Release 7.1.1; command was introduced.

Related Commands

show user password-policy	Displays the expiration date for passwords configured for user accounts stored on the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordContainUserName
   aaaAsaPasswordMinUpperCase
   aaaAsaPasswordMinLowerCase
   aaaAsaPasswordMinDigit
   aaaAsaPasswordMinNonAlpha
   aaaAsaPasswordHistory
   aaaAsaPasswordMinAge
   aaaAsaPasswordSizeMin
   aaaAsaDefaultPasswordExpirationInDays
```

show user lockout-setting

Displays the global user lockout settings for the switch.

show user lockout-setting

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

output definitions

Observation window	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the **user lockout-window** command.
Duration	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the **user lockout-duration** command.
Threshold	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the **user lockout-threshold** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout unlock	Manually locks or unlocks a user account on the switch.
show user	Displays information about all users or a particular user configured in the local user database on the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutWindow
   aaaAsaLockoutDuration
   aaaAsaLockoutThreshold
```

show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

show aaa priv hexa [*domain or family***]**

Syntax Definitions

domain or family	The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
domain-admin	**file telnet dshell debug**
domain-system	**system aip snmp rmon webmgt config**
domain-physical	**chassis module interface pmm health**
domain-network	**ip rip ospf bgp vrrp ip-routing ipx ipmr ipms**
domain-layer2	**vlan bridge stp 802.1q linkagg ip-helper**
domain-service	**dns**
domain-policy	**qos policy slb**
domain-security	**session avlan aaa**

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

Examples

```
-> show aaa priv hexa
file            = 0x00000001 0x00000000,
telnet          = 0x00000008 0x00000000,
dshell          = 0x00000020 0x00000000,
debug           = 0x00000040 0x00000000,
domain-admin    = 0x00000069 0x00000000,

-> show aaa priv hexa rip
0x00100000 0x00000000
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user	Configures or modifies user entries in the local user database.

MIB Objects

N/A

show system fips

Displays the administrative and operational status of the FIPS mode on the switch.

show system fips

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The **show system fips** command is the only command that can be used to view the FIPS mode status. The FIPS status is not shown in the **show configuration snaphot** command output.

Examples

```
-> show system fips
Admin State: Enabled
Oper State: Enabled
```

Release History

Release 8.1.1; command introduced.

Related Commands

aaa authentication	Enable or disable the FIPS mode on the switch.

MIB Objects

```
systemFipsAdminState
   systemFipsOperState
```

aaa switch-access mode

Globally sets the access mode as enhanced or default.

aaa switch-access mode {default | enhanced}

Syntax Definitions

default	Sets the access mode as default.
enhanced	Sets the access mode as enhanced.

Defaults

parameter	default
default | enhanced	**default**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

It is recommended to save configuration and reboot the switch when the ASA access mode is configured.

Example

```
-> aaa switch-access mode default

-> aaa switch-access mode enhanced
WARNING: Recommended to save configuration and reload the switch upon switch access
mode change.
```

Release History

Release 8.3.1; command introduced.

Related Commands

show aaa switch-access mode	Displays the access mode configuration.

MIB Objects

```
aaaAsaConfig
   aaaAsaAccessMode
```

aaa switch-access ip-lockout-threshold

Configures the threshold value for failed login attempts from an IP address after which the IP address will be banned from switch access.

aaa switch-access ip-lockout-threshold *number*

Syntax Definitions

number	Set the threshold value for login attempts in the range 0 to 999.

Defaults

parameter	default
number	**6**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The command is applicable only if ASA enhanced mode is enabled.
- Set the IP threshold value to ‘0’ to disable the IP lockout thresholds.
- IP address is permanently blocked/banned if the number of authentication failures from a particular IP reaches IP lockout threshold limit within two times of the user lockout window.
- Only the switch access will be restricted from the banned IP address. Any IP packet (with monitored port number) destined to a switch IP interfaces will be discarded. IP packets normally bridged/routed by the switch will not be discarded.
- A maximum of 128 IP addresses can be added to the banned list. When the maximum limit has reached, oldest entry from the list is removed to accommodate the new entries.
- User lockout window (**user lockout-window)** is applicable for IP lockout threshold as well.
- IP lockout threshold shall share the same window as user lockout window, and by default, IP lockout threshold shall be two times that of user lockout window. Since user lockout is giving more priority, the IP lockout threshold must be greater than the user lockout threshold value.
- The IP address will remain blocked until it is released using the command **aaa switch-access banned-ip release**.

Example

```
-> aaa switch-access ip-lockout-threshold 2
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode	Globally sets the access mode as enhanced or default.
show aaa switch-access ip-lockout-threshold	Displays the lockout threshold configured for the remote IP addresses.

MIB Objects

```
aaaAsaConfig
   aaaAsaAccessIpLockoutThreshold
```

aaa switch-access banned-ip release

Releases the banned IP addresses that are blocked due to failed login attempts.

aaa switch-access banned-ip {all | *ip_address***} release**

Syntax Definitions

all	Release all banned IP addresses from the banned list.
ip_address	Release a specific IP address from the banned list.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The IP addresses are banned if the failed login count reaches IP lockout threshold limit.

Example

```
-> aaa switch-access banned-ip all release
-> aaa switch-access banned-ip 100.2.45.56 release
```

Release History

Release 8.3.1; command introduced.

Related Commands

show aaa switch-access banned-ip	Displays the list of banned ip addresses.

MIB Objects

```
aaaSwitchAccessBannedIpTable
   aaaSwitchAccessBannedIpAddress
   aaaSwitchAccessBannedIpRowStatus
```

aaa switch-access priv-mask

Configure the functional privileges mask for the switch access based on the access type on top of the user privilege.

aaa switch-access priv-mask {console | telnet | ssh | http | https} {read-only | read-write} [*families...* | *domains...*| **all | none | all-except** *families...***]**

Syntax Definitions

read-only	Specifies that the user will have read-only access to the switch through a specific access type.
read-write	Specifies that the user will have read-write access to the switch through a specific access type.
families	Determines the command families available to the user on the switch for a specific access type. Each command family should be separated by a space. Command families are subsets of domains. See *Usage Guidelines* for more details.
domains	Determines the command domains available to the user on the switch for a specific access type. Each domain should be separated by a space. See the Usage Guidelines for more details.
all	Specifies that all command families and domains are available to the user for a specific access type.
none	Specifies that no command families or domains are available to the user for a specific access type.
all-except	Specifies that functional privileges for families followed by 'all-except' are disabled for a specific access type.

Defaults

By default, the access types are enabled with read-write privileges for all the families.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- The access privileges for the SSH, TELNET, Console, HTTP, HTTPS can be defined.
- Possible values for domains and families are listed in the table here:

Domain	Corresponding Families
domain-admin	file telnet debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health

domain-network	ip rip ospf bgp vrrp ip-routing ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa
domain-mpls	mpls
domain-datacenter	fips, auto-fabric
domain-afn	sip-snooping, dpi, app-mon

Example

```
-> aaa switch-access priv-mask ssh read-only webmgt vrrp vrf vlan udld
-> aaa switch-access priv-mask telnet read-write tftp-client telnet system stp ssh
-> aaa switch-access priv-mask ssh read-only all-except vlan
-> aaa switch-access priv-mask telnet read-write all-except ip
```

If privileges for specific families need to be applied, then remove the existing privilege using the **no** command, and re-apply the required family privilege.

```
-> no aaa switch-access priv-mask telnet read-write all
-> aaa switch-access priv-mask telnet read-write vlan aaa
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode	Globally sets the access mode as enhanced or default.
show aaa switch-access priv-mask	Displays the privilege details for the access types.

MIB Objects

   aaaSwitchAccessWriteRight2
   aaaSwitchAccessWriteRight3
   aaaSwitchAccessWriteRight4
```

aaa switch-access management-stations admin-state

Enables or disables the IP management station feature in a switch.

aaa switch-access management-stations admin-state {enable | disable}

Syntax Definitions

enable	Enables the IP management station feature in the switch.
disable	Disables the IP management station feature in the switch.

Defaults

The IP management station feature is disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- When the IP management station is disabled, switch access from any IP address shall be allowed. If there is a login failure (based on the **ip-lockout threshold** value), the IP address will be banned/ blocked and added to the banned IP address list.
- When the IP management station is enabled, the switch access will be allowed only from those IPs configured in the management station list and only if those are not in banned list.
- It is recommended to enable this command from console since this may terminate the existing session, if enabled through telnet or SSH.

Example

```
-> aaa switch-access management stations admin-state enable
-> aaa switch-access management stations admin-state disable
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode	Globally sets the access mode as enhanced or default.
aaa switch-access management-stations	Configure the management station in the switch, with or without mask value for the corresponding IP of the management station.
show aaa switch-access management-stations	Displays the list of configured management stations.

MIB Objects

```
aaaSwitchAccessMgmtStationTable
   aaaSwitchAccessMgmtStationRowStatus
```

aaa switch-access management-stations

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station. The remote access is allowed only from these IP addresses if management station feature is enabled.

aaa switch-access management-stations [*ip_address* | *ip_address /mask***]**

no aaa switch-access management-stations *ip_address*

Syntax Definitions

ip_address	IP address and the mask of the management station.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The command is configurable when **aaa switch-access management-stations admin-state** is enabled.
- A maximum of 64 management stations can be configured.
- Removing an IP address from the management station list will not remove the IP from the banned list.
- Whenever an IP address is removed from the management station, switch will stop responding to that IP. However, the existing sessions are not terminated automatically.

Example

```
-> aaa switch-access management stations 100.15.9.8
-> aaa switch-access management stations 100.15.9.9 255.255.255.0
```

Release History

Release 8.3.1; command introduced.

Related Commands

N/A

aaa certificate update-ca-certificate

Updates the CA-bundle with the custom CA server certificate provided by CA.

aaa certificate update-ca-certificate *ca_file*

Syntax Definitions

ca_file	The custom CA server certificate (in PEM format) provided by the CA.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The custom CA server certificate should be copied in PEM format to the **/flash/switch/cert.d** directory via SFTP.
- This command appends the existing CA bundle (**certs.pem**) and the custom CA server certificate provided as input.
- The update of custom CA server certificates needs to be done before corresponding server configurations are done on the switch. If the update is done post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate update-ca-certificate ca.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate update-crl	Updates the CRL list with the custom CRL provided by CA.

MIB Objects

N/A

aaa certificate update-crl

Updates the CRL list with the custom CRL provided by CA.

aaa certificate update-crl *crl_file*

Syntax Definitions

crl_file	The custom CRL file (in PEM format) provided by the CA.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The custom CRL file should be copied in PEM format to the **/flash/switch/cert.d** directory via SFTP.
- This command appends the existing CRL file (**crl.pem**) and the custom CRL provided as input.
- The update of the custom CRL needs to be done before corresponding server configurations are done on the switch. If the update is done post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate update-crl crl.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate update-ca-certificate	Updates the CA-bundle with the custom CA server certificate provided by CA.

MIB Objects

N/A

aaa certificate generate-rsa-key key-file

Generates the RSA 2048 bit key with the file name provided as input.

aaa certificate generate-rsa-key key-file *key_file*

Syntax Definitions

key_file	The name of the key file under which the RSA 2048 bit key is stored.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Generates RSA 2048 bit key in **/flash/switch/cert.d** directory with the file name as the input key file.

Examples

```
-> aaa certificate generate-rsa-key key-file myCliPrivate.key
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-self-signed	Generates the X.509 self-signed certificate for TLS client authentication.
aaa certificate view	Displays the contents of the X.509 certificate.
aaa certificate delete	Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate generate-self-signed

Generates the X.509 self-signed certificate for TLS client authentication.

aaa certificate generate-self-signed {*cert_file***} key {***key_file***} [days** *valid_period***} {CN** *common_name***} {ON** *org_name***} {OU** *org_unit***} {L** *locality***} {ST** *state***} {C** *country***}**

Syntax Definitions

cert_file	The name of the X.509 certificate file to be created.
key_file	The name of the key file under which the RSA 2048 bit key is stored.
valid_period	Validity period (in days) of the X.509 certificate.
common_name	Common Name used in X.509 certificate.
org_name	The Organization Name used in X.509 certificate.
org_unit	The Organization Unit used in X.509 certificate.
locality	The Locality used in X.509 certificate.
state	The State used in X.509 certificate.
country	The Country used in X.509 certificate.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command generates the file in **/flash/switch/cert.d** directory.
- Default values will be taken for all other optional parameters while generating the X.509 certificate.
- The X.509 certificate needs to be done before corresponding server configurations are done on the switch. If the certificate is created post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate generate-self-signed myCliCert.pem key clientkey.key days 3650
cn client.ale.com on ALE ou ESD l BAN st KAR c IN
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-rsa-key key-file	Generates the RSA 2048 bit key with the file name provided as input.
aaa certificate view	Displays the contents of the X.509 certificate.
aaa certificate delete	Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate view

Displays the contents of the X.509 certificate.

aaa certificate view *cert_file*

Syntax Definitions

cert_file	The X.509 certificate file (in PEM format) to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-self-signed	Generates the X.509 self-signed certificate for TLS client authentication.
aaa certificate delete	Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate verify ca-certificate

Verifies the contents of the X.509 certificate.

aaa certificate verify ca-certificate *cert_file* **certificate** *cert_file*

Syntax Definitions

ca_cert_file	The X.509 certificate file (in PEM format) to be displayed.
cert_file	The X.509 certificate file (in PEM format) to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> aaa certificate verify ca-certificate ca_cert certificate cert_file
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-self-signed	Generates the X.509 self-signed certificate for TLS client authentication.
aaa certificate delete	Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate delete

Deletes the X.509 certificate.

aaa certificate delete *cert_file*

Syntax Definitions

cert_file	The X.509 certificate file (in PEM format) to be deleted.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> aaa certificate delete clientcert.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-self-signed	Generates the X.509 self-signed certificate for TLS client authentication.
aaa certificate view	Displays the contents of the X.509 certificate.

MIB Objects

N/A

aaa certificate generate-csr

Generates the CSR (Certificate Signing Request) to be sent to get a CA signed certificate for TLS client authentication.

aaa certificate generate-csr {*csr_file***} key {***key_file***} [dn** *domain_name***} {CN** *common_name***} {ON** *org_name***} {OU** *org_unit***} {L** *locality***} {ST** *state***} {C** *country***}**

Syntax Definitions

csr_file	The name of the CSR certificate file to be created.
key_file	The name of the key file under which the RSA 2048 bit key is stored.
domain_name	Domain name to be used in the CSR.
common_name	Common Name used in X.509 certificate.
org_name	The Organization Name used in X.509 certificate.
org_unit	The Organization Unit used in X.509 certificate.
locality	The Locality used in X.509 certificate.
state	The State used in X.509 certificate.
country	The Country used in X.509 certificate.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Generates <csr_file>.pem file in **/flash/switch** directory. The <csr_file>.pem file created should be sent to CA signing authority to get the CA certificate.
- Default values will be taken for all other optional parameters while generating the CSR.
- The CSR needs to be created, sent to CA authority and the corresponding CA certificate (obtained from CA authority) should be uploaded to the **/flash/switch** directory before corresponding server configurations are done on the switch. If the CA certificate is uploaded post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate generate-csr myCliCert.pem key clientkey.key days 3650 cn
client.ale.com on ALE ou ESD l BAN st KAR c IN
```

Release History

Release 8.3.1; command introduced.

Related Commands

show aaa common-criteria config	Displays the common criteria status on the switch.

MIB Objects

N/A

ssl pki client validate-certificate admin-state

Enables or disables the server's certification validation when the application on the switch acts as TLS client.

ssl pki client validate-certificate admin-state {enable | disable}

Syntax Definitions

enable	Enables the server's certification validation for the client application on the switch.
disable	Disables the server's certification validation for the client application on the switch.

Defaults

By default, the feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the feature is enabled or disabled, the switch must be rebooted for the changes to be applied.
- When the feature is enabled, TLS client (LDAP, RADIIUS, and SYSLOG) applications validate server certificate based on:
  - TLS mutual authentication using X.509 certificates.
  - The presented identifier must match the reference identifier as per RFC 6125 Section 6.
  - X.509 certificate validation using OCSP and CRL.

Examples

```
-> ssl pki client validate-certificate admin-state enable
-> ssl pki client validate-certificate admin-state disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ssl pki config	Displays the Public Key Infrastructure (PKI) configuration.

MIB Objects

```
systemSslPki
   systemSslPkiClientCertificateValidation
```

ssl pki client mutual-authentication admin-state

Enables or disables the mutual authentication for the TLS client applications on the switch.

ssl pki client mutual-authentication admin-state {enable | disable}

Syntax Definitions

enable	Enables the mutual authentication for the TLS client applications on the switch. When mutual-authentication is enabled, TLS client applications will need to load **myCliCert.pem**, **myCliPrivate.key** files in **/flash/switch/cert.d** and provide the certificate to server.
disable	Disables the mutual authentication for the TLS client applications on the switch.

Defaults

By default, the feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the feature is enabled or disabled, the switch must be rebooted for the changes to be applied.
- Enable this feature when the TLS client (LDAP, RADIUS, SYSLOG) applications needs to load the certificate **myCliCert.pem** and **myCliPrivate.key** file in **/flash/switch/cert.d/** directory and provide the certificate file to server while establishing TLS connection.
- If the server certificate doest not meet the validation criteria, the TLS client application connection is terminated.

Examples

```
-> ssl pki client mutual-authentication admin-state enable
-> ssl pki client mutual-authentication admin-state disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ssl pki config	Displays the Public Key Infrastructure (PKI) configuration.
ssl pki server mutual-authentication admin-state	Enables or disables the mutual authentication for the TLS server applications on the switch.
aaa certificate update-ca-certificate	Updates the CA-bundle with the custom CA server certificate provided by CA.

MIB Objects

```
systemSslPki
   systemSslPkiClientMutualAuthentication
```

ssl pki server mutual-authentication admin-state

Enables or disables the mutual authentication for the TLS server applications on the switch.

ssl pki server mutual-authentication admin-state {enable | disable}

Syntax Definitions

enable	Enables the mutual authentication for the TLS server applications on the switch. When mutual-authentication is enabled, the TLS server (SNMP) application will require clients to provide their certificate to server while establishing TLS connection.
disable	Disables the mutual authentication for the TLS server applications on the switch.

Defaults

By default, the feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the feature is enabled or disabled, the switch must be rebooted for the changes to be applied.
- Enable this feature when the TLS server (SNMP) application must require clients to provide their certificate to server while establishing TLS connection.
- When the feature is enabled, TLS server (SNMP) application validates client certificate based on:
  - TLS mutual authentication using X.509 certificates.
  - The presented identifier must match the reference identifier as per RFC 6125 Section 6.
  - X.509 certificate validation using OCSP and CRL.
- If the client certificate doest not meet the validation criteria, the TLS server application connection is terminated.

Examples

```
-> ssl pki server mutual-authentication admin-state enable
-> ssl pki server mutual-authentication admin-state disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ssl pki config	Displays the Public Key Infrastructure (PKI) configuration.
ssl pki client mutual-authentication admin-state	Enables or disables the mutual authentication for the TLS client applications on the switch.

MIB Objects

```
systemSslPki
   systemSslPkiServerMutualAuthentication
```

ssl pki tls version

Configures the TLS version for both TLS client and server applications.

ssl pki tls version {1.0 | 1.1 | 1.2}

Syntax Definitions

1.0	Sets the TLS version for client and server to 1.0.
1.1	Sets the TLS version for client and server to 1.1.
1.2	Sets the TLS version for client and server to 1.2.

Defaults

By default, the SSL PKI TLS version is 1.0.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The switch must be rebooted for the changes to be applied.
- When the TLS version is configured, TLS client and server applications will deny all SSL and TLS versions which are lower than the configured version.
- The command is applicable only for LDAP, RADIUS, SYSLOG and SNMP applications.

Examples

```
-> ssl pki tls version 1.0
-> ssl pki tls version 1.2
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ssl pki config	Displays the Public Key Infrastructure (PKI) configuration.

MIB Objects

```
systemSslPki
   systemSslPkiTlsVersion
```

show ssl pki config

Displays the Public Key Infrastructure (PKI) configuration.

```

ssl cipher

Selects the cipher security level for the applications using the OpenSSL.

ssl cipher {[level {all | high | medium | low}] | [custom {*string* | **file** *string***}]}**

Syntax Definitions

all	Includes all the cipher suites, including NULL-SHA.
high	Includes only AES-256 with SHA-2 ciphers (Applicable only for TLSv1.2).
medium	Includes all ciphers suites, except NULL-SHA, DES-CBC-SHA, and RC4-MD5.
low	Includes all cipher suites, except NULL-SHA.
string	Name of the cipher suite. It can be list of ciphers or a collective cipher file name. The custom cipher can have a maximum length of 255 characters in CLI and the cipher file can be of maximum 1024 bytes in size.

Defaults

By default, the SSL cipher security level is set to medium in default switch operation mode and high in common criteria mode.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To apply the new SSL cipher security level, switch must be rebooted.
- The command is applicable only for LDAP, Syslog, RADIUS, SNMP, and Captive Portal applications.
- Custom ciphers cannot be more than 255 characters. Hence, the cipher files can be used to configure ciphers more than 255 characters.
- The cipher file can be created by copying the required ciphers in the notepad and saving it as a cipher file with "**.cipher**" as the file extension.
- The ciphers for the custom cipher and cipher file must be from the supported list of ciphers. To view the supported ciphers, use the **show ssl ciphers all** command.
- The cipher file must be copied to the flash directory of the switch before using this command.
- In chassis based model, the cipher file needs to be copied in both the primary and secondary unit flash directory. In VC based models, the cipher file must be copied to all the flash directory of all the modules.

Examples

```
-> ssl cipher level all
-> ssl cipher level low
-> ssl cipher level medium
-> ssl cipher level high
```

```
-> ssl cipher custom AECDH-AES256-SHA
-> ssl cipher custom file /flash/abc.cipher
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ssl ciphers all	Displays all the supported OpenSSL ciphers.
show ssl ciphers config	Displays the current cipher security level configuration.

MIB Objects

```
SSLCipherSuiteTable
   systemSslCipherLevel
   systemSslCipherSuite
```

show ssl ciphers all

Displays all the supported OpenSSL ciphers.

show ssl ciphers all

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The custom cipher suite must be configured based on the supported ciphers displayed in this output.

Examples

```
-> show ssl ciphers all
ECDHE-RSA-AES256-GCM-SHA384:ECDHE-ECDSA-AES256-GCM-SHA384:ECDHE-RSA-AES256-

```

kerberos inactivity-timer

Configures global inactivity timer on the switch for Kerberos users.

kerberos inactivity-timer *num*

Syntax Definitions

num	Time interval in minutes.

Defaults

By default, inactivity timer is set to 300 minutes.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The valid range of inactivity timer is 10–600 minutes.
- Whenever a Kerberos user becomes inactive, then the inactivity timer will be started for that user. If Kerberos user becomes active before inactivity timer expiry, then timer will be stopped. User entry will be removed from the Kerberos user database on timer expiry.

Examples

```
-> kerberos inactivity-timer 30
```

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos server-timeout	Configures global server reply time-out timer value on the switch for Kerberos users.
show kerberos configuration	Displays Kerberos global configuration.

MIB Objects

```
alaDaKerberosGlobalConfig
   alaDaKerberosGlobalInactivityTimer
```

kerberos ip-address

Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.

kerberos ip-address *ip_address* **[port** *num***]**

no kerberos ip-address *ip_address*

Syntax Definitions

ip_address	The IP address of the Kerberos server. (KDC)
num	UDP or TCP port number of the Kerberos application running on the Kerberos server. UDP port range is 1–65535.

Defaults

Default value of the port is 88.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- At least one Kerberos server and one Kerberos enabled port must be configured on the switch for Kerberos snooping to function.
- A maximum of two Kerberos server IP addresses can be configured on a switch
- Server IP address cannot be configured as 0.0.0.0, and the octet value in the IP address cannot be greater than 255 (for example, 1.256.2.3).
- Use the **port** keyword to configure both UDP and TCP protocol port number.
- Use the **no** form of this command to delete the Kerberos server IP address. Only one server can be deleted at a time.
- The UDP/TCP port number is not required to remove the Kerberos server IP address configuration.
- If all the authentication servers are removed from the switch, then all the Kerberos users learned so far on all the ports are not removed from the database.

Examples

```
-> kerberos ip-address 172.21.160.102 port 2001
-> kerberos ip-address 172.21.160.103 port 2003
-> no kerberos ip-address 172.21.160.102
```

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos inactivity-timer	Configures a global inactivity timer on the switch for Kerberos users.
kerberos server-timeout	Configures a global server reply time-out timer value on the switch for Kerberos users.
show kerberos configuration	Displays the Kerberos global configuration.

MIB Objects

```
alaDaKerberosServerTable
   alaKerberosIpAddress
   alaDaKerberosUdpPort
   alaDaKerberosRowStatus
```

kerberos server-timeout

Configures global server reply time-out timer value on the switch for Kerberos users.

kerberos server-timeout *num*

Syntax Definitions

secs	Server reply time-out time interval in seconds in the range 1 second to 30 seconds.

Defaults

By default, reply-timeout is 2 seconds.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All the users trying to get authenticated from a specific server will have the same value for reply-timeout timer.
- Whenever a Kerberos request packet is sent to the server, the server reply time-out starts. If the timer expires before receiving the reply from the server, the user authentication is marked as server-time-out and a trap is generated.

Examples

```
-> kerberos server-timeout 20
```

Release History

Release 8.6R2; command introduced.

Related Commands

show kerberos configuration	Displays Kerberos global configuration.

MIB Objects

```
alaDaKerberosGlobalConfig
   alaDaKerberosGlobalServerTimeoutTimer
```

kerberos authentication-pass policy-list-name

Configures a global classification QoS policy list on the switch for Kerberos users.

kerberos authentication-pass policy-list-name *policy_list*

no kerberos authentication-pass policy-list-name

Syntax Definitions

policy_list	Name of the QoS policy list.

Defaults

By default, there is no Kerberos global QoS policy list configured.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The QoS policy list must be created prior to this configuration.
- Per-user Kerberos policy list configuration is not supported.
- Use the **no** form of this command to remove the global classification QoS policy list from the switch.
- There is no validation done for QoS policy list in Kerberos. It is the user's responsibility to associate the correct QoS policy list with Kerberos.
- If the QoS policy list is deleted from the system, then the corresponding configuration in Kerberos will be removed and no error message will be thrown.
- If a domain level policy list is configured in the switch and any user belonging to that domain gets authenticated from the Kerberos server, then the domain level policy list is applied to the user over the global policy list.
- If a user gets authenticated from the Kerberos server and the domain level policy list is not configured on the switch for the authenticated user, then the global policy list is applied to the user if the global policy list is configured on the switch.
- If a user gets authenticated from the Kerberos server and neither the domain level policy list (for that user domain) nor the global policy list is configured, then the user traffic is classified on the basis of already applied non-supplicant authentication classification.

Examples

```
-> kerberos authentication-pass policy-list-name p2
```

The following example shows that the **p2** is configured as the global classification QoS policy list on the switch for Kerberos users.

```
-> show kerberos configuration
Inactivity Timer            :30 (mins),
Server Timeout              :20 (secs),
Global QoS Policy List      :p2,

Servers                     :
IP-Address           UDP Port
-----------------+---------------
1.1.1.1              88

Per Domain QoS policy List  :
Domain-Name                               Policy-List-Name
--------------------------------+-------------------------+--
EXAMPLE.COM                          p11
```

When the QoS policy list **p2** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list p2
-> qos apply

-> show kerberos configuration
Inactivity Timer            :30 (mins),
Server Timeout              :20 (secs),

Servers                     :
IP-Address           UDP Port
-----------------+---------------
1.1.1.1              88

Per Domain QoS policy List  :
Domain-Name                               Policy-List-Name         Status
--------------------------------+-----------------------------+----------
EXAMPLE.COM                          pl1                           active
```

The following command removes the global classification QoS policy list from the switch:

```
-> no kerberos authentication-pass policy-list-name
```

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos ip-address	Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.
kerberos authentication-pass domain	Configures "per domain" classification policy for the Kerberos users.
show kerberos configuration	Displays Kerberos global configuration.

MIB Objects

```
alaDaKerberosGlobalConfig
   alaDaKerberosGlobalPolicy
```

kerberos authentication-pass domain

Configures a per-domain classification policy for the Kerberos users.

kerberos authentication-pass domain *domain_name* **policy-list-name** *policy_list*

no kerberos authentication-pass domain *domain_name*

Syntax Definitions

domain_name	Domain name on which the QoS policy is applied. Domain name length can be a maximum of 32 characters. Domain name is case sensitive.
policy_list	Name of the QoS policy list already configured.

Defaults

By default, there is no Kerberos global QoS policy list configured.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the per-domain classification policy for Kerberos users.
- Domain name is case sensitive.

Examples

```
-> kerberos authentication-pass domain EXAMPLE.COM policy-list-name p11
```

The following example shows that the **p11** is configured as the policy list associated with the domain EXAMPLE.COM:

```
-> show kerberos configuration
Inactivity Timer            :30 (mins),
Server Timeout              :20 (secs),

Servers                     :
IP-Address           UDP Port
-----------------+----------------
1.1.1.1              88

Per Domain QoS policy List  :
Domain-Name                               Policy-List-Name
--------------------------------+--------------------------
EXAMPLE.COM                          pl1
```

When the QoS policy list **p11** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list pl1
-> qos apply
```

```
-> show kerberos configuration
Inactivity Timer            :30 (mins),
Server Timeout              :20 (secs),

Servers                     :
IP-Address           UDP Port
-----------------+---------------
1.1.1.1              88

Per Domain QoS policy List  :
Domain-Name                              Policy-List-Name
---------------------------------+-----------------------------+
EXAMPLE.COM                          pl1
```

The following command removes the per-domain classification policy for Kerberos users:

```
-> no kerberos authentication-pass domain EXAMPLE.COM
```

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos authentication-pass policy-list-name	Configures global classification QoS policy list on the switch for Kerberos users.

```

show kerberos configuration

Displays Kerberos global configuration.

show kerberos configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display information about Kerberos settings configured through the **kerberos inactivity-timer** command.

Examples

```
-> show kerberos configuration

Inactivity Timer            :30 (mins),
Server Timeout              :9 (secs),
Global QoS Policy List      :p2,

Servers                     :
IP-Address            UDP Port
------------------+----------------
1.2.3.5               90
4.5.6.7               88
11.22.33.55           80

Per Domain QoS policy List  :
Domain-Name                        Policy-List-Name                 Status
-------------------------------+-------------------------------+----------------
EXAMPLE.COM                          pl1                           Active
```

output definitions

Inactivity Timer	Global inactivity timer configured on the switch for Kerberos users.
Server Timeout	Global server reply time-out timer value configured on the switch for Kerberos users.
Global QoS Policy List	Global classification QoS policy list associated with the Kerberos users
Servers	**IP Address**: IP address configured of the Kerberos server. **UDP Port**: UDP or TCP port of the Kerberos application running on the Kerberos server.

output definitions (continued)

Per Domain QoS policy List	**Domain-Name**: Per-domain classification policy configured for Kerberos users. **Policy-List-Name**: Name of the QoS policy list associated with the domain. **Status**: Per-domain QoS policy list status (**Active** or **Inactive**). Inactive status indicates that the policy list does not exist in the switch or the policy list exists, but is not applied.

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos inactivity-timer	Configures global inactivity timer on the switch for Kerberos users.

   alaKerberosGlobalInactivityTimer
   alaKerberosGlobalServerTimeoutTimer
   alaKerberosGlobalPolicy
alaKerberosServerTable
   alaKerberosIpAddress
   alaKerberosUdpPort
alaKerberosPolicyConfigTable
   alaKerberosPolicyDomainName
   alaKerberosPolicyName
```

show kerberos users

Displays the learned Kerberos users information.

show kerberos users [port *chassis/slot/port* **|linkagg** *agg_id* **| mac-address** *mac_address* | **count]**

Syntax Definitions

chassis	The Chassis Identifier.
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
agg_id	Enter a link aggregate ID number.
mac_address	MAC address of the Kerberos user.
count	Displays the number of Kerberos users.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a *chassis/slot/port* is specified, the Kerberos users learned on that port are displayed.
- If *agg_id* is specified, the Kerberos users learned on that link aggregate are displayed.
- If a MAC address is specified, then the information related to that Kerberos user is displayed.
- If none of the parameters are specified (chassis/slot/port, MAC address), then the information related to all the Kerberos users learned on the switch is displayed.

Examples

```
-> show kerberos users
 Port    Username          MAC Address       Auth Status      QOS Policy Domain
-------+-----------------+-----------------+-----------------+----------+----------
2/1/18  root/admin        00:11:22:33:44:55 tgs-authenticated    pl1     AP01.ORG
2/1/19  guest             00:01:02:03:04:05 tgs-timeOut                  AP01.ORG

-> show kerberos users port 2/1/18
 Port    Username          MAC Address       Auth Status      QOS Policy Domain
-------+-----------------+-----------------+-----------------+----------+---------
2/1/18  root/admin         00:11:22:33:44:55  tgs-authenticated    pl1    AP01.ORG
```

output definitions

Port	The Kerberos chassis, slot, and port number.
Username	User name of the client.

output definitions (continued)

MAC Address	MAC address of the Kerberos user.
Auth Status	Kerberos authentication process involves exchange of two requests (AS_REQ and AS_REP) and two response (AS_REP and TGS_REP). This field indicates up to which level the authentication has reached. On successful authentication, "tgs-authenticated" is displayed.
QoS Policy	QoS policy list configured on the switch for the Kerberos user.
Domain	Per-domain classification policy configured for the Kerberos user.

```
-> show kerberos users mac-address 00:11:22:33:44:55
Detail User Information:
  MAC Address            : 00:11:22:33:44:55
  Port                   : 1/1/1
  Authentication Status  : tgs-authenticated
  QoS Policy             : pl1
  Domain Name            : EXAMPLE.COM
  User Name              : root\admin
  User Entry State       : active
  Inactivity Timer Left  : NA
```

output definitions

MAC Address	MAC address of the Kerberos user.
Port	The Kerberos chassis, slot, and port number.
Authentication Status	Kerberos authentication process involves exchange of two requests (AS_REQ and AS_REP) and two response (AS_REP and TGS_REP). This field indicates up to which level the authentication has reached. On successful authentication, "tgs-authenticated" is displayed.
QoS Policy	QoS policy list configured on the switch for the Kerberos user.
Domain Name	Per-domain classification policy configured for the Kerberos user.
User Name	User name of the client.
User Entry State	The current state of the user.
Inactivity Timer Left	The amount of time left, in seconds, of the inactivity timer value.

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos authentication-pass policy-list-name	Configures global classification QoS policy list on the switch for Kerberos users.
kerberos authentication-pass domain	Configures per-domain classification policy for the Kerberos users.
show kerberos configuration	Displays Kerberos global configuration.
clear kerberos statistics	Clears global Kerberos statistics.

MIB Objects

```
alaDaKerberosUserTable
   alaDaKerberosUserMac
   alaDaKerberosUserPort
   alaDaKerberosUserName
   alaDaKerberosUserDomain
   alaDaKerberosUserAuthState
   alaDaKerberosUserPolicy
   alaDaKerberosUserLeftTime
   alaDaKerberosUserState
```

show kerberos statistics

Displays global Kerberos statistics.

show kerberos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display the global Kerberos statistics.

Examples

```
-> show kerberos statistics
Total Client Packet Rx         :  52
Total Server Packet Rx         :  13
Total KRB-AS-REQ Packet Rx     :  47
Total KRB-AS-REP Packet Rx     :  8
Total KRB-TGS-REQ Packet Rx    :  5
Total KRB-TGS-REP Packet Rx    :  5
Total KRB-ERROR Packet Rx      :  0
Total Client Packet Sw Discard :  0
Total Server Packet Sw Discard :  2
```

output definitions

Total Client Packet Rx	Total client request packets received.
Total Server Packet Rx	Total server response packets received.
Total KRB-AS-REQ Packet Rx	Total AS-REQ request packets received.
Total KRB-AS-REP Packet Rx	Total AS-REP response packets received.
Total KRB-TGS-REQ Packet Rx	Total TGS-REQ request packets received.
Total KRB-TGS-REP Packet Rx	Total TGS-REP response packets received.
Total KRB-ERROR Packet Rx	Total error packets received from the server.
Total Client Packet Sw Discard	Total client's request packets discarded at software by Kerberos module.
Total Server Packet Sw Discard	Total server's response packets discarded at software by Kerberos module.

Release History

Release 8.6R2; command introduced.

Related Commands

show kerberos configuration	Displays Kerberos global configuration.
clear kerberos statistics	Clears global and port-level Kerberos statistics.

```

aaa jitc admin-state

Enables or disables Joint Interoperability Test Command (JITC) mode on the switch.

aaa jitc admin-state {enable | disable}

Syntax Definitions

enable | disable	Enables or disables the JITC (Joint Interoperability Test Command) mode.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration is applied only after a reload of the switch.
- The JITC mode is mutually exclusive of Common Criteria mode and Enhanced-mode. If the switch is already running in Common Criteria or enhanced-mode (NIS) it must be disabled before enabling JITC mode and vise versa.

Examples

```
-> aaa jitc admin-state enable
WARNING: JITC mode configuration is applied only after reload
```

Release History

Release 8.4.1; command introduced.

Related Commands

show aaa jitc config	Displays the JITC status on the switch.

MIB Objects

N/A

show aaa jitc config

Displays the JITC status on the switch.

show aaa jitc config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show aaa jitc config
Admin State: Enabled,
Operational State: Enabled
```

output definitions

Admin State	Indicates configuration status of JITC mode (**Enabled** or **Disabled**).
Operational State	Indicates operational status of JITC mode (**Enabled** or **Disabled**).

Release History

Release 8.4.1; command introduced.

Related Commands

aaa jitc admin-state	Enables or disables JITC mode on the switch.

39 Access Guardian Commands

Access Guardian refers to a set of OmniSwitch security functions that work together to provide a dynamic, proactive network security solution. This chapter provides information about the commands that are used to configure the following Access Guardian features through the Command Line Interface (CLI):

- **Universal Network Profile (UNP)**—Access Guardian is configured and applied through the framework of the UNP feature. UNP is enabled on switch ports to activate Access Guardian functionality that is used to authenticate and classify users into UNP profiles. Each profile is mapped to a VLAN ID or Service Access Point (SAP) to which the user is dynamically assigned. Specific UNP port configurations help to simplify and easily replicate the same configuration across multiple ports.
- **Bring Your Own Device (BYOD) - OmniSwitch / UPAM or ClearPass Integration**: The OmniSwitch leverages Access Guardian functionality along with the OmniVista Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) to provide an overall BYOD solution.
  - Configurable UNP port and profile attributes are used to redirect traffic from the OmniSwitch to the UPAM or CPPM server.
  - Configurable GRE tunnels allow the OmniSwitch to intercept and tunnel Multicast Domain Name System (mDNS) and Simple Service Discovery Protocol (SSDP) packets to or from a WLAN controller in a BYOD network.
- **Captive Portal**—Internal and external Captive Portal Web-based authentication. Internal Captive Portal authentication is provided through an internal Web server on the OmniSwitch that presents default or customized Web pages to the user. A post-authentication and/or post-classification process to validate user credentials and dynamically assign a new role (policy list) to enforce user access to the network. External, guest Captive Portal authentication is provided through the OmniSwitch Access Guardian interaction with the OmniVista Unified Policy Access Manager or the ClearPass Policy Manager.
- **Quarantine Manager and Remediation (QMR)**—QMR is a switch-based application that restricts the network access of known quarantined users and provides a remediation path to allow quarantined users to regain their network access.
- **IoT Device Profiling IoT**—Device Profiling allows the network administrators to support and manage smart phones, Tablets and other devices connecting to the network. The IoT Device Profiling uses DHCP FingerPrinting and MAC OUI (MAC Vendors) to identify IoT devices.

For commands used to configure device authentication, authorization, and accounting parameters that are used to support Access Guardian functionality, see “Chapter 38, “AAA Commands.”

For commands used to configure Learned Port Security (LPS), which is used by Access Guardian to help ensure that only certain devices are allowed to connect to the switch, see “Chapter 46, “Learned Port Security Commands.”

MIB information for the UNP commands is as follows:

Filename: ALCATEL-IND1-DA-MIB.mib
Module: alcatelIND1DaMIB

Filename: ALCATEL-IND1-UDP-RELAY-MIB.mib
Module: alcatelIND1UDPRelayMIB

A summary of the available commands is listed here:

UNP Global Configuration Commands	**unp dynamic-vlan-configuration** **unp dynamic-profile-configuration** **unp delay-learning** **unp auth-server-down** **unp auth-server-down-timeout** **unp policy validity-period** **unp policy validity-location** **unp domain description** **unp redirect port-bounce** **unp redirect pause-timer** **unp redirect proxy-server-port** **unp redirect-server** **unp redirect allowed-name** **unp force-l3-learning** **unp 802.1x-pass-through** **unp ipv6-drop** **unp ap-mode** **unp mac-mobility** **unp user flush** **show unp global configuration** **show unp domain** **show unp user** **show unp user status** **show unp user details** **show unp policy validity-period** **show unp policy validity-location**

UNP Profile Commands	**unp profile** **unp profile qos-policy-list** **unp profile location-policy** **unp profile period-policy** **unp profile captive-portal-authentication** **unp profile captive-portal-profile** **unp profile kerberos-authentication** **unp profile authentication-flag** **unp profile mobile-tag** **unp profile maximum-ingress-bandwidth** **unp profile maximum-egress-bandwidth** **unp profile maximum-ingress-depth** **unp profile maximum-egress-depth** **unp profile inactivity-interval** **unp profile mac-mobility** **unp profile saa-profile** **unp profile map vlan** **unp profile map service-type spb** **unp profile map service-type vxlan** **unp vxlan far-end-ip-list** **unp profile map service-type l2gre** **unp l2gre far-end-ip-list** **unp profile map service-type static** **show unp profile** **show unp profile map** **show unp vxlan far-end-ip-list** **show unp l2gre far-end-ip-list**
UNP System Default Profile Commands	**unp system-default service-mod** **unp system-default service-base** **unp system-default multicastmode** **unp system-default vlan-xlation** **unp system-default multicastgroup** **unp system-default far-end-ip-list** **show unp global configuration**
UNP SAA Profile Commands	**unp saa-profile** **show unp saa-profile**
Device Profiling Commands	**device-profile admin-state** **device-profile port linkagg** **device-profile device-type** **device-profile update-signature** **device-profile update-signature from** **device-profile auto-unp-assignment** **show device-profile config** **show device-profile summary** **show device-profile catalog** **show device-profile signatures from** **show device-profile signatures**

UNP Port Commands	**unp port-type** **unp l2-profile** **unp redirect port-bounce** **unp 802.1x-authentication** **unp 802.1x-authentication pass-alternate** **unp 802.1x-authentication tx-period** **unp 802.1x-authentication supp-timeout** **unp 802.1x-authentication max-req** **unp 802.1x-authentication bypass-8021x** **unp 802.1x-authentication failure-policy** **unp mac-authentication** **unp mac-authentication pass-alternate** **unp mac-authentication allow-eap** **unp classification** **unp trust-tag** **unp default-profile** **unp domain** **unp aaa-profile** **unp port port-template** **unp direction** **unp admin-state** **unp dynamic-service** **unp vlan** **unp port profile** **unp force-l3-learning** **unp port ap-mode** **show unp port** **show unp port config** **show unp port bandwidth** **show unp port 802.1x statistics** **show unp port configured-vlans** **show unp port profile**
UNP Port Template Commands	**unp port-template** **show unp port-template**
Router Domain Authentication	**unp network-group** **unp router-auth user-group** **unp router-auth cp-profile** **unp router-auth user flush** **show unp network-group** **show unp router-auth user-group** **show unp router-auth configuration** **show unp router-auth users**
Classification Rule Commands	**unp classification port** **unp classification domain** **unp classification mac-address** **unp classification mac-oui** **unp classification mac-range** **unp classification ip-address** **unp classification vlan-tag** **unp classification lldp med-endpoint** **unp classification authentication-type** **show unp classification**

Extended Classification Rule Commands	**unp classification-rule** **unp classification-rule port** **unp classification-rule domain** **unp classification-rule mac-address** **unp classification-rule mac-oui** **unp classification-rule mac-range** **unp classification-rule ip-address** **unp classification-rule vlan-tag** **unp classification-rule lldp med-endpoint** **unp classification-rule authentication-type** **unp classification-rule device-type** **show unp classification-rule**
User Role Commands	**unp user-role** **unp user-role policy-list** **unp user-role profile** **unp user-role authentication-type** **unp user-role cp-status-post-login** **unp restricted-role policy-list** **show unp user-role** **show unp restricted-role**
Captive Portal Commands	**captive-portal mode** **captive-portal name** **captive-portal ip-address** **captive-portal success-redirect-url** **captive-portal proxy-server-port** **captive-portal retry-count** **captive-portal authentication-pass** **captive-portal authentication-pass domain** **captive-portal-profile** **captive-portal customization** **show captive-portal configuration** **show captive-portal profile-names**
Quarantine Manager and Remediation (QMR) Commands	**qmr quarantine path** **qmr quarantine page** **qmr quarantine allowed-name** **qmr quarantine custom-proxy-port** **show qmr** **show quarantine mac group**

Zero Configuration Networking Commands (mDNS and SSDP)	**zeroconf mdns admin-state** **zeroconf ssdp admin-state** **zeroconf mode** **zeroconf responder-ip** **zeroconf gateway-vlan-list** **zeroconf access-vlan-list** **zeroconf server-policy** **zeroconf client-policy** **zeroconf service-rule policy** **zeroconf service-rule service-id** **zeroconf service-list** **zeroconf service-id query-request** **zeroconf edge-ip-list** **zeroconf refresh-database** **show zeroconf** **show zeroconf services** **show zeroconf services-cache** **show zeroconf edge-details** **show zeroconf server policies** **show zeroconf client policies** **show zeroconf service rules** **show zeroconf server policy-instances**

unp dynamic-vlan-configuration

Configures the UNP status for dynamic VLAN configuration. When this functionality is enabled and a VLAN mapping is configured with a VLAN ID that does not exist, the switch will dynamically create the necessary VLAN ID.

unp dynamic-vlan-configuration

no unp dynamic-vlan-configuration

Syntax Definitions

N/A

Defaults

By default, dynamic VLAN configuration is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Note. Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootup.

- Use the **no** form of this command to disable dynamic VLAN configuration.
- When dynamic VLAN configuration is disabled, configuring a VLAN mapping with a VLAN ID that does not exist in the switch configuration is not allowed.
- The VLAN status and other port (non-UNP port) assignments for a dynamic UNP VLAN are configurable using standard VLAN commands. In addition, the STP status is configurable and enabled by default when the dynamic VLAN is created.
- A dynamic VLAN cannot be deleted using standard VLAN commands (**no vlan** *vlan_id*).
- UNP dynamic VLANs are identified as a separate type of VLAN. The **show vlan** command will display this type with the default name of “UNP-DYN-VLAN” and the designated type as “UNP Dynamic Vlan”.

Examples

```
-> unp dynamic-vlan-configuration
-> no unp dynamic-vlan-configuration
```

Release History

Release 7.2.1; command was introduced.

Related Commands

unp profile	Configures a UNP in the switch configuration.
show unp global configuration	Displays the dynamic VLAN configuration status for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPDynamicVlanConfigFlag
```

unp dynamic-profile-configuration

Configures the UNP status for dynamic profile configuration. When this functionality is enabled, a UNP profile is dynamically created based on specific traffic conditions.

unp dynamic-profile-configuration

no unp dynamic-profile-configuration

Syntax Definitions

N/A

Defaults

By default, dynamic profile configuration is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable dynamic profile configuration.
- When dynamic profile configuration is enabled, a UNP profile is dynamically created when the trust VLAN tag option is enabled on the UNP port or link aggregate and one of the following conditions occurs:
  - A tagged packet received on the UNP port contains a VLAN tag that matches an existing MVRP VLAN in the switch configuration that is not assigned to a profile.
  - There is no matching VLAN in the switch configuration.
- Dynamically created profiles are saved in the **boot.cfg** file for the switch.
- By default, dynamically created profiles are automatically named **dynamic_profile_***vlan_id*, where the VLAN ID is the ID of the VLAN contained in the packet tag.
- After the dynamic profile is created, changing the profile name, the associated VLAN ID, or the QoS policy list is allowed. To avoid any confusion, change the profile name if the VLAN ID associated with the profile has changed.
- If the dynamic profile configuration option is enabled along with the dynamic VLAN configuration option and a dynamically created profile refers to a VLAN that is an MVRP VLAN, then the MVRP VLAN is automatically converted to a dynamic UNP VLAN (UNP-DYN-VLAN).

Examples

```
-> unp dynamic-profile-configuration
-> no unp dynamic-profile-configuration
```

Release History

Release 7.2.1.R02; command was introduced.

Related Commands

unp profile	Configures a UNP in the switch configuration.
unp dynamic-vlan-configuration	Configures the status of dynamic VLAN configuration. When enabled, UNP will create a VLAN at the time a VLAN mapping for a profile is created that specifies a VLAN ID that does not exist in the switch configuration.
show unp global configuration	Displays the dynamic profile configuration status for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPDynamicProfileConfigFlag
```

unp delay-learning

Configures the UNP delay learning time interval. This specifies the amount of time, in seconds, that UNP will delay learning packets received on UNP ports.

unp delay-learning *seconds*

Syntax Definitions

seconds	The amount of time to wait before UNP learning starts. The valid range is 0–600 seconds.

Defaults

By default, the delay learning timer is disabled (timer value is set to 0).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To disable the delay learning timer, set the timer value to zero (the default).
- The configured time interval is triggered when the switch boots up. During this time, any packets received on all UNP ports are dropped until the timer expires.
- Configuring a delay learning interval gives the switch time to bring up IP interfaces and for route convergence to complete before any attempt to reach an authentication server is made.

Examples

```
-> unp delay-learning 250
-> unp delay-learning 600
-> unp delay-learning 0
```

Release History

Release 8.5R2; command was introduced.

Related Commands

unp auth-server-down	Configures a UNP to which a device is classified if MAC or 802.1X authentication fails because the RADIUS server is not reachable.
show unp global configuration	Displays the UNP delay learning timer value for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPDelayLearning
```

unp auth-server-down

Configures a UNP profile to which a device is classified if authentication fails because the RADIUS server is unreachable.

unp auth-server-down {profile1 *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp auth-server-down [profile1] [profile2] [profile3]

Syntax Definitions

profile_name	The name of an existing profile to which the device is assigned when the authentication server is unreachable.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an authentication server down UNP profile.
- When a device is classified into the specified profile, a configurable authentication down timer is started for that device. When the timer runs out, the authentication process is performed again. If authentication fails again, the device is classified back into the authentication server down profile. The switch will repeat this process until the device authentication is completed.
- Configuring an authentication server down UNP is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, the traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- If the authentication server down UNP is removed, the authentication server down timer is also removed.
- Up to three different profile names are configurable as authentication server down UNP profiles. The profile applied to the traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to device traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to device traffic received on UNP access ports.
  - When multiple profiles are configured, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the device traffic.

- Configuring both a VLAN profile and a service profile ensures that an authentication server down UNP is available for device traffic received on both types of UNP ports (bridge and access).

Examples

```
-> unp auth-server-down profile1 unp1-vlan
-> no unp auth-server-down profile1
-> unp auth-server-down profile1 unp1-vlan profile2 unp2-vxlan
-> no unp auth-server-down profile1 profile2
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.4; command syntax changed; **vxlan-profile** parameter added.
Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters replaced with **profile1**, **profile2**, and **profile3** parameters.

Related Commands

unp auth-server-down-timeout	Configures the value for the authentication server down timer.
show unp global configuration	Displays the profiles designated as the authentication server down UNP for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPAuthServerDownUnp
```

unp auth-server-down-timeout

Configures the authentication server down timer value. This timer value is applied to devices that are learned in the authentication server down UNP.

unp auth-server-down-timeout *seconds*

no unp auth-server-down-timeout

Syntax Definitions

seconds	The number of seconds the authentication server down timer is active.The valid range is 10 to 1000 seconds.

Defaults

By default, the timeout value is set to 60 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the timer value back to the default value (60 seconds).
- When this timer expires, devices learned in the authentication server down UNP are cleared from that UNP. The authentication and classification process is attempted again.
- When the authentication server down UNP is removed, the authentication server down timer is also cleared.

Examples

```
-> unp auth-server-down-timeout 500
-> unp auth-server-down-timeout 120
-> no unp auth-server-down-timeout
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.4; command syntax changed; **vxlan-profile** parameter added.
Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters deprecated.

Related Commands

unp auth-server-down	Configures a UNP to which a device is classified if MAC or 802.1X authentication fails because the RADIUS server is not reachable.
show unp global configuration	Displays the authentication server down timeout value for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPAuthServerDownTimeout
```

unp policy validity-period

Configures a UNP validity period policy that specifies the days and times during which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria.

unp policy validity-period *policy_name* **[days** *days***] [months** *months***] [hours** *hh:mm* **to** *hh:mm***] [interval** *mm:dd:yy hh:mm* **to** *mm:dd:yy hh:mm***] [timezone** *zones***]**

no unp policy validity-period *policy_name* **[days** *days* **| months** *months* **| hours** | **interval | timezone]**

Syntax Definitions

policy_name	The name of the validity period policy (up to 31 alphanumeric characters).
days	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., **monday**, **tuesday**, **wednesday**, etc.).
months	The month(s) in which the validity period is active. Enter the actual month (e.g., **january**, **february**, **march**, etc.).
hh:mm	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
mm:dd:yy hh:mm	An interval of time during which the validity period is active. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:17 12:01 to 11:02:17 12:01).
zones	The timezone in which the validity period is active (for example, **pst**, **est**, **gmt**, etc.)

Defaults

parameter	default
days	no restriction
months	no restriction
hh:mm	no specific time
mm:dd:yyyy hh:mm	no interval
zones	local timezone

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a UNP period policy from the configuration, or to remove parameters from a particular validity period policy.

- Any combination of the **days**, **months**, **hours**, **interval**, and **timezone** parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **unp profile period-policy** command to associate a period policy with a UNP profile.

Examples

```
-> unp policy validity-period Office-Time
-> no unp policy validity-period Office-Time

-> unp policy validity-period Office-Time days monday
-> unp policy validity-period Office-Time days monday time-zone IST
-> no unp policy validity-period Office-Time time-zone
-> no unp policy validity-period Office-Time days monday

-> unp policy validity-period Office-Time days all
-> unp policy validity-period Office-Time days all time-zone PST
-> no unp policy validity-period Office-Time days saturday sunday

-> unp policy validity-period Office-Time hours 9:00 to 17:00
-> unp policy validity-period Office-Time hours 9:00 to 17:00 time-zone IST
-> no unp policy validity-period Office-Time hours

-> unp policy validity-period Holiday months december january
-> no unp policy validity-period Holiday months january

-> unp policy validity-period Holiday months december time-zone IST
-> no unp policy validity-period Holiday time-zone
-> no unp policy validity-period Holiday months december

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
-> no unp policy validity-period Seminar interval

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
time-zone PST
-> no unp policy validity-period Seminar time-zone
-> no unp policy validity-period Seminar interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp profile period-policy	Assigns a UNP period policy to a profile.
show unp policy validity-period	Displays information about the UNP period policy configuration.

MIB Objects

   alaDaUNPValidityPeriodActiveStatus
```

unp policy validity-location

Configures a UNP validity location policy that defines a specific location from which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria defined.

unp policy validity-location *policy_name* **[port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]** **[system-name** *system_name***] [system-location** *system_location***]**

no unp policy validity-location *policy_name* **[port | linkagg | system-name | system-location]**

Syntax Definitions

policy_name	The name of the validity location policy (up to 31 alphanumeric characters).
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1) of a UNP port. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number of a UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
system_name	The configured system name for the switch from which the device can access the network.
system_location	The configured system location for the switch from which the device can access the network.

Defaults

parameter	default
*chassis/slot/port***[**-*port2***]**	no restriction
*agg_id***[**-*agg_id2***]**	no restriction
system_name	no restriction
system_location	no restriction

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a UNP location policy from the configuration, or to remove parameters from a particular location policy.
- Any combination of the **port**, **linkagg**, **system-name**, and **system-location** parameters is allowed. The location policy is only in effect when all specified parameters are true.
- Use the **unp profile location-policy** command to associate a location policy with a UNP profile.

Examples

```
-> unp policy validity-location ALU-NA
-> no unp policy validity-location ALU-NA

-> unp policy validity-location ALU-NA port 1/1/10
-> unp policy validity-location ALU-NA port 1/1/1-5
-> no unp policy validity-location ALU-NA port

-> unp policy validity-location ALU-NA linkagg 10
-> unp policy validity-location ALU-NA linkagg 1-5
-> no unp policy validity-location ALU-NA linkagg

-> unp policy validity-location ALU-NA system-name OS6860
-> no unp policy validity-location ALU-NA system-name OS6860

-> unp policy validity-location ALU-NA system-location US-West
-> no unp policy validity-location ALU-NA system-location
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp profile location-policy	Assigns a UNP location policy to a profile.
show unp policy validity-location	Displays information about the UNP location policy configuration.

MIB Objects

```
alaDaUNPLocationPolicyTable
   alaDaUNPLocationPolicyName

   alaDaUNPLocationPolicyPortStatus
   alaDaUNPLocationPolicySystemName
   alaDaUNPLocationPolicySystemLocation
```

unp domain description

Configures a customer domain ID to which UNP ports and classification rules are assigned.

unp domain *domain_id* **[description** *domain_description***]**

no unp domain *domain_id* **description** *domain_description*

Syntax Definitions

domain_id	A numerical customer domain ID.
domain_description	An alphanumeric string (1–128 characters).

Defaults

By default, customer domain ID zero (0) is assigned to all UNP ports.

parameter	default
domain_description	Domain ID

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the customer domain ID from the switch configuration. When a domain ID is removed, the following actions are triggered:
  - All UNP ports assigned to that domain are moved to the default domain ID 0.
  - Any classification rules assigned to that domain are removed.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain (see the **unp domain** command page**)**, classification rules associated with the same customer domain ID are applied only to UNP ports associated with the same domain ID.

Examples

```
-> unp domain 1
-> unp domain 2 description CustomerA
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp domain	Assigns a UNP port or link aggregate to the specified customer domain (UNP group) ID.
show unp domain	Displays the customer domain ID configuration for the switch.

MIB Objects

```
alaDaUnpCustomerDomainTable
   alaDaUnpCustomerDomainId
   alaDaUnpCustomerDomainDesc
```

unp redirect pause-timer

Configures the global pause timer value for the switch. Use this command to configure the amount of time the switch filters traffic from a non-supplicant (non-802.1X device) on a UNP port. This is done to allow enough time for the switch to clear the authentication state of the non-supplicant, at which time the device is re-authenticated.

unp redirect pause-timer *seconds*

no redirect pause-timer

Syntax Definitions

seconds	The pause timer value. The valid range is 60–65535

Defaults

By default, the pause timer is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to reset the pause time back to the default (timer no set).
- The pause timer is triggered when a Change of Authorization (COA) request is received that requires a VLAN change for a non-supplicant (non-802.1X device) *and* the port bounce action is not triggered for the device.
- During the pause time period, it is expected that the DHCP lease of the client IP in the old VLAN will expire and the client device will re-initiate DHCP resulting in new authentication and a UNP VLAN assignment.
- This command is used when configuring the switch to interact with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect pause-timer 180
-> no unp redirect pause-timer
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect proxy-server-port	Configures the HTTP proxy port number to use for redirection.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP parameter settings for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPRedirectPauseTimer
```

unp redirect proxy-server-port

Configures the HTTP proxy port number to use for redirection to the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) server.

unp redirect proxy-server-port *proxy_port*

no unp rediret proxy-server-port

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1024–49151.

Defaults

By default, the redirect proxy port number is set to 8080 (traps HTTP 80, 8080, and 443).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- Configuring the switch to interact with the UPAM or CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect proxy-server-port 8887
-> no unp redirect proxy-server-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP parameter settings for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
  alaDaUNPRedirectServerIP
```

unp redirect-server

Configures an IP network address or a Fully Qualified Domain Name (FQDN) to allow redirection of HTTP traffic to the Unified Policy Access Manager (UPAM) server or the ClearPass Policy Manager (CPPM) server. Specify the address or domain name that is associated with the dynamic URL returned from the UPAM or CPPM server.

unp redirect-server {*ip_address* | *domain_name***}**

no unp redirect-server

Syntax Definitions

ip_address	The IPv4 network address (e.g., 171.15.0.0) to which HTTP traffic is redirected.
domain_name	An FQDN (e.g., upam.com) to which HTTP traffic is redirected.

Defaults

By default, no redirect server IP address or FQDN is specified.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the redirect server IP or FQDN from the switch configuration.
- If the redirect server IP address or FQDN does not match the UPAM or CPPM server configuration, then redirection to the URL will not work. This provides additional security.
- Configuring the switch to interact with UPAM or CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect-server 10.0.0.20
-> no unp redirect-server
-> unp redirect-server upam.com
-> no unp redirect-server
```

Release History

Release 8.1.1; command was introduced.
Release 8.5R1; *domain_name* parameter added.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch
unp redirect proxy-server-port	Configures the HTTP proxy port number to use for redirection.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
show unp global configuration	Displays the global UNP configuration for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
  alaDaUNPRedirectServerIPType
  alaDaUNPRedirectServerIP
```

unp redirect allowed-name

Configures a list of additional IP addresses to which a host can access. This allows traffic to reach additional subnets other than that of the Unified Policy Access Manager (UPAM) server or the ClearPass Policy Manager (CPPM) server.

unp redirect allowed-name *name* **ip-address** *ip_address* **ip-mask** *ip_mask*

no unp redirect allowed-name *name*

Syntax Definitions

name	Specify a name to assign to the allowed IP network address.
ip_address	An IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
ip_mask	The IP subnet mask for the allowed IP network address.

Defaults

By default, no allowed IP addresses are configured.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- Explicitly configure and append the allowed IP list to the built-in "restrictedPolicylist" policy list.

Examples

```
-> unp redirect allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no unp redirect allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

MIB Objects

```
alaDaUNPRedirectAllowedServerTable
  alaDaUNPRedirectAllowedServerName
  alaDaUNPRedirectAllowedServerIP
  alaDaUNPRedirectAllowedMaskIP
```

unp force-l3-learning

Configures the status of UNP Layer 3 learning on the specified UNP port or globally on all UNP ports. When this functionality is enabled and IP-based classification rules are configured on the switch, only Layer 3 packets are used to learn devices connected to UNP ports. Layer 2 packets are not used for learning devices.

unp [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] force-l3-learning [port-bounce]**

no unp [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] force-l3-learning [port-bounce]**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number for a specific UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
port-bounce	Resets the context in which the user device is learned after the device is re-classified with a new IP address. This option is not supported on UNP link aggregates.

Defaults

By default, UNP Layer 3 learning is disabled and the port bounce action is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To disable Layer 3 learning for a specific port or link aggregate, use the **no** form of this command with the **port** or **linkagg** parameter. To globally disable Layer 3 learning, use the **no** form of this command without the **port** or **linkagg** parameter.
- When UNP Layer 3 learning is enabled and there is at least one IP-based classification rule configured, the first packet of the following types of packets is used to learn the device:
  - An IP packet with a non-zero source IP address.
  - A valid ARP/GARP request/reply.
  - DHCP packets, even if the source IP address is 0.0.0.0.

  However, the first packet of the following types of packets is *dropped* and not used to learn the device:
  - Layer 2 frames.
  - Invalid ARP/GARP request/reply (one with sender IP address 0.0.0.0 or 169.254.0.0/16).
  - IP packet with a source IP address of 0.0.0.0, except for DHCP packets where the source IP address is 0.0.0.0.
- When Layer 3 learning is enabled and a device is learned and assigned to a UNP profile, any subsequent change to the IP address for that device (for example, the device is assigned a leased IP address) will trigger UNP to re-classify the device based on the new IP address.

- When Layer 3 learning is enforced, the following users learned on a UNP port or link aggregate would not undergo IP reclassification:
  - 802.1x (supplicant) and MAC authenticated (non-supplicant).
  - Users learned through a non-IP-based classification rule that has a higher precedence over IP-based classification rules (such as any UNP extended classification rule, binding rule, MAC address rule, or MAC address range rule).
- When Layer 3 learning is enforced, the following users learned on a UNP port or link aggregate might undergo IP reclassification:
  - Users learned through a non-IP-based classification rule that has a lower precedence than IP-based classification rules (such as a VLAN rule).
  - IP-based classification rule.
- If the port bounce action is enabled for Layer 3 learning, IP reclassification for a user might result in obtaining a new UNP profile based on an IP-based classification rule, and the new UNP profile may assign a VLAN that is different from the initial UNP profile VLAN. If this occurs, the port would be toggled causing the user context to get flushed, and the subsequent packet from the user would then be used to relearn the user. It is assumed that user in this case would subsequently send either a valid ARP packet or an IP packet with a valid source IP address as the first packet, which would be used for re-learning the user directly into the final UNP profile.
- Note that the IP address update/change for an already learned UNP user can happen only when a valid ARP packet is sent from the user after the user is initially learned. As a result, Layer 3 enforcement relies on an ARP packet from the user.
- Whenever an additional port is configured as a UNP port , the Layer 3 learning status is derived from the global setting for the switch.
- When Layer 3 learning is changed at the global level, all port-level configurations are also changed unless a custom port template that configures this function is assigned to the port. For example, when Layer 3 learning is globally disabled, it is automatically disabled on any port that has Layer 3 learning enabled. However, if a port is assigned to a custom port template that enables this function, then the Layer 3 learning status for that port is not changed.
- The port-level setting of the Layer 3 learning function overrides the global setting for the switch. For example, if Layer 3 learning is globally disabled but enabled on port 1/1/20, then Layer 3 learning is active only on port 1/1/20.

Examples

```
-> unp force-l3-learning
-> unp force-l3-learning port-bounce
-> no unp force-l3-learning port-bounce
-> no unp force-l3-learning

-> unp port 1/1/20 force-l3-learning
-> unp port 1/1/20 force-l3-learning port-bounce
-> no unp port 1/1/20 force-l3-learning port-bounce
-> no unp port 1/1/20 force-l3-learning
```

Release History

Release 8.3.1; command was introduced.
Release 8.3.1.R02; **port**, **linkagg**, and **port-bounce** parameters added.

Related Commands

show unp global configuration	Displays the status of UNP Layer 3 learning for the switch.
show unp port config	Displays the status of port-level UNP Layer 3 learning.

   alaDaUNPPortForceL3LearningPortBounce
```

unp 802.1x-pass-through

Configures the global status of 802.1x pass through for the switch. When this functionality is enabled, 802.1x packets from supplicants attempting to authenticate are not processed on the local switch. Instead, the packets are passed along to another switch for authentication.

unp 802.1x-pass-through

no unp 802.1x-pass-through

Syntax Definitions

N/A

Defaults

By default, 802.1x pass through is disabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable 802.1x pass through for the switch.
- Enabling 802.1x pass through on a switch that has an existing UNP or LPS configuration is not recommended. This functionality is intended for a local or intermediate switch when the supplicant device requires authentication through an upstream switch.
- If 802.1x pass through is enabled on a switch that has an existing UNP or LPS configuration, consider the following:
  - 802.1x authentication, 802.1x authentication bypass, and MAC authentication allow EAP functionality is not supported on UNP ports.
  - The initial frame for unknown 802.1x traffic is learned on the switch. If the frame is learned in the forwarding mode, subsequent frames with the same source MAC address are passed through to the next switch. If the frame is learned in the filtering mode, subsequent frames with the same source MAC address are dropped and not passed through.

Examples

```
-> unp 802.1x-pass-through
-> no unp 802.1x-pass-through
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

show unp global configuration Displays the status of 802.1x pass through for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNP8021XPassThrough
```

unp ipv6-drop

Configures whether IPv6 packets received on UNP ports are learned or dropped. When this functionality is enabled, IPv6 packets are dropped by UNP on the local switch.

unp ipv6-drop

no unp ipv6-drop

Syntax Definitions

N/A

Defaults

By default, IPv6 packet drop is disabled. IPv6 packets are learned and processed by UNP.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable IPv6 packet drop for the switch.

Examples

```
-> unp ipv6-drop
-> no unp ipv6-drop
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show unp global configuration Displays the status of IPv6 packet drop for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPIpv6Drop
```

unp ap-mode

Configures the global status of the Access Point (AP) mode. The global AP mode status determines the default AP mode status that is applied when a port or link aggregate is configured as a UNP bridge port. For example, if the global status is disabled, the port-level status defaults to disabled; if the global status is enabled, the port-level status defaults to enabled.

unp ap-mode {enable | disable}

Syntax Definitions

enable	Sets the AP mode default status to enabled.
disable	Sets the AP mode default status to disabled.

Defaults

By default, the AP mode is enabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Changing the global AP mode status at any given time is allowed but does not change the port-level status set for any existing UNP bridge ports. If the AP mode is disabled for the port, it remains disabled after the global status change; if the AP mode is enabled for the port, it remains enabled after the global status change and any devices or clients learned on the port are not disrupted.
- To change the AP mode status for a specific UNP bridge port, use the **unp port ap-mode** command.

Examples

```
-> unp ap-mode disable
-> unp ap-mode enable
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

unp port ap-mode	Configures AP mode functionality for a UNP bridge port.
show unp global configuration	Displays the status of UNP Layer 3 learning for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPApMode
```

unp mac-mobility

Configures the global status of MAC address mobility; any new UNP service profiles will inherit the global MAC mobility status when the profile is created. Enabling MAC address mobility for a UNP service profile supports VRRP router communication over a Shortest Path Bridging (SPB) service domain.

unp mac-mobility

no unp mac-mobility

Syntax Definitions

N/A

Defaults

By default, the global MAC address mobility status is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to globally disable UNP MAC address mobility.
- Although the MAC mobility status is configured for UNP profiles, it's functionality is supported only on profiles mapped to SPB services. SPB service-mapped profiles generate Service Access Points (SAPs) on which a VRRP router can communicate with other VRRP routers across the SPB service domain.
- When a new UNP service profile is created, the MAC mobility status for the profile defaults to the global value. For example, if the global status is enabled, then the new service profile status is set to enabled by default; if the global status is disabled, then the new service profile status is set to disabled by default.
- If the global MAC mobility status is changed at any given time, it will not affect the MAC mobility status of any existing UNP service profiles; the global setting only applies at the time a service profile is created. Any subsequent profiles created will default to the new global MAC mobility status.
- To change the MAC mobility status for a specific UNP service profile, use the **unp profile mac-mobility** command.

Examples

```
-> unp mac-mobility
-> no unp mac-mobility
```

Release History

Release 8.6R1; command was introduced.

