-test** **show aaa switch-access process-self-test**
Common Criteria	**aaa common-criteria admin-state** **show aaa common-criteria config** **aaa certificate update-ca-certificate** **aaa certificate update-crl** **aaa certificate generate-rsa-key key-file** **aaa certificate generate-self-signed** **aaa certificate view** **aaa certificate verify ca-certificate** **aaa certificate delete** **aaa certificate generate-csr**
Public Key Infrastructure (PKI)	**ssl pki client validate-certificate admin-state** **ssl pki client mutual-authentication admin-state** **ssl pki server mutual-authentication admin-state** **ssl pki tls version** **show ssl pki config**
Cipher Security Level	**ssl cipher** **show ssl ciphers all** **show ssl ciphers config**
Kerberos Snooping	**kerberos inactivity-timer** **kerberos ip-address** **kerberos server-timeout** **kerberos authentication-pass policy-list-name** **kerberos authentication-pass domain** **clear kerberos statistics** **show kerberos configuration** **show kerberos users** **show kerberos statistics**
Joint Interoperability Test Command (JITC)	**aaa jitc admin-state** **show aaa jitc config**

aaa radius-server

Configures a RADIUS server for Authenticated Switch Access and device authentication.

aaa radius-server *server_name* **host {***hostname* **|** *ip_address* | *ipv6_address***} [***hostname2* **|** *ip_address2* | *ipv6_address2***] {key** *secret* **| hash-key** *hash_secret* **| prompt-key}[salt** *salt* **| hash-salt** *hash_salt***] [retransmit** *retries***] [timeout** *seconds***] [auth-port** *auth_port***] [acct-port** *acct_port***] [vrf-name** *name***] [ssl | no ssl]**

no aaa radius-server *server_name*

Syntax Definitions

server_name	The name of the RADIUS server.
hostname	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
ip_address | *ipv6_address*	The IPv4 or IPv6 address of the primary RADIUS server. An IP address or host name is required when creating a server.
hostname2	The host name (DNS name) of an optional backup RADIUS server.
ip_address2 | *ipv6_address2*	The IPv4 or IPv6 address of an optional backup RADIUS server.
secret	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
hash_secret	A shared secret that the switch saves with a hashing algorithm.
prompt-key	This option enters the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears asking for the secret key. Re-enter the key and only if both entries match, the command is accepted. The key provided in this mode is not displayed on the CLI as text.
salt	The input given through ‘salt’ will be used to add randomness to the encryption of the key. The maximum length of the salt is 15 characters and must be in clear text format. By default, system time will be taken as default salt value.
hash-salt	The salt value for which the input must be in an encrypted format. The maximum length of the hash-salt should not exceed 64 characters.
retries	The number of retries the switch makes to authenticate a user before trying the backup server (*hostname2* or *ip_address2*).
seconds	The timeout for server replies to authentication requests.
auth_port	The UDP destination port for authentication requests.
acct_port	The UDP destination port for accounting requests.
name	The name of the VRF to be used to access the server.
ssl	Enables Transport Layer Security (TLS) between the switch and the RADIUS server.
no ssl	Disables Transport Layer Security (TLS) between the switch and the RADIUS server.

Defaults

parameter	default
retries	3
seconds	2
auth_port	1812
acct_port	1813
ssl | no ssl	**no ssl**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be RADIUS servers.
- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server can be deleted at a time.
- A host name (or IP address) and a secret key are required when configuring a server.
- If **key** and **hash-key** parameters are both configured, the **hash-key** value is given priority over **key**.
- The user configured or default salt along with the server name will be combined with 'key' and encrypted as a whole, the output of which will be displayed under ‘hash-key'.
- If **salt** and **hash-salt** parameters are both configured, the **hash-salt** value is given priority over **salt**.
- The special character '!' and pure integers will not be accepted as a valid input for both **salt** and **hashsalt**.
- If you want to provide special characters in salt value, give it in between "" double quotes.
- The input given through **salt** and **hash-salt** is encrypted and will be displayed as “hash-salt” in **show configuration snapshot** command.
- Backward compatibility for **salt** and **hash-salt** is not supported. In case of an accidental downgrade, a boot.cfg error is generated for that particular configuration, and re-configuration is required.
- RADIUS server can be configured on any VRF instance or the default VRF instance. However, all the RADIUS servers must reside on the same VRF instance.
- Enabling the RADIUS server health check feature is recommended for each RADIUS server to help improve the user authentication time. Use the **aaa radius-server health-check** command to enable this feature and the **show aaa server** command to determine the reachability status of each RADIUS server on which health check is enabled.

Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5
-> no aaa radius-server pubs2
```

```
-> aaa radius-server radsrv1 host rad1_ipaddr key rad1_secret vrf-name rad_vrf
-> aaa radius-server “Rad1” host 10.10.10.2 key myorg salt mysalt
-> aaa radius-server “Rad1” host 10.10.2.1 key myorg hash-salt
c7f5eee2c0f9b33e72e3482673fb6059

-> aaa radius-server rad1 prompt-key host 10.10.2.1
Enter Key: *******
Confirm Key: *******
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **prompt-key** parameter added.
Release 8.4.1; **IPv6** and **SSL support** for radius server added.
Release 8.6R1; **salt** and **hash-salt** parameters added.

Related Commands

show aaa server	Displays information about AAA servers.
aaa authentication	Specifies the AAA servers to be used for Authenticated Switch Access.
aaa device-authentication	Specifies the AAA servers to use for Access Guardian device authentication.
aaa accounting session	Specifies the accounting servers to be used for Authenticated Switch Access.

MIB Objects

   aaasVrfName
   aaasRadEnableSsl
   aaasRadSalt
   aaasRadSaltHash
```

aaa radius-server health-check

Enables or disables the RADIUS server health check configuration for the specified RADIUS server. When this feature is enabled, individual RADIUS servers are polled at the specified time interval to determine whether the server is up or down.

aaa radius-server *server_name* **health-check [poling-interval** *seconds* **| username** *user_name* **| password** *password* **| hash-key** *hash_secret* **| failover]**

no aaa radius-server *server_name* **health-check [failover]**

Syntax Definitions

server_name	The name of the RADIUS server for which a health check session is configured.
seconds	The number of seconds after which a health check request is sent to the specified RADIUS server. The valid range is 60–600 seconds.
user_name	The user name (up to 32 characters) to use in polling requests to the server.
password	The password (up to 64 characters) to use in polling requests to the server.
hash_secret	A shared secret that the switch saves with a hashing algorithm.
failover	Triggers an attempt to re-authenticate users assigned to the authentication server down profile when the RADIUS server comes back up before the authentication server down timeout expires.

Defaults

By default, RADIUS server health check is disabled. When health check is enabled without specifying any of the optional parameters, the following default health check parameter values are set for the specified RADIUS server:

parameter	default
seconds	60
user_name	alcatel
password	alcatel
failover	disabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Make sure the specified RADIUS server is defined on the switch before attempting to enable a health check session for that server. See the **aaa radius-server** command for more information on RADIUS server configuration.

- Each RADIUS server with health check enabled is polled at regular intervals (instead of checked sequentially) to determine if the server is up or down. Notification of the server status is then provided to help expedite the authentication process.
- User devices are typically assigned to a UNP authentication server down profile when the authentication server is down (unreachable).
  - If the **failover** option is disabled (the default) for the health check session, re-authentication is not attempted for the profile devices until the authentication server down timeout value expires.
  - If the **failover** option is enabled for the health check session, there is no waiting for the authentication server down timeout value to expire. When the health check session receives notification that a server has transitioned from down to up, a re-authentication attempt is immediately triggered for the profile devices.
- Use the **no** form of this command to disable health check.
- Use the **no** form of this command with the **failover** parameter to disable the failover operation.

Examples

```
-> aaa radius-server rad1 health-check
-> aaa radius-server rad1 health-check polling-interval 300
-> aaa radius-server rad1 health-check username admin password switch failover
-> no aaa radius-server rad1 health-check failover
-> no aaa radius-server rad1 health-check
```

Release History

Release 8.5R4; command introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for Authenticated Switch Access and device authentication.
show aaa radius health-check-config	Displays the health check configuration for each RADIUS server.
show aaa server	Displays information about AAA servers configured for the switch.

MIB Objects

```
aaaServerTable
   aaasHostName
   aaasRadHealthCheck
   aaasRadPollingInterval
   aaasRadFailover
   aaasRadUsername
   aaasRadPassword
```

aaa radius unp-profile-precedence

This command can be used to set the precedence to filter ID or tunnel private group ID attributes for selection of UNP profile in the event of both these attributes being returned from the RADIUS server.

aaa radius unp-profile-precedence {**tunnel-private-group-id** | **filter-id**}

Syntax Definitions

tunnel-private-group-id	The tunnel private group ID attribute.
filter-id	The filter ID RADIUS attribute.

Defaults

By default, filter ID will be given precedence over the tunnel private group ID.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> aaa radius unp-profile-precedence tunnel-private-group-id
-> aaa radius unp-profile-precedence filter-id
```

Release History

Release 8.5R4; command introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for Authenticated Switch Access and device authentication.
show aaa radius config	Displays the global AAA attribute values and MAC address format.

MIB Objects

```
alaAaaRadUnpProfilePrecedence
```

aaa test-radius-server

RADIUS test tool allows the user to test the RADIUS server reachability from the OmniSwitch. Use this command to start the authentication or accounting test for the specified user name and password.

aaa test-radius-server *server_name* **type {authentication user** *user_name* **password** *password* **[method {md5 | pap}] | accounting user** *user_name***}**

Syntax Definitions

server_name	RADIUS server name for which test has been configured.
authentication | accounting	Type of test to run.
user_name	User name configured on the server.
password	Password for the given user name.
md5 | pap	Authentication method for the test.

Defaults

By default, MD5 is used as the authentication method.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- RADIUS server must be configured on the switch to test the tool.
- The switch must have the following RADIUS server configuration before starting the test tool: RADIUS server name, acct-port, auth-port, secret key, retransmit count, and timeout. See the **aaa radius-server** command for more information on RADIUS server configuration.
- Supports multiple sessions (console, telnet, SSH) to test multiple RADIUS servers.
- The CLI of the user session (console, telnet, SSH) goes in the blocking state when the test is started. In the blocking state, no other command (CLI) is accepted. The blocking state of the CLI prompt of the switch can be terminated by pressing any key.
- Two IP addresses are configurable for a RADIUS server. When the test starts, the requests are sent to the first address. When all the requests to the first address time out, then the requests are sent to the second address.

Examples

```
-> aaa test-radius-server rad1 type authentication user admin password switch
method MD5
-> aaa test-radius-server rad2 type authentication user admin password switch
method pap
-> aaa test-radius-server rad1 type accounting user admin
```

Release History

Release 8.1.1; command introduced.

Related Commands

aaa authentication	Servers for authenticated switch access.
show aaa server	Displays information about AAA servers configured for the switch.

MIB Objects

N/A

aaa tacacs+-server

Configures or modifies a TACACS+ server for Authenticated Switch Access.

aaa tacacs+-server *server_name* **host {***hostname* **|** *ip_address***} [***hostname2* **|** *ip_address2***] {key** *secret* **| prompt-key}[salt** *salt* **| hash-salt** *hash_salt***] [timeout** *seconds***] [port** *port***] [vrf-name** *name***]**

no aaa tacacs+-server *server*

Syntax Definitions

server_name	The name of the TACACS+ server.
hostname	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
ip_address	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
hostname2	The host name (DNS name) of an optional backup TACACS+ server.
ip_address2	The IP address of an optional backup TACACS+ server.
secret	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
salt	The input given through ‘salt’ will be used to add randomness to the encryption of the key. The maximum length of the salt is 15 characters, and must be in clear text format. By default, the system time will be taken as default salt value.
hash-salt	The salt value for which the input must be in an encrypted format. The maximum length of the hash-salt should not exceed 64 characters.
prompt-key	This option enters the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears asking for the secret key. Re-enter the key and only if both the entries match, the command is accepted. Password provided in this mode is not displayed on the CLI as text.
seconds	The timeout for server replies to authentication requests.
port	The port number for the primary TACACS+ server.
name	The name of the VRF to be used to access the server.

Defaults

parameter	default
seconds	2
port	49

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time.
- A host name (or IP address) and a secret are required when configuring a server.
- If ‘key’ and ‘hash-key’ parameters are configured at a time, hash-key value is given priority over key.
- The user configured or default salt along with the server name will be combined with 'key' and encrypted as a whole, the output of which will be displayed under ‘hash-key'.
- If ‘salt’ and ‘hash-salt’ parameters are configured at a time, hash-salt value is given priority over salt.
- The special character '!' and pure intergers will not be accepted as a valid input for both salt and hashsalt.
- If you want to provide special characters in salt value, give it in between "" double quotes.
- The input given through ‘salt’ and ‘hash-salt’ is encrypted and will be displayed as ‘hash-salt’ in 'show configuration snapshot' command.
- Backward compatibility for ‘salt’ and ‘hash-salt’ is not supported. In case of an accidental downgrade, boot.cfg error is generated for that particular configuration, and re-configuration is required.
- The server and the backup server must both be TACACS+ servers.
- TACACS+ server can be configured on any VRF instance or the default VRF instance. However, all the TACACS+ servers must reside on the same VRF instance.

Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
-> aaa tacacs+-server T1 host 10.10.10.3 key myorg salt salt@123
-> aaa tacacs+-server tacsrv1 host tac1_ipaddr key tac1_secret vrf-name tac_vrf

-> aaa tacacs+-server tac1 prompt-key host 10.10.2.2
Enter Key:  *******
Confirm Key:   *******
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf-name** parameter added.
Release 8.3.1; **prompt-key** parameter added.
Release 8.6R1; **salt** and **hash-salt** parameters added.

Related Commands

show aaa server	Displays information about AAA servers.
aaa authentication	Specifies the AAA servers to be used for Authenticated Switch Access.
aaa accounting session	Specifies the accounting servers to be used for Authenticated Switch Access.

MIB Objects

```
aaaServerTable
   aaasName
   aaasProtocol
   aaasHostName
   aaasIpAddress
   aaasHostName2
   aaasIpAddress2
   aaasTacacsKey
   aaasTimout
   aaasTacacsPort
   aaasVrfName
   aaasRadSalt
   aaasRadSaltHash
```

aaa tacacs command-authorization

Configures a command based authorization in TACACS+ server for authenticated switch.

aaa tacacs command-authorization {enable | disable}

Syntax Definitions

enable	Enable command based authorization in TACACS+ server.
disable	Disable command based authorization. This enables partition-management family based authorization in TACACS+ server.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command is applicable only for CLI commands.
- If this command is enabled, then in the TACACS+ server the authorization of every command executed on the switch is command based. CLI commands executed on the switch are sent for authorization to the TACACS+ server along with-mode of operation (read or read-write). After authorization, the server will send the response message to the TACACS+ client.
- If the command is disabled, then in the TACACS+ server the authorization is partition-management family based.
- Use **show configuration snapshot aaa** command to view the configuration details of this command.

Examples

```
-> aaa tacacs command-authorization enable
-> aaa tacacs command-authorization disable
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show aaa server	Displays information about AAA servers.

MIB Objects

```
alaAaaAuthConfig
   alaAaaTacacsServerCmdAuthorization
```

aaa ldap-server

Configures or modifies an LDAP server for Authenticated Switch Access.

aaa ldap-server *server_name* **host {***hostname* | *ip_address***} [***hostname2* | *ip_address2***] dn** *dn_name* **{password** *super_password* | **prompt-password}[salt** *salt* | **hash-salt** *hash_salt***] [base** *search_base***] [retransmit** *retries***] [timeout** *seconds***] [ssl | no ssl] [port** *port***] [vrf-name** *name***]**

no aaa ldap-server *server-name*

Syntax Definitions

server_name	The name of the LDAP server.
hostname	The host name (DNS name) of the primary LDAP server. The host name or IP address is required when creating a server.
ip_address	The IP address of the primary LDAP server.
hostname2	The host name (DNS name) of the backup LDAP server.
ip_address2	The IP address of a backup host for the LDAP server.
dn_name	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers. For example: **cn=manager**. Must be different from the *search-base* name and must be in a format supported by the server. Required when creating a new server.
super_password	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
prompt-password	This option enters the super-user password in a obscured format rather than as clear text. When this option is selected, press the Enter key. A password prompt appears asking for the super-user password. Re-enter the password and only if both the passwords match, the command is accepted. Password provided in this mode is not displayed on the CLI as text.
salt	The input given through ‘salt’ will be used to add randomness to the encryption of the key. The maximum length of the salt is 15 characters and must be in clear text format. By default, the system time will be taken as default salt value.
hash-salt	The salt value for which the input must be in an encrypted format. The maximum length of the hash-salt should not exceed 64 characters.
search_base	The search base recognized by the LDAP-enabled directory servers. For example, **o=company** or **c=country**. Must be different from the *dn_name*. Required when creating a new server.
retries	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
seconds	The timeout in seconds for server replies to authentication requests from the switch.
ssl	Enables Transport Layer Security (TLS) between the switch and the LDAP server.

no ssl	Disables Transport Layer Security (TLS) between the switch and the LDAP server.
port	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.
name	The name of the VRF to be used to access the server.

Defaults

parameter	default
port	389 (SSL disabled) 636 (SSL enabled)
retries	3
seconds	2
ssl | no ssl	**no ssl**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The *dn_name* must be different from the *search_base* name.
- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time.
- The port number configured on the switch must match the port number configured for the server.
- If ‘salt’ and ‘hash-salt’ parameters are configured at a time, hash-salt value is given priority over salt.
- The special character '!' and pure intergers will not be accepted as a valid input for both salt and hashsalt.
- If you want to provide special characters in salt value, give it in between "" double quotes.
- The input given through ‘salt’ and ‘hash-salt’ is encrypted and will be displayed as ‘hash-salt’ in 'show configuration snapshot' command.
- Backward compatibility for ‘salt’ and ‘hash-salt’ is not supported. In case of an accidental downgrade, boot.cfg error is generated for that particular configuration, and re-configuration is required.
- LDAP server can be configured on any VRF instance or the default VRF instance. However, all the LDAP servers must reside on the same VRF instance.

Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> aaa ldap-server omnivista host 1.2.3.4 dn "cn=DirMgr, o=alcatel.com" password
somepass base "ou=People, o=alcatel.com" vrf-name ldap_vrf
-> no aaa ldap-server topanga5

-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager prompt-password base c=us
```

```
retransmit 4
Enter Password:  *******
Confirm Password:   *******

-> aaa ldap-server L1 host 10.10.10.5 dn cn=manager password tpub base c=us salt
mysalt
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf-name** parameter added.
Release 8.3.1; **prompt-password** parameter added.
Release 8.6R1; **salt** and **hash-salt** parameters added.

Related Commands

```

system fips admin-state

Enable or disable the Federal Information Processing Standards (FIPS) mode on the switch.

system fips admin-state {enable | disable}

Syntax Definitions

enable | disable	Enables or disables the FIPS mode.