Related Commands

unp profile mac-mobility	Configures the MAC mobility status for the specified UNP service profile.
show unp global configuration	Displays the status of MAC mobility for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPMacMobility
```

unp user flush

Performs a MAC address flush of Access Guardian users (devices learned on UNP ports) based on the specified port, link aggregate, authentication type, or MAC address.

unp user flush [port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]] [sap-id [linkagg]** *sap_id***] [service-id** *service_id***] [authentication-type {mac | 802.1x | none} [profile** *profile_name***] [mac-address** *mac_address***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
[linkagg] *sap_id*	A Service Access Point (SAP) ID. Use the optional **linkagg** parameter if the SAP ID is for a link aggregate.
service_id	A service ID.
mac	Clears only the MAC authenticated users.
802.1x	Clears only the 802.1X authenticated users.
none	Clears only the users that have not been authenticated.
mac_address	A MAC address (e.g., 00:00:39:59:f1:0c).
profile_name	The name of an existing UNP profile.

Defaults

By default, all MAC addresses learned on all UNP ports are flushed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** parameter to flush users on a specific port or link aggregate.
- Use the **sap-id** parameter to flush users learned on a specific SAP. A SAP ID is comprised of a device-facing port or link aggregate (referred to as a service access port) and an encapsulation value that is used to identify the type of device traffic to map to the associated service.
- Use the **service-id** parameter to flush users learned on a specific service.
- Use the **authentication-type** parameter with the **mac**, **802.1x**, or **none** options to flush users that were authenticated (MAC or 802.1X) or users that were not authenticated.
- Use the **mac-address** parameter to flush a specific device.

- Use the **profile** parameter to flush all users associated with the specified profile name. Combine this parameter with the **mac-address** parameter to flush a specific user associated with the specified profile name.
- Combine the **sap-id** or **service-id** parameter with the **profile** parameter option to flush only users on the SAP or service that are classified into the specified profile.
- Combine the **sap-id** or **service-id** parameter with the **authentication-type** parameter option to flush only users on the SAP or service that were authenticated with the specified authentication type.

Examples

```
-> unp user flush
-> unp user flush port 1/1/6
-> unp user flush linkagg 10
-> unp user flush sap-id 1/1/2:50
-> unp user flush service-id 10
-> unp user flush authentication-type mac
-> unp user flush mac-address 00:11:22:33:44:55
-> unp user flush profile unp1-vlan
-> unp user flush profile unp1-vlan mac-address 00:da:95:11:22:01
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show unp user	Displays information about the devices learned on a UNP port.

```

unp profile

Configures a classification profile that is used to provide role-based access to the switch. This type of profile determines the VLAN or service a device can join and applies any additional profile-defined attributes to the device.

When a profile is created with this command, the base command (**unp profile** *profile_name*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

unp profile *profile_name*
[qos-policy-list *list_name***]**
[location-policy *policy_name***]**
[period-policy *policy_name***]**
[captive-portal-authentication]
[captive-portal-profile *profile_name***]**
[kerberos-authentication]
[authentication-flag]
[mobile-tag]
[maximum ingress-bandwidth *bps***[k | m]]**
[maximum egress-bandwidth *bps***[k | m]]**
[maximum ingress-depth *bps***]**
[maximum egress-depth *bps***]**
[inactivity-interval *seconds***]**
[mac-mobility]
[saa-profile *profile_name***]**

no unp profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the UNP classification profile.

Defaults

When a profile is created without specifying any parameter values, the profile parameters are set to the following default values:

parameter	default
qos-policy-list *list_name*	No list assigned
location-policy	No policy assigned
period-policy	No policy assigned
captive-portal-authentication	disabled
captive-portal-profile	No profile assigned
kerberos-authentication	disabled
authentication-flag	disabled

parameter	default
mobile-tag	disabled
maximum ingress-bandwidth *bps***[k | m]**	None
maximum egress-bandwidth *bps***[k | m]**	None
maximum ingress-depth *bps*	None
maximum egress-depth *bps*	None
inactivity-interval *seconds*	10
mac-mobility	disabled
saa-profile *profile_name*	No profile assigned

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a profile from the switch configuration.
- Profiles are applied only to traffic received on UNP bridge and access ports or link aggregates.
- After a profile is created, use the **unp profile map** command to map the profile to a VLAN or service.
  - If the profile is mapped to a VLAN, the profile is used to classify traffic received on UNP bridge ports.
  - If the profile is mapped to a service (SPB, VXLAN, or static), the profile is used to classify traffic received on UNP access ports.
- Any configuration change to a profile will flush all MAC addresses learned on that profile.

Examples

```
-> unp profile unp-prof1
-> no unp profile unp-prof1
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile qos-policy-list	Assigns a QoS policy list to an existing profile.
unp profile location-policy	Assigns a UNP location policy to the specified profile.
unp profile period-policy	Assigns a UNP time-based policy to the specified profile.
unp profile captive-portal-authentication	Configures the status of Captive Portal authentication for the specified profile.
unp profile captive-portal-profile	Assigns a Captive Portal configuration to the specified profile.
unp profile kerberos-authentication	Configures the status of Kerberos snooping for the specified profile.
unp profile authentication-flag	Configures whether the specified profile only allows authenticated devices into the profile.
unp profile mobile-tag	Configures whether a tagged VLAN-port association is created for a device port that is classified into the specified profile.
unp profile maximum-ingress-bandwidth	Configures a maximum ingress bandwidth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-egress-bandwidth	Configures a maximum egress bandwidth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-ingress-depth	Configures a maximum ingress depth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-egress-depth	Configures a maximum egress depth value that is applied to UNP ports associated with the specified profile.
unp profile inactivity-interval	Configures the inactivity interval timer for the specified profile.
unp profile mac-mobility	Configures the MAC address mobility status for the specified UNP service profile to support VRRP router communication over an SPB service domain.
unp profile saa-profile	Assigns an existing Service Assurance Agent (SAA) profile to the specified profile.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
```

unp profile qos-policy-list

Configures the QoS policy list attribute for the specified profile. Use this command to assign the name of an existing QoS policy list to the profile. A policy list contains QoS policy rules/ACLs that are applied to devices classified with the associated profile.

unp profile *profile_name* **qos-policy-list** *list_name*

no unp profile *profile_name* **qos-policy-list**

Syntax Definitions

profile_name	The name of a UNP profile.
list_name	The name of a QoS policy list to associate with the specified UNP.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the QoS list name from the profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.
- The QoS policy list is used to define the initial role for any UNP user learned in the profile.

Examples

```
-> unp profile unp-prof1 qos-policy-list unp-list1
-> no unp profile unp-prof1 qos-policy-list unp-list2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP classification profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
policy list	Configures a QoS policy list.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileQoSPolicy
```

unp profile location-policy

Configures the location policy attribute for the specified profile. Use this command to assign the name of an existing UNP location policy to a profile. This type of policy defines criteria (such as the slot/port, system name and location) to determine if a device is accessing the network from a valid location.

unp profile *profile_name* **location-policy** *policy_name*

no unp profile *profile_name* **location-policy**

Syntax Definitions

profile_name	The name of a UNP profile.
policy_name	The name of an existing UNP location policy.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the location policy name from the profile configuration.
- The location policy name specified with this command must already exist in the switch configuration.
- Profile location and time period policies are configurable on the switch or on the RADIUS server. If the policies are configured on both the switch and the RADIUS server, then the switch policies take precedence.
- If a UNP device does not meet the criteria applied through the location policy, the device role is changed to unauthorized.

Examples

```
-> unp profile unp-prof1 location-policy alu-na
-> no unp profile unp-prof1 location-policy
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp policy validity-location	Configures a UNP location policy.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileLocationPolicy
```

unp profile period-policy

Configures the period policy attribute for the specified profile. Use this command to assign the name of an existing UNP period policy to a profile. This type of policy specifies the days and times during which a device can access the network.

unp profile *profile_name* **period-policy** *policy_name*

no unp profile *profile_name* **period-policy**

Syntax Definitions

profile_name	The name of a UNP profile.
policy_name	The name of an existing UNP period policy.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the period policy name from the profile configuration.
- The period policy name specified with this command must already exist in the switch configuration.
- Profile location and time period policies are configurable on the switch or on the RADIUS server. If the policies are configured on both the switch and the RADIUS server, then the switch policies take precedence.
- If a UNP device does not meet the criteria applied through the period policy, the device role is changed to unauthorized.

Examples

```
-> unp profile unp-prof1 period-policy office-time
-> no unp profile unp-prof1 period-policy
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp policy validity-period	Configures a UNP period policy.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfilePeriodPolicy
```

unp profile captive-portal-authentication

Configures the status of Captive Portal (CP) authentication for the specified UNP profile. When enabled, the Captive Portal authentication process is triggered for devices classified into the profile.

unp profile *profile_name* **captive-portal-authentication**

no unp profile *profile_name* **captive-portal-authentication**

Syntax Definitions

profile_name	The name of a UNP profile.

Defaults

By default, Captive Portal authentication is disabled for the profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- Use the **no** form of this command to disable Captive Portal authentication for the profile configuration.
- When CP authentication is enabled, the UNP user is assigned an implicit CP pre-login role to facilitate the CP authentication process with the configured CP RADIUS server.
- The CP profile associated with the UNP profile defines the CP RADIUS server to use for the CP authentication process. If a CP profile is not associated with the UNP profile, then the server defined in the global CP configuration for the switch is used instead.
- If CP authentication for the device is successful, the user role is automatically changed according to the CP pass policy list returned from the RADIUS server if it is the highest precedence role known for the user.
- If CP authentication for the device fails, the user role will be changed to the last known highest precedence role for the user.
- When successful CP authentication results in assigning the UNP user to a different profile, CP authentication does not need to be enabled for that profile. For example, if the user is initially assigned to a “Guest” profile and successful CP authentication assigns the user to the “Admin” profile, CP authentication must be enabled on the “Guest” profile but does not have to be enabled on the “Admin” profile.
- When CP authentication is disabled for the profile, BYOD redirection is automatically made available to devices assigned to the profile. When CP authentication is enabled, CP is enforced and BYOD redirection is not available.

Examples

```
-> unp profile unp-prof1 captive-portal-authentication
-> no unp profile unp-prof1 captive-portal-authentication
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileCPortalAuthentication
```

unp profile captive-portal-profile

Configures the Captive Portal (CP) profile attribute for the specified profile. Use this command to assign the name of an existing CP profile to a profile. This type of profile defines a CP configuration that is applied to devices when CP authentication is enabled for the profile.

unp profile *profile_name* **captive-portal-profile** *cp_profile_name*

no unp profile *profile_name* **captive-portal-profile**

Syntax Definitions

profile_name	The name of a UNP profile.
cp_profile_name	The name of an existing UNP Captive Portal profile.

Defaults

By default, no CP profile is assigned to a profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- Use the **no** form of this command to remove the CP profile name from the profile configuration.
- The CP profile name specified with this command must already exist in the switch configuration.
- The configuration defined in the CP profile overrides the global CP configuration for the switch.

Examples

```
-> unp profile unp-prof1 captive-portal-profile cp-prof
-> no unp profile unp-prof1 captive-portal-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
captive-portal-profile	Configures a Captive Portal profile.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileCPortalProfile
```

unp profile kerberos-authentication

Enables or disables Kerberos snooping on UNP profile.

unp profile *profile_name* **kerberos-authentication**

no unp profile *profile_name* **kerberos-authentication**

Syntax Definitions

profile_name	The name of a UNP profile.

Defaults

By default, Kerberos is disabled on UNP profile.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable Kerberos snooping on the UNP profile.
- When Kerberos is disabled on the UNP profile, all users learned in that profile are deleted.
- Although the status of Kerberos snooping is configurable for UNP profiles, it's functionality is supported only on profiles mapped to a VLAN.
- Kerberos is an L3 authentication. It will be available only after successful L2 authentication.
- Kerberos snooping will work only when the switch has at least one Kerberos server IP address configured.

Examples

```
-> unp profile p1 kerberos-authentication
-> no unp profile p1 kerberos-authentication
```

Release History

Release 8.6R2; command introduced.

Related Commands

kerberos inactivity-timer	Configures the global inactivity timer for Kerberos users.
show kerberos configuration	Displays the Kerberos global configuration.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileKerberosAuthentication
   alaDaUNPProfileRowStatus
```

unp profile authentication-flag

Configures the authentication flag status for the specified UNP profile. When enabled, only devices successfully authenticated are classified into the profile.

unp profile *profile_name* **authentication-flag**

no unp profile *profile_name* **authentication-flag**

Syntax Definitions

profile_name	The name of a UNP profile.

Defaults

By default, the authentication flag is disabled for the profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the authentication flag for the profile configuration.
- When the authentication flag is enabled for a profile, devices that did not pass L2 authentication (802.1X or MAC) are not allowed into the profile. However, other configured classification options are applied to such devices to determine the appropriate network access control for that device.

Examples

```
-> unp profile unp-prof1 authentication-flag
-> no unp profile unp-prof1 authentication-flag
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileAuthenticationFlag
```

unp profile mobile-tag

Configures the mobile tag status for the specified UNP profile. When enabled, the first user that is learned on a UNP port and classified into the specified UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created.

unp profile *profile_name* **mobile-tag**

no unp profile *profile_name* **mobile-tag**

Syntax Definitions

profile_name	The name of a UNP profile.

Defaults

By default, the mobile tag status is disabled for the profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the mobile tag status for the profile configuration.
- When the mobile tag status is disabled for a profile, any user device classified into the profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association would be determined based on the user traffic which was learned as tagged or untagged, respectively.
- If the device port is already an untagged member of the VLAN associated with the profile, then a tagged association is not created.

Examples

```
-> unp profile unp-prof1 mobile-tag
-> no unp profile unp-prof1 mobile-tag
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
show unp profile	Displays the UNP profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileMobileTag
```

unp profile maximum-ingress-bandwidth

Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified profile.

unp profile *profile_name* **maximum-ingress-bandwidth** *bps***[k | m]**

no unp profile *profile_name* **maximum-ingress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum ingress bandwidth value is not defined for the profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress bandwidth value for the specified profile. If a maximum ingress depth value is set for the same profile, then both the maximum ingress bandwidth and depth values must be removed together (on the same command line).
- If the maximum ingress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum ingress bandwidth value is set to zero, then all ingress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

Examples

```
-> unp profile unp-prof1 maximum-ingress-bandwidth 100
-> unp profile unp-prof1 maximum-ingress-bandwidth 10m
-> no unp profile unp-prof1 maximum-ingress-bandwidth

-> unp profile unp-prof1 maximum-ingress-bandwidth 100
-> unp profile unp-prof1 maximum-ingress-depth 50
-> no unp profile unp-prof1 maximum-ingress-bandwidth maximum-ingress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-ingress-depth	Configures how much the traffic can burst over the maximum ingress bandwidth rate.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileMaxIngressBandwidth
```

unp profile maximum-egress-bandwidth

Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified profile.

unp profile *profile_name* **maximum-egress-bandwidth** *bps***[k | m]**

no unp profile *profile_name* **maximum-egress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum egress bandwidth value is not defined for the profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the maximum egress bandwidth value for the specified profile. If a maximum egress depth value is set for the same profile, then both the maximum egress bandwidth and depth values must be removed together (on the same command line).
- If the maximum egress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum egress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

Examples

```
-> unp profile unp-prof1 maximum-egress-bandwidth 100
-> unp profile unp-prof1 maximum-egress-bandwidth 10m
-> no unp profile unp-prof1 maximum-egress-bandwidth

-> unp profile unp-prof1 maximum-egress-bandwidth 100
-> unp profile unp-prof1 maximum-egress-depth 50
-> no unp profile unp-prof1 maximum-egress-bandwidth maximum-egress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-egress-depth	Configures how much the traffic can burst over the maximum egress bandwidth rate.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileMaxEgressBandwidth
```

unp profile maximum-ingress-depth

Configures the maximum ingress queue depth or bucket size assigned to each port that is associated with the specified UNP profile. The depth value is configured in bytes and is used for traffic metering. The queue depth or bucket size determines the amount of buffers allocated to the UNP port. When the queue or bucket size is reached, the switch starts dropping packets.

unp profile *profile_name* **maximum-ingress-depth** *bytes*

no unp profile *profile_name* **maximum-ingress-depth**

Syntax Definitions

profile_name	The name of a UNP profile.
bytes	The maximum ingress depth value in bytes. The valid range is 0–16384.

Defaults

By default, the maximum ingress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress depth value from the profile.
- The maximum ingress depth value is configured in conjunction with the maximum ingress bandwidth parameter. When the ingress depth value is reached, the switch starts to drop packets.
- Configure the maximum ingress bandwidth rate (**unp profile maximum-ingress-bandwidth**) before attempting to set the maximum ingress depth value.
- The maximum ingress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

Examples

```
-> unp profile unp-prof1 maximum-ingress-bandwidth 10
-> unp profile unp-prof1 maximum-ingress-depth 5
-> no unp profile unp-prof1 maximum-ingress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-ingress-bandwidth	Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified profile.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileMaxIngressDepth
```

unp profile maximum-egress-depth

Configures the maximum ingress queue depth or bucket size assigned to each port that is associated with the specified UNP profile. The depth value is configured in bytes and is used for traffic metering. The queue depth or bucket size determines the amount of buffers allocated to the UNP port. When the queue or bucket size is reached, the switch starts dropping packets.

unp profile *profile_name* **maximum-egress-depth** *bytes*

no unp profile *profile_name* **maximum-egress-depth**

Syntax Definitions

profile_name	The name of a UNP profile.
bytes	The maximum egress depth value in bytes. The valid range is 0–16384.

Defaults

By default, the maximum egress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the maximum egress depth value from the profile.
- The maximum egress depth value is configured in conjunction with the maximum egress bandwidth parameter. When the egress depth value is reached, the switch starts to drop packets.
- Configure the maximum egress bandwidth rate (**unp profile maximum-egress-bandwidth**) before attempting to set the maximum egress depth value.
- The maximum egress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

Examples

```
-> unp profile unp-prof1 maximum-egress-bandwidth 10
-> unp profile unp-prof1 maximum-egress-depth 5
-> no unp profile unp-prof1 maximum-egress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-egress-bandwidth	Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified UNP profile.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileMaxEgressDepth
```

unp profile inactivity-interval

Configures whether or not an authenticated device is automatically logged out of the network after a specific period of inactivity (MAC address for the device has aged out). This timer value applies only to devices learned in the specified profile.

unp profile *profile_name* **inactivity-interval** *seconds*

Syntax Definitions

profile_name	The name of a UNP profile.
seconds	The inactivity timer value. The valid range is 10 to 600 seconds.

Defaults

By default, the inactivity interval value is set to 10 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Make sure the configured inactivity interval time is set to a value greater than the MAC address aging time for the switch.
- When a specific time is configured for the inactivity interval timer, the device is not logged out of the network if the MAC address aging time expires before the configured timer value.
- When the inactivity interval time is changed for the profile, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- If a user undergoes MAC authentication and then secondary Captive Portal authentication, the higher of the two inactivity logout timer values returned is applied to the device.
- An inactivity logout timer value is also configurable through authentication, authorization, and accounting (AAA) commands. The value set through the AAA commands takes precedence over the inactivity interval value set for the UNP.

Examples

```
-> unp profile unp-prof1 inactivity-interval 500
-> unp profile unp-prof1 inactivity-interval 10
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileInactivityInterval
```

unp profile mac-mobility

Configures the MAC address mobility status for the specified UNP service profile. Enable MAC address mobility for a UNP service profile to support VRRP router communication over an SPB service domain.

unp profile *profile_name* **mac-mobility**

no unp profile *profile_name* **mac-mobility**

Syntax Definitions

profile_name	The name of a UNP profile that is mapped to SPB service parameters.

Defaults

By default, the MAC mobility status for the SPB service-mapped profile is set to the global MAC mobility status when the profile is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the MAC mobility status for the profile configuration.
- When the MAC mobility status is disabled for a profile, VRRP MAC address movement that is required for the VRRP master/slave election process is disrupted. This may cause a VRRP configuration to generate two VRRP masters within the SPB service domain.
- Although the MAC mobility status is configured for UNP profiles, it's functionality is supported only on profiles mapped to SPB services. SPB service-mapped profiles generate Service Access Points (SAPs) on which a VRRP router can communicate with other VRRP routers across the SPB service domain.
- To support VRRP router communication over an SPB service domain, the following configuration is required:
  - Enable MAC address mobility for the SPB service-mapped UNP profile.
  - Assign the service profile to a UNP access port to create a persistent UNP SAP on which a VRRP router will communicate. A persistent SAP does not age out and will ensure an uninterrupted flow of VRRP advertisements between the VRRP master and slave routers.

Examples

```
-> unp profile unp-prof1 mac-mobility
-> no unp profile unp-prof1 mac-mobility
```

Release History

Release 8.6R1; command was introduced.

Related Commands

unp mac-mobility	Configures the global MAC mobility status for the switch.
unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile map service-type spb	Configures the mapping of SPB service parameters to the specified UNP profile. The service parameter values are used to define an SPB SAP on which profile traffic is forwarded.
show unp profile	Displays the UNP profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileMacMobility
```

unp profile saa-profile

Assigns a Service Assurance Agent (SAA) profile to the specified UNP profile. Although an SAA profile can be assigned to a UNP profile with this command, an SAA profile is mainly used by the OmniVista network management application to monitor connections between virtual machines (VMs) in a data center network.

unp profile *profile_name* **saa-profile** *profile_name*

no unp profile *profile_name* **saa-profile**

Syntax Definitions

profile *profile_name*	The name of a UNP profile.
saa-profile *profile_name*	The name of the SAA profile to assign to the UNP profile.

Defaults

By default, no SAA profile is assigned to a UNP profile.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove an SAA profile assignment from a UNP profile configuration.
- The SAA profile specified with this command must already exist in the switch configuration.

Examples

```
-> unp profile unp-prof1 saa-profile saa1
-> no unp profile unp-prof1 saa-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp saa-profile	Configures an SAA profile.
show unp saa-profile	Displays the SAA profile configuration for the switch.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
   alaDaUNPProfileSaaProfile
```

unp profile map vlan

Configures the mapping of a standard VLAN to a UNP profile. When a device is assigned to a profile through authentication or classification, the device and the port on which the device was learned are dynamically assigned to the VLAN that is mapped to the profile.

unp profile *profile_name* **map vlan** *vlan_id*

Syntax Definitions

profile_name	The name of an existing UNP profile.
vlan_id	The VLAN ID number to associate with the specified profile name. Devices assigned to the profile are assigned to the associated VLAN.

Defaults

By default, no mapping configuration is applied to a profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Removing a VLAN mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- The VLAN associated with a profile must already exist in the switch configuration, unless one of the following conditions occur:
  - The dynamic VLAN configuration functionality is enabled for the switch.
  - The VLAN mapping to a profile is done when the switch boots up.
- Configuring a new VLAN mapping for a profile will overwrite the existing VLAN mapping for that profile. Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.

Examples

```
-> unp profile unp1-vlan map vlan 10
-> no unp profile unp1-vlan
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile.
unp dynamic-vlan-configuration	Configures the global UNP status for dynamic VLAN configuration.
unp profile map service-type spb	Maps SPB parameters to a profile. The parameters are used for creating an SPB service access point (SAP) to forward profile traffic.
unp profile map service-type vxlan	Maps VXLAN parameters to a profile. The parameters are used for creating a VXLAN service access point (SAP) to forward profile traffic.
unp profile map service-type static	Maps an existing SPB or VXLAN service ID to a profile.
show unp profile map	Displays the VLAN or service mapping configuration assigned to a UNP profile.

MIB Objects

```
alaDaUNPProfileTable
   alaDaUNPProfileName
alaDaUNPProfileMapVlanTable
   alaDaUNPProfileMapVlanVlanID
```

unp profile map service-type spb

Configures the mapping of Shortest Path Bridging (SPB) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, an SPB service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

unp profile *profile_name* **map service-type spb tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id* **[multicast-mode {headend | tandem}] [vlan-xlation] [igmp-snooping [profile {default |** *ipms_profile***}] [mld-snooping [profile {default |** *ipms_profile***}]**

no unp profile *profile_name* **map service-type spb [vlan-xlation] [igmp-snooping [profile]] [mld-snooping [profile]]**

Syntax Definitions

profile_name	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
headend	Specifies the head-end replication mode for the service associated with this UNP.
tandem	Specifies the tandem replication mode for the service associated with this UNP.
vlan-translation	Configures egress VLAN translation for the service associated with this UNP.
igmp-snooping	Configures IGMP snooping for the service associated with this UNP.
mld-snooping	Configures MLD snooping for the service associated with this UNP.
ipms_profile_name	The name of an optional IP Multicast Switching profile to use when IGMP or MLD snooping is enabled.
default	Use default IPMS profile settings for IGMP or MLD snooping.

Defaults

By default, no mapping configuration is applied to a profile. When the SPB mapping is configured, the following default values are applied for the optional parameters:

parameter	default
multicast-mode {headend | tandem}	headend

parameter	default
vlan-xlation	disabled
igmp-snooping	disabled
mld-snooping	disabled
default | *ipms_profile_name*	default

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable VLAN translation, IGMP snooping, and MLD snooping for the UNP service profile. To remove any other SPB mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- Configuring a new SPB mapping for a profile will overwrite the existing SPB mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the SPB service that is dynamically created based on the specified I-SID and BVLAN values.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and I-SID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- If the I-SID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- The BVLAN ID specified with this command must already exist in the switch configuration.

- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- When an SPB service is configured to use the head-end multicast mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem multicast mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.
- When configuring the IGMP and MLD snooping mapping parameters, it is necessary to also configure the VLAN translation and multicast mode status for the profile mapping.

Examples

```
-> unp profile unp1-spb map service-type spb tag-value 10 isid 1510 bvlan 4001
-> unp profile unp2-spb map service-type spb tag-value 20 isid 1520 bvlan 4002
multicast-mode tandem vlan-xlation
-> unp profile unp3-spb map service-type spb tag-value 30 isid 1530 bvlan 4003
vlan-xlation multicast-mode headend igmp-snooping mld-snooping
-> unp profile unp4-spb map service-type spb tag-value 40 isid 1540 bvlan 4004
vlan-xlation multicast-mode headend igmp-snooping profile ipms-prof1
-> unp profile unp4-spb map service-type spb tag-value 40 isid 1540 bvlan 4004
vlan-xlation multicast-mode headend mld-snooping profile default

-> no unp profile unp1-spb
-> no unp profile unp2-spb map service-type spb vlan-xlation
-> no unp profile unp3-spb map service-type igmp-snooping
-> no unp profile unp3-spb map service-type mld-snooping
-> no unp profile unp4-spb map service-type mld-snooping profile
-> no unp profile unp4-spb map service-type mld-snooping
```

Release History

Release 8.3.1; command was introduced.
Release 8.6R1; **igmp-snooping** and **mld-snooping** parameters added.

Related Commands

unp profile map service-type vxlan

Configures the mapping of Virtual eXtensible LAN (VXLAN) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, a VXLAN service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

unp profile *profile_name* **map service-type vxlan tag-value {0 |** *qtag* | *outer_qtag:inner_qtag***} vnid** *vxlan_id* **{far-end-ip-list** *ip_list_name* **[multicast-group** *mc_group_address***] | multicast-group** *mc_group_address* **[far-end-ip-list** *ip_list_name***]} [multicast-mode [tandem | headend | hybrid] [vlan-xlation]**

no unp profile *profile_name* **map service-type vxlan [far-end-ip-list | multicast-group | vlan-xlation]**

Syntax Definitions

profile_name	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
vxlan_id	The VXLAN network identifier that identifies the VLAN segment form where the frames originate. This value is used to create the VXLAN service that is required to dynamically create the SAP.
ip_list_name	The name of an existing list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The valid range is 1–32 characters. The IP addresses in this list are used to dynamically create service distribution points (SDPs) for the VXLAN service.
mc_group_address	The multicast IP address of the group to which this service will join.
tandem	Specifies the tandem replication mode for the service associated with this UNP. This mode uses PIM routing and sends traffic through multicast SDPs.
headend	Specifies the head-end replication mode for the service associated with this UNP. This mode sends traffic through unicast SDPs.
hybrid	Specifies the hybrid replication mode for the service associated with this UNP. This mode uses both the head-end and tandem methods.
vlan-translation	Configures egress VLAN translation for the VXLAN service associated with this UNP.

Defaults

By default, no mapping configuration is applied to a profile. When the VXLAN mapping is configured, the following default values are applied for the optional parameters:

parameter	default
multicast-mode {headend | tandem | hybrid}	hybrid
vlan-xlation {enable | disable}	disabled

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to disable VLAN translation, remove a far-end IP list, or remove a multicast group IP address for the profile. To remove any other VXLAN mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- Configuring a new VXLAN mapping for a profile will overwrite the existing VXLAN mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
  - If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
  - If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the VXLAN service that is dynamically created based on the specified VXLAN ID value.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP on which the traffic is forwarded.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is forwarded on the SAP. If the traffic tags do not match, traffic is not forwarded on the SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags). If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one based on the profile attributes for the profile traffic.

- If the VXLAN ID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- Configuring both a far-end IP list and a multicast group IP address is allowed for the same profile.
- The following multicast modes are supported for a VXLAN service:
  - **Tandem**: In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This also requires the manual configuration of a multicast SDP object to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
  - **Headend**: In this mode, unicast SDP objects are manually configured to tunnel traffic to the far-end nodes. In this case, PIM multicast routing is not required. Any BUM traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
  - **Hybrid**: In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.
- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.

Examples

```
-> unp profile unp1-vxlan map service-type vxlan tag-value 10:12 vnid 100
multicast-group 225.1.1.1
-> unp profile unp2-vxlan map service-type vxlan tag-value 15 vnid 200 far-end-ip-
list vtep-list1 vlan-xlation
-> unp profile unp3-vxlan map service-type vxlan tag-value 0 vnid 200 far-end-ip-
list vtep-list2 multicast-group 225.1.1.2
-> no unp profile unp3-vxlan map service-type vxlan vlan-xlation far-end-ip-list
-> no unp profile unp2-vxlan
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile.
unp profile map vlan	Maps VLAN IDs to a UNP profile. Traffic assigned to the profile is forwarded on the associated VLAN IDs.

   alaDaUNPProfileMapVxlanEncapVal
   alaDaUNPProfileMapVxlanVnid
   alaDaUNPProfileMapVxlanFarEndIPList
   alaDaUNPProfileMapVxlanMulticastIPAddressType
   alaDaUNPProfileMapVxlanMulticastIPAddress
   alaDaUNPProfileMapVxlanVlanXlation
   alaDaUNPProfileMapVxlanMulticastMode
```

unp vxlan far-end-ip-list

Configures a list of IP addresses, each of which is assigned to the Loopback0 interface of a far-end VXLAN node. The list name is assigned to a profile through the mapping of VXLAN service parameters to the profile. This allows multiple far-end nodes to be associated with the service created for the VXLAN Network ID (VNID) specified in the VXLAN profile.

unp vxlan far-end-ip-list *ip_list_name ip_address* **[***ip_address***]**

no unp vxlan far-end-ip-list *ip_list_name* **[***ip_address* **[***ip_address***]]**

Syntax Definitions

ip_list_name	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEP). The valid range is 1–32 characters.
ip_address	The IP address of the Loopback0 interface for the far-end VTEP node. The Loopback0 address is required on every VXLAN node that serves as a VTEP. Use a space to specify a list of IP addresses to assign to the list name.

Defaults

N/A

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the far-end list from the switch configuration or to remove an individual IP address from the list.
- The reachability of a far-end IP address is not tested. Make sure the addresses are valid before adding them to the list.
- There is no limit to the number of IP addresses that can be assigned to a single list.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- The far-end IP list is used to build service distribution points (SDPs) for VXLAN services.
- When there is any change to the VXLAN profile, all users associated with that profile are flushed.
- Configuring VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.

Examples

```
-> unp vxlan far-end-ip-list vtep-list1 10.1.1.1 11.1.1.1 12.1.1.1 13.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1 10.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1
```

```

unp profile map service-type l2gre

Configures the mapping of a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, an L2 GRE Service Access Point (SAP) is dynamically created using the specified service parameters. Traffic from the device is then encapsulated and forwarded through an L2 GRE tunnel to a tunnel aggregation switch.

unp profile *profile_name* **map service-type l2gre tag-value {0 |** *qtag* | *outer_qtag:inner_qtag***} vpnid** *vpn_id* **{far-end-ip-list** *ip_list_name* **| far-end-ip** *ip_address***} [port-isolation-disable] [vlan-xlation]**

no unp profile *profile_name* **map service-type l2gre [far-end-ip-list | far-end-ip | vlan-xlation]**

Syntax Definitions

profile_name	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
vpn_id	A GRE tunnel Virtual Private Network (VPN) ID. This is a unique value that is used in the header of a GRE encapsulated packet and should be the same at both ends of a Guest Tunnel.
ip_list_name	The name of an existing list that contains the IP address of the Loopback0 interface configured on the far-end tunnel aggregation switch. The valid range is 1–32 characters. The IP address in this list is used to dynamically create the L2 GRE tunnel from the edge switch to the tunnel aggregation switch.
ip_address	The IP address of the Loopback0 interface configured on the far-end tunnel aggregation switch.
vlan-xlation	Configures egress VLAN translation for the service associated with this UNP.

Defaults

By default, no mapping configuration is applied to a profile. When the L2 GRE tunnel service mapping is configured, the following default values are applied for the optional parameters:

parameter	default
vlan-xlation	disabled

Platforms Supported

OmniSwitch 6560, 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **no** form of this command to do the following;
  - remove a far-end IP list or a far-end IP address for the profile.
  - disable VLAN translation for the dynamic SAP.
- To remove any other L2 GRE mapping parameters requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the L2 GRE tunnel that is dynamically created based on the specified VPN ID value.
- The same far-end IP address can be used for multiple L2 GRE tunnels that have to reach the same far-end tunnel aggregation switch.
- Configuring a new L2 GRE tunnel mapping for a profile will overwrite the existing tunnel mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, L2 GRE tunnel, or static) is associated with a profile at any given time.
- A UNP L2 GRE profile is applied to users learned on UNP bridge and access ports.
  - Classifying users learned on UNP bridge ports into an L2 GRE profile is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, 6900-X72, and OmniSwitch 9900.
  - Classifying users learned on UNP access ports into an L2 GRE profile is supported on the OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, 6900-X72, and OmniSwitch 9900.
  - Only one UNP L2 GRE profile (one L2 GRE service) can be applied to users learned on UNP bridge ports. The exception to this is on an OmniSwitch 6560 where up to eight UNP L2 GRE profiles (eight L2 GRE services) can be applied to users learned on UNP bridge ports.
  - Multiple UNP L2 GRE profiles (multiple L2 GRE services) can be applied to users learned on UNP access ports.
  - When users are learned on UNP bridge ports and classified into an L2 GRE profile, the VLAN translation status is not applied. VLAN translation only applies to user traffic learned on UNP access ports.
  - The mobile tag functionality is supported on UNP L2 GRE profiles and is applied when users learned on UNP access ports are dynamically assigned to the profile; this functionality is not supported for users learned on UNP bridge ports. Use the **unp profile mobile-tag** command to configure the mobile tag status for the profile.
  - There is no VLAN association with the SAP created for the L2 GRE tunnel, so all traffic egressing on the UNP bridge port will be untagged.
- UNP first checks the switch configuration to see if an L2 GRE tunnel SAP already exists for the expected VPN ID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one based on the profile attributes for the profile traffic.
- If the GRE tunnel VPN ID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the UNP GRE tunnel profile are learned as filtering.

Examples

```
-> unp profile guest-profile map service-type l2gre tag-value 0 vpnid 100 far-end-
ip 192.168.10.1
-> unp profile guest-profile map service-type l2gre tag-value 0 vpnid 100 far-end-
ip-list l2greEndpoint
-> unp profile guest-profile map service-type l2gre tag-value 0 vpnid 200 far-end-
ip 192.168.10.1 vlan-xlation
-> no unp profile guest-profile map service-type l2gre far-end-ip-list
-> no unp profile guest-profile map service-type l2gre vlan-xlation
-> no unp profile guest-profile map service-type l2gre
-> no unp profile guest-profile
```

Release History

Release 8.4.1.R02; command was introduced.
Release 8.6R1; **vlan-xlation** parameter added.

Related Commands

unp profile	Configures a UNP profile.
unp profile mobile-tag	Configures the mobile tag status for the specified profile.
unp l2gre far-end-ip-list	Configures a list of IP addresses that represent far-end Guest Tunnel Termination Switch.
show unp profile map	Displays the VLAN or service mapping configuration for the profile.

   alaDaUNPProfileMapL2GreFarEndIPAddress
   alaDaUNPProfileMapL2GreFarEndIPList
   alaDaUNPProfileMapL2GreRowStatus
   alaDaUNPProfileMapL2GreVlanXlation
```

unp l2gre far-end-ip-list

Configures an IP address list that contains the IP address of the Loopback0 interface configured on the far-end L2 GRE tunnel aggregation switch. The list name is assigned to a profile through the mapping of L2 GRE tunnel parameters to the profile.

unp l2gre far-end-ip-list *ip_list_name ip_address*

no unp l2gre far-end-ip-list *ip_list_name* **[***ip_address***]**

Syntax Definitions

ip_list_name	The name of the list that contains the IP address for the far-end tunnel aggregation switch. The valid range is 1–32 characters.
ip_address	The IP address of the Loopback0 interface for the far-end tunnel aggregation switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **no** form of this command to remove the far-end list from the switch configuration or to remove the IP address from the list.
- Only one IP address can be assigned to a single list.
- The reachability of a far-end IP address is not tested. Make sure the IP address is valid before adding the address to the list.
- The same far-end IP list can be used on multiple L2 GRE tunnel access switches that have to reach the same tunnel aggregation switch.
- The far-end IP list is used to build L2 GRE tunnels to the tunnel aggregation switch.
- When there is any change to the L2 GRE profile associated with the far-end IP list, all users associated with that profile are flushed.

Examples

```
-> unp l2gre far-end-ip-list l2gre-ip-list 192.168.10.1
-> no unp l2gre far-end-ip-list l2gre-ip-list 192.168.10.1
-> no unp l2gre far-end-ip-list l2gre-ip-list
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

```

unp profile map service-type static

Configures the mapping of an existing Shortest Path Bridging (SPB) or Virtual eXtensible LAN (VXLAN) service ID to the specified UNP profile. This type of profile mapping is only valid if the specified SPB or VXLAN service is already configured; the switch does not dynamically create the service. The specified service ID is then used to dynamically create a service access point (SAP) based on the specified tag value.

unp profile *profile_name* **map service-type static tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **service-id** *service_id*

Syntax Definitions

profile_name	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
service_id	An existing (statically configured) numerical value that identifies a specific SPB or VXLAN service. The valid service ID range is 1–32767. *Specifying a VXLAN service ID is supported only on the OmniSwitch 6900-V72, OmniSwitch 6900-C32, OmniSwitch 6900-Q32, and OmniSwitch 6900-X72.*

Defaults

By default, no mapping configuration is applied to a profile.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Removing a static service mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- Configuring a new static service mapping for a profile will overwrite the existing static service mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.

- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the service ID value specified with this command.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and service ID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- When there is a MAC flush for all UNP users learned and forwarded on the static service ID:
  - UNP triggers the removal of all dynamic SAPs associated with the service ID.
  - The service ID is not removed because the service was statically created; not dynamically generated through UNP.
- A static service ID cannot be removed until all the UNP users learned and forwarded on that service and associated SAPs are deleted.

Examples

```
-> unp profile unp1-static map service-type static tag-value 10 service-id 1
-> unp profile unp2-static map service-type static tag-value 20 service-id 2
-> no unp profile unp1-static
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile.

   alaDaUNPProfileName
alaDaUNPProfileMapStaticTable
   alaDaUNPProfileMapStaticEncapVal
   alaDaUNPProfileMapStaticServiceID
```

unp system-default service-mod

Specifies the modulo number that the switch will use to dynamically calculate an SPB Service Instance Identifier (I-SID) value or a VXLAN Network Identifier (VNID) value for a System Default profile. System Default profiles are dynamically created to accommodate device traffic received on UNP access ports that is not classified into a user-defined UNP service profile.

unp system-default service-mod {*mod_number* **| default}**

Syntax Definitions

mod_number	The modulo number to use for calculating an SPB I-SID or VNID value. The valid range is 1–4096.
default	Sets the modulo number value back to the default value.

Defaults

By default, modulo 512 is used for the System Default profile calculation.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A System Default profile is defined to carry traffic for an SPB service or for a VXLAN service based on the dynamic service setting for the UNP access port on which the traffic is received (see the **unp dynamic-service** command**)**. For example:
  - If the dynamic service value is set to SPB, then the System Default profile is dynamically created with attributes to define an SPB SAP.
  - If the dynamic service value is set to VXLAN, then the System Default profile is dynamically created with attributes to define a VXLAN SAP.
- One of the attributes defined for a System Default profile is an SPB I-SID or VXLAN VNID. This value is dynamically calculated using the base service number, modulo number, VLAN tag of the UNP port traffic, and the UNP port domain value. For example, if the base service number is 10000000, the modulo number is 512, the VLAN tag is 30, and the domain is 10, then the following calculation is used to determine the SPB I-SID or VXLAN VNID number:

  10000000 + (10 * 10000) + (30 % 512) = 10100030

  Based on the above calculation, “10100030” is the resulting service instance value.
- Once the SPB I-SID or VXLAN VNID number is determined, that number is used to derive the System Default profile name. For example:
  - The name of an SPB System Default profile is “SystemDefaultISID”, where ISID is the calculated attribute value for the profile. For example, if the calculated I-SID number is 10100030, then the SPB profile “SystemDefault10100030” is created.
  - The name of a VXLAN System Default profile is “SystemDefaultVNID”, where VNID is the calculated attribute value for the profile. For example, if the calculated VNID number is 10000100, then the VXLAN profile “SystemDefault10001000” is created.

- When the modulo number value is changed, all users learned in System Default profiles are flushed (logged out of the network) and dynamic SAPs created for the profiles are cleared.

Examples

```
-> unp system-default service-mod 800
-> unp system-default service-mod default
```

Release History

Release 8.5R1; command was introduced.

Related Commands

unp system-default vlan-xlation	Specifies the VLAN translation configuration to use for dynamic services that are created for System Default profiles.
unp system-default multicastgroup	Specifies the multicast group IP address to use for dynamic VXLAN services that are created for System Default profiles.
unp system-default far-end-ip-list	Specifies the name of a far-end IP list to associate with dynamic VXLAN services that are created for System Default profiles.
show unp global configuration	Displays the configurable System Default profile values for the switch.
unp dynamic-service	Configures whether the System Default service profile dynamically creates an SPB SAP or a VXLAN SAP based on the traffic received on the UNP access port.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceModule
```

unp system-default service-base

Specifies the base service number that the switch will use to dynamically calculate an SPB Service Instance Identifier (I-SID) value or a VXLAN Network Identifier (VNID) value for a System Default profile. System Default profiles are dynamically created to accommodate device traffic received on UNP access ports that is not classified into a user-defined UNP service profile.

unp system-default service-base {*base_number* **| default}**

Syntax Definitions

base_number	The base service number to use for calculating an SPB I-SID or VNID value. The valid range is 1–10000000.
default	Sets the base service number value back to the default value.

Defaults

By default, base service number 10,000,000 is used for the System Default profile calculation.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A System Default profile is defined to carry traffic for an SPB service or for a VXLAN service based on the dynamic service setting for the UNP access port on which the traffic is received (see the **unp dynamic-service** command**)**. For example:
  - If the dynamic service value is set to SPB, then the System Default profile is dynamically created with attributes to define an SPB SAP.
  - If the dynamic service value is set to VXLAN, then the System Default profile is dynamically created with attributes to define a VXLAN SAP.
- One of the attributes defined for a System Default profile is an SPB I-SID or VXLAN VNID. This value is dynamically calculated using the base service number, modulo number, VLAN tag of the UNP port traffic, and the UNP port domain value. For example, if the base service number is 10,000,000, the modulo number is 512, the VLAN tag is 30, and the domain is 10, then the following calculation is used to determine the SPB I-SID or VXLAN VNID number:

  10,000,000 + (10 * 10,000) + (30 % 512) = 10,100,030

  Based on the above calculation, “10,100,030” is the resulting service instance value.
- Once the SPB I-SID or VXLAN VNID number is determined, that number is used to derive the System Default profile name. For example:
  - The name of an SPB System Default profile is “SystemDefaultISID”, where ISID is the calculated attribute value for the profile. For example, if the calculated I-SID number is “10,100,030”, then the SPB profile “SystemDefault10100030” is created.
  - The name of a VXLAN System Default profile is “SystemDefaultVNID”, where VNID is the calculated attribute value for the profile. For example, if the calculated VNID number is “10,001,000”, then the VXLAN profile “SystemDefault10001000” is created.

- When the base service number value is changed, subsequent System Default profiles are created with the new value while profiles created with the previous base value are retained.

Examples

```
-> unp system-default service-base 5000
-> unp system-default service-base default
```

Release History

Release 8.5R1; command was introduced.

Related Commands

unp dynamic-service	Configures whether the System Default service profile dynamically creates an SPB SAP or a VXLAN SAP based on the traffic received on the UNP access port.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceBase
```

unp system-default multicastmode

Specifies the multicast replication mode configuration to use for dynamic services that are created for System Default profiles.

unp system-default multicastmode {tandem | headend | hybrid}

Syntax Definitions

tandem	Specifies the tandem replication mode for services dynamically created for System Default profiles.
headend	Specifies the head-end replication mode for services dynamically created for System Default profiles.
hybrid	Specifies the hybrid replication mode for services dynamically created for System Default profiles.

Defaults

By default, System Default profile services are configured to use the head-end mode.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The multicast mode selection specified with this command is a global setting that is applied to all of the dynamic services that are created for System Default profiles.
- The following multicast modes are supported for an SPB service:
  - **Tandem**: In this mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
  - **Headend**: In this mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- The following multicast modes are supported for a VXLAN service:
  - **Tandem**: In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This also requires the manual configuration of a multicast SDP object to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
  - **Headend**: In this mode, unicast SDP objects are manually configured to tunnel traffic to the far-end nodes. In this case, PIM multicast routing is not required. Any BUM traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
  - **Hybrid**: In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.

Examples

```
-> unp system-default multicastmode tandem
-> unp system-default multicastmode headend
```

```
-> unp system-default multicastmode hybrid
```

Release History

Release 8.5R1; command was introduced.
Release 8.6R2; **hybrid** parameter added.

Related Commands

unp system-default vlan-xlation	Specifies the VLAN translation configuration to use for dynamic services that are created for System Default profiles.
unp system-default multicastgroup	Specifies the multicast group IP address to use for dynamic VXLAN services that are created for System Default profiles.
unp system-default far-end-ip-list	Specifies the name of a far-end IP list to associate with dynamic VXLAN services that are created for System Default profiles.
show unp global configuration	Displays the configurable System Default profile values for the switch.
show unp profile map	Displays the VLAN or service mapping configuration for the profile.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceMulticastMode
```

unp system-default vlan-xlation

Specifies the VLAN translation configuration to use for dynamic services that are created for System Default profiles.

unp system-default vlan-translation {enable | disable}

Syntax Definitions

enable	Enables egress translation of VLAN tags.
disable	Disables egress translation of VLAN tags.

Defaults

By default, VLAN translation is enabled for System Default profile services.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The VLAN translation status specified with this command is a global setting that is applied to all of the dynamic services that are created for System Default profiles.
- When VLAN translation is enabled for a service, the VLAN tags for outgoing frames on SAPs associated with that service are processed according to the local SAP configuration (the SAP on which the frames will egress) and not according to the configuration of the SAP on which the frames were received.
- When VLAN translation is disabled, frames simply egress without any modification of the VLAN tags. In other words, the frames are transparently bridged without tag modification.

Examples

```
-> unp system-default vlan-xlation disable
-> unp system-default vlan-xlation enable
```

Release History

Release 8.5R1; command was introduced.

Related Commands

unp system-default multicastmode	Specifies the multicast replication mode configuration to use for dynamic services that are created for System Default profiles.
unp system-default multicastgroup	Specifies the multicast group IP address to use for dynamic VXLAN services that are created for System Default profiles.
unp system-default far-end-ip-list	Specifies the name of a far-end IP list to associate with dynamic VXLAN services that are created for System Default profiles.
show unp global configuration	Displays the configurable System Default profile values for the switch.
show unp profile map	Displays the VLAN or service mapping configuration for the profile.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceVlanXlation
```

unp system-default multicastgroup

Specifies a multicast group IP address to associate with dynamic VXLAN services that are created for System Default profiles.

unp system-default multicastgroup {*mc_group_address* | **default}**

Syntax Definitions

mc_group_address	The multicast IP address of the group to which this service will join.
default	Sets the multicast group IP address back to the default value (239.0.0.0).

Defaults

By default, a VXLAN service associated with a System Default profile will join the 239.0.0.0 multicast group.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- The multicast group IP address specified with this command is a global setting that is applied to all of the dynamic VXLAN services that are created for System Default profiles.
- When a dynamic VXLAN service is created for a System Default profile, the specified multicast group IP address is used to build a VXLAN Service Distribution Point (SDP) tunnel for the VXLAN service traffic. VXLAN nodes that subscribe to the same multicast group will receive traffic through the associated SDP tunnel from all the other VXLAN nodes that belong to the same multicast group.

Examples

```
-> unp system-default multicastgroup 225.1.1.2
-> unp system-default multicastgroup 239.0.0.0
-> unp system-default multicastgroup default
```

Release History

Release 8.5R1; command was introduced.

Related Commands

unp system-default multicastmode	Specifies the multicast replication mode configuration to use for dynamic services that are created for System Default profiles.
unp system-default vlan-xlation	Specifies the VLAN translation configuration to use for dynamic services that are created for System Default profiles.

show unp global configuration	Displays the configurable System Default profile values for the switch.
show unp profile map	Displays the VLAN or service mapping configuration for the profile.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceMulticastGroup
```

unp system-default far-end-ip-list

Specifies the name of a far-end IP list to associate with dynamic VXLAN services that are created for System Default profiles. The list contains IP addresses assigned to the Loopback0 interfaces of far-end VXLAN nodes. This allows multiple far-end nodes to be associated with the dynamic service created for the VXLAN Network ID (VNID) specified in a VXLAN System Default profile.

unp system-default far-end-ip-list {*ip_list_name* | **default}**

Syntax Definitions

ip_list_name	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Point (VTEP) nodes. The valid range is 1–32 characters.
default	Sets the far-end list name to the default value (no list name is specified).

Defaults

N/A

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- The far-end IP list name specified with this command is a global setting that is applied to all of the dynamic VXLAN services that are created for System Default profiles.
- When a dynamic VXLAN service is created for a System Default profile, the specified IP address list name is used to build VXLAN Service Distribution Point (SDP) tunnels between the VXLAN nodes. Traffic associated with the dynamic VXLAN service is encapsulated and sent through an SDP tunnel to the destined far-end node.

Examples

```
-> unp system-default far-end-ip-list vtep-list1
-> unp system-default far-end-ip-list default
```

Release History

Release 8.5R1; command was introduced.
Release 8.6R2; **default** parameter added.

Related Commands

unp system-default multicastmode	Specifies the multicast replication mode configuration to use for dynamic services that are created for System Default profiles.

unp system-default multicastgroup	Specifies the multicast group IP address to use for dynamic VXLAN services that are created for System Default profiles.
show unp global configuration	Displays the configurable System Default profile values for the switch.
show unp profile map	Displays the VLAN or service mapping configuration for the profile.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPServiceFarEndIpList
```

unp saa-profile

Configures a Service Assurance Agent (SAA) performance monitoring profile. This type of profile is assigned to UNP profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP profile.

unp saa-profile *profile_name* **[jitter-threshold** *jitter_thresh***] [latency-threshold** *latency_thresh***]**

no unp saa-profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the SAA profile.
jitter_thresh	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
latency_thresh	The latency threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

Defaults

parameter	default
jitter_thresh	0 (disabled)
latency_thresh	0 (disabled)

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the SAA profile from the switch configuration.
- Although SAA profiles can be configured and assigned to a UNP through the CLI, these profiles are mainly used by the OmniVista network management application to trigger SAA sessions that monitor connections between virtual machines (VMs) in a data center network.
- Assigning SAA profiles is supported only with UNP profiles that are assigned to UNP bridge ports. UNP access ports do not support this functionality.

Examples

```
-> unp saa-profile unp_saa1 jitter-threshold 100 latency-threshold 500
-> unp saa-profile unp_saa2 jitter-threshold 150
-> unp saa-profile unp_saa3 latency-threshold 250
```

Release History

Release 7.3.2; command was introduced.

Related Commands

unp profile saa-profile	Assigns an SAA profile to the specified UNP profile.
show unp saa-profile	Displays the SAA profile configuration for the switch.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```

   alaDaSaaProfileLatencyThreshold
   alaDaSaaProfileJitterThreshold
```

unp port-type

Configures UNP functionality for the specified port or link aggregate. This includes configuring the UNP port type (bridge or access). Traffic received on a UNP bridge port is classified using VLAN profiles and port attributes. Traffic received on a UNP access port is classified using service profiles and port attributes.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id1***[-***agg_id2***]} port-type {access | bridge}**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id1***[-***agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port1***[-***port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id1***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
access	Configures the specified port or link aggregate as a service access port. This port type is used for classifying traffic into service-based profiles. T*his parameter is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
bridge	Configures the specified port or link aggregate as a standard bridge port. This port type is used for classifying traffic into VLAN-based profiles.

Defaults

By default, UNP is disabled on all ports and link aggregates.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the UNP configuration from a port or link aggregate.
- Any configuration change to a UNP-enabled port will flush all MAC addresses learned on that port. This applies only to CLI commands used to configure UNP port parameters.
- Only one UNP port type is configurable for a specific port or link aggregate. To change the port type of an existing UNP port, remove the current UNP configuration first using the **no unp port** or **no unp linkagg** command then use the **unp port-type** command to set the new port type.
- There is no limit to the number of switch ports that can have UNP enabled.
- Enabling UNP is *not* supported on the following switch ports:
  - 802.1q-tagged ports.
  - MVRP ports.
  - Port Mirroring destination ports (MTP).

  - Port Mapping network ports.
  - STP and ERP ports.
  - Ports on which a static MAC address is configured.
  - Ports on which dynamic Source Learning is disabled.
  - VLAN Stacking (Ethernet Services NNI or UNI) ports.
  - Service Manager access and network ports.
  - Ethernet OAM ports.

- UNP and Learned Port Security (LPS) are supported on the same port with the following conditions:
  - LPS is not supported on link aggregates.
  - The LPS learning window is set globally but not on a per-port basis. So the window applies to all UNP ports.
  - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - Configuring a static MAC address is not allowed on a UNP port unless LPS is also enabled on the same port.
  - When both LPS and UNP are enabled on the same port, UNP first authenticates and classifies any MAC addresses received, then LPS rules are applied. If a MAC address violates any of the LPS rules for the port, the address may get filtered or the port violated even if UNP initially determined the address was valid. In other words, LPS rules take precedence over UNP to determine if a MAC address is bridged or filtered on the port.
  - If UNP classifies a MAC address as learning but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the **show unp user** command will display “LPS-Blocked” as the classification source for that MAC address.

- UNP ports support both tagged and untagged packets. If the VLAN ID of a tagged packet matches the VLAN associated with a UNP into which the packet was classified, the packet is learned as forwarding and a tagged VLAN-port association is created. However, if the VLAN ID tag does not match the VLAN ID associated with the profile, the packet is filtered.

- UNP bridge and access ports support single-tagged and double-tagged packets with the following conditions:
  - Double-tagged packets are treated the same as single-tagged packets in that UNP will only use the outer VLAN tag to determine how the packet is processed on the UNP bridge port.
  - UNP access ports use the inner VLAN tag of double-tagged packets received on the port to determine the service access port (SAP) to use or create for forwarding the traffic on the network backbone.

Examples

```
-> unp port 1/1 port-type access
-> unp port 1/1-3 port-type bridge
-> unp port 1/10 port-type access
-> no unp port 1/10
-> unp linkagg 5 port-type access
-> unp linkagg 8 port-type bridge
-> unp linkagg 2 port-type access
-> no unp linkagg 2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp admin-state	Configures the administrative status of the UNP configuration for the specified port or link aggregate.
unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortType
```

unp l2-profile

Assigns an existing Layer 2 profile to the specified UNP access port. This profile determines how Layer 2 protocol frames received on the access port are processed.

unp {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} l2-profile** *l2profile_name*

no unp {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} l2-profile**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
l2profile_name	The name of an existing Layer 2 profile.

Defaults

By default, the Layer 2 profile “unp-def-access-profile” is assigned when a port is configured as a UNP access port.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Layer 2 profile configuration from the UNP port.
- Specify only ports or link aggregates that are configured as UNP access ports. This command does not apply to UNP bridge ports.
- Specify a Layer 2 profile name that already exists in the switch configuration. Layer 2 profiles are created using the **service l2profile** command.

Examples

```
-> unp port 1/1/3 l2-profile sap_1_profile
-> unp linkagg 10 l2-profile sap_1_profile
-> unp port 1/1/3 l2-profile unp-def-access-profile
-> unp linkagg 10 l2-profile unp-def-access-profile
-> no unp port 1/1/3 l2-profile
-> no unp linkagg 10 l2-profile
```

Release History

Release 8.4.1; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
service l2profile	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.
show unp port config	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortL2Profile
```

unp redirect port-bounce

Enables or disables the port bounce action on the specified UNP bridge port or globally on all UNP bridge ports. When enabled, a port bounce is triggered upon receipt of a RADIUS Change of Authorization (COA) or a Disconnect request (DM) message from a redirection server to enforce a user role or terminate a user session.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} redirect port-bounce**

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} redirect port-bounce**

unp redirect port-bounce {enable | disable}

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
enable	Globally enables the port bounce function for all UNP bridge ports.
disable	Globally disables the port bounce function for all UNP bridge ports.

Defaults

By default, port bounce is disabled on all UNP bridge ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** parameter to enable port bounce for a specific UNP bridge port or link aggregate. Use the **no** form of this command to disable port bounce for a specific UNP bridge port or link aggregate. Note that port bounce is not supported on UNP access ports.
- Use the **enable** or **disable** parameters to globally enable or disable the port bounce status for all UNP bridge ports or link aggregates on the entire switch.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- The port bounce action only applies to a MAC authenticated non-supplicant (non-802.1X device). If the device is a supplicant (802.1X device), then an EAP-Fail frame is sent instead. In both cases, re-authentication is triggered for both types of devices.
- The port-level setting of the port bounce action overrides the global setting for the switch. The following table indicates when a port is toggled based on the status of port bounce at the global and port level:

Global Port Bounce	Per-Port Bounce	Action
Enabled	Disabled	Port is not toggled
Enabled	Enabled	Port is toggled
Disabled	Enabled	Port is toggled
Disabled	Disabled	Port is not toggled

- This command is used when configuring the switch to interact with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

Port-level configuration example:

```
-> unp port 1/1/6 redirect port-bounce
-> no unp port 1/1/6 redirect port-bounce
```

Global configuration example:

```
-> unp redirect port-bounce enable
-> unp redirect port-bounce disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; **no** form of this command added for specific port or link aggregate configuration.

Related Commands

   alaDaUNPRedirectPortBounce
```

unp 802.1x-authentication

Configures the status of 802.1X authentication for the specified UNP port. Enable this functionality to invoke 802.1X-based authentication for devices connected to the UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} 802.1x-authentication**

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} 802.1x-authentication**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

By default, 802.1X authentication is enabled on UNP ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable 802.1X authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- An option exists to classify a device into an alternate UNP in the event successful 802.1X authentication does not return a UNP name. See the **unp 802.1x-authentication pass-alternate** command.
- If UNP MAC authentication, 802.1X authentication, and classification (see **unp classification** and **unp mac-authentication**) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured.
- Configuring an authentication server down UNP (see **unp auth-server-down)** is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

– The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

Examples

```
-> unp port 1/1/5 802.1x-authentication
-> no unp port 1/1/5 802.1x-authentication

-> unp port 1/1/10-15 802.1x-authentication
-> no unp port 1/1/10-15 802.1x-authentication

-> unp linkagg 10 802.1x-authentication
-> no unp linkagg 20 802.1x-authentication

-> unp linkagg 10-50 802.1x-authentication
-> no unp linkagg 10-50 802.1x-authentication
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.

   alaDaUNPPortIfIndex
   alaDaUNPPort8021XAuthStatus
```

unp 802.1x-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate profile. A device is assigned to the alternate profile when successful 802.1X authentication does not return the name of a profile.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication pass-alternate** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} 802.1X-authentication pass-alternate**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing VLAN, SPB, or VXLAN profile.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1/1 802.1x-authentication pass-alternate Finance
-> unp port 1/1/1-3 802.1x-authentication pass-alternate CustomerA
-> no unp port 1/1/1-3 802.1x-authentication pass-alternate

-> unp linkagg 5 802.1x-authentication pass-alternate AltUNP
-> unp linkagg 10-15 802.1x-authentication pass-alternate CustomerB
-> no linkagg 5 mac-authentication pass-alternate
```

Release History

   alaDaUNPPort8021XPassAltProfileName
```

unp 802.1x-authentication tx-period

Configures the 802.1X authentication re-transmission time interval for the specified UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} 802.1x-authentication tx-period** *seconds*

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} 802.1x-authentication tx-period**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
seconds	The amount of time before an EAP Request Identity is retransmitted. The valid range is 1–60 seconds.

Defaults

By default, the retransmission period is set to 30 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the re-transmission time interval back to the default value of 30 seconds.
- The re-transmission time period only applies to UNP ports on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication tx-period 60
-> unp port 1/1/6-10 802.1x-authentication tx-period 20
-> no unp port 1/1/5 802.1x-authentication tx-period

-> unp linkagg 10 802.1x-authentication tx-period 60
-> unp linkagg 20-25 802.1x-authentication tx-period 20
-> no unp linkagg 10 802.1x-authentication tx-period
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XTxPeriod
```

unp 802.1x-authentication supp-timeout

Configures the 802.1X authentication supplicant timeout for the specified UNP port. This value is the amount of time the switch will wait before timing out an 802.1X user that is attempting to authenticate.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication supp-timeout** *seconds*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication supp-timeout**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15)
seconds	The timeout value. The valid range is 1–120 seconds.

Defaults

By default, the supplicant timeout value is set to 30 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the supplicant timeout back to the default value of 30 seconds.
- Increase the supplicant timeout value if the authentication process requires additional steps by the user (for example, entering a challenge).
- The supplicant timeout is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication supp-timeout 10
-> unp port 1/1/10-15 802.1x-authentication supp-timeout 60
-> no unp port 1/1/5 802.1x-authentication supp-timeout

-> unp linkagg 10 802.1x-authentication supp-timeout 40
-> unp linkagg 2-5 802.1x-authentication supp-timeout 40
-> no unp linkagg 10 802.1x-authentication supp-timeout
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XSuppTimeOut
```

unp 802.1x-authentication max-req

Configures the maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge) to an 802.1X user on the specified UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication max-req** *max_req*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication max-req**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
max_req	The maximum number of times information requests are retransmitted. The valid range is 1–3.

Defaults

By default, the maximum number of requests is set to two.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the maximum number of times information requests are retransmitted back to the default value of two.
- The 802.1X requests are transmitted, up to the maximum number allowed, until the authentication session is shut down based on the supplicant timeout value configured for the 802.1X port.
- The maximum number of requests is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication max-req 10
-> unp port 1/1/10-15 802.1x-authentication max-req 5
-> no unp port 1/1/5 802.1x-authentication max-req

-> unp linkagg 10 802.1x-authentication max-req 10
-> unp linkagg 2-5 802.1x-authentication max-req 5
-> no unp linkagg 10 802.1x-authentication max-req
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp 802.1x-authentication supp-timeout	Configures the number of seconds before the switch will time out an 802.1X user that is attempting to authenticate.

   alaDaUNPPort8021XMaxReq
```

unp 802.1x-authentication bypass-8021x

Configures whether the 802.1X authentication process is bypassed on the specified UNP port. When enabled, the 802.1X device authentication process is skipped; only MAC authentication or rule-based classification is applied to device traffic on the UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication bypass-8021x**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication bypass-8021x**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

By default, 801.1X authentication bypass is disabled on the UNP port; 802.1X authentication is attempted first.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- Enabling 802.1X authentication bypass is not allowed on UNP ports that are configured with an 802.1X authentication failure policy.

Examples

```
-> unp port 1/1/5 802.1x-authentication bypass-8021x
-> no unp port 1/1/5 802.1x-authentication bypass-8021x
-> unp port 1/1/10-15 802.1x-authentication bypass-8021x
-> no unp port 1/1/10-15 802.1x-authentication bypass-8021x

-> unp linkagg 10 802.1x-authentication bypass-8021x
-> no unp linkagg 10 802.1x-authentication bypass-8021x
-> unp linkagg 2-5 802.1x-authentication bypass-8021x
-> no unp linkagg 2-5 802.1x-authentication bypass-8021x
```

Release History

Release 7.3.4; command was introduced.

unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
unp mac-authentication allow-eap	Configures whether or not subsequent 802.1X authentication is attempted based on the MAC authentication results.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XBypassStatus
```

unp 802.1x-authentication failure-policy

Configures whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication failure-policy {mac}**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication failure-policy**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
mac	Perform MAC authentication if 802.1X authentication fails.

Defaults

By default, device classification is performed after the initial 802.1X authentication process fails.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuring the 802.1X authentication failure policy is not allowed on UNP ports on which 802.1X authentication bypass is enabled.
- Device classification (the default) is performed based on the classification options configured for the UNP port.

Examples

```
-> unp port 1/1/5 802.1x-authentication failure-policy mac
-> no unp port 1/1/10-15 802.1x-authentication failure-policy

-> unp linkagg 10 802.1x-authentication failure-policy mac
-> no unp linkagg 2-5 802.1x-authentication failure-policy
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
unp 802.1x-authentication bypass-8021x	Configures the 802.1X bypass operation status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XFailurePolicy
```

unp mac-authentication

Configures the status of MAC authentication for the specified UNP port. Enable this functionality to invoke MAC-based authentication for devices connected to the UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} mac-authentication**

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} mac-authentication**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, MAC authentication is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable MAC authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports (both bridge and access port types).
- MAC-based authentication is supported only through a RADIUS server.
- An option exists to classify a device into an alternate UNP in the event successful MAC authentication does not return a UNP name.
- If MAC authentication fails, any classification rules configured for the UNP port are applied.
- If UNP MAC authentication, 802.1X authentication, and classification (see **unp classification** and **unp 802.1x-authentication**) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured and/or trust VLAN tag is enabled for the port.
- Configuring an authentication server down UNP (see **unp auth-server-down)** is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.

- If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

Examples

```
-> unp port 1/1 mac-authentication
-> no unp port 1/1 mac-authentication
-> unp linkagg 2 mac-authentication
-> no unp linkagg 2 mac-authentication
```

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **linkagg** parameter added.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp mac-authentication pass-alternate	Assigns the device to another VLAN-based or service-based UNP when successful MAC authentication does not return a UNP name.
unp classification	Configures the classification status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortMacAuthFlag
```

unp mac-authentication pass-alternate

Configures the name of an existing VLAN-based or service-based UNP to use as an alternate profile. A device is assigned to the alternate profile when successful MAC authentication does not return a UNP name.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} mac-authentication pass-alternate** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} mac-authentication pass-alternate**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
profile_name	The name of an existing VLAN, SPB, or VXLAN profile.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- Service-based profiles classify traffic received on UNP access ports; VLAN-based profiles classify traffic received on UNP bridge ports. Make sure the specified port is of the correct type for the specified profile.
- The UNP name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1 mac-authentication pass-alternate Finance
-> unp port 1/1-3 mac-authentication pass-alternate CustomerA
-> unp port 1/4-10 mac-authentication pass-alternate CustomerC
-> no unp port 1/1-3 mac-authentication pass-alternate

-> unp linkagg 5 mac-authentication pass-alternate AltUNP
-> unp linkagg 1-5 mac-authentication pass-alternate CustomerB
-> unp linkagg 10-12 mac-authentication pass-alternate CustomerD
-> no linkagg 5 mac-authentication pass-alternate
```

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **linkagg** parameter added.
Release 7.3.1; **spb-profile** parameter added, **unp-name** parameter changed to **vlan-profile**.
Release 7.3.4; **vxlan-profile** parameter added.
Release 8.3.1; **vlan-profile**, **spb-profile**, and **vxlan-profile** parameters deprecated.

Related Commands

unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
unp port-type	Configures UNP functionality on a port or link aggregate.
unp mac-authentication	Configures the MAC authentication status for the UNP port.
show unp port	Displays the UNP port parameter configuration.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortPassAltProfileName
```

unp mac-authentication allow-eap

Configures whether the switch attempts subsequent 802.1X authentication for a device connected to a UNP port on which 802.1X authentication bypass is enabled. When 802.1X bypass is enabled on the port, MAC authentication is performed first on any device connected to that port. This command specifies the conditions under which 802.1X authentication is performed or bypassed after the initial MAC authentication process.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} mac-authentication allow-eap {pass | fail | noauth}**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} mac-authentication allow-eap**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
pass	Perform 802.1X (EAP frame) authentication if the device passes MAC authentication.
fail	Perform 802.1X (EAP frame) authentication if the device fails MAC authentication.
noauth	Perform 802.1X (EAP frame) authentication if MAC authentication is not configured on the UNP port.

Defaults

By default, the allow 802.1X authentication option is not set.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to set the allow 802.1X authentication option back to the default value of none (option is not set).
- The port specified with this command must also have 802.1X bypass enabled (see the **unp 802.1x-authentication bypass-8021x** command). If bypass is not enabled, the option configured with this command does not apply.
- This command is only allowed on UNP-enabled ports and link aggregates.

Examples

```
-> unp port 1/1/5 mac-authentication allow-eap pass
-> unp port 1/1/10-15 mac-authentication allow-eap fail
-> no unp port 1/1/5 mac-authentication allow-eap
```

```
-> unp linkagg 10 mac-authentication allow-eap noauth
-> unp linkagg 2-5 mac-authentication allow-eap none
-> no unp linkagg 10 mac-authentication allow-eap
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication bypass-8021x	Configures the 802.1X bypass operation status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortMacAllowEap
```

unp classification

Configures the classification status for the specified UNP port. When classification is enabled but authentication is disabled or fails, UNP classification rules (such as MAC address, MAC address range, IP network address, or VLAN tag) are applied to the traffic received on the UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} classification**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} classification**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

Defaults

By default, classification is enabled on the UNP port.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the classification status for a UNP port or link aggregate.
- This command is allowed only on UNP-enabled ports (both bridge and access ports).
- UNP classification rules are applied if authentication is disabled on the port, is enabled on the port but the RADIUS server is not configured, or the authentication method fails.
- If untagged device traffic does not match any of the classification rules, the device is assigned to the default UNP configured for the port.
- If tagged device traffic does not match any of the classification rules and the trust VLAN tag option (see **unp trust-tag**) is enabled for the port, the device is classified based on the VLAN tag of the traffic if a VLAN matching the tag exists in the switch configuration.
- If all of the UNP authentication methods *and* UNP classification are disabled for the UNP port, then all MAC addresses received on that port are blocked unless a default VLAN is specified and/or trust VLAN tag is enabled for the port.

- When classification is enabled for the port, UNP classification rules are applied in the following order of precedence:
  - MAC address + VLAN tag
  - MAC address
  - MAC address range + VLAN tag
  - MAC address range
  - IP address + VLAN tag
  - IP address
  - VLAN tag

Examples

```
-> unp port 1/1 classification
-> no unp port 1/1 classification
-> unp port 1/1-4 classification
ERROR: Port 1/3 is not a unp-port
-> unp linkagg 5 classification
-> no unp linkagg 5 classification
```

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **linkagg** parameter added.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortClassificationFlag
```

unp trust-tag

Configures the option of whether or not to trust the VLAN ID of a tagged packet to determine how the packet is classified.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} trust-tag**

no {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} trust-tag**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

Defaults

By default, the trust VLAN tag option is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the trust tag status for a UNP port or link aggregate.
- When this option is enabled, the device is classified into a VLAN or service access point (SAP) when one of the following conditions occur:
  - MAC or 802.1X authentication passes, but the RADIUS server returns a UNP that does not exist in the switch configuration.
  - MAC or 802.1X authentication passes, but the RADIUS server does not return a UNP and the alternate UNP option is disabled for the port.
  - Device traffic does not match any of the classification rules configured for the UNP port.
  - The UNP VLAN obtained from a matching classification rule does not exist in the switch configuration.
  - Auth-Server-Down UNP option is used, but the VLAN associated with that UNP does not exist in the switch configuration.
- When the trust tag option is triggered on a UNP bridge port and a VLAN exists in the switch configuration that matches the VLAN tag, a VLAN-port-association (VPA) is created between the UNP port and the matching VLAN even if the matching VLAN is *not* associated with a UNP.
- When the trust tag option is triggered on a UNP access port, the VLAN tag information is used to create a dynamic SAP (virtual port) to which the access port is associated.
- Enabling the trust VLAN ID tag option provides an implicit method of VLAN tag classification that will accept tagged traffic matching any of the existing UNPs without the need to create specific classification rules for those profiles.

Examples

```
-> unp port 1/1 trust-tag
-> unp port 1/1-4 trust-tag
-> no unp port 1/1 trust-tag

-> unp linkagg 5 trust-tag
-> unp linkagg 6-10 trust-tag
-> no unp linkagg 5 trust-tag
```

Release History

Release 7.2.1; command was introduced.

Related Commands

show unp port	Displays the UNP configuration for the port.
show unp user	Displays information about the devices learned on a UNP port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortTrustTagStatus
```

unp default-profile

Configures the name of an existing UNP classification profile to serve as the default UNP for the specified UNP port or link aggregate.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} default-profile** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} default-profile**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[-***port2***]**	The slot and port number (3/1) of a UNP-enabled port. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
profile_name	The name of an existing UNP classification profile.

Defaults

By default, there is no default profile configured for UNP ports or link aggregates.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the default UNP from the port configuration.
- This command is allowed only on UNP-enabled ports.
- The UNP classification profile specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
  - UNP authentication and classification are not enabled on the port.
  - MAC authentication fails.
  - Device traffic does not match any UNP classification rules.
  - The UNP trust VLAN tag option (see **unp trust-tag**) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist in the switch configuration.
  - Untagged device traffic is not classified.

Examples

```
-> unp port 1/1 default-profile Sales
-> no unp port 1/1 default-profile
-> unp port 1/1-4 default-profile Sales
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
```

```
-> unp port 1/1 default-profile BAD-UNP
ERROR: UNP doesn't exist
-> no unp port 1/1-4 default-profile
-> unp linkagg 5 default-profile VM1-Server1
-> no unp linkagg 5 default-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
unp port-type	Configures the status of UNP functionality on the port.
unp trust-tag	Configures whether or not a device is classified into an existing VLAN that matches the VLAN ID tag of the packets received from the device.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortDefaultProfileName
```

unp domain

Assigns a UNP port or link aggregate to a customer domain (UNP group).

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} domain** *domain_id*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} domain** *domain_id*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
domain_id	The numerical domain ID to which the specified port or link aggregate is assigned.

Defaults

By default, all UNP ports are assigned to customer domain zero (0).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The domain ID specified with this command must already exist in the switch configuration.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain, only classification rules associated with the same customer domain ID are applied to that port.

Examples

```
-> unp port 1/1 domain 1
-> unp port 1/1-3 domain 2
-> no unp port 1/1 domain 1
-> unp linkagg 5 domain 5
-> unp linkagg 8-10 domain 6
-> no unp linkagg 5 domain 5
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type	Configures the status of UNP for the specified port or link aggregate.
unp domain description	Creates a customer domain ID.
show unp domain	Displays the available customer domain IDs.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortDomainId
```

unp aaa-profile

Assigns the name of an existing authentication, authorization, and accounting (AAA) profile to the specified UNP port or link aggregate. This type of profile defines AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are applied to device traffic received on the UNP port to which the profile is assigned.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} aaa-profile** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} aaa-profile**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing AAA profile.

Defaults

By default, there is no AAA profile assigned to UNP ports or link aggregates. The global AAA configuration for the switch is applied.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the AAA profile from the port configuration.
- The AAA profile specified with this command must already exist in the switch configuration.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> unp port 1/1/5 aaa-profile A1
-> no unp port 1/1/5 aaa-profile

-> unp port 1/1/1-5 aaa-profile A2
-> no unp port 1/1/1-5 aaa-profile

-> unp linkagg 10 aaa-profile A3
-> no unp linkagg 10 aaa-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port-type	Configures UNP functionality for the specified port or link aggregate.
aaa profile	Configures an AAA configuration profile.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortAaaProfile
```

unp port port-template

Assigns the name of an existing port template to the specified UNP port or link aggregate. A port template defines UNP port configuration options (such as the type of authentication, classification status, a default profile) that are applied to the UNP port to which the template is assigned.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} port-template** *template_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} port-template**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
template_name	The name of an existing port template.

Defaults

By default, the “bridgeDefaultPortTemplate” port template is assigned to UNP bridge ports, and the “accessDefaultPortTemplate” port template is assigned to UNP access ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the port template from the port configuration.
- When a custom template is removed from a UNP port, the port reverts back to using the default template to define UNP port parameter options.
- The port template specified with this command must already exist in the switch configuration.
- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.

Examples

```
-> unp port 1/1/5 port-template up1
-> unp port 1/1/1-5 port-template up2
-> no unp port 1/1/5 port-template
-> no unp port 1/1/1-5 port-template

-> unp linkagg 10 port-template up3
-> unp linkagg 10-50 port-template up4
-> no unp linkagg 10 port-template
-> no unp linkagg 10-50 port-template
```

```
-> unp port 1/10 802.1x-authentication
ERROR: Port Template already enforced on port, please remove it for manual config
on Port
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type	Configures the UNP status and port type for the specified port or link aggregate.
unp port-template	Configures a port template.
show unp port config	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortPortTemplate
```

unp direction

Configures whether network access control is applied to both incoming and outgoing traffic or only applied to incoming traffic on the specified UNP bridge port or link aggregate.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} direction {both | in}**

no unp {port *chassis//slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} direction**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
both	Enables bidirectional network access control on the specified port or link aggregate.
in	Enables network access control for incoming traffic only on the specified port or link aggregate.

Defaults

By default, bidirectional network access control is enabled on the port.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the network access control direction to the default (**both**).
- When the port control direction is set to **both**, egress broadcast, unknown unicast, and multicast traffic is blocked on the UNP port.
- When the port control direction is set to **in**, egress broadcast, unknown unicast, and multicast traffic is allowed on the UNP port.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.

Examples

```
-> unp port 1/1/5 direction in
-> unp port 1/1/10-15 direction both
-> no unp port 1/1/10-15 direction

-> unp linkagg 10 direction in
-> unp linkagg 2-5 direction both
-> no unp linkagg 2-5 direction
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortAdminControlledDirections
```

unp admin-state

Enables or disables the UNP configuration for a port or link aggregate.

unp {port {*chassis/slot/port1***[-***port2***] | linkagg** *agg_id1***[-***agg_id2***]} admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id1***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
enable	Activates the UNP configuration for the UNP port or link aggregate. UNP functionality is applied to traffic received on the UNP port or link aggregate.
disable	Disables the UNP configuration for the UNP port or link aggregate. UNP functionality is not applied to traffic received on the UNP port or link aggregate.

Defaults

By default, UNP is administratively enabled at the time UNP functionality is configured for the port or link aggregate.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When UNP functionality is disabled, the UNP configuration for the port or link aggregate is retained but is not applied to traffic received on the port or link aggregate.