Defaults

By default, the FIPS mode is disabled on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enabling or disabling FIPS mode takes effect only after a switch reboot. The FIPS mode configuration is persistent across reboots.
- When FIPS mode is disabled, all other existing cryptographic algorithms will be supported.
- A FIPS supported client is required to access the switch in FIPS enabled mode. For example, Absolute Telnet.
- Other unsecured management interfaces, such as Telnet or FTP, have to be manually disabled after FIPS mode is enabled to achieve a completely secure device.

Examples

```
-> system fips admin-state enable
WARNING: FIPS Admin State only becomes Operational after write memory and reload

-> system fips admin-state disable
WARNING: FIPS Admin State only becomes Operational after write memory and reload
```

Release History

Release 8.1.1; command introduced.

Related Commands

show system fips	Show the configured and running status of the FIPS mode on the Switch.

MIB Objects

```
systemFipsAdminState
```

aaa authentication

Configures the interface for Authenticated Switch Access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

aaa authentication {console | telnet | ftp | http | snmp | ssh | default} *server1* **[***server2***...] [local]**

no aaa authentication [console | telnet | ftp | http | snmp | ssh | default]

Syntax Definitions

console	Configures Authenticated Switch Access through the console port.
telnet	Configures Authenticated Switch Access for any port used for Telnet.
ftp	Configures Authenticated Switch Access for any port used for FTP.
http	Configures Authenticated Switch Access for any port used for Web-based management.
snmp	Configures Authenticated Switch Access for any port used for SNMP.
ssh	Configures Authenticated Switch Access for any port used for Secure Shell.
default	Configures Authenticated Switch Access for any port using any service (**telnet**, **ftp**, etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
server1	The name of the authentication server used for Authenticated Switch Access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
server2...	The names of backup servers for Authenticated Switch Access. Up to 3 backups may be specified (including **local**). These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
local	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify **local** for *server1*.

Defaults

- At switch startup, Authenticated Switch Access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- The default user on the switch is **admin**, and **switch** is the password.
- Remote authentication is not supported on secondary CMMs or Slave chassis. Use local authentication on secondary CMMs and Slave chassis.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The server type may be RADIUS, TACACS+, LDAP, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

aaa console admin-only

Enables or disables the user restriction for all users except the user “admin” from accessing the switch through the secure console session.

aaa console admin-only {enable | disable}

Syntax Definitions

enable	Restricts all users from accessing the switch through the secure console session expect the user “admin”. Only user “admin” can access the switch through the secure console session.
disable	Disables the user restrictions.

Defaults

By default, console admin-only is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enable this feature to restrict all users except user “admin” from accessing the switch through the secure console session.

Examples

```
-> aaa console admin-only enable
-> aaa console admin-only disable
```

Release History

Release 8.3.1 R02; command was introduced.

Related Commands

user	Configures user information for the local database on the switch.

MIB Objects

```

aaa authentication default

Sets the authenticated switch access type to the default server setting.

aaa authentication {console | telnet | ftp | http | snmp | ssh} default

Syntax Definitions

console	Configures the default Authenticated Switch Access server setting for the console port.
telnet	Configures the default Authenticated Switch Access server setting for Telnet.
ftp	Configures the default Authenticated Switch Access server setting for FTP.
http	Configures the default Authenticated Switch Access server setting for Web-based management.
snmp	Configures the default Authenticated Switch Access server setting for any port used for SNMP.
ssh	Configures the default Authenticated Switch Access server setting for any port used for Secure Shell.

Defaults

By default, the default Authenticated Switch Access server setting does not include any servers.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **aaa authentication** command to set the default servers.

Examples

```
-> aaa authentication telnet default
-> aaa authentication default default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

aaa accounting session

Configures an accounting server or servers for authenticated switch sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting session *server1* **[***server2***...] [local]**

no accounting session

Syntax Definitions

server1	The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
server2...	The names of backup servers. Up to 3 backups may be specified (including **local**); each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated Switch Access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will ***only*** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.

Examples

```
-> aaa accounting session ldap1 radius2 local
-> no aaa accounting session
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show aaa accounting	Displays information about accounting servers configured for Authenticated Switch Access.

   aaacsName3
   aaacsName4
```

aaa accounting command

Enables or disables the server for command accounting. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting command *server1* **[***server2***...] [local]**

no accounting command

Syntax Definitions

server1	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the **aaa tacacs+-server** commands.
server2...	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers can be only TACACS+ servers.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the **aaa tacacs+-server** command.

Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show aaa accounting	Displays information about accounting servers configured for Authenticated Switch Access.

```

aaa device-authentication

Configures the switch to use RADIUS servers for 802.1X, MAC, and Captive Portal device authentication.

aaa device-authentication {802.1x | mac | captive-portal} *server1* **[***server2***] [***server3***] [***server4***]**

no device-authentication {802.1x | mac | captive-portal}

Syntax Definitions

802.1x	Use the specified RADIUS server to authenticate 802.1X users.
mac	Use the specified RADIUS server for MAC authentication.
captive-portal	Use the specified RADIUS server for Captive Portal authentication.
server1	The name of the RADIUS authentication server to use for the specified type of authentication. (*Note that only RADIUS servers are supported for these types of authentication.*) At least one server is required. RADIUS server names are configured through the **aaa radius-server** command.
server2...server4	The names of backup servers used for authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a RADIUS server assignment for a specific authentication type.
- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.
- Configuring the RADIUS servers to use for 802.1X, MAC, and Captive Portal authentication is required to support authentication and classification of devices connected to Universal Network Profile (UNP) ports.

Examples

```
-> aaa device-authentication 802.1x rad1
-> aaa device-authentication 802.1x rad1 rad2
-> no aaa device-authentication 802.1x

-> aaa device-authentication mac rad1
-> aaa device-authentication mac rad1 rad2
-> no aaa device authentication mac

-> aaa device-authentication captive-portal rad1
-> aaa device-authentication captive-portal rad1 rad2
-> no aaa device-authentication captive-portal
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.4; **802.1x** parameter added.
Release 8.1.1; **captive-portal** parameter added.

Related Commands

unp port-type	Enables or disables UNP port-based access control on a port.
show aaa device-authentication	Displays a list of RADIUS servers assigned to provide 802.1X or MAC authentication.

MIB Objects

```
AaaAuthDATable
   aaaDaName1
   aaaDaName2
   aaaDaName3
   aaaDaName4
```

aaa accounting

Configures RADIUS server accounting or local Switch Logging (syslog) accounting for 802.1X, MAC, and Captive Portal authenticated device sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting {802.1x | mac | captive-portal} {*server1* **[***server2***...] | syslog** *ip_address* **[port** *udp_port***]}**

no accounting {802.1x | mac | captive-portal}

Syntax Definitions

802.1x	Enables the specified RADIUS or syslog server to log accounting of 802.1X authenticated sessions.
mac	Enables the specified RADIUS or syslog server to log accounting for MAC authenticated sessions.
captive-portal	Enables the specified RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.
server1	The name of the RADIUS server used for accounting of authenticated switch sessions. At least one server is required. RADIUS server names are configured through the **aaa radius-server** command.
server2...	The names of backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
ip_address	The IP network address for syslog accounting.
udp_port	The UDP port number for syslog accounting.

Defaults

By default, no RADIUS server or syslog accounting is configured for the switch.

parameter	default
udp_port	514

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable accounting for device authentication sessions.
- Up to 4 RADIUS accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.

- Accounting with the local syslog facility is not allowed if RADIUS accounting is already configured. In other words, configure either RADIUS *or* syslog accounting.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.

Examples

```
-> aaa accounting 802.1x rad1
-> aaa accounting 802.1x rad1 rad2 rad3 rad4
-> aaa accounting 802.1x syslog 10.135.67.99 port 8000
-> no aaa accounting 802.1x

-> aaa accounting mac rad1
-> aaa accounting mac rad1 rad2
-> aaa accounting mac syslog 10.135.67.99 port 8000
-> no aaa accounting mac

-> aaa accounting captive-portal rad1
-> aaa accounting captive-portal rad1 rad2 rad3
-> aaa accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa accounting captive-portal
```

Release History

Release 8.1.1; command was introduced.

Related Commands

   aaacdSyslogUdpPort
```

aaa accounting radius calling-station-id

Configures the RADIUS Calling-Station-Id attribute for the specified accounting session type.

aaa accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}

Syntax Definitions

802.1x	Configures the attribute for 802.1X accounting sessions.
mac	Configures the attribute for MAC accounting sessions.
captive-portal	Configures the attribute for Captive Portal accounting sessions.
mac-address	Sets the Calling Station ID to the MAC address of the user.
ip-address	Sets the Calling Station ID to the IP address of the user.

Defaults

By default, the RADIUS Calling -Station-Id attribute value is set to the MAC address of the user.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuring the Calling-Station-Id attribute is not allowed if the accounting server configuration is set to use local Switch Logging (syslog) for the specified accounting session type (802.1x, MAC, or Captive Portal).
- The Calling Station ID attribute is defined in a RADIUS Accounting-Request message that is sent to the RADIUS accounting server.

Examples

```
-> aaa accounting 802.1x radius calling-station-id ip-address
-> no aaa accounting 802.1x radius calling-station-id ip-address
-> aaa accounting 802.1x radius calling-station-id mac-address

-> aaa accounting mac radius calling-station-id ip-address
-> no aaa accounting mac radius calling-station-id ip-address
-> aaa accounting mac radius calling-station-id mac-address

-> aaa accounting captive-portal radius calling-station-id ip-address
-> no aaa accounting onex radius calling-station-id ip-address
-> aaa accounting captive-portal radius calling-station-id mac-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa accounting	Displays the AAA accounting configuration.

MIB Objects

```
aaaAcctDATable
   aaacdInterface
   aaacdCallngStationId
```

aaa 802.1x re-authentication

Configures the automatic re-authentication of authenticated 802.1X users.

aaa 802.1x re-authentication {enable | disable | interval *seconds* **| trust-radius {enable | disable}}**

Syntax Definitions

enable	Enables re-authentication of 802.1X users.
disable	Disables re-authentication of 802.1X users.
seconds	The amount of time the switch waits before triggering re-authentication of 802.1X users. The valid range is 600–7200 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute value for the re-authentication time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured re-authentication time interval value.

Defaults

By default, 802.1X re-authentication is disabled for the switch. When re-authentication is enabled, the following default values apply:

parameter	default
seconds	3600
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The re-authentication time interval is triggered when 802.1X re-authentication is enabled.
- When the re-authentication time interval is changed, the new value does not apply to existing authenticated 802.1X users until the user is flushed out or when the user is authenticated again. Any new 802.1X users are re-authenticated based on the current time interval setting.
- When the trust RADIUS option is enabled, the Session-Timeout attribute value received from the RADIUS server overrides the locally configured value for the switch.
- AAA profile settings for 802.1x re-authentication take precedence over global 802.1x re-authentication settings configured with this command. For example, if the global trust RADIUS option is enabled and the AAA profile trust RADIUS option is disabled (the default), the trust RADIUS status is disabled on the UNP port when the AAA profile is assigned to that port.

Examples

```
-> aaa 802.1x re-authentication enable
-> aaa 802.1x re-authentication enable interval 7200
-> aaa 802.1x re-authentication enable trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius enable
-> aaa 802.1x re-authentication interval 7200 trust-radius disable
-> aaa 802.1x re-authentication disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa config	Displays the global AAA parameter configuration for 802.1X sessions.

MIB Objects

```
alaAaaAuthConfig
   alaAaaOnexReAuthStatus
   alaAaaOnexReAuthIntrvl
   alaAaaOnexReAuthTrustRadStatus
```

aaa interim-interval

Configures the amount of time between each interim accounting update for any given session.

aaa {802.1x | mac | captive-portal} interim-interval *seconds* **[trust-radius {enable | disable}]**

Syntax Definitions

802.1x	Configures the interim interval value for 802.1X accounting sessions.
mac	Configures the interim interval value for MAC accounting sessions.
captive-portal	Configures the interim interval value for Captive Portal accounting sessions.
seconds	The amount of time between each interim accounting update. The valid range is 60–1200 seconds.
trust-radius enable	Directs the switch to use the Acct-Interim-Interval attribute value for the interim time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured interim time interval value.

Defaults

By default, the accounting interim interval value is set to 600 seconds.

parameter	default
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the trust RADIUS option is enabled, the accounting interim interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the accounting interim interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

Examples

```
-> aaa 802.1x interim-interval 1200
-> aaa 802.1x interim-interval 1200 trust-radius enable
-> aaa 802.1x interim-interval 1200 trust-radius disable

-> aaa mac interim-interval 1200
-> aaa mac interim-interval 1200 trust-radius enable
-> aaa mac interim-interval 1200 trust-radius disable

-> aaa captive-portal interim-interval 1200
```

```
-> aaa captive-portal interim-interval 1200 trust-radius enable
-> aaa captive-portal interim-interval 1200 trust-radius disable
```

Release History

Release 8.1.1; command was introduced.

```

aaa session-timeout

Configures whether or not an authenticated user is automatically logged out of the network based on a session timeout value.

aaa {mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]**

Syntax Definitions

mac	Configures the session timeout parameter for authenticated MAC users.
captive-portal	Configures the session timeout parameter for authenticated Captive Portal users.
session-timeout enable	Enables the session timeout timer for authenticated user sessions.
session-timeout disable	Disables the session timeout timer for authenticated user sessions.
seconds	The session timeout value. The valid range is 12000–86400 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured timeout interval value.

Defaults

By default, the session timer is disabled for the switch.

parameter	default
seconds	43200 seconds (12 hours)
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The session timeout parameter is configurable only for MAC and Captive Portal authentication sessions. When 802.1x re-authentication is enabled, the session timeout is set to 43200 seconds by default.
- The timeout interval is triggered when the session timeout parameter is enabled for the switch.
- When the trust RADIUS option is enabled, the timeout interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the session timeout interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- When the session timeout value is reached, the authenticated users are logged out and the MAC address for each logged out user device is flushed.

Examples

```
-> aaa mac session-timeout enable interval 13000
-> aaa mac session-timeout enable interval 14000 trust-radius enable
-> aaa mac session-timeout disable

-> aaa captive-portal session-timeout enable interval 13000
-> aaa captive-portal session-timeout enable interval 14000 trust-radius enable
-> aaa captive-portal session-timeout disable
```

Release History

Release 8.1.1; command was introduced.

```

aaa session console

Enables or disables switch access through the console port of the switch.

aaa session console {enable | disable}

Syntax Definitions

enable	Enables the switch access through the console port through the CLI shell.
disable	Disables the switch access through the console port through the CLI shell.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- It is recommended to create a back-up of the configuration file before using this command. Contact customer support to recover the switch.
- Before disabling the CLI console shell, configuration for telnet or SSH access with proper user privilege must be made.
- When the CLI console shell is disabled, the switch log output to the console is also disabled.
- When the CLI console shell is disabled, the switch can be accessed through SSH or telnet or WebView session.
- The command can be stored to the configuration file using **write memory**.
- If the console access is disabled through configuration (on both working and certified directory) and the telnet/SSH/WebView session is also not available to the switch, contact customer support to recover the switch.

Note. Deleting the configuration file will also delete the other configurations. Hence, it is recommended to create a back-up of the configuration file before deleting the configuration file.

- In a virtual chassis, the command must be used only on the master chassis; the console on master and all slaves will be disabled/enabled accordingly.

Examples

```
-> session console disable
-> session console enable
```

Release History

Release 8.6R2; command introduced.

Related Commands

show aaa session console config	Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

MIB Objects

   alaAaaConsoleAccessAdminState
```

aaa inactivity-logout

Configures whether or not an authenticated user is automatically logged out of the network after a specific period of inactivity.

aaa {mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds***]**

Syntax Definitions

mac	Configures the inactivity logout timer for authenticated MAC users.
captive-portal	Configures the inactivity logout timer for authenticated Captive Portal users.
enable	Enables the inactivity logout timer for the specified authentication type.
disable	Disables the inactivity logout timer for the specified authentication type.
seconds	The inactivity logout time. The valid range is 60–1200 seconds, or enter 0 to indicate that an authenticated user should never be logged out.

Defaults

By default, the inactivity logout timer is disabled for the switch.

parameter	default
seconds	600 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The inactivity logout timer is configurable only for MAC and Captive Portal authentication sessions.
- The timer is triggered when the inactivity logout parameter is enabled for the switch.
- Make sure the configured inactivity logout time is set to a value greater than the MAC address aging time for the switch.
- If a specific time is configured for the inactivity logout timer, the user is *not* logged out of the network even if the MAC address for the user device ages out before the inactivity logout timer value expires.
- Setting the inactivity logout time to zero helps prevent silent devices from getting automatically logged out; the silent device will always remain logged in.
- When the inactivity logout time is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- If a user undergoes MAC authentication and then secondary Captive Portal authentication, the higher of the two inactivity logout timer values is applied to the device.

Examples

```
-> aaa mac inactivity-logout enable
-> aaa mac inactivity-logout enable interval 600
-> aaa mac inactivity-logout enable interval 0
-> aaa mac inactivity-logout disable

-> aaa captive-portal inactivity-logout enable
-> aaa captive-portal inactivity-logout enable interval 600
-> aaa captive-portal inactivity-logout enable interval 0
-> aaa captive-portal inactivity-logout disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.4.1.R02; setting the inactivity logout time to zero is supported (user is never logged out).

```

aaa radius nas-port-id

Configures the RADIUS client NAS-Port attribute for authentication and accounting sessions.

aaa radius nas-port-id {user-string *string* **| default}**

Syntax Definitions

string	A text string (up to 31 characters) used to define a NAS-Port identifier for the NAS-Port attribute.
default	Sets the NAS-Port attribute value to the chassis/slot/port of the user.

Defaults

By default, the NAS-Port attribute is set to the user port (chassis/slot/port).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The NAS-Port attribute value specified with this command is used in Account-Request messages and in Accounting-Request messages.

Examples

```
-> aaa radius nas-port-id default
-> aaa radius nas-port-id user-string nasport
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa radius config	Displays the global RADIUS client attribute configuration.

MIB Objects

```
alaAaaClientAttrGroup
   alaAaaRadNasPortId
```

aaa radius nas-identifier

Configures the RADIUS client NAS-Identifier attribute for authentication and accounting sessions.

aaa radius nas-identifier {user-string *string* **| default}**

Syntax Definitions

string	A text string (up to 31 characters) used to identify the switch (RADIUS client) in the NAS-Identifier attribute.
default	Sets the NAS-Identifier attribute to the system name of the switch.

Defaults

By default, the NAS-Identifier attribute is set to the system name of the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The NAS-Identifier attribute value specified with this command is used in both Account-Request and Accounting-Request messages.

Examples

```
-> aaa radius nas-identifier default
-> aaa radius nas-identifier user-string os6860
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa radius config	Displays the global RADIUS client attribute configuration.