Examples

```
-> unp port 1/1 admin-state disable
-> unp port 1/2-5 admin-state disable
-> unp port 1/1 admin-state enable
-> unp linkagg 5 admin-state disable
-> unp linkagg 8-10 admin-state disable
-> unp linkagg t admin-state enable
```

Release History

Release 8.3.1; command was introduced.

   alaDaUNPPortIfIndex
   alaDaUNPPortAdminState
```

unp dynamic-service

Configures whether the System Default service profile dynamically creates an SPB Service Access Point (SAP) or a VXLAN SAP based on the traffic received on the UNP access port.

unp {port [*chassis_id/***]***slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} dynamic-service {spb | vxlan | none}**

Syntax Definitions

chassis_id	The chassis identifier when running in virtual chassis mode.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
spb	Dynamically creates an SPB SAP.
vxlan	Dynamically creates a VXLAN SAP (*supported only on OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32*).
none	No SPB or VXLAN SAP is dynamically created.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to ports and link aggregates configured as UNP access ports; this command does not apply to UNP bridge ports.
- Traffic received on UNP access ports that is not assigned to a user-defined service profile is assigned to the System Default service profile. The System Default profile attributes used to dynamically create a SAP for such traffic are derived based on the setting for this UNP port parameter.
  - If the dynamic service port parameter is set to SPB, then a calculated SPB control BVLAN, a calculated default I-SID number, and an incremental reserved service ID number are used to dynamically create a SAP for SPB service traffic received on the UNP access port.
  - If the dynamic service port parameter is set to VXLAN, then a calculated VNI number, a default multicast group IP address, and an incremental reserved service ID number are used to dynamically create a SAP for VXLAN service traffic received on the UNP access port.

Examples

```
-> unp port 1/1/5 dynamic-service vxlan
-> unp port 1/1/10-15 dynamic-service spb
-> unp port 1/1/10-15 dynamic-service none
-> unp linkagg 10 dynamic-service vxlan
-> unp linkagg 2-5 dynamic-service spb
-> unp linkagg 2-5 dynamic-service none
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortDynamicService
```

unp vlan

Configures an untagged or tagged VLAN-port association between the specified UNP bridge port and VLAN ID. This type of static VLAN assignment is particularly useful when connecting silent devices to UNP bridge ports.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} vlan** *vlan_id* **[-***vlan_id2***] [tagged]**

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} vlan** *vlan_id* **[-***vlan_id2***]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
vlan_id **[-***vlan_id2***]**	The VLAN ID to assign to the UNP port. Use a hyphen to specify a range of VLAN IDs.
tagged	Configures a tagged VLAN association for the UNP bridge port.

Defaults

By default, no VLAN associations are configured for UNP bridge ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a VLAN association from the UNP port configuration. The **tagged** keyword is not required to remove a tagged VLAN association.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- When the **tagged** parameter option is not specified, the VLAN-port association created is untagged.
- Configuring a UNP port or link aggregate with an untagged *and* tagged VLAN-port association is allowed as long as the untagged and tagged VLANs are different (for example, **unp port 1/4/45 vlan 100** and **unp port 1/4/45 vlan 200 tagged**).
- When this command is used to assign a VLAN to a UNP bridge port, the port goes into a forwarding state for egress traffic associated with the VLANs assigned to the port. This automatically occurs even when there is no MAC address learned on the UNP port in the assigned VLANs and regardless of the direction value (in or both) set for the port.

Examples

```
-> unp port 1/1/5 vlan 500
-> unp port 1/1/5 vlan 600 tagged
-> unp port 1/1/10 vlan 100-105
-> unp port 1/1/10 vlan 200-205 tagged
```

```
-> no unp port 1/1/5 vlan 500
-> no unp port 1/1/5 vlan 600
-> no unp port 1/1/10 vlan 100-105
-> no unp port 1/1/10 vlan 200-205

-> unp linkagg 10 vlan 500
-> unp linkagg 10 vlan 600 tagged
-> unp linkagg 20 vlan 100-105
-> unp linkagg 20 vlan 200-205 tagged
-> no unp linkagg 10 vlan 500
-> no unp linkagg 10 vlan 600
-> no unp linkagg 20 vlan 100-105
-> no unp linkagg 20 vlan 200-205
```

Release History

Release 8.2.1; command was introduced.
Release 8.5R4; **tagged** parameter added.

MIB Objects

```
alaDaUNPPortVlanTable
   alaDaUNPPortVlanVID
```

unp port profile

Configures a UNP service profile as a static profile for the specified UNP port. This type of profile assignment is particularly useful for silent devices that are connected to a UNP port; the profile SAP won't age out when the device goes idle.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} profile** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} profile** *profile_name*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an SPB, VXLAN, or L2 GRE service profile to statically assign to the specified UNP port.

Defaults

By default, no static profile is configured for UNP ports.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static profile association from the UNP port configuration.
- When a MAC address is learned on a UNP port and classified into a service profile, a SAP is dynamically created based on the parameter values of the service profile. Once the MAC address associated with the dynamic SAP ages out, the SAP ages out as well. To accommodate silent devices, use this command to assign a service profile to the UNP port. This will dynamically create a persistent SAP that will not age out when the device MAC address ages out; the SAP continues to receive broadcast and multicast packets for the silent device.
- Make sure the specified UNP profile name already exists in the switch configuration and is mapped to an SPB, VXLAN, L2 GRE, or static service.
  - Profiles mapped to SPB, VXLAN, or static services are configured as static profiles on UNP access ports.
  - Profiles mapped to an L2 GRE service are configured as static profiles on UNP bridge ports.
- There can be up to eight SPB or VXLAN service profiles statically assigned to one UNP access port, but mixing service types on the same port is not supported. For example, configure only eight SPB service profiles or eight VXLAN service profiles.
- There can only be one L2 GRE service profile statically assigned to a UNP bridge port.

Examples

```
-> unp port 1/1/5 profile static-spb1
-> unp port 1/1/5 profile static-spb2
-> unp port 1/1/10 profile static-vxlan1
-> unp port 1/1/10 profile static-vxlan2
-> unp port 1/1/20 profile static-l2gre1
-> no unp port 1/1/20 profile static-l2gre1

-> unp linkagg 10 profile static-spb1
-> unp linkagg 20 profile static-vxlan1
-> unp linkagg 30 profile static-l2gre1
-> no unp linkagg 30 profile static-l2gre
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp profile map service-type spb	Configures the mapping of SPB parameters to the specified UNP profile.
unp profile map service-type vxlan	Configures the mapping of VXLAN parameters to the specified UNP profile.

   alaDaUNPPortProfile
```

unp port ap-mode

Configures the status of the Access Point (AP) mode for the specified UNP bridge port or link aggregate.

unp {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} ap-mode**

no unp {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} ap-mode**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number for a specific UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

By default, the AP mode status for the port or link aggregate is set to the global AP mode status when UNP is enabled on the port or link aggregate. For example, if the global status is disabled, the port-level status is initially disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the AP mode is enabled on the specified UNP bridge port and an AP device is detected on that port, the following actions are triggered to automatically change the operational status of the specified options (the operational status overrides the configured status):
  - The transmission of LLDP Port VLAN ID and AP Location TLVs is operationally enabled on the UNP bridge port.
  - The trust tag status for the UNP bridge port is operationally enabled.
  - The global status for dynamic VLAN configuration is operationally enabled for the switch.
- If the UNP AP mode is not enabled, the detection, learning, and management of connected OmniAccess Stellar AP devices may not occur as expected.
- AP mode functionality is not supported on UNP access ports or Learned Port Security (LPS) ports.

Examples

```
-> unp port 1/1/6 ap-mode
-> unp linkagg 10 ap-mode
-> no unp port 1/1/6 ap-mode
-> no unp linkagg 10 ap-mode
```

Release History

Release 8.6R1; command was introduced.

Related Commands

unp ap-mode	Configures the global AP mode status.
show unp port config	Displays the UNP configuration for the port.
show unp global configuration	Displays the status of UNP Layer 3 learning for the switch.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortApMode
```

unp port-template

Configures a UNP port template that is used to apply a pre-defined port configuration to a UNP port or link aggregate. Using a port template to configure UNP functionality on a port or link aggregate avoids having to configure each parameter with a separate CLI command. Applying a template configures all port-based parameters with a single CLI command.

This section describes the base command (**unp port-template**) along with optional command keywords that are used to configure port parameter values that are applied when the template is assigned to a UNP port or link aggregate. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the template.

There are two default port templates: "bridgeDefaultPortTemplate" (applied to UNP bridge ports) and "accessDefaultPortTemplate" (applied to UNP access ports). These templates define a default set of port parameter values that are applied at the time a port or link aggregate is configured as a UNP bridge or access port. The default templates cannot be deleted, but the template parameter values are configurable through this command.

unp port-template {*template_name* | **bridgeDefaultPortTemplate | accessDefaultPortTemplate}**
[802.1x-authentication]
[802.1x-authentication pass-alternate *profile_name***]**
[mac-authentication]
[mac-authentication pass-alternate *profile_name***]**
[classification]
[trust-tag]
[default-profile *profile_name***]**
[domain *domain_id***]**

[redirect port-bounce]
[direction {in | both}]
[802.1x-authentication tx-period *seconds***]**
[802.1x-authentication supp-timeout *seconds***]**
[802.1x-authentication max-req *max_req***]**
[802.1x-authentication bypass]
[802.1x-authentication failure-policy {mac}]
[mac-authentication allow-eap {pass | fail | noauth}]
[force-l3-learning [port-bounce]]
[admin-state {enable | disable}
[dynamic-service {spb | vxlan}
[vlan *vlan_id* **[-***vlan_id2***] [tagged]**
[l2-profile *l2profile_name***]**
[profile *profile_name***]**
[ap-mode]

no unp port-template *template_name* **[802.1x-authentication | 802.1x authentication pass-alternate | mac-authentication | mac-authentication pass-alternate | ...]**

Syntax Definitions

template_name	The name to associate with the UNP port template.
bridgeDefaultPortTemplate	The name of the default port template applied to UNP bridge ports.
accessDefaultPortTemplate	The name of the default port template applied to UNP access ports. *This parameter is currently not supported on an OmniSwitch 6465 or OmniSwitch 6560.*

Defaults

The following table contains the default values for the system-defined port templates (“accessDefaultPortTemplate” and “bridgeDefaultPortTemplate”):

parameter	system-defined port template values
802.1x-authentication	enabled
802.1x-authentication pass-alternate *profile_name*	none
mac-authentication	enabled
mac-authentication pass-alternate *profile_name*	none
classification	enabled
trust-tag	disabled
default-profile *profile_name*	none
domain *domain_id*	0
aaa-profile *profile_name*	none
redirect port-bounce	disabled
direction {in | both}	both
802.1x-authentication tx-period *seconds*	30
802.1x-authentication supp-timeout *seconds*	30
802.1x-authentication max-req *max_req*	2
802.1x-authentication bypass	disabled
802.1x-authentication failure-policy {mac}	default
mac-authentication allow-eap {pass | fail | noauth}	none
force-l3-learning [port-bounce]	disabled port bounce is enabled
admin state {enable | disable}	enabled
dynamic-service {vxlan | spb}	none for UNP bridge port template SPB for UNP access port template
vlan *vlan_id* **[-***vlan_id2***] [tagged]**	none
l2-profile *l2profile_name*	unp-def-access-profile

parameter	system-defined port template values
ap-mode	enabled
profile *profile_name*	none

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a port template from the switch configuration.
- To change the value of a specific port template parameter, specify the parameter keyword with this command. For example, **no unp port-template port1 mac-authentication**, **unp port-template port1 domain 2**, or **unp port-template port1 default-profile defprof1**. The new parameter values are applied to all UNP ports to which the template is assigned.
- The **l2-profile** port template parameter is not supported on the OmniSwitch 9900.
- If the name of the template does not exist when this command is used to modify a port parameter, the switch will automatically create a new template using the name specified. For example, the **unp port-template port1 mac-authentication** command will create the "port1" template if it does not already exist in the switch configuration.
- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.
- For more information about specific port parameter values, refer to the following explicit UNP port configuration commands for each template parameter:

Port Template Parameter	Explicit Port Configuration Command
[802.1x-authentication]	**unp 802.1x-authentication**
[802.1x-authentication pass-alternate *profile_name***]**	**unp 802.1x-authentication pass-alternate**
[mac-authentication]	**unp mac-authentication**
[mac-authentication pass-alternate *profile_name*]	**unp mac-authentication pass-alternate**
[classification]	**unp classification**
[default-profile *profile_name***]**	**unp default-profile**
[domain *domain_id***]**	**unp domain**
[aaa-profile *profile_name***]**	**unp aaa-profile**
[redirect port-bounce]	**unp redirect port-bounce**
[direction {in | both}	**unp direction**
[802.1x-authentication tx-period *seconds***]**	**unp 802.1x-authentication tx-period**
[802.1x-authentication supp-timeout *seconds*]	**unp 802.1x-authentication supp-timeout**
[802.1x-authentication max-req *max_req***]**	**unp 802.1x-authentication max-req**
[802.1x-authentication bypass]	**unp 802.1x-authentication bypass-8021x**

Port Template Parameter	Explicit Port Configuration Command
[802.1x-authentication failure-policy {mac}	**unp 802.1x-authentication failure-policy**
[mac-authentication allow-eap {pass | fail | noauth}]	**unp mac-authentication allow-eap**
[force-l3-learning [port-bounce]	**unp force-l3-learning**
[trust-tag]	**unp trust-tag**
[admin-state {enable | disable}]	**unp admin-state**
[dynamic-service {spb | vxlan}]	**unp dynamic-service**
[vlan *vlan_id* **[-***vlan_id2***] [tagged]**	**unp vlan**
[l2-profile *l2profile_name***]**	**unp l2-profile**
[ap-mode]	**unp port ap-mode**
[profile *profile_name***]**	**unp port profile**

Examples

```
-> unp port-template port1
-> unp port-template port1 mac-authentication
-> unp port-template port1 mac-authentication pass-alternate unp1
-> unp port-template port1 classification
-> no unp port-template port1 mac-authentication
-> no unp port-template port1
-> unp port-template port2 802.1x-authentication
-> unp port-template port2 classification
-> unp port-template port2 domain 10
-> no unp port-template port2 classification
-> no unp port-template port2
```

Release History

Release 8.3.1; command was introduced.
Release 8.3.1.R02; **force-l3-learning** parameter added.
Release 8.4.1; **l2-profile** parameter added.
Release 8.5R4; **profile** parameter added, **tagged** option added to **vlan** parameter.
Release 8.6R1; **ap-mode** parameter added.

unp network-group

Configures a network group name and its associated IPv4 addresses. The group is used to specify source or destination IP networks for UNP router domain authentication. Users attempting to access networks defined in this group are challenged for authentication.

unp network-group *net_group_name ip_address* **[mask** *net_mask***] [***ip_address2* **[mask** *net_mask2***]...]**

no unp network-group *net_group_name* **[***ip_address* **[mask** *net_mask***] [***ip_address2* **[mask** *net_mask2***]...]**

Syntax Definitions

net_group_name	The name of the network group (up to 31 alphanumeric characters).
ip_address	An IPv4 address included in the network group.
net_mask	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
ip_address2	Optional. Another IPv4 address to be included in the network group. Multiple IPv4 addresses (up to a maximum of five) may be configured for a network group. Separate each address/mask combination with a space.
net_mask2	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a network group from the configuration or to remove an IP address from a network group.
- The network group defined with this command is used to configure a router authentication condition that will trigger authentication for user traffic that matches the IPv4 networks defined in the group.
- Make sure that the IP networks/masks specified for a network group do not overlap.

Examples

```
-> unp network-group net-grp1 10.10.12.5 mask 255.255.0.0
-> unp network-group net-grp1 20.10.12.5 mask 255.255.0.0 10.50.3.1
-> unp network-group net-grp1 30.12.12.5

-> unp network-group net-grp1 10.10.12.5 mask 255.255.0.0 20.10.12.5 mask
255.255.0.0 10.50.3.1 30.12.12.5

-> no unp network-group net-grp1 10.10.12.5
```

```
-> no unp network group net-grp1
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp router-auth user-group	Configures a user group as a condition for Layer 3 authentication. A network group is specified when this type of condition is configured.
unp router-auth cp-profile	Configures a Captive Portal profile for router authentication.
unp router-auth user flush	Performs a MAC address flush of the specified router domain authentication users.
show unp network-group	Displays the UNP network group configuration.

```

unp router-auth user-group

Configures a user group as a condition for Layer 3 authentication. A user group specifies a destination network group and an optional source network group; traffic matching the networks in these groups is subject to router domain authentication.

unp router-auth user-group *user_group_name* **{[src-network-group** *net_group***] dst-network-group** *net_group_name***}**

no unp router-auth user-group *user_group_name*

Syntax Definitions

user_group_name	The name of the router authentication condition (up to 31 alphanumeric characters).
net_group_name	The name of an existing network group (configured through the **unp network-group** command).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a router authentication user group from the switch configuration.
- Make sure the network group specified with this command exists in the switch configuration before attempting to configure the router authentication user group.
- To configure an optional source network group; specify the source network group name first then the destination network group name.
- When the first router authentication user group is configured, the router domain authentication feature is enabled for the switch.
- HTTP/HTTPS traffic that matches a user group condition is challenged with Captive Portal authentication; other IPv4 traffic that matches a user group condition is challenged with IP-based authentication.
- Configuring multiple router authentication user groups is allowed.
  - Any two user groups can share the same source network group as long as the destination network group for each user group is different and the IP addresses do not overlap.
  - Any two user groups can share the same destination network group as long as the source network group for each user group is different and the IP addresses do not overlap.

Examples

```
-> unp router-auth user-group ra-ugrp1 src-network-group net-grp1 dst-network-group
net-grp2
-> unp router-auth user-group ra-ugrp2 dst-network-group net-grp3

-> no unp router-auth user-group ra-ugrp1
-> no unp router-auth user-group ra-ugrp2

-> unp router-auth user-group ra-ugrp1 dst-network-group grp5
ERROR: Dst Network Group does not exist
-> unp router-auth user-group ra-ugrp2 src-network-group grp5 dst-network-group
net-grp2
ERROR: Src Network Group does not exist
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp network-group	Configures a network group name and its associated IPv4 addresses.
unp router-auth cp-profile	Configures a Captive Portal profile for router authentication.
unp router-auth user flush	Performs a MAC address flush of the specified router domain authentication users.
show unp router-auth user-group	Displays the router authentication user group configuration.

MIB Objects

```
alaDaUNPRouterAuthUserGroupTable
   alaDaUNPRouterAuthenticationName
   alaDaUNPRouterAuthenticationSrcGroup
   alaDaUNPRouterAuthenticationDestGroup
```

unp router-auth cp-profile

Specifies an existing Captive Portal (CP) profile to use for router authentication. This type of profile defines CP authentication parameter options that are applied to users that match router authentication user group conditions. If no CP profile is specified, then the global CP configuration is applied.

unp router-auth cp-profile *cp_profile_name*

no unp router-auth cp-profile *cp_profile_name*

Syntax Definitions

cp_profile_name	The name of an existing CP profile (configured through the **captive-portal-profile** command).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the CP profile assignment.
- Make sure the CP profile name specified with this command exists in the switch configuration.
- The following global and CP profile settings are applied for CP authentication:
  - The RADIUS server to use for authentication.
  - Session timeout value (determines aging of an accept/deny entry).
  - CP maximum retry attempts (number of login attempts the user is given before access is blocked).
  - Success redirect URL (the URL to display to the client after successful CP authentication)
- The following global and CP profile settings are applied for IP-based authentication:
  - The RADIUS server to use for authentication.
  - Session timeout value (determines aging of an accept/deny entry).
- If the RADIUS server returns a session timeout value that is set to zero and the trust RADIUS option is enabled, then the session timeout for CP and IP authenticated users is set to infinity (the user session does not time out). A zero session timeout value is supported only when it is returned by the RADIUS server; setting the value to zero through the CLI is not supported.
- The router domain authentication feature is not enabled for the switch until at least one router authentication user group is configured.
- CP authentication is applied to HTTP/HTTPS traffic that matches a router authentication user group condition.

Examples

```
-> unp router-auth cp-profile cp-1
-> no unp router-auth cp-profile
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp network-group	Configures a network group name and its associated IPv4 addresses.
unp router-auth user-group	Configures a user group as a condition for Layer 3 authentication. A network group is specified when this type of condition is configured.
unp router-auth user flush	Performs a MAC address flush of the specified router domain authentication users.
show unp router-auth configuration	Displays the CP profile configuration that is used for router domain authentication.

MIB Objects

```
alaDaUNPRouterAuthenticationConfig
   alaDaUNPRouterAuthCpProfileName
```

unp router-auth user flush

Performs a MAC address flush of the specified router domain authentication users.

unp router-auth user flush {user-group *user_group_name* **| user-name** *cp_user_name* **| [ip-address** *ipv4_address* **| auth-type {cp | ip} | all}**

Syntax Definitions

user_group_name	The name of an existing router authentication user group.
cp_user_name	The Captive Portal (CP) user name.
ipv4_address	The IPv4 address associated with the router authentication user.
cp	Clears only the CP-authenticated users.
ip	Clears only the IP-authenticated users.
all	Clears all of the router authentication users.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **user-group** parameter to flush all users associated with the specified router authentication user group.
- Use the **user-name** parameter to flush the CP user name associated with the router authentication user.
- Use the **ip-address** parameter to flush the IPv4 address associated with the router authentication user.
- Use the **auth-type** parameter with the **cp** or **ip** options to flush router authentication users that were authenticated through Captive Portal or IP-based mechanisms.
- Use the **all** parameter to flush all router authentication users learned on the switch.

Examples

```
-> unp router-auth user flush all
-> unp router-auth user flush user-group ra-grp1
-> unp router-auth user flush user-name san
-> unp router-auth user flush ip-address 10.0.0.1
-> unp router-auth user flush auth-type cp
-> unp router-auth user flush auth-type ip
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp network-group	Configures a network group name and its associated IPv4 addresses.
unp router-auth user-group	Configures a user group as a condition for Layer 3 authentication. A network group is specified when this type of condition is configured.

   alaDaUNPRouterAuthenticationFlushType
   alaDaUNPRouterAuthenticationFlushUserName
   alaDaUNPRouterAuthenticationFlushIpAddressType
   alaDaUNPRouterAuthenticationFlushIpAddress
```

show unp network-group

Displays the router authentication network group configuration.

show unp network-group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

A UNP network group is used to configure a router authentication user group condition that will trigger authentication for user traffic that matches the IPv4 networks defined in the network group.

Examples

```
-> show unp network-group
  Network Group Name      IP-Address/Mask
----------------------+-----------------------
net-grp1                10.0.0.1/255.255.0.0,
                        20.0.0.1/255.255.0.0,
                        30.0.0.1/255.0.0.0
net-grp2                40.0.0.1/255.255.0.0
net-grp3                10.0.0.1/255.255.0.0,
                        40.0.0.1/255.255.0.0

 Total Network-Group Count: 3
```

output definitions

Network Group Name	The name of the UNP network group.
IP-Address/Mask	The IPv4 network addresses that are associated with the network group name.

Release History

Release 8.5R4; command was introduced.

Related Commands

unp network-group	Configures a network group name and its associated IPv4 addresses.

MIB Objects

```
alaDaUNPNetworkGroupTable
   alaDaUNPNetworkGroupName
   alaDaUNPNetworkGroupIpAddrType
   alaDaUNPNetworkGroupIpAddr
   alaDaUNPNetworkGroupIpMask
```

show unp router-auth user-group

Displays the router authentication user group configuration.

show unp router-auth user-group [*user_group_name***]**

Syntax Definitions

user_group_name	The name of an existing router authentication user group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

A router authentication user group specifies Layer 3 conditions for authentication; UNP network groups assigned to the router authentication user group contain IPv4 addresses. User traffic matching these networks are challenged with Captive Portal or IP-based authentication.

Examples

```
-> show unp router-auth user-group
User-Group Name                  Src-Network-Group               Dst-Network-Group
--------------------------+--------------------------+--------------------------
ra-ugrp1                    net-grp1                    net-grp2
ra-ugrp2                    net-grp3                    net-grp2
ra-ugrp3                    net-grp1                    net-grp3
ra-ugrp4                    net-grp2                    net-grp3
ra-ugrp5                                                net-grp4

-> show unp router-auth user-group UserGrp1
User-Group Name                  Src-Network-Group               Dst-Network-Group
--------------------------+--------------------------+--------------------------
ra-ugrp3                    net-grp1                    net-grp3

Rule Status = ACTIVE
```

output definitions

User-Group-Name	The name of the router authentication user group.
Src-Network-Group	The name of the UNP network group that is designated as a group of source IPv4 networks. Specifying a source network group is optional when configuring a user group condition.
Dst-Network-Group	The name of the UNP network group that is designated as a group of destination IPv4 networks.

Release History

Release 8.5R4; command was introduced.

Related Commands

unp router-auth user-group Configures a router authentication user group.

MIB Objects

```
alaDaUNPRouterAuthUserGroupTable
   alaDaUNPRouterAuthenticationName
   alaDaUNPRouterAuthenticationSrcGroup
   alaDaUNPRouterAuthenticationDestGroup
```

show unp router-auth configuration

Displays the Captive Portal (CP) profile configuration that is used for router domain authentication.

show unp router-auth configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If no CP profile is designated for this feature, then the global CP configuration is used.

Examples

```
-> show unp router-auth configuration
       CP-Profile Name     : cp-prof1

       CP Params:
            Captive Portal AAA Profile Name        = a1
            Captive Portal Success Redirect URL    = http://server-1.com/pass.html
            Captive Portal Retry Count             = 3
```

output definitions

CP-Profile Name	The name of the Captive Portal profile to use for router authentication. Configured through the **captive-portal-profile** command.
Captive Portal AAA Profile Name	The name of the AAA profile assigned to the CP profile. The AAA profile defines the session timeout value. Configured through the **captive-portal-profile** command.
Captive Portal Success Redirect URL	The URL to which a user is redirected after successful CP authentication. Configured through the **captive-portal success-redirect-url** command.
Captive Portal Retry Count	The number of login attempts a client is allowed. Configured through the **captive-portal retry-count** command.

Release History

Release 8.5R4; command was introduced.

Related Commands

unp router-auth cp-profile	Specifies an existing CP profile to use for router authentication.

MIB Objects

```
alaDaUNPRouterAuthenticationConfig
   alaDaUNPRouterAuthCpProfileName
```

show unp router-auth users

Displays information about users authenticating through the router authentication process.

show unp router-auth users [user-name *cp_user_name***] [ip-address** *ipv4_address***] [auth-type {cp | ip}] [auth-status {pass | fail}]**

Syntax Definitions

cp_user_name	The Captive Portal (CP) user name for the router authentication user.
ipv4_address	The IPv4 address of the router authentication user.
cp	Displays only Captive Portal authenticated users.
ip	Displays only IP authenticated users.
pass	Displays only users that have successfully authenticated.
fail	Displays only users that have failed authentication.

Defaults

By default, all router authenticated users are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results.
- The “Username” field displays either the user name that was entered to authenticate a user device through the Captive Portal process or the IP address of the user device if IP-authentication was used to authenticate the user.

Examples

```
-> show unp router-auth users
   UserName   Destination    User-Group Intf-Name/  Auth Auth   LoginTime
              IP-Network                  Vlan      Type Status
-------------+-------------+----------+-----------+----+------+------------------

Total users : 2
```

output definitions

UserName	Displays either the IP address or Captive Portal user name for the learned user device.
Destination IP-Network	The destination IP network address for the user device.
User-Group	The name of the router authentication user group condition that matches the user device traffic.
Intf-Name/VLAN	The name of the IP interface and VLAN associated with the user device.
Auth Type	Indicates whether the user device attempted Captive Portal or IP-based authentication.
Auth Status	Indicates whether the user device passed or failed authentication.
LoginTime	The date and time the user logged into the network.

```
-> show unp router-auth users user-name Guest-user1
User-Name                      : Guest-user1
IP-Address                     : 20.0.0.5,
Destination IP-Network         : 70.0.0.1,
Access Timestamp               : 06/20/2018 06:43:47,
Interface-Name/Vlan            : L3-auth1/20,
User-Group                     : DST-GRP1,
Authentication-Type            : CP,
Authentication-Status          : Pass,
Session-Time Remaining(sec)    : 1000 sec

-> show unp router-auth users user-name 40.1.1.20

Authentication-Type            : IP,
Authentication-Status          : Fail,
Session-Time Remaining(sec)    : 200 sec
```

output definitions

UserName	Displays either the IP address or Captive Portal user name for the learned user device.
IP-Address	The IP address of the user device.
Destination IP-Network	The destination IP network address for the user device.
Access Timestamp	The date and time the user device accessed the network.
Interface-Name/VLAN	The name of the IP interface and VLAN associated with the user device.
User-Group	The name of the router authentication user group condition that matches the user device traffic.
Authentication-Type	Indicates whether the user device attempted Captive Portal or IP-based authentication.
Authentication-Status	Indicates whether the user device passed or failed authentication.
Session-Time Remaining (sec)	The amount of time remaining for the users login session.

Release History

Release 8.5R4; command was introduced.

Related Commands

unp router-auth user flush	Performs a MAC address flush of the specified router domain authentication users.

MIB Objects

N/A

unp classification port

Defines a Port classification rule for the specified UNP profile. If the UNP port or link aggregate on which the device traffic is received matches the port or link aggregate defined for the rule, the specified profile is applied to the device.

unp classification {port *chassis/slot/port1***[-***port2***] | linkagg [***agg_id***[-***agg_id2***]} [vlan-tag** *vlan_id* **|** *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} [profile1] [profile2] [profile3]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
[*agg_id***[-***agg_id2***]**	The link aggregate ID for a specific UNP link aggregate. Use a hyphen to specify a range of IDs (5-10).
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Port rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- The Port rule configured for the specified profile is applied only to traffic learned on the specified UNP port or link aggregate.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.
- When configuring a Port classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is applied only to tagged packets that are received on the specified UNP port *and* that contain the VLAN ID tag.
- Untagged packets are only classified using the specified UNP port; the VLAN ID tag is ignored if it is specified with this rule.
- A Port classification rule can be combined with a MAC address rule and IP address rule to configure a port-based binding rule.

Examples

```
-> unp classification port 1/1/5 vlan-tag 100 profile1 unp1-vxlan profile2 unp2-spb
-> unp classification port 1/1/10-15 profile1 unp1-vlan profile2 unp2-spb
-> no unp classification port 1/1/5 profile2
-> no unp classification port 1/1/5

-> unp classification linkagg 5 profile1 unp1-vlan profile2 unp2-vxlan profile3
unp3-spb
-> unp classification linkagg 6-10 vlan-tag 10:20 profile1 unp1-vlan
-> no unp classification linkagg 5 profile3
-> no unp classification linkagg 5
```

Port + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15
```

Port + MAC address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 port 1/1/5 profile1 Pr1
-> no unp classification mac-address 00:11:22:33:44:55 port 1/1/5
```

Port + IP address binding rule example:

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 profile1
Pr2
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp profile	Configures a UNP profile.
show unp classification	Displays the UNP classification rule configuration.

  alaDaUNPPortRuleProfile2
  alaDaUNPPortRuleProfile3
```

unp classification domain

Defines a Domain ID classification rule for the specified UNP profile. If the port or link aggregate on which the device traffic is received belongs to a Domain ID that matches the Domain ID defined for the rule, the specified profile is applied to the device.

unp classification domain *domain_id* **[vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification domain *domain_id* **[profile1] [profile2] [profile3]**

Syntax Definitions

domain_id	A domain ID number.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the domain ID rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a Port classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets received on a UNP port associated with the Domain ID *and* tagged with the specified VLAN ID.
- Untagged packets are only classified using the specified domain ID; the VLAN ID tag is ignored if it is specified with this rule.
- A domain ID classification rule can be combined with a MAC address rule and an IP address rule to configure a domain-based binding rule.

Examples

```
-> unp classification domain 10 profile1 unp1-vlan
-> unp classification domain 20 vlan-tag 100 profile1 unp1-vxlan profile2 unp2-spb
profile3 unp3-vlan
-> no unp classification domain 20 profile3
-> no unp classification domain 20
```

Domain ID + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10
```

Release History

Release 8.3.1; command was introduced.

  alaDaUNPCustDomainRuleProfile2
  alaDaUNPCustDomainRuleProfile3
```

unp classification mac-address

Defines a MAC address classification rule for the specified UNP. If the source MAC address of the device traffic matches the MAC address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

unp classification mac-address *mac_address* **[domain** *domain_id***] [vlan-tag** *vlan_id* **|** *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification mac-address *mac_address* **[profile1] [profile2] [profile3]**

Syntax Definitions

mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
domain_id	An existing customer domain ID to which this rule will apply.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
vlan_id	none
domain_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the MAC address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address classification rule, specify and optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is configured for this rule.

Examples

```
-> unp classification mac-address 00:11:22:33:44:55 profile1 CustA
-> unp classification mac-address 00:2a:95:00:00:01 vlan-tag 200 profile1 VNP1

unp classification mac-oui

Defines a MAC address Organizationally Unique Identifier (OUI) classification rule for the specified UNP profile. If the OUI of the source MAC address of the device traffic matches the OUI defined for the rule, the specified profile is applied to the device.

unp classification mac-oui *mac_oui* **[vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification mac-oui *mac_oui* **[profile1] [profile2] [profile3]**

Syntax Definitions

mac_oui	The first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
vlan_id	none

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the MAC OUI rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address OUI classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address OUI *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address OUI; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```
-> unp classification mac-oui 00:11:22 profile1 unp1-vlan
-> unp classification mac-oui 00:11:33 vlan-tag 10 profile1 unp1-vlan profile2
unp2-spb profile3 unp3-vxlan
-> no classification mac-oui 00:11:33 profile3
-> no unp classification mac-oui 00:11:22
```

```

unp classification mac-range

Defines a MAC address range classification rule for the specified UNP. If the source MAC address of the device traffic matches any address within the range of MAC addresses, the specified UNP is applied to the device. An optional VLAN ID tag parameter is also available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

unp classification mac-range *low_mac_address high_mac_address* **[domain** *domain_id***] [vlan-tag** *vlan_id | outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification mac-range *low_mac_address high_mac_address* **[profile1] [profile2] [profile3]**

Syntax Definitions

low_mac_address	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
high_mac_address	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
domain_id	An existing customer domain ID to which this rule will apply.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
vlan_id	none
domain_id	0

Platforms Supported

unp classification ip-address

Defines an IP network address classification rule for the specified UNP. If the source IP address of the device traffic matches the IP address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source IP address.

unp classification ip-address *ip_address* **mask** *subnet_mask* **[domain** *domain_id***] [vlan-tag** *vlan_id* **|** *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification ip-address *ip_address* **mask** *subnet_mask* **[profile1] [profile2] [profile3]**

Syntax Definitions

ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
subnet_mask	An IP address mask to identify the IP subnet for the interface (supports class-less masking).
domain_id	An existing customer domain ID to which this rule will apply.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
vlan_id	none
domain_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IP network address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring an IP network address classification rule, specify and optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.

- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source IP address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified IP address; the VLAN ID tag is ignored if it is specified with this rule.

unp classification vlan-tag

Defines a VLAN tag classification rule for the specified UNP. If the VLAN ID tag of the device traffic matches the VLAN ID defined for the rule, the specified UNP is applied to the device.

unp classification vlan-tag {*vlan_id* | *outer_vlan_id***:***inner_vlan_id***]} [domain** *domain_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification vlan-tag *vlan_id* **[profile1] [profile2] [profile3]**

Syntax Definitions

vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
domain_id	An existing customer domain ID to which this rule will apply.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
domain_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a VLAN tag rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a VLAN tag classification rule, specify an optional customer domain ID before specifying the name of the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Untagged packets are not classified with this rule.

Examples

```
-> unp classification vlan-tag 400 profile1 CustA
-> unp classification vlan-tag 10:20 domain 3 profile1 unp1 profile2 spb1
-> no unp classification vlan-tag 10:20 profile1
-> no unp classification vlan-tag 400
```

Release History

   alaDaUNPCustDomainVlanTagRuleProfile3
```

unp classification lldp med-endpoint

Defines a Link Layer Discovery Protocol (LLDP) classification rule for the specified UNP profile. This rule is used specifically for IP phones and OmniAccess Stellar Access Point (AP) devices.

unp classification lldp med-endpoint {ip-phone | access-point} {profile1 *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification lldp med-endpoint {ip-phone | access-point} [profile1] [profile2] [profile3]

Syntax Definitions

ip-phone	When LLDP TLVs from an IP phone are detected, apply the specified profile to the IP phone.
access-point	When LLDP TLVs from an OmniAccess Stellar AP are detected, apply the specified profile to the AP device.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- There is a built-in LLDP classification rule for access points that is assigned to a built-in profile named “defaultWLANProfile”. This rule facilitates the automatic detection and classification of OmniAccess Stellar APs that are connected to UNP bridge ports. Consider the following regarding the built-in LLDP access point rule:
  - The rule cannot be removed from the switch configuration. However, the profile designation for the rule can be changed.
  - The rule does not appear in the configuration snapshot for the switch unless the profile assignment for the rule was changed.
  - When Stellar APs are detected, they are classified and assigned to the VLAN that is mapped to the built-in “defaultWLANProfile”. This VLAN serves as the management VLAN for untagged AP traffic.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

Examples

```
-> unp classification lldp med-endpoint ip-phone profile1 unp1-vlan profile2 unp2-
vlan
-> no unp classification lldp med-endpoint ip-phone profile2
-> no unp classification lldp med-endpoint ip-phone

-> unp classification lldp med-endpoint access-point profile1 defaultWLANProfile
-> no unp classification lldp med-endpoint access-point
ERROR: BUILT-IN Access-Point LLDP Rule cannot be deleted
```

```

unp classification authentication-type

Defines an Authentication Type classification rule for the specified UNP profile. If the type of authentication applied to the device traffic matches the authentication type defined for the rule, the specified profile is applied to the device.

unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [vlan-tag *vlan_id* **|** *outer_vlan_id:inner_vlan_id***] {profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [profile1] [profile2] [profile3]

Syntax Definitions

none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
profile_name	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

parameter	default
vlan_id	none

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.

- When configuring this type of classification rule, specify an optional VLAN tag before specifying the UNP profile name for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified authentication type *and* the VLAN ID tag.
- Untagged packets are only classified using the specified authentication type; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```
-> unp classification authentication-type 802.1X profile1 unp1-vlan profile2 unp2-
vlan profile3 unp3-vlan
-> no unp classification authentication-type 802.1X profile2
-> no unp classification authentication-type 802.1X

-> unp classification authentication-type 802.1X fail profile1 unp1-vlan profile2
unp2-vlan profile3 unp3-vlan
-> no unp classification authentication-type 802.1X fail profile3
-> no unp classification authentication-type 802.1X fail

-> unp classification authentication-type MAC profile1 unp1-vlan profile2 unp2-vlan
profile3 unp3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC

-> unp classification authentication-type MAC fail profile1 unp1-vlan profile2
unp2-vlan profile3 unp3-vlan
-> no unp classification authentication-type MAC fail profile3
-> no unp classification authentication-type MAC fail

-> unp classification authentication-type MAC vlan-tag 10 profile1 unp1-vlan
profile2 unp2-vlan profile3 unp3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp profile	Configures a UNP profile.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPAuthRuleTable
  alaDaUNPAuthRuleType
  alaDaUNPAuthRuleVlanTag
  alaDaUNPAuthRuleProfile1
  alaDaUNPAuthRuleProfile2
  alaDaUNPAuthRuleProfile3
```

unp classification-rule

Configures an extended classification rule name and assigns a precedence value to the specified name. This type of rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name.

unp classification-rule *rule_name* **[precedence** *precedence_value***] [profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]]**

no unp classification-rule *rule_name* **[profile1] [profile2] [profile3]**

Syntax Definitions

rule_name	The name to associate with the extended classification rule.
precedence_value	The precedence level to assign to the extended rule. The valid range is 1–255 (1 = lowest, 255 = highest). Precedence value 255 is reserved for Device Profiling classification rules.
profile_name	The name of an existing UNP profile to assign to the extended rule.

Defaults

parameter	default
precedence_value	1
profile_name	none

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the extended rule from the switch configuration or to remove a UNP profile name assigned to the rule.
- The precedence value specified with this command is used to determine precedence among extended classification rules.
- Extended rules take precedence over all other UNP classification rules (individual rules and binding rule combinations).
- Although some individual classification rules can be combined to form a binding rule, a binding rule is not assigned a rule name and does not have a configurable precedence value. In addition, extended classification rules offer more rule combinations than binding rules.

- The following extended classification rules are automatically defined when Device Profiling is enabled for the switch (these rules cannot be removed):
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets

Examples

```
-> unp classification-rule ext-r1
-> unp classification-rule ext-r1 profile1 UNP1 profile2 UNP2
-> unp classification-rule ext-r1 precedence 250

-> unp classification-rule ext-r2
-> unp classification-rule ext-r2 precedence 255
ERROR: Precedence 255 is reserved for Device Profiling
-> unp classification-rule ext-r2 precedence 254
-> unp classification-rule ext-r2 profile1 UNP3 profile2 UNP4 profile3 UNP5

-> no unp classification-rule ext-r1 profile1 UNP1
-> no unp classification-rule ext-r1

-> no unp classification-rule ext-r2 profile1 UNP4
-> no unp classification-rule ext-r2

-> no unp classification-rule devProfPrinter
ERROR: Device Profiling Rule cannot be modified
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; **edge-profile** parameter deprecated; **profile1**, **profile2**, and **profile3** parameters added.
Release 8.5R2; precedence value 255 reserved for Device Profiling extended classification rules.

Related Commands

unp classification-rule port	Defines a Port rule condition for an extended classification rule.

  alaDaUNPClassifRulePrecedenceNum
  alaDaUNPClassifRuleProfile1
  alaDaUNPClassifRuleProfile2
  alaDaUNPClassifRuleProfile3
```

unp classification-rule port

Defines a Port rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **{port** *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***}**

no unp classification-rule *rule_name* **{port | linkagg}**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	Link aggregate ID.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Port rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 port 1/1/10
-> no unp classification-rule ext-r1 port

-> unp classification-rule ext-r2 port 1/1/1-5
-> no unp classification-rule ext-r2 port

-> unp classification-rule ext-r3 linkagg 10
-> unp classification-rule ext-r3 linkagg
```

Release History

Release 8.1.1; command was introduced.

Related Commands

  alaDaUNPClassifRuleName
  alaDaUNPClassifRulePort
```

unp classification-rule domain

Defines a domain ID rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **domain** *domain_id*

no unp classification-rule *rule_name* **domain**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
domain_id	Domain ID number.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Domain ID rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 domain-id GRP1
-> no unp classification-rule ext-r1 domain-id
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; **group-id** parameter changed to **domain**.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName

```

unp classification-rule mac-address

Defines a MAC address, rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-address** *mac_address*

no unp classification-rule *rule_name* **mac-address**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-address 00:11:22:33:44:55
-> no unp classification-rule ext-r1 mac-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated UNP profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleMacAddr
```

unp classification-rule mac-oui

Defines a MAC OUI rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-oui** *mac_oui*

no unp classification-rule *rule_name* **mac-oui**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
mac_oui	The Organizationally Unique Identifier (OUI) of the MAC address. The OUI is the first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-oui 00:11:22
-> no unp classification-rule ext-r1 mac-oui
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleMacOuiAddr
```

unp classification-rule mac-range

Defines a MAC address range rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-range** *low_mac_address high_mac_address*

no unp classification-rule *rule_name* **mac-range**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
low_mac_address	MAC address that defines the low end of the range (for example, 00:00:39:59:f1:00).
high_mac_address	MAC address that defines the high end of the range (for example, 00:00:39:59:f1:90).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-range 00:11:22:33:44:55 00:11:22:33:44:66
-> no unp classification-rule ext-r1 mac-range
```

Release History

Release 8.1.1; command was introduced.

Related Commands

  alaDaUNPClassifRuleMacRngLoaddr
  alaDaUNPClassifRuleMacRngHiaddr
```

unp classification-rule ip-address

Defines an IP network address rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **ip-address** *ip_address* **mask** *subnet_mask*

no unp classification-rule *rule_name* **ip-address**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
subnet_mask	An IP address mask to identify the IP subnet for the interface (supports class-less masking).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 ip-address 10.0.0.20 mask 255.0.0.0
-> no unp classification-rule ext-r1 ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

  alaDaUNPClassifRuleIpAddressType
  alaDaUNPClassifRuleIpAddress
  alaDaUNPClassifRuleIpMaskType
  alaDaUNPClassifRuleIpMask
```

unp classification-rule vlan-tag

Defines a VLAN tag rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **vlan-tag [***vlan_id* | *outer_vlan_id:inner_vlan_id***]**

no unp classification-rule vlan-tag

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
vlan_id	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets. Specify a value of zero to classify untagged traffic.
outer_vlan_id:inner_vlan_id	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 vlan-tag 200
-> unp classification-rule ext-r2 vlan-tag 10:20
-> unp classification-rule ext-r3 vlan-tag 0
-> no unp classification-rule ext-r1 vlan-tag
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.

MIB Objects

```
alaDaUNPClassifRuleTable
   alaDaUNPClassifRuleName
   alaDaUNPClassifRuleVlanTag
```

unp classification-rule lldp med-endpoint

Defines an LLDP rule condition for the specified extended classification rule name. This rule condition is specifically to detect IP phone TLVs or OmniAccess Stellar Access Point (AP) TLVs.

unp classification-rule *rule_name* **lldp med-endpoint {ip-phone | access-point}**

no unp classification-rule *rule_name* **lldp med-endpoint ip-phone**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
ip-phone	When LLDP TLVs from an IP phone are detected, apply the specified profile to the IP phone.
access-point	When LLDP TLVs from an OmniAccess Stellar AP are detected, apply the specified profile to the AP device.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- When using the **access-point** option to define this rule condition, make sure “defaultWLANProfile” is assigned as the profile for the specified extended classification rule name.

Examples

```
-> unp classification-rule ext-r1 lldp med-endpoint ip-phone
-> no unp classification-rule ext-r1 lldp med-endpoint ip-phone

-> unp classification-rule AP profile1 defaultWLANProfile
-> unp classification-rule AP lldp med-endpoint access-point
-> no unp classification-rule AP lldp med-endpoint access-point
```

Release History

Release 8.1.1; command was introduced.
Release 8.4.1.R02; **access-point** parameter added.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleEndPoin
```

unp classification-rule authentication-type

Defines an authentication type rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **authentication-type {none | mac [fail] | 802.1x [fail]}**

no unp classification-rule *rule_name* **authentication-type**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.

Examples

```
-> unp classification-rule ext-r1 authentication-type 8021x
-> unp classification-rule ext-r1 authentication-type 8021X fail
-> unp classification-rule ext-r1 authentication-type mac
-> unp classification-rule ext-r1 authentication-type mac fail
-> no unp classification-rule ext-r1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleAuthType
```

unp classification-rule device-type

Defines a Device Profiling rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **device-type** *device_name*

no unp classification-rule *rule_name* **device-type**

Syntax Definitions

rule_name	The name of an extended classification rule to which the rule condition is assigned.
device_name	The name of a device type to which the condition is assigned.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- The following extended classification rules are automatically defined when Device Profiling is enabled for the switch (the device type for these rules cannot be removed):
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets

Examples

```
-> unp classification-rule ext-r1 device-type Printer

-> no unp classification-rule ext-r1 device-type

-> no unp classification-rule devProfPrinter device-type
ERROR: Device-type cannot be modified on built-in rules
```

Release History

Release 8.5R2; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleDeviceType
```

unp user-role

Configures a user-defined role name and assigns a precedence value to the specified name. This type of role is used to define a list of conditions and a QoS policy list name. If the current context of a device matches all of the role conditions, then the policy list is applied to that device.

unp user-role *role_name* **[precedence** *precedence_value***]**

no unp user-role *role_name*

Syntax Definitions

role_name	The name to associate with the user-defined role.
precedence_value	The precedence level to assign to the user-defined role. The valid range is 1–255 (1 = lowest, 255 = highest).

Defaults

parameter	default
precedence_value	**1**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the user-defined role from the switch configuration.
- The precedence value specified with this command is used to determine precedence among other user-defined roles.
- Every time the user context changes for a device, all the user-defined roles are checked to see if there is a role that matches the current user context.
- Only one user-defined role per user is allowed because only one QoS policy list per user is allowed.

Examples

```
-> unp user-role role1
-> unp user-role role2 precedence 255
-> no unp user-role role2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role profile	Configures a UNP profile condition for a user-defined role name.
unp user-role authentication-type	Defines an authentication type condition for a user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePrecedenceNum
```

unp user-role policy-list

Assigns a QoS policy list to the specified user-defined role name. When the context of a user device matches all the user-defined role conditions, the policy list associated with the role is applied to the device.

unp user-role *role_name* **policy-list** *list_name*

no unp user-role *role_name* **policy-list**

Syntax Definitions

role_name	The name of a user-defined role to which the QoS policy list is assigned.
list_name	The name of an existing QoS policy list.

Defaults

By default, no QoS policy list is assigned to a user-defined role.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a QoS policy list from the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the QoS policy list with that name.
- The QoS policy list name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 policy-list role1-list
-> unp user-role role2 policy-list role2-list
-> no unp user-role role2 policy-list
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
policy list	Configures a QoS policy list.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePolicyList
```

unp user-role profile

Defines a UNP profile condition for the specified user-defined role name.

unp user-role *role_name* **{profile1** *profile_name* **[profile2** *profile_name***] [profile3** *profile_name***]}**

no unp user-role *role_name* **[profile1] [profile2] [profile3]**

Syntax Definitions

role_name	The name of a user-defined role.
profile_name	The name of an existing UNP profile.

Defaults

By default, the profile condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the profile name as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 profile1 unp1
-> unp user-role role2 profile1 unp1 profile2 unp2
-> unp user-role role3 profile1 unp1 profile2 unp2 profile3 unp3
-> no unp user-role role1 profile1
-> no unp user-role role2 profile1 profile2
-> no unp user-role role3 profile3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRoleProfile1
  alaDaUNPUserRoleProfile2
  alaDaUNPUserRoleProfile3
```

unp user-role authentication-type

Defines an authentication type condition for the specified user-defined role name.

unp user-role *role_name* **authentication-type {none | mac [fail] | 802.1x [fail]}**

no unp user-role *role_name* **authentication-type**

Syntax Definitions

role_name	The name of a user-defined role.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.

Defaults

By default, the authentication type condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the authentication type as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.

Examples

```
-> unp user-role role1 authentication-type 8021x
-> unp user-role role1 authentication-type 8021X fail
-> unp user-role role1 authentication-type mac
-> unp user-role role1 authentication-type mac fail
-> no unp user-role role1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRoleAuthType
```

unp user-role cp-status-post-login

Configures the Captive Portal (CP) post login status as a condition for the specified user-defined role name.

unp user-role *role_name* **cp-status-post-login**

no unp user-role *role_name* **cp-status-post-login**

Syntax Definitions

role_name	The name of an existing user-defined role.

Defaults

By default, the CP post login status condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the CP post login status as a condition for the specified user-defined role.
- When this condition is active for a user-defined role, the switch will check to see if a device is in a CP post login state before applying the QoS policy list associated with the user-defined role.

Examples

```
-> unp user-role role1 cp-status-post-login
-> no unp user-role role1 cp-status-post-login
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePostLoginStatus
```

unp restricted-role policy-list

Assigns an explicit QoS policy list to an implicit restricted role. When the switch assigns a user device to one of the restricted role states (unauthorized, Quarantine Manager, or Captive Portal pre-login), the explicit QoS policy list is applied instead of the built-in policy list associated with the restricted role.

unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list *list_name*

no unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list

Syntax Definitions

list_name	The name of an existing QoS policy list.
unauthorized	Applies the explicit policy list to unauthorized devices.
qmr	Applies the explicit policy list to quarantined devices. *Supported only on OmniSwitch 6860 and OmniSwitch 6865.*
cp-prelogin	Applies the explicit policy list to devices in a Captive Portal pre-login state. *Not supported on OmniSwitch 6900.*

Defaults

By default, the built-in policy list associated with the restricted role state.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the explicit QoS policy list assignment.
- An explicit QoS policy list overrides the built-in policy list associated with the restricted role state.
- When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> unp restricted-role unauthorized policy-list unauth1
-> unp restricted-role qmr policy-list quarantined1
-> unp restricted-role cp-prelogin policy-list cplogin1
-> no unp restricted-role unauthorized
-> no unp restricted-role qmr
-> no unp restricted-role cp-prelogin
```

Release History

Release 8.1.1; command was introduced.

Related Commands

policy list	Configures a QoS policy list.
show unp restricted-role	Displays the UNP restricted role policy list configuration.

MIB Objects

```
alaDaUNPRstrctedRoleTable
  alaDaUNPRstrctedRoleType
  alaDaUNPRstrctedRolePolicyList
```

captive-portal mode

Configures the Captive Portal mode of operation.

captive-portal mode {internal | internal dhcp [ip-lease-time *seconds***] [ip-renew-time** *seconds***] [ip-rebinding-time** *seconds***] | external}**

no captive-portal mode internal

Syntax Definitions

internal	Internal Captive Portal (Web server is on the switch. A VLAN change requires a port bounce).
internal dhcp	Internal DHCP Captive Portal (Web server is on the switch. IP address from Captive Portal subnet is leased to the client; VLAN change does not require a port bounce).
ip-lease-time *seconds*	The amount of time an IP address is leased to a client. The valid range is 20–120 seconds.
ip-renew-time *seconds*	The amount of time until a client with a leased IP address attempts to renew the leased IP address.
ip-rebinding-time *seconds*	The amount of time until a client attempts to obtain a new leased IP address (occurs when renew attempts fail).
external	Not supported; an external Captive Portal operation is provided through the OmniSwitch Bring Your Own Device (BYOD) solution.

Defaults

By default, the mode is set to internal Captive Portal. When the internal DHCP Captive Portal mode is selected without specifying any optional parameter values, the following default values are set:

parameter	default
ip-lease-time	30 seconds
ip-renew-time	15 seconds
ip-rebinding-time	26 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the Captive Portal mode back to the default internal mode (no internal DHCP functionality).
- Only the internal and internal DHCP Captive Portal modes (Web server on the switch) are configurable for the switch. An external Captive Portal operation is provided through interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.

- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login state. The Captive Portal mode determines how a device in the pre-login state obtains an IP address, the necessary DNS information, and whether a port bounce is required after a VLAN change.
  - If the internal Captive Portal mode (the default) is active, the device can directly contact a DHCP server to get an IP address and DNS information. A port bounce action is required if the initial VLAN assignment for the device is changed.
  - If the internal DHCP Captive Portal mode is active, the switch provides basic DHCP functionality to assign the device an IP address with a short-term lease from the Captive Portal subnet (10.123.0.0) and provide the necessary DNS information. A port bounce action is not required if the initial VLAN assignment for the device is changed.
- Consider the following when changing the internal DHCP parameter values:
  - The **ip-renew-time** is 50% of the **ip-lease-time**.
  - The **ip-rebinding-time** is 87.5% of the **ip-lease-time**.
  - When only the **ip-lease-time** is changed, the **ip-renew-time** and **ip-rebinding-time** are automatically recalculated based on the noted percentages.
  - Make sure the **ip-renew-time** specified is less than the **ip-rebinding-time**.
  - Make sure the **ip-rebinding-time** specified falls between the **ip-renew-time** and **ip-lease-time**.

Examples

```
-> captive-portal mode internal-dhcp
-> captive-portal mode internal-dhcp ip-least-time 120
-> captive-portal mode internal
-> no captive-portal mode internal
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

   alaDaCPortalDHCPRenewTime
   alaDaCPortalDHCPRebindingTime
```

captive-portal name

Configures an IP address or Fully Qualified Domain Name (FQDN) as a redirect URL to use for Captive Portal.

captive-portal name {*ip_address* | *domain_name***}**

no captive-portal name

Syntax Definitions

ip_address	The IPv4 network address (e.g., 171.15.0.0) to which HTTP traffic is redirected.
domain_name	An FQDN (up to 32 characters) to which HTTP traffic is redirected.

Defaults

By default, the Captive Portal redirect name is set to “captive-portal.com”.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the URL name back to the default “captive-portal.com”.
- Use this command to change the Captive Portal redirect URL name to match the common name (cn) used by the public certificate on the switch. Matching these two names prevents a certificate warning message caused when these names do not match.

Note. Do not preface the redirect URL domain name with **https://**; the switch automatically adds **https://** to the beginning of the domain name.

- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login state. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login Web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal name cert-name
-> captive-portal name “20.2.2.1”
-> no captive-portal name
```

Release History

Release 8.1.1; command was introduced.

Related Commands

captive-portal ip-address	Configures the internal Captive Portal IP address for the switch.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalRedirectUrlName
```

captive-portal ip-address

Configures the internal Captive Portal IP address for the switch.

captive-portal ip-address *ip_address*

Syntax Definitions

ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).

Defaults

By default, the internal Captive Portal IP address is set to 10.123.0.1.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the default 10.123.0.0 subnet is already in use, then use this command to change the Captive Portal IP address to another 10.x.0.0 subnet (only the second octet of the Captive Portal IP address can be changed).
- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login role. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect URL name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal ip-address 10.255.0.20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

captive-portal name	Configures the name of the redirect URL that is used for accessing a public certificate.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalIpAddress
```

captive-portal success-redirect-url

Configures the URL of a specific site to which a user is redirected after a successful Captive Portal authentication.

captive-portal success-redirect-url *redirect_url*

no captive-portal success-redirect-url

Syntax Definitions

redirect_url	The redirect URL (up to 63 characters).

Defaults

By default, no success redirect URL is configured.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove the success redirect URL from the Captive Portal global configuration.

Examples

```
-> captive-portal success-redirect-url http://server-1.com/pass.html
-> no captive-portal success-redirect-url
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalSuccRedirectUrl
```

captive-portal proxy-server-port

Configures the proxy server port to use for Captive Portal.

captive-portal proxy-server-port *proxy_port*

no captive-portal proxy-server-port

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1024–49151.

Defaults

By default, the proxy server port number is set to 8080.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- This command overwrites the existing proxy port number for the switch.
- The proxy port number only requires changing if the proxy port used is not 80 or 8080.

Examples

```
-> captive-portal proxy-server-port 1200
-> no captive-portal proxy-server-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalProxyPort
```

captive-portal retry-count

Configures the number of times a device can try to login before Captive Portal determines that authentication for that device has failed.

captive-portal retry-count *retries*

Syntax Definitions

retries	The number of login attempts allowed. The valid range is 1–99.

Defaults

By default, the retry count is set to 3.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

No access page is sent to devices that exceed the number of login retries allowed.

Examples

```
-> captive-portal retry-count 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalRetryCnt
```

captive-portal authentication-pass

Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process. Each policy can specify a QoS policy list and UNP profile name to assign to the authenticated devices.

captive-portal authentication-pass {policy-list *list_name* **| profile** *profile_name* **| profile-change {enable | disable}}**

no captive-portal authentication-pass {policy-list | profile}

Syntax Definitions

list_name	The name of a QoS policy list to apply to the authenticated user device.
profile_name	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

By default, no policy list name or UNP profile name is specified for the global Captive Portal configuration.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal authentication pass policy from the global Captive Portal configuration.
- When the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal users is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new UNP profile assigned also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.
- When the **profile-change** parameter is disabled, the QoS policy list name returned from the RADIUS server or the list name specified with this command is applied instead.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
  - The policy list name returned from the RADIUS server.

  - The policy list name specified with this command for the global Captive Portal configuration.
  - The policy list name associated with the UNP profile returned from the RADIUS server.
  - The policy list name associated with the UNP profile specified with this command for the global Captive Portal configuration.

- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

Examples

```
-> captive-portal authentication-pass policy-list list1
-> captive-portal authentication-pass profile unp1-vlan profile-change enable
-> captive-portal authentication-pass profile-change disable
-> no captive-portal authentication-pass policy-list
-> no captive-portal authentication-pass profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.
Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

Related Commands

captive-portal authentication-pass domain	Configures a domain specific authentication pass policy to determine the QoS policy list or UNP profile name to apply to authenticated devices. This type of policy overrides the global Captive Portal configuration.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalPolicyListName
   alaDaCPortalUNPProfile
   alaDaCPortalUNPProfileChange
```

captive-portal authentication-pass domain

Configures a domain specific authentication pass policy. This type of policy is applied to all devices within the specified domain that were successfully authenticated through the Captive Portal process.

captive-portal authentication-pass realm {prefix | suffix} domain *domain_name* **{policy-list** *list_name* **| profile** *profile_name* **| profile-change {enable | disable}}**

no captive-portal authentication-pass [realm {prefix | suffix} domain *domain_name***]**

Syntax Definitions

prefix	Specifies a prefix domain name (for example, *domain_name*/user).
suffix	Specifies a suffix domain name (for example, user@*domain_name*)
domain_name	The domain name for the user device.
list_name	The name of a QoS policy list to apply to the authenticated user device.
profile_name	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

By default, no domain specific authentication pass policy is configured for the Captive Portal process.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the domain specific authentication pass policy from the Captive Portal configuration.
- Use the **realm prefix domain** or **realm suffix domain** parameter to apply the authentication policy list or UNP profile based on the domain name of the Captive Portal authenticated user device.
- If the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal user is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is then applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new profile assigned to the user also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.

- If the **profile-change** parameter is disabled, then the QoS policy list name returned from the RADIUS server or the list name specified through the global (non-domain specific) Captive Portal configuration is applied.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
  - The policy list name returned from the RADIUS server.
  - The policy list name specified with this command or through the global Captive Portal configuration.
  - The policy list name associated with the UNP profile returned from the RADIUS server.
  - The policy list name associated with the UNP profile specified with this command or through the global Captive Portal configuration.
- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

Examples

```
-> captive-portal authentication-pass realm prefix domain asia-pacific policy-list
list2
-> captive-portal authentication-pass realm suffix domain north-america profile
unp2 profile-change enable
-> no captive-portal authentication-pass realm suffix domain north-america
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.
Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

Related Commands

captive-portal authentication-pass	Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalAuthPassTable
   alaDaCPortalAuthDomainName
   alaDaCPortalAuthRealm

   alaDaCPortalAuthUNPProfile
   alaDaCPortalAuthUNPProfileChange
```

captive-portal-profile

Configures a Captive Portal profile that is assigned to a UNP profile. This type of profile defines Captive Portal configuration options that are applied to devices classified into the assigned UNP profile. This command page describes the base command (**captive-portal-profile** *profile_name*) along with the other command keywords that are used to configure profile attributes.

captive-portal-profile *profile_name*
[aaa-profile *aaa_profile_name***]**
[success-redirect-url *redirect_url***]**
[retry-count *retries***]**
[authentication-pass [realm {prefix | suffix} domain *domain_name***] {policy-list** *list_name* **| profile** *profile_name* **| profile-change {enable | disable}}]**

no captive-portal-profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the Captive Portal profile (up to 32 characters).
aaa_profile_name	The name of an authentication, authorization, and accounting (AAA) profile to associate with the Captive Portal profile.
redirect_url	A URL (up to 63 characters) to which user devices are redirected after successful Captive Portal authentication.
retries	The number of login attempts allowed. The range is 1–99.
realm prefix	Specifies a prefix domain name (for example, *domain_name*/user).
realm suffix	Specifies a suffix domain name (for example, user@*domain_name*).
domain_name	The domain name for the user device.
list_name	The name of a QoS policy list to apply to the authenticated user device.
profile_name	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

parameter	default
aaa_profile_name	none
redirect_url	none
retries	3
realm prefix | suffix	none
domain_name	none
list_name	none
profile_name	none
enable | disable	disabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal profile from the switch configuration.
- Creating a Captive Portal profile name with the base command (**captive-portal-profile** *profile_name*) is not required to configure a profile attribute value. If the profile name does not exist, the switch will automatically create the name specified when the attribute is configured. For example, the **unp captive-portal-profile cp-prof1 retry-count 5** command will create the "cp-prof1" profile if it does not already exist in the switch configuration.
- When a Captive Portal profile is applied to a UNP profile, the parameter values defined in the profile override the global Captive Portal parameter values configured for the switch.
- A Captive Portal profile is applied only when Captive Portal authentication is enabled for the UNP profile. If there is no Captive Portal profile associated with a UNP profile, then the global Captive Portal configuration is applied.
- Assigning an AAA profile to a Captive Portal profile defines specific AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are used for Captive Portal authentication. If there is no AAA profile assigned, then the global AAA configuration is used.
- AAA profiles are configured using the **aaa profile** command. See the "AAA Commands" chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> captive-portal-profile cp-p1
-> captive-portal-profile cp-p1 aaa-profile aaa_p1
-> captive-portal-profile cp-p1 authentication-pass realm prefix domain asia-
pacific policy-list list1
-> no captive-portal-profile cp-p1 aaa-profile aaa_p1
-> no captive-portal-profile cp-p1

-> captive-portal-profile cp-p2 retry-count 5
-> captive-portal-profile cp-p2 authentication-pass profile ep-1
-> captive-portal-profile cp-p2 authentication-pass profile-change enable
```

```
-> captive-portal-profile cp-p2 success-redirect-url http://server-1.com/pass.html
-> captive-portal-profile cp-p2 authentication-pass profile-change disable
-> no captive-portal-profile cp-p2 authentication-pass profile
-> no captive-portal-profile cp-p2
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.
Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

captive-portal customization

Enables or disables the use of custom Web pages for Captive Portal authentication. When customization is enabled, Captive Portal presents Web pages stored in the “/flash/switch/captive_portal/custom_files/” directory on the switch. When customization is disabled, Captive Portal presents Web pages stored in the “/flash/switch/captive_portal/release_files/” directory on the switch.

captive-portal customization {enable | disable}

Syntax Definitions

enable	Displays custom web pages for Captive Portal authentication.
disable	Displays default web pages for Captive Portal authentication.

Defaults

By default, the web pages provided on the switch are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To create custom Web pages, create a folder in the same path as the “release_files” folder and name the new folder “custom_files” (for example “/flash/switch/captive_portal/custom_files/”). Next, copy the “assets” and “templates” folders found under “/flash/switch/captive_portal/release_files/” to the “custom_files” folder. Modify the contents in the copied folders to create custom Web pages.
- The “release_files” folder is overwritten each time the switch reboots, so ***DO NOT*** modify the files in this folder for custom use.
- The folders "assets" and "templates" under the /flash/switch/captive_portal/custom_files/ directory are used to create and display Web pages to Captive Portal users when the switch reboots or at runtime when Captive Portal customization is enabled for the switch, if the “custom_files” folder exists.
- Anything in the custom "assets" folder is statically served by the internal Web server on the switch whenever they are requested. These pages are typically **.css** files, javascript files, or the acceptable use policy and are linked to files in the custom "templates" folder.
- The custom "templates" folder contains the Web pages that are dynamically served to users depending on the Captive Portal state of each user. The file names in this folder must not be changed. The login form field names and form action in these pages must not be changed. The variables in these pages, as denoted by "<?=$(name)?>”, are substituted in place by the internal Web server.

Examples

```
-> captive-portal customization enable
-> captive-portal customization disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalCustomization
```

show captive-portal configuration

Displays the global Captive Portal parameter settings configured for the switch.

show captive-portal configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Currently only the internal Captive Portal mode (Web server on the switch) is configurable for the switch. An external Captive Portal operation is provided through interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.
- The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration. A Captive Portal profile is associated with a UNP profile and is applied to devices classified into that profile.

Examples

```
-> show captive-portal configuration
Captive Portal Global Configuration:

  Captive Portal Mode                  = Internal
  DHCP Parameters:
     DHCP Lease Time     = 30
     DHCP Renew Time     = 15
     DHCP Rebinding Time = 26
  Captive Portal IP address            = 10.123.0.1
  Captive Portal Redirect String       = captive-portal.com
  Captive Portal Success Redirect URL  =
  Captive Portal Proxy Server Port     = 8080
  Captive Portal Retry Count           = 3
  Captive Portal Global Auth Policy List=
  Captive Portal Page Customization    = Disable
  Captive Portal Profile Name          =
  Captive Portal Profile Change        = Disable
  Domain Specific Policy Lists:
        Domain       | Realm |     Policy List     |   Profile Name      | Profile
                     |       |                     |                     | Change
---------------------|-------|---------------------|---------------------|---------
na01                 |Suffix |qos-bw1              |unp1-vlan            |Enable
na02                 |Prefix |qos-bw2              |unp2-vlan            |Enable
```

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only the internal and internal DHCP modes (Web server on the OmniSwitch) are supported at this time. Configured through the **captive-portal mode** command.
DHCP Parameters:	A list of DHCP parameter values that are applied when the internal DHCP mode is active. These fields display "N/A" when the internal DHCP mode is not active. Configured through the **captive-portal mode** command.
DHCP Lease Time	The amount of time an IP address is leased to a DHCP client.
DHCP Renew Time	The amount of time, in seconds, until an attempt is made to renew the leased IP address (50% of the DHCP Lease Time).
DHCP Rebinding Time	The amount of time until an attempt is made to obtain a new IP leased address (87.5% of the DHCP Lease Time).
Captive Portal IP address	The internal Captive Portal IP address for the switch. Configured through the **captive-portal ip-address** command.
Captive Portal Redirect String	The name of the redirect URL that is used for accessing a public certificate. Configured through the **captive-portal name** command.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication. Configured through the **captive-portal success-redirect-url** command.
Captive Portal Proxy Server Port	The proxy server port to use for Captive Portal. Configured through the **captive-portal proxy-server-port** command.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed. Configured through the **captive-portal retry-count** command.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication. Configured through the **captive-portal authentication-pass** command.
Captive Portal Page Customization	Whether or not (**Enable** or **Disable**) customized Captive Portal pages are presented to the user.
Captive Portal Profile Name	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled. Configured through the **captive-portal authentication-pass** command.
Captive Portal Profile Change	The status of profile change (**Enable** or **Disable**). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option. Configured through the **captive-portal authentication-pass** command.
Domain Specific Policy Lists:	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
Domain	The domain name associated with a domain specific policy. Configured through the **captive-portal authentication-pass domain** command.

output definitions

Realm	The realm of the domain name (**prefix** or **suffix**) associated with a domain specific policy. The realm identifies the domain name as a prefix (*domain-name*/user) or as a suffix (user@*domain-name*). Configured through the **captive-portal authentication-pass domain** command.
Policy List	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name. Configured through the **captive-portal authentication-pass domain** command.
Profile Name	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name. Configured through the **captive-portal authentication-pass domain** command.
Profile Change	The status of profile change (**Enable** or **Disable**) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name. Configured through the **captive-portal authentication-pass domain** command.

Release History

Release 8.1.1; command was introduced.
Release 8.5R4; DHCP Parameter fields added.

Related Commands

---------------------|-------|---------------------|---------------------|---------
na01                 |Suffix |qos-bw1              |unp1-vlan            |Enable
na02                 |Prefix |qos-bw2              |unp2-vlan            |Enable
```

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only internal mode (Web server on the OmniSwitch) is supported at this time.
Captive Portal AAA Profile Name	The name of an authentication, authorization, and accounting (AAA) profile associated with the Captive Portal profile.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication.
Captive Portal Profile Name	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled.
Captive Portal Profile Change	The status of profile change (**Enable** or **Disable**). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option.
Domain Specific Policy Lists:	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
Domain	The domain name associated with a domain specific policy.
Realm	The realm of the domain name (**prefix** or **suffix**) associated with a domain specific policy. The realm identifies the domain name as a prefix (*domain-name*/user) or as a suffix (user@*domain-name*).
Policy List	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name.
Profile Name	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name.
Profile Change	The status of profile change (**Enable** or **Disable**) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name.

Release History

Release 8.1.1; command was introduced.

```

qmr quarantine path

Specifies the URL for a remediation server. This information is used by the Quarantine Manager and Remediation (QMR) application. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

qmr quarantine path *url*

no qmr quarantine path

Syntax Definitions

url	The URL for the QMR remediation server.

Defaults

By default, no URL is configured.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the remediation server URL from the configuration.
- Make sure to add the corresponding IP address for the remediation server to the QMR list of exception subnets, configured through the **qmr quarantine allowed-name** command.
- Configuring the URL *and* adding the server IP address to the allowed list is required to redirect quarantined MAC addresses to the remediation server.

Examples

```
-> qos quarantine path www.remediate.com
-> no quarantine path
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qmr quarantine custom-proxy-port	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRGlobalConfig
   alaDaQMRPath
```

qmr quarantine page

Configures the QMR application to send a “Quarantined” page to a client if a remediation server is not configured. This page is used to notify the client that QMR has quarantined the client.

qmr qos quarantine page {enable | disable}

Syntax Definitions

enable	Enables the sending of a “Quarantined” page to the client.
disable	Disables the sending of a “Quarantined” page to the client.

Defaults

By default, no “Quarantined” page is sent to the client.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

A “Quarantined” page is only sent if a remediation server path was not configured for QMR. Note that even if the remediation server is not active, QMR will not send the page as long as there is a value set for the remediation server path.

Examples

```
-> qmr quarantine page enable
-> qmr quarantine page disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qmr quarantine custom-proxy-port	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRGlobalConfig
   alaDaQMRPage
```

qmr quarantine allowed-name

Configures a list of IP addresses that a restricted quarantined user is allowed to access.

qmr quarantine allowed-name *name* **ip-address** *ip_address* **[ip-mask** *ip_mask***]**

no qmr quarantine allowed-name *name*

Syntax Definitions

name	Specify a name to assign to the allowed IP network address.
ip_address	An IPv4 network address (for example, 10.0.0.0, 171.15.0.0, or 196.190.254.0).
ip_mask	A valid IP address mask for the allowed IP network address (for example, 255.0.0.0 or 255.255.0.0)

Defaults

By default, no IP addresses are configured as QMR allowed addresses.

parameter	default
ip_mask	IP address class

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- A maximum of three allowed IP addresses is supported.
- Make sure the IP address of the QMR remediation server is configured as an allowed IP address. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

Examples

```
-> qmr quarantine allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no qmr quarantine allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine custom-proxy-port	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRAllowedTable
   alaDaQMRAllowedName
   alaDaQMRAllowedIpAddr
   alaDaQMRAllowedIpMask
```

qmr quarantine custom-proxy-port

Configures the HTTP proxy port number used in the Web browser configuration of a host device. Quarantine Manager uses this information when trapping HTTP packets from a quarantined device and redirecting traffic from the device for remediation.

qmr quarantine custom-proxy-port *proxy_port*

no qmr quarantine custom-proxy-port

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1025–65535.

Defaults

By default, the redirect proxy port number is set to 8080.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

Use the **no** form of this command to set the proxy port number back to 8080 (the default).

Examples

```
-> qmr quarantined custom-proxy-port 8887
-> no qmr quarantined custom-proxy-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRGlobalConfig
  alaDaQMRCustomHttpProxyPort
```

show qmr

Displays the Quarantine Manager and Remediation (QMR) configuration for the switch.

show qmr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

QMR is an OmniSwitch application that interacts with the OmniVista Quarantine Manager (OVQM) application to restrict the network access of quarantined clients and provide a remediation path for such clients to regain their network access. This command displays the OmniSwitch QMR configuration.

Examples

```
-> show qmr

Quarantine Mac Group Name    : Quarantine,
Allowed IP Subnets           : IT-HD 135.254.1.10 /255.255.255.248,
                               oss-lan 10.1.1.0 /255.255.255.0,
                               rem-ser 135.254.200.0 /255.255.255.0,
Custom Proxy port            : 8888,
Quarantine Path              : www.remediation-server.alu.com,
Quarantine Page              : enabled,
```

output definitions

Quarantine MAC Group Name	The name of the QoS Quarantine MAC address group. Configured through the **qos quarantine mac-group** command.
Allowed IP Subnets	A list of IP network addresses that devices can still access while in a quarantined state. Configured through the **qmr quarantine allowed-name** command.
Custom Proxy port	The HTTP proxy port number used for redirection of HTTP traffic from quarantined devices. Configured through the **qmr quarantine custom-proxy-port** command.

output definitions

Quarantine Path	The URL of a remediation server to which a device is redirected when the device is quarantined. Configured through the **qmr quarantine path** command.
Quarantine Page	Whether or not QMR sends a “Quarantined” page notification to a quarantined user when there is no remediation server configuration. Configured through the **qmr quarantine page** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show quarantine mac group	Displays the contents of the QoS Quarantine MAC address group.

   alaDaQMRCustomHttpProxyPort
   alaDaQMRPath
   alaDaQMRPage
```

show quarantine mac group

Displays the contents of the QoS Quarantine MAC address group.

show quarantine mac group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

The QoS MAC address group contains the MAC addresses of clients that the OmniVista Quarantine Manager (OVQM) application has quarantined. This command displays the quarantined MAC addresses that belong to this group.