MIB Objects

```
alaAaaClientAttrGroup
   alaAaaRadNasIdentifier
```

aaa radius nas-ip-address

Configure the RADIUS client NAS IP address attribute for the outgoing RADIUS packets.

aaa radius nas-ip-address {default | local-ip [*ip_address***]}**

Syntax Definitions

default	Sets the NAS IP address attribute value to the source IP address of the interface used to send the RADIUS packet. In OmniVista Cirrus it will be the VPN IP address.
local-ip	Sets the NAS IP address attribute value with the DHCP-Client interface IP address as the device identifier.
ip_address	The IPv4 address for NAS IP address attribute in RADIUS packets.

Defaults

By default, the value of NAS IP address is default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The NAS IP address attribute value configured will be used in all Authentication-Request messages and in Accounting-Request messages.
- If the Local IP is configured without the optional IP address, then the NAS IP address attribute value will be the DHCP-Client interface IP address.
- If there is no DHCP IP address configured on the switch, then NAS IP address attribute will contain the IP address as per the default behavior.
- If Local IP option is configured with an IP address, then this configured IP address value will be used in the NAS IP address attribute.

Examples

```
-> aaa radius nas-ip-address default
-> aaa radius nas-ip-address local-ip
-> aaa radius nas-ip-address local-ip 12.12.12.12
```

Release History

Release 8.5R4; command was introduced.

   alaAaaRadNasIpAddressMode
   alaAaaRadNasIpAddressType
   alaAaaRadNasIpAddress
```

aaa radius mac-format

Configures the MAC address format to use in the specified RADIUS client attributes.

aaa radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* **| none} case {uppercase | lowercase}**

Syntax Definitions

username	Configures the MAC address format for the User-Name attribute.
password	Configures the MAC address format for the User-Password attribute.
calling-station-id	Configures the MAC address format for the Calling-Station-Id attribute.
called-station-id	Configures the MAC address format for the Called-Station-Id attribute.
char	The delimiter character to use to separate the octets within a MAC address. The valid characters are a space (“ “), a hyphen (“-”), or a colon (“:”). For example, “e8 e7 32 a4 63 23”, “e8-e7-32-a4-63-23”, or “e8:e7:32:a4:63:23”.
none	No delimiter is used in the MAC address format.
uppercase	Uses uppercase characters in the MAC address format.
lowercase	Uses lowercase characters in the MAC address format.

Defaults

By default, no delimiter is used and the MAC address characters are in uppercase.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The MAC address format configured for the User-Name and User-Password attributes is only applied for MAC authentication and accounting, where these attributes are set to the MAC address of the user. The configured format is not applied for 802.1X or Captive Portal authentication and accounting.
- The MAC address format configured for the Called-Station-Id and Calling-Station-Id attributes is applied for MAC, 802.1X, and Captive Portal authentication and accounting sessions when these attributes are set to a MAC address value.
- The Called-Station-Id attribute is set to the base MAC address of the switch.
- The Calling-Station-ID attribute is configurable and can be set to the MAC address or IP address of the user.

Examples

```
-> aaa radius mac-format username delimiter none case lowercase
-> aaa radius mac-format username delimiter ":" case lowercase

-> aaa radius mac-format password delimiter none case lowercase
-> aaa radius mac-format password delimiter ":" case lowercase
```

```
-> aaa radius mac-format calling-station-id delimiter none case lowercase
-> aaa radius mac-format calling-station-id delimiter ":" case lowercase

-> aaa radius mac-format called-station-id delimiter none case lowercase
-> aaa radius mac-format called-station-id delimiter ":" case lowercase
```

Release History

Release 8.1.1; command was introduced.

```

aaa profile

Configures an AAA profile that is used to define and apply specific AAA parameter values to Universal Network Profile (UNP) Edge ports, link aggregates, or an Access Guardian Captive Portal profile. This section describes the base command (**aaa profile** *profile_name*) along with the other command keywords that are used to configure AAA parameter values that are applied when the profile is assigned to a UNP port or link aggregate.

aaa profile *profile_name*
[device-authentication {802.1x | mac | captive-portal} *server1* **[***server2***] [***server3***] [***server4***]]**
[accounting {802.1x | mac | captive-portal} {*server1* **[***server2***...] | syslog** *ip_address*
[port *udp_port***]}]**
[accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}]
[802.1x re-authentication {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**
[{802.1x | mac | captive-portal} interim-interval *seconds* **[trust-radius {enable | disable}]]**
[{mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**
[{mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds***]]**
[radius nas-port-id {user-string *string* **| default}]**
[radius nas-identifier {user-string *string* **| default}]**
[radius nas-ip-address {default | local-ip [*ip_address***]}]**
[radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* **| none} case {uppercase | lowercase}]**

no aaa profile *profile_name*

Syntax Definitions

profile_name	The name to associate with the AAA configuration profile.

Defaults

The AAA profile parameters are set to the same default values that are set when the explicit AAA command is used to configure the parameter value. See the **show aaa profile** command output example in the “Examples” section of this command page to determine default values for AAA profile parameters.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the AAA profile from the switch configuration.
- Creating the template name with the base command (**aaa profile** *profile_name*) is required before attempting to configure profile parameter values.
- When an AAA profile is assigned to a UNP port, the parameter values defined in the profile will override any existing global AAA configuration for users authenticating on that port.

- When an AAA profile is assigned to a Captive Portal profile, the parameters values defined in the AAA profile will override any existing global AAA configuration for users authenticated through the Captive Portal profile configuration.
- For more information about specific AAA parameter values, refer to the following explicit AAA configuration commands for each profile parameter option:

AAA Profile Parameter	Explicit Port Configuration Command
[device-authentication {802.1x | mac | captive-portal} *server1* [*server2*] [*server3*] [*server4*]]	**aaa device-authentication**
[accounting {802.1x | mac | captive-portal} {*server1* [*server2*...] | **syslog** *ip_address* [**port** *udp_port*]}]	**aaa accounting**
[accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}]	**aaa accounting radius calling-station-id**
[802.1x re-authentication {enable | disable} [interval *seconds*] [trust-radius {enable | disable}]]	**aaa 802.1x re-authentication**
[{802.1x | mac | captive-portal} interim-interval *seconds* [trust-radius {enable | disable}]]	**aaa interim-interval**
[{mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**	**aaa session-timeout**
[{mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds*]]	**aaa inactivity-logout**
[radius nas-port-id {user-string *string* | **default}]**	**aaa radius nas-port-id**
[**radius nas-identifier {user-string** *string* | **default}]**	**aaa radius nas-identifier**
[radius nas-ip-address {default | local-ip [*ip_address*]}]	**aaa radius nas-ip-address**
[radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* | none} case {uppercase | lowercase}]	**aaa radius mac-format**

Examples

```
-> aaa profile prof1
-> no aaa profile prof1

-> aaa profile ap-1 device-authentication mac rad1 rad2
-> aaa profile ap-1 device-authentication 802.1x serv1 serv2 serv3 serv4
-> aaa profile ap-2 device-authentication captive-portal rad3 rad4

user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

user *username*
{password *password* **| password-prompt}**
[expiration {*day* **|** *date***}]**
[read-only | read-write [*families...* | *domains...*| **all | none | all-except [***families* | *domains....***]]]**
[no snmp | no auth | sha | md5 | sha+des | md5+des | sha+aes | sha224 | sha256]
[console-only {enable | disable}]
[priv-password *password* **| prompt-priv-password]**

no user *username*

Syntax Definitions

username	The name of the user. Used for logging into the switch. Required to create a new user entry or for modifying a user. Maximum 63 characters.
password	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. Maximum 30 characters.
password-prompt	This option allows to enter the password in a obscured format rather than as clear text. Select this option with the 'user' command to configure the password for the user. When this option is selected, a password prompt appears and the password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted. The password provided in this mode is not displayed on the CLI as text.
day	The number of days before this user's current password expires. The range is 1 to 150 days.
date	The date (in the format *mm/dd/yyyy hh:mm*) that the user's current password will expire.
read-only	Specifies that the user will have read-only access to the switch.
read-write	Specifies that the user will have read-write access to the switch.
families	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains.
domains	Determines the command domains available to the user on the switch. Each domain should be separated by a space.
all	Specifies that all command families and domains are available to the user.
none	Specifies that no command families or domains are available to the user.
all-except	Specifies that functional privileges for families or domains followed by 'all-except' are disabled to the user.
no snmp	Denies the specified user SNMP access to the switch.

no auth	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
sha	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
md5	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.
sha+des	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
md5+des	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
sha+aes	Specifies that the SHA authentication algorithm and AES encryption standard is used for authenticating and encrypting SNMP PDU for the user.
sha224	Specifies that the SHA224 authentication algorithm used for storing the user passwords.
sha256	Specifies that the SHA256 authentication algorithm used for storing the user passwords.
console-only enable	Enables console only access for the user *admin*.
console-only disable	Disables console only access for the user *admin*.
priv-password	Separate password that is used for SNMPv3 encryption. (8-30 characters)
prompt-priv-password	This option allows to enter the privacy password in a obscured format rather than as clear text. When this option is selected, press the Enter key. Select this option with the 'user' command to configure the privacy password for the user. When this option is selected, a password prompt appears and the privacy password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted. The password provided in this mode is not displayed on the CLI as text.

Defaults

- By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The ***default*** user account may be modified.
- By default, the password will be encrypted using SHA for all non SNMP users.
- For SNMP users without authentication, password will be encrypted with SHA.
- For SNMP users with authentication, it will be encrypted with the authentication method set for the user. If user is created with MD5, then it will be still encrypted with MD5.
- Users created with SHA2 authentication algorithm cannot be used for SNMP authentication.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Note that the exclamation point '!' is not a valid password character. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password **123456**** is allowed; **password ********** is not allowed.
- Some special characters are interpreted as a Linux shell variable by the switch when being used in a password. They can still be used in a password but they must be escaped ('\'). For example, to use the '$' as part of a password the following should be entered:

  ```
  -> user test password test\$1234
  ```

  this password will be interpreted as ***test$1234***.
- An alternative method is to use the **password-prompt** parameter when using special characters in a password. The **password-prompt** parameter exits the Linux shell and special characters are no longer interpreted as shell variables. The following characters are the majority of characters considered special characters by the switch [" " (white space), $, "", \,#, [], > <, |, ; , {}, (), ~, `].
- A password expiration for the user's current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user's password expiration will be configured with the global expiration setting.
- When modifying a user's SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user's password expires, the **admin** user will have access only through the console port.)
- New users or updated user settings are saved *automatically*.
- The priv-password token is accepted only when SNMP level with encryption is configured for the user. If SNMP level with encryption is not selected and **priv-password** is configured, then CLI command is rejected with error.
- If priv-password is not configured for the user with encryption SNMP level, then the user password parameter is used for priv-password (both for authentication/encryption).
- Password policy is not applicable for the new optional parameter **priv-password**.
- For authenticating switch access through other access types such as telnet, FTP, SSH the existing user password will be used irrespective of whether **priv-password** is configured or not.
- When the SNMP level for an existing user with priv-password configured is changed from one encryption level to another encryption level, then the previously configured priv-password will not be used with the new SNMP level. Priv-password needs to be configured again when SNMP level is changed for an existing user.

Examples

```
-> user techpubs password writer_pass read-only config
-> user techpubs password-prompt
Enter Password: *******
Confirm Password: ********

-> user techpubs password writer_pass read-write all sha256
```

The following example creates a user with read-write privileges for all families except aaa.

```
-> user techpubs password writer_pass read-write all-except aaa

-> no user techpubs

-> user snmpv3user password pass1pass1 priv-password priv1priv1 read-write all
sha+aes

-> user snmpv3user password pass1pass1 prompt-priv-password
Enter Priv-Password: *********
Confirm Priv-Password: *********
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **password-prompt**, **all-except**, **priv-password**, **prompt-priv-password** parameter added, **sha224** and **sha256** algorithm support added.

Related Commands

password	Configures the current user's password.
show user	Displays information about users configured in the local database on the switch.

MIB Objects

```
aaaUserTable
   aaauPassword
   aaauReadRight
   aaauWriteRight
   aaauSnmpLevel
   aaauSnmpAuthKey
   aaauPasswordExpirationDate
```

password

Configures the current user's password.

password

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password** ****123456**** is allowed; **password ********** is not allowed.
- Password settings are saved *automatically*.

Examples

```
-> password
enter old password: ********
enter new password: *********
reenter new password: *********
->
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

MIB Objects

```
aaaUserTable
   aaauPassword
   aaauOldPassword
```

user password-size min

Configures the minimum number of characters required when configuring a user password.

user password-size min *size*

Syntax Definitions

size	The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

Defaults

parameter	default
size	6

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A.

Examples

```
-> user password-size min 9
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.
show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordSizeMin
```

user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

user password-expiration {*day* | **disable}**

Syntax Definitions

day	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
disable	Disables password expiration for users configured locally on the switch.

Defaults

parameter	default
day | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.
show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaDefaultPasswordExpirationInDays
```

user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

user password-policy cannot-contain-username {enable | disable}

Syntax Definitions

enable	Does not allow the password to contain the username.
disable	Allows the password to contain the username.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

Examples

```
-> user password-policy cannot-contain-username enable
-> user password-policy cannot-contain-username disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordContainUserName
```

user password-policy min-uppercase

Configures the minimum number of uppercase English characters required for a valid password.

user password-policy min-uppercase *number*

Syntax Definitions

number	The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the minimum uppercase character requirement.
- The minimum number of uppercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-uppercase 2
-> user password-policy min-uppercase 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinUpperCase
```

user password-policy min-lowercase

Configures the minimum number of lowercase English characters required for a valid password.

user password-policy min-uppercase *number*

Syntax Definitions

number	The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the minimum lowercase character requirement.
- The minimum number of lowercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-lowercase 2
-> user password-policy min-lowercase 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinLowerCase
```

user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

user password-policy min-digit *number*

Syntax Definitions

number	The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinDigit
```

user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

user password-policy min-nonalpha *number*

Syntax Definitions

number	The minimum number of non-alphanumeric characters. The valid range is 0–7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-nonalpha 2
-> user password-policy min-nonalpha 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinNonAlpha
```

user password-history

Configures the maximum number of old passwords to retain in the password history.

user password-history *number*

Syntax Definitions

number	The maximum number of old passwords to retain. The range is 0–24.

Defaults

parameter	default
number	4

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the password history function.
- The user is prevented from specifying any passwords that are recorded in the password history and fall within the range configured through this command.
- The password history value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-history 2
-> user password-history 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordHistory
```

user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

user password-min-age *days*

Syntax Definitions

days	The number of days to use as the minimum age of the password. The range is 0–150.

Defaults

parameter	default
days	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinAge
```

user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

user lockout-window *minutes*

Syntax Definitions

minutes	The number of minutes the observation window remains active. The range is 0–99999.

Defaults

parameter	default
minutes	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*.

Examples

```
-> user lockout-window 500
-> user lockout-window 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout-duration	Configures the amount of time a user account remains locked out of the switch.
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutWindow
```

user lockout-threshold

Configures the number of failed password login attempts allowed during a certain period of time (observation window). If the number of failed attempts exceeds the lockout threshold number before the observation window period expires, the user account is locked out.

user lockout-threshold *number*

Syntax Definitions

number	The number of failed login attempts allowed. The range is 0–999.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- If the lockout threshold is set to zero (the default), there is no limit to the number of failed login attempts allowed.
- A user account remains locked out for the length of the lockout duration time period; at the end of this time, the account is automatically unlocked.
- If the lockout duration time period is set to zero, only the **admin** user or a user with read/write AAA privileges can unlock a locked user account. An account is unlocked by changing the user account password or with the **user lockout unlock** command.
- The lockout threshold time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

Examples

```
-> user lockout-threshold 3
-> user lockout-threshold 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.
user lockout-duration	Configures the length of time a user account remains locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutThreshold
```

user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

user lockout-duration *minutes*

Syntax Definitions

minutes	The number of minutes the user account remains locked out. The range is 0–99999.

Defaults

parameter	default
minutes	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts,
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutDuration
```

user lockout unlock

Manually locks or unlocks a user account on the switch.

user *username* **{lockout | unlock}**

Syntax Definitions

username	The username of the account to lock or unlock.
lockout	Locks the user account out of the switch.
unlock	Unlocks a locked user account.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*.

Examples

```
-> user j_smith lockout
-> user j_smith unlock
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user	Displays information about all users or a particular user configured in the local user database on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaUserTable
   aaauPasswordLockoutEnable
```

show aaa server

Displays information about a particular AAA server or AAA servers.

show aaa server [*server_name***]**

Syntax Definitions

server_name	The server name, which is defined through the **aaa radius-server, aaa tacacs+-server**, or **aaa ldap-server** commands.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a server name is not included with this command, information for all of the servers is displayed.

Examples

```
-> show aaa server
Server name = ldap2
   Server type         = LDAP,
   Host name 1         = ors40535,
   Retry number        = 3,
   Timeout (sec)       = 2,

   VRF                 = default
```

output definitions

Server name	The name of the server. A RADIUS, TACACS+ or LDAP server name is defined through the **aaa radius-server, aaa tacacs+-server,** and **aaa ldap-server** commands respectively.
Server type	The type of server (LDAP, TACACS+, or RADIUS).
Host name	The name of the primary LDAP, TACACS+, or RADIUS host.
IP address	The IP address of the server.
Retry number	The number of retries the switch makes to authenticate a user before trying the backup server.
Timeout	The timeout for server replies to authentication requests.
Port	The port number for the primary LDAP or TACACS+ server.

output definitions

Encryption enabled	The status of the encryption.
Domain name	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
Search base	The search base recognized by the LDAP-enabled directory servers.
Authentication port	The UDP destination port for authentication requests.
Accounting port	The UDP destination port for accounting requests.
SSL enable	The SSL enable field is displayed for the RADIUS server only when the SSL is enabled for RADIUS server.
VRF	Name of the VRF associated with the server.
Health Check	Whether a health check session is enabled or disabled for the RADIUS server.
Primary Server	The operational status, up time, down time, and the number of transitions from down to up for the primary RADIUS server. This field displays information gathered when RADIUS health check is enabled for the server.
Backup Server	The operational status, up time, down time, and the number of transitions from down to up for the back-up RADIUS server. This field displays information gathered when RADIUS health check is enabled for the server.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **SSL enable** output field added for RADIUS server.
Release 8.5R4; **Health Check**, **Primary Server**, and **Backup Server** fields added for RADIUS server.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for Authenticated Switch Access.
aaa ldap-server	Configures or modifies an LDAP server for Authenticated Switch Access.
aaa tacacs+-server	Configures or modifies an TACACS+ server for Authenticated Switch Access.
aaa radius-server health-check	Defines the RADIUS server health check configuration for a specific RADIUS server.
show aaa radius health-check-config	Displays the RADIUS server health check configuration.

MIB Objects

```

show aaa server statistics

Displays the authorization, authentication, accounting, and BYOD statistics for the specified RADIUS server.

show aaa server *server_name* **statistics**

Syntax Definitions

server_name	The name of the RADIUS server for which statistics will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to RADIUS servers known to the switch (servers are identified through the **aaa radius-server** command).
- All statistics displayed for authorization, authentication, and accounting are displayed as an aggregate of the primary and back-up RADIUS server; separate statistics are not displayed for the primary server and the back-up server.
- Use the **aaa radius-server clear-statistics** command to reset all the statistics counters to zero.

Examples

```
-> show aaa server rad2 statistics
Statistics for rad2:
Authorization:
 Total No of Access-Request     : 2
 Total No of Access-Response    : 2
 Total No of Timedout Request   : 0
 Min RTT of Access Req/Res  usec: 938

-> show aaa server auth-serv1 statistics
ERROR: Statistics are supported only for RADIUS servers
```

output definitions

Authorization	The statistics information displayed for authorization.
Total No of Access-Request	The total number of authorization access requests sent to the server.
Total No of Access-Response	The total number of authorization access responses received from the server.
Total No of Timedout Request	The total number of authorization access requests that timed out.
Min RTT of Access Req/Res	The minimum RTT of authorization access requests or responses for the last seven days.
Avg RTT of Access Req/Res	The average RTT of authorization access requests or responses for the last seven days.
Max RTT of Access Req/Res	The maximum RTT of authorization access requests or responses for the last seven days.
Last RTT of Access Req/Res	The last RTT of authorization access requests or responses.
Authentication	The statistics information displayed for authentication.
Total No of Access-Request	The total number of authentication access requests sent to the server.
Total No of Access-Response	The total number of authentication access responses received from the server.
Total No of Access-Accept	The total number of authentication access accepts received from the server.
Total No of Access-Reject	The total number of authentication access rejects received from the server.
Total No of Access-Challenge	The total number of authentication access challenges received from the server.
Total No of Timedout Request	The total number of authentication access requests that timed out.
Min RTT of Access Req/Res	The minimum RTT of authentication access requests or responses for the last seven days.
Avg RTT of Access Req/Res	The average RTT of authentication access requests or responses for the last seven days.

output definitions

Max RTT of Access Req/Res	The maximum RTT of authentication access requests or responses for the last seven days.
Last RTT of Access Req/Res	The last RTT of authentication access requests or responses.
Accounting	The statistics information displayed for accounting.
Total No of Acct -Request	The total number of accounting access requests sent to the server.
Total No of Acct -Response	The total number of accounting access responses received from the server.
Total No of Timedout Request	The total number of accounting access requests that timed out.
Min RTT of Acct Req/Res	The minimum RTT of accounting access requests or responses for the last seven days.
Avg RTT of Acct Req/Res	The average RTT of accounting access requests or responses for the last seven days.
Max RTT of Acct Req/Res	The maximum RTT of accounting access requests or responses for the last seven days.
Last RTT of Acct Req/Res	Displays the last RTT of accounting access requests or responses.
BYOD	Displays the BYOD statistics.
Total No of COA Request	The total number of Change of Authorization (CoA) requests received from the server.
Total No of COA ACK Sent	The total number of CoA-ACKs sent to the server.
Total No of COA NACK Sent	The total number of CoA-NACKs sent to the server.
Total No of DM Request	The total number of disconnect request messages received from the server.
Total No of DM ACK Sent	Displays the total number of disconnect ACKs sent to the server.
Total No of DM NACK Sent	Displays the total number of disconnect NACKs sent to the server.
Time of last statistics clear	The date and time the AAA statistics were last cleared for the server.

Release History

Release 8.5R4; command was introduced.

Related Commands

aaa radius-server clear-statistics

Clears the AAA statistics collected for the specified RADIUS server.

aaa radius-server *server_name* **clear-statistics**

Syntax Definitions

server_name	The name of the RADIUS server on which the AAA statistics will be cleared.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **show aaa server statistics** command to display the statistics collected for the specified server.

Examples

```
-> aaa radius-server rad1 clear-statistics
-> aaa radius-server rad2 clear-statistics
```

Release History

Release 8.5R4; command introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for Authenticated Switch Access and device authentication.
aaa radius-server health-check	Enables or disables a RADIUS server health check with the specified parameters.
show aaa server statistics	Displays authorization, authentication, accounting, and BYOD statistics collected for a RADIUS server.

MIB Objects

```
aaaServerTable
   aaasHostName
   aaasClearStats
```

show aaa authentication

Displays information about the current authenticated switch session.

show aaa authentication

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

Examples

```
-> show aaa authentication
Service type = Default
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Console
   1rst authentication server  = local
Service type = Telnet
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = FTP
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Http
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Snmp
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Ssh
   Authentication = Use Default,
   1rst authentication server  = TacacsServer
   2nd authentication server   = local
```

output definitions

Authentication	Displays **denied** if the management interface is disabled. Displays **Use Default** if the management interface is configured to use the default configuration.
1st authentication server	The first server to be polled for authentication information.
2nd authentication server	The next server to be polled for authentication information.

Release History

Release 7.1.1; command was introduced.

Related Commands

aaa authentication	Configures the interface for Authenticated Switch Access and specifies the server(s) to be used.

MIB Objects

```
aaaAuthSATable
   aaatsName1
   aaatsName2
   aaatsName3
   aaatsName4
```

show aaa device-authentication

Displays a list of RADIUS servers assigned to provide 802.1X, MAC, or Captive Portal authentication.

show aaa device-authentication [802.1x | mac | captive-portal]

Syntax Definitions

802.1x	Displays the servers used for 802.1X authentication.
mac	Displays the servers used for MAC authentication.
captive-portal	Uses the servers used for Captive Portal authentication.

Defaults

By default, all assigned servers are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the optional **802.1x**, **mac**, or **captive-portal** parameters to display the servers assigned to provide the specified type of authentication.

Examples

```
-> show aaa device-authentication
Authentication type = mac
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1
      3rd authentication server = rad2,
      4th authentication server = rad3

Authentication type = 802.1x
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1

Authentication type = captive-portal
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1
```

output definitions

Authentication type	The type of authentication the server is assigned to provide (**802.1x**, **mac**, or **captive-portal**)
1st authentication server	The first server to be polled for authentication information. Any backup servers are also displayed on subsequent lines.

Release History

Release 7.2.1; command was introduced.
Release 7.3.4; **802.1x** and **mac** parameters added.
Release 8.1.1; **captive-portal** parameter added.

Related Commands

aaa device-authentication	Configures the RADIUS server to use for 802.1X or MAC authentication.

MIB Objects

```
AaaAuthMACTable
   aaaDaName1
   aaaDaName2
   aaaDaName3
   aaaDaName4
```

show aaa accounting

Displays information about accounting servers configured for authenticated switch access and device authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

show aaa accounting [802.1x | mac | captive-portal]

Syntax Definitions

802.1x	Displays the RADIUS or syslog server used to log accounting for 802.1X authenticated sessions.
mac	Displays the RADIUS or syslog server used to log accounting for MAC authenticated sessions.
captive-portal	Displays the RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.

Defaults

By default, the accounting server configuration is displayed for TACACS+ commands and management sessions (Telnet, FTP, console port, HTTP, or SNMP).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **802.1x**, **mac**, or **captive-portal** parameters to display the accounting server configuration for a specific type of device authentication.
- If no parameters are entered with this command, the accounting server configuration for authentication sessions and TACACS+ commands is displayed.

Examples

```
-> show aaa accounting mac
Accounting type = mac
    Accounting Server:
      1st Accnt Server = rad1,
      2nd Accnt Server = rad2

-> show aaa accounting 802.1x
Accounting type = 802.1x
    Syslog Accnt Server:
      IP Address = 135.254.163.110,
      UDP port   = 514

-> show aaa accounting captive-portal
Accounting type = captive-portal
    Syslog Accnt Server:
      IP Address = 135.254.163.110,
      UDP port   = 514
```

```
-> show aaa accounting
Session (telnet, ftp, ...)
  1st accounting server  = rad1
Command accounting server
  1st accounting server  = server1
```

Release History

Release 7.1.1; command was introduced.
Release 8.1.1; **802.1x**, **mac**, and **captive-portal** parameters added.

Related Commands

aaa accounting session	Configures an accounting server for authenticated switch access sessions.
aaa accounting command	Enables or disables the TACACS+ server for command accounting
aaa accounting	Configures RADIUS server accounting or local Switch Logging (syslog) accounting for device authentication sessions.

MIB Objects

```
aaaAcctDATable
   aaacdInterface
   aaacdName1
   aaacdName2
   aaacdName3
   aaacdName4
   aaacdSyslogIPAddrType
   aaacdSyslogIPAddr
   aaacdSyslogUdpPort
   aaacdRowStatus
```

show aaa config

Displays the AAA parameter configuration for 802.1X, MAC, and Captive Portal sessions.

show aaa {802.1x | mac | captive-portal} config

Syntax Definitions

802.1x	Displays the parameter configuration for 802.1X authenticated sessions.
mac	Displays the parameter configuration for MAC authenticated sessions.
captive-portal	Displays the parameter configuration for Captive Portal authenticated sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **802.1x**, **mac**, or **captive-portal** parameters to display the parameter configuration for a specific type of device authentication.