Examples

```
-> show quarantine mac group

Group Name    : Quarantine,
Number of MACs quarantined    : 11,
00:00:00:11:11:1b,
00:00:00:11:11:1a,
00:00:00:11:11:19,
00:00:00:11:11:18,
00:00:00:11:11:17,
00:00:00:11:11:16,
00:00:00:11:11:15,
00:00:00:11:11:14,
00:00:00:11:11:13,
00:00:00:11:11:12,
00:00:00:11:11:11,
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qos quarantine mac-group	Configures the name of the QoS Quarantine MAC address group.

MIB Objects

N/A

zeroconf mdns admin-state

Enables or disables the Multicast DNS (mDNS) relay on the switch.

zeroconf mdns admin-state {enable | disable}

Syntax Definitions

enable	Enables the mDNS relay on the switch.
disable	Disables the mDNS relay on the switch.

Defaults

The mDNS relay feature is disabled by default.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Apple device use mDNS (multicast DNS) as the underlying protocol for Bonjour exchanges.
- The mDNS packets will be handled in the conventional way on disabling the mDNS relay on the switch.

Example

```
-> zeroconf mdns admin-state enable
-> zeroconf mdns admin-state disable
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf ssdp admin-state	Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfMdnsAdminStatus
```

zeroconf ssdp admin-state

Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch. SSDP relay enables the OmniSwitch to allow non-Apple devices to discover services with minimal configuration by the administrator.

zeroconf ssdp admin-state {enable | disable}

Syntax Definitions

enable	Enables the SSDP relay on the switch.
disable	Disables the SSDP relay on the switch.

Defaults

The SSDP relay feature is disabled by default.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The Digital Living Network Alliance (DLNA) uses Universal Plug and Play (UPnP) for media management, discovery, and control. DLNA/UPnP uses SSDP to discover services, similar to how Bonjour uses mDNS for the same. All the SSDP packets coming in on an OmniSwitch are intercepted and tunneled through the GRE tunnel to the WLAN controller (acting as a gateway).
- When SSDP relay is disabled on the switch, SSDP packets are handled in the same manner as conventional packets.

Example

```
-> zeroconf ssdp admin-state enable
-> zeroconf ssdp admin-state disable
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mdns admin-state	Enables or disables the Multicast DNS (mDNS) relay on the switch.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfSsdpAdminStatus
```

zeroconf mode

Configures the mode of the SSDP or MDNS packet processing.

zeroconf mode [tunnel [type standard] | gateway | responder]

Syntax Definitions

tunnel	This is Aruba mode. The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x0. The tunnel mode is configured on the edge switch.
tunnel type standard	The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x6558.
gateway	The received packets are forwarded to all the VLANs in the gateway VLAN list. The gateway mode is configured on the gateway switch.
responder	This is responder mode. The responder mode is configured on the core switch. Responder mode is not supported on an OmniSwitch 9900.

Defaults

The tunnel mode (Aruba mode) is enabled by default.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- In tunnel mode (both Aruba and Standard), the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.
- In tunnel mode (both Aruba and Standard) or responder mode, the mDNS and SSDP packets are processed only when the Loopback0 IP address is configured, which is considered as the source IP address for the tunneled packets. Use the **ip interface** command to configure the interface address.
- In responder mode, the tunnel for each edge switch must be configured manually.
- In responder mode if there is no service rules configured, the responder switch will learn all the service but will not process any query received from the mDNS or SSDP client.
- The switch can operate in only one mode at a time.

Example

```
-> zeroconf mode gateway
-> zeroconf mode tunnel
-> zeroconf mode responder
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mdns admin-state	Enables or disables the Multicast DNS (mDNS) relay on the switch.
zeroconf ssdp admin-state	Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
zeroconf responder-ip	Configures the IP address of the tunnel endpoint (zero configuration responder).
zeroconf gateway-vlan-list	Adds or deletes a VLAN from the gateway VLAN list
zeroconf access-vlan-list	Adds or deletes a VLAN from the access VLAN list.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfMode
   alaZeroConfTunnelMode
```

zeroconf responder-ip

Configures the IP address of the tunnel endpoint (zero configuration responder) on the edge switch.

zeroconf responder-ip *ip_address*

no zeroconf responder-ip *ip_address*

Syntax Definitions

ip_address	The IPv4 address of the zero configuration responder.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Only IPv4 address can be configured as a responder IP address.
- In gateway mode, the responder IP address must not be configured.
- In tunnel mode, the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.
- To remove the responder IP address configuration, use the **no** form of the command.

Example

```
-> zeroconf responder-ip 10.0.0.1
-> no zeroconf responder-ip 10.0.0.1
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mdns admin-state	Enables or disables the Multicast DNS (mDNS) relay on the switch.
zeroconf ssdp admin-state	Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
zeroconf mode	Configures the mode of the SSDP or MDNS packet processing.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfResponderIpAddr
   alaZeroConfResponderIpAddressType
```

zeroconf gateway-vlan-list

Adds or deletes a VLAN from the gateway VLAN list.

zeroconf gateway-vlan-list *vlan_id1...vlan_idn*

no zeroconf gateway-vlan-list *vlan_id1...vlan_idn*

Syntax Definitions

vlan_id	The existing VLAN ID to be added or deleted from the gateway VLAN list. The valid range is 1-4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The gateway VLAN list can be configured only in the gateway mode.
- A maximum of 10 gateway VLANs is supported.
- To remove a VLAN from the gateway VLAN list, use the **no** form of the command.

Example

```
-> zeroconf gateway-vlan-list 1 2 4
-> no zeroconf gateway-vlan-list 4
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfGatewayVlanTable
   alaZeroConfGatewayVlanEntry
```

zeroconf access-vlan-list

Adds or deletes a VLAN from the access VLAN list.

zeroconf access-vlan-list *vlan_id1...vlan_idn*

no zeroconf access-vlan-list *vlan_id1...vlan_idn*

Syntax Definitions

vlan_id	The existing VLAN ID to be added or deleted from the access VLAN list. The valid range is 1-4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The access VLAN list must be configured when the tunnel mode use GRE tunnel type standard.
- The query packets from the responder is sent to the VLANs configured in the access VLAN list.
- A maximum of 16 access VLANs is supported.
- To remove a VLAN from the access VLAN list, use the **no** form of the command.

Example

```
-> zeroconf access-vlan-list 6 7 9
-> no zeroconf access-vlan-list 7
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfAccessVlanTable
   alaZeroConfAccessVlanEntry
```

zeroconf server-policy

Configures the server policy.

zeroconf server-policy *policy_name* **[role | vlan | location | username | mac-address]**

no zeroconf server-policy *policy_name* **[role | vlan | location | username | mac-address]**

Syntax Definitions

policy_name	The name of the zero configuration server policy. The policy name can be maximum 31 characters in length.
role	The server role to be mapped with the server policy. Multiple roles can be mapped to a server policy. The role name can be maximum 32 characters in length.
vlan	The VLAN ID to be mapped with the server policy. Multiple VLAN IDs can be mapped to a server policy.
location	The location name to be mapped with the server policy. Multiple locations can be mapped to a server policy. The location name can be maximum 32 characters in length.
username	The user name to be mapped with the server policy. Multiple user names can be mapped to a server policy. The user name can be maximum 64 bytes in length.
mac-address	The MAC address to be mapped with the server policy. Multiple macaddress can be mapped to a server policy. Maximum size of macaddress allowed is six bytes.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configured server policy is not applied unless it is mapped to a service rule.
- A maximum of 16 roles, 16 locations, 16 VLANs, 16 username, and 16 MAC address can be configured for a server policy.
- The server policy can be modified even when it is mapped to a service rule.
- The server policy cannot be deleted if it is being used by a service rule.
- The server policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.
- To remove the server policy, use the **no** form of the command. To remove specific attribute associated to the policy mention the attribute along with the **no** command.

Example

```
-> zeroconf server-policy SP1 role employee
-> zeroconf server-policy SP1 vlan 10 20 30
-> zeroconf server-policy SP1 location meetingroom1 meetingroom2
-> zeroconf server-policy SP1 username user1 user2
-> zeroconf server-policy SP1 mac-address e8:e7:32:9a:53:3 e8:e7:32:9a:53:3
-> no zeroconf server-policy SP1
-> no zeroconf server-policy SP1 role employee
-> no zeroconf server-policy SP1 vlan 10 20
-> no zeroconf server-policy SP1 location meetingroom1
-> no zeroconf server-policy SP1 username user2
-> no zeroconf server-policy SP1 mac-address e8:e7:32:9a:53:3
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **username** and **mac-address** parameters included.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf client-policy	Configures the client policy.
zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.
zeroconf refresh-database	Displays the zero configuration for the switch.
show zeroconf server policies	Displays the information of the server policies configured.

MIB Objects

```
alaZeroConfServerPolicyTable
   alaZeroConfServerPolicyEntry
   alaZeroConfServerPolicyName
   alaZeroConfServerRoleMappingName
   alaZeroConfServerVlanMappingId
   alaZeroConfServerLocationMappingString
   alaZeroConfServerUsernameMappingString
   alaZeroConfServerMacAddressMapping
```

zeroconf client-policy

Configures the client policy.

zeroconf client-policy *policy_name* **[role | vlan | location | username | mac-address]**

no zeroconf client-policy *policy_name* **[role | vlan | location | username | mac-address]**

Syntax Definitions

policy_name	The name of the zero configuration client policy. The policy name can be maximum 31 characters in length.
role	The client role to be mapped with the client policy. Multiple roles can be mapped to a client policy. The role name can be maximum 32 characters in length.
vlan	The VLAN ID to be mapped with the client policy. Multiple VLAN IDs can be mapped to a client policy.
location	The location name to be mapped with the client policy. Multiple locations can be mapped to a client policy. The location name can be maximum 32 characters in length.
username	The user name to be mapped with the client policy. Multiple user names can be mapped to a client policy. The user name can be maximum 64 bytes in length.
mac-address	The MAC address to be mapped with the client policy. Multiple MAC addresses can be mapped to a client policy. Maximum size of MAC address allowed is six bytes.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configured client policy is not applied unless it is mapped to a service rule.
- A maximum of 16 roles, 16 locations, 16 VLANs, 16 username, and 16 MAC address can be configured for a client policy.
- The client policy can be modified even when it is mapped to a service rule.
- The client policy cannot be deleted if it is being used by a service rule.
- The client policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.
- To remove the client policy, use the **no** form of the command. To remove specific attribute associated to the policy mention the attribute along with the **no** command.

Example

```
-> zeroconf client-policy SP1 role employee
-> zeroconf client-policy SP1 vlan 10 20 30
-> zeroconf client-policy SP1 location meetingroom1 meetingroom2
-> zeroconf client-policy SP1 username username1 username2
-> zeroconf client-policy SP1 mac-address e8:e7:32:9a:53:3 e8:e7:32:9a:53:3
-> no zeroconf client-policy SP1
-> no zeroconf client-policy SP1 role employee
-> no zeroconf client-policy SP1 vlan 10 20
-> no zeroconf client-policy SP1 location meetingroom1
-> no zeroconf client-policy SP1 username user2
-> no zeroconf client-policy SP1 mac-address e8:e7:32:9a:53:3
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **username** and **mac-address** parameters included.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf server-policy	Configures the server policy.
zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.
zeroconf refresh-database	Displays the zero configuration for the switch.
show zeroconf client policies	Displays the information of the client policies configured on the responder.

MIB Objects

```
alaZeroConfClientPolicyTable
   alaZeroConfClientPolicyEntry
   alaZeroConfClientPolicyName
   alaZeroConfClientRoleMappingName
   alaZeroConfClientVlanMappingId
   alaZeroConfClientLocationMappingString
   alaZeroConfClientUsernameMappingString
   alaZeroConfClientMacAddressMapping
```

zeroconf service-rule policy

Defines service rules for selective sharing of services with the clients.

zeroconf service-rule *rule_name* **server-policy** *server_policy_name* **client-policy** *client_policy_name*

no zeroconf service-rule *rule_name*

Syntax Definitions

rule_name	The name of the service rule. The rule name can be maximum 31 characters in length.
server_policy_name	Name of the server policy to be mapped with service rule. A server policy cannot be mapped to multiple service rules.
client_policy_name	The name of the client policy to be mapped with the service rule. A client policy cannot be mapped to multiple service rules.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- There must be one-to-one mapping between the server and client policy.
- The responder will respond to a service query only when the server and client policy is matched.
- A service rule with an existing server and client policy mapping cannot be linked to a new server and client policy without deleting the existing mapping.
- A maximum of 64 service rule configuration is supported on a responder.
- To remove a service rule, use the **no** form of the command.

Example

```
-> zeroconf service-rule SR1 server-policy SP1 client-policy CP1
-> no zeroconf service-rule SR1
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf server-policy	Configures the server policy.
zeroconf client-policy	Configures the client policy.
zeroconf service-rule service-id	Allows to configure selective services for a service rule to be shared with the clients.
zeroconf refresh-database	Displays the zero configuration for the switch.
show zeroconf service rules	Displays the information of the service rules configured on the responder.

MIB Objects

```
alaZeroConfServiceRuleTable
   alaZeroConfServiceRuleEntry
   alaZeroConfServiceRuleName
   alaZeroConfServiceRuleServerPolicyName
   alaZeroConfServiceRuleClientPolicyName
```

zeroconf service-rule service-id

Configures selective services for a service rule.

zeroconf service-rule *rule_name* **[mdns-service-id | ssdp-service-id]** *service_id1.....[service_idn]*

no zeroconf service-rule *rule_name* **[mdns-service-id | ssdp-service-id]** *service_id1.....[service_idn]*

Syntax Definitions

rule_name	The name of the service rule.
mdns-service-id	Configures the mDNS service ID list to be mapped with the service rule.
ssdp-service-id	Configures the SSDP service ID list to be mapped with the service rule.
service_id	The service ID to be mapped with the service rule. Multiple service IDs can be mapped with a service rule.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A service ID can be part of multiple service rule or multiple service IDs can be mapped to a service rule.
- A service ID can be mapped or removed form a service rule without deleting the service rule.
- The responder will respond to a service query only when the server and client policy is matched.
- A maximum of 64 service IDs can be configured for a service rule.
- To remove a service ID, use the **no** form of the command.

Example

```
-> zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local _ipp._tcp.local
-> zeroconf service-rule SR2 ssdp-service-id urn:schemas-upnp-
org:device:MediaServer:1 upnp:rootdevice
-> no zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local
-> no zeroconf service-rule SR2 ssdp-service-id upnp:rootdevice
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp-service-id** parameter included.

Related Commands

zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.
zeroconf refresh-database	Displays the zero configuration for the switch.
show zeroconf service rules	Displays the information of the service rules configured on the responder.

MIB Objects

```
alaZeroConfServiceRuleMdnsServiceMappingTable
   alaZeroConfServiceRuleMdnsServiceMappingEntry
   alaZeroConfServiceRuleSsdpServiceMappingEntry
```

zeroconf service-list

Configures a list of known services for mDNS or SSDP service query.

zeroconf [mdns service-list | ssdp service-list] *service_id1...service_idn*

no zeroconf [mdns service-list | ssdp service-list] *service_id1...service_idn*

Syntax Definitions

mdns service-list	Configures the list of mDNS services for the service query.
ssdp service-list	Configure the list of SSDP services for the service query.
service_id	The service ID to be included in the service list. A maximum of 64 service IDs can be configured in the list.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The services in the list are queried for re-learning by the responder, in an event of reload or takeover on the responder.
- A maximum of 64 service IDs can be configured in a service list.
- To remove a service ID from the service list, use the **no** form of the command.

Example

```
-> zeroconf mdns service-list _scanner._tcp.local _ipp._tcp.local
-> zeroconf ssdp service-list urn:schemas-upnp-org:device:MediaServer:1
upnp:rootdevice
-> no zeroconf mdns service-list _scanner._tcp.local
-> no zeroconf ssdp service-list upnp:rootdevice
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp service-list** parameter included.

Related Commands

zeroconf service-id query-request	Allows to query a specific service.
show zeroconf services-cache	Displays the list of services assigned along with the service information.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfMdnsServiceTable
   alaZeroConfMdnsServiceEntry
   alaZeroConfSsdpServiceEntry
```

zeroconf service-id query-request

Queries a specific service. If the responder does not learn a service, that specific service can be queried for re-learning by the responder.

zeroconf {mdns | ssdp} service-id *service-id* **query-request**

Syntax Definitions

mdns	Sends mDNS query for the service ID to all the configured tunnels to re-learn the service instance.
ssdp	Sends SSDP query for the service ID to all the configured tunnels to re-learn the service instance.
service_id	The service ID to be queried for learning by the responder.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to manually query for a specific service.

Example

```
-> zeroconf mdns service-id _scanner._tcp.local query-request
-> zeroconf ssdp service-id upnp:rootdevice
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp** parameter included.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfMdnsServiceTriggerQuery
alaZeroConfSsdpServiceTriggerQuery
```

zeroconf edge-ip-list

Configures the list of tunnel edge endpoint IP addresses. The edge-ip-list must be configured for the responder.

zeroconf edge-ip-list *ip_address1...ip_addressn*

no zeroconf edge-ip-list *ip_address1...ip_addressn*

Syntax Definitions

ip_address	The tunnel edge endpoint IP address, which is the Loopback0 IP address of the edge switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configured tunnel edge endpoint IP address in the list must be reachable. If the IP addresses are not reachable then the operational status of the mDNS will be down.
- To remove a tunnel edge endpoint IP address from the list, use the **no** form of the command.

Example

```
-> zeroconf edge-ip-list 10.1.1.1 10.2.2.2 10.3.3.3
-> no zeroconf edge-ip-list 10.1.1.1
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mode	Configures the mode of the SSDP or mDNS packet processing.
show zeroconf edge-details	Displays the IP address and reachability status of the tunnel endpoints configured on the responder.
zeroconf refresh-database	Displays the zero configuration for the switch.

MIB Objects

```
alaZeroConfEdgeIpTable
   alaZeroConfEdgeIpEntry
```

zeroconf refresh-database

Refreshes the database (mDNS or SSDP records) with latest server policies, client policies, server rules, learned service instances, and service cache entry.

zeroconf {mdns | ssdp} refresh-database

Syntax Definitions

mdns	Refreshes the mDNS database. The files “mdns_srvr_plcy”, “mdns_srvr_plcy_inst”, “mdns_clnt_plcy” and “mdns_srvc_rule” are updated.
ssdp	Refreshes the SSDP database. The files “ssdp_srvr_plcy”, “ssdp_srvr_plcy_inst”, “ssdp_clnt_plcy” and “ssdp_srvc_rule” are updated.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to update the latest server policies, server policy name along with learned service instance, client policies and server rules configuration.
- After refreshing the database, use the **show zeroconf services-cache** and **show zeroconf server policy-instances** commands to display the latest cache and service instances information.

Example

```
-> zeroconf mdns refresh-database
-> zeroconf ssdp refresh-database
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp** parameter included.

Related Commands

show zeroconf services-cache	Displays the list of services learned by mDNS or SSDP stack.
show zeroconf server policy-instances	Displays the mDNS or SSDP service instance learned on the responder for each server policy.

MIB Objects

```
alaZeroConfMdnsActions
alaZeroConfSsdpActions
```

show zeroconf

Displays the basic zero configuration details.

show zeroconf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf
zero-conf mode          : responder,
MDNS admin status       : enabled,
SSDP admin status       : disabled
MDNS operational status : up,
SSDP operational status : down,
Tunnel Source IP        : 172.16.1.1

-> show zeroconf
zero-conf mode          : gateway,
MDNS admin status       : disabled,
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Gateway vlans list      : 1, 2, 3

-> show zeroconf
zero-conf mode          : tunnel,
zero-conf tunnel type   : standard,
MDNS admin status       : disabled,
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Responder IP            : -
Tunnel source IP        : -
Access vlans list       : 4, 5, 6

-> show zeroconf
zero-conf mode          : tunnel,
zero-conf tunnel type   : aruba,
MDNS admin status       : disabled,
```

```
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Responder IP            : -
Tunnel source IP        : -
```

output definitions

zero-conf mode	Displays the zero configuration mode configured.
zero-conf tunnel type	Displays if the tunnel type is Aruba or Standard. This is displayed if the mode type is tunnel.
MDNS admin status	Displays the administrative status of the mDNS.
SSDP admin status	Displays the administrative status of the SSDP.
MDNS operational status	Displays the operational status of mDNS. The operation status will be down if the responder IP address is not configured or not reachable.
SSDP operational status	Displays the operational status of SSDP. The operation status will be down if the responder IP address is not configured or not reachable.
Responder IP	Displays the configured responder IP address. This is displayed if the mode type is tunnel.
Tunnel Source IP	Displays the source IP address of the tunnel. This is displayed if the mode type is tunnel or responder.
Gateway vlans list	Displays the configured gateway VLANs list. This is displayed if the mode type is gateway.
Access vlans list	Displays the configured access VLANs list. This is displayed if the mode type is tunnel and the tunnel type is standard.

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf mdns admin-state	Enables or disables mDNS tunnel relay for the switch.
zeroconf ssdp admin-state	Associates a GRE tunnel interface with the mDNS relay feature.
zeroconf mode	Configures the mode of the SSDP or MDNS packet processing.
zeroconf responder-ip	Configures the IP address of the tunnel endpoint (zero configuration responder).
zeroconf gateway-vlan-list	Adds or deletes a VLAN from the gateway VLAN list.
zeroconf access-vlan-list	Adds or deletes a VLAN from the access VLAN list.

MIB Objects

```
alaZeroConfConfig
   alaZeroConfMdnsAdminStatus
   alaZeroConfSsdpAdminStatus
   alaZeroConfMode
   alaZeroConfTunnelMode
   alaZeroConfResponderIpAddressType
   alaZeroConfResponderIpAddress
   alaZeroConfMdnsOperStatus
   alaZeroConfSsdpOperStatus
```

show zeroconf services

Displays all the configured mDNS or SSDP service IDs.

show zeroconf [mdns | ssdp] services

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf mdns services
Service Id                              CfgType
----------------------------------------+-----------------
_ipp._tcp.local                          Configured

-> show zeroconf ssdp services
Service Id                              CfgType
----------------------------------------+-----------------
upnp:rootdevice                          Configured
```

output definitions

Service Id	Displays the name of the service ID.
CfgType	Displays if the service is a configured service or learnt service.

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp** parameter included.

Related Commands

zeroconf service-list	Allows to configure a list of know services for mDNS or SSDP service query.
zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.

MIB Objects

   alaZeroConfSsdpServiceEntry
   alaZeroConfSsdpServiceId
   alaZeroConfSsdpServiceType
```

show zeroconf services-cache

Displays the list of services learned by mDNS or SSDP stack.

show zeroconf [mdns | ssdp] services-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf mdns services-cache
Service Instance: Officejet 7500 E910 [3EA581] (2)
Service-ID      : _http-alt._tcp.local
IP address      : 18.6.1.7
Port            : 8080
Ttl             : 4500
Role            : Media_server
Location        : APPLE_printer_server_1111
User Name       : 88:51:fb:3e:a5:81
Mac             : 88:51:fb:3e:a5:81
Vlan            : 77

-> show zeroconf ssdp services-cache
Service Instance: uuid:00bc1f27-d258-4ad0-be79-d5e6ffa1aaee::upnp:rootdevice
Service-ID      : urn:schemas-upnp-org:service:ConnectionManager:1
IP address      : 25.1.1.1
Port            : 42433
Ttl             : 1800
Role            : STUDENT_ACCESS
Location        : media_client_28213798127389172371738712893 7
User Name       : 00:0f:fe:26:9e:ad
Mac             : 00:0f:fe:26:9e:ad
Vlan            : 45
```

output definitions

Service Instance	Displays the device name of the service instance.
Service-ID	Displays the type of service.
IP address	Displays the IP address of the device on which the service is discovered.

output definitions

Port	Displays the UDP port number of the discovered service instance.
TTL	Displays the age of the service cache entry in seconds.
Role	Displays the role derived from UNP policy list name on the edge switch.
Location	Displays the location derived from the edge switch.
User Name	Displays the user name assigned for the service.
Mac	Displays the MAC address assigned for the service.
Vlan	Displays the VLAN ID assigned for the service.

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **ssdp** parameter included.

Related Commands

zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.
zeroconf service-rule service-id	Allows to configure selective services for a service rule to be shared with the clients.

MIB Objects

N/A

show zeroconf edge-details

Displays the IP address and reachability status of the tunnel endpoints configured on the responder.

show zeroconf edge-details

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf edge-details
EdgeIP                Status
----------------------+---------
172.16.1.2            DOWN,
172.16.1.3            DOWN,
172.16.1.4            UP,
172.16.1.5            UP,
```

output definitions

EdgeIP	The tunnel endpoint IP address configured on the responder.
Status	The reachability status of the tunnel endpoint IP address.

Release History

Release 8.4.1 R02; command introduced.

Related Commands

zeroconf edge-ip-list	Allows to configure the list of tunnel edge endpoint IP addresses.

MIB Objects

```

show zeroconf server policies

Displays information about the server policies configured.

show zeroconf server policies

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf server policies
Server policies:

    Policy name         : SP1
    Attached locations  : MMS_server_36_1_1_1
    Attached roles      : Media_server
    Attached vlans      : 55
    Attached username   : -
    Attached mac        : 00:0f:fe:3a:63:da

    Policy name         : printer1
    Attached locations  : -
    Attached roles      : -
    Attached vlans      : 1100
    Attached username   : -
    Attached mac        : -
```

output definitions

Policy name	Displays the name of the server policy.
Attached roles	Displays the role of the server policy.
Attached locations	Displays the location of the server policy.
Attached vlans	Displays the VLANs tagged to the server policy.
Attached username	Displays the username tagged to the server policy.
Attached mac	Displays the MAC address tagged to the server policy.

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **Attached username** and **Attached mac** output fields added.

Related Commands

zeroconf server-policy	Configures the server policy.

show zeroconf client policies

Displays information about the client policies configured on the responder.

show zeroconf client policies

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf client policies
Client policies:

    Policy name         : CP1
    Attached locations  : media_client_2821379812738917237173871289 37
    Attached roles      : STUDENT_ACCESS
    Attached vlans      : 45
    Attached username   : -
    Attached mac        : 00:0f:fe:3a:34:1a
```

output definitions

Policy name	Displays the name of the client policy.
Attached roles	Displays the role of the client policy.
Attached locations	Displays the location of the client policy.
Attached vlans	Displays the VLANs tagged to the client policy.
Attached username	Displays the username tagged to the client policy.
Attached mac	Displays the MAC address tagged to the client policy.

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **Attached username** and **Attached mac** output fields added.

Related Commands

show zeroconf service rules

Displays information about the service rules configured on the responder.

show zeroconf service rules

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf service rules
Service rules:

    Rule name                       : SR1
    Client Policy                   : CP1
    Server Policy                   : SP1
    Attached mdns services          : _ipp._tcp.local
    Attached ssdp services          : upnp:rootdevice

    Rule name                       : SR2
    Client Policy                   : CP2
    Server Policy                   : SP2
    Attached mdns services          : _ipp._tcp.local
    Attached ssdp services          : upnp:rootdevice

    Rule name                        : SR3
    Client Policy                    : CP3

```

show zeroconf server policy-instances

Displays the mDNS or SSDP service instance learned on the responder for each server policy.

show zeroconf [mdns | ssdp] server policy-instances

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> show zeroconf mdns server policy-instances
MDNS server policy instances:

   Policy name                    : SP1
   Attached service instance      : -

   Policy name                    : SP2
   Attached service instance      : PRINTER_EDGE4
                                    PRINTER_EDGE3

   Policy name                    : SP3
   Attached service instance      : -

   Policy name                     : SP4
   Attached service instance       : PRINTER_EDGE4

-> show zeroconf ssdp server policy-instances
 SSDP server policy instances :

    Policy name              : SP1
    Attached service instance:

    Policy name              : SP3
    Attached service instance: uuid:88618bb0-6790-4cb0-9166-
e1d15af5a87c::upnp:rootdevice

    Policy name              : SP4
    Attached service instance: uuid:88618bb0-6790-4cb0-9166-
e1d15af5a87c::upnp:rootdevice
```

output definitions

Policy name	Displays the name of the server policy.
Attached service instance	Displays the service instance learned for the server policy.

Release History

Release 8.4.1 R03; command introduced.

Related Commands

zeroconf service-rule policy	Allows to define service rules for selective sharing of services with the clients.

MIB Objects

N/A

show unp profile

Displays the UNP profile configuration for the switch.

show unp profile [*profile_name***]**

Syntax Definitions

profile_name	The name of the UNP to display.

Defaults

By default, the configuration for all profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UNP profile name with this command to display information for a specific profile.
- Use the **show unp profile map** command to display the VLAN or service type (SPB, VXLAN, or static) that is mapped to the UNP profile.
- If Device Profiling is enabled for the switch, the following UNP profiles are automatically created on the switch and will be included in the display:
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets

Examples

```
-> show unp profile
Profile Name: unp2-spb
    Qos Policy      = qrules1,

    Egress Depth    = -,
    Inact Interval  = 10
    Mac-Mobility    = Dis
    Kerberos Auth   = Dis
```

output definitions

Profile Name	The name of the UNP profile. Configured through the **unp profile** command.
QoS Policy	The name of the QoS policy list associated with the profile. Configured through the **unp profile qos-policy-list** command.

output definitions

Location Policy	The name of the location policy assigned to the UNP profile. Configured through the **unp profile location-policy** command.
Period Policy	The name of the period policy assigned to the UNP profile. Configured through the **unp profile period-policy** command.
CP Profile	The name of the Captive Portal (CP) profile assigned to the UNP profile A CP profile defines a CP configuration that is applied to devices when CP authentication is enabled for the UNP profile. Configured through the **unp profile captive-portal-profile** command.
CP State	The CP authentication status (**Ena** or **Dis**) for the UNP profile. Indicates whether CP authentication is triggered for devices classified into the profile. Configured through the **unp profile captive-portal-authentication** command.
Authen Flag	The authentication flag status (**Ena** or **Dis**) for the UNP profile. Indicates whether only authenticated devices are allowed into the profile. Configured through the **unp profile authentication-flag** command.
Mobile Tag	The mobile tag status (**Ena** or **Dis**) for the UNP profile. When enabled, the first user that is learned on a UNP port and is classified into a UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created. Configured through the **unp profile mobile-tag** command.
SAA Profile	The name of a Service Assurance Agent (SAA) profile that is associated with the UNP profile. Configured through the **unp profile saa-profile** command.
Ingress BW	The maximum ingress bandwidth setting that is applied to ports associated with the profile. Configured through the **unp profile maximum-ingress-bandwidth** command.
Egress BW	The maximum egress bandwidth setting that is applied to ports associated with the profile. Configured through the **unp profile maximum-egress-bandwidth** command.
Ingress Depth	The maximum ingress depth setting that is applied to ports associated with the profile. Configured through the **unp profile maximum-ingress-depth** command.
Egress Depth	The maximum egress depth setting that is applied to ports associated with the profile. Configured through the **unp profile maximum-egress-depth** command.
Inact Interval	The amount of time, in seconds, that a device can remain inactive after the MAC address for the device has aged out. When the timer reaches this value, inactive devices are automatically logged out of the network. Configured through the **unp profile inactivity-interval** command.

output definitions

Mac-Mobility	The status of MAC address mobility (**Ena** or **Dis**) for the UNP profile. MAC mobility functionality applies only to profiles that are mapped to SPB services and is *not supported on the OmniSwitch 6465 or OmniSwitch 6560*. Configured through the **unp profile mac-mobility** command.
Kerberos Auth	The status of Kerberos snooping (**Ena** or **Dis**) for the UNP profile. Indicates whether Kerberos snooping authentication is triggered for devices classified into the profile. Configured through the **unp profile kerberos-authentication** command.

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; the built-in “defaultWLANProfile” included in the display.
Release 8.4.1.R03; “Redirect State” field deprecated.
Release 8.5R2; default UNP profiles for Device Profiling included in the display.
Releae 8.6R1; “Mac-Mobility” field added.
Release 8.6R2; “Kerberos Auth” field added.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.
show unp global configuration	Displays the UNP global parameter values configured for the switch.
show unp port	Displays the UNP configuration for the port.
show unp user	Displays information about the devices learned on a UNP port.

show unp profile map

Displays the VLAN, service, or L2 GRE tunnel mapping configuration assigned to a UNP profile.

show unp profile [*profile_name***] map {vlan | service-type {spb | vxlan | static | l2gre}}**

Syntax Definitions

profile_name	The name of the UNP to display.
vlan	Displays the VLAN mapping configuration for a UNP profile.
spb	Displays the Shortest Path Bridging (SPB) service mapping configuration for a UNP profile.
vxlan	Displays the Virtual eXtensible Local Area Network (VXLAN) service mapping configuration for a UNP profile.
static	Displays the existing SPB or VXLAN service IDs that are statically assigned to a UNP profile. This type of mapping is used to map the profile to a known service ID.
l2gre	Displays the L2 GRE tunnel mapping configuration for a UNP profile.

Defaults

By default, the VLAN, service, or L2 GRE tunnel mapping configuration for all profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UNP profile name with this command to display the mapping information for a specific profile.
- Only one VLAN or service is mapped to a profile at any given time.

Examples

```
-> show unp profile map vlan
Profile Name                    Vlan-Id
--------------------------------+--------
unp1-vlan                       300
unp2-vlan                       301
unp3-vlan                       500

Total Profile Vxlan-Map Count: 3
```

output definitions

Profile Name	The name of the UNP profile that is mapped to the VXLAN service.
Vnid	The VXLAN network identifier for the VXLAN segment that will be used to dynamically create the VXLAN service access point (SAP) for the profile.

output definitions

Tag Value	The VLAN ID tags of the traffic that the dynamically created VXLAN SAP will carry for the profile.
Far-End-List	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The VTEPs are used to create Service Distribution Points (SDPs) for the dynamically created VXLAN SAP.
Vlan Xlation	The status of egress VLAN translation (**Ena** or **Dis**) for the dynamically created VXLAN SAP.
Mcast Mode	The multicast mode (**Headend**, **Tandem**, or **Hybrid**) for the dynamically created VXLAN SAP.
Mcast Group	The multicast group IP address that the dynamically created VXLAN SAP will use to forward traffic to participating VTEPs.

```

Total Profile L2gre-Map Count: 1
```

output definitions

Profile Name	The name of the UNP profile that is mapped to the L2 GRE tunnel.
Vpnid	The tunnel ID that identifies a GRE tunnel VPN.
Tag Value	The VLAN ID tags of the traffic that the dynamically created L2 GRE SAP will carry for the profile.
Far-End-List	The name of the list that contains the Loopback0 IP interface address for the far-end tunnel aggregation switch.
Far-End-Ip	The Loopback0 IP interface address for the far-end tunnel aggregation switch.
Port Isolation	The status of port isolation for the dynamically created L2 GRE SAP. Port isolation is implicitly enabled and is not configurable in this release.
Vlan Xlation	The status of VLAN translation (**Ena** or **Dis**) for the dynamically created L2 GRE SAP.

```
-> show unp profile map service-type static
Profile                                 Tag
Name                           SvcId    Value
-------------------------------+--------+--------
unp1-staticSPB                 10       20
unp2-staticVXLAN               20       40:50

Total Profile Static-Service-Map Count: 2
```

output definitions

Profile Name	The name of the UNP profile that is mapped to the static service.
SvvcId	The service ID for the existing SPB or VXLAN service.
Tag Value	The VLAN ID tags of the traffic that the SAP associated with the service ID will carry.

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; **l2gre** parameter added.
Release 8.6R1; IGMP and MLD snooping related fields added to SPB service-mapped profile display; "Port-Isolation" and "Vlan Xlation" fields added to L2 GRE service-mapped profile display.

Related Commands

unp profile map vlan	Configures the mapping of a standard VLAN to a UNP profile.
unp profile map service-type spb	Configures the mapping of SPB parameters that are used to dynamically create an SPB SAP to carry profile traffic.
unp profile map service-type vxlan	Configures the mapping of VXLAN parameters that are used to dynamically create a VXLAN SAP to carry profile traffic.
unp profile map service-type l2gre	Configures the mapping of L2 GRE tunnel parameters that are used to dynamically create an L2 GRE tunnel SAP to carry profile traffic.
unp profile map service-type static	Configures the mapping of an existing SPB or VXLAN service to the profile.
show unp profile	Displays the UNP profile configuration for the switch.
show unp vxlan far-end-ip-list	Displays the contents of a far-end IP address list that is used to map VXLAN service parameters to a profile.
show unp l2gre far-end-ip-list	Displays the contents of a far-end IP address list that is used to map L2 GRE service parameters to a profile.

show unp vxlan far-end-ip-list

Displays the contents of an IP address list. Each address represents a VXLAN Tunnel End Point (VTEP). A far-end IP list is associated with a VXLAN service to identify all the VTEPs that will participate in that service.

show unp vxlan far-end-ip-list [*ip_list_name***]**

Syntax Definitions

ip_list_name	The name of a list that contains the IP addresses for the far-end VTEPs.

Defaults

By default, the contents of all the VXLAN far-end IP address lists is displayed.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

Enter a list name with this command to display information for a specific list.

Examples

```
-> show unp vxlan far-end-ip-list
Far-End-Ip-List Name: toDataCenter1, IP-Count: 3,
    IP-Addresses:
         101.1.1.1
         102.1.1.1
         103.1.1.1
Far-End-Ip-List Name: toDataCenter2, IP-Count: 3,
    IP-Addresses:
         201.1.1.1
         202.1.1.1
         203.1.1.1

-> show unp vxlan far-end-ip-list toDataCenter2
Far-End-Ip-List Name: toDataCenter2, IP-Count: 3,
    IP-Addresses:
         201.1.1.1
         202.1.1.1
         203.1.1.1
```

output definitions

Far-End-Ip-List Name	The name of the far-end IP address list.
IP-Count	The number of IP addresses in the list.
IP-Addresses	The IP addresses that are members of the specified list name.

Release History

Release 7.3.4; command was introduced.

Related Commands

unp vxlan far-end-ip-list	Configures a UNP VXLAN far-end IP list.
show unp profile map	Displays the VXLAN service profile mapping configuration for the switch.

MIB Objects

```
alaDaUNPVxlanFarEndIPListTable
   alaDaUNPVxlanFarEndIPListName
   alaDaUNPVxlanFarEndIPListIPAddressCount
```

show unp l2gre far-end-ip-list

Displays the contents of an IP address list that contains the IP address of the Loopback0 interface configured on the far-end tunnel aggregation switch.

show unp l2gre far-end-ip-list [*ip_list_name***]**

Syntax Definitions

ip_list_name	The name of a list that contains the IP address for the far-end tunnel aggregation switch.

Defaults

By default, the contents of all the far-end IP address lists is displayed.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

Enter a list name with this command to display information for a specific list.

Examples

```
-> show unp l2gre far-end-ip-list
Far-End-Ip-List Name: toDataCenter1, IP-Count: 1,
    IP-Addresses:
         100.1.1.1
Far-End-Ip-List Name: toDataCenter2, IP-Count: 1,
    IP-Addresses:
         202.1.1.1

-> show unp l2gre far-end-ip-list toDataCenter2
Far-End-Ip-List Name: toDataCenter2, IP-Count: 1,
    IP-Addresses:
         202.1.1.1
```

output definitions

Far-End-Ip-List Name	The name of the far-end IP address list.
IP-Count	The number of IP addresses in the list.
IP-Addresses	The IP address that is a member of the specified list name.

Release History

Release 8.5R2; command was introduced.

Related Commands

unp l2gre far-end-ip-list	Configures an L2 GRE far-end IP list.
show unp profile map	Displays the L2 GRE service profile mapping configuration for the switch.

MIB Objects

show unp saa-profile

Displays the Service Assurance Agent (SAA) performance monitoring profile configuration for the switch. SAA profiles are assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

show unp saa-profile [*profile_name***]**

Syntax Definitions

profile_name	The name of an existing SAA profile to display.

Defaults

By default, all SAA profiles are displayed.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Enter an SAA profile name with this command to display information for a specific profile.
- This command does not provide the UNP assignment for each SAA profile. Use the **show unp profile** command to display the assignment information.

Examples

```
-> show unp saa-profile
Profile                          Latency     Jitter       MC Conf
Name                             Threshold   Threshold    Status
---------------------------------+-----------+------------+----------
unp_saa1                               500          100   Local
unp_saa2                                 0          150   Local
unp_saa3                               250            0   Local
```

output definitions

Profile Name	The name of the SAA profile.
Latency Threshold	The latency threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
Jitter Threshold	The jitter threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
MC Conf Status	The MCLAG consistency check status of the UNP configuration (**Sync, Out-Of-Sync**, or **Local**). *Note that MCLAG is not supported in this release.*

Release History

Release 7.3.2; command was introduced.

Related Commands

unp saa-profile	Configures SAA performance monitoring profiles.
show unp profile	Displays the UNP profile configuration for the switch.

MIB Objects

```
alaDaSaaProfileTable
   alaDaSaaProfileName
   alaDaSaaProfileLatencyThreshold
   alaDaSaaProfileJitterThreshold
   alaDaSaaProfileRowStatus
```

show unp global configuration

Displays the switch configuration for the global Universal Network Profile (UNP) parameter settings.

show unp global configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- UNP global parameter settings determine specific actions related to the following:
  - Dynamically creating VLANs and/or profiles.
  - Whether or not devices attempting to authenticate are assigned to a temporary profile if the authentication server is unreachable.
  - Interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.
- A hyphen, "-", indicates that a value has not been configured for the global UNP parameter.

Examples

```
-> show unp global configuration
  Dynamic Vlan Configuration       = Disabled,
  Dynamic Profile Configuration    = Disabled,
  Auth Server Down Profile1        = -,
  Auth Server Down Profile2        = -,
  Auth Server Down Profile3        = -,
  Auth Server Down Voice Profile1  = -,
  Auth Server Down Voice Profile2  = -,
  Auth Server Down Voice Profile3  = -,
  Auth Server Down Port Bounce     = Disabled
  Auth Server Down Timeout         = 60,
  Redirect Port Bounce             = Enabled,
  Redirect Pause Timer             = -
  Redirect http proxy-port         = 8080
  Redirect Server FQDN             = cppm.abc.com
  Redirect Server IP               = 10.135.20.50
  Allowed IP                       = -
  Force L3-Learning                = Disabled
  Force L3-Learning Port Bounce    = Enabled
  802.1x Pass Through Mode         = Disabled
  AP Mode                          = Enabled
  System-default service-mod       = 512
  System-default service-base      = 10000000
```

```
 System-default Multicast-Mode    = Headend
 System-default Vlan-Xlation      = Enabled
 System-default Multicast-Group   = 239.0.0.0
 System-default far-end-ip-list   = -
IPv6 Drop Packets                 = Disabled,
Delayed Learning Interval         = 0,
Global Mac-Mobility              = Disabled,
```

output definitions

Dynamic Vlan Configuration	The status (**Enabled** or **Disabled**) of dynamic VLAN configuration. Configured through the **unp dynamic-vlan-configuration** command.
Dynamic Profile Configuration	The status (**Enabled** or **Disabled**) of dynamic profile configuration. Configured through the **unp dynamic-profile-configuration** command.
Auth Server Down Profile1 **Auth Server Down Profile2** **Auth Server Down Profile3**	The name of a UNP that a device is assigned to in the event the RADIUS server is unreachable. Up to three different profile names are configurable as authentication server down UNP profiles. Configured through the **unp auth-server-down** command.
Auth Server Down Voice Profile1 **Auth Server Down Voice Profile2** **Auth Server Down Voice Profile3**	*Not supported in this release.*
Auth Server Down Port Bounce	*Not supported in this release.*
Auth Server Down Timeout	The amount of time, in seconds, that devices remain assigned to the authentication server down UNP. Configured through the **unp auth-server-down-timeout** command.
Redirect Port Bounce	The status (**Enabled** or **Disabled**) of the port bounce operation for non-supplicant devices. Configured through the **unp redirect port-bounce** command.
Redirect Pause Timer	The amount of time, in seconds, the switch pauses to clear all device authentication states and trigger re-authentication. Configured through the **unp redirect pause-timer** command.
Redirect http proxy-port	The HTTP proxy port number to use for redirection to a server. Configured through the **unp redirect proxy-server-port** command.
Redirect Server FQDN	The Fully Qualified Domain Name of a redirection server. Configured through the **unp redirect-server** command. This field is blank if an IP address was configured for the redirect server.
Redirect Server IP	The IP network address of a redirection server. Configured through the **unp redirect-server** command. If an FQDN was configured for the redirect server, then the resolved IP address for that domain will appear in this field.
Allowed IP	A list of IP addresses to which a host can access additional servers. Configured through the **unp redirect allowed-name** command.
Force L3-Learning	The status (**Enabled** or **Disabled**) of UNP Layer 3 learning. Configured through the **unp force-l3-learning** command.
Force L3-Learning Port Bounce	The status (**Enabled** or **Disabled**) of the port bounce action, which is associated with the Layer 3 learning function. Configured through the **unp force-l3-learning** command.

output definitions

802.1x Pass Through Mode	Whether a supplicant device is authenticated locally (**Enabled**) or passed through to another switch for authentication (**Disabled**). Configured through the **unp 802.1x-pass-through** command.
AP Mode	The status (**Enabled** or **Disabled**) of the Access Point (AP) mode. This mode is enabled to support the detection of connected OmniAccess Stellar AP devices. Configured through the **unp ap-mode** command.
System-default service-mod	The modulo number that is used to dynamically calculate an SPB I-SID value or a VXLAN VNID value for a System Default profile. Configured through the **unp system-default service-mod** command.
System-default service-base	The base service number that is used to dynamically calculate an SPB I-SID value or a VXLAN VNID value for a System Default profile. Configured through the **unp system-default service-base** command.
System-default Multicast-Mode	The multicast replication mode (**Headend** or **Tandem**) for dynamic services that are created for System Default profiles. Configured through the **unp system-default multicastmode** command.
System-default Vlan-Xlation	The status (**Enabled** or **Disabled**) of VLAN translation for dynamic services that are created for System Default profiles. Configured through the **unp system-default vlan-xlation** command.
System-default Multicast-Group	The multicast group IP address for dynamic VXLAN services that are created for System Default profiles. Configured through the **unp system-default multicastgroup** command.
System-default far-end-ip-list	The name of a far-end IP list associated with dynamic VXLAN services that are created for System Default profiles.. Configured through the **unp system-default far-end-ip-list** command.
IPv6 Drop Packets	The status (**Enabled** or **Disabled**) of IPv6 packet drop on UNP ports. Configured through the **unp ipv6-drop** command.
Delayed Learning Interval	The amount of time, in seconds, that UNP will wait before starting to learn packets received on UNP ports. Configured through the **unp delay-learning** command.
Global Mac-Mobility	The status (**Enabled** or **Disabled**) of MAC address mobility. The global status specifies the default status that is applied to new UNP profiles that are mapped to SPB service parameters. MAC mobility functionality is *not supported on the OmniSwitch 6465 or OmniSwitch 6560*. Configured through the **unp mac-mobility** command.

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **Dynamic Profile Configuration** and **MC Conf Status** fields added.
Release 7.3.4; VXLAN fields added; **MC Conf Status** fields deprecated.
Release 8.3.1; **Auth Server Down UNP** field replaced with **Auth Server Down UNP Profile1**, **Auth Server Down UNP Profile2**, and **Auth Server Down UNP Profile3** fields; **Force L3-Learning** field added.
Release 8.3.1.R02; **Force L3-Learning Port Bounce** field added.

Release 8.4.1.R02; **802.1x Pass Through Mode** and **AP Mode** fields added.
Release 8.5R1; **Redirect Server FQDN** and all of the **System-default** fields added.
Release 8.5R2; **IPv6 Drop Packets** and **Delayed Learning Interval** fields added.
Release 8.6R1; **Global Mac-Mobility** field added.

Related Commands

show unp profile	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.
show unp user	Displays information about the devices learned on a UNP port.

show unp domain

Displays the UNP domain configuration for the switch.

show unp domain

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific domain, classification rules associated with the same domain ID are applied only to UNP ports associated with that same domain ID.

Examples

```
-> show unp domain

Domain   Description
--------+-----------------------------------
0        Default-Domain
1        UNP Domain 1
2        UNP Domain 2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp domain description	Configures a domain ID to which UNP ports and classification rules are assigned.
unp domain	Assigns a UNP port to a customer domain ID.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUnpCustomerDomainTable
   alaDaUnpCustomerDomainId
   alaDaUnpCustomerDomainDesc
```

show unp classification

Displays the UNP classification rule configuration for the switch.

show unp classification *rule_type*

Syntax Definitions

rule_type	The rule type to display (refer to the table in the "Usage Guidelines" section of this command page for a list of rule type parameters).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specifying one of the following classification rule type parameters is required with this command:

Standard Rule Parameters	Binding Rule Parameters
mac-rule	**mac-port-rule**
mac-domain-rule	**mac-ip-port-rule**
mac-oui-rule	**mac-ip-domain-rule**
mac-range-rule	**ip-port-rule**
mac-range-domain-rule	
ip-rule	
ip-domain-rule	
vlan-tag-rule	
vlan-domain-rule	
port-rule	
domain	
authentication-type-rule	
lldp-rule	

- Standard classification rule parameters are combined at the time a rule is created to define a binding classification rule. The parameter combinations provided with this command reflect the allowed binding rule parameter combinations.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration (see the **show unp classification-rule** command).

Examples

```
-> show unp classification mac-rule
MAC Address        VLAN Tag Profile1 Name      Profile2 Name      Profile3 Name
-----------------+--------+-----------------+------------------+----------------
00:2a:da:11:22:01  -        unp1-vlan          unp2-vxlan         unp3-vlan
00:0f:b5:46:d7:56   20      unp4-spb           -                   -

```

output definitions

Domain	The customer domain ID assigned to the classification rule for the specified profiles. The rule is applied to traffic received on UNP ports that are assigned to the same domain ID. This rule is also supported in combination with each of the other classification rules. Configured through the **unp domain** command or as a parameter with the other classification rule commands**.**
MAC Address	The MAC address value to match for this profile rule. Configured through the **unp classification mac-address** command.
Low MAC Address **High MAC Address**	The lowest and highest MAC address values used to specify a range of addresses to match for this rule. Configured through the **unp classification mac-range** command.
IP Address **IP Mask**	The IP network address and mask values to match for this rule. Configured through the **unp classification ip-address** command.
Profile1, Profile2, Profile3	The name of the UNP profile to which the rule is applied. Configured through the **unp profile** command.
VLAN Tag	The VLAN ID value to match for this profile rule. • If one VLAN ID is displayed, the rule will match single-tagged packets or the outer VLAN tag of double-tagged packets. • If two VLAN IDs are displayed, the rule will match double-tagged packets (for example, 10:20 will match outer VLAN tag 10 *and* inner VLAN tag 20). This rule is also supported in combination with each of the other classification rules. Configured through the **unp classification vlan-tag** or as a parameter with the other classification rule commands.
MED Endpoint	The LLDP Media Endpoint Device to match for this profile rule (**IP-Phone** or **Access-Point**). Configured through the **unp classification lldp med-endpoint** command.

Release History

Release 8.3.1; command was introduced.

Related Commands

show unp classification-rule	Displays the extended classification rule configuration for the switch.
show zeroconf server policy-instances	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.
show unp user	Displays information about the devices learned on a UNP port.

MIB Objects

N/A

show unp classification-rule

Displays the UNP extended classification rule configuration for the switch. An extended classification rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name. A name and precedence value is also assigned to the list of rule conditions.

show unp classification-rule [*rule-name***]**

Syntax Definitions

rule_name	The name of an existing extended classification rule.

Defaults

By default, the configuration for all extended rules is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter the name of an extended classification rule to display information for a specific rule.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than a binding rule configuration.
- An extended classification rule is associated with a UNP profile and applied to traffic learned on UNP ports.
- If Device Profiling is enabled for the switch, the following “built-in” extended classification rules are also displayed:
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets

Examples

```
-> show unp classification-rule

Rule Name: "ext_rule1"
  Precedence              = 10,
  Profile1                = unp1-vlan,
    Conditions:
      Domain              = 2,
      Mac-OUI             = 00:22:11,
      VLAN Tag            = 100

show unp user-role

Displays the user-defined role configuration for the switch.

show unp user-role [*role_name***]**

Syntax Definitions

role_name	The name of an existing user-defined role.

Defaults

By default, all user-defined role are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter a user-defined role name with this command to display information for a specific role.

Examples

```
-> show unp user-role
Role Name: ur1
  Qos Policy List       : qlist1
  Priority              : 1
  Conditions:
    Profile1            : unp1-vlan
    Profile2            : unp2-spb
    Profile3            : -
    Authentication-Type : Mac
    CP Status           : Enabled

Role Name: ur2
  Qos Policy List       : qlist-allow
  Priority              : 1
  Conditions:
    Profile1            : -
    Profile2            : -
    Profile3            : -
    Authentication-Type : 802.1x Fail
    CP Status           : Disabled

Total User Role Derivation Rule Count: 2

-> show unp user-role ur2
Role Name                       QoS Policy List Name             Priority
--------------------------------+--------------------------------+--------
ur2                             qlist-allow                      1
```

output definitions

Role Name	The name of the user-defined role. Configured through the **unp user-role** command.
Qos Policy List	The name of the QoS policy list associated with the role name. The specified list defines the user role for the device. Configured through the **unp user-role policy-list** command.
Priority	The role precedence, which assigns a priority value to the user-defined role. This value determines which role to apply if a device matches the conditions of more than one user-defined role. Configured through the **unp user-role** command.
Profile1, Profile2, Profile3	The name of a UNP profile. The user-defined role is only applied to devices classified into the specified profile name. Configured through the **unp user-role profile** command.
Authentication-Type	The type of authentication applied to a device (**none**, **mac**, or **802.1x**). The user-defined role is only applied to devices authenticated with the specified type. Configured through the **unp user-role authentication-type** command.
CP Status	The Captive Portal post login status. If enabled, the role is only applied to devices in this state. Configured through the **unp user-role cp-status-post-login** command.

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; **Edge-Profile** field replaced with **Profile1**, **Profile2**, and **Profile3** fields.

Related Commands

unp user-role	Configures a user-defined role.
show unp user	Displays information about devices learned on UNP ports.

   alaDaUNPUserRoleName
   alaDaUNPUserRolePrecedenceNum
   alaDaUNPUserRolePolicyList
   alaDaUNPUserRoleProfile1
   alaDaUNPUserRoleProfile2
   alaDaUNPUserRoleProfile3
   alaDaUNPUserRoleAuthType
   alaDaUNPUserRolePostLoginStatus
```

show unp restricted-role

Displays the names of the explicit QoS policy lists assigned to the built-in restricted role states (Captive Portal pre-login, Unauthorized, and QMR) used by the switch.

show unp restricted-role

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> show unp restricted-role
Role name    Qos Policy List Name
------------+------------------------
UNAUTHORIZED qlist-bad
QMR          qlist-qmr
CP PRE-LOGIN qlist-cp

Total Restricted Role Count: 3
```

output definitions

Role Name	The restricted role name.
Qos Policy List	The name of the QoS policy list associated with the restricted role name.

Release History

Release 8.1.1; command was introduced.

Related Commands

unp restricted-role policy-list	Configures a user-defined role.
show unp user	Displays information about devices learned on UNP ports.

MIB Objects

```
alaDaUNPRstrctedRoleTable
   alaDaUNPRstrctedRoleType
   alaDaUNPRstrctedRolePolicyList
```

show unp port

Displays the UNP configuration for the port. Includes only ports and link aggregates on which UNP is enabled.

show unp {port [*chassis/slot/port1***[-***port2***]] | linkagg [***agg_id***[-***agg_id2***]]} [type {bridge | access}]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
bridge	Displays only UNP bridge ports.
access	Displays only UNP access ports.

Defaults

By default, configuration information for all UNP ports or link aggregates is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a port or link aggregate ID number to display information specific to the port or link aggregate.
- Specify a UNP port type (**bridge** or **access**) to display information only for that type of UNP port.

Examples

```
-> show unp port
Port  Port    Type   802.1x  Mac      Class.   Default    802.1X     MAC       Trust-Tag

15         0 Bridge Disabled Disabled Disabled unp-1001     -          -       Disabled
```

output definitions

Port/LagID	The port or link aggregate on which UNP is enabled. Configured through the **unp port-type** command.
Port Domain	The customer domain ID assigned to the UNP port. Traffic received on the port is classified with UNP profile rules that are assigned to the same domain ID. Configured through the **unp domain** command**.**
Type	The type of UNP port (**Bridge** or **Access**). UNP bridge ports classify traffic into VLAN profiles; UNP access ports classify traffic into service profiles. Configured through the **unp port-type** command.
802.1x Auth	The status of 802.1X authentication (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp 802.1x-authentication** command.
Mac Auth	The status of MAC authentication (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp mac-authentication** command.
Class.	The status of classification (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp classification** command.
Default	The name of the default UNP assigned to the port or link aggregate. Configured through the **unp default-profile** command.
802.1X Pass-Alt	The name of the 802.1X authentication pass alternate UNP assigned to the port or link aggregate. Configured through the **unp 802.1x-authentication pass-alternate** command.
MAC Pass-Alt	The name of the MAC authentication pass alternate UNP assigned to the port or link aggregate. Configured through the **unp mac-authentication pass-alternate** command.
Trust-Tag	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the **unp trust-tag** command.

Release History

Release 8.3.1; command was introduced.

Related Commands

```

output definitions

Port or **Linkagg ID**	The port or link aggregate on which UNP is enabled. Configured through the **unp port-type** command. A "0" indicates the port is a link aggregate (for example, 0/12 is link aggregate ID 12).
Port Type	The type of UNP port (**Bridge** or **Access**).
Redirect Port Bounce	The status of the port bounce operation (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp redirect port-bounce** command. This field applies only to UNP bridge ports and link aggregates.
802.1x Authentication	The 802.1X authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp 802.1x-authentication** command.
802.1x Pass Alternate Profile	The name of the 802.1X authentication pass alternate profile assigned to the port or link aggregate. Configured through the **unp 802.1x-authentication pass-alternate** command
802.1x Bypass	The status of 802.1X bypass (**Enabled** or **Disabled**).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (**default** = no MAC authentication or **mac-authentication**).
Mac-auth allow-eap	Indicates the conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process (**pass** = MAC authentication passes, **fail** = if MAC authentication fails, **noauth** = no MAC authentication, or **none** = do not attempt 802.1X authentication). This parameter option only applies to a UNP port or link aggregate on which 802.1X authentication bypass is enabled. Configured through the **unp mac-authentication allow-eap** command.
Mac Authentication	The MAC authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp mac-authentication** command.
Mac Pass Alternate Profile	The name of the MAC authentication pass alternate profile assigned to the port or link aggregate. Configured through the **unp mac-authentication pass-alternate** command.
Classification	The classification status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp classification** command.
Trust-Tag	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the **unp trust-tag** command.
Default Profile	The name of the default UNP profile assigned to the UNP port or link aggregate. Configured through the **unp default-profile** command.
Port Domain Name	The domain ID number assigned to the UNP port or link aggregate. Configured through the **unp domain** command.
AAA Profile	The name of an AAA profile assigned to the UNP port or link aggregate. Configured through the **unp aaa-profile** command.

output definitions

Port Template	The name of a port template assigned to the UNP port or link aggregate. A port template defines and saves UNP port configuration options (such as the type of authentication, classification status, a default profile). Configured through the **unp port port-template** command.
Port Control Direction	Whether 802.1X access control is applied to ingress and egress traffic (**both**) or just ingress traffic (**in**). Configured through the **unp direction** command. This field applies only to UNP bridge ports and link aggregates.
Egress Flooding	Indicates whether egress broadcast, unknown unicast, and multicast traffic is blocked (**Not Allowed**) or unblocked (**Allowed**) on the UNP port. The value displayed in this field is based on the port control direction setting for the port (**both** = Not Allowed; **in** = Allowed). This field is displayed only for UNP bridge ports and link aggregates.
Admin State	The administrative status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp admin-state** command.
Dynamic Service	The type of dynamic service (**vxlan** or **spb**) to generate on the UNP port or link aggregate. Configured through the **unp dynamic-service** command. This field applies only to UNP access ports and link aggregates.
PVLAN Port Type	The Private VLAN (PVLAN) port type for the UNP port or link aggregate (**promiscuous**, **isl**, **community**, or **isolated**). This field is displayed only for UNP access ports, not link aggregates.
Force L3-Learning	The status of Layer 3 learning (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp force-l3-learning** command.
Force L3-Learning Port Bounce	The status of the port bounce action, which is an optional parameter associated with the Layer 3 learning function. Configured through the **unp force-l3-learning** command.
AP Mode	The Access Point mode status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp port ap-mode** command. This field applies only to UNP bridge ports and link aggregates.
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted. Configured through the **unp 802.1x-authentication tx-period** command.
802.1x Supp-Timeout	The amount of time, in seconds, the switch waits before timing out an 802.1X user (supplicant) that is attempting to authenticate. Configured through the **unp 802.1x-authentication supp-timeout** command.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information. Configured through the **unp 802.1x-authentication max-req** command.
L2 Profile	The name of a Layer 2 profile that is assigned to the UNP port or link aggregate. Configured through the **unp l2-profile** command. This field applies only to UNP access ports and link aggregates.

Release History

Release 8.3.1; command was introduced.
Release 8.3.1.R02; “Force L3-Learning” and “Force L3-Learning Port Bounce” fields added.
Release 8.4.1; “L2 Profile” field added.
Release 8.6R1; “AP Mode” field added.

Related Commands

show unp port bandwidth

Displays the bandwidth parameter values applied to a UNP port or link aggregate. These values are optionally assigned through the UNP profile to which a UNP port is associated.

show unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} bandwidth**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.
- Bandwidth parameter values are not applied to UNP link aggregates that are assigned to the profile. As a result, this command will always show the bandwidth parameter values as not set for link aggregates.
- The optional bandwidth parameter values are applied when a UNP port is classified into a UNP profile. The profile name is obtained through local classification or returned from the RADIUS server.
- The source from which the bandwidth parameter values was last updated is also included in the display information. The source updates are based on the following conditions:
  - The UNP profile applies the bandwidth values at the time the UNP port is classified into the profile. This overrides any existing QoS bandwidth policies configured on the physical port.
  - QoS bandwidth policies defined in a QoS policy list associated with the profile are applied after the port is classified into the profile. This overrides the profile bandwidth values initially applied.
  - User-configured QoS bandwidth policies are applied after the port is classified into the profile.

Examples

```
The following example shows the default display of UNP rate limit parameters when
no users are learned on the UNP port:

-> show unp port 1/1/11 bandwidth
Port   Port   Type    Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
       Domain         Bandwidth   Source     profile  Bandwidth  Source    profile   Depth       Depth
------+------+-------+-----------+----------+--------+----------+---------+---------+-----------+----------
1/1/11 0      Bridge  0                      -       0                     -        0           0

The following example shows the UNP rate limit parameters that are applied when
user devices are assigned to a UNP profile that specifies bandwidth parameter
values:
```

```
-> show unp port 1/1/11 bandwidth
Port   Port   Type   Max Ingress Ingress BW Ingr BW   Max Egress Egress BW Egress BW Max Ingress Max Egress
       Domain        Bandwidth   Source     profile   Bandwidth  Source    profile   Depth       Depth
------+------+------+-----------+----------+---------+----------+---------+---------+-----------+----------
1/1/11 0      Bridge 50.0M       UNP        Ingress50 30.0M      UNP       Egress30  0           0
```

The following example shows the rate limit parameter values that are applied when QoS policies override the bandwidth parameter values that were applied through UNP profile settings:

```
-> qos port 1/1/11 maximum ingress-bandwidth 60M maximum egress-bandwidth 60M

-> show unp port 1/1/11 bandwidth
Port   Port   Type   Max Ingress Ingress BW Ingr BW   Max Egress Egress BW Egress BW Max Ingress Max Egress
       Domain        Bandwidth   Source     profile   Bandwidth  Source    profile   Depth       Depth
------+------+------+-----------+----------+---------+----------+---------+---------+-----------+----------
1/1/11 0      Bridge 60.0M       QOS        -         60.0M      QOS       -         0           0
```

output definitions

Port	The port or link aggregate on which UNP is enabled. A “0” indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11). Configured through the **unp port-type** command.
Port Domain	The domain ID assigned to the UNP port or link aggregate. Configured through the **unp domain** command.
Type	The type of UNP port (**Bridge** or **Access**). Configured through the **unp port-type** command.
Max Ingress Bandwidth	The maximum ingress bandwidth value applied to the UNP port. Configured through the **unp profile maximum-ingress-bandwidth** command.
Ingress BW Source	The source from which the maximum ingress bandwidth value was updated on the port (**UNP** or **QoS**).
Ingr BW Profile	The name of the UNP profile responsible for setting the maximum ingress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Egress Bandwidth	The maximum egress bandwidth value applied to the UNP port. Configured through the **unp profile maximum-egress-bandwidth** command.
Egress BW Source	The source from which the maximum egress bandwidth value was updated on the port (**UNP** or **QoS**).
Egress BW Profile	The name of the UNP profile responsible for setting the maximum egress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Ingress Depth	The maximum ingress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum ingress bandwidth rate. Configured through the **unp profile maximum-ingress-depth** command.
Max Egress Depth	The maximum egress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum egress bandwidth rate. Configured through the **unp profile maximum-egress-depth** command.

Release History

Release 8.2.1; command was introduced.

show unp port 802.1x statistics

Displays 802.1X statistics for a UNP port or link aggregate on which 802.1X authentication is enabled.

show unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x statistics**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific UNP port or link aggregate ID.

Examples

```
-> show unp port 1/1/13 802.1x statistics
Port  1/1
    Mac-address=00:00:00:00:00:01,
        Vlan=0,

          Last EAP Frame Version=0,
          Last EAP Source=00:00:00:00:00:00
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show unp port	Displays the UNP port configuration for the switch.
show unp user	Displays information about the devices learned on a UNP port.

MIB Objects

N/A

show unp port configured-vlans

Displays the VLANs assigned to UNP bridge ports or link aggregates.

show unp {port [*chassis/slot/port1***[-***port2***]] | linkagg [***agg_id***[-***agg_id2***]} configured-vlans**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific UNP bridge port or link aggregate ID.
- If the **port** or **linkagg** parameter is used without specifying an individual port, a range of ports, or link aggregate ID, then the configured VLAN information for all UNP ports and link aggregates is displayed.
- The “Type” field indicates if the VLAN assignment is untagged (unpUntag) or tagged (unpQtag).

Examples

```
-> show unp port configured-vlans
Port     Vlan   Type
-------+------+---------
0/10      500  unpUntag
0/10      501  unpUntag
1/1/10    600  unpQtag
1/1/11    601  unpUntag
1/1/11    602  unpQtag
1/1/11    603  unpQtag

-> show unp port 1/1/11 configured-vlans
Port     Vlan   Type
-------+------+---------
1/1/11    601  unpUntag
1/1/11    602  unpQtag
1/1/11    603  unpQtag
```

```
-> show unp linkagg configured-vlans
LagId    Vlan   Type
-------+------+---------
0/10      500  unpUntag
0/10      501  unpQtag
0/100     100  unpQtag
0/100     101  unpUntag
0/101     200  unpQtag
0/101     201  unpQtag

-> show unp linkagg 100 configured-vlans
LagId    Vlan   Type
-------+------+---------
0/100     100  unpQtag
0/100     101  unpUntag
```

Release History

show unp port profile

Displays the UNP service profiles that are statically assigned to UNP ports or link aggregates.

show unp {port [*chassis/slot/port1***[-***port2***]] | linkagg [***agg_id***[-***agg_id2***]} profile**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID for a specific UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific UNP port or link aggregate ID.
- If the **port** or **linkagg** parameter is used without specifying an individual port, a range of ports, or link aggregate ID, then the static profile information for all UNP ports and link aggregates is displayed.

Examples

```
-> show unp port profile
Port    Profile
-------+----------------
1/1/5   static-spb1
1/1/5   static-spb2
1/1/10  static-vxlan1
1/1/10  static-vxlan2
1/1/20  static-l2gre

-> show unp port 1/1/5 profile
Port    Profile
-------+----------------
1/1/5   static-spb1
1/1/5   static-spb2
```

Release History

Release 8.5R4; command was introduced.

Related Commands

unp port profile	Configures static profile assignments for UNP ports.
show unp port	Displays the UNP port and link aggregate configuration for the switch.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortProfile
```

show unp port-template

Displays the port template configuration for the switch.

show unp port-template [*template_name***] [config | configured-vlans | profile]**

Syntax Definitions

template_name	The name of the UNP port template to display.
config	Displays additional details about the parameter configuration for the template.
configured-vlans	Displays the VLAN IDs that the specified template assigns to a UNP port.
profile	Displays the names of UNP service profiles that the specified template assigns as static profiles to a UNP port.

Defaults

By default, displays a summary of the configuration information for all port templates.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a template name with this command to display information for a specific port template.
- Use the **config** option with this command to display the full configuration for each template.
- Use the **configured-vlans** option with this command to display the VLAN IDs that a port template will statically assign to a UNP bridge port when the template is applied on the port. Configuring a static VLAN-port association (VPA) applies only to UNP bridge ports.
- Use the **profile** option with this command to display the names of UNP service profiles that a port template will assign as a static profile to a UNP port when the template is applied on the port.

Examples

```
-> show unp port-template

```

output definitions

Port Template	The name of the port template. By default, the "accessDefaultPortTemplate" is assigned to UNP access ports and the "bridgeDefaultPortTemplate" is assigned to UNP bridge ports.
802.1x Authentication	The 802.1X authentication status (**Enabled** or **Disabled**).
802.1x Pass Alternate Profile	The name of an alternate profile for devices that pass 802.1X authentication.
Mac Authentication	The MAC authentication status (**Enabled** or **Disabled**).
Mac-Auth Pass Alternate Profile	The name of an alternate profile for devices that pass MAC authentication.
Classification	The classification status (**Enabled** or **Disabled**).
Trust-Tag	The trust VLAN ID tag status (**Enabled** or **Disabled**).
Default Profile	The name of a default profile for devices that are not classified by any other classification methods.
Port Domain Num	The domain ID number assignment for the UNP port.
Redirect Port Bounce	The status of port bounce (**Enabled** or **Disabled**) for BYOD registration and authorization.This parameter is only configurable on UNP bridge ports.
AAA Profile	The name of an AAA profile to apply to the port.
Port Control Direction	Whether 802.1X access control is applied to ingress and egress traffic (**both**) or just ingress traffic (**in**). This parameter is only configurable on UNP bridge ports.
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted.
802.1x Supp-Timeout	The amount of time, in seconds, the switch will wait before timing out an 802.1X user that is attempting to authenticate.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information.
802.1x Bypass	The status of 802.1X bypass (**Enabled** or **Disabled**).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (**default** = no MAC authentication is attempted or **mac-authentication**).
Mac-auth allow-eap	The conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process (**pass** = if MAC authentication passes, **fail** = if MAC authentication fails, or **noauth** = if MAC authentication is not configured). This parameter option only applies to UNP ports on which 802.1X authentication bypass is enabled.
Force L3-Learning	The status of Layer 3 learning (**Enabled** or **Disabled**).
Force L3-Learning Port Bounce	The status of the port bounce action, which is an optional parameter associated with the Layer 3 learning function.
Admin State	The administrative status of the UNP port configuration (**Enabled** or **Disabled**).
Dynamic Service	Whether the UNP port generates dynamic SPB or VXLAN services. This parameter is only configurable on UNP access ports.

output definitions

L2 Profile	The name of a Layer 2 service profile to apply to a UNP access port. This parameter is not configurable when the template is assigned to a UNP bridge port.
AP Mode	The status of Access Point (AP) mode functionality (**Enabled** or **Disabled**). This parameter is only configurable on UNP bridge ports.

```
-> show unp port-template unp-pt1 configured-vlans
Template Name                    Vlan  Type
-------------------------------+------+----------
unp-pt1                          200   unpUntag
unp-pt1                          201   unpQtag
```

output definitions

Template Name	The name of a UNP port template.
VLAN	The VLAN IDs that are assigned to a UNP bridge port when the template is applied to the port.
Type	Indicates if the VLAN assignment is untagged (**unpUntag**) or tagged (**unpQtag**).

```
-> show unp port-template unp-port1 profile
Template Name                   Profile
-------------------------------+----------------
unp-port1                        static-spb1
                                 static-spb2
```

output definitions

Template Name	The name of a UNP port template.
Profile	The name of UNP service profiles that are statically assigned to a UNP port when the template is applied to the port.

Release History

Release 8.3.1; command was introduced.
Release 8.3.1.R02; “Force L3-Learning” and “Force L3-Learning Port Bounce” fields added.
Release 8.4.1; “L2 Profile” field added.
Release 8.5R4; **profile** parameter added, “Type” field added to configured VLANs display.
Release 8.6R1; “AP Mode” field added.

Related Commands

unp port-template	Configures UNP port parameter values for a port template.
unp port port-template	Assigns a port configuration template to a UNP port.
show unp port config	Displays the full UNP configuration for a port, including the name of a port template that is associated with the port.

show unp user

Displays information about the MAC addresses learned on a UNP port or link aggregate.

show unp user [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] [sap-id** *sap_id***] [service-id** *service_id***] [profile** *profile_name***] [authentication-type {none | mac | 802.1x}] [mac-address** *mac_address***] [count]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
sap_id	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
service_id	A service ID number. This parameter displays all UNP users associated with the specified service ID.
profile_name	The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
none	Displays all UNP users that did not undergo the authentication process.
mac	Displays all UNP users that were authenticated through the MAC authentication process.
802.1x	Displays all UNP users that were authenticated through the 802.1X authentication process.
mac_address	A source MAC address. This parameter displays the UNP user device with the specified source MAC address.
count	Displays the number of UNP users learned on the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
  - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
  - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “Username” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

Examples

```
-> show unp user count
Total users: 6

-> show unp user
                                          User
Port  Username           Mac address      IP      Vlan Profile   Type    Status
-----+------------------+----------------+-------+----+---------+-------+-------
1/1/1 00:00:00:00:00:01  00:00:00:00:00:01  1.1.1.1  10  unp-1     Access  Active
1/1/2 00:00:00:00:00:02  00:00:00:00:00:02  1.1.1.2  11  unp-2     Bridge  Active
1/1/3 guest_user         00:00:00:00:00:04  1.1.1.4  20  unp-guest Access  Active
1/1/7 00:00:00:00:00:07  00:00:00:00:00:07  1.1.1.7  11  unp-emp   Bridge  Active
0/10  Employee-001       00:00:00:00:00:03  1.1.1.3  12  unp-emp   Bridge  Active
0/12  00:00:00:00:00:14  00:00:00:00:00:14  1.1.2.4  20  unp-7     Bridge  Active

Total users : 6
```

output definitions

Port	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
Username	Displays either a source MAC address or a Captive Portal user name for the learned user device.
MAC address	The MAC address of the user device. This field and the **Username** field may contain the same MAC address, depending on how the user device was authenticated.
User IP	The IP network address of the user device.
Vlan	The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
Profile	The name of the UNP profile to which the user device was assigned.
Type	The type of UNP port on which the device was learned (**Bridge** or **Access**).
Status	The status of the device: • **In progress**—device learning is in progress. • **Active**—device is learned in forwarding state. • **Block**—device is learned in filtering state.

```
-> show unp user port 1/1/3

output definitions

Port	The UNP port or link aggregate on which the device was learned.
Mac-address	The MAC address of the device.
SAP	The port or link aggregate and encapsulation value for an SPB or VXLAN Service Access Point (SAP).
Service ID	The SPB or VXLAN service ID number.
VNID	The VXLAN Network Identifier. This value is associated with a VXLAN service ID.
ISID	The SPB service instance identifier. This value is associated with an SPB service ID.
VPNID	The L2 GRE tunnel VPN ID.
Access Timestamp	The date and time the device was learned.
User Name	The MAC address of the user.
IP-Address	The IP network address of the device.
Vlan	The VLAN ID number for the VLAN in which the device was learned.
Authentication Type	The type of authentication used (**Mac-Authentication** or **802.1x-Authentication**).
Authentication Status	The status of the authentication process (**blank** "–", **Authenticated**, **Failed**, or **In Progress**).
Authentication Failure Reason	The reason authentication failed.
Authentication Retry Count	The number of times authentication has been attempted.
Authentication Server IP Used	The IP address of the authentication server.
Authentication Server Used	The name of the authentication server used.
Server Reply-Message	Reply message from the authentication server.
Profile	The name of the UNP profile to which the user was assigned.
Profile Source	The source of the profile (returned from the server or assigned through the UNP process on the switch).
Profile From Auth Server	The name of the UNP profile returned from the authentication server.
Classification profile rule	The rule that resulted in the device classification into the UNP profile.
QMR Status	The Quarantine Manager Remediation status for the device.
Redirect Url	The URL to which the device is redirected upon classification.
SIP Call Type	The Session Initiation Protocol (SIP) call type status for a non-supplicant (non-802.1X) device.
SIP Media Type	The SIP media type status for a non-supplicant device.
Applications	The applications a non-supplicant device is running.