Examples

```
-> show aaa 802.1x config
Authentication type = 802.1x
    Re-Authentication Timeout:
      Status                  = enable,
      Interval (sec)          = 3600,
      Trust Radius            = disable

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable

-> show aaa mac config
Authentication type = mac
    Session Timeout:
      Status                  = disable,
      Interval (sec)          = 43200,
      Trust Radius            = disable

    Inactivity Timeout:
      Status                  = disable,
      Interval (sec)          = 600

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable
```

```
-> show aaa captive-portal config
Authentication type = captive-portal
    Session Timeout:
      Status                  = disable,
      Interval (sec)          = 43200,
      Trust Radius            = disable

    Inactivity Timeout:
      Status                  = disable,
      Interval (sec)          = 600

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable
```

output definitions

Authentication type	The type of authentication (**802.1x**, **mac**, or **captive-portal**).
Session Timeout	The parameter values for the AAA session timeout parameter. Does not apply to 802.1X authentication. Configured through the **aaa session-timeout** command.
Inactivity Logout	The parameter values for the AAA inactivity logout parameter. Does not apply to 802.1X authentication. Configured through the **aaa inactivity-logout** command.
Accounting Interim	The parameter values for the AAA accounting interim parameter. Configured through the **aaa interim-interval** command.
Re-authentication Timeout	The parameter values for the AAA 802.1X re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication. Configured through the **aaa 802.1x re-authentication** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa device-authentication	Displays the device authentication server configuration.
show aaa accounting	Displays the accounting server configuration.
show aaa profile	Displays the AAA parameter profile configuration.

MIB Objects

```
alaAaaAuthConfig
   alaAaa8021XReAuthStatus
   alaAaa8021XReAuthIntrvl

```

show aaa radius config

Displays the global AAA attribute values and MAC address format.

show aaa radius config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The MAC address format determines the delimiter character used between MAC address octets and whether or not characters are in uppercase or lowercase. This format is applied only when the RADIUS attribute value is set to a MAC address.

Examples

```
-> show aaa radius config
RADIUS client attributes:
  NAS port id         = default,
  NAS identifier      = default
  NAS IP address      = default
    MAC format delimiter:
      Username            = none, UserNameCase = uppercase,
      Password            = none, PasswordCase = uppercase,
      calling station id  = none, ClgStaIdCase = uppercase,
      called station id   = none, CldStaIdCase = uppercase
Unp Profile Precedence = Filter-Id
```

output definitions

NAS port id	The RADIUS client NAS-Port attribute for authentication and accounting sessions.
NAS identifier	The RADIUS client NAS-Identifier attribute for authentication and accounting sessions.
NAS IP address	The RADIUS client NAS-IP address attribute for authentication and accounting sessions.
MAC format delimiter	The MAC address format used in the specified RADIUS client attributes.
UNP Profile Precedence	The UNP profile precedence: **Filter-ID** or **Tunnel-Private-Group-ID**

Release History

Release 8.1.1; command was introduced.
Release 8.5R4; UNP Profile Precedence and NAS IP address field added.

Related Commands

show aaa device-authentication	Displays the device authentication server configuration.
show aaa accounting	Displays the accounting server configuration.
show aaa profile	Displays the AAA parameter profile configuration.
aaa radius nas-ip-address	Configure the RADIUS client NAS IP address attribute for the outgoing RADIUS packets.

MIB Objects

```

show aaa radius health-check-config

Displays the RADIUS server health check configuration for each RADIUS server.

show aaa radius health-chec-config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the health check configuration for all RADIUS servers defined on the switch.

Examples

```
-> show aaa radius health-check-config
 Server                Health     Polling    Failover     Username
 Name                  Check      Interval   Status
--------------------+----------+----------+----------+-----------------------
RAD1                 DISABLED   60         DISABLED  alcatel
RAD2                 ENABLED    90         ENABLED   alcatel
```

output definitions

Server Name	The name of the RADIUS server.
Health Check	The operational status of the RADIUS health check feature for the server.
Polling Interval	The configured polling interval for the RADIUS server.
Failover Status	The status of the failover operation. When enabled, the re-authentication of users assigned to the authentication server down profile is triggered when the RADIUS server comes back up before the authentication server down timeout value expires).
Username	The configured user name for RADIUS server polling.

Release History

Release 8.5R4; command was introduced.

Related Commands

aaa radius-server health-check	Configures RADIUS health check for the specified RADIUS server.

MIB Objects

```

```

show aaa profile

Displays the AAA profile configuration.

show aaa profile [*profie_name***]**

Syntax Definitions

profile_name	The name of an existing AAA profile.

Defaults

By default, all profiles are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter an AAA profile name with this command to display information about a specific profile.

Examples

```
-> show aaa profile ap2

AAA profile name = ap2
Authentication type = mac
    Authentication Server:
      1st Auth Server   = rad1,
      2nd Auth Server   = rad2

    Accounting Server:
      1st Accnt Server  = rad1,
      2nd Accnt Server  = rad2

    Session Timeout:
      Status            = disable,
      Interval (sec)    = 43200,

      calling station id = none, ClgStaIdCase = uppercase,
      called station id  = none, CldStaIdCase = uppercase
```

output definitions

Authentication type	The type of authentication (**802.1x**, **mac**, or **captive-portal**) configured through the profile.
Session Timeout	The profile values defined for the AAA session timeout parameter. Does not apply to 802.1X authentication.
Inactivity Logout	The profile values defined for the AAA inactivity logout parameter. Does not apply to 802.1X authentication.
Accounting Interim	The profile values defined for the AAA accounting interim parameter.
Re-authentication Timeout	The profile values defined for the AAA re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication.
RADIUS client attributes	The profile values defined for the NAS-Port, NAS-Port-Identifier and the NAS-IP address attributes and the format to use when the specified attribute value is set to a MAC address.

Release History

Release 8.1.1; command was introduced.
Release 8.5R4; **NAS IP address** output field added.

show aaa session console config

Displays the current administrative state of the session console configuration.

show aaa session console config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show aaa session console config
Console access admin-state: disabled
```

Release History

Release 8.6R2; command introduced.

Related Commands

aaa session console	Enables or disables switch access through the console port of the switch

MIB Objects

N/A

show user

Displays information about all users or a particular user configured in the local user database on the switch.

show user [*username***]**

Syntax Definitions

username	The name of the user. Used for logging into the switch.

Defaults

By default, all users are displayed if the *username* parameter is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display information about read/write access and partitioned management access (domains and families).

Examples

```
-> show user
User name = Customer1,
  Password expiration     = 10/27/2010 11:01 (30 days from now),
  Password allow to be modified date     = 9/30/2010 10:59 (3 days from now),
  Account lockout     = Yes (Automatically unlocked after 19 minute(s)from now),
  Password bad attempts     = 3,
  Read Only for domains   = None,
  Read/Write for domains  = Admin System Physical Layer2 Services policy Security ,

```

output definitions

User name	The user name for this account.
Password expiration	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the **user password-expiration** command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the **system date** and **system time** commands.)
Password allow to be modified date	The earliest date and time on which the user may change the password. Configured through the **user password-min-age** command.
Account lockout	Indicates if the user account is locked out (**Yes** or **No**) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the **admin** user or a user with admin privileges must manually unlock the account. Configured through the **user lockout-duration** and **user lockout unlock** commands.
Password bad attempts	The number of failed password login attempts for this user account.
Read Only for domains	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains.
Read/Write for domains	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains.
Read Only for families	The command families available with the user's read-only access. See the table on the next page for a listing of valid families.
Read/Write for families	The command families available with the user's read-write access. See the table on the next page for a listing of valid families.
Snmp allowed	Indicates whether or not the user is authorized to use SNMP (**YES** or **NO**). SNMP is allowed for the user account when SNMP authentication is specified for the account.
Snmp authentication	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
Snmp encryption	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.

Possible values for command domains and families are listed here:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

Release History

Release 7.1.1; command was introduced.

Related Commands

user	Configures user entries in the local user database.
show user password-policy	Displays the global password policy configuration for the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

show user password-policy

Displays the global password settings configured for the switch.

show user password-policy

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

output definitions

Contain username flag	Indicates if the username is included with the password check (**Enable** or **Disable**). Configured through the **user password-policy cannot-contain-username** command.
Minimum number of English uppercase characters	The minimum number of uppercase characters required in a password. Configured through the **user password-policy min-uppercase** command.
Minimum number of English lowercase characters	The minimum number of lowercase characters required in a password. Configured through the **user password-policy min-lowercase**.
Minimum number of base-10 digit	The minimum number of digits required in a password. Configured through the **user password-policy min-digit** command.

output definitions

Minimum number of non-alphanumeric	The minimum number of non-alphanumeric characters required in a password. Configured through the **user password-policy min-nonalpha** command.
Minimum size	The minimum number of characters required for the password size. Configured through the **user password-size min** command.
Password history	The maximum number of old passwords retained in the password history. Configured through the **user password-history** command.
Password minimum age	The number of days a password is protected from any modification. Configured through the **user password-min-age** command.
Password expiration	The default expiration date applied to all passwords. Configured through the **user password-expiration** command.