Release History

Release 8.1.1; command was introduced.
Release 8.4.1.R02; **VPNID** field added.

Related Commands

show unp user status	Displays information about the authentication and validation status of users learned on UNP ports.
unp user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
show zeroconf server policy-instances	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

N/A

show unp policy validity-period

Displays the UNP period policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unp policy validity-period [*policy_name***]**

Syntax Definitions

policy_name	The name of an existing UNP period policy.

Defaults

By default, all UNP period policies are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter a UNP period policy name to display information about a specific policy.

Examples

```
-> show unp policy validity-period
Policy Days    Months       Hours         Interval                          TZ Active
------+-------+------------+-------------+---------------------------------+---+----
tp1    SMTWTFS JFMAMJJASOND 08:00 - 17:00            - - -                 -   NO
tp2    ------- ------------     - - -     01/01/13 00:00 - 01/02/13 00:00 CST NO

Total Period Policy Count: 2

-> show unp policy validity-period tp1
Policy Days    Months       Hours         Interval                          TZ Active
------+-------+------------+-------------+---------------------------------+---+----
tp1    SMTWTFS JFMAMJJASOND 08:00 - 17:00              - - -               -   NO
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

show unp policy validity-location

Displays the UNP location policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unp policy validity-location [*policy_name***]**

Syntax Definitions

policy_name	The name of an existing UNP location policy.

Defaults

By default, all UNP location policies are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter a location policy name to display information about a specific policy.

Examples

```
-> show unp policy validity location
Policy: l1
  Port            = 1/1
  System Name     = shasta
  System Location = Bangalore

Total Location Policy Count: 1
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp policy validity-location	Configures a UNP location policy.
unp profile location-policy	Assigns a UNP location policy to a UNP profile.

MIB Objects

```
alaDaUNPLocationPolicyTable
   alaDaUNPLocationPolicyName
   alaDaUNPLocationPolicyPort
   alaDaUNPLocationPolicyPortHigh
   alaDaUNPLocationPolicyPortStatus
   alaDaUNPLocationPolicySystemName
   alaDaUNPLocationPolicySystemLocation
```

device-profile admin-state

Enables or disables the Device Profiling configuration on the switch.

device-profile admin-state {enable | disable}

Syntax Definitions

enable	Enables Device Profiling configuration on the switch.
disable	Disables Device Profiling configuration on the switch.

Defaults

By default Device Profiling configuration is disabled globally on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When Device Profiling is globally enabled for the switch, Device Profiling functionality is automatically enabled on all ports and link aggregates.

Example

```
-> device-profile admin-state enable
-> device-profile admin-state disable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile port linkagg	Enables or disables the Device Profiling on the ports or linkagg interface.
show device-profile config	Displays the global configuration of the Device Profile.

MIB Objects

```
alaDpAdminState
```

device-profile port linkagg

Enables or disables the Device Profiling on the ports or linkagg interface.

device-profile [port *chassis/]slot/port1***[-***port2***] | linkagg** *agg_id1***[-***agg_id2***] admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port1***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id1***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
enable	Enables the Device Profiling on the specified port or linkagg.
disable	Disables the Device Profiling on the specified port or linkagg.

Defaults

By default Device Profiling is enabled on all ports or linkagg when the Device Profiling feature is enabled globally on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to disable Device Profiling on specific ports or linkagg when the Device Profiling is globally enabled on the switch.
- Device Profiling configuration is not allowed on VFL or HiGig ports.

Example

```
-> device-profile linkagg 1 admin-state enable
-> device-profile port 2/1/2-5 admin-state enable
-> device-profile port 1/1/2 admin-state enable
-> device-profile port 1/1/2 admin-state disable
-> device-profile linkagg 1-5 admin-state disable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show device-profile config	Displays the global configuration of the Device Profile.
show device-profile catalog	Displays the details of known and unknown devices identified in the network.

MIB Objects

```
alaDpIfTable
   alaDpIfAdminStatus
```

device-profile device-type

Adds or removes a new device type and category in the Device Profile.

device-profile device-type *type_name* **device-name** *device_name* **from {mac-address** *mac_address* **| dhcp-option-55** *dhcp_option***}**

no device-profile device-type *type_name*

Syntax Definitions

type_name	The type of the device. The device type name can be of maximum size 32 alphanumeric characters.
device_name	The name of the device type. The device name can be of maximum size 32 alphanumeric characters.
mac_address	The MAC address of the device. The device with that MAC address must be in the unknown cataloged devices.
dhcp_option	The DHCP option 55 codes of the device.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The unknown cataloged devices can be identified or moved to trusted identity in the Device Profile using this command.
- While specifying the MAC address of the device for identity, the device must first be present in the unknown cataloged devices. Otherwise, the MAC address will not be recognized.
- Custom signatures can be created using the DHCP option 55.
- The new signatures created will not be persistent unless it is saved. Use the **device-profile update-signature** CLI command to update the flash or signature database.
- Use the **no** form of the command to remove the device and its category from the trusted device list.

Example

```
-> device-profile device-type Printer-Fax device-name Kyocera-Printer mac-address
00:aa:bb:12:43:55
-> device-profile device-type IP-Camera device-name netgear dhcp-option-55
1,3,6,15,119,252
-> no device-profile device-type Printer-Fax
```

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile auto-unp-assignment	Enables auto assignment of UNP profile when the device gets identified and categorized into existing device types.
show device-profile catalog	Displays the details of known and unknown devices identified in the network.
device-profile update-signature	Updates the custom or user-defined device type to the flash and signature database.
device-profile update-signature from	Apply the new signature file in the system.

MIB Objects

```
alaDpDeviceTable
   alaDpDeviceType
   alaDpDeviceName
   alaDpDeviceMacAddress
   alaDpDeviceDhcpOpt55
   alaDpDeviceRowStatus
```

device-profile update-signature

Updates the custom or user-defined device type to the flash and signature database.

device-profile update-signature

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If the flash or the signature database is not updated with the new device type, it will not be persistent.

Example

```
-> device-profile update-signature
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show device-profile catalog	Displays the details of known and unknown devices identified in the network.
device-profile update-signature from	Apply the new signature file in the system.
show device-profile signatures	Displays the device types in the local database and indicates the signatures which are not saved to the flash.

MIB Objects

```
alaDpUpdateSignature
   alaDpUpdateSignature
```

device-profile update-signature from

Applys the new signature file in the system.

device-profile update-signature from *file-name*

Syntax Definitions

file_name	The name of the file which contains device signatures.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to update the signature file in the system. Currently, only DHCP option 55 based signature is updated.
- The command also updates the custom signature into the flash.
- To view the content of the signature file, use the **show-device-profile** CLI command.

Example

```
-> device-profile update-signature from /flash/dhcp_option55_list.txt
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show device-profile catalog	Displays the details of known and unknown devices identified in the network.
show device-profile signatures	Displays the device types in the local database and indicates the signatures which are not saved to the flash.
show device-profile signatures from	Displays the contents of the signature file.

MIB Objects

```
alaDpGlobalConfig
   alaDpUpdateSignatureFileName
```

device-profile auto-unp-assignment

Configures the status of automatic assignment to a UNP profile when the device gets identified and categorized into existing device types.

device-profile auto-unp-assignment

no device-profile auto-unp-assignment

Syntax Definitions

N/A

Defaults

By default, automatic assignment to a UNP profile is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the device profile is from a different VLAN, then it must be port bounced using the **unp redirect port-bounce** command to toggle.
- Use the **no** form of the command to disable the auto assignment of the UNP profile.
- When Device Profiling is globally enabled for the switch, the following UNP profiles and extended classification rules are automatically created on the switch:
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets
- Automatically created UNP profiles are not mapped to a VLAN; manually configuring the VLAN assignment for the profile is still required.
- UNP profiles automatically created for the device types still require mapping the profiles to a VLAN.

Example

```
-> device-profile auto-unp-assignment
-> no device profile auto-unp-assignment
```

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile device-type	Adds or removes new device type and category in Device Profile.
show unp user	Displays information about the MAC addresses learned on a UNP port or link aggregate.
show unp profile	Displays the UNP profile configuration for the switch.
show unp classification-rule	Displays the UNP extended classification rule configuration for the switch.
show device-profile summary	Displays the number of devices identified based on the device type.

MIB Objects

```
alaDpGlobalConfig
   alaDpAutoUnpAssignment
```

show device-profile config

Displays the global configuration for Device Profiling.

show device-profile config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The command displays the non-default status per physical port and linkagg.
- The UNP profile auto-assignment status is also displayed.

Examples

```
-> show device-profile config

Admin-State:  Enable
UNP Auto-Assignment: Disable
Interface    Admin-Status
------------+-------------
1/1/1         Disable
1/1/2         Disable
1/1/4         Disable
0/1           Disable
```

output definitions

Admin-State	Displays the administrative status of Device Profiling.
UNP Auto-Assignment	Displays the status of automatic UNP profile assignment for the identified devices**.**
Interface	Displays the interface on which Device Profiling is configured.
Admin-Status	Displays the administrative status of Device Profiling on the interface.

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile admin-state	Enables or disables the Device Profiling configuration on the switch.
device-profile port linkagg	Enables or disables Device Profiling on the ports or linkagg interface.

MIB Objects

```
alaDpGlobalConfig
   alaDpAdminState
   alaDpAutoUnpAssignment
   alaDpDeviceRowStatus
```

show device-profile summary

Displays the number of devices identified based on the device type. Also displays information about the number of devices identified in the last one hour and one day.

show device-profile summary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show device-profile summary

Device-Type                Total      1 Hr      1 Day
                           Count      Count     Count
-------------------------+----------+----------+------------
SmartPhone/PDA/Tablets     10         2         4
Windows                     5         0         2
IP-Camera                   2         0         2
IP-Phone                    3         3         3
Access-Points               1         1         1
Printers                    1         1         1
```

output definitions

Device-Type	Displays the name of the device type.
Total Count	Displays the total number of devices identified for the device type**.**
1 Hr Count	Displays the number of device identified in the last one hour for the device type.
1 Day Count	Displays the number of device identified in the last one day for the device type.

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile device-type	Adds or removes new device type and category in Device Profile.

MIB Objects

```
alaDpDeviceType
   alaDpDeviceRowStatus
```

show device-profile catalog

Displays the details of known and unknown devices identified in the network.

show device-profile catalog [unknown]

Syntax Definitions

unknown	Displays only the unknown devices discovered.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the option **unknown** in the CLI to display the unknown devices.

Examples

```
-> show device-profile catalog
Legend: * indicates 'Unknown/Un-catalogued' devices

Port/LAGG Device Type  Device Name Mac-Address       IP Address TimeStamp Initial  TimeStamp Most-Recent

```

output definitions

Port/ LAGG	Displays the port number or the linkagg ID on which the device is identified.
MAC-Address	Displays the MAC address of the device.
DHCP VCI (Option 60)	Displays the DHCP option 60 information of the device.
DHCP Option 55	Displays the DHCP option 55 information of the device.
Mac-Vendor	Displays the unique MAC identifier for the vendor.

Release History

Release 8.5R2; command was introduced.
Release 8.6R1; “IP Address” field added.

Related Commands

device-profile port linkagg	Enables or disables the Device Profiling on the ports or linkagg interface.

MIB Objects

```
alaDpDeviceTable
   alaDpDeviceType
   alaDpDeviceName
   alaDpDeviceMacAddress
```

show device-profile signatures from

Displays the contents of the signature file.

show device-profile signatures from *file-name*

Syntax Definitions

file_name	The name of the file which contains device signatures.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show device-profile signatures from device_profile_sigs.csv

Device Type          Device Name                 DHCP Option 55
-------------------+-------------------+---------------------------------------
ale-ip-phone         ale-ip-phone         1,3,6,12,15,28,42,43,66,67,138,212

Number of Signatures: 7
```

output definitions

Device Type	Displays the type of device identified.
Device Name	Displays the name of the identified device.
DHCP Option 55	Displays the DHCP Option 55 information of the identified device.

Release History

Release 8.5R2; command was introduced.

Related Commands

device-profile update-signature from	Applys the new signature file in the system.

MIB Objects

```
alaDpUpdateSignature
   alaDpUpdateSignatureFileName
```

show device-profile signatures

Displays the device types in the local database and indicates the signatures which are not saved to the flash.

show device-profile signatures

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Displays all the device types in the local database (/flash file).
- An asterisk (*) next to the device type indicates that the device signature is not saved to the flash.

Examples

```
-> show device-profile signatures

Device Type                     Device Name                    DHCP Option 55

40 Application Monitoring and Enforcement Commands

Application usage patterns in the enterprise network is changing with the increase in use of the social networking, browser based file sharing, and peer to peer applications. The use of these applications result in the new traffic patterns in the network that are not straightforward to distinguish. There is also an increase in consumerization of IT with multiplication of thin clients, HTTP based, and virtual desktop clients.

OmniSwitch Application Monitoring and Enforcement (AppMon) feature addresses the key challenges of real time classification of flows at application level by providing differential QoS treatment in the form of higher priority marking and security policies at application level. AppMon feature improves the quality of user experience through application aware network optimization and control.

MIB information for the AppMon commands is as follows:

Filename: ALCATEL-IND1-APP-MON-MIB.mib
Module: alaAppMonMIB

A summary of the available commands is listed here:

app-mon admin-state

Enable or disable the Application Monitoring and Enforcement (AppMon) feature.

app-mon admin-state {enable | disable}

Syntax Definitions

enable	Enables AppMon support on the switch.
disable	Disables AppMon support on the switch.

Defaults

By default, AppMon is disabled on the switch.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- AppMon cannot be enabled globally when,
  - all the mirroring sessions are used by port mirroring or monitoring features.
  - mirroring session is used by policy manager.
- When AppMon is enabled globally, it reserves a mirroring session in the system.
- If AppMon functionality is enabled at a port level, disabling AppMon globally overrides the functionality of all AppMon ports; however, configuration on the ports remain the same.
- AppMon is supported in a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.

Examples

```
-> app-mon admin-state enable
-> app-mon admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon port admin-state	Enable or disable AppMon on one or more switch ports.
show app-mon config	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonAdminStatus
```

app-mon port admin-state

Enable or disable AppMon Monitoring and Enforcement on one or more switch ports.

app-mon {port *chassis/slot/port***[**-*port2***] | slot** *chassis/slot* **[**-*slot***]} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
enable	Enables AppMon on the port.
disable	Disables AppMon on the port.

Defaults

By default, AppMon is disabled on all ports.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- It is mandatory to enable AppMon globally for the port level AppMon to function.
- When slot option is used, then AppMon configuration is applied on all the physical ports of that particular slot.
- AppMon configuration is not allowed on Virtual Fabric Link, ERP, VLAN stacking, or SPB ports.
- AppMon cannot be configured on a port that is part of a link aggregate or a port mirroring port.
- AppMon must not be configured on user ports and uplink ports at the same time.

Examples

```
-> app-mon slot 1/1 admin-state enable
-> app-mon port 1/1/2-5 admin-state enable
-> app-mon slot 1/1 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon admin-state	Enable or disable the Application Monitoring feature.
show app-mon port	Displays AppMon status per physical port or per slot for the switch.

MIB Objects

```
alaAppMonPortConfigTable
   alaAppMonPortConfigSlotPortIndex
   alaAppMonPortConfigPortStatus
```

app-mon auto-group create

Creates application groups automatically on the switch. The application groups are automatically created based on the ‘category' field of each application present in the application pool.

app-mon auto-group create

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Modifications are allowed in auto application groups with addition or deletion of applications using the **app-mon app-group** command.
- Enter **app-mon apply** and **write memory** to save the auto group configuration or modification on the switch.
- The **show app-mon app-pool** command displays the application categories in the signature file. The application group names are derived from the category name.

Examples

```
-> app-mon auto-group create
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

```
alaAppMonAutoGroupCreation
```

app-mon app-group

Creates an application group. Applications can be added or removed from the application group.

app-mon app-group *app_group_name* **{add | remove} {app-name** *app_name* **| from** *app_name* **to** *app_name***}**

no app-mon app-group *app_group_name*

Syntax Definitions

app_group_name	Name of the application group. The group name can be a maximum of 32 alphanumeric characters.
app_name	The name of the application to be added to the application group. The application name can be a maximum of 32 alphanumeric characters.
from *app_name*	The first application name when adding a range of applications to an application group.
to *app_name*	The last application name when adding a range of applications to an application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **no** form of this command to remove an application group.
- This command can be used to add or delete applications for the auto application groups as well.
- One application can belong to more than one application group.
- Only those applications that are part of an application pool are allowed to be added to an application group.
- To add a range of applications or multiple applications to an application group, use the **from** and **to** options. Range is expanded based on the list of applications in the app-pool list (application pool). Use the **show app-mon app-pool** command to view the application names.
- If an application is removed from an application group which has only one application, then the complete application group is removed.
- If any application is added to a user group (group name same name as category name), and signature toolkit update operation or 'app-mon auto-group create' is done, then added group is not deleted. Only update happens.
- If an application group contains a single application and the group is part of an application list, then this single application cannot be removed from the application group.
- An application group cannot be deleted when it is part of an application list.

- When the last application from the application group is removed, the application group is automatically deleted.
- The list of applications (added or deleted) to an application group is displayed in **show configuration snapshot** command after **app-mon apply** command is entered. A list of applications (added or deleted) are displayed with the **show app-mon app-group** command even without using the **app-mon apply** command.

Examples

```
-> app-mon app-group apg2 add app-name whatsapp
-> app-mon app-group apg2 remove app-name whatsapp
-> no app-mon app-group apg2
```

To add a range of applications or multiple applications to an application group, use the **show app-mon app-pool** command to view the application names. For example:

```
-> show app-mon app-pool
Legend: Application-name: *= Not present in recently updated kit,
 AppId       Application-name             Revision       Category
-------+--------------------------------+-----------+----------------
968           amazon                        1.0.0         Web
244           facebook                      1.0.0         Web
182           sip                           1.0.0         Audio/Video
183           skype                         1.1.0         Instant Messaging
211           tftp                          1.0.0         File Server
503           twitter                       1.0.0         Web
597           viber                         1.0.0         Audio/Video
890           webex                         1.0.0         Audio/Video
1093          whatsapp                      1.0.0         Instant Messaging
240           youtube                       1.0.0         Web
--------------------------------
Number of Applications: 10
```

Select any two applications for the range option using the **app-mon app-group** command.

```
-> app-mon app-group apg1 add from sip to viber
```

This command adds the applications from sip to viber to the application group (sip, skype, tftp, twitter, and viber).

If an application is removed from an application group which has only one application, then the complete application group is removed. For example:

```
-> show app-mon app-group group1
AppGrp-Id   App-group                        App-name
----------+-----------------------------+---------------------------
1093         whatsapp                      Instant Messaging
```

Now, remove the application name ‘whatsapp’ from the application group. The complete application group gets removed as shown below.

```
-> app-mon app-group group1 remove app-name whatsapp
-> show app-mon app-group group1
AppGrp-Id   App-group                        App-name
----------+-----------------------------------+---------------------------
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-list	Displays a list of applications and application groups added to an application list.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

```
alaAppMonAppGroupTable
   alaAppMonAppGroupName
   alaAppMonAppGroupMember
   alaAppMonAppGroupStatus
   alaAppMonAppGrpFromAppName
   alaAppMonAppGrpToAppName
   alaAppMonAddAppGrpName
   alaAppMonAppGroupBuiltIn
   alaAppMonAppGroupCategoryName
   alaAppMonAppGrpId
   alaAppMonAppGroupAppStatus
```

app-mon app-list

Add or remove applications or application groups to an application list for enforcement or monitoring.

app-mon app-list {enforcement | monitor} {add | remove} {app-name *app_name* **| app-group** *app_group_name***}**

Syntax Definitions

add	Adds the specified application or application group to an application list.
remove	Removes the specified application or application group from an application list.
app_name	Name of the application to be added to the application list. This adds the specified application to the application list.
app_group_name	Name of the application group to be added to the application list. This enables the addition of multiple applications in the application group to the application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- The application group can be user created or generated automatically (see **app-mon app-group** and **app-mon auto-group create** command).
- Separate application list is maintained for enforcement and monitoring.
- The **show configuration snapshot** command displays the applications added or removed from the application list only after the **app-mon apply** command is used. The **app-mon apply** command saves the list of applications added or removed to the application list. The saved list of applications are displayed with the **show app-mon app-list active** command.
- QoS policy rules can be configured for a given application as well as an application group where the same application also exists. QoS matches policies based on the application-name or application-group name configured in an application list. For more information on configuring enforcement for QoS policy rules, see the "**QoS Policy Commands**" chapter.

Examples

```
-> app-mon app-list enforcement add app-name whatsapp
-> app-mon app-list enforcement add app-group apg1
-> app-mon app-list monitor add app-group apg2
-> app-mon app-list enforcement remove app-name whatsapp
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon auto-group create	Enables or disables Auto-Group functionality on the switch.
app-mon app-group	Creates an application group. Applications can be added or removed from the application group.
show app-mon app-list	Displays list of applications and application groups added to an application list.
clear app-mon app-list	Removes all applications signatures from the application list.

MIB Objects

```
alaAppMonAppListTable
   alaAppMonAppListMemberName
   alaAppMonAppListMemberType
   alaAppMonAppListMemberStatus
   alaAppMonAppListAppId
   alaAppMonAppListAppStatus
```

app-mon apply

This activates both enforcement and monitoring application lists for flow classification.

app-mon apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The following operations are performed with the **app-mon apply** command:

- Saves the current application-list, application-group, and auto-groups to flash when 'write memory' command is used.
- The application list is checked for any application configured more than once in an application list (individually or as a part of application group).
  - The **app-mon apply** command will not be successful until the conflict is resolved.
  - The **show app-mon app-list** command with the **monitor conflict** or the **enforcement conflict** parameter displays the available conflicts in an application list.
  - The duplicate application names must be removed for a successful **app-mon apply** operation.
- QoS is applied to the flows learned for the activated applications based on the configured QoS policies for Enforcement application list.

Examples

```
-> app-mon apply
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon port	Displays AppMon status per physical port or per slot for the switch.
show app-mon app-list	Displays a list of applications and application groups added to an application list.

MIB Objects

```
alaAppMonUpdateAppList
```

app-mon l3-mode

Enables or disables monitoring and enforcement for IPv4 flows, IPv6 flows, or both.

app-mon l3-mode {ipv4 | ipv6} admin-state {enable | disable}

Syntax Definitions

IPv4	Applies monitoring and enforcement to IPv4 flows.
IPv6	Applies monitoring and enforcement to IPv6 flows.
enable	Enables the specified L3 mode on the switch.
disable	Disables the specified L3 mode on the switch.

Defaults

By default, monitoring and enforcement is enabled for both IPv4 and IPv6 flows.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

N/A

Examples

```
-> app-mon l3-mode ipv4 admin-state disable
-> app-mon l3-mode ipv4 admin-state enable
-> app-mon l3-mode ipv6 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonEnforcementIpv4
alaAppMonEnforcementIpv6
```

app-mon l4-mode

Enables or disables monitoring and enforcement for TCP or UDP flows.

app-mon {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot***} l4-mode {tcp | udp} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
tcp	Applies monitoring and enforcement to TCP flows.
udp	Applies monitoring and enforcement to UDP flows.
enable	Enables the specified L4 mode on the switch.
disable	Disables the specified L4 mode on the switch.

Defaults

By default, both TCP and UDP flows are processed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

N/A

Examples

```
-> app-mon port 1/1/2 l4-mode udp admin-state disable
-> app-mon slot 1/1 l4-mode tcp admin-state enable
-> app-mon port 1/1/2 l4-mode udp admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon l4port-exclude	Configures the L4 port range to exclude from the AppMon operation.
show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonPortConfigTable
   alaAppMonPortConfigSlotPortIndex
   alaAppMonEnforcementPortConfigTcpStatus
   alaAppMonEnforcementPortConfigUdpStatus
```

app-mon l4port-exclude

Configures the L4 port range to exclude from the AppMon operation.

app-mon l4port-exclude range-id *number* **{tcp-service-port | udp-port} start** *number* **end** *number*

no app-mon l4port-exclude range-id

Syntax Definitions

range-id *number*	The range ID number. The valid range is 1–8.
tcp-service-port	Specifies TCP service ports.
udp-port	Specifies UDP ports.
start *number*	The first port associated with the range ID number. The valid port range is 1–65535.
end *number*	The last port associated with the range ID number. The valid port range is 1–65535.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **no** form of this command to remove an L4 exclude range ID from the switch configuration.
- For the **udp-port** option, the AppMon operation is not performed on the flows with a source or destination port that is in the excluded port range.
- For the **tcp-service-port** option, the AppMon operation is not performed on the flows with a destination TCP port of TCP-SYN packet or a source TCP port of TCP-SYN-ACK packet that is in the excluded port range.
- This configuration applies to both enforcement and monitor features.

Examples

```
-> app-mon l4port-exclude range-id 5 tcp-service-port start 20 end 30
-> app-mon l4port-exclude range-id 6 udp-port start 90 end 100
-> no app-mon l4port-exclude range-id 6
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon l4port-exclude Displays the port range excluded from AppMon operation.

MIB Objects

```
alaAppMonEnforcementL4PortRangeTable
   alaAppMonEnforcementL4PortRangeStart
   alaAppMonEnforcementL4PortRangeEnd
   alaAppMonEnforcementL4PortType
   alaAppMonEnforcementL4PortStatus
```

app-mon flow-table flush

Clears all the learned flow-table entries for both IPv4 and IPv6 flow tables.

app-mon flow-table {enforcement | monitor} flush

Syntax Definitions

enforcement	Flushes all the learned flow-table entries from the enforcement application.
monitor	Flushes all the learned flow-table entries from the monitor application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- When the **enforcement** option is used, all the active flows information are cleared; no QoS treatment is provided (if configured). The data (active, gross counters, statistics, and flow information) in the following commands are cleared: **show app-mon app-list enforcement active**, **show app-mon app-list enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon ipv6-flow-table enforcement**, **show app-mon stats**.
- When the **monitor** option is used, all the learned flows information will be cleared. The data (gross counters and flow information) in the following commands are cleared: **show app-mon app-list monitor active**, **show app-mon ipv4-flow-table monitor**, **show app-mon ipv6-flow-table monitor**.
- When this command is used, application-record information is not cleared.

Examples

```
-> app-mon flow-table enforcement flush
-> app-mon flow-table monitor flush
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon app-list	Displays a list of applications and application groups added to an application list. ‘stats’ option in this command displays active or gross packets/byte counters on per application basis.
show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

MIB Objects

```
alaAppMonFlowTableFlush
```

app-mon flow-table enforcement stats

Enable or disable flow table statistics update for enforcement applications.

app-mon flow-table enforcement stats admin-state {enable | disable}

Syntax Definitions

enable	Enable flow-table statistics update.
disable	Disable flow-table statistics update.

Defaults

By default, statistics admin status is disabled.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is applicable only for enforcement applications.
- The statistics collection capability is shared with Service Manager, which means that either the Service Manager feature or AppMon can use this capability at any given time. Hence, disabling the counter usage in Service Manager using the **service stats disable** command is required to view the flow table statistics update for enforcement applications. For more information about this command, see the "Service Manager Commands" chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- When update statistics is enabled, the updated statistics is displayed in the **show app-mon ipv4-flow-table enforcement verbose**, **show app-mon ipv6-flow-table enforcement verbose**, and **show app-mon app-list enforcement active stats** commands. Statistics are refreshed every 160 seconds from data path, and based on the flow sync interval between the data path and the control path.

Examples

```
-> app-mon flow-table enforcement stats admin-state enable
-> app-mon flow-table enforcement stats admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonEnforcementFlowTableStatsAdminStatus
```

app-mon aging enforcement

Configures aging time for dynamically learned TCP/UDP flows for each application for Enforcement applications.

app-mon aging enforcement app-name *app_name* **[tcp | udp] interval {120m | 60m | 30m | 10m | 5m | 3m | default}**

Syntax Definitions

app_name	Name of the application to configure its aging interval. The application must be part of the application pool.
interval	The aging time interval for dynamically learned flows in the flow table, in minutes.
default	Configures the default aging interval.

Defaults

By default, aging interval is set per application and TCP or UDP flow type basis.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- User can set separate TCP or UDP flows aging interval for an given application.
- When TCP option is used to configure aging interval for an application, TCP flows generated by a given application age out with configured value.
- When UDP option is used to configure aging interval for an application, UDP flows generated by a given application age out with configured value.
- Flow aging is supported for the applications that are part of the enforcement application list. Flows related with enforcement application list are made active for QoS treatment as well statistics collection.
- Flow aging is not supported for applications that are part of Monitor application list. Monitor flow tables log these flows when they are detected until logging threshold is reached.

Examples

```
-> app-mon aging enforcement app-name sip tcp interval 60m
-> app-mon aging enforcement app-name tftp udp interval 120m
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon aging enforcement	Displays the aging interval for each application for enforcement feature.

MIB Objects

```
alaAppMonEnforcementAgingTimerTable
   alaAppMonEnforcementAgingTimerValue
```

app-mon logging-threshold

Configures the threshold for the number of matched flows for enforcement and monitor applications.

app-mon logging-threshold {enforcement | monitor} num-of-flows {*number* | **default}**

Syntax Definitions

number	Threshold value for the number of matched flows. The valid range is 1000–60000.
default	Sets the threshold back to the default value of 20K.

Defaults

By default, 20000 flows are logged.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- When the logging threshold value is set to ‘0’, flows are not logged to the log file.
- When used with enforcement option, it configures the threshold for the number of matched flows to be saved on to the log file for enforcement applications.
- When used with monitor option, it configures the threshold for the number of matched flows to be displayed in the monitor flow table commands.

Examples

```
-> app-mon logging-threshold monitor num-of-flows 10000
-> app-mon logging-threshold monitor num-of-flows default
-> app-mon logging-threshold enforcement num-of-flows 10000
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonThresholdNumberOfFlows
```

app-mon flow-sync enforcement interval

Configures the interval at which the enforcement flows information is refreshed.

app-mon flow-sync enforcement interval {*number* **| default}**

Syntax Definitions

number	Flow sync interval at which the enforcement flows information is refreshed. The valid range is 10–3600 seconds. The interval can be configured only for the enforcement feature.
default	Configures the default flow-sync interval.

Defaults

Default flow-sync interval is 60 seconds for enforcement.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The refreshed information is shown in the following show commands: **show app-mon applist enforcement active**, **show app-mon applist enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon stats**.

Examples

```
-> app-mon flow-sync enforcement interval 10
-> app-mon flow-sync enforcement interval default
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries.

MIB Objects

```
alaAppMonFlowSyncEnforcementInterval
```

app-mon force-flow-sync

Synchronizes flows learned in the data path.

app-mon force-flow-sync {enforcement | monitor}

Syntax Definitions

enforcement	Synchronizes flows learned in the data path for the enforcement feature from the hardware.
monitor	Synchronizes flows learned in the data path for the monitor feature from the hardware.

Defaults

By default, flow synchronization occurs every 5 minutes for monitor flows and 60 seconds for enforcement flows.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Use this command to force a flow synchronization with the control path database in real time.

Examples

```
-> app-mon force-flow-sync enforcement
-> app-mon force-flow-sync monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries.

MIB Objects

```
alaAppMonForceFlowSyncStatus
```

show app-mon config

Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

show app-mon config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The operational state is enabled if there is at least one OmniSwitch 6860E chassis in the virtual chassis (VC). If there is no OmniSwitch 6860E in the VC, the operational-state is disabled.

Examples

```
-> show app-mon config
Admin State                          : Enable,
Operational State                    : Enable,
L3-IPv4                              : Enable,
L3-IPv6                              : Enable,
Enforcement Flow-Table Stats         : Enable,
Enforcement Flow-Sync Interval       : 10 seconds,
Monitor Logging Threshold            : 20000,
Enforcement Logging Threshold        : 20000,
App-Pool Applications                : 10,
Monitor Applied Applications         : 10,
Enforcement Applied Applications     : 10,
Upgraded Signature File Type         : Factory,
AOS Compatible Signature Kit Version : 1,
Signature Kit version                : 1.1.1
```

output definitions

Admin-state	The AppMon administrative status (**Enabled** or **Disabled**). Configured through the **app-mon admin-state** command.
Operational State	The operational status (**Enabled** or **Disabled**).
L3-IPv4	Status of IPv4 l3 mode on the switch (**Enable** or **Disable**)
L3-IPv6	Status of IPv6 l3 mode on the switch (**Enable** or **Disable**)
Enforcement Flow-Table Stats	Status of the enforcement flow table statistics update.
Enforcement Flow Sync interval	Enforcement flow sync interval at which the switch polls for flow information.

output definitions (continued)

Monitor Logging-Threshold	Monitor threshold value for the flows to be saved in the IPv4 or IPv6 flow table.
Enforcement Logging-Threshold	Enforcement threshold value for the flows to be saved on to the log file.
App-Pool Applications	The number of application signatures in the application pool.
Monitor Applied Applications	The number of active applications in the Monitor application list.
Enforcement Applied Applications	The number of active applications in the enforcement application list.
Upgraded Signature File Type	The signature file type: Factory or Production
AOS Compatible Signature Kit Version	Determines the compatibility between AOS software and the signature file.
Signature Kit version	The signature file version that contains the application signatures.

Release History

Release 8.2.1; command introduced.

show app-mon app-list

Displays a list of applications and application groups added to an application list.

show app-mon app-list {monitor | enforcement} [active [stats]] [conflict]

Syntax Definitions

monitor	Displays information for applications added for monitoring.
enforcement	Displays information for applications added for enforcement.
active [stats]	Displays the list of activated applications in an application list. Use the **stats** option together with the **enforcement** option.
conflict	Displays the list of applications that are present more than once in an application list.

Defaults

By default, all applications and application groups that belong to an application list are displayed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **conflict** option to identify applications that are present more than once in an application list. This needs to be checked and resolved for **app-mon apply** to be successful.
- The **active** option displays active and gross number of flows detected on per application basis.
- For monitor feature, **active** option displays only the gross counters.
- The **stats** option is used only for the **enforcement** option. This displays active or gross packets/byte counters per application basis.

Examples

```
-> show app-mon app-list monitor
App-Id/        Application-List                          Application-List
AppGrp-Id      Member Name                               Member Type

show app-mon app-group

Displays the details of all the applications in an application group.

show app-mon app-group [group-name *group_name***]**

Syntax Definitions

group_name	The name of an application group. This is a case sensitive string.

Defaults

By default, information is displayed for all application groups.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command displays both user created and automatically created application groups and the applications added to the respective group.
- Application names which are added to group and not yet activated are also displayed.
- This also display the auto application groups.

Examples

```
-> show app-mon app-group
Legend: Application-name: *= Not present in recently updated kit,

AppGrp-Id  App-group                              App-name

show app-mon app-record

Displays current-hour application-record information as well the historic application-records on the hourly or 24-hours basis for monitored applications.

show app-mon app-record [hourly | twenty-four-hours | current-hour] [verbose]

Syntax Definitions

hourly	Displays flows detected for an applications in an hour. An Hour is defined with fixed boundary (for example, 1:30 p.m to 2:30 p.m).
twenty-four-hours	Displays aggregate of available 'hourly' records for each application, flows detected in last 24-hours since last hour boundary. 'current-hour' data will not be part of this. This information is updated every one hour when 'hourly' record is updated.
current-hour	Displays new flow detected for an application in the current hour which is not part of 'hourly' historic data. When current-hour reaches an hour boundary, this data is moved to 'hourly' records. For example, if current time is 2.40 p.m, then information between 2.30 p.m to 2.40 p.m is displayed. On 3.30 p.m, current-hour information is moved to the latest hourly record.
verbose	Select this option to view detail information for each option. Detail information include minimum, maximum and average flows detected for each application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This is supported for monitoring.

show app-mon ipv4-flow-table

Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

show app-mon ipv4-flow-table {monitor | enforcement [verbose]} [{src-ipv4 | dest-ipv4} *ip_address*] **[app-name** *app_name* **| app-group** *grp_name*]

Syntax Definitions

verbose	Displays detailed information of the flows.
src-ipv4 *ip_address*	Filter flow table based on the specified source IPv4 address.
dest-ipv4 *ip_address*	Filter flow table based on the specified destination IPv4 address.
app_name	Filter flow table based on application name.
grp_name	Filter flow table based on application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

Examples

```
-> show app-mon ipv4-flow-table monitor

show app-mon l4port-exclude

Displays the port range excluded from AppMon operation.

show app-mon l4port-exclude range-id [*number***]**

Syntax Definitions

number	A range ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all range ID numbers.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Enter a range ID number with this command to display information for a specific range.

Examples

```
-> show app-mon l4port-exclude range-id
Range-Id     Start-port     End-port      Port-type
----------+------------+--------------+----------
1             100           200           UDP-Port
2             20            25            TCP-Service-Port

-> show app-mon l4port-exclude range-id 1
Range-Id     Start-port     End-port      Port-type
----------+------------+--------------+----------
1             100             200         UDP-Port
```

output definitions

Range-Id	The service port range ID.
Start-port	The start port associated with the range ID.
End-port	The end port associated with the range ID.
Port-type	Indicates the port type (**TCP** or **UDP**)

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon l4port-exclude	Configures the L4 port range to exclude from the AppMon operation.

MIB Objects

   alaAppMonEnforcementL4PortRangeID
   alaAppMonEnforcementL4PortRangeStart
   alaAppMonEnforcementL4PortRangeEnd
   alaAppMonEnforcementL4PortType
   alaAppMonEnforcementL4PortStatus
```

show app-mon stats

Displays the number of flow statistics.

show app-mon stats

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Use the **app-mon flow-table enforcement flush** command to clear the counters.

Examples

```
-> show app-mon stats
Chassis/  Total Enforcement Total           Total TCP         Total UDP
Slot      Matched Flows     Used Flows      Overflow Flows    Overflow Packets
--------+----------------+---------------+-----------------+----------------
1/1         8192              8192             1422            0
2/1         0                 3                0               0
3/1         0                 0                0               0
4/1         0                 0                0               0
Total       8192              8195             1422            0
```

output definitions

Chassis/Slot	The chassis ID and slot number.
Total Enforcement Matched Flows	Total number of active flows that matched to any active application signature for enforcement feature.
Total Used Flows	Total number of active flows (including unmatched and enforcement matched) on a given chassis/slot. Each IPv4 flow takes one entry count, while each IPv6 flow takes two entries for Total Used Flows count.
Total TCP Overflow Flows	Total number of TCP flows missed to create flow entry in flow table due to hash collision.
Total UDP Overflow Packets	Cumulative number of UDP packets missed to create flow entry in flow table due to hash collision.

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon flow-table enforcement stats	Enable or disable flow table statistics update for enforcement applications.

MIB Objects

show app-mon aging enforcement

Displays the aging interval for each application for enforcement feature.

show app-mon aging enforcement [app-name *app_name***]**

Syntax Definitions

app_name	The name of the application. This is a case sensitive string.

Defaults

By default, the aging time for all applications is displayed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

N/A

Examples

```
-> show app-mon aging enforcement
AppId    Application-name                      TCP Aging-time/
                                               UDP Aging-time(minutes)
------+--------------------------------------+-------------------------
968        amazon                                 6/1
244        facebook                               6/1

211        tftp                                   15/15
503        twitter                                6/1
597        viber                                  6/1
890        webex                                  6/1
1093       whatsapp                               6/1
240        youtube                                6/1

-> show app-mon aging enforcement app-name sip
AppId    Application-name                      TCP Aging-time/
                                               UDP Aging-time(minutes)
------+--------------------------------------+-------------------------
182      sip                                    60/60
```

output definitions

AppId	Identity of the application.
Application-name	Name of the application.
TCP Aging-time/UDP Aging-time (minutes)	Aging time configured for the application.

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon aging enforcement	Configures the aging time for dynamically learned flows for each application for enforcement feature.

MIB Objects

```
alaAppMonEnforcementAgingTimerTable
   alaAppMonEnforcementAgingTimerAppName
   alaAppMonEnforcementAgingTimerValue
```

show app-mon vc-topology

Displays the AppMon virtual chassis topology.

show app-mon vc-topology

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Displays the topology of the available OmniSwitch 6860 and OmniSwitch 6860E chassis. This also displays the connectivity between the chassis for flow classification.

Examples

```
-> show app-mon vc-topology
Chassis/    Node            Designated
Slot        Type            Chassis/Slot
--------+----------------+----------------
1/1         OS6860             2/1
2/1         OS6860E            2/1
3/1         OS6860E            3/1
```

output definitions

Chassis/Slot	The chassis ID and slot number.
Node Type	Indicates the switch type.
Designated Chassis/Slot	The chassis and slot of the switch.

Release History

Release 8.2.1; command introduced

Related Commands

N/A

MIB Objects

```
alaAppMonVCTopologyTable
   alaAppMonVCTopologyChassisIndex
   alaAppMonVCTopologyChassisType
   alaAppMonVCTopologyDesignatedChassisIndex
```

clear app-mon app-list

Removes all applications from the enforcement or monitor application list.

clear app-mon app-list {monitor| enforcement}

Syntax Definitions

monitor	Removes all applications from the monitor application list.
enforcement	Removes all applications from the enforcement application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This command does not clear the active application list until the **app-mon apply** command is used.

Examples

```
-> clear app-mon app-list enforcement
-> clear app-mon app-list monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon app-list	Add or remove applications or application groups to an application list for enforcement or monitoring.

MIB Objects

```
alaAppMonClearAppList
```

41 Application Fingerprinting Commands

The OmniSwitch Application Fingerprinting feature attempts to detect and identify remote applications by scanning IP packets and comparing them to pre-defined bit patterns (application signatures). Once an application is identified, Application Fingerprinting collects and stores information about the application flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and generating SNMP traps when a signature match occurs.

Using this implementation of Application Fingerprinting, an administrator can obtain more detailed information about protocols running on a specific device or make sure that certain QoS actions are automatically applied wherever an application might be running.

MIB information for the Application Fingerprinting commands is as follows:

Filename: ALCATEL-IND1-APP-FINGERPRINT-MIB.mib
Module: alcatelIND1AppFPMIB

A summary of the available commands is listed here:

app-fingerprint admin-state

Enables or disables the Application Fingerprinting process on all Application Fingerprinting ports.

app-fingerprint admin-state {enable | disable}

Syntax Definitions

enable	Enables Application Fingerprinting.
disable	Disables Application Fingerprinting.

Defaults

By default, Application Fingerprinting is enabled for the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When Application Fingerprinting is enabled for the switch, traffic flows on Application Fingerprinting ports are sampled and compared to REGEX application signatures defined in the “app-regex.txt” file located in the **/flash/app-signature** directory on the local switch. This is done to identify the presence of remote applications on a flow-by-flow basis.
- Disabling the administrative status of the Application Fingerprinting feature does not remove the Application Fingerprinting configuration from the switch.

Examples

```
-> app-fingerprint admin-state disable
-> app-fingerprint admin-state enable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint configuration	Displays the Application Fingerprinting configuration for the switch.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
   alaAppFPGlobalAdminState
```

app-fingerprint port

Configures a port or link aggregate as an Application Fingerprinting interface. Once the interface is configured and Application Fingerprinting is enabled for the switch, IP packets received on the interface are sampled to determine if they match pre-defined patterns in application signature files that reside on the local switch. When a match occurs, the flow is monitored and/or subject to QoS policy rules.

app-fingerprint {port *chassis/slot/port***[-***port***] | linkagg** *agg_id***[-***agg_id2***]} {monitor-app-group** *group_name* **| policy-list-name** *policy_list* **| unp-profile}**

no app-fingerprint {port *chassis/slot/port***[-***port***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports.
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
group_name	The name of an existing signature application group.
policy_list	The name of an existing QoS policy list.
unp-profile	Apply QoS policy list from UNP to which matching traffic is classified.

Defaults

By default, Application Fingerprinting is disabled on all switch ports.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to disable the Application Fingerprinting service on the specified port or link aggregate.
- Use the **monitor-app-group** parameter to specify a group (profile) that represents a set of application signature files. All of the signature files in the group are checked against the IP packets received on the port. When a packet match is detected, the flow is identified and monitored. No other action is taken.
- Use the **policy-list-name** parameter to associate a QoS policy list with the Application Fingerprinting port. When a packet match is detected, the policy rules in the specified policy list are applied to the matching traffic flow.
- Use the **unp-profile** parameter to specify that if traffic received on an Application Fingerprinting interface is classified into a Universal Network Profile (UNP), then the QoS policy list rules associated with that profile are applied to the traffic.
- The QoS policy list specified with the **policy-list-name** parameter or assigned to a UNP for Application Fingerprinting traffic, must contain policy rules with the **appfp-group** condition.
- The QoS policy list specified with the **policy-list-name** parameter must be configured as an **appfp** list. However, the UNP policy list must be configured as a UNP list.

- Application Fingerprinting uses the sFlow mechanism to sample packets. Do not run Application Fingerprinting and other sFlow services on the same port or link aggregate.

Examples

```
-> app-fingerprint port 2/1-5 monitor-app-group my-p2p
-> app-fingerprint linkagg 10 policy-list-name list1
-> app-fingerprint port 1/11 unp
-> no app-fingerprint port 2/1-5
-> no app-fingerprint linkagg 10
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port	Displays the Application Fingerprinting port configuration.

MIB Objects

```
alaAppFPPortTable
   alaAppFPPort
   alaAppFPGroupNameOrPolicyList
   alaAppFPPortOperationMode
   alaAppFPPortStatus
   alaAppFPPortRowStatus
```

app-fingerprint signature-file

Specifies the name of the Application Fingerprinting signature file. This file contains the REGEX signatures that are used to identify applications accessing the network on Application Fingerprinting ports.

app-fingerprint signature-file *filename*

Syntax Definitions

filename	The name of an existing REGEX application signature file.

Defaults

By default, the “app-regex.txt” file is used.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command is only required to use a REGEX signature file that has a filename that is different from the default “app-regex.txt” name..
- The signature file must reside in the **/flash/app-signature** directory on the local switch.
- After specifying the signature filename to use, upload the signature file into the switch memory using the **app-fingerprint reload-signature-file** command.

Examples

```
-> app-fingerprint signature-file app2_regex.txt
```

Release History

Release 7.3.2; command was introduced.

Related Commands

app-fingerprint reload-signature-file	Reloads the contents of the active application signature file into the switch memory.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
   alaAppFPGlobalSignatureFile
```

app-fingerprint reload-signature-file

Reloads the contents of the active application signature file into the switch memory. Use this command after making any changes to the current signature file.

app-fingerprint reload-signature-file

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command reloads the application signature file that was previously applied to the switch. This may be the default “app-regex.txt” file or another signature file that was applied through the **app-fingerprint signature-file** command.
- A switch reboot is *not* required after the signature file is reloaded.

Examples

```
-> app-fingerprint reload-signature-file
```

Release History

Release 7.3.2; command was introduced.

Related Commands

app-fingerprint signature-file Specifies a different signature file to use for Application Fingerprinting.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
   alaAppFPGlobalReloadSignatureFile
```

app-fingerprint trap

Enables or disables trap generation for the Application Fingerprinting feature.

app-fingerprint trap {enable | disable|

Syntax Definitions

enable	Enables Application Fingerprinting traps.
disable	Disables Application Fingerprinting traps.

Defaults

By default, traps are disabled for this feature.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

A trap is generated when a traffic flow matches an application signature.

Examples

```
-> app-fingerprint trap enable
-> app-fingerprint trap disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration for the switch.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
alaAppFPGlobalTrapConfig
```

show app-fingerprint configuration

Displays the Application Fingerprinting status and configuration information for the switch.

show app-fingerprint configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show app-fingerprint configuration

Admin-state:          Enabled,
SNMP Trap:            Disabled,
Signature File:       app-regex.txt
```

output definitions

Admin-state	The administrative status of Application Fingerprinting for the switch (**Enabled** or **Disabled**). Configured through the **app-fingerprint admin-state** command.
SNMP Trap	The status of SNMP trap generation for the switch (**Enabled** or **Disabled**). Configured through the **app-fingerprint trap** command.
Signature File	The name of the text file that contains the REGEX application signatures used to identify traffic flows. This file resides in the **/flash/app-signature** directory on the switch. Configured through the **app-fingerprint signature-file** and **app-fingerprint reload-signature-file** commands.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port	Displays the Application Fingerprinting port configuration.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
   alaAppFPGlobalAdminState
   alaAppFPGlobalSignatureFile
   alaAppFPGlobalReloadSignatureFile
   alaAppFPGlobalTrapConfig
```

show app-fingerprint port

Displays the Application Fingerprinting port configuration for the switch.

show app-fingerprint [port *chassis/slot/port* **| linkagg** *agg_id***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

By default, the configuration for all Application Fingerprinting ports is displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

Examples

```
-> show app-fingerprint port
Legend: * = Port or App-Group is invalid

  Port    Operation Mode          App-group/Policy-list
--------+---------------+---------------------------------------
1/2/1     Monitoring        Testing13
1/2/1     QoS               list1
1/2/1     QoS               list2

-> show app-fingerprint linkagg
Legend: * = Port or App-Group is invalid

  Port    Operation Mode          App-group/Policy-list
--------+---------------+---------------------------------------
0/100     Monitoring        Testing16
0/100     QoS               list3
0/100     QoS               list4
```

output definitions

Port	The slot/port or link aggregate ID of the Application Fingerprinting interface. A “0” slot number indicates that the interface is a link aggregate.
Operation Mode	The Application Fingerprinting mode (**Monitoring**, **QoS**, or **UNP**) in which the port is operating.
App-group/Policy-list	The name of the group of application signatures or the QoS policy list that is applied to the traffic flows on the port.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port	Displays the Application Fingerprinting interface configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration for the switch.

MIB Objects

```
alaAppFPPortTable
   alaAppFPPort
   alaAppFPGroupNameOrPolicyList
   alaAppFPPortOperationMode
   alaAppFPPortStatus
   alaAppFPPortRowStatus
```

show app-fingerprint app-name

Displays the REGEX application signature configuration for the switch. When the switch samples Application Fingerprinting ports, the traffic flow patterns on these ports are compared against the REGEX signatures specified in the “app-regex.txt” file. When a match occurs, the traffic flow is classified and monitored. In addition, QoS policies can be applied to these flows based on a specific match to an application signature group.

show app-fingerprint app-name [*app_name***]**

Syntax Definitions

app_name	The name of an existing application signature.

Defaults

By default, all application signatures are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Application signatures are defined in the “app-regex.txt” file that resides in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Application signatures can also be combined into an application group. This type of group is then assigned to one or more Application Fingerprinting ports. All the application signatures that are members of the assigned group are then applied to traffic flows on that same port.
- Use the *app_name* parameter to display information for a specific application signature.

Examples

```
-> show app-fingerprint app-name
App Name: ciscovpn
  Description: VPN client software to a Cisco VPN server
  REGEX Signature: \x01\xf4\x01\xf4

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58

App Name: dhcp
  Description: Dynamic Host Configuration Protocol
  REGEX Signature: [\x01\x02][\x01- ]\x06.*c\x82sc

-> show app-fingerprint app-name citrix

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58
```

output definitions

App-name	The name of the application for which this signature applies.
Description	A description of the application.
REGEX signature	The regular expression (REGEX) that identifies this application.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-group	Displays the application group configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration.

MIB Objects

```
alaAppFPAppGrpNameTable
   alaAppFPGrpAppName
```

show app-fingerprint app-group

Displays the Application Fingerprinting application group configuration for the switch. An application group contains a user-configured list of REGEX application signatures that are represented by the group name. The group name is then assigned to Application Fingerprinting ports or link aggregates.

show app-fingerprint app-group [*group_name***]**

Syntax Definitions

group_name	The name of an existing application group.

Defaults

By default, all application groups are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Application groups are defined in the “app-regex.txt” file that is located in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Use the *group_name* parameter to display information for a specific application group.

Examples

```
-> show app-fingerprint app-group

App Group: chatting
  App names: jabber

App Group: mail
  App names: smtp

App Group: network
  App names: bgp dhcp rtsp smb

App Group: p2p
  App names: hotline

App Group: remote_access
  App names: ciscovpn citrix rdp ssh vnc

App Group: voip
  App names: h323 sip

-> show app-fingerprint app-group network

App Group: network
  App names: bgp dhcp rtsp smb
```

output definitions

App-Group	The name of the application group file.
App names	The names of the application signature files that belong to this group.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-name	Displays the contents of the REGEX application signatures that are stored in the “app-regex.txt” file on the switch.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration.

MIB Objects

```
alaAppFPAppGrpNameTable
   alaAppFPAppGroupName
   alaAppFPGrpAppName
```

show app-fingerprint database

Displays Application Fingerprinting database entries. When a match occurs between an IP traffic flow and a REGEX application signature, a multi-tuple classifier and the name of the matching application group and signature are stored in a local switch database to identify and track the application associated with the flow.

show app-fingerprint database [port *chassis/slot/port* **| linkagg** *agg_id***] [detail]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and the port number (3/1).
agg_id	The link aggregate ID number.
detail	Displays additional information about the classified traffic flow.

Defaults

By default, all application flow database entries are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The following multi-tuple classifier is used to identify an application traffic flow:
  - Ingress Port
  - Dest MAC
  - Src MAC
  - VLAN
  - Dest IP
  - Src IP
  - Dest Port
  - Src Port
- Each database entry is subject to a 15 minute aging period. If the database fills up, older entries are aged out before the 15 minute limit (fast aging). However, fast aging is not applied to database entries associated with QoS. In this case, the QoS is removed after the regular 15 minute aging time period expires.
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

Examples

```
-> show app-fingerprint database

Port   App-Group/Name       SRC MAC        VLAN   SRC IP/Port
-----+----------------+-----------------+------+--------------
0/1/2  P2P/aim          00:00:22:33:44:55    20    2.3.4.4/200
0/1/2  P2P/ares         00:00:22:33:44:55    20    2.3.4.4/200
0/1/2  Mail/smtp        00:00:22:33:44:55    20    2.3.4.4/100
```

output definitions

Port	The slot/port or link aggregate ID of the AFP interface on which the flow was classified. A “0” slot number indicates a link aggregate.
App-Group/Name	The name of the application group and signature that matched the flow.
SRC MAC	The source MAC address of the flow.
VLAN	The VLAN on which the flow is learned and forwarded.
SRC IP/Port	The source IP network address and port.

```
-> show app-fingerprint database detail
Port 1/2/1:
    App-Group/Name: Testing2/App_4
      SRC-DST MAC:    00:00:00:00:04:01  -  00:e0:b1:e6:f9:b5,
      VLAN:           20,
      SRC IP/PORT:    20.20.20.21/65,
      DST IP/PORT:    10.10.10.11/55

    App-Group/Name: Testing2/App_5
      SRC-DST MAC:    00:00:00:00:04:02  -  00:e0:b1:e6:f9:b5,
      VLAN:           20,
      SRC IP/PORT:    20.20.20.21/64,
      DST IP/PORT:    10.10.10.11/54

    App-Group/Name: Testing2/App_6
      SRC-DST MAC:    00:00:00:00:04:03  -  00:e0:b1:e6:f9:b5,
      VLAN:           20,
      SRC IP/PORT:    20.20.20.21/66,
      DST IP/PORT:    10.10.10.11/56

Port 2/3/23:
    App-Group/Name: Testing1/App_1
      SRC-DST MAC:    00:00:00:00:03:01  -  00:e0:b1:e6:f9:b5,
      VLAN:           10,
      SRC IP/PORT:    10.10.10.11/115,
      DST IP/PORT:    20.20.20.21/137

    App-Group/Name: Testing1/App_2
      SRC-DST MAC:    00:00:00:00:03:02  -  00:e0:b1:e6:f9:b5,
      VLAN:           10,
      SRC IP/PORT:    10.10.10.11/114,
      DST IP/PORT:    20.20.20.21/138

    App-Group/Name: Testing1/App_3
      SRC-DST MAC:    00:00:00:00:03:03  -  00:e0:b1:e6:f9:b5,
      VLAN:           10,
      SRC IP/PORT:    10.10.10.11/113,
      DST IP/PORT:    20.20.20.21/135
```

output definitions

Port	The slot and port number on which the flow was classified.
App-Group/Name	The name of the application group and signature that matched the flow.
SRC-DST MAC	The source and destination MAC addresses of the flow.
VLAN	The VLAN on which the flow is learned and forwarded.
SRC IP/Port	The source IP network address and port.
DST IP/Port	The destination IP network address and port.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-group	Displays the application group configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration.

   alaAppFPDbDstPort
   alaAppFPDbDstMacAddr
```

show app-fingerprint statistics

Displays statistics for each application flow on an Application Fingerprinting ingress port.

show app-fingerprint statistics [port *chassis/slot/port* **| linkagg** *agg_id***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and the port number (3/1).
agg_id	The link aggregate ID number.

Defaults

By default, statistics are displayed for all application flows.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Statistics displayed with this command include total number of packets matched, the number of unmatched packets, and the packets matched for each application signature.

Examples

```
-> show app-fingerprint statistics
   Port    Group/App name                                Last 1 hour       Last 1 day
---------+---------------------------------------------+---------------+----------------
1/2/1     Testing2/App_4                                        19976        19976
1/2/1     Testing2/App_5                                        20000        20000
1/2/1     Testing2/App_6                                        20000        20000
2/3/23    Testing1/App_1                                        19975        19975
2/3/23    Testing1/App_2                                        20000        20000
2/3/23    Testing1/App_3                                        20000        20000
```

Release History

42 FIP Snooping Commands

The OmniSwitch implementation of Fibre Channel over Ethernet (FCoE) Initiation Protocol (FIP) snooping supports the FCoE technology used to tunnel Fibre Channel (FC) frames within Ethernet MAC frames.When the FCoE and FIP snooping functionality is enabled, the OmniSwitch serves as an FCoE transit switch. In this role, the OmniSwitch implementation of Data Center Bridging (DCB) is also used to provide the lossless Ethernet network required to support FCoE.

This implementation of FIP snooping ensures the security of the FCoE network and maintains a virtual point-to-point network connection between FCoE Nodes (ENodes) and FCoE Forwarder (FCF) devices. In addition, FIP snooping is also required to support OmniSwitch FCoE/FC gateway functionality that allows the switch to provide FCoE forwarding services between an FCoE network and a native FC storage area network (SAN).

- An OmniSwitch FCoE transit switch is placed between ENodes (servers or other bridges) and an FCF or an OmniSwitch FCoE/FC gateway to extend the reach of the FCoE network without extending the physical FC connections.
- An OmniSwitch FCoE/FC gateway runs FIP snooping on the 10G Ethernet FCoE ports that connect to an FCoE network. On the same switch, FC ports connect to native FC switches or nodes. Traffic is transmitted between the FCoE network and the FC SAN through the gateway switch.

This chapter provides information about configuring FCoE and FIP global and port parameters through the Command Line Interface (CLI). See Chapter 43, “FCoE/FC Gateway Commands,” for more information about configuring OmniSwitch FCoE/FC gateway functionality.

MIB information for the FCoE and FIP snooping commands is as follows:

Filename: ALCATEL-IND1-FIPS-MIB.mib
Module: alcatelIND1FipsMIB

The FCoE and FIP Snooping commands are listed here:

Global commands	**fcoe fip-snooping** **fcoe address-mode** **fcoe priority** **fcoe priority-protection** **fcoe priority-protection action** **fcoe filtering-resource trap-threshold** **fcoe house-keeping-time-period**
VLAN and Port commands	**fcoe vlan** **fcoe fcf mac** **fcoe fc-map** **fcoe discovery-advertisement** **fcoe role**

Show commands	**show fcoe** **show fcoe ports** **show fcoe sessions** **show fcoe enode** **show fcoe fcf** **show fcoe fc-map** **show fcoe discovery-advertisement**
Statistics commands	**show fcoe statistics** **clear fcoe statistics**

fcoe fip-snooping

Enables or disables Fibre Channel Initiation Protocol (FIP) snooping on the switch. FIP Snooping is enabled to allow the OmniSwitch to serve as an FCoE transit switch.

fcoe fip-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables FIP Snooping.
disable	Disables FIP Snooping.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

When FIP Snooping is enabled, traffic with an Ethertype of FCoE is dropped on all switch VLANs and ports that are not configured as FCoE VLANs and ports.

Examples

```
-> fcoe fip-snooping admin-state enable
-> fcoe fip-snooping admin-state disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigFIPSAdmin
```

fcoe address-mode

Configures the FCoE addressing mode. This mode determines whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities.

fcoe address-mode {spma | fpma}

Syntax Definitions

spma	Selects the SPMA address mode.
fpma	Selects the FPMA address mode.

Defaults

parameter	default
spma | fpma	FPMA

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The FCoE Node (ENode) and the FCoE Forwarder (FCF) must use the same addressing mode to establish virtual links between the ENode and FCF. Configure the global OmniSwitch addressing mode to match the mode used by the ENode and FCF.
- When the FPMA mode is active, a MAC address is assigned by an FCF to a single ENode MAC. This MAC address is not assigned to any other ENode MAC in the same VLAN.
- When the SPMA mode is active, MAC addresses are assigned by the ENode server.
- To change the addressing mode selection, disable FIP Snooping for the switch then make the change and enable FIP Snooping again.

Examples

```
-> fcoe address-mode spma
-> fcoe address-mode fpma
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigAddressMode
```

fcoe priority

Configures up to two global priority values that are designated as lossless for FCoE traffic.

fcoe priority {*priority***} [***priority***]**

Syntax Definitions

priority	A priority value between 0–7.

Defaults

parameter	default
priority	3

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command overwrites the existing FCoE priority values used by the switch.
- If two priority values are configured but there is a need to change only one of the values, both priority values must be specified with this command. For example, if the current priority is set to 2 and 5, to change priority 2 to 3, specify both 3 and 5 as the priority values.
- Specify a priority value of 3 to set the priority back to the default value.
- The FCoE priority values are used when FCoE priority protection is enabled for the switch.
- In addition to enabling priority protection, a lossless DCB FCoE profile with the same FCoE priority values must be assigned to the FCoE interfaces.

Examples

```
-> fcoe priority 2 5
-> fcoe priority 3 5
-> fcoe priority 3
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe priority-protection	Configures the status of priority protection for the switch.
fcoe priority-protection action	Configures the action taken when traffic is not FCoE or FIP.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigPriorityOne
   alaFipsConfigPriorityTwo
```

fcoe priority-protection

Enables or disables priority protection.

fcoe priority-protection {enable | disable}

Syntax Definitions

enable	Enables priority protection for the switch.
disable	Disables priority protection for the switch.

Defaults

By default, priority protection is disabled for the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When priority protection is enabled, only FCoE and FIP traffic that matches the FCoE lossless priority values is allowed. All other traffic is either marked or dropped, based on the priority protection action configured for the switch.
- This command applies only to the priority value that is specified using the **fcoe priority** command.
- The FCoE priority value is advertised to FCoE-enabled hosts using the Data Center Bridging Exchange (DCBx) protocol.

Examples

```
-> fcoe priority-protection enable
-> fcoe priority-protection disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe priority	Configures the lossless priority values for the switch.
fcoe priority-protection action	Determines whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigPrioProtection
```

fcoe priority-protection action

Specifies whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value. This action is only valid when FCoE priority protection is enabled for the switch.

fcoe priority-protection action {drop | remark *priority***}**

Syntax Definitions

drop	All non-FCoE and non-FIP traffic is dropped.
priority	Specifies the priority value to use for remarking non-FCoE and non-FIP traffic.

Defaults

By default, non-FCoE and non-FIP traffic is dropped when priority protection is enabled for the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When priority protection is enabled, only FCoE traffic that matches the protected priority values is allowed in the priority queues. All other traffic is either re-marked or dropped, based on the priority protection action configured for the switch.
- If the re-mark action is configured, traffic is marked with the specified priority value and forwarded on the switch.

Examples

```
-> fcoe priority-protection action drop
-> fcoe priority-protection action remark 0
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe priority	Configures the lossless priority values for the switch.
fcoe priority-protection	Configures the status of priority protection for the switch
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigPriorityProtectionAction
```

fcoe filtering-resource trap-threshold

Configures the percentage of filtering resources used as a trap threshold value. When this percentage is reached, a trap is generated by the switch.

fcoe filtering-resource trap-threshold *percentage*

Syntax Definitions

percentage	The percentage of filtering resources used.

Defaults

By default, the filtering resource trap threshold percentage is set to 80%.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

To disable the generation of filtering resource traps, set the trap threshold value to “0”.

Examples

```
-> fcoe filtering-resource trap-threshold 50
-> fcoe filtering-resource trap-threshold 0
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
Notifications (Traps)
   alaFipsResourceThresholdReached
   alaFipsFilterResourceUsage
```

fcoe house-keeping-time-period

Configures the amount of time the FCoE switch waits to receive keep alive messages from the ENode and FCF for a given FCoE session. When this time expires and no keep alive messages were received for any entity of the session, the session information is removed.

fcoe house-keeping-time-period *seconds*

Syntax Definitions

seconds	The keep alive wait time, in seconds.

Defaults

By default, the housekeeping timer is set to 300 seconds.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

To disable the housekeeping timer, set the timer value to “0”

Examples

```
-> fcoe house-keeping-time-period 120
-> fcoe house-keeping-time-period 0
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
   alaFipsConfigHouseKeepingTimePeriod
```

fcoe vlan

Configures an FCoE VLAN. This type of VLAN is used to deploy the OmniSwitch implementation of FIP snooping.

fcoe vlan *vlan_id* **[admin-state {enable | disable}] [name** *description***]**

no fcoe vlan *vlan_id*

Syntax Definitions

vlan_id	A numeric value that uniquely identifies an individual FCoE VLAN. The valid ID range is 2–4094.
enable	Enables the FCoE VLAN administrative status.
disable	Disables the FCoE VLAN administrative status.
description	An alphanumeric string. Optional name description for the VLAN ID. Enclose the description in double quotes if it contains more than one word with a space in between.

Defaults

parameter	default
enable | disable	**enable**
description	**VLAN ID**

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a FCoE VLAN from the switch configuration. All VLAN ports are detached before the VLAN is removed.
- Specify a VLAN ID that does not exist in the switch configuration, or the ID of a dynamically created MVRP VLAN.
- Only 802.1q-tagged FCoE ports and link aggregates can be members of FCoE VLANs.
- Configuring a FCoE VLAN as a default VLAN for a port or link aggregate is not allowed. All port associations are created by tagging FCoE ports with the FCoE VLAN ID.
- Configuring default VLAN 1 as an FCoE VLAN is not allowed.

- The following features are not supported on FCoE VLANs:
  - IGMP Snooping
  - IP interface
  - HA VLANs
  - SVLAN and CVLAN
  - Shortest Path Bridging (SPB)
  - MCLAG
  - UDP Relay, DHCP Snooping
  - Universal Network Profile (UNP)
- An OmniSwitch FCoE transit switch operates between an FCoE Node (ENode) and a FCoE Forwarder (FCF). Manual configuration of the FCoE VLAN is required along the transit switch path. However, the ENode and FCF may invoke FIP VLAN discovery to discover the FCoE VLANs within the transit path. If not, manual configuration of the FCoE VLANs may also be required on the appropriate ENodes and FCFs.

Examples

```
-> fcoe vlan 100
-> no fcoe vlan 100
-> fcoe vlan 100 admin-state enable name fcoe-vlan1
-> fcoe vlan 100 admin-state enable
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe fcf mac	Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable
   alaFipsVlanId
   alaFipsVlanFCMap
   alaFipsVlanRowStatus
```

fcoe fcf mac

Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN. Virtual Fibre Channel (FC) links that traverse the lossless Ethernet network send FCoE frames to and from the FCF MAC address.

fcoe fcf mac *mac_address* **vlan** *vlan_id*

no fcoe fcf *mac_address* **vlan** *vlan_id*

Syntax Definitions

mac_address	Enter the FCF MAC Address (for example, 00:00:39:59:f1:0c).
vlan_id	An existing FCoE VLAN ID. The valid ID range is 2–4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the FCF MAC address from the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.

Examples

```
-> fcoe fcf mac 30:10:94:01:00:00 vlan 100
-> no fcoe fcf 30:10:94:01:00:00
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN for the switch.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable
   alaFipsVlanId
   alaFipsVlanFCMap
```

fcoe fc-map

Configures a static Fibre Channel Mapped Address Prefix (FC-MAP) for the specified FCoE VLAN. The FC-MAP is a 24-bit value used by the Fibre Channel Forwarder (FCF) to identify an individual fabric.

fcoe fc-map *prefix* **vlan** *vlan_id*

no fcoe fc-map *prefix* **vlan** *vlan_id*

Syntax Definitions

prefix	Enter the FC-MAP prefix value. The valid range is 0EFC00–0EFCFF.
vlan_id	An existing FCoE VLAN ID. The valid ID range is 2–4094.

Defaults

By default, the FC-MAP is set to 0E:FC:00.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- On an OmniSwitch 6900, use the **no** form of this command to set the FC-MAP back to the default value (0E:FC:00) for the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.
- The configured FC-MAP value assigned to an FCoE VLAN must match the FC-MAP value used by the FCF device. FCF advertisement packets that contain a different FC-MAP are not processed by the switch.
- When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FCF uses the FC-MAP value (upper 24 bits) combined with an FCID value (lower 24 bits) to generate a unique MAC address to identify an ENode VN_Port for FCoE transactions.

Examples

```
-> fcoe fc-map 0E:FC:04 vlan 30
-> no fcoe fc-map 0E:FC:04 vlan 30
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN for the switch.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable
   alaFipsVlanId
   alaFipsVlanFCMap
```

fcoe discovery-advertisement

Configures FIP discovery advertisement message parameters for the specified FCoE VLAN. These parameter values are advertised in both unicast and multicast advertisements.

fcoe discovery-advertisement vlan *vlan_id***[-***vlan_id2***] [a-bit {enable | disable}] [fka-adv-period** *adv_seconds***] [priority** *priority***] [uds-retries** *retries***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
enable	Enables the available-for-login bit (A-bit) in the discovery advertisement message to indicate that the switch can accept fabric logins from ENodes.
disable	Disables the A-bit in the discovery advertisement message to indicate that the switch cannot accept fabric logins from ENodes.
adv_seconds	The discovery advertisement transmission interval and the number of FIP ENode keep alive packets expected. The valid range is 1–90 seconds.
priority	The priority value assigned to the switch, indicated in the priority descriptor of the discovery advertisement message. The valid range is 0–255 (0 = highest priority, 255 = lowest priority).
retries	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down. The valid range is 0–10.

Defaults

parameter	default
a-bit enable | disable	**enable**
fka-adv-period *acv_seconds*	**8**
priority *priority*	**128**
uds-retries *retries*	**0**

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When the A-bit parameter is disabled, the switch will not process any new logins for the FCoE VLAN. However, there is no impact on existing VN_Port sessions, which are allowed to continue.
- Transmitting unicast discovery solicitations helps to find out if the same FCF is reachable on some other port of the same FCoE VLAN.

Examples

```
-> fcoe discovery-advertisement vlan 100 priority 10
-> fcoe discovery-advertisement uds-retries 3
-> no fcoe discovery-advertisement vlan 100
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe discovery-advertisement	Displays the discovery advertisement parameter values for the specified VLANs.

   alaFipsDiscAdvtVlanId
   alaFipsDiscAdvtAbit,
   alaFipsDiscAdvtFkaAdvPeriod,
   alaFipsDiscAdvtPriority,
   alaFipsDiscAdvtUdsRetries,
   alaFipsDiscAdvtRowStatus
```

fcoe role

Configures the specified port or link aggregate as an FCoE interface and defines the role of the interface in the FCoE network.

fcoe {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} role {edge | enode-only | fcf-only | mixed | trusted | ve}**

no fcoe {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). FCoE is only supported on 10G or faster ports.
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
edge	Port connects directly to an ENode for transmission of FCoE and FIP frames from the ENode to the FCF.
enode-only	Link between FCoE switches that carries traffic from ENode to FCF.
fcf-only	Link between FCoE switches that carries traffic from FCF to ENode.
mixed	Link between FCoE switches that carries traffic in both directions (from FCF to ENode or from ENode to FCF).
trusted	Trust the FCoE Edge port; traffic on this port is not filtered by FIP ACLs. This port role type is typically assigned to the switch FCoE port that connects to an Ethernet port on the FCF.
ve	Configures port as a virtual expansion port (VE_Port) that is associated with an E2E-tunnel session. A VE_Port emulates an E_Port in an FCoE network, providing connectivity between FC switches. VE_Ports discover FCFs.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to revert the FCoE port back to a regular switch port. Before doing so, however, delete any associations the port may have with an FCoE VLAN.
- To change the role of an FCoE port, first remove the FCoE configuration from the port, then configure FCoE and the new role again for that same port.
- FCoE is only supported on 10G or faster ports that are associated with an FCoE lossless DCB profile. In addition, DCBX must be enabled on the port with both PFC and ETS in an active state (either forced

or negotiated via DCBX). The DCB configuration is done separately using QoS port and profile commands.

- The maximum frame size for an FCoE port must be at least 2500 bytes to accommodate FCoE encapsulated frames, which are larger than the standard Ethernet frame size. In addition, make sure the FCoE port frame size is configured the same end-to-end.
- When configuring a link aggregate as an FCoE port, make sure the link aggregate ID number already exists in the switch configuration. Ports already configured as FCoE ports cannot be added to a link aggregate.
- FCoE ports must be manually assigned to a default VLAN and then tagged with the FCoE VLAN that will carry the FCoE and FIP frames on that port.
- The following features are not supported on FCoE ports:
  - Learned Port Security (LPS)
  - Port Mirroring and Remote Port Mirroring
  - Shortest Path Bridging (SPB)
- Enabling FCoE on a Universal Network Profile (UNP) port is only supported to allow UNP dynamic assignment of a default VLAN for an FCoE port. Manual tagging of the FCoE UNP port with FCoE VLAN IDs is still required.
- FCoE VLANs may be dynamically learned through the transmission of MVRP join PDU, but any port associations with that VLAN must be manually configured.
- Assigning FCoE interfaces to different FCoE VLANs provides a method for configuring multiple FC fabrics through the same FCoE switch.

Examples

```
-> fcoe port 1/1 role edge
-> fcoe port 1/1/1 role edge
-> fcoe port 2/1 role fcf-only
-> no fcoe port 2/1
```

Release History

Release 7.3.2; command introduced.

Priority 2                : -,
Priority Protection       : Enable,
Priority Protection Action: Drop,
Re-Mark Priority          : -,
Total Filter Resources    : 256,
Used Filter Resources     : 0,
Trap threshold (%)        : 80,
House Keeping Time Period : 300
```

output definitions

FIP Snooping	The administrative status of FIP snooping for the switch (**Enable** or **Disable**). Configured through the **fcoe fip-snooping** command.
Address-mode	Indicates whether a server-provided MAC address (**SPMA**) or a fabric-provided MAC address (**FPMA**) is assigned to virtual FCoE entities. Configured through the **fcoe address-mode** command.
Priority 1	One of two global lossless priority values for FCoE traffic. Configured through **fcoe priority** command.
Priority 2	Two of two global lossless priority values for FCoE traffic. Configured through **fcoe priority** command.

output definitions (continued)

Priority Protection	The status of priority protection for the switch (**Enable** or **Disable**). Configured through the **fcoe priority-protection** command.
Priority Protection Action	The action applied to traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value (**Drop** or **Remark**). Configured through the **fcoe priority-protection action** command.
Re-mark Priority	The priority value to use for marking traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value. This value is only applied when the priority protection action is set to **Remark**. Configured through the **fcoe priority-protection action** command.
Total Filtering Resources	The number of ACL entries available for filtering of FCoE traffic.
Used Filtering Resources	The number of ACL entries currently in use for filtering FCoE traffic.
Trap threshold (%)	The percentage of filtering resources used for FIP. When this percentage is reached, a trap is sent indicating the available and maximum percentage of filtering resources. Configured through the **fcoe filtering-resource trap-threshold** command.
House Keeping Time Period	The amount of time the FCoE switch will wait to receive keep alive messages from the ENode and FCF. When this amount of time expires, information for the specific FCoE session is removed. Configured through the **fcoe house-keeping-time-period** command

Release History

Release 7.3.2; command was introduced.

Related Commands

show fcoe ports	Displays the FCoE port configuration for the switch.

show fcoe ports

Displays the FCoE interface configuration for the switch.

show fcoe ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

This command also shows the FCoE role assigned to the interface.

Examples

```
-> show fcoe ports
  Ports       FCoE Role       Status
----------+---------------+-----------
 1/3        Edge Port         DISABLE
 1/4        Edge Port         DISABLE
 1/5        Edge Port         DISABLE
 1/6        Edge Port         DISABLE
 1/7        Edge Port         DISABLE
 1/11       Edge Port         DISABLE
 1/13       Edge Port         ENABLED
 1/14       Edge Port         ENABLED
 1/15       Edge Port         DISABLE
 1/19       FCF Port          DISABLE
 2/1        Edge Port         DISABLE
 2/8        Edge Port         DISABLE
 0/1        Mixed Port        DISABLE
 0/12       Mixed Port        ENABLED
 0/40       Mixed Port        DISABLE
 0/50       Mixed Port        ENABLED
```

output definitions

Ports	The slot/port or link aggregate ID of the FCoE interface. A “0” slot number indicates that the FCoE interface is a link aggregate.
FCoE Role	The designated role of the FCoE interface (**Edge Port**, **ENode Port**, **FCF Port**, **Mixed Port**, or **Trusted Port**).
Status	The operational status of the FCoE interface (**ENABLE** or **DISABLE**).

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe role	Configures a port or link aggregate as an FCoE interface.
show fcoe	Displays the FCoE and FIP status and configuration for the switch.

MIB Objects

```

show fcoe sessions

Displays the FIP snooping session status and configuration for the switch.

show fcoe sessions [[fips | npiv-proxy | r-npiv] [port *chassis/slot/port***]** | **vlan** *vlan_id* **| linkagg** *agg_id***] | [e-tunnel [***tunnel_id***]]]**

Syntax Definitions

fips	Displays FIP snooping sessions on FCoE ports.
npiv-proxy	Displays N_Port proxy (NPIV) sessions between ENode and FC switch.
r-npiv	Displays F_Port proxy (R- NPIV) sessions between the HBA and the gateway switch.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
vlan_id	An existing FCoE VLAN ID. The valid ID range is 2–4094.
agg_id	The link aggregate ID number.
tunnel_id	Displays E2E tunnel sessions between two E_Ports on different FC switches. Optionally enter a tunnel ID to display information for a specific tunnel.

Defaults

By default, all FCoE sessions are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** or **linkagg** parameter to display sessions for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to display the sessions for a specific FCoE VLAN ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), F_Port proxy (reverse-NPIV), and E2E tunnel sessions. However, the N_Port proxy, F_Port proxy, and E2E tunnel sessions are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see Chapter 43, “FCoE/FC Gateway Commands” for more information.

output definitions

PORT	The FCoE port or link aggregate ID for a FIP snooping session. A “0” slot number indicates that the FCoE interface is a link aggregate. Configured through the **fcoe role** command.
ENODE MAC	The MAC address of the ENode for this session.
VN_PORT MAC	The MAC address of the virtual node (VN) port for this session.
FCF MAC	The MAC address of the FCoE Forwarder (FCF) for this session.

output definitions

VLAN	The FCoE VLAN used for this session. Configured through the **fcoe vlan** command.
STATUS	The operational status of this session.
IN-PORT	The FCoE port or link aggregate ID for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the **fcoe role** command.
OUT-PORT	The FC port for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the **fibre-channel port mode** command.
VSAN	The VSAN ID mapped to the FCoE VLAN ID for an F_Port proxy (R-NPIV) session. Configured through the **fibre-channel vsan** command.
FCID	The FC port ID (also referred to as N_Port ID) received after successful login for an F_Port proxy (R-NPIV) session.
TUNNEL-ID	The E2E tunnel ID associated with the session. Configured through the **fcoe e-tunnel** command.
PORT1, PORT2	The FCoE port (in VE_Port role) and/or FC port (in TE_Port mode) for this session. The FCoE port rule is configured through the **fcoe role** command. The FC port mode is configured through the **fibre-channel port mode** command.
PAIR MODE	The type of E2E tunnel (**TE to VE** or **TE to TE**).

Release History

Release 7.3.2; command introduced.
Release 7.3.3; fields added to display NPIV, reverse-NPIV, and E2E tunnel sessions.

Related Commands

show fcoe	Displays the global FCoE and FIP snooping configuration for the switch.
show fcoe ports	Displays the FCoE port configuration for the switch.
show fibre-channel port	Displays the FC port configuration for the switch.

show fcoe enode

Displays FCoE Node (ENode) information for FIP Snooping sessions associated with the switch.

show fcoe enode [*mac_address***]**

Syntax Definitions

mac_address	Enter an ENode MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all ENodes associated with the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify an ENode MAC address to display more detailed information about a specific ENode.

Examples

```
-> show fcoe enode
Port   Enode MAC         VLAN       Sessions
----+------------------+-----+------------
1/1  00:10:00:00:00:02    100             2
2/1  00:00:a0:bb:00:01    200             1

->show fcoe enode 00:10:00:00:00:02
Enode MAC: 00:10:00:00:00:02   Port : 1/1

    VN-Port-MAC          FCF-MAC       Vlan     Login time

 0E:FC:00:00:00:09   0E:AE:00:00:00:01  200  Thu Feb 14 07:12:22 2013
```

output definitions

Port	The slot/port or link aggregate ID of the FCoE interface that is connected to the FCoE Node (ENode). A “0” slot number indicates that the FCoE interface is a link aggregate.
Enode MAC	The MAC address of the ENode connected to the FCoE interface.
VLAN	The FCoE VLAN ID.
Sessions	The number of sessions associated with the ENode MAC.
VN-Port-MAC	The MAC address of the virtual node port (VN_port) for this session.
FCF-MAC	The MAC address of the FCoE Forwarder (FCF).
Login time	The date and time the ENode logged into the FCoE fabric.

Release History

Release 7.3.2; command introduced.

Related Commands

show fcoe sessions	Displays FCoE FIP snooping session status and configuration for the switch.
show fcoe fcf	Displays FCoE Forwarder (FCF) information for the switch.

MIB Objects

```

show fcoe fcf

Displays FCoE Forwarder (FCF) information for FIP Snooping sessions associated with the switch.

show fcoe fcf [*mac_address***]**

Syntax Definitions

mac_address	Enter an FCF Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all FCFs associated with the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify an FCF MAC address with this command to display more detailed information for a specific FCF.

Examples

```
-> show fcoe fcf
       FCF-MAC         VLAN    Config     Sessions  A-bit   MaxFrmVer  Priority

 46      0E:FC:00:01:00:82
 46      0E:FC:00:01:00:81
```

output definitions

FCF-MAC	The MAC address of the FCoE Forwarder (FCF).
VLAN	The FCoE VLAN ID.
Config	Whether the FCF MAC address was user-configured or learned through the FIP Snooping session for the given FCoE VLAN.
Sessions	The number of sessions associated with the FCF MAC for the given FCoE VLAN.
A-bit	Whether or not the available-for-login bit is set for this FCF.

output definitions

MaxFrmVer	Whether or not the maximum frame size was verified for this FCF.
VN-Port-MAC	The MAC address of the virtual node port (VN_Port) for this session. This address is comprised of the FCID that the FCF assigned to the port combined with the FC-MAP.

Release History

Release 7.3.2; command introduced.
Release 7.3.3; **A-bit** and **MaxFrmVer** fields added.

Related Commands

show fcoe sessions	Displays FCoE FIP snooping session status and configuration for the switch.
show fcoe enode	Displays FCoE Node (ENode) information for the switch.

MIB Objects

```

show fcoe fc-map

Displays the Fibre Channel Mapped Address Prefix (FC-MAP) for each FCoE VLAN.

show fcoe fc-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FC-MAP value is the required upper 24 bits of a MAC address that is assigned to a Virtual N_Port (VN_Port).

Examples

```
-> show fcoe fc-map
  VLAN     FC-MAP
--------+-----------
     10   0E:FC:00
    100   0E:FC:22
    200   0E:FC:23
    300   0E:FC:23
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN for the switch.
fcoe fc-map	Configures the FC-MAP for and FCoE VLAN.
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

show fcoe discovery-advertisement

Displays the FIP discovery advertisement message parameter values for the specified FCoE VLAN.

show fcoe discovery-advertisement [vlan *vlan_id***[-***vlan_id2***]]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).

Defaults

By default, the discovery advertisement parameters are displayed for all FCoE VLANs.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *vlan_id***[-***vlan_id2***]** parameter to display information for a specific FCoE VLAN or for a range of FCoE VLANs.

Examples

```
-> show fcoe discovery-advertisement
VLAN  A-Bit   FKA Pd Priority  UDS-Retries
----+--------+------+--------+--------------
46    ENABLE  8      128      3
56    ENABLE  8      128      3
76    ENABLE  8      128      3
3000  ENABLE  8      128      3
4000  ENABLE  8      128      3

-> show fcoe discovery-advertisement vlan 3000
  VLAN     A-Bit      FKA Period    Priority       UDS-Retries
---------+----------+------------+-----------+----------------
   3000    ENABLE        8           128            3
```

output definitions

VLAN	The FCoE VLAN ID. Configured through the **fcoe vlan** command**.**
A-Bit	The status of the available-for-login bit (Enabled or Disabled). When enabled, indicates the switch can accept fabric logins from ENodes.
FKA-PD	The discovery advertisement transmission interval, in seconds.
Priority	The priority value assigned to the switch (0 = highest priority, 255 = lowest priority.
UDS-Retries	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down.

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe discovery-advertisement Configures FIP discovery advertisement parameter values.

MIB Objects

```
alaFipsDiscAdvtTable
   alaFipsDiscAdvtVlanId
   alaFipsDiscAdvtAbit,

```

show fcoe statistics

Displays both ENode and FCF generated statistics for FCoE interfaces or specific VLANs.

show fcoe statistics [enode | fcf] {interface | vlan [*vlan_id***[***vlan_id2***] | port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

enode	Display statistics only for ENode traffic.
fcf	Display statistics only for FCF traffic.
interface	Display statistics for all FCoE interfaces (ports and link aggregates).
*vlan_id***[-***vlan_id2***]**	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, FCF and ENode statistics are displayed for all FCoE interfaces and VLANs.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), and F_Port proxy (reverse-NPIV) statistics. However, the N_Port proxy and F_Port proxy statistics are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see Chapter 43, “FCoE/FC Gateway Commands” for more information.

Examples

```
-> show fcoe statistics interface

output definitions

Port	The slot/port or link aggregate ID of the FCoE interface. A “0” slot number indicates that the FCoE interface is a link aggregate.
Sess	The number of FIP Snooping sessions.
MDS	The number of Multicast Discovery Solicitation packets.
UDS	The number of Unicast Discovery Solicitation packets.
FLOGI	The number of Fabric Login packets.
FDISC	The number of Fabric Discovery packets.

output definitions

LOGO	The number of Fabric Logout packets.
E KA	The number of ENode keep-alive packets.
VN KA	The number of VN_Port keep-alive packets
VLAN	The FCoE VLAN ID.
MDA	The number of Multicast Discovery Advertisement packets.
UDA	The number of Unicast Discovery Advertisement packets.
FLOGI_ACC	The number of Fabric Login Accept packets.
FLOGI_RJT	The number of Fabric Login Reject packets.
FDISC_ACC	The number of Fabric Discovery Accept packets.
FDISC_RJT	The number of Fabric Discover Reject packets.
LOGO_ACC	The number of Fabric Logout Accept packets.
LOGO_RJT	The number of Fabric Logout Reject packets.
CVL	The number of Clear Virtual Link packets.

Release History

Release 7.3.2; command introduced.
Release 7.3.3; N_Port proxy and F_Port proxy statistics displayed only on an OmniSwitch 6900.

Related Commands

clear fcoe statistics	Clears ENode and FCF statistics.

MIB Objects

```
alaFipsIntfEnodeStatsTable
alaFipsIntfFcfStatsTable
alaFipsVlanEnodeStatsTable
alaFipsVlanFcfStatsTable
```

clear fcoe statistics

Clears ENode and FCF generated statistics on FCoE interfaces or specific VLANs.

clear fcoe statistics [enode | fcf] [interface | vlan [*vlan_id***[***vlan_id2***] | port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id***[-***agg_id2***]]**

Syntax Definitions

enode	Clears statistics only for ENode traffic.
fcf	Clears statistics only for FCF traffic.
interface	Clears statistics on all FCoE interfaces (ports and link aggregates).
*vlan_id***[***vlan_id2***]**	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared for all FCoE interfaces and VLANs.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** or **linkagg** parameters to clear the statistics for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to clear the statistics for a specific FCoE VLAN ID.

Examples

```
->clear fcoe statistics

->clear fcoe statistics interface

->clear fcoe statistics vlan
->clear fcoe statistics vlan 2
->clear fcoe statistics vlan 2-3

->clear fcoe statistics port 1/2
->clear fcoe statistics port 1/2-3
->clear fcoe statistics port 1/1/2
->clear fcoe statistics port 1/1/2-3

->clear fcoe statistics linkagg 2
->clear fcoe statistics linkagg 2-6
```

```
->clear fcoe statistics enode interface

->clear fcoe statistics enode vlan
->clear fcoe statistics enode vlan 2
->clear fcoe statistics enode vlan 2-3

->clear fcoe statistics enode port 1/2
->clear fcoe statistics enode port 1/2-3
->clear fcoe statistics enode port 1/1/2
->clear fcoe statistics enode port 1/1/2-3

->clear fcoe statistics enode linkagg 2
->clear fcoe statistics enode linkagg 2-6

->clear fcoe statistics fcf interface
->clear fcoe statistics fcf vlan
->clear fcoe statistics fcf vlan 2
->clear fcoe statistics fcf vlan 2-3

->clear fcoe statistics fcf port 1/2
->clear fcoe statistics fcf port 1/2-3
->clear fcoe statistics fcf port 1/1/2
->clear fcoe statistics fcf port 1/1/2-3

->clear fcoe statistics fcf linkagg 2
->clear fcoe statistics fcf linkagg 2-6
```

43 FCoE/FC Gateway Commands

The OmniSwitch implementation of FCoE/FC gateway functionality allows the switch to transparently connect FCoE and FC nodes with an FC SAN across an FCoE (lossless Ethernet) network. To provide this type of connectivity, an OmniSwitch FCoE/FC gateway supports the following three modes of operation that are used to converge FC over Ethernet and FC-to-FC over Ethernet:

- **N_Port Proxy mode**—allows ENodes in an FCoE network and FC switches in an FC SAN to communicate with each other. To an ENode the OmniSwitch gateway emulates an FCoE forwarder; to an FC switch the OmniSwitch gateway emulates an N_Port ID Virtualization (NPIV) host.
- **F_Port Proxy mode**—allows FC nodes to connect with FC switches and FCFs across an FCoE network. The OmniSwitch gateway forwards login requests from an FC node (N_Port on a server or storage with an HBA) across Ethernet via an FCoE VLAN to an NPIV node or FCF. This mode is sometimes referred to as reverse-NPIV proxy (R-NPIV).
- **E_Port Proxy mode**—allows FC switches to set up inter-switch link trunking between FC fabrics over an FCoE network. The OmniSwitch gateway provides an E_Port to E_Port (E2E) tunneling function that emulates a point-to-point FC link between E_Ports on native FC switches.

The OmniSwitch FCoE/FC gateway sits at the entry point of an FC fabric, which is required to handle the login process for ENodes and FC nodes accessing the fabric through the gateway switch.

OmniSwitch FCoE/FC gateway operations are not automatically activated for the switch; there is no single command to enable or disable gateway functionality. Instead, the configuration of the following software components enables one or more of the supported gateway operations:

- **FIP snooping**—FCoE/FC gateway functionality requires an active FIP snooping configuration. FIP Snooping ensures the security of an FCoE network.
- **Virtual Storage Area Network (VSAN)**—an FC port is assigned to a VSAN to create an NP_Port or F_Port connection to an FC switch or node in that VSAN. Not required for E2E Tunnel configuration.
- **VSAN-to-FCoE VLAN mapping**—identifies the FCoE/FC gateway fabric for the ENode or FC node login process via the FCoE VLAN. Not required for E_Port proxy (E2E Tunnel) configuration.
- **FC port mode**—the operational mode of the FC port determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.
- **FCoE port role**—an FCoE port serves as an E2E tunnel endpoint in an FCoE network only when the port is configured as a virtual E_Port (VE_Port). The role of other FCoE ports is configured based on the FIP snooping configuration for the gateway switch.

This chapter and the Chapter 42, “FIP Snooping Commands,” describe the command line interface (CLI) commands used to configure these components.

MIB information for the FCoE/FC gateway commands is as follows:

Filename: ALCATEL-IND1-FIPS-MIB.mib
Module: alcatelIND1FipsMIB

The acronyms used in this chapter are defined here:

CNA	Converged Network Adapter
CVL	Clear Virtual Link
E2E	E_Port-to-E_Port Tunnel
ELP	Exchange Link Parameters
ENode	FCoE Node
E_Port	Expansion Port
F_Port	Fabric Port
FC	Fibre Channel
FCF	FCoE Forwarder
FDISC	Fabric Discovery
FCID	Fabric Port ID (same as N_Port ID).
FCoE	Fibre Channel over Ethernet
FIP	FCoE Initialization Protocol
FLOGI	Fabric Login
FLOGO	Fabric Logout
HBA	Host Bus Adapter
ISL	Inter-switch Link
NPIV	N_Port ID Virtualization
N_Port	Node Port
NP_Port	Proxy Node Port
TE_Port	Tunnel Expansion Port
VE_Port	Virtual E_Port
VF_Port	Virtual F_Port
VN_Port	Virtual N_Port
VSAN	Virtual Storage Area Network
WWNN	World Wide Node Name
WWPN	World Wide Port Name

The FCoE/FC gateway commands are listed here:

Configuration commands	**fibre-channel vsan** **fibre-channel port mode** **fibre-channel vsan members** **fcoe vsan-map** **fibre-channel npiv-proxy load-balance** **fibre-channel npiv-proxy load-balance static** **fcoe e-tunnel**
Show commands	**show fibre-channel vsan** **show fibre-channel vsan members** **show fibre-channel port** **show fcoe vsan-map** **show fibre-channel sessions** **show fibre-channel node** **show fcoe e-tunnel** **show fibre-channel** **show fibre-channel npiv-proxy load-balance**
Statistics commands	**show fibre-channel statistics** **show fcoe statistics npiv-proxy** **show fcoe statistics r-npiv** **show fcoe statistics e-tunnel**
Clear commands	**clear fibre-channel statistics** **clear fibre-channel sessions** **clear fcoe statistics npiv** **clear fcoe statistics r-npiv** **clear fcoe statistics e-tunnel** **clear fcoe sessions**

fibre-channel vsan

Configures an OmniSwitch VSAN with the specified VSAN ID and an optional description. This type of VSAN is used to segment OmniSwitch Fibre Channel ports into a virtual FCoE/FC gateway fabric.

Note. The VSAN created with this command only applies to the local switch configuration. There is no correlation between an OmniSwitch VSAN and a VSAN created within a native FC SAN.

fibre-channel vsan {*vsan_id***[-***vsan_id2***]} [admin-state {enable | disable}] [name** *description***]**

no fibre-channel vsan {*vsan_id***[-***vsan_id2***]}**

Syntax Definitions

*vsan_id***[-***vsan_id2***]**	A numeric value that will uniquely identify the VSAN. Use a hyphen to specify a range of VSAN IDs (for example, 100-105). The valid range is 2–4094).
enable	Enable the VSAN administrative status.
disable	Disable the VSAN administrative status.
description	An alphanumeric string. Optional name description for the VSAN ID.

Defaults

By default, VSAN 1 is created on the switch and all unassigned FC ports are assigned to VSAN 1.

parameter	default
enable | disable	**enable**
name *description*	**VSAN ID**

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete a VSAN from the configuration.
- When a VSAN is administratively disabled, all sessions established over that VSAN are cleared and the switch stops sending periodic FIP multicast discovery advertisement messages for the corresponding FCoE VLAN.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.
- Only FC switch ports can be assigned to a VSAN.
- Assigning multiple FC ports to the same VSAN is allowed, but an FC port can only belong to one VSAN.

- Configuring N_Port and F_Port proxy functionality requires mapping a VSAN to an FCoE VLAN. Note that only one VSAN is mapped to one FCoE VLAN (one-to-one) at any given time. This mapping defines a single traffic path through the gateway switch.
- If an FCoE VLAN is not mapped to a VSAN, then the FCoE VLAN participates only in the FIP snooping process.

Examples

```
-> fibre-channel vsan 200 name “Fabric A”
-> fibre-channel vsan 100-105 admin-state disable
-> no fibre-channel vsan 200
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan members	Assigns FC switch ports to a VSAN.

show fibre-channel vsan	Displays the VSAN configuration for the switch.
show fcoe vsan-map	Displays the VSAN-VLAN mapping configuration for the switch.
show fibre-channel vsan members	Displays FC port assignments for each VSAN.

MIB Objects

```
alaFcVsanTable
   alaFcVsanNumber
   alaFcVsanDescription,
   alaFcVsanAdmStatus
   alaFcVsanOperStatus
```

fibre-channel port mode

Configures the port type and operational mode for an eligible FC port. The port type is only set to Fibre Channel and the specified operational mode determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.

fibre-channel port *chassis/slot/port***[**-*port2***] mode {np | f | te} [bb-sc-n** *buffer_num***]**

no fibre-channel port *chassis/slot/port***[**-*port2***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). Only ports on an OmniSwitch 6900 OS-XNI-U12E module with an SFP-FC-SR transceiver are eligible for this command.
np	Activates N_Port proxy functionality on the port. In this mode the port serves as a proxy node port (NP_Port) that aggregates N_Port transactions between FCoE devices and FC switches.
f	Activates F_Port proxy functionality on the port. In this mode the port operates as a fabric port (F_Port), which connects to an N_Port in a point-to-point link between FC devices.
te	Activates E_Port functionality on the port. In this mode, the port operates as a tunnel expansion port (TE_Port) that connects to an E_Port on an FC switch. TE_Ports allow E_Ports to connect across an FCoE network as part of an inter-switch link (ISL) tunnel that is used to expand the native FC fabric over Ethernet.
buffer_num	The buffer-to-buffer state change (BB_SC) number. FC ports exchange BB_SC primitives after 2^BB_SC_N frames. These primitives are used to recalculate buffer credits as part of a buffer-to-buffer flow control function between FC switch connections. The valid range is 0–15.

Defaults

By default, no operational mode is configured for the FC ports and the port type is set to Ethernet.

parameter	default
bb-sc-n *buffer_num*	**0**

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the operational mode configuration from the FC port. The port type reverts back to Ethernet.
- To change the FC mode for the port, use the **no** form of this command to remove the current mode configuration then configure the FC mode again for the same port.

- Changing the **bb-sc-n** parameter value can be changed at any time (removing the FC mode configuration is not required to change this parameter value).
- Make sure the **bb-sc-n** parameter value is the same on both ends of the connection between the OmniSwitch FCoE/FC gateway and an FC switch. If the value is different on each end of the connection then the greater value is used. However, if this value is set to zero for one of the ports on the connection, then the buffer-to-buffer state change function is disabled.
- FC ports do not participate in Ethernet features, such as a link aggregates, a virtual fabric links (VFLs) in virtual chassis (VC) configurations, standard VLANs, or FCoE VLANs.
- To ensure end-to-end lossless connectivity through the gateway switch, assign a PAUSE-enabled DCB profile to each FC port. For more information, see Chapter 5, “Configuring an FCoE Gateway”, in the *OmniSwitch AOS Release 8 Data Center Switching Guide*.

Examples

```
-> fibre-channel port 2/1 mode np
-> fibre-channel port 2/3 mode f
-> fibre-channel port 2/5 mode te
-> no fibre-channel port 2/5
```

To change the FC port mode:

```
-> no fibre-channel port 2/1
-> fibre-channel port 2/1 f
```

To change the **bb-sc-n** parameter value:

```
-> fibre-channel port 2/1 bb-sc-n 3
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan members	Assigns FC ports to VSANs.
show fibre-channel port	Displays the FC port configuration for the switch.

   alaFcIntfBbRxDataField
   alaFcIntfClassOfService
   alaFcIntfRowStatus
```

fibre-channel vsan members

Configures the VSAN assignment for the specified FC port.

fibre-channel vsan *vsan_id* **members port** *chassis/slot/port***[**-*port2***]**

no fibre-channel vsan *vsan_id* **members port** *chassis/slot/port***[**-*port2***]**

Syntax Definitions

vsan_id	An existing VSAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all FC ports are assigned to VSAN 1.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the association between the specified FC port and VSAN.
- When an NP_Port is removed from a VSAN, a FIP CVL is generated for all the VN_Ports that are logged in through that NP_Port and an FC LOGO is sent on the FC port. An FC LOGO is also sent for any R-NPIV sessions that exist when the CVL is generated.
- When an F_Port (used for R-NPIV) is removed from a VSAN, then FC LOGO is sent to the host and also to the FCF.
- When an FC port is moved from VSAN 1 to another VSAN, traffic loss will occur for all existing sessions. Moving FC ports between other VSANs (for example, between VSAN 2 and 3) is not allowed.
- Multiple FC ports can belong to the same VSAN, but an FC port can belong to only one VSAN. In other words, it is not possible to tag FC ports with multiple VSANs.
- When a VSAN is mapped to an FCoE VLAN and an active FC port is assigned to that VSAN, the FC mode configured for that port determines the FCoE/FC gateway functionality provided. For example, if the FC port mode is set to operate as:
  - an NP_Port, then NPIV proxy functionality is automatically enabled.
  - an F_Port, then the R-NPIV functionality is automatically enabled.
  - a TE_Port and an FCoE port is set to operate as a virtual E_Port (VE_Port), then E2E tunneling functionality is automatically enabled.

- When more than one NP_Port is associated with the same VSAN, the OmniSwitch will load balance ENode FLOGI requests across the NP_Ports for that VSAN. By default, the NP_Port with the lowest number of logins provided is selected. If all the NP_Ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Examples

```
-> fibre-channel vsan 10 members port 2/1
-> fibre-channel vsan 10 members port 2/1-3
-> no fibre-channel vsan 10 members port 2/1-3
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan	Creates an FC VSAN.
fibre-channel port mode	Configures the operational mode for the FC port.
fibre-channel npiv-proxy load-balance	Configures the load balancing method applied when more than one FC port is assigned to the same VSAN.
show fibre-channel vsan	Displays the VSAN configuration for the switch.
show fibre-channel vsan members	Displays the VSAN port assignments.

MIB Objects

```
alaFcVfpaTable
   alaFcVfpaVsanNumber
   alaFcVfpaIfIndex
   alaFcVfpaRowStatus
```

fcoe vsan-map

Maps an FC VSAN to an FCoE VLAN. This mapping is required to activate the processing of specific FCoE ENode traffic traveling to and from the designated virtual FC fabric through the FCoE/FC gateway OmniSwitch.

fcoe vsan-map vsan *vsan_id* **vlan** *vlan_id*

no fcoe vsan-map vsan *vsan_id* **vlan** *vlan_id*

Syntax Definitions

vsan_id	An existing VSAN ID number.
vlan_id	An existing FCoE VLAN ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the VSAN-to-FCoE VLAN mapping.
- When a mapping is removed, all sessions associated with the FCoE VLAN are cleared.
- Only one VSAN is mapped to one FCoE VLAN.
- The FCoE/FC gateway does not participate in FCoE discovery mechanisms for FCoE VLANs not mapped to a VSAN.
- If an FCoE VLAN is not mapped to a VSAN, then only FIP snooping functionality is applied to that VLAN.

Examples

```
-> fcoe vsan-map vsan 10 vlan 100
-> no fcoe vsan-map vsan 10 vlan 100
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan	Configures a VSAN for the switch.
fcoe vlan	Configures an FCoE VLAN for the switch.
show fcoe vsan-map	Displays the VSAN-VLAN mapping configuration.

MIB Objects

```
alaFipsVsanVlanMapTable
   alaFipsVsanVlanMapVsanNumber
   alaFipsVsanVlanMapVlanNumber
   alaFipsVsanVlanMapRowStatus
```

fibre-channel npiv-proxy load-balance

Configures the dynamic load balancing method that is applied to ENode FLOGI requests when more than one FC port is associated with the same VSAN. Load balancing is not applied to FDISC requests.

fibre-channel npiv-proxy load-balance static {default | dynamic-reorder | enode-based}

Syntax Definitions

default	Selects the default load balancing method.
dynamic-reorder	Ensures that all sessions are load balanced evenly at any given time.
enode-based	Selects the FC for the new session based on the ENode MAC address.

Defaults

By default, the FC port with the lowest number of logins provided is selected for new FLOGI requests. If all the ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The load balancing method is globally applied to the switch, and only one method is applied at a time.
- Using the dynamic reorder load balancing method may trigger the tearing down of some sessions, so that upon re-login the ENode FLOGI is processed on a different NP_Port in the same VSAN. For example, when a new FC NP_Port is added to the VSAN, some of the sessions are torn down and logged in again on the newly added port to distribute sessions across all ports in the VSAN.
- When the ENode-based load balancing method is used, each NP_Port in the VSAN will send a multicast discovery advertisement to all ENodes in the mapped FCoE VLAN. The FCF MAC address in the discovery advertisement is the MAC address of the FC port. The ENode then decides which FCF (NP_Port) to use for the login.
- The default and ENode-based load balancing methods do not disturb existing sessions.
- The load balancing method is *not* applied to statically mapped FCoE and FC ports.

Examples

```
-> fibre-channel npiv-proxy load-balance dynamic-reorder
-> fibre-channel npiv-proxy load-balance enode-based
-> fibre-channel npiv-proxy load-balance default
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel npiv-proxy load-balance static	Configures a static mapping between an FCoE port and an FC NP_Port. Load balancing does not apply to statically mapped ports.
show fibre-channel	Displays the global load balancing method applied to NP_Ports.

MIB Objects

```
alaFcInfo
   alaFcConfigNpivLoadBalance
```

fibre-channel npiv-proxy load-balance static

Configures a static port association between an FCoE port and an FC NP_Port to ensure that FC sessions on the specified FCoE port are mapped to the specified NP_Port.

fibre-channel npiv-proxy load-balance static {port *chassis/slot/port* | **linkagg** *agg_id***} fc-port** *chassis/slot/port*

no fibre-channel npiv-proxy load-balance static {port *chassis/slot/port* | **linkagg** *agg_id***} fc-port** *chassis/slot/port*

Syntax Definitions

chassis	The chassis identifier.
port *slot/port*	The slot and port number (3/1) of an FCoE port.
agg_id	The link aggregate ID number.
fc-port *slot/port*	The slot and port number (3/1) of an FC port.

Defaults

By default, there are no static FCoE-to-FC port associations. The dynamic load balancing method is applied to the FC NP_ports.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the static association between the FCoE port and the FC port. When this association is removed, the dynamic load balancing method is applied.
- Use caution when configuring static FCoE-to-FC port assignments. Static assignments exempt both the FCoE port and the FC NP_Port from dynamic load balancing of sessions when multiple FC ports belong to the same VSAN.

Examples

```
-> fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1

-> fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel npiv-proxy load-balance	Displays the static FCoE port/FC NP_Port mapping and FC port session counts.

MIB Objects

```
alaFcNpivStaticLoadBalanceTable
   alaFcNpivStaticLoadBalanceRowStatus
   alaFcNpivStaticLoadBalanceEtherIfIndex
   alaFcNpivStaticLoadBalanceFibreIfIndex
```

fcoe e-tunnel

Configures an E2E tunnel identifier and associates the identifier with tunnel endpoints and an FCoE VLAN. An E2E tunnel allows FC switches to set up ISLs between fabrics over an FCoE network.

fcoe e-tunnel *tunnel_id* **{fc-port1** *chassis/slot/port***} {fc-port2** *chassis/slot/port* | **vlan** *vlan_id***}**

no fcoe e-tunnel *tunnel_id*

Syntax Definitions

tunnel_id	A unique ID number to assign to this tunnel session.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1) of an FC tunnel edge (TE) port.
vlan_id	An existing FCoE VLAN ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the tunnel configuration.
- An OmniSwitch FC port is configured as a tunnel E_Port (TE_Port) and connects to an E_Port on an FC switch. TE_Ports can carry traffic from multiple VSANs. This command is used to associate the TE port with an FCoE VLAN or with another TE port on the same switch.
- An OmniSwitch FCoE port is configured as a virtual expansion port (VE_Port) on the FCoE network side. The VE port is associated with an FCoE VLAN by tagging the VE port with the FCoE VLAN ID.
- This command does not establish a connection. Once the required tunnel components are configured, successful exchange of exchange link parameters (ELP) between a TE_Port and a VE_Port or between two TE_Ports will establish the tunnel session.
- To create a tunnel connection between two FC switches across the FCoE network requires the following steps:
  - Configure the FCoE port that will connect to the FCoE network as a virtual expansion port (VE_Port).
  - Tag the VE_Port to the FCoE VLAN that will carry traffic through the tunnel.
  - Configure the FC port that will connect to an E_Port on an FC as a TE_Port.
  - Use this command (**fcoe e-tunnel**) with the **fc-port1** and **vlan** parameters to associate the TE_Port with the FCoE VLAN to which the VE_Port is tagged.
- To create a tunnel between two FC TE_Ports on the same switch or in a virtual chassis configuration, use the **fc-port1** and **fc-port2** parameters to specify the slot and port number of the two TE ports.

Examples

```
-> fcoe e-tunnel 1 fc-port1 2/1 fc-port2 2/2
-> fcoe e-tunnel 10 fc-port1 2/3 vlan 200
-> fcoe e-tunnel 11 fc-port1 2/4 vlan 200
-> no fcoe e-tunnel 10
```

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN.
fcoe role	Configures an FCoE port as a VE_Port.
fibre-channel port mode	Configures an FC port as a TE_Port
show fcoe e-tunnel	Displays the E2E tunnel configuration.
show fibre-channel sessions	Displays FC sessions on FC ports.

   alaFipsEtunnelVlanId
   alaFipsEtunnelIfIndexOne
   alaFipsEtunnelIfIndexTwo
   alaFipsEtunnelRowStatus
```

show fibre-channel vsan

Displays the VSAN configuration for the switch.

show fibre-channel vsan [*vsan_id***]-***vsan_id2***]**

Syntax Definitions

*vsan_id***[-***vsan_id2***]**	An existing VSAN ID. Use a hyphen to specify a range of VSAN IDs (10-25).

Defaults

By default, a list of all VSANs is displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify a VSAN ID with this command to display information about a specific VSAN.

Examples

```
-> show fibre-channel vsan

 vsan  oper admin  name
------+----+-----+---------
    1  Ena   Dis  test1
 1000  Dis   Dis  test2
 2000  Ena   Dis  test3

-> show fibre-channel vsan 101

vsan  oper admin  name
------+----+-----+---------
 1000  Dis   Dis  test2
```

output definitions

vsan	The numerical VSAN ID.
oper	The operational status of the VSAN: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active FC port is assigned to the VSAN. A VSAN must have an enabled administrative status before it can become operationally enabled.
admin	The administrative status of the VSAN: **Ena** specifies that VSAN functions are enabled; **Dis** specifies that VLAN functions are disabled.
name	The user-defined text description for the VSAN. By default, the VSAN ID is displayed if the VLAN description is not specified.

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan	Configures a VSAN for the switch.
show fibre-channel vsan members	Displays VSAN port assignments.

MIB Objects

   alaFcVsanNumber
   alaFcVsanDescription
   alaFcVsanAdmStatus
   alaFcVsanOperStatus
   alaFcVsanRowStatus
```

show fibre-channel vsan members

Displays the VSAN port assignments.

show fibre-channel vsan [*vsan_id* **[-***vsan_id2***]] members [port** *chassis/slot/port***[-***port2***]]**

Syntax Definitions

vsan_id[-*vsan_id2*]	An existing VSAN ID number. Use a hyphen to specify a range of VSAN IDs (10-25).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all VSAN port assignments are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If the *vsan_id* is specified without a *slot/port*, then all port assignments for that VSAN are displayed.
- If both the *vsan_id* and *slot/port* are specified, then information only for that VSAN and slot/port is displayed.
- Only OmniSwitch FC ports can be assigned to a VSAN.

Examples

```
-> show fibre-channel vsan members
 vsan   port  status
------+------+--------
    1  2/2/1   Enabled
 1003  2/2/12  Enabled
 1005  3/2/5   Disbled

-> show fibre-channel vsan 1003 members
  port   status
-------+--------
 2/2/12  Enabled

-> show fibre-channel vsan 1005 members port 3/2/5
vsan   : 1005,
port   : 3/2/5,
status : disabled
```

output definitions

vsan	The numerical VSAN ID. Configured through the **fibre-channel vsan** command.
port	The FC port number associated with the VSAN ID. Configured through the **fibre-channel vsan members** command.
status	The operational status of the port (**enabled** or **disabled**).

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel vsan	Displays the VSAN configuration for the switch.

MIB Objects

   alaFcVfpaVsanNumber
   alaFcVfpaIfIndex
   alaFcVfpaState
   alaFcVfpaRowStatus
```

show fibre-channel port

Displays the FC port configuration for the switch.

show fibre-channel port [info]

Syntax Definitions

info	Displays session details for each FC port.

Defaults

By default, the parameters for each FC port are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When the **info** parameter is used with this command, the **fcid** field shows an FC port ID for NP_Ports. For all other port modes, this field is blank. Only NP_Ports perform fabric login (FLOGI) and obtain a port ID from an FC switch.
- If an FC port is configured to operate in the fabric or tunnel E_Port mode, there is no fabric login process performed. Ports running in these modes will come up immediately.
- FLOGI is triggered only after an NP_Port is assigned to a VSAN.

Examples

```
-> show fibre-channel port
Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port

ports   oper-status mode  BB-SC-N  service class
-------+-----------+-----+-------+---------------
  2/1        Up      NP        3              3
  2/2        Up      F         0              3
  2/3        Up      TE        3            3/F
  2/4       Down     NP        0              3
```

output definitions

ports	The slot and port number of the FC port.
oper-status	The operational status of the FC port.
mode	The operational mode for the FC port.
BB-SC-N	The buffer-to-buffer state change number configured for the FC port.
service class	The service class for the FC port session (**2**, **3**, **F**, or **3/F**). This value indicates the level of delivery integrity required for an application.

```
-> show fibre-channel port info
Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port

 ports  mode  fcid        wwpn                state
-------+----+-------+----------------------+----------
   2/1   NP  010010c 10:00:01:00:00:0a:22:11 Up
   2/2   F       -   10:00:01:00:00:0b:22:1a Up
   2/3   TE      -   10:00:01:00:00:0b:23:22 Up
   2/4   NP      -   10:00:01:00:00:0b:23:23 FLOGI_Sent
   2/5   NP      -   10:00:01:00:00:0b:23:24 Not_Init
```

output definitions

ports	The slot and port number of the FC port.
mode	The operational mode for the FC port (**NP** = proxy N_Port, **F** = fabric port, **TE** = tunnel E_Port). Configured through the **fibre-channel port mode** command.
fcid	The FC port_ID obtained after successful fabric login. This field applies only to NP_Ports.
wwpn	The world-wide port name assigned to the OmniSwitch FC port.
state	The operational state of the fabric login process (**Up**, **Down**, **FLOGI_Sent**, **Not_Init**, **ELP_Sent**, **Sess_Clear**).

Release History

Release 7.3.3; command introduced.

show fcoe vsan-map

Displays the VSAN-to-FCoE VLAN mapping configuration.

show fcoe vsan-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Mapping a VSAN to an FCoE VLAN is required to activate the processing of specific ENode traffic traveling to and from the designated virtual FC fabric through the NPIV OmniSwitch.

Examples

```
-> show fcoe vsan-map
 vsan   vlan
------+-----
    10    10
  2000  2000
  3000  3000
```

output definitions

vsan	The VSAN ID. Configured through the **fibre-channel vsan** command**.**
vlan	The FCoE VLAN ID. Configured through the **fcoe vlan** command**.**

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe vsan-map	Configures a one-to-one mapping between a VSAN and FCoE VLAN.
show vlan	Displays the FCoE VLAN configuration.

MIB Objects

   alaFipsVsanVlanMapVsanNumber
   alaFipsVsanVlanMapVlanNumber
   alaFipsVsanVlanMapRowStatus
```

show fibre-channel sessions

Displays the sessions established on the OmniSwitch FC ports.

show fibre-channel sessions [vsan *vsan_id* **| e-tunnel** *tunnel_id***] [port** *chassis/slot/port***] [summary]**

Syntax Definitions

vsan_id	An existing VSAN ID number.
tunnel_id	An existing E-Tunnel (E2E Tunnel) ID.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).

Defaults

By default, all FC sessions are displayed for all FC ports.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

The **port** parameter can be combined with the **vsan** or **e-tunnel** parameters to display sessions for a specific FC port within a VSAN or E2E tunnel.

Examples

```
-> show fibre-channel sessions summary
Total FIBRE-CHANNEL Sessions               : 7    ,
Total NPIV Sessions                        : 4    ,
Total R-NPIV Sessions                      : 1    ,
Total E-TUNNEL Sessions                    : 2

-> show fibre-channel sessions
Total FIBRE-CHANNEL Sessions               : 4
Total NPIV Sessions                        : 2

```

output definitions

Port	The slot and port number for the FC port.
Mode	The operational mode for the FC port (**F** = F_Port, **NP** = proxy N_Port, **TE** = tunnel E_Port). Configured through the **fibre-channel port mode**.
vsan	The VSAN ID to which the NP_Port or F_Port is assigned. Configured through the **fibre-channel vsan** command**.**
T-ID	The E2E tunnel ID. Configured through the **fcoe e-tunnel** command.
WWPN	The world-wide port name associated with the OmniSwitch FC port.
FCID	The FC port ID assigned to the node during login.
Status	The status of the login session.
Login Type	The type of login (FLOGI = fabric login, FDISC = fabric discovery, or ELP = exchange link parameters).

Release History

Release 7.3.3; command introduced.

Related Commands

clear fibre-channel sessions	Clears FC sessions.
show fibre-channel node	Displays a list of FC nodes connected through the switch.

MIB Objects

   alaFcSessFcid,
   alaFcSessWwpn,
   alaFcSessType,
   alaFcSessTunnelId
```

show fibre-channel node

Displays a list of FC nodes connected to OmniSwitch FC ports.

show fibre-channel node [vsan *vsan_id* **| port** *chassis/slot/port***]**

Syntax Definitions

vsan_id	An existing VSAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).

Defaults

By default, a list of all FC nodes is displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Specify a VSAN ID to display nodes associated with a specific VSAN.
- Specify an FC port number to display nodes connected on a specific FC port.

Examples

```
-> show fibre-channel node
VSAN  VLAN       WWNN                     WWPN               Port   FC-ID

```

output definitions

Port	The slot/port of the FC interface that is connected to the FC node.
VSAN	The VSAN ID associated with the FC node. Configured through the **fibre-channel vsan** command.
VLAN	The FCoE VLAN ID on which FC nodes are provided. Configured through the **fcoe vlan** command.
WWNN	The world-wide node name assigned to an FC node.
WWPN	The world-wide port name assigned to the FC port.
FC-ID	The FC port ID assigned to an N_Port (or VN_Port, or NP_Port) after successful fabric login.

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel sessions	Displays the sessions established on the OmniSwitch FC ports.

show fcoe e-tunnel

Displays the E2E tunnel configuration for the switch.

show fcoe e-tunnel [*tunnel_id***]**

Syntax Definitions

tunnel_id	An existing tunnel ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *tunnel_id* to display parameters for a specific tunnel.

Examples

```
-> show fcoe e-tunnel

 tunnel  vlan  Port1   Port2
-------+-----+-------+----------
     1   1000  1/1/1     -
     2     -   1/1/2   3/3/1
     3   3000  1/1/3     -

-> show fcoe e-tunnel 2
 tunnel  vlan  Port1   Port2
-------+-----+-------+----------
     2     -   1/1/2   3/3/1
```

output definitions

Tunnel	The E2E tunnel ID associated with the session. Configured through
Vlan	The FCoE VLAN on which the tunnel is defined. Configured through the **fcoe vlan** command.
Port1, Port2	The FCoE port (in VE_Port role) and/or FC port (in TE_Port mode) for this session. The FCoE port rule is configured through the **fcoe role** command. The FC port mode is configured through the **fibre-channel port mode** command.

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe e-tunnel	Configures E2E tunnel parameters.

MIB Objects

```

show fibre-channel

Displays global Fibre Channel parameter values.

show fibre-channel

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

This command currently displays the following:

- The load-balancing method that is applied to FLOGI requests when there is more than one NPIV proxy port assigned to the same VSAN. This mode does not apply to FC ports configured to operate in the F_Port proxy mode (R-NPIV) or as E2E tunnel ports.
- The World Wide Node Name (WWNN) for the switch. The WWNN is comprised of “10:00” combined with the next available increment of the switch based MAC address.

Examples

```
-> show fibre-channel
Fibre Channel Global Configurations     :
----------------------------------------
NPIV Proxy Global Load Balance Method   : Default
Local WWNN                              : 10:00:00:E0:B1:E7:09:A4
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel npiv-proxy load-balance	Configures the load balancing method applied to multiple FC ports that belong to the same VSAN.

MIB Objects

show fibre-channel statistics

Displays FC port statistics.

show fibre-channel statistics [npiv | r-npiv] [vsan *vsan_id***[***vsan_id2***] [port** *chassis/slot/port***[-***port2***] [e-tunnel port** *chassis/slot/port***[-***port2***]]**

Syntax Definitions

npiv	Displays statistics for N_Port proxy sessions**.**
r-npiv	Displays statistics for F_Port proxy sessions.
e-tunnel [*tunnel_id***]**	Displays E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
*vsan_id***[***vsan_id2***]**	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all statistics are displayed

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vsan** parameter to display statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to display statistics for a specific FC port.

Examples

```
-> show fibre-channel statistics vsan 46
NPIV VSAN Statistics:

show fcoe statistics npiv-proxy

Displays ENode fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

show fcoe statistics npiv-proxy {enode-login | enode-discovery} {interface | vlan [*vlan_id***[***vlan_id2***] | port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

enode-login	Displays ENode login statistics**.**
enode-discovery	Displays ENode discovery statistics.
interface	Display statistics for all FCoE interfaces (ports and link aggregates).
*vlan_id***[***vlan_id2***]**	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

Examples

```
->show fcoe statistics npiv-proxy enode-discovery interface

show fcoe statistics e-tunnel

Displays E2E tunnel statistics.

show fcoe statistics e-tunnel [ve | te] [*tunnel_id***[-***tunnel_id***]]**

Syntax Definitions

ve	Displays VE_Port statistics**.**
te	Displays TE_Port statistics.
*tunnel_id***[-***tunnel_id***]**	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

Examples

```
-> show fcoe statistics e-tunnel

show fibre-channel npiv-proxy load-balance

Displays the NPIV proxy load balancing static mapping and session count.

show fibre-channel npiv-proxy load balance {static | session-count}

Syntax Definitions

static	Displays the static FCoE port/FC NP_Port mapping.
session-count	Displays the number of sessions on each FC port.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command displays information only for FC ports operating in the NP_Port mode.
- Use the **static** parameter to display only the static mapping of FCoE ports to FC NP_Ports.
- When the **sessions-count** parameter is used, the “FC Port” field includes all NP_Ports.

Examples

```
-> show fibre-channel npiv-proxy load-balance static

FCoE Port   FC port
-----------+---------
 1/1        2/1
 1/2        2/1

-> show fibre-channel npiv-proxy load-balance sessions-count

 FC Port  session_count
--------+--------------
  2/1                2
  2/2                0
  2/3                5
```

output definitions

FCoE Port	The slot/port of the FCoE port that is mapped to the FC port.
FC Port	The slot/port of the FC NP_Port.
Session Count	The number of sessions per FC port.

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel npiv-proxy load-balance static	Configures a static mapping between an FCoE port and an FC NP_Port.
fibre-channel npiv-proxy load-balance	Configures the NPIV proxy load-balancing method applied to all FC NP_Ports on the switch.

MIB Objects

clear fibre-channel statistics

Clears FC port statistics.

clear fibre-channel statistics [npiv | r-npiv] [port *chassis/slot/port***[**-*port2***] [e-tunnel port** *chassis/slot/port***[**-*port2***]]**

Syntax Definitions

npiv	Clears statistics for N_Port proxy sessions**.**
r-npiv	Clears statistics for F_Port proxy sessions.
e-tunnel [*tunnel_id***]**	Clears E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
*vsan_id***[***vsan_id2***]**	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all statistics are cleared.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vsan** parameter to clear statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to clear statistics for a specific FC port.

Examples

```
-> clear fibre-channel statistics
-> clear fibre-channel statistics port 2/2/5
-> clear fibre-channel statistics npiv
-> clear fibre-channel statistics r-npiv
-> clear fibre-channel statistics e-tunnel
-> clear fibre-channel statistics npiv port 2/2/1
-> clear fibre-channel statistics r-npiv port 2/2/3
-> clear fibre-channel statistics e-tunnel port 2/2/4
```

Release History

Release 7.3.3; command introduced.

Related Commands

clear fibre-channel sessions

Clears the specified sessions on all FC ports.

clear fibre-channel sessions {npiv-proxy | r-proxy | e-tunnel | all}

Syntax Definitions

npiv-proxy	Clears NP_Port proxy sessions.
r-proxy	Clears reverse NP_Port proxy sessions.
e-tunnel	Clears E-Tunnel (E2E Tunnel) sessions.
all	Clears all NP_Port proxy, reverse proxy, and E-Tunnel sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Only the sessions associated with the specified parameter are cleared. For example, if the **npiv-proxy** parameter is used, only NPIV proxy sessions are cleared. All other session types remain active.
- When sessions are cleared on FC ports, the corresponding sessions on the FCoE ports are also cleared.

Examples

```
-> clear fibre-channel sessions npiv-proxy
-> clear fibre-channel sessions r-npiv
-> clear fibre-channel sessions e-tunnel
-> clear fibre-channel sessions all
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel sessions	Displays FC sessions.

MIB Objects

```
alaFcInfo
   alaFcConfigSessClear

clear fcoe statistics npiv

Clears N_Port proxy (NP_Port) statistics for FCoE interfaces or specific FCoE VLANs.

clear fcoe statistics npiv-proxy {interface | vlan [*vlan_id***[***vlan_id2***] | port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

interface	Clears statistics for all FCoE interfaces (ports and link aggregates).
*vlan_id***[***vlan_id2***]**	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vlan** parameter to clear statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to clear statistics for a specific FCoE port or link aggregate ID.

Examples

```
-> clear fcoe statistics npiv-proxy interface
-> clear fcoe statistics npiv-proxy vlan 100
-> clear fcoe statistics npiv-proxy vlan 200-205
-> clear fcoe statistics npiv-proxy port 1/1
-> clear fcoe statistics npiv-proxy port 1/5-10
-> clear fcoe statistics npiv-proxy port 1/1/1
-> clear fcoe statistics npiv-proxy linkagg 10
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe statistics npiv-proxy Displays N_Port proxy statistics.

MIB Objects

```
alaFipsVlanTable
   alaFipsVlanStatsFnreClear
alaFipsIntfTable
   alaFipsIntfStatsFnreClear
```

clear fcoe statistics r-npiv

Clears F_Port proxy (reverse-NPIV) statistics for FCoE interfaces or specific FCoE VLANs.

clear fcoe statistics r-npiv {interface | vlan [*vlan_id***[***vlan_id2***] | port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

interface	Clears statistics for all FCoE interfaces (ports and link aggregates).
*vlan_id***[***vlan_id2***]**	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **vlan** parameter to clear statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to clear statistics for a specific FCoE port or link aggregate ID.

Examples

```
-> clear fcoe statistics r-npiv interface
-> clear fcoe statistics r-npiv vlan 100
-> clear fcoe statistics r-npiv vlan 200-205
-> clear fcoe statistics r-npiv port 1/1
-> clear fcoe statistics r-npiv port 1/5-10
-> clear fcoe statistics r-npiv port 1/1/1
-> clear fcoe statistics r-npiv linkagg 10
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe statistics r-npiv	Displays F_Port proxy statistics.

MIB Objects

```
alaFipsVlanTable
   alaFipsVlanStatsFnreClear
alaFipsIntfTable
   alaFipsIntfStatsFnreClear
```

clear fcoe statistics e-tunnel

Clears E_Port proxy (E2E tunnel) statistics.

clear fcoe statistics e-tunnel [ve | te] {*tunnel_id***[-***tunnel_id***]}**

Syntax Definitions

ve	Clears VE_Port statistics**.**
te	Clears TE_Port statistics.
*tunnel_id***[-***tunnel_id***]**	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **ve** parameter to clear only VE_Port statistics for the specified tunnel ID.
- Use the **te** parameter to clear only TE_Port statistics for the specified tunnel ID.

Examples

```
-> clear fcoe statistics e-tunnel 1
-> clear fcoe statistics e-tunnel ve 2
-> clear fcoe statistics e-tunnel te 2
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe statistics e-tunnel	Displays E_Port proxy (E2E tunnel) statistics.

MIB Objects

alaFipsEtunnelVePortStatsTable
   alaFipsEtunnelVePortStatsTunnelId
   alaFipsEtunnelVePortStatsClear
alaFipsEtunnelTePortStatsTable
   alaFipsEtunnelTePortStatsTunnelId
   alaFipsEtunnelTePortStatsClear
```

clear fcoe sessions

Clears the specified sessions on all FCoE ports.

clear fcoe sessions [fips | npiv-proxy | r-proxy | e-tunnel | all]

Syntax Definitions

fips	Clears FIP snooping sessions.
npiv-proxy	Clears NP_Port proxy sessions.
r-proxy	Clears reverse NP_Port proxy sessions.
e-tunnel	Clears E-Tunnel (E2E Tunnel) sessions.
all	Clears all FCoE, NP_Port proxy, reverse proxy, and E-Tunnel sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When FIP snooping sessions are cleared, a clear virtual link (CVL) request is sent for all logged ENodes.
- When R-NPIV sessions are cleared, FIP FLOGO is sent to the FCF and FC FLOGO is sent to the HBA for each R-NPIV session created.
- Once sessions are cleared, NP_Ports will trigger a fabric login to the connected fabric.

Examples

```
-> clear fcoe sessions fips
-> clear fcoe sessions npiv-proxy
-> clear fcoe sessions r-npiv
-> clear fcoe sessions e-tunnel
-> clear fcoe sessions all
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe sessions	Displays the FCoE session information for the switch.

MIB Objects

```
alaFipsInfo
   alaFipsConfigSessClear
```

44 VXLAN Snooping Commands

The OmniSwitch Virtual eXtensible LAN (VXLAN) Snooping feature attempts to detect and identify VXLAN traffic by sampling packets to determine if they are VXLAN encapsulated packets. Once this type of traffic is identified, VXLAN Snooping collects and stores information about the flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and SNMP trap generation.

A VXLAN segment is a Layer 2 overlay network through which devices can communicate. Traffic from such devices is encapsulated into VXLAN frames and then tunneled through the VXLAN segment. Using this implementation of VXLAN Snooping, an administrator can obtain more detailed information about the traffic flow through the overlay network.

Note. Throughout this chapter, the terms “VXLAN Snooping” and “VM Snooping” are interchangeable.

MIB information for the VXLAN Snooping commands is as follows:

Filename: ALCATEL-IND1-VM-SNOOPING-MIB.mib
Module: alaVMSnoopingMIB

A summary of the available commands is listed here:

vm-snooping admin-state

Configures the global status of the VXLAN Snooping process for the switch.

vm-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables VXLAN Snooping for the switch.
disable	Disables VXLAN Snooping for the switch.

Defaults

By default, VXLAN Snooping is disabled for the switch.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Enable VXLAN Snooping first before attempting any other VXLAN Snooping command. When enabled, the switch allocates resources for this feature. When disabled, switch resources are released for other purposes.
- This command enables or disables this feature on all VXLAN Snooping ports.

Examples

```
-> vm-snooping admin-state enable
-> vm-snooping admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingAdminStatus
```

vm-snooping policy-mode

Configures the allocation of hardware resources for VXLAN Snooping. Use this command to change the policy lookup mode to basic or advanced and specify the number of policies reserved for VXLAN Snooping. In addition, an optional inner header parameter is available to specify if the header of the inner Ethernet frame is tagged or untagged.

vm-snooping policy-mode {basic | advance} [policy-resource {extended | default}] [inner-header {tagged | untagged | default}]

Syntax Definitions

basic	Reserves resources for VNI, VXLAN UDP port, inner source MAC address, and inner IPv4 source address policy conditions.
advance	For IPv4 packets, reserves resources for VNI, VXLAN UDP port, inner source MAC address, inner IPv4 source address, IP protocol, and Layer 4 source and destination port policy conditions. For IPv6 packets, reserves resources for VNI, VXLAN UDP port, inner source IPv6 address, Layer 4 source and destination port for policy conditions.
policy-resource extended	Doubles the amount of resources for VXLAN Snooping policies.
policy-resource default	Reserves the minimum amount of resources for VXLAN Snooping policies.
inner-header tagged	The header of the inner frame is tagged.
inner-header untagged	The header of the inner frame is untagged.
inner-header default	The header of the inner frame is either tagged or untagged (basic mode) or just tagged (advance mode).

Defaults

parameter	default
[basic | advance]	**basic**
[extended | default]	**default**

By default, the inner header option is set to the following values based on the current policy lookup mode:

- Basic mode—untagged and tagged header for the inner frame.
- Advanced mode—tagged header for the inner frame.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- To change the policy mode, globally disable VXLAN Snooping then make the changes and enable VXLAN Snooping again to apply the changes to the switch. This command is also allowed when the VXLAN Snooping feature is globally disabled.
- When the VXLAN Snooping policy mode is changed, all database and QoS entries are flushed.
- When the VXLAN policy mode is set to **basic**, any QoS policy rules with advanced mode policy conditions will not work. When the mode is set to **advance**, QoS policy rules with basic *and* advance policy conditions will work.
- When configuring the **inner-header** parameter for **basic** mode, specifying only tagged or only untagged may increase the number of policies allowed. In other words, specifying both tagged and untagged (the default) may reduce the number of policies allowed.
- When configuring the **inner-header** parameter for **advance** mode, specifying both tagged and untagged is not allowed. In this case, the **default** option sets the parameter to tagged.
- Other applications, such as QoS user policies, VLAN Stacking, Application Fingerprinting, DHCP Snooping, Open Flow, IP multicast, and FIP Snooping also use up system resources. Depending on which application comes first, other applications may not be able to get the required hardware resources.
- If the resources are increased by two times (**policy-resource extended**), then none of the above-mentioned applications can work simultaneously.
- Only one set of hardware resources are reserved for the VXLAN Snooping application when VXLAN Snooping is globally enabled.

Examples

```
-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic policy-resource extended inner-header tagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode advance policy-resource extended inner-header untagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic inner-header default
-> vm-snooping policy-mode advance inner-header default
-> vm-snooping admin-state enable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingPolicyMode
   alaVMSnoopingPolicyResource
   alaVMSnoopingVMTrafficTagged
```

vm-snooping trap

Enables or disables trap generation for the VXLAN Snooping feature.

vm-snooping trap {enable | disable}

Syntax Definitions

enable	Enables VXLAN Snooping trap generation.
disable	Disables VXLAN Snooping trap generation.

Defaults

By default, trap generation for this feature is disabled.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

A trap is generated when one of the following occurs:

- A new VXLAN database entry is learned or ages out.
- The usage of system resources allocated for VXLAN Snooping exceeds a configurable threshold value.

Examples

```
-> vm-snooping trap enable
-> vm-snooping trap disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping filtering-resource trap threshold	Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.
show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingTrapStatus
```

vm-snooping filtering-resource trap threshold

Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.

vm-snooping filtering-resource trap threshold {*percentage* **| default}**

Syntax Definitions

percentage	The percentage of system resources used by VXLAN Snooping.
default	Sets the trap threshold value back to 80 percent (the default).

Defaults

By default, the filtering resource threshold is set to 80 percent.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

A trap is generated when the system resources used by VXLAN Snooping reach the specified threshold value.

Examples

```
-> vm-snooping filtering-resource trap threshold 50
-> vm-snooping filtering-resource trap threshold default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.
show vm-snooping filtering-resource	Displays the system resources used by VXLAN Snooping on a per-port basis.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingFilteringResourceTrapThreshold
```

vm-snooping sampling-rate

Configures the packets-per-second (pps) sampling rate for the VXLAN Snooping feature.

vm-snooping sampling-rate *pps*

Syntax Definitions

pps	The number of packets-per-second to sample on all VXLAN Snooping ports. The valid range is 1–1000.

Defaults

By default, the sampling rate is set to 1000 pps.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

The sampling rate value specified with this command is applied to every VXLAN Snooping port on the switch.

Examples

```
-> vm-snooping sampling-rate 500
-> vm-snooping sampling-rate 1000
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingSamplingRate
```

vm-snooping aging-timer

Configures the aging time value for VXLAN packet flows learned in the VXLAN Snooping database on the local switch.

vm-snooping aging-timer *seconds*

Syntax Definitions

seconds	The number of seconds to wait before aging out a learned VM. The valid range is 60–86400 seconds.

Defaults

By default, the aging timer is set to 300 seconds.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Set this timer to zero to prevent the learned VMs from aging out.
- Note that an inactive VXLAN packet flow (no packets received for the flow) can take up to twice as long as the aging time value specified to be removed from the VXLAN Snooping database. For example, if an aging time of 300 seconds is specified, the database entry for the flow ages out any time between 300 and 600 seconds of inactivity.

Examples

```
-> vm-snooping aging-timer 100
-> vm-snooping aging-timer 300
-> vm-snooping aging-timer 0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingAgingTimer
```

vm-snooping vxlan udp-port

Configures additional UDP destination port numbers to look for when the switch inspects packets received on VXLAN Snooping ports. This value is used to identify encapsulated VXLAN packets.

vm-snooping vxlan udp-port {*udp_port_num***[-***udp_port_num2***}**

no vm-snooping vxlan udp-port {*udp_port_num***[-***udp_port_num2***}**

Syntax Definitions

*udp_port_num***[-***udp_port_num2*	The UDP destination port number. Use a hyphen to specify a range of port numbers. Do not specify a range that configures more than seven UDP ports.

Defaults

By default, the well-known UDP port number 4789 is used.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a UDP destination port number. Note that the default UDP port number of 4789 is not configurable, so it can not be removed with this command. Only port numbers that were added through this command can be removed.
- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Including the default UDP port number (4789), up to eight UDP ports are allowed. However, configuring multiple UDP ports may slow down the VXLAN Snooping process.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.

Examples

```
-> vm-snooping vxlan udp-port 8472
-> no vm-snooping vxlan udp-port 8472
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the destination UDP port value that is used to identify VXLAN traffic.

MIB Objects

```
alaVMSnoopingUDPPortTable
      alaVMSnoopingUDPPortIndex
       alaVMSnoopingUDPRowStatus
```

vm-snooping static-policy rule

Configures a static QoS policy rule. When configured, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.

vm-snooping static-policy rule *rule_name* **[list** *list_name***]**

no vm-snooping static-policy rule *rule_name* **[list** *list_name***]**

Syntax Definitions

rule_name	The name of the policy rule (alphanumeric string up to 32 characters).
list_name	The name of the policy list (alphanumeric string up to 32 characters).

Defaults

parameter	default
list_name	"Default"

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a static VXLAN Snooping policy rule. If the rule is associated with a user-configured policy list (not the default list), then the list name must be specified as well to remove the static policy rule. If the rule is associated with the default list, then specifying a list name is not required to remove the static policy rule.
- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.

Examples

```
-> vm-snooping static-policy rule r1
-> vm-snooping static-policy rule r2 list l2
-> no vm-snooping static-policy rule r1
-> no vm-snooping static-policy rule r2 list l2
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping static-policy Displays the static policy configuration.

MIB Objects

```
alaVMSnoopingStaticPolicyTable
   alaVMSnoopingStaticPolicyRuleName
   alaVMSnoopingStaticPolicyListName
   alaVMSnoopingStaticPolicyRowStatus
```

vm-snooping logging-threshold

Configures the threshold value that determines how many entries for VXLAN packet flows and statistics are logged into a .csv file on the local switch.

vm-snooping logging-threshold number-of-flows {*flow_num* **| default}**

Syntax Definitions

flow_num	The number of VXLAN packet flows to log. The range is 1000–6000.
default	Sets the logging threshold value back to 5000 (the default).

Defaults

By default, the logging threshold value is set to 5000 packet flows.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Set the logging threshold value to zero to turn off the logging function.
- When the logging function is on, setting the VXLAN Snooping aging timer to 300 seconds is recommended. If the aging timer is set to zero, no logging occurs regardless of this threshold setting.
- The packet flows and hardware statistics are logged to the **vm_snoop_db_flow_rec.csv** file and the **vm_snoop_hw_stats_rec.csv** file in the **/flash/switch/bridge/vm_snoop/** directory on the local switch to maintain a packet flow history.
- When the number of records logged to the .csv files exceeds the logging threshold value, the corresponding files are renamed to **/flash/switch/bridge/vm_snoop/vm_snoop_db_flow_old_rec.csv** and to **/flash/switch/bridge/vm_snoop_hw_stats_old_rec.csv**.
- These files are accessed and used by Alcatel-Lucent Enterprise network management tools to provide management and visibility of the overlay network traffic.

Examples

```
-> vm-snooping logging-threshold number-of-flows 1000
-> vm-snooping logging-threshold number-of-flows 0
-> vm-snooping logging-threshold number-of-flows default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
   alaVMSnoopingLoggingThresholdFlows
```

vm-snooping port

Configures a switch port or link aggregate as a VXLAN Snooping interface. Once the interface is configured and enabled and VXLAN Snooping is enabled for the switch, IP packets received on the interface are sampled to determine if they contain the designated UDP destination port.

vm-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} [admin-state {enable | disable}]**

no vm-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the VXLAN Snooping administrative status on the port or link aggregate ID.
disable	Disables the VXLAN Snooping administrative status on the port or link aggregate ID

Defaults

By default, VXLAN Snooping is disabled on all switch ports and link aggregates.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to revert the VXLAN Snooping interface back to a regular switch port or link aggregate. This will clear the VXLAN Snooping configuration from the interface.
- Disabling the administrative status of a VXLAN Snooping interface does not remove the VXLAN Snooping configuration from the interface.
- Make sure the VXLAN Snooping feature is globally enabled for the switch to ensure that VXLAN Snooping ports will process VXLAN packets.
- VXLAN Snooping uses the sFlow mechanism to sample packets.

Examples

```
-> vm-snooping port 1/1/1
-> vm-snooping port 1/1/5-10
-> no vm-snooping port 1/1/1
-> no vm-snooping port 1/1/5-10
-> vm-snooping port 1/1/1 admin-state enable
-> vm-snooping port 1/1/5-10 admin-state enable
```

```
-> vm-snooping port 1/1/1 admin-state disable
-> vm-snooping port 1/1/5-10 admin-state disable

-> vm-snooping linkagg 1
-> vm-snooping linkagg 5-10
-> no vm-snooping linkagg 1
-> no vm-snooping linkagg 5-10
-> vm-snooping linkagg 1 admin-state enable
-> vm-snooping linkagg 5-10 admin-state enable
-> vm-snooping linkagg 1 admin-state disable
-> vm-snooping linkagg 5-10 admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping admin-state	Configures the global VXLAN Snooping status for the switch.
show vm-snooping port	Displays the VXLAN Snooping port configuration.

MIB Objects

```
alaVMSnoopingPortTable
   alaVMSnoopingPortIndex
   alaVMSnoopingPortAdminStatus
   alaVMSnoopingPortIsVNP
   alaVMSnoopingPortRowStatus
```

show vm-snooping config

Displays the global VXLAN Snooping status and configuration information for the switch.

show vm-snooping config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show vm-snooping config
VM-Snooping Status                          : Enable,
Trap                                        : Disable,
Trap-Threshold                              : 80,
Policy-Mode                                 : Basic
Policy-Resource                             : Default
VM Inner Header                             : Tagged and Untagged,
Aging-Timer                                 : 300 seconds,
UDP-Port(s)                                 : 4789,
Sampling-Rate                               : 1000
Logging-Threshold                           : 5000
Qos Allocation Status                       : Success
```

output definitions

VM-Snooping Status	The global administrative status of VXLAN Snooping for the switch (**Enabled** or **Disabled**). Configured through the **vm-snooping admin-state** command.
Trap	The status of SNMP trap generation for the switch (**Enabled** or **Disabled**). Configured through the **vm-snooping trap** command.
Trap-Threshold	The percentage of switch resources used that will trigger the switch to generate a trap. Configured through the **vm-snooping filtering-resource trap threshold** command.
Policy-Mode	The policy mode setting that designates switch resources for VXLAN Snooping. Configured through the **vm-snooping policy-mode** command.

output definitions (continued)

Policy Resource	Indicates the number of VXLAN Snooping policies allowed (**Default** or **Extended**). Configured through the **vm-snooping policy-mode** command.
VM Inner Header	Whether to check tagged and/or untagged VM traffic. Configured through the **vm-snooping policy-mode** command.
Aging-Timer	The number of seconds before a learned VM is aged out. Configured through the **vm-snooping aging-timer** command.
UDP-Port(s)	The UDP port numbers to snoop for VXLAN packets. Configured through the **vm-snooping vxlan udp-port** command.
Sampling-Rate	The number of packets-per-second (pps) to sample. Configured through the **vm-snooping sampling-rate** command.
Logging-Threshold	The number of VXLAN packet flow entries and statistics logged to a .csv file on the local switch.
Qos Allocation Status	The status of QoS resource allocation (**Success**, **inProgress**, or **Failed**). This field is blank when VXLAN Snooping is disabled.

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping port	Displays the VXLAN Snooping port configuration.

show vm-snooping port

Displays the VXLAN Snooping port configuration for the switch.

show vm-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The display output also indicates whether or not the VXLAN Snooping port is a virtual machine network profile (vNP) port.

Examples

```
-> show vm-snooping port
Port    VM-Snooping   vNP
-------+------------+--------
1/2/1   Enable        Yes
1/2/2   Enable        No
1/2/2   Enable        Yes
1/2/2   Enable        Yes
0/12    Disable       No
```

output definitions

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates that the interface is a link aggregate.
VM-Snooping	The administrative status (**Enable** or **Disable**) of VXLAN Snooping on the port or link aggregate. Configured through the **vm-snooping port** command.
vNP	Whether the port is also a vNP port (**Yes** or **No**).

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

   alaVMSnoopingPortIndex
   alaVMSnoopingPortAdminStatus
   alaVMSnoopingPortIsVNP
   alaVMSnoopingPortRowStatus
```

show vm-snooping database

Displays VXLAN Snooping database entries. When a VXLAN packet is detected and the packet contains the designated UDP destination port, VXLAN Snooping creates an entry in the local switch database to identify and track the VXLAN packet flow.

show vm-snooping database [vxlan udp-port *udp_port_num* **| vtep-ip** *ip_address* **| vni** *vxlan_id* **| vm-src-mac** *mac_address* **| vm-ip** *ip_address***] [detail] [port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] [detail]**

Syntax Definitions

udp_port_num	The UDP destination port number used to identify VXLAN traffic.
vtep-ip *ip_address*	The IP address of the VXLAN Tunnel End Point (VTEP). This is the Loopback0 interface address on the OmniSwitch.
vxlan_id	The VXLAN Network Identifier (VNI) for the VXLAN segment on which the VM was learned.
mac_address	The source MAC address of a VM.
vm-ip *ip_address*	The source IP address of a VM.
detail	Displays additional information about the classified traffic flow.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, all database entries are displayed.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Each database entry is subject to a VXLAN Snooping aging period. If the database fills up, older entries are aged out before the limit (fast aging).
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

Examples

```
-> show vm-snooping database
Total number of VM Flows: 15

```

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates a link aggregate.
VTEP SRC IP	The source IP network address for the VTEP.
VTEP DST IP	The destination IP network address for the VTEP.
VTEP VLAN	The VLAN ID associated with the VTEP.
VXLAN VNI	The VNI for the VXLAN segment on which the VM was learned.
VXLAN Port	The UDP port for the VXLAN segment.
VM SRC MAC	The source MAC address for the VM.
VM DEST MAC	The destination MAC address for the VM.
VM VLAN	The VLAN on which the VM is learned and forwarded.

VM SRC IP/PORT	The source IP address of the VM.
VM DEST IP/PORT	The destination IP address of the VM.
VM IP PROTO	The IP protocol version for the VM.
POLICY RULE	The name of the QoS policy rule applied to the VM flow.
POLICY LIST	The name of the QoS policy list applied to the VM flow.
SAMPLED PKTS	The number of packets sampled for this flow.
LEARNED TIME	The date and time the flow entry was learned.

Release History

Release 7.3.4; command was introduced.

Related Commands

clear vm-snooping database	Clears the local database entries for each virtual machine (VM) flow.
show vm-snooping config	Displays the VXLAN Snooping configuration for the switch.

clear vm-snooping database

Clears the local database entries for each virtual machine (VM) flow.

clear vm-snooping database [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, all database entries are cleared for all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **port** and **linkagg** parameters to clear database entries for a specific port or link aggregate.

Examples

```
-> clear vm-snooping database
-> clear vm-snooping database port 3/1/1
-> clear vm-snooping database linkagg 10
```

Release History

Release 7.3.4; command introduced.

Related Commands

show vm-snooping database	Displays the contents of the VXLAN Snooping database.

MIB Objects

```

```

show vm-snooping virtual-machines

Displays the port, source MAC address, and VLAN associated with Virtual Machines (VMs) discovered through the VXLAN Snooping process.

show vm-snooping virtual-machines

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

The output display of this command shows the port, source MAC address, and VLAN associated with each VM learned through the VXLAN Snooping process.

Examples

```
-> show vm-snooping virtual-machines
Port       SRC MAC       VLAN
------+-----------------+-----+
1/1/2  00:00:00:88:00:01  -
1/1/2  00:00:00:88:00:02  -
1/1/2  00:00:00:88:00:03  -
1/1/2  00:00:00:88:00:04  -
1/1/2  00:00:00:88:00:05  -
```

output definitions

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates a link aggregate.
SRC MAC	The source MAC address of the VM.
VLAN	The VLAN on which the VM is learned and forwarded.

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping configuration for the switch.
show vm-snooping database	Displays the contents of the local VXLAN Snooping database.

MIB Objects

   alaVMSnoopingLearntVMSrcMac,
   alaVMSnoopingLearntVMVlanId
```

show vm-snooping filtering-resource

Displays the amount of switch resources available for and used by QoS policies that contain VXLAN conditions.

show vm-snooping filtering-resource

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- VXLAN Snooping uses the amount of resources used to calculate the percentage of switch resources used and then determine if that percentage exceeds the value set for the filtering trap threshold. An SNMP trap is generated when the percentage used meets or exceeds the trap threshold value.
- The output display of this command shows the percentage of switch resources used by VXLAN policies on a per-slot basis.

Examples

```
-> show vm-snooping filtering-resource
Total Filtering Resources     :256,
Chassis/Slot    Filtering Resources Used
--------------+---------------------------
  1/SLOT-1       0
  2/SLOT-1       0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping filtering-resource trap threshold	Configures the trap threshold value for system resources used by VXLAN Snooping.
show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingFilterResourceTable
   alaVMSnoopingFilterResourceChassisId
   alaVMSnoopingFilterResourceSlotNum
   alaVMSnoopingFilterResourceMax
   alaVMSnoopingFilterResourceUsed
```

show vm-snooping statistics

Displays statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

show vm-snooping statistics [hardware | sampling] [port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]]**

Syntax Definitions

hardware	Displays the VXLAN policy rule and list and the number of packets and bytes on which the policy rule was applied.
sampling	Displays the number of VXLAN packets that were sampled for a specific flow.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are displayed for all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

Examples

```
-> show vm-snooping statistics
Total number of Hardware Statistics: 0

Policy Rule                 Policy List        Number of pkts       Number of Bytes
---------------------------+------------------+--------------------+--------------+
Total number of Sampling Statistics: 1

   alaVMSnoopingHardwareStatsPolicylist
   alaVMSnoopingHardwareStatsPolicyrule
   alaVMSnoopingHardwareStatsNumOfPackets
   alaVMSnoopingHardwareStatsNumOfBytes
```

show vm-snooping static-policy

Displays the static QoS policy rule configuration for VXLAN Snooping.

show vm-snooping static-policy

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When a static policy rule is configured for VXLAN Snooping, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.
- If the static policy rule was created with a user-configured policy list (not the default list), then the list name appears in the “Policy List” field. However, if the static policy rule was created without specifying a policy list name, then the “Default” list name appears in the “Policy List” field.

Examples

```
-> show vm-snooping static-policy
Total number of Static-Policy: 5

Policy Rule                      Policy List
---------------------------------+---------------------------------
r0                                Default
r1                                Default
r2                                L1
r2                                l3
r2                                Default
```

output definitions

Policy Rule	The name of the QoS policy rule that was specified when the static policy rule was created.
Policy List	The name of the QoS policy list associated with the static policy rule.

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping static-policy rule Configures a VXLAN Snooping static policy rule.

clear vm-snooping statistics

Clears the collected statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

clear vm-snooping statistics [sampling [port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]]] [hardware]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared on all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **port** and **linkagg** parameters to clear statistics for a specific port or link aggregate.

Examples

```
-> clear vm-snooping statistics
-> clear vm-snooping statistics sampling port 3/1/1
-> clear vm-snooping statistics sampling linkagg 10
-> clear vm-snooping statistics hardware
```

Release History

Release 7.3.4; command introduced.

Related Commands

show vm-snooping statistics	Displays VXLAN Snooping statistics.

   alaVMSnoopingClearAllData
alaVMSnoopingSamplingStatsTable
   alaVMSnoopingSamplingStatsClear
```

45 Port Mapping Commands

Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

Filename: ALCATEL-IND1-PORT-MAPPING.mib
Module: alcatelIND1PortMappingMIB

A summary of the available commands is listed here:

port-mapping user-port network-port
port-mapping (configures port mapping status and direction)
port-mapping unidirectional bidirectional
port-mapping unknown-unicast-flooding
port-mapping dynamic-proxy-arp
show port-mapping status
show port-mapping

port-mapping user-port network-port

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

port-mapping *session_id* **[user-port {slot** *chassis/slot* **|** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***}] [network-port {slot** *chassis/slot* **|** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***}]**

no port-mapping *session_id* **[user-port {slot** *chassis/slot* **|** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***}] [network-port {slot** *chassis/slot* **|** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***}]**

Syntax Definitions

session_id	The port mapping session ID.
user-port	Specifies a user port of the mapping session.
network-port	Specifies a network port of the mapping session.
chassis	The chassis identifier.
slot	The slot number to be assigned to the mapping session.
*slot/port***[**-*port2***]**	The slot and port number to assign to the mapping session. Use a hyphen to specify a range of ports (1/5-10).
agg_id	The link aggregate ID number to assign to the mapping session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.

Examples

```
-> port-mapping 3 user-port 2/3 network-port 6/4
-> port-mapping 4 user-port 2/5-8
-> port-mapping 5 user-port 2/3 network-port slot 3
-> no port-mapping 5 user-port 2/3
-> no port-mapping 6 network-port linkagg 7
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping	Enables, disables, or deletes a port mapping session.
port-mapping unidirectional bidirectional	Configures the direction of a port mapping session.
port-mapping unknown-unicast-flooding	Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   pmapSessionNumber
portMappingTable
   pmapPortIfindex
   pmapPortType
```

port-mapping

Enables, disables, or deletes a port mapping session.

port-mapping *session_id* **{enable | disable}**

no port-mapping *session_id*

Syntax Definitions

session_id	The port mapping session ID.
enable	Enables a port mapping session.
disable	Disables a port mapping session.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To be enabled, a session should have a minimum of two ports.

Examples

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.
port-mapping unidirectional bidirectional	Configures the direction of a port mapping session.
show port-mapping status	Displays the status of one or more port mapping sessions.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   pmapSessionNumber
   pmapSessionStatus
```

port-mapping unidirectional bidirectional

Configures the direction of a port mapping session.

port-mapping *session_id* **[unidirectional | bidirectional]**

Syntax Definitions

session_id	The port mapping session ID.
unidirectional	Specifies unidirectional port mapping.
bidirectional	Specifies bidirectional port mapping.

Defaults

parameter	default
enable | disable	**enable**
unidirectional | bidirectional	**bidirectional**

Platform Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.
- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

Examples

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports or both.
port-mapping	Enables, disables, or deletes a port mapping session.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   PmapSessionNumber
   PmapSessionDirection
```

port-mapping unknown-unicast-flooding

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

port-mapping *session_id* **unknown-unicast-flooding {enable | disable}**

Syntax Definitions

session_id	The port mapping session ID.
enable	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
disable	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

Defaults

parameter	default
enable | disable	**enable**

Platform Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

Examples

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports or both.
port-mapping	Enables, disables, or deletes a port mapping session.
show port-mapping	Displays the configuration of one or more port mapping sessions.
show port-mapping status	Displays the status of one or more port mapping sessions.

MIB Objects

```
portMappingSessionTable
   pmapSessionUnknownUnicastFloodStatus
```

port-mapping dynamic-proxy-arp

Enables or disables the dynamic proxy ARP functionality for the port mapping session.

port-mapping *session_id* **dynamic-proxy-arp {enable | disable}**

Syntax Definitions

session_id	The port mapping session for which the dynamic proxy ARP status is enabled or disabled.
enable	Enables the dynamic proxy ARP status.
disable	Disables the dynamic proxy ARP status.

Defaults

parameter	default
enable | disable	**disable**

Platform Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Clients must be connected to the user-ports and the head end routers connected to the network-ports of the port mapping session for dynamic proxy ARP to function properly.
- DHCP snooping must be enabled for dynamic proxy ARP to function.
- Using dynamic proxy ARP in conjunction with DHCP snooping allows for the configuration of the MAC Forced Forwarding feature.

Examples

```
-> port-mapping 1 dynamic-proxy-arp enable
-> port-mapping 1 dynamic-proxy-arp disable
```

Release History

Release 8.6R1; command was introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports or both.
port-mapping	Enables, disables, or deletes a port mapping session.
show port-mapping	Displays the configuration of one or more port mapping session.
show port-mapping status	Displays the status of one or more port mapping session.

MIB Objects

```
portMappingSessionTable
   pmapSessionDynProxyARP
```

show port-mapping status

Displays the status of one or more port mapping sessions.

show port-mapping [*session_id***] status**

Syntax definitions

session_id	The port mapping session ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions are displayed.

Examples

```
-> show port-mapping status

SessionID       Direction       Status          Unknown Unicast    DPA Status
------------+-----------------+--------------+------------------+--------------
     1           bi            disable         flood              enable
     1           bi            enable          drop               disable
     2           bi            disable         flood              disable
```

output definitions

SessionID	Displays the port mapping session ID.
Direction	Displays the direction of a port mapping session.
Status	Displays status of a port mapping session.
Unknown Unicast	Whether unknown unicast traffic is dropped or flooded from all the switch ports to the user ports related to the port mapping session
DPA Status	Displays the status of Dynamic Proxy ARP for the port mapping session. *This functionality is supported only on the OmniSwitch 6465 and OmniSwitch 6865*.

Release History

Release 7.1.1; command introduced.
Release 8.6R1; “DPA Status” field added.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.
port-mapping	Enables, disables, or deletes a port mapping session.

MIB Objects

```
PortMappingSessionTable
   PmapSessionNumber
   PmapSessionDirection
   pmapSessionStatus
   pmapSessionUnknownUnicastFloodStatus
   pmapSessionDynProxyARP
```

show port-mapping

Displays the configuration of one or more port mapping sessions.

show port-mapping [*session_id***]**

Syntax Definitions

session_id	The port mapping session ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you do not specify the port mapping session ID, then the user port and network port information are displayed for all the port mapping sessions active on the switch.

Examples

```
-> show port-mapping 3

SessionID       USR-PORT        NETWORK-PORT
----------+---------------+------------------
     1           1/2               1/3
     1           1/6
     1           1/7
```

output definitions

SessionID	Displays the port mapping session ID.
USR-PORT	Displays the set of user ports of a port mapping session.
NETWORK-PORT	Displays the set of network ports of a port mapping session.

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.
port-mapping	Enables, disables, or deletes a port mapping session.

MIB Objects

```
PortMappingSessionTable
   PmapSessionNumber
PortMappingTable
   pmapPortIfindex
   pmapPortType
```

46 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

Filename: ALCATEL-IND1-LPS-MIB.mib
Module: alcatelIND1LearnedPortSecurityMIB

A summary of the available commands is listed here:

port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

port-security {port *chassis/slot/port***[-***port2***] | chassis} [admin-state {enable | disable | locked}]**

no port-security port *chassis/slot/port***[-***port2***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	Specifies all LPS ports.
enable	Administratively enables LPS on the specified port(s).
disable	Administratively disables LPS on the specified port(s). All bridged and filtered MAC addresses are cleared, but the static MAC address and LPS configuration for the port is retained. Learning is unrestricted.
locked	Administratively disables all learning on the port. Existing MAC addresses are retained but no additional learning of addresses, except for static MAC addresses, is allowed.

Defaults

By default, LPS functionality is disabled on all ports.

The following default value applies if the **admin-state** parameter is *not* specified with this command:

parameter	default
admin-state	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the LPS configuration from the specified port *and* clear all MAC addresses learned on the port. Note that the **chassis** parameter is not supported when using the **no** form of this command.
- The **admin-state disable** option disables LPS on the port but does not clear the LPS configuration.
- Use the **chassis** parameter to administratively disable or enable all active LPS ports with one command. This option does not apply to ports on which LPS was not previously enabled.
- LPS is supported on Ethernet fixed and 802.1Q-tagged ports. However, LPS is *not* supported on ports that are configured as service access ports.

- LPS is not supported on link aggregates, 802.1Q tagged (trunked) link aggregates, or link aggregate member ports.
- Note that when LPS is enabled on an active port, all MAC addresses previously learned on that port are cleared from the source learning MAC address table.
- LPS is also supported on ports that have Universal Network Profile (UNP) functionality enabled, with the following conditions:
  - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - UNP authentication and classification is applied first, then LPS rules.
  - If UNP classifies a MAC address as forwarding but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the **show unp user status** command will display “LPS-B” as the profile classification source for that MAC address.
- LPS allows for the configuration of the following source MAC address learning restrictions:
  - A source learning time limit window to specify the length of time learning is allowed on a port.
  - A maximum number of bridged and filtered MAC addresses allowed on a specific port
  - A list of MAC addresses (individual or range of addresses) allowed on a port.
  - How a port handles traffic that is unauthorized.

Examples

```
-> port-security port 4/8 admin-state enable
-> port-security port 2/1-10 admin-state enable
-> port-security chassis admin-state disable
-> no port-security port 1/1-12
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security mac-range	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security learning-window	Configures the amount of time, in minutes, to allow source learning on all LPS ports.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

MIB Objects

```
learnedPortSecurityTable
   lpsAdminStatus
```

port-security learning-window

Configures the amount of time, in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

port-security learning-window *minutes* **[convert-to-static {enable | disable}] [no-aging {enable | disable}] [mac-move {enable | disable}] [learn-as-static {enable | disable}] [boot-up {enable | disable}]**

no port-security learning-window

Syntax Definitions

minutes	The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window. The valid range is 0–2880. When this value is set to zero, the learning window time is set to infinity (no source learning time restriction on LPS ports).
convert-to-static enable	Enables the **convert-to-static** option for the learning window. Dynamically learned bridged (not filtered) MAC addresses are automatically converted to static addresses when the learning window closes. This option is automatically disabled when the LPS learning window is set to infinity (zero).
convert-to-static disable	Disables the **convert-to-static** option for the learning window. Dynamically learned bridged MAC addresses are not converted to static addresses and will start to age out when the learning window closes.
no-aging enable	Enables the **no-aging** option for the learning window. Dynamically learned bridged MAC addresses are learned as *pseudo-static* MACs, which do not age out but are not saved in the switch configuration. MAC movement is not allowed for pseudo-static MAC addresses unless the **mac-move** option is also enabled.
no-aging disable	Disables the **no-aging** option for the learning window. MAC addresses are learned as dynamic addresses that will age out.
mac-move enable	Enables the **mac-move** option. Allows a pseudo-static MAC address to move to a different port in the same VLAN without getting dropped. The **mac-move** option is used with the **no-aging** option to allow MAC movement for pseudo-static MAC addresses.
mac-move disable	Disables the **mac-move** option. If the **no-aging** option is enabled, MAC movement for pseudo-static MAC addresses is not allowed. Frames from a duplicate pseudo-static MAC address are dropped.
learn-as-static enable	Enables the **learn-as-static** option for the learning window. Dynamically learned bridged MAC addresses are converted to permanent static MAC addresses during the learning window time (even if the **convert-to-static** option is disabled). MAC movement is allowed for the permanent static MAC addresses. This option and the **no-aging** option are mutually exclusive.

learn-as-static disable	Disables the **learn-as-static** option for the learning window. Dynamically learned bridged MAC addresses are not converted to permanent static MAC addresses during the learning window time.
boot-up enable	Enables the automatic start of the LPS learning window timer when the switch restarts.
boot-up disable	Disables the automatic start of the LPS learning window timer when the switch restarts.

Defaults

By default, the LPS source learning time limit is not set for the switch; the learning window defaults to infinity (source learning is not limited to a specific time frame).

parameter	default
convert-to-static	**disable**
no-aging	**disable**
mac-move	**disable**
learn-as-static	**disable**
boot-up	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to clear the learning window time (no learning window time limit is applied to the port).
- The LPS source learning time window is started and/or reset each time the **port-security learning-window** command is issued or when the **port-security learning-window boot-up** option is enabled and the switch restarts.
- Setting the LPS learning window time to 0 (zero) configures an infinite source learning time period for all LPS ports. The learning of MAC addresses on LPS ports never times out.
- When the LPS learning window time is set to zero, all options except the **convert-to-static** option are still valid. For example, the **no-aging** option setting still applies.
- After the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.
- Enabling the **no-aging** option triggers the following LPS learning window behavior:
  - All new bridged MAC addresses are learned as pseudo-static MAC addresses during the learning window time period. Pseudo-static addresses do not age out but are not saved to the switch configuration.
  - MAC movement is not allowed for pseudo-static MAC addresses unless the **mac-move** option is also enabled. The **mac-move** status (enabled or disabled) applies only to the **no-aging** option.

  - Enabling the **mac-move** option is not allowed unless the **no-aging** option is also enabled. When the **mac-move** option is enabled, disabling the **no-aging** option is *not* allowed.
  - When the learning window starts, any MAC addresses that were learned prior to the learning window time period are retained as dynamic addresses; they are not converted to pseudo-static MAC addresses.

- The **learn-as-static** and **no-aging** options are mutually exclusive; if both are enabled, then the **learn-as-static** option takes precedence.
- If the **convert-to-static** option is enabled, then all dynamic bridged and pseudo-static MAC addresses are converted to static MAC addresses when the learning window closes. Static MAC addresses do not age out and are saved to the switch configuration.

Note. When UNP is enabled on any one LPS port, the **convert-to-static**, **no-aging**, and **boot-up** parameter options are not supported on *all* LPS-enabled ports. This is because the learning window configuration is global and applies to all LPS ports.

Examples

```
-> port-security learning-window 25
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 60 no-aging enable mac-move enable
-> port-security learning-window 0 learn-as-static enable
-> port-security learning-window 500 boot-up disable
-> port-security learning-window 2 convert-to-static enable no-aging enable
-> port-security learning-window 2 no-aging enable convert-to-static enable boot-up
enable learn-as-static enable mac-move enable
-> no port-security learning-window
```

Release History

Release 7.1.1; command introduced.
Release 7.2.1.R02; **no-aging** and **boot-up** parameters added.
Release 8.2.1; **learn-as-static** and **mac-move** parameters added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security learning-window	Displays the source learning window configuration.

MIB Objects

```
learnedPortSecurityGlobalGroup
   lpsLearningWindowTime
   lpsLearningWindowTimeWithStaticConversion
   lpsLearningWindowNoAging
   lpsLearningWindowBootupStatus
   lpsLearningWindowLearnAsStatic,
   lpsLearningWindowPseudoMacMove
```

port-security convert-to-static

Converts all MAC addresses dynamically learned on the LPS port(s) to static MAC addresses. This command does not apply to MAC addresses that are filtered.

port-security {port *chassis/slot/port***[-***port2***]** | **chassis} convert-to-static**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	Specifies all the LPS ports on the chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Converting dynamic MAC addresses to static MAC addresses is not supported on Universal Network Profile (UNP) ports.
- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.
- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

Note. The **port-security convert-to-static** command is not supported on UNP ports.

Examples

```
-> port-security port 4/8 convert-to-static
-> port-security chassis convert-to-static
```

Release History

Release 7.2.1.R02; command was introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

MIB Objects

```
learnedPortSecurityGlobalGroup
   lpsConvertToStatic
```

port-security mac

Configures a static MAC address on the specified LPS port. This command also enables LPS on the specified port, if LPS is not already active on the port.

port-security port *chassis/slot/port***[**-*port2***] mac** *mac_address* **[vlan** *vlan_id***]**

no port-security port *chassis/slot/port***[**-*port2***] mac [all |** *mac_address***] [vlan** *vlan_id***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
mac_address	MAC address to configure as a static MAC address on the specified LPS port (for example, 00:20:95:00:10:2A).
vlan	The VLAN ID to associate with the specified LPS port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a specific static MAC address or all of the static MAC addresses configured on the specified LPS port. Note that even when all statically configured MAC addresses are removed, LPS remains active on the port.
- A VLAN-port association (VPS) must exist between the specified VLAN and the LPS port. If no VLAN ID is specified with this command, the default VLAN for the LPS port is used.
- The following conditions will display an error or warning message:
  - A VLAN ID is specified that is not associated with the LPS port:
  - An attempt is made to configure a MAC address more than once on the same LPS port with the same VLAN association.
  - A duplicate MAC address is configured on different LPS ports.
- Configuring a multicast MAC address, an all zero MAC address, or a broadcast MAC address is not allowed with this command.
- Use this command instead of the **mac-learning static mac-address** command to create a static MAC address on an LPS port.

Examples

```
-> port-security port 1/1/20 mac 00:20:95:00:fa:5c
-> port-security port 1/1/1-15 mac 00:da:95:00:00:10
-> no port-security port 1/1/20 mac 00:20:95:00:fa:5c
```

```
-> no port-security port 1/1/1-15 mac 00:da:95:00:00:10

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
ERROR: Vlan 200 is not valid on this port

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200

```

Release History

Release 8.4.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityAgL2MacAddressTable
   lpsAgL2MacAddress
   lpsAgL2VlanId
   lpsAgL2MacAddressRowStatus
```

port-security maximum

Specifies the maximum number of bridged MAC addresses that an LPS port(s) is allowed to learn.

port-security port *chassis/slot/port***[**-*port2***]** **maximum** *number*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
number	The number of source MAC addresses that are allowed on this port. The valid range is 1–1000.

Defaults

By default, the number of MAC addresses allowed is set to 1.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

Examples

```
-> port-security port 2/14 maximum 25
-> port-security port 4/10-15 maximum 100
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security learn-trap-threshold	Configures the number of bridged MAC addresses to learn before sending a SNMP trap.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

MIB Objects

```
learnedPortSecurityTable
   lpsMaxMacNum
```

port-security learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

port-security port *chassis/slot/port***[**-*port2***] learn-trap-threshold** *number*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
number	The number of bridged MAC addresses to learn before sending a trap. The valid range is 0–1000.

Defaults

By default, the number of bridged MAC addresses to learn before sending a trap is set to the same value as the maximum number of bridged MAC addresses allowed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.
- If this threshold value is set to zero, a trap is sent for every MAC address learned on the LPS port.

Examples

```
-> port-security port 1/10 learn-trap-threshold 6
-> port-security port 1/10-13 learn-trap-threshold 18
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security maximum	Configures the maximum number of source MAC addresses that an LPS port is allowed to learn.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsLearnTrapThreshold
```

port-security port max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

port-security port *chassis/slot/port***[**-*port2***]** **max-filtering** *number*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
number	The maximum number of filtered MAC addresses that are allowed on this port. The valid range is 0–100.

Defaults

By default, the maximum number of MAC addresses that can be filtered on an LPS port is 5.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of filtered MAC addresses learned on the port reaches the maximum, the violation mode (restrict, discard, or shutdown) configured for the port is applied.
- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Even after the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> port-security port 1/10 max-filtering 6
-> port-security port 1/10-13 max-filtering 18
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsMaxFilteredMacNum
```

port-security mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

port-security port *chassis/slot/port***[**-*port2***] mac-range [low** *mac_address* | **high** *mac_address***]**

no port-security port *chassis/slot/port***[**-*port2***] mac-range [low** *mac_address***]**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis, slot and port number (1/1/1). Use a hyphen to specify a range of ports (1/1/1-8). On the OmniSwitch 6900 only, configuring multiple MAC address ranges for the same port is supported.
low *mac_address*	MAC address that defines the low end of a range of MACs (for example, 00:20:95:00:10:2A).
high *mac_address*	MAC address that defines the high end of a range of MACs (for example, 00:20:95:00:10:2F).

Defaults

parameter	default
high *mac_address*	ff:ff:ff:ff:ff:ff
low *mac_address*	00:00:00:00:00:00

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, each LPS port is set to a range of 00:00:00:00:00:00–ff:ff:ff:ff:ff:ff, which includes all MAC addresses.
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match the configured authorized addresses are not allowed (filtered) on the port, regardless of the LPS learning window time limit or the maximum number of bridged addresses allowed. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Configuring more than one MAC address range per port is supported. When attempting to configure multiple MAC address ranges on the same port, consider the following:
  - A maximum of eight multiple MAC address ranges can be configured per port.
  - On a newly configured LPS port, the first user configured MAC range would overwrite the default MAC range.
  - A MAC range cannot overlap with another MAC range configured for the port.
  - Modifying a MAC range is allowed only if the lower MAC address is not changed and the defined new range does not overlap with the existing range. To modify the lower MAC address, the existing

range must be deleted before adding the new range.

- When modifying a MAC range, the new range must match or accommodate any existing static MACs on the port, else an error will be thrown indicating some static MACs exist on the port that fall outside the new/resultant MAC range being configured. (Note: It is required to flush such static MACs on the port, if user needs to configure the new MAC range, which was not accommodating the static MACs).
- When the MAC range size is increased, all the dynamic filtering MACs on the port would be flushed.
- When the MAC range size is reduced, any existing dynamic forwarding MACs learned on the port would be flushed if they fall outside any MAC ranges configured on the port at that point of time.
- All the dynamic filtering MACs learned on the port would be flushed.

- Use the **no** form of this command to delete the configured MAC range.
- The default MAC range is automatically applied when all the configured MAC ranges for the port are deleted.
- The default MAC range on the port cannot be deleted.

Examples

```
-> port-security port 1/5/11-15 mac-range low 00:da:95:00:00:10 high
00:da:95:00:00:1f
-> port-security port 1/1/5 mac-range low 00:01:01:22:22:56 high 00:01:01:22:22:67
-> port-security port 1/1/5 mac-range low 00:01:01:22:33:56 high 00:01:01:22:33:67
-> port-security port 1/1/5 mac-range low 00:01:01:22:44:56 high 00:01:01:22:44:67
-> port-security port 1/1/5 mac-range low 00:01:22:22:11:56 high 00:01:22:22:11:67
-> port-security port 1/1/5 mac-range low 00:01:22:22:22:56 high 00:01:22:22:22:67
-> port-security port 1/1/5 mac-range low 00:01:22:22:33:56 high 00:01:22:22:33:67
-> port-security port 1/1/5 mac-range low 00:01:22:22:44:56 high 00:01:22:22:44:67
-> port-security port 1/1/5 mac-range low 00:01:22:22:55:56 high 00:01:22:22:55:67
-> no port-security port 1/1/5 mac-range low 00:01:01:22:33:56
```

Release History

Release 7.1.1; command introduced.
Release 8.5R3; ability to configure multiple MAC ranges per port added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays the LPS configuration and table entries.
show port-security mac-range	Displays the MAC ranges configured on the LPS ports.

MIB Objects

   lpsHiMacRange
   lpsRowStatus
learnedPortSecurityL2MacRangeTable
   lpsL2LowMacAddress
   lpsL2HighMacAddress
```

port-security port violation

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

port-security port *chassis/slot/port***[**-*port2***] violation {shutdown | restrict | discard}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
shutdown	The port is administratively disabled when the port receives unauthorized traffic. No further traffic is allowed on the port.
restrict	Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port. The port remains administratively enabled.
discard	Disables learning on the port when unauthorized traffic is received or the configured maximum number of MAC addresses is reached. The port remains administratively enabled.

Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table, but they are recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses attempting unauthorized access to the LPS port.

Examples

```
-> port-security port 2/14 violation restrict
-> port-security port 4/10-15 violation shutdown
-> port-security port 1/37 violation discard
```

Release History

Release 7.1.1; command introduced.
Release 7.2.1.R02; **discard** parameter added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
interfaces fec	Clears all port violations; allows the port to resume normal operation without a manual reset of the port or module.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsViolationOption
```

show port-security

Displays the Learned Port Security (LPS) configuration and table entries.

show port-security {port [*chassis/slot/port***[-***port2***] | slot** *chassis/slot***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).

Defaults

By default, all ports with an LPS configuration are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the **port** parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the **slot** parameter with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses learned on the LPS enabled port that are within the specified MAC address range appear as a separate entries in the LPS table as dynamic MAC type addresses.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

Examples

```
-> show port-security port 1/1/20
Legend: Mac Address: * = address not valid,

        Mac Address: & = duplicate static address,

Port:  1/1/20
 Admin-State      :               ENABLED,
 Operation Mode   :               ENABLED,
 Max MAC bridged  :                     3,
 Trap Threshold   :                     1,
 Violation        :              RESTRICT
 Max MAC filtered :                     5,
 Violating MAC    :                  NULL
```

```
           MAC              VLAN       MAC TYPE          OPERATION
------------------------+--------+-----------------+-----------------
 00:11:22:22:22:21           1       STATIC           bridging
 00:11:22:22:22:22           1       STATIC           bridging
 00:11:22:22:22:23           1       PSEUDO-STATIC    bridging
```

output definitions

Port	The module slot number and the physical port number on that module.
Admin-State	The LPS administrative state for the port (**Enabled**, **Disabled**, or **Locked**). Configured through the **port-security** command.
Operation Mode	The LPS operational mode for the port (**Enabled**, **Disabled**, **Restricted**, **Shutdown**, **Discard**, **Locked**, or **Filtered-only**).
Max MAC bridged	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the **port-security maximum** command.
Trap Threshold	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If **disabled** is displayed in this field, the trap threshold is not in force. Configured through the **port-security learn-trap-threshold** command.
Violation	The security violation mode for the port (**restrict**, **shutdown**, or **discard**). Configured through the **port-security port violation** command.
Max MAC filtered	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the **port-security port max-filtering** command.
Violating MAC	The MAC Address that caused the violation on this port.
MAC	The MAC address learned dynamically or configured statically on the LPS port. Static MAC addresses configured through the **port-security mac** command.
VLAN	The VLAN to which the LPS port belongs.
MAC TYPE	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port.
OPERATION	The operational status of the MAC address (**bridging** or **filtering**).

Release History

Release 7.1.1; command introduced.
Release 7.2.1.R02: **Admin-State** and **Violating MAC** fields added.
Release 8.4.1; **MAC Address: * = address not valid** and **MAC Address: & = duplicate static address** legend added.

Related Commands

show port-security learning-window	Displays the amount of time during which source learning can occur on all LPS ports.

```

show port-security mac-range

Displays the MAC range configured on the Learned Port Security (LPS) ports.

show port-security [port *chassis/slot/port***[**-*port2***]] mac-range**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis, slot and port number (1/1/1). Use a hyphen to specify a range of ports (1/1/1-8).

Defaults

By default, all the LPS ports configured with MAC range are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Specify the chassis, slot, and port to view the MAC range configured for the specific port.

Examples

```
-> show port-security port 1/1/4 mac-range
Port:  1/1/4:
      Low MAC Range              High MAC Range
-------------------------+-------------------------
00:00:00:00:00:00             00:00:00:00:00:10
00:00:00:44:00:01             00:00:00:66:ff:ff

-> show port-security mac-range
Port:  1/1/2:
      Low MAC Range              High MAC Range
-------------------------+-------------------------
00:00:00:00:00:01             00:00:00:00:00:20
00:00:00:00:55:01             00:00:00:00:55:ff
00:00:00:66:00:01             00:00:00:99:ff:ff

Port:  1/1/4:
      Low MAC Range              High MAC Range
-------------------------+-------------------------
00:00:00:00:00:00             00:00:00:00:00:10
00:00:00:44:00:01             00:00:00:66:ff:ff
```

output definitions

Port	The chassis slot number and the physical port number on that chassis.
Low MAC Range	MAC address that defines the lower end of a MAC address range. Configured through the **port-security mac-range** command.
High MAC Range	MAC address that defines the higher end of a MAC address range. Configured through the **port-security mac-range** command.

Release History

Release 8.5R3; command introduced.

Related Commands

port-security mac-range	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.

MIB Objects

```
learnedPortSecurityL2MacRangeTable
   lpsL2LowMacAddress
   lpsL2HighMacAddress
```

show port-security brief

Displays the LPS port configuration for all the LPS ports.

show port-security brief

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LPS port parameter values are displayed even if the LPS is disabled on the port.
- The operation mode displayed for the LPS port is based on a combination of the existing administrative status and the operational status of the port, the result of which is one of the following values:
  - Enabled
  - Restricted (only when the administrative status is enabled)
  - Shutdown (only when the administrative status is enabled)
  - Discard (only when the administrative status is enabled)
  - Disabled
  - Locked
  - Filtered_only

Examples

```
-> show port-security brief

1/3   RESTRICTED       5       100        5          100        0          0
1/4   SHUTDOWN         5       100        -          -          -          0
1/5   DISABLED         5       100        -          -          -          0
1/6   LOCKED           5       100        -          -          3          0
```

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (e.g., 1/2 specifies port 2 on slot 1).
Operation Mode	Displays the status of the LPS port.

output definitions

Max Bridge	The maximum number of bridged MAC addresses that are allowed on the LPS port. Configured through the **port-security maximum** command.
Max Filter	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the **port-security port max-filtering** command.
Nb Macs Dyn Br	Total number of bridged MAC addresses learned on the LPS port.
Nb Macs Dyn Fltr	Total number of filtered MAC addresses learned on the LPS port.
Nb Macs Static Br	Total number of bridged static MAC addresses (configured static and MAC addresses learned as pseudo-static) on the LPS port.
Nb Macs Static Fltr	Total number of filtered static MAC addresses configured on the LPS port.

Release History

Release 7.2.1.R02; command was introduced.

Related Commands

show port-security	Displays the LPS configuration and table entries for individual LPS ports.

MIB Objects

   lpsMaxFilteredMacNum
   lpsMaxStaticMacNum
   lpsOperStatus
   lpsAdminStatus
```

show port-security learning-window

Displays the source learning window configuration.

show port-security learning-window

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the learning window time is not set, then no source learning time limit is applied to LPS ports.
- Even after the LPS learning window time expires, dynamic MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> show port-security learning-window
Learning-Window             =  2 min,
Convert-to-static           =  DISABLE,
No Aging                    =  DISABLE,
Boot Up                     =  ENABLE,
Remaining Learning Window   =  120 sec
Learn As Static             =  ENABLE,
Mac Move                    =  DISABLE,
```

output definitions

Learning-Window	The configured amount of time during which the LPS port can learn new MAC addresses. This value of this field is set to **INFINITY** when the learning time window is set to zero (no source learning time restriction on LPS ports).
Convert-to-static	Indicates whether or not dynamic bridged or pseudo-static MACs are converted to static MACs (**ENABLED** or **DISABLED**). This option is always disabled when the LPS learning window is set to infinity (zero).

output definitions

No Aging	Indicates whether or not bridged MAC addresses are learned as pseudo-static MAC addresses, which do not age out during the LPS learning window time period (**DISABLED** or **ENABLED**).
Boot Up	Indicates whether or not the LPS learning window automatically starts when the switch boots up (**enabled** or **disabled**).
Learn As Static	Indicates whether or not dynamic MAC addresses are automatically learned as static MAC addresses during the LPS learning window time period. The **Learn As Static** and **No Aging** learning window options are mutually exclusive.
Mac Move	Indicates whether or not pseudo-static MAC addresses are allowed to move to a different port in the same VLAN during the LPS learning window time period. The **Mac Move** learning window option applies only when the **No Aging** option is enabled.
Remaining Learning Window	The remaining amount of time during which the LPS port can learn MAC addresses. If the learning time window is set to **INFINITY** (zero), this field does not display in the show command output.

Release History

Release 7.1.1; command introduced.
Release 7.2.1.R02; **LPS Shutdown Config** field changed to **Learning-Window**, **No Aging** and **Boot Up** fields added.
Release 8.2.1; **Learn As Static** and **Mac Move** fields added.

Related Commands

port-security learning-window	Configures the learning window parameters that are applied to all LPS ports.
show port-security	Displays the LPS configuration and table entries for individual LPS ports.

47 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or "mirrored," port transmits and receives network traffic normally and the "mirroring" port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

Filename: ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib
Module: alcatelIND1PortMirrorMonitoringMIB

The following table summarizes the available commands:

Port Mirroring Commands	**port-mirroring source destination** **port-mirroring** **show port-mirroring status**
Port Monitoring Commands	**port-monitoring source** **port-monitoring** **show port-monitoring status** **show port-monitoring file**

port-mirroring source destination

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

port-mirroring *port_mirror_sessionid* **source {port** *chassis/slot/port***[-***port2***]} destination {port** *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg***[-***linkagg2***]} [rpmir-vlan** *vlan_id***] [bidirectional |inport |outport] [unblocked-vlan** *vlan_id***] [tag-remove] [enable | disable]**

port-mirroring *port_mirror_sessionid* **no source {port** *chassis/slot/port***[-***port2***] [***chassis/slot/port***[-***port2***]...}**

port-mirroring *port_mirror_sessionid* **no destination {port** *chassis/slot/port***[-***port2***] [***chassis/slot/port***[-***port2***]...]** | **linkagg** *linkagg***[-***linkagg2***] [***linkagg***[-***linkagg2***]...}**

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.
source	Specifies source port, or range of ports desired to be mirrored.
destination	Specifies the destination port or linkagg that receives all the mirrored packets.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number. Use a hyphen to specify a range of ports.
linkagg[-*linkagg2I*]	The destination link aggregate. Use a hyphen to specify a range. *This parameter is supported only on the OmniSwitch 6900, OmniSwitch 6860, and OmniSwitch 9900.*
rpmir-vlan *vlan_id*	Specifies a reserved VLAN to carry the mirroring traffic. Use this parameter to configure remote port mirroring. See "Usage Guidelines - Remote Port Mirroring" below for more information.
bidirectional	Specifies bidirectional port mirroring.
inport	Specifies incoming unidirectional port mirroring.
outport	Specifies outgoing unidirectional port mirroring.
unblocked-vlan *vlan_id*	Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
tag-remove	Removes the VLAN tag on mirrored traffic that egresses out of the destination mirroring ports. *This parameter is supported only on the OmniSwitch 9900.*
enable	Enables port mirroring status.
disable	Disables port mirroring status.

Defaults

parameter	default
bidirectional | inport | outport	**bidirectional**
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Port mirroring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same network interface module.
- A mirroring port can not be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.
- To mirror traffic from SAP port to destination port, explicitly create a VLAN same as the SAP VLAN.
- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Port mirroring destination port can be a link aggregate. This functionality is supported on OmniSwitch 6900 and OmniSwitch 6860 platforms only.
- Use the **port mirroring source destination** command to define the mirrored port and enable port mirroring status. Use the **port mirroring** command to enable the port mirroring session.
- Specify the *vlan_id* number of the mirroring port that is to remain **unblocked** when the command is executed. The **unblocked** VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning Tree remains disabled on the unblocked VLAN.
- A maximum of 128 source mirroring ports can be configured. In case of mirroring to LACP Link Aggregate, only the first 8 aggregable ports will be used for mirroring.
- Unblocked VLAN and RPMIR configuration cannot co-exist in the same port mirroring session.
- A port/link aggregate which is to be configured as a mirroring destination should have no prior configuration on it, for example, a MVRP enabled port/link aggregate cannot be configured as a mirroring destination. The only exception to this rule is that a port can be a untagged or a tagged member of a standard VLAN.
- Any protocol/feature configurations on existing mirroring destinations would fail. All such configuration attempts would result in an error. The only exception to this is that if a mirroring destination is part of a mirroring session which has remote port mirroring VLAN configured (RPMIR VLAN) then such a destination can be made a tagged and/or untagged member of standard VLAN(s).
- Supports single destination mirroring port per session and seven port mirroring sessions in a system on OmniSwitch 6560 and OmniSwitch 6465 platforms.
- Supports multiple destination mirroring port and link aggregates per session and seven port mirroring sessions, and 128 destination mirroring ports or link aggregates in a system. This functionality is supported on OmniSwitch 9900.

- Supports policy based multiple destination mirroring on a single port mirroring session. This functionality is supported on OmniSwitch 9900.
  - To enable this functionality, configure port mirroring session with destination port and then apply policy based configuration on the port mirroring session.
  - Use the QoS mirror session attribute to support policy based multiple destination mirroring. QoS mirroring session attribute can be specified as a part of policy action in the command **policy action** command. Mirroring can be done on the ingress packets only. Only one session ID is supported for policy based mirroring, thus all the policies must specify the same session ID. For more information on policy based mirroring, see **QoS Commands** chapter.
- Use the **tag remove** option to remove the VLAN tag on mirrored traffic that egresses out of destination mirroring ports. For double tagged mirrored packet, this option removes the outer VLAN tag.
- RPMIR and **tag remove** configuration is mutually exclusive and hence cannot co-exist in the same port mirroring session.

Usage Guidelines - Remote Port Mirroring

- Use the **rpmir-vlan** parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring. Note that remote port mirroring is *not* supported on the OmniSwitch 6900-C32, OmniSwitch 6900-V72, and OmniSwitch 9900.
- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- The QoS redirect feature can be used to override source learning.
- The **mac-learning** command can also be used to disable learning on the RPMIR VLAN ID.
- VLAN 1 cannot be configured as the RPMIR VLAN.
- When mirroring configuration is removed from a mirroring destination, the port/link aggregate is made an untagged member of VLAN 1. The only exception to this is when the destination in a mirroring session with RPMIR configuration.

Examples

```
-> port-mirroring 6 source port 1/2/2 destination port 1/1/3
-> port-mirroring 6 destination port 1/1/3 rpmir-vlan 7
-> port-mirroring 6 no source port 1/2/2

-> port-mirroring 7 source port 1/2/3 destination linkagg 3 unblocked-vlan 750
-> port-mirroring 7 source port 1/2/3 outport

-> port-mirroring 7 source port 1/2/3 destination linkagg 3 tag-remove

-> port-mirroring 9 source port 1/1/23 destination port 1/1/24
-> port-mirroring 9 disable
```

Release History

Release 7.1.1; command introduced.
Release 8.4.1.R03; Mirroring to a link aggregate supported on OmniSwitch 6900 and OmniSwitch 6860.

Release 8.6.R1; **tag-remove** keyword added, policy based multiple destination mirroring supported on OmniSwitch 9900.

Related Commands

port-mirroring	Enables, disables, or deletes a port mirroring session.
show port-mirroring status	Displays the status of mirrored ports. This value may be enabled or disabled.

MIB Objects

   mirrorDstTagRemove
```

port-mirroring

Enables, disables, or deletes a port mirroring session.

port-mirroring *port_mirror_sessionid* **{enable | disable}**

no port-mirroring *port_mirror_sessionid*

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.
enable	Enables port mirroring.
disable	Disables port mirroring.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- Use the **port-mirroring source destination** command to specify the mirrored ports and destination port. before using this command to enable or disable port mirroring activity for the particular port mirroring session.

Examples

```
-> port-mirroring 6 enable
-> port-mirroring 6 disable
-> no port-mirroring 6
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mirroring source destination	Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status.
show port-mirroring status	Displays the status of mirrored ports. This value may be enabled or disabled.

MIB Objects

```
mirrorTable
   mirrorMirroringIfindex
   mirrorTaggedVLAN
   mirrorStatus
```

port-monitoring source

Configures a port monitoring session.

port-monitoring *port_monitor_sessionid* **source port** *chassis/slot/port***[**-*port2***] [file** *filename* **[size** *filesize***] | no file | overwrite {on | off}] [inport | outport | bidirectional] [timeout** *seconds***] [enable | disable] [capture-type {full | brief}]**

port-monitoring *port_monitor_sessionid* **no source port** *chassis/slot/port***[**-*port2***]**

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number. Use a hyphen to specify a range of ports.
filename	Specifies a file name and pathname for capturing information related to the monitoring session (for example, **/flash/port2.enc**).
filesize	Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
no file	*This option is not supported at this time.*
on	Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
off	Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
inport	Specifies incoming unidirectional port monitoring.
outport	Specifies outgoing unidirectional port monitoring.
seconds	Specifies the number of seconds after which the session is disabled.
enable	Enables the port monitoring status.
disable	Disables the port monitoring status.
full	Captures port monitoring information in detail.
brief	Captures only the concise port monitoring data transmitted.

Defaults

parameter	default
filesize	1
on | off	**on**
bidirectional | inport | outport	**bidirectional**
seconds	0
enable | disable	**disable**
capture-type	**brief**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Port monitoring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same NI.
- If the port monitoring capture-type is set to **brief**, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to **full**, the entire packet is captured.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- The **/flash** directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.

Examples

```
-> port-monitoring 6 source port 1/2/3
-> port-monitoring 6 source port 1/2/3 file /flash/user_port size 2 enable
-> port-monitoring 6 source port 1/2/3 file /flash/user_port capture-type full
-> port-monitoring 10 source port 1/4/22-30
-> port-monitoring 10 no source port 1/4/30
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring status	Displays the port monitoring status.
show port-monitoring file	Displays the port monitoring data.

MIB Objects

```
monitorTable
   monitor
   monitorSessionNumber
   monitorIfindex
   monitorFileStatus
   monitorFileName
   monitorFileSize
   monitorScreenStatus
   monitorScreenLine
   monitorCaptureType
   monitorTrafficType
   monitorStatus
   monitorFileOverWrite
   monitorDirection
   monitorTimeout
```

port-monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

port-monitoring *port_monitor_sessionid* **{disable | pause | resume}**

no port-monitoring *port_monitor_sessionid*

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.
disable	Disables the port monitoring session.
pause	Pauses the port monitoring session.
resumes	Resumes the port monitoring session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

Examples

```
-> port-monitoring 6 pause
-> port-monitoring 6 disable
-> port-monitoring 6 resume
-> no port-monitoring 6
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-monitoring	Configures a port monitoring session.
show port-monitoring status	Displays the port monitoring status.

MIB Objects

```
monitorTable
   monitorSessionNumber

```

show port-mirroring status

Displays the status of mirrored ports.

show port-mirroring status [*port_mirror_sessionid***]**

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

Examples

```
-> show port-mirroring status
 Session    Mirror        Mirror      Unblocked   RPMIR     Config    Oper
           Destination    Direction     Vlan       Vlan     Status    Status
----------+-----------+----------------+--------+---------+-------+---------
     1.     1/1/11       bidirectional  NONE      NONE      Enable    on
----------+-----------+----------------+--------+---------+---------+---------
         Mirror
         Source
----------+-----------+--------------+----------+---------+----------+---------
     1.      1/1/2       bidirectional     -         -      Enable    On
     1.      1/1/3       bidirectional     -         -      Enable    On
     1.      1/1/4       bidirectional     -         -      Enable    On
     1.      1/1/5       bidirectional     -         -      Enable    On
```

output definitions

Session	The port mirroring session identifier.
Mirror Destination	The location of the mirrored port.
Mirror Direction	The direction of the mirroring or mirrored port, which can be **bidirectional** (the default), **inport**, or **outport**.
Unblocked VLAN	The mirroring VLAN ID number.
RPMIR VLAN	The reserved VLAN to carry the mirroring traffic.
Config Status	The configuration status of the session.
Oper Status	The current status of the mirroring or mirrored port.
Mirror Source	The location of the mirroring port.

Release History

Release 7.1.1; command introduced.

Related Commands

port-mirroring	Enables, disables, or deletes a port mirroring session.
port-mirroring source destination	Defines a port to mirror and a port that receives data from the mirrored port, and enables or disables port mirroring status.

MIB Objects

```
mirrorTable
   mirrorMirroringIfindex
   mirrorMirroredIfindex
   mirrorDirection
   mirrorStatus

   mirrorSrcStatus
   mirrorSrcDirection
   mirrorSrcRowStatus
   mirrorSrcOperStatus
   mirrorUnblockedVLAN
```

show port-monitoring status

Displays port monitoring status.

show port-monitoring status [*port_monitor_sessionid***]**

Syntax Definitions

port_monitor_sessionid Monitoring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

Examples

```
-> show port-monitoring status

 Sess Mon. Mon. Over  Oper.  Admin  Capt.   Max.   File
      Src  Dir  write Stat   Stat   Type    Size   Name
-----+----+----+-----+------+------+-------+------+-------------------------
  1.  1/1/2   Out  OFF    OFF   OFF   Brief     64K  /flash/pm.enc
```

output definitions

Sess	**Session** - The port monitoring session identifier.
Mon. Src	**Monitor Source** - The source ports that are monitored.
Mon Dir	**Monitor Direction** - The direction of the monitoring session, which can be **bidirectional** (the default), **inport**, or **outport**.
Overwrite	Whether files created by a port monitoring session can be overwritten. The default is ON.
Oper Stat	**Operating Status** - The current operating status of the port monitoring session (on/off).
Admin Stat	**Admin Status** - The current administrative status of the port monitoring session (on/off).
Capt Type	**Capture type**: **Brief** - captures only 64 bytes of data per traffic data packet. **Full** - captures the entire packet.
Max Size	**Maximum Size** - The maximum size of the port monitoring file.
File Name	The name of the port monitoring file.

Release History

Release 7.1.1; command introduced.

Related Commands

port-monitoring source	Configures a port monitoring session.
port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring file	Displays port monitoring data.

MIB Objects

```
monitorTable
   monitorSessionNumber
   monitorIfindex
   monitorStatus
   monitorFileStatus
   monitorFileName
   monitorFileSize
   monitorScreenStatus
   monitorScreenLine
   monitorTrafficType
   monitorDirection
   monitorTimeout
   monitorCaptureType
   monitorFileOverWrite
   monitorDirection
```

show port-monitoring file

Displays port monitoring data.

show port-monitoring file *port_monitor_sessionid*

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.

Defaults

A single line from the captured packet is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Only a single line from the captured packet is displayed, even though the full packet is captured.To view the entire packet, download the file and view it using compatible network analyzer tool.

Examples

```
-> show port-monitoring file 1

Destination       | Source            |  Type  | Data

```

48 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

Filename: ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib
Module: alcatelIND1PortMirrorMonitoringMIB

Filename: SFLOW-MIB.MIB.mib
Module: sFlow

A summary of the available commands is listed here:

sflow agent
sflow receiver
sflow sampler
sflow poller
show sflow agent
show sflow receiver
show sflow sampler
show sflow poller

sflow agent

Configures a specific sFlow agent IP address.

sflow agent ip *ip_address*

no sflow agent ip *ip_address*

Syntax Definitions

ip_address	The sFlow agent IP address.

Defaults

parameter	default
ip-address	0.0.0.0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured, 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

Examples

```
-> sflow agent ip 192.168.1.1
-> no sflow agent ip 192.168.1.1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; command deprecated. Use **ip service source-ip.**

Related Commands

show sflow agent	Displays the agent table.

MIB Objects

```
mirmonSFlowObjects
   alasFlowAgentConfigType
   alasFlowAgentAddressType
   alasFlowAgentAddress
```

sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

sflow receiver *receiver_index* **{name** *string* **| timeout {***seconds* **| forever} | address {***ip_address* **|** *ipv6_address* **|** *domain_name***} | udp-port** *port* **| packet-size** *size* **version** *num* **| release}**

Syntax Definitions

receiver_index	The receiver index number.
string	The name.
seconds | **forever**	Specifies the timeout value.
ip_address	Specifies the 32-bit IPv4 address.
ipv6_address	Specifies the 128-bit IPv6 address.
domain_name	Specifies a Fully Qualified Domain Name (FQDN). The domain name can be up to 255 characters in length.
port	Specifies the UDP (destination) port.
size	Specifies the maximum number of data bytes (size) that can be sent.
num	Specifies the version number.

Defaults

parameter	default
string	empty
seconds	0
ip_address	0.0.0.0(ipv4)
port	6343
size	1400
version num	5

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **release** parameter at the end of the command to delete a receiver.
- Use the *domain_name* option to specify an FQDN instead of an IPv4 or IPv6 address. The switch will then resolve the domain name to an IP address. Make sure the specified domain name maps to a valid and reachable address. If the address is not valid or cannot be reached, then flow and counter samples may not be sent out of the sFlow agent as expected.

- After the IPv4 or IPv6 address for the specified domain name is determined, a refresh is triggered every 30 seconds. If the mapping of the domain name to an IP address changes before the next refresh, both flow and counter samples are not sent to the new address until the next refresh occurs.

Examples

```
-> sflow receiver 1 name Golden Rcvr1 address 198.206.181.3
-> sflow receiver 1 name Golden Rcvr1 address upam.omnivista.com
-> sflow receiver 1 release
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; *domain_name* parameter option added.

Related Commands

show sflow receiver	Displays the receiver table.

MIB Objects

```
sFlowRcvrTable
   sFlowRcvrIndex
   sFlowRcvrOwner
   sFlowRcvrTimeout
   sFlowRcvrMaximumDatagramSize
   sFlowRcvrAddressType
   sFlowRcvrAddress
   sFlowRcvrPort
   sFlowRcvrDatagramVersion
```

sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

sflow sampler *num* **port** *chassis/slot/port***[-***port***] {receiver** *receiver_index* **| rate** *value* **| sample-hdr-size** *size***}**

no sflow sampler *num* **port [***chassis_id/***]***slot/port***[-***port***]**

Syntax Definitions

num	Specifies the instance ID.
chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
receiver_index	Specifies the receiver index.
value	Specifies the rate value for packet sampling.
size	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.

Defaults

parameter	default
receiver_index	0
value	0
size	128

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

Examples

```
-> sflow sampler 1 port 1/2/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 port 1/2/1-5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show sflow sampler	Displays the sampler table.

MIB Objects

```
sFlowFsTable
   sFlowFsDataSource
   sFlowFsInstance
   sFlowFsReceiver
   sFlowFsPacketSamplingRate
   sFlowFsMaximumHeaderSize
```

sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

sflow poller *num* **port** *chassis/slot/port***[**-*port***] {receiver** *receiver_index* **| interval** *value***}**

no sflow poller *num* **port [***chassis_id/***]***slot/port***[**-*port***]**

Syntax Definitions

num	Specifies the instance ID.
chassis	The chassis identifier.
*slot/port***[**-*port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
receiver_index	Specifies the receiver index.
value	Specifies the maximum number of seconds between successive samples (interval value).

Defaults

parameter	default
receiver_index	0
value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

Use the **no** form of this command to delete a poller.

Examples

```
-> sflow poller 1 port 1/1/1 receiver 2 interval 20
-> sflow poller 1 port 1/2/6-10 receiver 1 interval 30
-> no sflow poller 1 port 1/2/6-10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show sflow poller	Displays the poller table.

MIB Objects

```
sFlowCpTable
   sFlowCpDataSource
   sFlowCpInstance
   sFlowCpReceiver
   sFlowCpInterval
```

show sflow agent

Displays the sFlow agent table.

show sflow agent

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- It is necessary to execute the **ip interface** command to make a loopback0 IP address as the fixed primary address of the switch to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

Examples

```
-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version  = 1.3; Alcatel; 6.1.1
Agent IP       = 127.0.0.1
```

output definitions

Agent Version	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
Agent address	IP address associated with the agent. Configured through the **sflow agent** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show sflow receiver	Displays the receiver table.

MIB Objects

```
sFlowAgent
   sFlowVersion
   sFlowAgentAddressType
   sFlowAgentAddress
```

show sflow receiver

Displays the sFlow receiver table.

show sflow receiver [*num***]**

Syntax Definitions

num	Specifies the receiver index.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show sflow receiver
Receiver 1
Name       = Golden
Address    = IP_V4  198.206.181.3
UDP Port   = 6343
Timeout    = 65535
Packet Size= 1400
DatagramVer= 5

-> show sflow receiver

 Receiver 1
 Name       = Golden
 Address    = Domain Name  upam.omnivista.com IP_V4  198.206.181.3
 UDP Port   = 6343
 Timeout    = 65535
 Packet Size= 1400
 DatagramVer= 5
```

output definitions

Name	Name of the entry to claim.
Address	IP address of the sFlow collector. If a receiver address was configured as a domain name, then both the domain name and IP address for that domain are displayed. If the domain name did not translate to a valid IP address, a hyphen is displayed instead of an address.
UDP Port	Destination port for sFlow datagrams.
Timeout	Time remaining before the sampler is released and stops sampling.

output definitions

Packet size	Maximum number of data bytes that can be sent in a single sample datagram.
Datagram ver	Version of sFlow datagrams that should be sent.

Release History

Release 7.1.1; command was introduced.

Related Commands

sflow receiver	Sets the destination hosts where the sFlow datagrams are sent out.

MIB Objects

```
sFlowRcvrTable
   sFlowRcvrIndex
```

show sflow sampler

Displays the sFlow sampler table.

show sflow sampler [*num***]**

Syntax Definitions

num	Specifies the instance ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A.

Examples

```
-> show sflow sampler
Instance   Interface    Receiver  Sample-rate   Sample-hdr-size
-----------------------------------------------------------------
   1         2/1/1          1         2048             128
   1         2/1/2          1         2048             128
   1         2/1/3          1         2048             128
   1         2/1/4          1         2048             128
   1         2/1/5          1         2048             128
```

output definitions

Instance	Instance for the flow sampler.
Interface	Interface used for the flow sampler.
Receiver	Receiver associated with the flow sampler.
Sample-rate	Statistical sampling rate for packet sampling from the source.
Sample-hdr-size	Maximum number of bytes that should be copied from a sampled packet.

Release History

Release 7.1.1; command was introduced.

Related Commands

sflow sampler	Gets hardware sampled from Q-dispatcher.

MIB Objects

```

   sFlowFsInstance
```

show sflow poller

Displays the sFlow poller table.

show sflow poller [*num***]**

Syntax Definitions

num	Specifies the instance ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show sflow poller
Instance   Interface    Receiver  Interval(Secs)
----------------------------------------
     1        2/1/6         1         30
     1        2/1/7         1         30
     1        2/1/8         1         30
     1        2/1/9         1         30
     1        2/1/10        1         30
```

output definitions

Instance	Instance for the counter poller.
Interface	Interface used for the counter poller.
Receiver	Receiver associated with the counter poller.
Interval	The maximum number of seconds between successive samples of the counters associated with the data source.

Release History

Release 7.1.1; command was introduced.

Related Commands

sflow poller	Gets counter samples.

MIB Objects

```
sFlowCpTable
   sFlowCpInstance
```

49 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

Filename: RMON-MIB.mib
Module: rmonMibModule

The following table summarizes the available commands:

rmon probes
show rmon probes
show rmon events

rmon probes

This command enables or disables types of RMON probes.

rmon probes {stats | history | alarm} [*entry_number***] {enable | disable}**

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
entry_number	The entry number in the list of probes *(optional)*.
enable	Enables the RMON probe.
disable	Disables the RMON probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show rmon probes	Displays a list of RMON probes or a single RMON probe.
show rmon events	Displays a list of RMON logged events or a single RMON event.

MIB Objects

```
ETHERSTATSTABLE
   etherStatsStatus
HISTORYCONTROLTABLE
   historyControlStatus
ALARMTABLE
   alarmStatus
```

show rmon probes

Displays a list of RMON probes or a single RMON probe.

show rmon probes [stats | history | alarm] [*entry_number***]**

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
entry_number	The entry number in the list of probes *(optional)*.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry_number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes** *entry-number* command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

Examples

```
-> show rmon probes stats

        Chassis/
Entry  Slot/Port  Flavor    Status      Duration     System Resources
-------+----------+---------+-----------+------------+----------------
   1026 1/1/26     Ethernet  Active      71:49:41     301 bytes
   1025 1/1/25     Ethernet  Active      71:49:20     301 bytes
   1001 1/1/1      Ethernet  Active      71:48:05     300 bytes
```

```
-> show rmon probes history

          Chassis/
   Entry  Slot/Port    Flavor    Status      Duration     System Resources
   -------+---------+---------+-----------+------------+---------------
      1     1/1/26     History   Active      71:50:08     5471 bytes
      2     1/1/25     History   Active      71:49:47     5471 bytes
      3     1/1/1      History   Active      71:48:32     5470 bytes
      4     1/1/22     History   Active      71:48:30     5471 bytes
      5     1/1/23     History   Active      71:48:30     5471 bytes

-> show rmon probes alarm

Entry    Slot/Port   Flavor     Status       Duration          System Resources
-------+-----------+-----------+----------+---------------+---------------------
11235    1/4/8       Alarm       Active      00:07:00          835 bytes

   -> show rmon probes 4005

   Probe's Owner: Switch Auto Probe on Chassis 1, Slot 4, Port 5, ifindex 4005
       Entry    4005
         Flavor = Ethernet, Status = Active,
         Time = 48 hrs 54 mins,
      System Resources (bytes) = 301

   -> show rmon probes history 30562

   Probe's Owner: Switch Auto Probe on Chassis 8, Slot 1, Port 29
     History Control Buckets Requested = 50,
     History Control Buckets Granted   = 50,
     History Control Interval          = 30 seconds,
     History Sample Index              = 287
       Entry       9
         Flavor = History, Status = Active,
         Time = 71 hrs 48 mins,
      System Resources (bytes) = 5471

-> show rmon probes alarm 11235

Probe’s Owner:
  Alarm Rising Threshold         = 5
  Alarm Falling Threshold        = 0
  Alarm Rising Event Index       = 26020
  Alarm Falling Event Index      = 0
  Alarm Interval                 = 10 seconds
  Alarm Sample Type              = delta value
  Alarm Startup Alarm            = rising alarm
  Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008
   Entry 11235
      Flavor = Alarm, Status = Active
      Time = 48 hrs 48 mins,
      System Resources (bytes) = 1677
```

output definitions

Probe's Owner	Description and interface (location) of the probe.
Slot/Port	The Slot/Port number (interface) that this probe is monitoring.
Entry	The Entry number in the list of probes.
Flavor	Whether the probe type is Ethernet, History, or Alarm.
Status	The status of the probe–**Creating** (the probe is under creation), **Active** (the probe is Active), or **Inactive** (the probe is inactive).
Duration	Elapsed time (hours/minutes/seconds) since the last change in status.
System Resources	Amount of memory that has been allocated to this probe.

Release History

Release 7.1.1; command was introduced.

Related Commands

rmon probes	Enables or disables types of RMON probes.
show rmon events	Displays RMON logged events.

MIB Objects

```
ETHERSTATSTABLE
   etherStatsIndex
HISTORYCONTROLTABLE
   historyControlIndex
ALARMTABLE
   alarmIndex
```

show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

show rmon events [*entry_number***]**

Syntax Definitions

entry_number	The entry number in the list of probes *(optional)*.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- To display a list of logged events, omit the *entry_number* from the command line.
- To display statistics for a particular event, include the *entry_number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events** *entry_number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

Examples

```
-> show rmon events

Entry               Time               Description
---------+------------------+-----------------------------------------------------
1               00:08:00       etherStatsPkts.4008: [Falling trap] “Falling Event”
2               00:26:00       etherStatsCollisions.2008: “Rising Event”

-> show rmon events 2

Entry               Time               Description
---------+------------------+-----------------------------------------------------
2               00:26:00       etherStatsCollisions.2008: “Rising Event”
```

output definitions

Entry	The entry number in the list of probes.
Time	Time (hours, minutes, and seconds) since the last change in status.
Description	Description of the Alarm condition detected by the probe.

Release History

Release 7.1.1; command was introduced.

Related Commands

rmon probes	Enables or disables types of RMON probes.
show rmon probes	Displays RMON probes or a single RMON probe.

   eventIndex
```

50 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

A summary of the available commands is listed here.

swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

swlog {enable | disable | preamble | hash-time-limit *seconds* **| duplicate-detect | console level** *num* **}**

no swlog [preamble | duplicate-detect]

Syntax Definitions

enable	Enables the switch logging functionality.
disable	Disables the switch logging functionality.
preamble	Enables or disables the display of the preamble to the console.
hash-time-limit *seconds*	Configures the amount of elapsed time for an entry to no longer be considered a duplicate entry.
duplicate-detect	Enables or disables the duplicate detection capability.
console level *num*	The severity level filter keyword or numeric value for the application ID. *(see table for* **swlog appid** *command).*

Defaults

parameter	default
enable | disable	**enable**
preamble	**enable**
hash-time-limit *num*	**60 seconds**
duplicate-detect	**enable**
console level *num*	**6 (info)**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to enable or disable the **preamble** and **duplicate-detect** setting.
- The syslog preamble includes the level, appid, and timestamp that precedes the actual log messages.
- If duplicate entries are received within the configured **hash-time-limit,** only a single entry will be logged along with the number of times duplicated.
- Use the **swlog console level** command to set the switch logs of different levels to be displayed on the console.

Examples

```
-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1.R02; **gmt-time** parameter added.
Release 8.4.1; **gmt-time** parameter removed.

Related Commands

swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.
swlog console level	Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingEnable
   systemSwitchLoggingPreamble
   systemSwitchLoggingHashAgeLimit
   systemSwitchLoggingDuplicateDetect
   systemSwitchLoggingConsoleLevel
   systemSwitchLoggingGmtTime
```

swlog syslog-facility-id

Specifies a facility ID that switch logging includes in the priority (PRI) section of the event message.

swlog syslog-facility-id {*facility_id* **|** *num***}**

Syntax Definitions

facility_id	A facility identification keyword. Current facility IDs are listed in the table below.
num	A numerical equivalent value for the facility ID. The range is 0–23. Current numeric equivalent values are listed in the table below.

Supported Facility IDs with Numerical Equivalents	
kernel - 0	**NTP - 12**
user - 1	**log-audit - 13**
mail - 2	**log-alert - 14**
system - 3	**clock2 - 15**
sec-auth1-2	**local0 - 16**
syslog - 5	**local1 - 17**
lptr - 6	**local2 - 18**
net-news - 7	**local3 - 19**
UUCP - 8	**local4 - 20**
clock1- 9	**local5 - 21**
sec-auth2 - 10	**local6 - 22**
FTP - 11	**local7 - 23**

Defaults

parameter	default
facility_id	**local0**
num	**16**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the ID name (**system**) or the numeric equivalent to specify the facility ID.

Examples

```
-> swlog syslog-facility-id system
-> swlog syslog-facility-id 3
-> swlog syslog-facility-id user
-> swlog syslog-facility-id 1
```

Release History

Release 8.3.1; command introduced.

Related Commands

swlog	Enables or disables switch logging.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingSysLogFacilityId
```

swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

swlog appid {all | *string***} {library {all |** *string***} | subapp {all |** *num***} | exclude {all |** *num***}} {disable | enable | level {***level* **|** *num***} [vrf** *num***]**

Syntax Definitions

string	An application or library identification keyword. Enter a question mark (?) on the command line to get a list of application or library IDs.
subapp *num*	A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.
exclude *num*	A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.
disable	Disables the logging of the associated application.
enable	Enables the logging of the associated application.
level *level* | *num*	The severity level filter keyword or numerical equivalent value for the application ID *(see table below)*. All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.
vrf *num*	The VRF ID.

Supported Levels	Numeric Equivalents	Description
off	**0**	Disabled
alarm	**1**	Highest severity. The system is about to crash and reboot.
error	**2**	System functionality is reduced.
alert	**3**	A violation has occurred.
warning	**4**	A unexpected, non-critical event has occurred.
event	**5**	A clear readable customer event.
info	**6**	Any other non-debug message (default).
debug1	**7**	A normal event debug message.
debug2	**8**	A debug-specific message.
debug3	**9**	All debug messages.

Defaults

Default severity level is **info**.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show swlog appid** command to display available registered applications.
- Specify the **event** severity level keyword to define the new event level at which switch logging information will be filtered for the specified application.

Examples

```
-> swlog appid all subid all enable
-> swlog appid mvrpNi subapp 1 level 8
-> swlog appid all supapp all level event
-> swlog appid all library all level event
-> swlog appid all exclude all level event
-> show swlog appid mvrpNi

Application Name                   : mvrpNi,

```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **exclude** parameter added.
Release 8.6.R1; **event** severity level keyword added.

Related Commands

swlog	Enables or disables switch logging.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.
swlog console level	Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingAppName
   systemSwitchLoggingLibraryName
   systemSwitchLoggingLevel
```

swlog output

Enables or disables switch logging output to the console, file, data socket (remote session), or external syslog server.

swlog output {tty {enable | disable} | console | flash | socket {*ip_address* **|** *ipv6Address* **|** *domain_name***} [tls] [remote command-log] [vrf-name** *name***]}**

no swlog output {console | flash | socket [*ip_address* **|** *ipv6Address* **|** *domain_name***]}**

Syntax Definitions

tty enable	Enables switch logging to a connected Telnet session.
tty disable	Disables switch logging to a connected Telnet session.
console	Specifies console output. When enabled, switch logging output is printed to the user console.
flash	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
socket	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
ip_address	The IPv4 address for the remote session host.
ipv6Address	The IPv6 address for the remote session host.
domain_name	A Fully Qualified Domain Name (FQDN) for the remote session host. Specify a domain name up to 128 characters in length.
tls	Enables or disables syslog over TLS.
remote command-log	Enables command logging to a remote session host.
name	Specifies the VRF to be used to access the remote syslog server.

Defaults

parameter	default
console | **flash** | **socket**	**flash** and **console**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- Use the **socket** keyword to send output to a syslog server, followed by the IP address or FQDN of the remote host. Up to 12 servers can be configured. When an FQDN is specified, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.

- Syslog over TLS:
  - Remote command log will not work when syslog over TLS is enabled.
  - VRF cannot be used to access the syslog server when syslog over TLS is enabled.
  - In OmniSwitch 9900 only CMM swlog is transferred to the external syslog server over TLS.
  - Dying Gasp syslog messages are not captured in syslog over TLS.
  - Use the **no** form of the command to disable syslog over TLS.
- VRF name must either be 'default' or a pre-defined VRF (user-defined).

Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
-> swlog output socket 14.1.1.1 remote command-log
-> swlog output socket 14.1.1.1 vrf-name vrf1
-> no swlog output socket 14.1.1.1

-> swlog output socket upam.omnivista.com
-> swlog output socket upam.omnivista.com remote command-log
-> swlog output socket upam.omnivista.com vrf-name vrf1
-> no swlog output socket upam.omnivista.com
-> swlog output socket opendaylight.com
ERROR: DNS lookup failed, unknown host opendaylight.com
-> swlog output socket 192.168.120.140 tls
-> swlog output socket 2001::1 tls
-> no swlog output socket 2001::1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf-name** parameter added.
Release 8.3.1; **remote command-log** parameter added.
Release 8.5R1; *domain_name* parameter option added.
Release 8.6R1; **tls** parameter added.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```

swlog output flash-file-size

Configures the size of the switch logging file.

swlog output flash-file-size *kilobytes*

Syntax Definitions

kilobytes	The size of the switch logging file in kilobytes. The range is 125–12500.

Defaults

parameter	default
kilobytes	1250

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show hardware-info** command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

Examples

```
-> swlog output flash-file-size 256
```

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog advanced	Clears the files that store switch logging data.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingFileSize
```

swlog advanced

Enable or disable switch logging in RFC5424 format.

swlog advanced {enable | disable}

Syntax Definitions

enable	Enable switch logging in RFC5424 format.
disable	Disable switch logging in RFC5424 format.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, the switch logs the messages in BSD syslog format (RFC3164) to files and remote syslog servers.
- When switch logging RFC5424 format is enabled, the old RFC3164 syslog messages are reformatted to comply with the RFC5424 before writing to files or sending to remote syslog servers.

Examples

```
-> swlog advanced enable
-> swlog advanced disable
```

Release History

Release 8.4.1; command introduced.

Related Commands

show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingSyslogProtocol
```

swlog size-trap-threshold

Configures the threshold limit of the storage space used for swlog record storage. When the storage reaches the configured threshold limit a notification is displayed in the swlog message.

swlog size-trap-threshold *threshold*

Syntax Definitions

threshold	The percentage of storage space to be set as threshold limit. The valid range is 50–90.

Defaults

parameter	default
threshold	90

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure the threshold limit of the storage space used for swlog record storage.
- Use the **swlog clear** command to clear the files that store switch logging data.

Examples

```
-> swlog size-trap-threshold 90
```

Release History

Release 8.4.1; command introduced.

Related Commands

swlog clear	Clears the files that store switch logging data.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingSizeTrapThreshold
```

swlog clear

Clears the files that store switch logging data.

swlog clear [all]

Syntax Definitions

all	Clears all the contents of the switch log file.

Defaults

By default, the contents of the switch log file is cleared but the event logs are retained.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.
- To clear all the contents including the event log use the "**all**" parameter with swlog clear command.

Examples

```
-> swlog clear
-> swlog clear all
```

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; **all** parameter added.

Related Commands

swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingClear
```

show log swlog

Displays stored switch logging information.

show log swlog

show log swlog [timestamp *mm/dd/yyyy hh:mm:ss***] [slot** *num***]**

Syntax Definitions

mm/dd/yyyy hh:mm:ss	Specify the starting time for the switch logging information to be displayed. Use the format ***mm/dd/yyyy hh:mm:ss*** where ***mm*** represents the month, ***dd*** is the day, ***yyyy*** is the year, ***hh*** is the hour, ***mm*** is the minutes and ***ss*** is the seconds. Use four digits to specify the year.
num	The slot number to display the logging information for. *Currently not supported*.

Default

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the switch logging display is too long, you may use the **swlog advanced** command to clear all of the switch logging information.
- The use of **grep** and the **timestamp** parameter can be used to filter the log files.
- When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command. Only those users who provide the valid ASA credentials are allowed to view the data. For more information on Authenticated Switch Access - Enhanced Mode mode, refer to the “Managing Switch Security” chapter in *OmniSwitch AOS Release 8 Switch Management Guide.*

Examples

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command.

```
-> show log swlog
Username: test
Password:   *******
```

show log swlog | grep error and **show log swlog | grep more** commands are not supported in enhanced mode.

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Adds or removes a filter level for a specified subsystem.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
swlog advanced	Clears the files that store switch logging data.
show swlog	Displays switch logging information.

MIB Objects

```
N/A
```

show swlog

Displays switch logging information (for example, switch logging status, log devices, application IDs with non-default severity level settings).

show swlog [library | appid {all | *string***} | dying-gasp-station]**

Syntax Definitions

library	Displays the entire library for all application IDs.
string	The name of the application ID to display. Enter a question mark (?) on the command line to get a list of application IDs.
dying gasp-station	Displays switch logging information for Dying Gasp entries.

Defaults

By default, the switch logging configuration for the switch is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```

output definitions

Operational Status	Displays whether switch logging is enabled or disabled.
File Size per file	The maximum file size of the switch log file.
Log Device	Which devices are the switch log messages being sent to.
Log Device	Which devices are the switch log messages being sent to.
Syslog FacilityID	The Facility ID value that is included in the priority (PRI) section of the event messages.
Hash Table entries age limit	The elapsed time for duplicate entries.
Switch Log Preamble	Status of displaying message preamble on console.
Switch Log Debug	Status of swlog debug.
Switch Log Duplicate Detection	Status of duplicate detection.
Console Display Level	The console severity level.
RFC5424 Format Logging	Displays if switch logging in RFC5424 format is enabled or disabled.
Swlog Threshold	Displays the configured threshold limit for swlog record storage.
Syslog over TLS	Displays the operational status of syslog over TLS.
Application Name(id)	The subsystem information for the Application ID.

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **dying-gasp-station** parameter added.
Release 8.3.1.R02; **GMT time logging** field added.
Release 8.4.1; **GMT time logging** field replaced with **RFC5424 Format Logging**. **Swlog Threshold**.
Release 8.6R1; **Syslog over TLS** field added in show swlog output.

Related Commands

swlog	Enables or disables switch logging.
swlog syslog-facility-id	Configures the value of the facility ID that switch logging includes in the priority (PRI) section of the event message.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
swlog output flash-file-size	Configures the size of the switch logging file.
swlog size-trap-threshold	Configures the threshold limit of the storage space used for swlog record storage.
show log swlog	Displays stored switch logging information from flash.
show log events	Displays customer event logs on the switch.
show log events output	Captures all event log to a specified file name on the switch.

```
   systemSwitchLoggingHostVrfName
   systemSwitchLoggingHostTls
systemSwitchLoggingDgHostTable
   systemSwitchLoggingDgHostIndex
   systemSwitchLoggingDgHostIpType
   systemSwitchLoggingDgHostIpAddr
```

swlog console level

Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

swlog console level {*num* **| alarm | alert | debug1 | debug2 | debug3 | error | info | off | warning }**

Syntax Definitions

console level *num*	The severity level filter keyword or numeric value for the application ID. *(see table for* **swlog appid** *command).*
alarm	Sets the log level to display highest severity. (The system is about to crash and rebbot)
alert	Sets the log level to display on console when a violation has occured.
debug1	Sets the log level to display normal event debug message to be displayed on console.
debug2	Sets the log level to display a debug-specific message to be displayed on console.
debug3	Sets the log level to display all debug messages on the console.
error	Sets the log level to display on console when system functionality is reduced.
info	Sets the log level to display any other non-debug message on the console.
off	Sets the log level as disabled. No logs are displayed on the console.
warning	Sets the log level to display on console when an unexpected, non-critical event has occurred.

Defaults

parameter	default
console level *num*	**6 (info)**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show swlog** command to display the console display level.

Examples

```
-> swlog console level 5
-> swlog console level info
```

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.
show log events	Displays customer event logs on the switch.
show log events output	Captures all event log to a specified file name on the switch.

MIB Objects

```
systemSwitchLogging
   systemSwitchLoggingConsoleLevel
```

show log events

Displays customer event logs on the switch.

show log events

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display customer event logs.

Examples

```
-> show log events
2019 Apr 28 19:17: 8.83  : CMM : ChassisSupervisor : chassisTrapsAlert - CERTIFY w/
FLASH SYNCHRO process started
2019 Apr 28 19:17:32.697 : CMM : ChassisSupervisor : chassisTrapsAlert - CERTIFY
process completed successfully
2019 Apr 28 19:21:33.154 : CMM : ChassisSupervisor : chassisTrapsAlert - ACTIVATE
process scheduled
2019 Apr 28 19:21:57.462 : CMM : ChassisSupervisor : System Reboot
2019 Apr 28 19:25:25.302 : CMM : ChassisSupervisor : chassisTrapsAlert - Power
supply is OK
2019 Apr 28 19:25:25.303 : CMM : ChassisSupervisor : The switch was restarted by
the user
2019 Apr 28 19:25:25.304 : CMM : ChassisSupervisor : chassisTrapsAlert - CMM
startup completed
```

output definitions

The log output is in the following format: <SWLOG TIMESTAMP> : <CMM>/<NI> : <MODULE_NAME> : <LOG_DESCRIPTION>

Release History

Release 8.6R1; command was introduced.

Related Commands

show log events output	Captures all event log to a specified file name on the switch.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

N/A

show log events output

Captures all event log to a specified file name on the switch.

show log events output *filename*

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to capture all event log to a filename.
- All the logs related to customer events will be appended “CUSTLOG” to the prefix to differentiate events from normal debug logs.

Examples

```
-> show log events output /flash/myevents
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show log events	Displays customer event logs on the switch.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

N/A

51 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

Filename: ALCATEL-IND1-HEALTH-MIB.mib
Module: alcatelIND1HealthMonitorMIB

A summary of the available commands is listed here:

health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and flash usage.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user.

health threshold {rx *percent* **| txrx** *percent* **| memory** *percent* **| cpu** *percent* **| flash** *percent***}**

Syntax Definitions

rx	Specifies the maximum input (RX) traffic threshold.
txrx	Specifies the maximum output/input (TX/RX) traffic threshold.
memory	Specifies the maximum RAM memory usage threshold.
cpu	Specifies the maximum CPU usage threshold.
flash	Specifies the maximum flash usage threshold.
percent	The new threshold value, in percent, for the corresponding resource (**rx**, **txrx**, **memory**, **cpu, flash**). The valid range is 1–100.

Defaults

parameter	default
percentage	80

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to page 51-5, or refer to the chapter titled “Diagnosing Switch Problems” in the *OmniSwitch AOS Release 8 Network Configuration Guide*.
- To view the current health threshold values, use the **show health configuration** command.

Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

Release History

Release 7.1.1; command introduced.

Related Commands

show health configuration	Displays the current health threshold settings.

MIB Objects

```
HealthThreshInfo
   healthThreshDeviceRxLimit
   healthThreshDeviceTxRxLimit
   healthThreshDeviceMemoryLimit
   healthThreshDeviceCpuLimit
   healthThreshFlashLimit
```

health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

health interval *seconds*

Syntax Definitions

seconds	Sampling interval (in seconds). Valid entries are 10, 12, 15, 20, 30.

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Decreasing the polling interval may impact switch performance.

Examples

```
-> health interval 20
```

Release History

Release 7.1.1; command introduced.

Related Commands

show health	Displays the current health sampling interval.

MIB Objects

```
HealthThreshInfo
   healthSamplingInterval
```

show health configuration

Displays current health configuration settings.

show health configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show health configuration
Rx Threshold                  = 80,
TxRx Threshold                = 80,
CPU Threshold                 = 80,
Memory Threshold              = 80,
Flash Threshold               = 80,
Sampling Interval (Secs)      = 10
```

output definitions

Rx Threshold	The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *incoming traffic* on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the **health threshold** command.
TxRx Threshold	The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *all incoming and outgoing traffic*. As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the **health threshold** command.
CPU Threshold	Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the **health threshold** command.

output definitions (continued)

Memory Threshold	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the **health threshold** command.
Flash Threshold	Displays the current flash usage threshold. The default value is 80 percent and can be changed using the **health threshold** command.
Sampling Interval	Displays the sampling interval time period in seconds. Sampling interval can be changed using the **health interval** command.

Release History

Release 7.1.1; command introduced.

Related Commands

health threshold	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage and CPU usage.
health interval	Configures the sampling interval between health statistics checks.

MIB Objects

```
HealthThreshInfo
   healthThreshDeviceRxLimit
   healthThreshDeviceTxRxLimit
   healthThreshDeviceMemoryLimit
   healthThreshDeviceCpuLimit
```

show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

show health [port *chassis/slot/port* **| slot** *chassis/slot***[-***slot2***]] [statistics]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	To view a specific port, enter the slot and port number (3/1) along with the **port** keyword (port 3/1).
*slot***[-***slot2***]**	To view a series of slots, enter the range of slot numbers along with the **slot** keyword (1-10).
statistics	Optional command syntax. It displays the same information as the **show health** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

Examples

```
-> show health
CMM                  Current    1 Min    1 Hr   1 Day
Resources                       Avg      Avg    Avg
-------------------+---------+-------+------+-------
CPU                      0      0       0      0
Memory                  30      30     24     24

-> show health port 1/1/24
Port 1/1/24     Limit  Current  1 Min   1 Hr  1 Day
Resources              Avg      Avg     Avg
---------------+-----+--------+-------+-----+-------
Receive          80     01       01      01    01
Transmit/Receive 80     01       01      01    01
```

output definitions

Receive	Traffic received by the switch.
Transmit/Receive	Traffic transmitted and received by the switch.
Memory	Switch memory.
CPU	Switch CPU.

output definitions (continued)

Limit	Currently configured device threshold levels.
Curr	Current device bandwidth usage.
1 Min Avg	Average device bandwidth usage over a 1-minute period.
1 Hr Avg	Average device bandwidth usage over a 1-hour period.
1 Hr Max	Maximum device bandwidth usage over a 1-hour period (the maximum of the 1 minute averages).

Release History

Release 7.1.1; command introduced.
Release 8.5R1; **Limit** output field included.

Related Commands

show health all	Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

MIB Objects

```
healthModuleTable
   healthModuleSlot
   healthModuleRxLatest
   healthModuleRx1MinAvg
   healthModuleRx1HrAvg
   healthModuleRx1HrMax
   healthModuleRxTxLatest
   healthModuleRxTx1MinAvg
   healthModuleRxTx1HrAvg
   healthModuleRxTx1HrMax
   healthModuleMemoryLatest
   healthModuleMemory1MinAvg
   healthModuleMemory1HrAvg
   healthModuleMemory1HrMax
   healthModuleCpuLatest
   healthModuleCpu1MinAvg
   healthModuleCpu1HrAvg
   healthModuleCpu1HrMax
```

show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

show health all {memory | cpu | rx | txrx}

Syntax Definitions

memory	Displays the RAM memory health statistics for all active NI modules in the switch.
cpu	Displays the CPU health statistics for all active NI modules.
rx	Displays the health statistics for traffic *received* on all active NI modules.
txrx	Displays the health statistics for traffic both *transmitted and received* on all active NI modules.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show health all memory

* - current value exceeds threshold

                         1 Min  1 Hr  1 Hr
Memory              Curr   Avg    Avg   Max
-----------------+-------+------+------+-----
01                   40     40    40    40
02                   40     40    40    40
03                   40     40    40    40
04                   40     40    40    40
05                   40     40    40    40
06                   40     40    40    40
07                   40     40    40    40
13                   40     40    40    40
```

output definitions

Memory (Cpu, TXRX, RX)	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if **show health all cpu** is entered, **Cpu** is used as the column header.
Curr	Current usage of the resource on the corresponding slot, in percent (the amount of the total resource bandwidth actually being used by the switch applications).
1 Min Avg	Average usage of the resource on the corresponding slot over a one minute period.
1 Hr Avg	Average usage of the resource on the corresponding slot over a one hour period.
1 Hr Max	The highest average hourly usage for the resource on the corresponding slot.

Release History

Release 7.1.1; command introduced.

Related Commands

show health	Displays the health statistics for the switch.
health threshold	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, and CPU usage.

MIB Objects

```
healthModuleTable
   healthModuleSlot
   healthModuleRxLatest
   healthModuleRx1MinAvg
   healthModuleRx1HrAvg
   healthModuleRx1HrMax
   healthModuleRxTxLatest
   healthModuleRxTx1MinAvg
   healthModuleRxTx1HrAvg
   healthModuleRxTx1HrMax
   healthModuleMemoryLatest
   healthModuleMemory1MinAvg
   healthModuleMemory1HrAvg
   healthModuleMemory1HrMax
   healthModuleCpuLatest
   healthModuleCpu1MinAvg
   healthModuleCpu1HrAvg
   healthModuleCpu1HrMax
```

52 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

Filename: Alcatel-IND1-ETHERNET-OAM-MIB.mib
Module: alcatelIND1EoamMIB

Filename: IEEE8021-CFM-MIB.mib
Module: ieee8021CfmMib

A summary of the available commands is listed here:

EthOAM vlan Configuration Commands	**ethoam vlan**
EthOAM Domain Configuration Commands	**ethoam domain** **ethoam domain mhf** **ethoam domain id-permission**
EthOAM Management Association Configuration Commands	**ethoam association** **ethoam association primary vlan** **ethoam association mhf** **ethoam association id-permission** **ethoam association ccm-interval** **ethoam association endpoint-list** **clear ethoam statistics**
EthOAM Default-Domain Configuration Commands	**ethoam default-domain level** **ethoam default-domain mhf** **ethoam default-domain id-permission** **ethoam default-domain primary-vlan**
EthOAM Management Point Configuration Commands	**ethoam endpoint** **ethoam endpoint admin-state** **ethoam endpoint rfp** **ethoam endpoint ccm** **ethoam endpoint priority** **ethoam endpoint lowest-priority-defect**

EthOAM Loopback and Linktrace Commands	**ethoam linktrace** **ethoam loopback**
EthOAM Timer Configuration Commands	**ethoam fault-reset-time**
EthOAM Performance Monitoring Configuration Commands	**ethoam one-way-delay** **ethoam two-way-delay** **clear ethoam**
EthOAM Show Commands	**show ethoam** **show ethoam domain** **show ethoam domain association** **show ethoam domain association end-point** **show ethoam default-domain configuration** **show ethoam default-domain** **show ethoam remote-endpoint domain** **show ethoam cfmstack** **show ethoam linktrace-reply** **show ethoam linktrace-tran-id** **show ethoam vlan** **show ethoam statistics** **show ethoam config-error** **show ethoam one-way-delay** **show ethoam two-way-delay**

ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

ethoam vlan *vlanid_list* **primary-vlan** *vlan_id*

no ethoam vlan *vlanid_list*

Syntax Definitions

vlanid_list	A list of VLAN Identifiers (e.g.,'10 30-40' or '10').
vlan_id	VLAN Identifier (e.g., '20').

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either 'mhf' is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan *vlan_id*) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

Examples

```
-> ethoam vlan 10 primary-vlan 20
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam vlan	Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

MIB Objects

```
dot1agCfmVlanTable
   dot1agCfmVlanComponentId
   dot1agCfmVlanVid
   dot1agCfmVlanPrimaryVid
   dot1agCfmVlanRowStatus
```

ethoam domain

Creates an Ethernet domain with a specific name.

ethoam domain *md_name* **format {none | dnsname | mac-address-uint | string} level** *num*

no ethoam domain *name*

Syntax Definitions

md_name	Specifies the domain name.
none	This format is supported for the inter-op with ITU-T Y.1731.
dnsname	Domain Name like string, globally unique text string derived from a DNS name.
mac-address-unit	MAC address + 2-octet (unsigned) integer.
string	Character String.
num	MD Level and it ranges from 0 to 7.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Maximum domain length is 43.
- Use format as ‘none’ for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs, and MIPs configured in the MD.

Examples

```
-> ethoam domain MD format none level 3
-> ethoam domain MD1 format string level 4
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam	Displays the information of all the Management Domains (MD) configured on the bridge.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdFromat
   dot1agCfmMdLevel
```

ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

ethoam domain *md_name* **mhf {none** | **explicit** | **default}**

Syntax Definitions

md_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
default	MHFs can be created.

Defaults

parameter	default
none | explicit | default	**none**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD mhf default
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam	Displays the information of all the Management Domains (MD) configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdMhfCreation
```

ethoam domain id-permission

Configures the ID-permission value for MD entry.

ethoam domain *md_name* **id-permission {none | chassisid}**

Syntax Definitions

md_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.System name shall be filled as Chassis ID.

Defaults

parameter	default
none | chassisid	**none**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD id-permission chassisid
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdIdPermission
```

ethoam association

Creates Maintenance Association (MA) entry.

ethoam association *ma_name* **format {vpnid | unsignedint | string | primaryvid | icc-based} domain** *md_name*

no ethoam association *ma_name* **domain** *md_name*

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
vpnid	As specified in RFC 2685 VPN ID.
unsignedint	2-octet unsigned integer.
string	Character String.
primaryvid	Primary VLAN ID (12 bits represented in a 2-octet integer).
icc-based	This format is supported for inter-op with ITU-T.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as ‘icc-based’ to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the **no** form of the command to delete the Maintenance Association (MA) entry.

Examples

```
-> ethoam association MA format string domain MD
-> no ethoam association MA format string domain MD
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetFormat
   dot1agCfmMaNetName
   dot1agCfmMaNetRowStatus
dot1agCfmMaCompTable
   dot1agCfmMaComponentId
   dot1agCfmMaCompPrimaryVid
   dot1agCfmMaCompRowStatus
```

ethoam association primary vlan

Creates a primary VLAN for the Maintenance Association (MA) entry.

ethoam association *ma_name* **domain** *md_name* **primary-vlan** *vlan_id*

no ethoam association *ma_name* **domain** *md_name* **primary-vlan** *vlan_id*

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
vlan_id	Primary VLAN Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Domain must be created before the creation of MA.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the **no** form of the command to remove the Primary VLAN association.

Examples

```
-> ethoam association MA domain MD primary-vlan 100
-> no ethoam association MA domain MD primary-vlan 100
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaCompTable
   dot1agCfmMaComponentId
   dot1agCfmMaCompPrimaryVid
   dot1agCfmMaCompRowStatus
```

ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

ethoam association *ma_name* **domain** *md_name* **mhf {none | default | explicit | defer}**

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdMhfCreation'.

Defaults

parameter	default
none | explicit | default | defer	**defer**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANS associated with this primary VID.

Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.
show ethoam default-domain	Displays the information of the default MA.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMhfCreation
```

ethoam association id-permission

Configure id-permission value for MA Entry.

ethoam association *ma_name* **domain** *md_name* **id-permission {none | chassisid | defer}**

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
defer	The contents of the Sender ID TLV are determined by the corresponding MD object 'dot1agCfmMdIdPermission'.

Defaults

parameter	default
none |chassisid | defer	**defer**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

MA must be created before it is modified.

Examples

```
-> ethoam association MA domain MD id-permission defer
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMIdPermission
```

ethoam association ccm-interval

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

ethoam association *ma_name* **domain {***md_name* | *mac_address***} ccm-interval {interval-invalid | interval100ms | interval1s | interval10s | interval1m | interval10m}**

Syntax Definitions

ma_name	Name of the Ethernet OAM Association.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 52-5.
interval-invalid	Specifies that no CCMs are sent by a MEP.
interval100ms	Specifies the CCMs are sent every 100 milli seconds.
interval1s	Specifies that CCMs are sent every 1 second.
interval10s	Specifies that CCMs are sent every 10 seconds.
interval1m	Specifies that CCMs are sent every minute.
interval10m	Specifies that CCMs are sent every 10 minutes.

Defaults

parameter	default
interval-invalid | **interval100ms** | **interval1s** | **interval10s** | **interval1m** | **interval10m**	**interval10s**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The *ma_name* should be unique amid all those used by or available to the service provider within a domain.

Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMIdPermission
```

ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

ethoam association *ma_name* **domain {***md_name* | *mac_add***} endpoint-list** *mep_id***[**-*mep_id2***]**

no ethoam association *ma_name* **domain {***md_name* | *mac_add***} endpoint-list** *mep_id***[**-*mep_id2***]**

Syntax Definitions

ma_name	Name of the Ethernet OAM Association.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 52-5.
mac_add	Specifies the CFM system MAC address.
*mep_id***[**-*mep_id2***]**	Specifies the MEP number. Use a hyphen to specify a range of MEP numbers.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma_name* should be unique within a domain.

Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
    dot1agCfmMdName
dot1agCfmMaNetTable
    dot1agCfmMaNetName
Dot1agCfmMaMepList
    dot1agCfmMaMepListIdentifier
    dot1agCfmMaMepListRowStatus
```

clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

clear ethoam statistics [domain *md_name* **association** *ma_name* **endpoint** *mep_id***]**

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mep_id	MEP Identifier. Valid Range is 1-8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Statistics are cleared for all MEPs if a specific MEP is not entered with this command.

Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam statistics	Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMepTable
   dot1agCfmMepIdentifier
   alaCfmMepClearStats
   alaCfmGlobalClearStats
```

ethoam default-domain level

Configure the effective level of all default domain entries with the level value set to **no level**.

ethoam default-domain level *num*

no ethoam default-domain

Syntax Definitions

num	The MD level value. The valid range is 0-7.

Defaults

Default value is 0.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The MD level specified with this command applies to all default domain values that are currently set to **no level**.

Examples

```
-> ethoam default-domain level 1
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.

MIB Objects

```
Dot1agCfmDefaultMdLevel
```

ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

ethoam default-domain mhf {none | default | explicit}

no ethoam default-domain

Syntax Definitions

none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.

Defaults

Default value is none.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain mhf default
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.

MIB Objects

```
dot1agCfmDefaultMdDefMhfCreation
```

ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

ethoam default-domain id-permission {none | chassisid}

no ethoam default-domain

Syntax Definitions

none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

Defaults

Default value is none.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain id-permission chassisid
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the default domain configuration.

MIB Objects

```
dot1agCfmDefaultMdDefIdPermission
```

ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

ethoam default-domain primary-vlan {*vlan_id***} [level {no-level | *num*}] [mhf {none | default | explicit | defer}] [id-permission {none | chassisid | defer}]**

no ethoam default-domain

Syntax Definitions

vlan_id	VLAN Identifier.
no-level	MD level is inherited from the default domain level.
num	MD Level. Valid range is 0 to 7.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	MHF defers to the default domain MHF value.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype, and Chassis ID TLV are to be present.
defer	ID permission defers to the default domain ID permission value.

Defaults

parameter	default
no-level | *num*	**no-level**
none | **explicit** | **default** | **defer**	**defer**
none | **chassisid** | **defer**	**defer**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANs associated with this primary VID.

Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassid level 3 mhf default.
-> ethoam default-domain primary-vlan 10 id-permission chassid
-> ethoam default-domain primary-vlan 10 level 3
-> ethoam default-domain primary-vlan 10 mhf default
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

Release History

Release 7.3.1; command was introduced..

Related Commands

show ethoam default-domain Displays the information of all the default MD.

MIB Objects

```
dot1agCfmDefaultMdTable
   dot1agCfmDefaultMdComponentId
   dot1agCfmDefaultMdPrimaryVid
   dot1agCfmDefaultMdLevel
```

ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

ethoam endpoint *mep_id* **domain** *md_name* **association** *ma_name* **direction {up | down} {port** *chassis/slot/port* **| virtual | linkagg** *agg_id***} [primary-vlan** *vlan_id***]**

no ethoam endpoint *mep_id* **domain** *md_name* **association** *ma_name*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Association name for the created Ethernet OAM Association.
up	For UP MEP.
down	For DOWN MEP.
chassis	The chassis identifier.
slot/port	Physical slot and port number on which MEP needs to be created.
virtual	Keyword for creating virtual MEP.
agg_id	Linkagg Identifier on which MEP needs to be created.
vlan_id	VLAN Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
- For creating a virtual MEP the value of port must be given the keyword “virtual”.

Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> no ethoam endpoint 10 domain MD association MA
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
dot1agCfmMaNetTable
   dot1agCfmMaNetName

   dot1agCfmMepIdentifier
   dot1agCfmMepDirection
   dot1agCfmMepIfIndex
   dot1agCfmMepPrimaryVid
```

ethoam endpoint admin-state

Configures the administrative state of MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **admin-state {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables MEP.
disable	Administratively disables MEP.

Defaults

The default value is disable.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The *mep_id* specified must already exist in the switch configuration.

Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```
Dot1agCfmMep
   dot1agCfmMepIndex
   dot1agCfmMepIdentifier
   dot1agCfmMepDirection
   dot1agCfmMepPortNumber
   dot1agCfmMepMacAddress
   dot1agCfmMepAdminStatus
   dot1agCfmMepFngState
   dot1agCfmMepCcmEnabled
   dot1agCfmMepCcmTransmitting
   dot1agCfmMepCcmLtmPriority

   dot1agCfmMepCcmStreamError
   dot1agCfmMepCcmStreamOther
   dot1agCfmMepRdiReceived
   dot1agCfmMepLastCcmMaFault
   dot1agCfmMepLastCcmCrossConnFault
   dot1agCfmMepCcmOut
   dot1agCfmMepLbmNextSeqNumber
   dot1agCfmMepLbrIn
   dot1agCfmMepLbrInOutOfOrder
   dot1agCfmMepLbrOut
   dot1agCfmMepLtmNextSeqNumber
   dot1agCfmMepLtmIn
   dot1agCfmMepLtrOut
   dot1agCfmMepDefectsPresent
   dot1agCfmMepDefectsAbsent
   dot1agCfmMepRowStatus
```

ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **rfp {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables RFP on MEP.
disable	Administratively disables RFP on MEP.

Defaults

The default value of RFP is disable.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The *mep_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

   dot1agCfmRfpEnabled
```

ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **ccm {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.
enable	Enables MEP to generate CCMs.
disable	Disables MEP to generate CCMs.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA ccm enable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

ethoam endpoint priority

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **priority** *ccm_ltm_priority*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
ccm_ltm_priority	Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

Defaults

parameter	default
ccm_ltm_priority	7

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA priority 6
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

ethoam endpoint lowest-priority-defect

Configures the lowest priority fault alarm for the lowest priority defect for a MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **lowest-priority-defect** *lowest_priority_defect*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
lowest_priority_defect	The lowest priority defect that can generate a Fault alarm. Possible values are **xcon**, **rem-err-xcon**, **no-defect**, **mac-rem-err-xcon**, **err-xcon**, and **all-defect**.

Defaults

parameter	default
lowest_priority_defect	mac-rem-err-xcon

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain esd.ale.com association ale-sales lowest-priority-
defect all-defect
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

ethoam linktrace {target-macaddress *mac_address* **| target-endpoint** *t_mepid***} source-endpoint** *s_mepid* **domain {***md_name* | *mac_address***} association** *ma_name* **[flag [fdb-mpdb | fdbonly]] [hop-count** *hop_count***]**

Syntax Definitions

mac_address	Target MAC address to be transmitted.
t_mepid	Specifies the MEP for which the Loopback message is targeted.
s_mepid	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
domain *mac_address*	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
fdbonly	Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
hop_count	Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2^32.

Defaults

parameter	default
flag	**fdbonly**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD
association flag fdbonly hop-count 32
Transaction Id: 6943

-> ethoam linktrace target-endpoint 15 source 4 domain MD association
Transaction Id: 6934
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain	Displays the information of a specified Management Domain configured on the bridge.

MIB Objects

   dot1agCfmMepTransmitLtmTargetlsMepId
   dot1agCfmMepTransmitLtmTtl
   dot1agCfmMepTransmitLtmResult
   dot1agCfmMepTransmitEgressIdentifier
```

ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

ethoam loopback {target-endpoint *t_mepid* **| target-macaddress** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[number** *num***] [data** *string***] [vlan-priority** *vlan_priority***] [drop-eligible {true | false}]**

Syntax Definitions

t_mepid	Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
mac_address	Target MAC address to be transmitted.
s_mepid	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
num	Number of loopback messages. The valid range is 1-10.
string	Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255.
vlan_priority	VLAN Priority. The valid range is 0-7.
true	Sets the drop eligibility bit in the VLAN tag to true.
false	Sets the drop eligibility bit in the VLAN tag to false.

Defaults

parameter	default
num	1
vlan_priority	CCM priority
drop-eligible {true | false}	**true**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms
Reply form 00:0E:B1:6B:43:89: bytes=64 seq=0 time=112ms
Request timed out.
----00:E0:B1:6B:43:89 ETH-LB Statistics----
3 packets transmitted, 2 packets received, 33% packet loss
round-trip (ms)  min/avg/max = 100/106/112
```

ethoam fault-alarm-time

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

ethoam fault-alarm-time *centiseconds* **endpoint** *mep_id* **domain** *md_name* **association** *ma_name*

no ethoam fault-alarm-time endpoint *mep_id* **domain** *md_name* **association** *ma_name*

Syntax Definitions

centiseconds	The Fault Notification Generation Alarm timeout value, in centi seconds. The valid range is 250–1000.
mep_id	Specifies the MEP of a specific MA. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
centiseconds	250

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.ale.com association
ale_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.ale.com association ale_sales
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```
Dot1agCfmMep
   dot1agCfmMepFngAlarmTime
```

ethoam fault-reset-time

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

ethoam fault-reset-time *centiseconds* **endpoint** *mep_id* **domain** *md_name* **association** *ma_name*

no ethoam fault-reset-time endpoint *mep_id* **domain** *ma_name* **association** *ma_name*

Syntax Definitions

centiseconds	The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
mep_id	Specifies the MEP of a specific MA. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
centiseconds	1000

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.ale.com association
ale_sales
-> no ethoam fault-reset-time end-point 100 domain esd.ale.com association
ale_sales
```

Release History

Release 7.3.1; command was introduced.

Related Commands

   dot1agCfmMepFngResetTime
```

ethoam one-way-delay

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

ethoam one-way-delay {target-endpoint *t_mepid* **| target-macaddress** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[vlan- priority** *vlan_priority***]**

Syntax Definitions

t_mepid	Target MEP ID. The valid range is 1-8191.
mac_address	Target MAC address.
s_mepid	Source MEP ID. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
vlan_priority	VLAN Priority. The valid range is 0-7.

Defaults

parameter	default
vlan_priority	7

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating 1DM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP_OK or RMEP_FAILED, before initiating 1DM. So **target-macaddress** can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the 1DM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP's VLAN.
- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

Release History

Release 7.3.1; command was introduced.

Related Commands

   alaCfmMepOWDTMepIdentifier
   alaCfmMepOWDTPriority
```

ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

ethoam two-way-delay {target-endpoint *t_mepid* **| target-macaddress** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[vlan- priority** *vlan_priority***]**

Syntax Definitions

t_mepid	Target MEP ID. The valid range is 1-8191.
mac_address	Target MAC address.
s_mepid	Source MEP ID. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
vlan_priority	VLAN Priority. The valid range is 0-7.

Defaults

parameter	default
vlan_priority	7

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP_OK or RMEP_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure an SAA for continuous two-way frame delay measurement.

Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply form 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

Release History

Displays the information of all the Management Domains (MD) configured on the bridge.

show ethoam

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

This command displays all the MAs for all the MDs.

Examples

```
-> show ethoam
System Configuration
  Ethernet OAM system mac address: 00:D0:95:EC:84:B0,
  Number of Maintenance Domains: 1
    Maintenance Domain: esd.ale.com
        Maintenance Association: ale-sales
```

output definitions

Ethernet OAM system mac address	The MAC address of the Ethernet OAM system.
Number of Maintenance Domains	The number of maintenance domains configured on the bridge.
Maintenance Domain	The name of the maintenance domain.
Maintenance Association	The name of the maintenance association.

Release History

Release 7.3.1; command was introduced.

      MA-IdPermission : sendIdNone,
      CCM-interval : interval10s,
      MEP-List(MEP-Id) : 10
```

output definitions

MD-level	The level at which the MD was created.
MD-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MD. Options include **none, explicit,** or **default**.
Maintenance Association	The name of the maintenance association.
Vlan	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
MA-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MA. Options include **none, explicit,** or **default**.

output definitions (continued)

CCM-interval	The interval between the CCM transmissions.
MEP-Id	Indicates the Maintenance End Point.

show ethoam domain association end-point

Displays the information of a specific MEP in a Management Domain configured on the bridge.

show ethoam domain *md_name* **association** *ma_name* **end-point** *mep_id*

Syntax Definitions

md_name	Specifies the management domain name.
ma_name	Specifies the name of the Ethernet OAM Association.
mep_id	Specifies the MEP of a specific MA. The valid range is 1–8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ethoam domain MD association MA endpoint 10
Admin State : disable,
Direction : up,
Slot/Port: virtual,
MacAddress: 00:E0:B1:A0:78:A3,
Fault Notification : FNG_RESET,
CCM Enabled : disabled,
RFP Status : enabled,
CCM Linktrace Priority : 7,
CCM Not Received : false,
CCM Error defect : false,
CCM Xcon defect : false,
MEP RDI defect : false,
MEP Last CCM Fault : not specified,
MEP Xcon Last CCM Fault : not specified,
MEP Error Mac Status : false,
MEP Lbm NextSeqNumber : 0,
MEP Ltm NextSeqNumber : 32157,
Fault Alarm Time : 250,
Fault Reset Time : 1000,
Lowest PrDefect Allowed : DEF_MAC_REM_ERR_XCON,
Highest PrDefect Present : DEF_NONE
```

output definitions

Admin State	Indicates the administrative state **(up** or **down**) of the MEP.
Direction	The direction of the MEP.

output definitions (continued)

Slot/Port	The slot/port number of the Bridge port to which the MEP is attached. If the value is virtual, it indicates a virtual port.
MAC Address	The MAC address of the MEP.
Fault Notification	Indicates the current state of the MEP Fault Notification Generator State Machine, which can be **FNG_RESET**, **FNG_DEFECT**, **FNG_REPORT_DEFECT**, **FNG_DEFECT_REPORTED**, or **FNG_DEFECT_CLEARING**.
RFP Status	Indicates the status of the RFP.
CCM Enabled	Indicates whether the MEP generates CCMs (**enabled**) or not (**disabled**).
CCM Linktrace Priority	Indicates the priority value for CCMs and LTMs transmitted by the MEP.
CCM Not Received	Indicates if CCMs are not being received (**true**) or received (**false**) from at least one of the configured remote MEPs.
CCM Error defect	Indicates if a stream of erroneous CCMs is being received (**true**) or not (**false**) from a MEP in this MA.
CCM Xcon defect	Indicates if a stream of CCMs is being received (**true**) or not (**false**) from a MEP that belongs to another MA.
MEP RDI Received	Indicates that any other MEP in this MA is transmitting the RDI bit. Options include **true** or **false**.
MEP Last CCM Fault	The last-received CCM that triggered a MA fault.
MEP Xcon Last CCM Fault	The last-received CCM that triggered a cross-connect fault.
MEP Error Mac Status	Indicates a port status TLV. Options include **true** or **false**.
MEP Lbm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LBM.
MEP Ltm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LTM.
Fault Alarm Time	The time interval during which one or more defects should be detected before the fault alarm is issued
Fault Reset Time	The time interval during which the fault alarm is re-enabled to process faults
Lowest PrDefect Allowed	The lowest priority defect that allowed to generate fault alarm.
Highest PrDefect Present	The highest priority defect since the MEPs Fault Notification Generator in reset state.

Release History

Release 7.3.1; command was introduced.

show ethoam default-domain configuration

Displays the level, MHF, and ID permission values for the default domain.

show ethoam default-domain configuration

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ethoam default-domain configuration
Level : 3,
MHF-Creation : mhfdefault,
ID-Permission : sendIdnone
```

output definitions

Level	The level assigned to the default domain. Configured through the **ethoam default-domain level** command.
MHF-creation	Indicates the MHF value for a VLAN that is part of the default MD Options include **none**, **explicit**, or **default**. Configured through the **ethoam default-domain mhf** command.
ID-Permission	The ID permision of the default domain. Configured through the **ethoam default-domain id-permission** command.

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain	Displays the primary VLAN configuration for the default domain.

MIB Objects

```
dot1agCfmMaDefaultMdDefLevel
   dot1agCfmMaDefaultMdDefMhfCreation
   dot1agCfmMaDefaultMdDefIdPermission
```

show ethoam default-domain

Displays all the default MD information for all the primary VLANs or for a specific primary VLAN.

show ethoam default-domain [primary-vlan *vlan_id***]**

Syntax Definitions

vlan_id	The primary VLAN ID.

Defaults

By default, the default MD information for all primary VLANs is displayed.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *vlan_id* parameter with this command to view information about the default MD for a specific primary VLAN.

Examples

```
-> show ethoam default-domain

Primary-Vlan   Mhf-creation    Level      Id-Permission Status
--------------+-------------+-----------+--------------+--------
      1        mhfDefer       no-level    sendIdDefer    true
      10       mhfDefault         3       sendIdNone     true

-> show ethoam default-domain primary-vlan 10
Primary-Vlan   Mhf-creation    Level      Id-Permission  Status
--------------+-------------+-----------+--------------+--------
      10        mhfDefault        3       sendIdNone     true
```

output definitions

Primary Vlan	The primary VLAN ID of the default MD.
Mhf-creation	The primary VLAN ID MHF value (**none**, **explicit**, or **default**).
Level	The primary VLAN level (**no-level**, **0–7**).
Id-Permission	The primary VLAN ID permission (**none**, **chassid**, or **defer**).

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam default-domain primary-vlan	Modifies the default domain for the specified primary VLAN.

show ethoam remote-endpoint domain

Displays the information of all remote MEPs learned as a part of the CCM message exchange.

show ethoam remote-endpoint domain *md_name* **association** *ma_name* **end-point** *s_mepid* **[remote-mep** *r_mepid***]**

Syntax Definitions

md_name	Specifies the domain name.
ma_name	Specifies the name of the Ethernet OAM Association.
s_mepid	Specifies the MEP of a specific MA. The valid range is 1–8191.
r_mepid	The remote MEP. The valid range is 1–8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ethoam remote-endpoint domain MD association MA endpoint 10
Legends: PortStatusTlv: 1 = psBlocked, 2 = psUp, 0 = psNoTlv
         InterfaceStatusTlv: 1 = ifUp, 2 = ifDown, 4 = ifUnknown, 0=ifNoTlv

RMEP-ID RMEP     OkFailed  Mac Address    port I/f   RDI   Ch-id  Ch-id
        Status    Time                   Tlv  Tlv  value Subtype
------+---------+------+----------------+---+----+-----+--------+------
  20   RMEP_OK   634600 00:E0:B1:6E:41:65  2   1   false LCL-ASND DUT-1
  30   RMEP_OK   334600 00:E0:B1:6E:41:64  2   1   false LCL-ASND DUT-2
```

output definitions

MEP-ID	Indicates the Maintenance End Point.
RMEP Status	The operational state of the remote MEP Remote State machines for this MEP, which can be **RMEP_IDLE**, **RMEP_START**, **RMEP_FAILED**, or **RMEP_OK**.
OkFailed Time	The time (SysUpTime) when the Remote MEP state machine last entered either the **RMEP_FAILED** or **RMEP_OK**.
MacAddress	The MAC address of the remote MEP.
Port Status Tlv	The MAC status TLV last received.
I/f Status Tlv	The interface status TLV last received.

Note: Output shown above is not accurate as it is adjusted to display it in the single row. Following are modified:
P/S Tlv - Port Status Tlv
I/F Tlv - I/F Status Tlv
Ch-id Subtype - Chassis ID Subtype
Ch-id - Chassis ID
LCL-ASND - LOCALLY_ASSIGNED

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam cfmstack

Displays the contents of CFM Stack Managed Object, which determines the relationships among MEPs and MIPs on a specific bridge port.

show ethoam cfmstack {port *chassis/slot/port* **| virtual | linkagg** *agg_id***}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Slot and port number for which the contents of the configured MEP or MIP will be displayed.
virtual	Virtual port.
agg_id	The aggregate ID for which the contents of the configured MEP or MIP will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ethoam cfmstack port 1/3
Up MHF Configured:
  Vlan-id: 100,
  Direction:  up,
  MAC-Address: 00:D0:95:EC:84:B0,

  MD-level: 3

-> show ethoam cfmstack port virtual
MEP-Id 32 - Vlan 30:
  Direction: up,
  MAC-Address: 00:E0:B1:A5:F2:34,
  Maintenance Association: MA4,
  Maintenance Domain: MD4,
  MD-level: 4
```

output definitions

Vlan-id	The VLAN ID to which the MEP is attached.
Direction	Indicates the direction (**Inward** or **Outward)** of the Maintenance Point (MP) on the Bridge port.
MAC-Address	The MEP ID configured on this port.
Maintenance Domain	The name of the maintenance domain.
Maintenance Association	The name of the maintenance association.
MD-level	The MD level at which the MD was created.

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam endpoint admin-state	Creates an Ethernet OAM Maintenance End Point in the specified MA.

show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

show ethoam linktrace-reply domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **tran-id** *num*

Syntax Definitions

md_name	Specifies the domain name.
ma_name	Name of the Ethernet OAM Association.
s_mepid	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.
num	Specifies the Transaction ID or sequence number returned from a previously transmitted LTM.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- "LTM operation successful. Target is reachable." – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- "LTM operation unsuccessful. Target not reachable." – This message suggests that LTM is successfully initiated but the target is not reachable.
- "LTM operation unsuccessful. Target is reachable." – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- "LTM operation in progress." – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- "LTM Timed out."- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
Ttl : 63,
  LTM Forwarded : yes,
  Terminal MEP : no,
  Last Egress Identifier : 00-00:00:D0:95:EA:79:62,
  Next Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
  Relay Action : RLY_FDB,
  Chassis ID Subtype : LOCALLY_ASSIGNED,
```

```
  Chassis ID : DUT-2,
  Ingress Action : ING_OK,
  Ingress Mac : 00:D0:95:EA:9E:D4,
  Ingress Port ID Subtype : LOCALLY_ASSIGNED,
  Ingress Port ID : 1/1,
  Egress Action : EGR_OK,
  Egress Mac : 00:D0:95:EA:9E:D5,
  Egress Port ID Subtype : LOCALLY_ASSIGNED,
  Egress Port ID : 1/2

Ttl : 62,
  LTM Forwarded : no,
  Terminal MEP : yes,
  Last Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
  Next Egress Identifier : 00-00:00:00:00:00:00:00:00,
  Relay Action : RLY_HIT,
  Chassis ID Subtype : LOCALLY_ASSIGNED,
  Chassis ID : DUT-3,
  Ingress Action : ING_OK,
  Ingress Mac : 00:D0:95:EA:AB:D2,

  Egress Action : EGR_NONE,
  Egress Mac : 00:00:00:00:00:00,
  Egress Port ID Subtype : NONE,
  Egress Port ID : none
```

output definitions

Ttl	Time to live field for the returned LTR.
LTM Forwarded	Indicates whether the LTM was forwarded or not.
Terminal MEP	Indicates whether the MP reported in the reply Ingress/Egress TLV is a MEP.
Last Egress Identifier	Identifies the MEP linktrace initiator that originated, or the responder that forwarded, the LTM to which this LTR is the response.
Next Egress Identifier	Identifies the linktrace responder that transmitted this LTR, and can forward the LTM to the next hop.
Relay Action	Indicates how the dataframe targeted by the LTM would be passed to Egress bridge port. Options include **RLY_HIT**, **RLY_FDB**, or **RLY_MPDB**.
Ingress Action	Indicates how the dataframe targeted by the LTM would be received on the receiving MP. Options include **ING_NONE**, **ING_OK**, **ING_DOWN**, **ING_BLOCKED**, or **ING_VID**.
Ingress Mac	The MAC address returned in the ingress MAC address field.
Egress Action	Indicates how the dataframe targeted by the LTM would be passed through Egress bridge port. Options include **ING_NONE**, **ING_OK**, **ING_DOWN**, **ING_BLOCKED**, or **ING_VID**.
Egress Mac	The MAC address returned in the egress MAC address field.

Release History

show ethoam linktrace-tran-id

Displays the transaction identifiers returned by previously generated LTMs from a specified MEP.

show ethoam linktrace-tran-id domain {*md_name* | *mac_address***} association** *ma_name* **endpoint** *mep_id*

Syntax Definitions

md_name	Specifies the domain name.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association.
mep_id	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ethoam linktrace-tran-id domain esd.ale.com association ale-sales endpoint
3
S.No   Transaction Id
-------+----------------------
      1    13357,
      2    13358,
      3    13359,
```

output definitions

S.No	Indicates the sequence number.
Transaction Id	Indicates the Transaction Identifier returned from a previously transmitted LTM.

Release History

10       1/2    CFMleak
30       1/2    CFMleak

-> show ethoam config-error vlan 10 port 1/2
vlan    port   error-type
------+------+------------
10       1/2    CFMleak
```

output definitions

vlan	VLAN identifier number.
port	Physical slot and port number.
error-type	Type of an error.

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam linktrace	Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

MIB Objects

```
dot1agCfmConfigErrorListTable
   dot1agCfmConfigErrorListVid
   dot1agCfmConfigErrorListIfIndex
   dot1agCfmConfigErrorListErrorType
```

show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

show ethoam one-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **[mac-address** *mac_address***]**

Syntax Definitions

md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
s_mepid	Source MEP ID. The valid range is 1–8191.
mac_address	MAC Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Dash (‘-‘) in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when 1DM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

Examples

```
-> show ethoam one-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value

Remote Mac address            Delay (us)  Jitter (us)
--------------------------+-------------+--------------------------------
00:d0:95:ef:44:44              2369          1258
00:d0:95:ef:66:88              5896           282
00:d0:95:ef:88:88              2584           -
00:d0:95:ef:66:55              2698          4782

-> show ethoam one-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value

Remote Mac address       Delay (us)   Jitter (us)
-------------------+-------------+-------------------
00:d0:95:ef:44:44        2369           1258
```

output definitions

Remote Mac address	Remote MAC address.
Delay	Physical slot and port number.
eJitter	Type of an error.

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam one-way-delay	Initiates one-way-delay messages from a particular MEP to an RMEP.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMepTable
   dot1agCfmMepIdentifier
alaDot1agCfmMepDelayRsltTable

   alaCfmMepDelayVariation
```

show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

show ethoam two-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **[mac-address** *mac_address***]**

Syntax Definitions

md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
s_mepid	Source MEP ID. The valid range is 1–8191.
mac_address	MAC Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If ‘0’ appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash (‘-‘) appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

Examples

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID   Delay (us)     Jitter (us)
------------------+--------+-------------+-------------
 00:d0:95:ef:44:44   12         2369          1258

-> show ethoam two-way-delay domain MD association MA endpoint 10 remote-mep 0
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address
```

```
Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:66:88    0         5896   282
 00:d0:95:ef:88:88    0         2584   1856

-> show ethoam two-way-delay domain MD association MA endpoint 10 remote-mep 15
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:66:55   15         2736     -

-> show ethoam two-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:44:44   12         2369  1258
 00:d0:95:ef:66:88    0         5896   282
 00:d0:95:ef:88:88    0         2584   1856
 00:d0:95:ef:66:55   15         2736     -
```

output definitions

Remote Mac address	Remote MAC address.
RMEP-ID	Value of RMEP-ID
Delay	Physical slot and port number.
Jitter	Type of an error.

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam two-way-delay	Initiate two-way-delay messages from a particular MEP to an RMEP using target-endpoint or target-MAC address.

53 LINK OAM Commands

Ethernet in the First Mile (EFM), also known as LINK OAM, is a collection of protocols specified in IEEE 802.3ah, defining Ethernet in the access networks that connects subscribers to their immediate service provider. EFM, EFM-OAM and LINKOAM refers to IEEE 802.3ah standard.

LINK OAM (operation, administration, and maintenance) is a tool which monitors Layer-2 link status on the network by sending OAM protocol data units (OAMPDUs) between the network devices. OAMPDUs contain control and status information used to monitor, test and troubleshoot OAM-enabled links. By enabling LINK OAM on switch ports, network administrators can monitor the link-related issues on the first mile. LINK OAM provides network administrators the ability to monitor link performance, remote fault detection and remote loopback control.

Note. EFM (LINK OAM) does not include functions such as station management, bandwidth allocation or provisioning functions.

MIB information for the EFM (LINK OAM) commands is as

Filename: alcatel-ind1-dot3-oam-mib.mib
Module: ALCATEL-IND1-DOT3-OAM-MIB

Filename: dot3-oam-mib.mib
Module: DOT3-OAM-MIB

A summary of the available commands is listed here:

Global Configuration Commands	**efm-oam admin-state** **efm-oam multiple-pdu-count** **efm-oam errored-frame-seconds-summary** **efm-oam errored-frame-period** **efm-oam errored-frame**
Port Status Commands	**efm-oam port admin-state** **efm-oam port mode** **efm-oam port propagate-events**
Port Event Notification Commands	**efm-oam errored-frame** **efm-oam errored-frame-period** **efm-oam errored-frame-seconds-summary**
Timer Interval Commands	**efm-oam port keepalive-interval** **efm-oam port hello-interval**

Remote Loopback Commands	**efm-oam port remote-loopback** **efm-oam port remote-loopback start** **efm-oam port l1-ping**
Show Commands	**show efm-oam port** **show efm-oam port detail** **show efm-oam port remote detail** **show efm-oam port history** **show efm-oam port l1-ping detail** **show efm-oam port statistics** **show efm-oam configuration**
Clear Commands	**clear efm-oam statistics** **clear efm-oam log-history**

efm-oam admin-state

Enables or disables the LINK OAM protocol on the switch.

efm-oam admin-state {enable | disable}

Syntax Definitions

enable	Enables the LINK OAM protocol.
disable	Disables the LINK OAM protocol.

Defaults

By default, the LINK OAM protocol is disabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- When LINK OAM is disabled globally, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.

Examples

```
-> efm-oam admin-state enable
-> efm-oam admin-state disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port admin-state	Enables or disables LINK OAM protocol on the specified port or on a range of ports.
efm-oam port mode	Configures the LINK OAM mode on the port or on the range of ports to active or passive.
show efm-oam configuration	Displays the global LINK OAM configuration.

MIB Objects

```
alaDot3OamStatus
```

efm-oam port admin-state

Enables or disables LINK OAM protocol on the specified port or on a range of ports.

efm-oam port *chassis/slot/port* **[**-*port2***] admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number of the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.
enable	Enables LINK OAM protocol on the specified port.
disable	Disables LINK OAM protocol on the specified port.

Defaults

By default, the LINK OAM protocol is disabled on all ports for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- If LINK OAM is disabled for the port or globally disabled for the switch, any OAMPDUs received are discarded.
- When LINK OAM is disabled for the port, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.
- LINK OAM is not supported on the mirroring ports.
- In link aggregates, LINK OAM is supported on an individual aggregable port only.

Examples

```
-> efm-oam port 1/1/1 admin-state enable
-> efm-oam port 1/1/1 admin-state disable
-> efm-oam port 2/1/1-10 admin-state enable
-> efm-oam port 2/1/1-4 admin-state disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port mode	Configure a LINK OAM mode on the port or on the range of ports to active or passive.
show efm-oam configuration	Displays the global LINK OAM configuration.
show efm-oam port	Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.
show efm-oam port detail	Displays the configuration and other related parameters for a port.

MIB Objects

```
dot3OamTable
   dot3OamAdminState
```

efm-oam port mode

Configures the LINK OAM mode on the port or on the range of ports to active or passive.

efm-oam port *chassis/slot/port***[**-*port2***] mode {active | passive}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.
active	Configures the LINK OAM mode to active.
passive	Configures the LINK OAM mode to passive.

Defaults

By default, LINK OAM mode is set to active on all ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- LINK OAM discovery process is never initiated from a port when it is in passive mode. At least one of the two peer ports should be in active mode.
- An active port will respond to Loopback-control OAMPDUs only if the peer EFM-OAM client is also in active mode.

Examples

```
-> efm-oam port 1/1/1 mode active
-> efm-oam port 1/1/1 mode passive
-> efm-oam port 2/1/1-10 mode active
-> efm-oam port 2/1/1-4 mode passive
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port admin-state	Enables or disables LINK OAM protocol on the specified port or on a range of ports.
show efm-oam port	Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.
show efm-oam configuration	Displays the global LINK OAM configuration.

MIB Objects

```
dot3OamTable
   dot3OamMode
```

efm-oam port keepalive-interval

Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.

efm-oam port *chassis/slot/port***[***-port2***] keepalive-interval** *seconds*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.
seconds	Specifies the keep-alive interval value in seconds. The range for this interval is 5 to 120 seconds.

Defaults

By default, the keep-alive interval value is 5 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Even if unsupported OAMPDU is received on the port, keep-alive timer is reset on the port.
- To set the timer to its default value, set 5 seconds as the keepalive-interval.

Examples

```
-> efm-oam port 1/1/1 keepalive-interval 10
-> efm-oam port 2/1/1-10 keepalive-interval 10
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port hello-interval	Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of a LINK OAM enabled port.
show efm-oam port detail	Displays the configuration and other related parameters for a port.

MIB Objects

```
alaDot3OamTable
   alaDot3OamKeepAliveInterval
```

efm-oam port hello-interval

Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of an LINK OAM enabled port.

efm-oam port *chassis/slot/port***[**-*port2***] hello-interval** *seconds*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-*port2*	Specifies the last port in the range of ports.
seconds	Specifies the time interval (in seconds) this port waits before sending out the next hello packet.The range for this timer is 1 to 60 seconds.

Defaults

By default, the hello-interval value is set to 1 second.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Use the hello-interval value of 1 second to reset the timer to its default value.
- On a given port, hello interval time period should not be more than half of keep alive timer on the peer port.

Examples

```
-> efm-oam port 1/1/1 hello-interval 5
-> efm-oam port 2/1/1-10 hello-interval 10
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port hello-interval	Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of a LINK OAM enabled port.
efm-oam port keepalive-interval	Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.
show efm-oam port detail	Displays the configuration and other related parameters for a port.

MIB Objects

```
alaDot3OamTable
   alaDot3OamHelloInterval
```

efm-oam port remote-loopback

Specifies whether loopback requests from peers are processed or ignored on the specified port.

efm-oam port *chassis/slot/port***[**-*port2***] remote-loopback {process | ignore}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.
process	Processes incoming loopback request from peer LINK OAM port.
ignore	Ignore (discard) incoming loopback requests.

Defaults

By default, the incoming loopback requests are ignored.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- When the remote-loopback is in **process** mode, the session started by peer LINK OAM client will be processed by local LINK OAM port. As a result, remote port will be in remote-loopback state and the local port will be local-loopback state.
- When the remote-loopback is in **ignore** mode, the session started by peer LINK OAM will not be processed by the local port.

Examples

```
-> efm-oam port 1/1/1 remote-loopback process
-> efm-oam port 1/1/1 remote-loopback ignore
-> efm-oam port 2/1/1-10 remote-loopback process
-> efm-oam port 2/1/1-4 remote-loopback ignore
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port remote-loopback start	Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.
show efm-oam port detail	Displays the LINK OAM configuration and other related parameters for a port.
show efm-oam port remote detail	Displays the configuration and details of the related parameters of the remote port.

MIB Objects

```
dot3OamLoopbackTable
   dot3OamLoopbackIgnoreRx
```

efm-oam port remote-loopback start

Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.

efm-oam port *chassis/slot/port* **remote-loopback {start | stop}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
start	Specifies whether to start the loopback request.
stop	Specifies whether to stop the loopback request.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Before issuing this command, the LINK OAM port has to be in active mode and discovery of peer ports has to be completed.
- When loopback is started from a port towards a peer port which is configured to ignore the loopback request, the loopback response timer will timeout and no error is displayed. In such case, verify the loopback-state of two ports by using the command **show efm-oam port remote detail**.
- The maximum number of simultaneous loopback sessions supported per network interface is 2. If a third loopback is started through CLI, an error will be displayed at the CLI prompt.

Examples

```
-> efm-oam port 1/1/1 remote-loopback start
-> efm-oam port 1/1/1 remote-loopback stop
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port remote-loopback	Specifies an action that should perform when a loopback request is received from the peer on a port or on a range of ports.
show efm-oam port remote detail	Displays the configuration and details of the related parameters of the remote port.
show efm-oam configuration	Displays the global LINK OAM configuration.

MIB Objects

```
dot3OamLoopbackTable
   dot3OamLoopbackStatus
```

efm-oam port propagate-events

Configures whether or not the specified port or range of ports will propagate local event notifications to the remote peer.

efm-oam port *chassis/slot/port***[**-*port2***] propagate-events {critical-event | dying-gasp} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-*port2*	Specifies the last port in the range of ports.
critical-event	Configures the notification status for critical events.
dying-gasp	Configures the notification status for dying gasp events.
enable	Enables the notification of critical-event or dying-gasp events to the peer.
disable	Disables the notification of critical-event or dying-gasp events to the peer.

Defaults

By default, the notification status for both critical-event and dying-gasp events is set to enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- When the system is set for critical event or a dying-gasp event, the local OAM entity indicates the event through the OAMPDU flags to its peer OAM entity.
- In case of port admin down, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific port actually goes down.
- In case of takeover or reload of the switch, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific device actually goes down.
- The information PDUs with dying gasp bit set is transmitted towards peer as soon as link-down is detected at NI. However, if there is a link flap (i.e link comes again) before the expiry of link-flap timer, then normal information PDU transmission with dying-gasp bit reset shall resume. This will cause clearing of alarms or trap on the peer port.

Examples

```
-> efm-oam port 1/1/1 propagate-events critical-event enable
-> efm-oam port 1/1/1 propagate-events critical-event disable
-> efm-oam port 2/1/1-10 propagate-events dying-gasp enable
```

```
-> efm-oam port 2/1-4 propagate-events dying-gasp disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port remote detail	Displays the configuration and details of the related parameters of the remote port.
show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

MIB Objects

```
dot3OamEventConfigTable
   dot3OamDyingGaspEnable
   dot3OamCriticalEventEnable
```

efm-oam errored-frame-period

Configures the threshold, window frame values and the status for notification when the number of frame-errors exceed the threshold in a given period of time (specified) by window. When the number of frame errors exceeds a threshold within a given window defined by a number of frames (for example, 10 frames out of 1000 had errors), an Errored Frame Period event is generated.

efm-oam port *chassis/slot/port***[**-*port2***] errored-frame-period [threshold** *threshold_symbols***] [window** *window_frames***] [notify {enable | disable}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	The last port number in a range of ports that you want to configure on the same slot.
threshold_symbols	Specifies the frame error threshold number. The range supported is 1 to maximum 4 byte integer value (4294967295).
window_frames	Specifies the number of frames used to define a window within which the frame period errors are measured.
enable	Enables notification of the Errored Frame Period event.
disable	Disables notification of the Errored Frame Period event.

Defaults

parameter	default
threshold_symbols	1 frame error
enable | disable	enable

The default for *window_frames* depends on the port-types. The default, minimum and maximum supported values for various port-types are:

port-type	default value	minimum value	maximum value
100 mbps	200000	20000	12000000
1000 X	2000000	200000	120000000
1000 T	2000000	200000	120000000
10 Gig	20000000	2000000	1200000000

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

- The command can be issued in any order like window, threshold, and notify. However, at least one option needs to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

Examples

```
-> efm-oam port 1/1/1 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 1/1/1 errored-frame-period notify disable
-> efm-oam port 2/1/1-4 errored-frame-period threshold 1 window 3000000 notify
enable
-> efm-oam port 2/1/1-2 errored-frame-period notify disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam errored-frame	Configures the threshold, window and notify-status for errored-frame on a port. The frame-period measures the frame-errors, within a specified window of time.
efm-oam errored-frame-seconds-summary	Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.
show efm-oam port detail	Displays the Errored Frame Period Event threshold, window, and notification parameter values for a port.

MIB Objects

```
dot3OamEventConfigTable
   dot3OamErrFramePeriodWindow
   dot3OamErrFramePeriodThreshold
   dot3OamErrFramePeriodEvNotifEnable
```

efm-oam errored-frame

Configures an error frame threshold or window on a LINK OAM port and set notification status for errored frame events. When the number of frame errors exceeds a threshold within a given window defined by a period of time (for example, 10 frames in 1 second had errors), an Errored Frame Event is generated.

efm-oam port *chassis/slot/port***[**-*port2***] errored-frame [threshold** *threshold_symbols***] [window** *window_seconds***] [notify {enable | disable}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	The last port number in a range of ports that you want to configure on the same slot.
threshold_symbols	Specifies the frame error threshold number.
window_seconds	Specifies the window of time, in which the frame errors will be measured. The duration should be in units of 100ms.
enable	Enables notification of the Errored Frame event.
disable	Disables notification of the Errored Frame event.

Defaults

parameter	default
threshold_symbols	1 frame error
window_seconds	1 second (10 dsec)
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- The various options, threshold, window and notify can be issued in any order. However, at least one option has to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

Examples

```
-> efm-oam port 1/1/1 errored-frame threshold 10 window 32 notify enable
-> efm-oam port 1/1/1 errored-frame notify disable
-> efm-oam port 2/1/1-4 errored-frame threshold 10 window 32 notify enable
-> efm-oam port 2/1/1-2 errored-frame notify disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam errored-frame-seconds-summary	Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port.
efm-oam errored-frame-period	Configures the threshold, window and notify-status for errored-frame-period errors on a port. The errored-frame-period measures the frame-errors, within a specified window of frames.
show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

MIB Objects

```
dot3OamEventConfigTable
   dot3OamErrFrameWindow
   dot3OamErrFrameThreshold
   dot3OamErrFrameEvNotifEnable
```

efm-oam errored-frame-seconds-summary

Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.

efm-oam port *chassis/slot/port***[**-*port2***] errored-frame-seconds-summary [threshold** *threshold_seconds***] [window** *window_seconds***] [notify {enable | disable}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	The last port number in a range of ports that you want to configure on the same slot.
threshold_symbols	Specifies the frame error threshold number.
window_seconds	Specifies the window of time in which the frame errors will be measured.
enable	Enables notification of the Errored Frame Seconds Summary event.
disable	Disables notification of the Errored Frame Seconds Summary event.

Defaults

parameter	default
threshold_symbols	1 errored frame second
window_seconds	60 seconds. (600 dsec).
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- The various options, threshold, window and notify can be issued in any order. However, at least one option has to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

Examples

```
-> efm-oam port 1/1/1 errored-frame-seconds-summary threshold 1 window 700 notify
enable
-> efm-oam port 1/1/1 errored-frame-seconds-summary notify disable
-> efm-oam port 2/1/1-4 errored-frame-seconds-summary threshold 1 window 700 notify
enable
-> efm-oam port 2/1/1-2 errored-frame-seconds-summary notify disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam errored-frame	Configures the threshold, window and notify-status for errored-frame on a port. The frame-period measures the frame-errors, within a specified window of time.
efm-oam errored-frame-period	Configures the threshold, window and notify-status for errored-frame-period errors on a port. The errored-frame-period measures the frame-errors, within a specified window of frames.
show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

MIB Objects

```
dot3OamEventConfigTable
   dot3OamErrFrameSecsSummaryWindow
   dot3OamErrFrameSecsSummaryThreshold
   dot3OamErrFrameSecsEvNotifEnable
```

efm-oam multiple-pdu-count

Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

efm-oam multiple-pdu-count *count*

Syntax Definitions

count	Specifies the number of PDUs that have to be sent in case of event-notification TLVs. The range is 1 to 10 PDUs.

Defaults

By default, the PDU-count value is set to 3.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> efm-oam multiple-pdu-count 5
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam configuration	Displays the global LINK OAM configuration.
show efm-oam port remote detail	Displays the configuration and details of the related parameters of the remote port.

MIB Objects

```
alaDot3OamMultiplePduCount
```

efm-oam port l1-ping

Configures the number of frames to be sent by the current LINK OAM port to the remote port's MAC address (l1 ping) and the delay between each consecutive sent frames and to start the ping operation.

efm-oam port *chassis/slot/port* **l1-ping [num-frames** *number***] [delay** *milliseconds***] [start]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module.
number	Specifies the number of frames that needs to be sent during ping operation. The allowed range of numbers is between 1 to 20.
milliseconds	Specifies time interval between two consecutive PDUs. The allowed range of delay is between 100 to 1000 milliseconds.
start	Specifies to start the ping operation.

Defaults

parameter	default
number	5 frames
milliseconds	1000 milliseconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- The command is valid only when the LINK OAM is enabled globally, port is in active mode, discovery is done, and the port is in remote loopback mode.
- L1 ping can be started only when the port is in remote loopback mode.

Examples

```
-> efm-oam port 1/1/12 l1-ping num-frames 6 delay 300 start
-> efm-oam port 1/1/20 l1-ping num-frames 12 delay 500 start
-> efm-oam port 1/1/15 l1-ping num-frames 5 delay 100 start
-> efm-oam port 1/1/15 l1-ping num-frames 4 delay 200 start
-> efm-oam port 1/1/5 l1-ping num-frames 100 delay 300 start
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port l1-ping detail	Displays the frames lost during a loopback session.
show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

   alaDot3OamPortL1PingFramesReceived
   alaDot3OamPortL1PingAverageRoundTripDelay
```

show efm-oam configuration

Displays the global LINK OAM configuration.

show efm-oam configuration

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use this command to display the global configuration of LINK OAM.

Examples

```
-> show efm-oam configuration
EFM OAM Status                : enabled,
Multiple PDU Count            : 5
```

Output fields are described here:

output definitions

EFM OAM status	The current administrative status of LINK OAM on this switch (**Enabled** or **Disabled**).
Multiple PDU Count	The number of PDUs sent when LINK OAM needs to send multiple Event Notification.

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam admin-state	Enables or disables the LINK OAM protocol on the switch.
show efm-oam port detail	Displays the LINK OAM configuration and other related parameters for a port.

```
alaDot3OamStatus
   alaDot3OamMultiplePduCount
```

show efm-oam port

Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.

show efm-oam port [*chassis/slot/port1-port2***] [enable | disable] [active | passive]**

Syntax Definitions

chassis	The chassis identifier.
slot/port1	The slot number for the module and the physical port number on that module.
-port2	The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3).
enable	Specifies whether to display the LINK OAM enabled ports.
disable	Specifies whether to display the LINK OAM disabled ports.
active	Specifies whether to display the LINK OAM active ports.
passive	Specifies whether to display the LINK OAM passive ports.

Defaults

By default, displays the LINK OAM status on all ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use this command to display the state of LINK OAM on the basis of enabled or disabled port and on the basis of active or passive port.

Examples

```
-> show efm-oam port
Port   EFM-OAM Status      Mode  Operational Status  Loopback Status
-------+---------------+---------+------------------+---------------
1/1/1          enabled    active     operational           remoteLoopback
1/1/2         disabled    active     activeSendLocal       noLoopback
1/1/3          enabled   passive     activeSendLocal       noLoopback
1/1/4         disabled    active     activeSendLocal       noLoopback
1/1/5         disabled    active     activeSendLocal       noLoopback
1/1/6         disabled    active     activeSendLocal       noLoopback
1/1/7         disabled    active     activeSendLocal       noLoopback

-> show efm-oam port 1/1-5
Port   EFM-OAM Status      Mode  Operational Status  Loopback Status
-------+---------------+---------+------------------+---------------
1/1/1          enabled    active     operational           remoteLoopback
1/1/2         disabled    active     activeSendLocal       noLoopback
1/1/3          enabled   passive     activeSendLocal       noLoopback
```

```
1/1/4         disabled    active     activeSendLocal       noLoopback
1/1/5         disabled    active     activeSendLocal       noLoopback

-> show efm-oam port 1/1-3 enabled
Port   Mode       Operational Status   Loopback Status
-------+---------------+---------+------------------+----------------
1/1/1   active     operational          remoteLoopback
1/1/3   passive    activeSendLocal      noLoopback

-> show efm-oam port enabled
Port         Mode  Operational Status  Loopback Status

1/1/1      active     activeSendLocal   remoteLoopback
1/1/3     passive     activeSendLocal       noLoopback
1/1/7     passive     activeSendLocal       noLoopback

-> show efm-oam port disabled
Port         Mode  Operational Status  Loopback Status
---------+--------+------------------+----------------
1/1/2      active     activeSendLocal       noLoopback
1/1/4     passive     activeSendLocal       noLoopback
1/1/5      active     activeSendLocal       noLoopback

-> show efm-oam port enabled passive
Port   Operational Status  Loopback Status
---------+--------+------------------+----------------
1/1/3   activeSendLocal       noLoopback
1/1/7   activeSendLocal       noLoopback

-> show efm-oam port active
Port   EFM-OAM Status   Operational Status  Loopback Status
------+----------------+--------------------+-------+----------------
1/1/1    enabled         activeSendLocal      remoteLoopback
1/1/2    disabled        activeSendLocal      noLoopback
1/1/3    enabled         activeSendLocal      noLoopback
1/1/4    disabled        activeSendLocal      noLoopback
1/1/5    disabled        activeSendLocal      noLoopback
1/1/6    disabled        activeSendLocal      noLoopback
1/1/7    disabled        activeSendLocal      noLoopback
```

Output fields are described here:

output definitions

Port	Displays the chassis/slot/port number.
EFM-OAM Status	The state of the EFM-OAM. LINK OAM instance can have any of the following status. • **Enabled :** Specifies that the LINK OAM is disabled on the interface. • **Disabled** : Specifies that the LINK OAM is disabled on the interface.

output definitions (continued)

Operational Status	The status of the port in discovering whether the peer has LINK OAM capability or not.It has the following states: • **activeSendLocal**: Specifies that the LINK OAM port is actively trying to discover whether the peer has LINK OAM capability but has not yet made that determination. • **sendLocalAndRemote**: Specifies that the local LINK OAM port has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device will then decide that the peer device is acceptable or unacceptable and then accept or decline LINK OAM peering. • **sendLocalAndRemoteOk**: Specifies the state when LINK OAM peering is allowed by the local port. • **oamPeeringLocallyRejected**: Specifies the state when the local OAM entity rejects the peer OAM entity. • **oamPeeringRemotelyRejected**: Specifies the state when the remote LINK OAM port rejects the peering. • **operational**: Specifies the state when the local LINK OAM port learns that both the local LINK OAM entity and the remote LINK OAM entity have accepted the peering. • **nonOperHalfDuplex**: Specifies the value nonOperHalfDuplex is returned whenever LINK OAM is enabled. Since LINK OAM functions are not designed to work completely over half-duplex interfaces, the value nonOperHalfDuplex is returned whenever LINK OAM is enabled but the interface is in half-duplex operation. • **linkFault**: Specifies that the link between the host and the peer has detected a fault. • **passiveWait**: Specifies that the LINK OAM ports are in passive mode.
Loopback Status	The state of remote loopback. It can be **initiatingLoopback**, **terminatingLoopback**, **localLoopback**, **remoteLoopback, noLoopback**, or **unknown**.
Mode	The state of LINK OAM mode, **active** or **passive**.

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam multiple-pdu-count	Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

show efm-oam port detail

Displays the LINK OAM configuration and other related parameters for a port.

show efm-oam port *chassis/slot/port* **detail**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use this command when you want to get LINK OAM configuration details for a specific port.

Examples

```
-> show efm-oam port 1/1/1 detail
OAM Status                   : enable,

errored-frame-seconds-summary   600 dsec          1  framesec      enable
```

Output fields are described here:

output definitions

OAM Status	The state of LINK OAM on the port.
Operational Status	The state of the port in discovering whether the peer has LINK OAM capability or not.
Mode	The state of LINK OAM mode on the port, **active** or **passive**.
Max OamPDU size	Displays the maximum OAMPDU that the LINK OAM port can support.
Config Revision	Displays the configuration revision of the LINK OAM port as reflected in the latest OAMPDU sent by the peer port.
Functions Supported	Displays the LINK OAM functions supported by the specified port.
Loopback Status	Displays the loopback status of the specified LINK OAM port.
Loopback Rx Status	The action that should be performed by the LINK OAM port when a loopback request is received from the peer port.
Max OamPDUs	Specifies the maximum OAMPDUs that can be exchanged between two peers.
KeepAlive Interval	Displays the timeout interval of the specified LINK OAM port for the dynamically learned peer port.
Hello Interval	Displays the time interval between two OAMPDUs in seconds.
Dying Gasp Notify Status	The state of notification for dying gasp events, **enable** or **disable**.
Critical Event Notify Status	The state of notification for critical events, **enable** or **disable.**
Link Monitoring	Displays the errors detected on the remote link.
Window	The frame error event window in the received OAMPDU.
Threshold	The number of errored frames in the period required for the event to be generated.
Notify Status	The state of notification for LINK OAM errors on the port, **enable** or **disable**.

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port	Displays the status of LINK OAM on all the ports in the system, along with other relevant information like OAM mode, operational status and loopback status of the port.

show efm-oam port statistics

Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

show efm-oam port *chassis/slot/port***[**-*port2***] statistics**

show efm-oam port statistics

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module
-port2	The last port number in a range of ports that you want to configure on the same slot.

Defaults

By default, the statistics of all ports are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use the **port** parameter to display the statistics of a specific port.

Examples

```
-> show efm-oam port 1/1/1 statistics
Port 1/1/1:
  Information OAMPDU Tx                  : 1035,

show efm-oam port remote detail

Displays the LINK OAM configuration and details of the related parameters of the remote port.

show efm-oam port *chassis/slot/port* **remote detail**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

N/A.

Examples

```
-> show efm-oam port 1/1/1 remote detail
Remote MAC address  : 00:30:96:fd:6b:fa,
Remote Vendor (info): 0x15a1
Remote Vendor (oui) : XYZ
Mode                : active,
Max OAMPDU size     : 1518,
Config Revision     : 0,
Functions Supported : loopbackSupportEventSupport
```

Output fields are described here:

output definitions

Remote MAC address	Displays the MAC address of the remote peer.
Remote Vendor (info)	Displays the vendor number in hexadecimal of the remote peer.
Remote Vendor (oui)	Displays the Organizationally Unique Identifier (OUI) number of the remote peer.
Mode	The state of LINK OAM mode on the remote port, **active** or **passive**.
Max OAMPDU size	Displays the maximum OAMPDU size that the remote LINK OAM port can support.
Config Revision	Displays the configuration revision of the remote LINK OAM port.
Functions Supported	Displays the LINK OAM functions supported by the remote port.

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port history	Displays the log of events that have occurred on a port. This command can also be used to display specific event logs on a port.
clear efm-oam statistics	Clears the LINK OAM statistics on a port.

show efm-oam port history

Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

show efm-oam port *chassis/slot/port* **history [log-type { link-fault | errored-frame | errored-frame-period | errored-frame-seconds | dying-gasp | critical}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module.
link-fault	Displays link fault event logs. Specifies the loss of signal is detected by the receiver. This is sent once per second in the Information OAMPDU
errored-frame	Displays errored-frame event log. an errored frame event occurs when the number of detected error frames over a specific interval exceeds the predefined threshold.
errored-frame-period	Displays an errored-frame-period event logs. An errored frame period event occurs if the number of frame errors in specific number of received frames exceeds the predefined threshold.
errored-frame-seconds	Displays errored-frame-seconds event logs. When the number of error frame seconds detected on a port over a detection interval reaches the error threshold, an errored frame seconds event occurs.
dying-gasp	Specifies an unrecoverable condition (e.g., a power failure).
critical	Specifies a crucial event that has occurred on the port.

Defaults

By default, all log types are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Timestamp will be in following format:

DAY MON Date hh:mm:ss yyyy

Examples

```
-> show efm-oam port 1/1/1 history
Legend: Location: * - Remote, # - Local
LogID   TimeStamp                Log Type          Event
                                                   Total
------+------------------------+-------------+-------+----+
*    1     TUE JAN 06 19:44:51 2009   linkFault       1
#    2     TUE JAN 06 19:45:51 2009   erroredFrame    1
```

```
-> show efm-oam port 1/1/1 history log-type link-fault
Legend: Location: * - Remote, # - Local
LogID   TimeStamp                    Event
                                     Total
-----+---------+---------+------+-----------+
*   1      TUE JAN 06 19:46:51 2009     1
#   2      TUE JAN 06 19:46:51 2009     1
```

Output fields are described here:

output definitions

LogID	Specifies individual events within the event log.
Timestamp	The value of actual time at the time of the logged event.
Log Type	Specifies the type of event log.
Event Total	Specifies the total number of times one or more of these occurrences have resulted in an Event Notification.

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
clear efm-oam log-history	Clears the LINK OAM event logs history on a port.

```

show efm-oam port l1-ping detail

Displays the frames lost during a loopback session.

show efm-oam port *chassis/slot/port* **l1-ping detail**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

The command can also be used even on a port on which LINK OAM is not enabled.

Examples

```
-> show efm-oam port 1/1/1 l1-ping detail
frames configured              = 5,
frames delay(msec)             = 100,
L1 ping status                 = Sucessful,
frames sent                    = 4,
frames received                = 4,
avg delay (msec)               = 5
-> show efm-oam port 1/1/4 l1-ping detail
frames configured              = 5,
frames delay(msec)             = 200,
L1 ping status                 = Successful,
frames sent                    = 4,
frames received                = 2,
avg delay (msec)               = 15
```

Output fields are described here:

output definitions

frames configured	Specifies the number of frames that are sent during l1-ping.
delay configured	Specifies the delay between transmission of two consecutive frames during L1 ping.
L1 ping status	The status of the L1 ping operation. The status can be **Successful**, **Unsuccessful** or **default.**
frames sent	Specifies the frames sent during last L1 ping.

output definitions (continued)

frames received	Specifies the frames received during last L1 ping.
average delay	Specifies the average delay taken by frames during last L1 ping.

Release History

Release 8.5R4; command was introduced.

Related Commands

efm-oam port l1-ping	Configures the number of frames that needs to be sent during L1-ping, the delay between each consecutive sent frames and to start the L1-ping operation.

MIB Objects

   alaDot3OamPortL1PingFramesReceived
   alaDot3OamPortL1PingAverageRoundTripDelay
```

clear efm-oam statistics

Clears the LINK OAM statistics on a port, range of ports or all ports.

clear efm-oam statistics [port *chassis/slot/port***[**-*port2*]]

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.

Defaults

By default, the statistics are cleared for all the ports if no port is specified in the command.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

Examples

```
-> clear efm-oam statistics
-> clear efm-oam statistics port 1/1/1
-> clear efm-oam statistics port 2/1/1-3
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
clear efm-oam log-history	Clears the LINK OAM event logs history on a port.

MIB Objects

```
alaDot3OamGlobalClearStats
   alaDot3OamStatsTable
   alaDot3OamPortClearStats
```

clear efm-oam log-history

Clears the LINK OAM event logs history a port, range of ports or all ports.

clear efm-oam log-history [port *chassis/slot/port***[**-*port2*****]]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
-port2	Specifies the last port in the range of ports.

Defaults

By default, the event logs are cleared for all the ports if no port is specified in the command.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

Examples

```
-> clear efm-oam log-history
-> clear efm-oam log-history port 1/1/1
-> clear efm-oam log-history port 2/1/1-3
```

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port statistics	Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
show efm-oam port history	Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

MIB Objects

```
alaDot3OamGlobalClearEventLogs
   alaDot3OamEventLogTable
   alaDot3OamPortClearEventLogs
```

54 CPE Test Head Commands

The Customer Provider Edge (CPE) Test Head traffic generator and analyzer is a Test-OAM (Operation, Administration, and Maintenance) tool used in the Metro Ethernet Network to validate the customer Service Level Agreements (SLA). This functionality allows the operator to validate the Metro Ethernet Network between customer end points, which is critical when provisioning or troubleshooting network services.

This implementation of CPE Test Head supports unidirectional and bidirectional ingress tests. Traffic is generated at the UNI port as if the traffic was generated from a test head connected to the UNI port. This validates the actual customer SLA by subjecting the test traffic to the ingress QoS defined at the UNI port (Ethernet SAP profile or QoS policy rules for priority and bandwidth control) and the egress QoS defined at the egress NNI port and carrier network.

The CPE test is non-disruptive to traffic running on other UNI ports that are associated with the same SAP profile as the test UNI port. All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This is important to consider when analyzing test results.

The feature provides a multi-stream test capability. The CPE multi-test feature is supported on non-metro switches with metro license. The feature supports a stack containing up to eight switches.

Multi-stream test requires a free port. The port must not be used and not have any configuration. When a multi-stream test starts, the port is made out of service. The port is made operational again and the configuration is retained when the test is stopped.

MIB information for the CPE Test Head commands are:

Filename: alcatelIND1testoam.mib
Module: ALCATEL-IND1-TEST-OAM-MIB

A summary of available commands is listed here:

Single-test	**test-oam** **test-oam direction** **test-oam src-endpoint dst-endpoint** **test-oam port** **test-oam vlan test-frame** **test-oam role** **test-oam duration rate packet-size** **test-oam frame** **test-oam l2-saa** **test-oam start stop** **test-oam remote-sys-mac** **test-oam statistics flash-logging** **show test-oam** **show test-oam saa statistics** **clear test-oam statistics**
Multi-test	**test-oam group** **test-oam group tests** **test-oam feeder** **test-oam group src-endpoint dst-endpoint** **test-oam group role** **test-oam group port** **test-oam group direction** **test-oam group duration rate** **test-oam group start stop** **test-oam group remote-sys-mac** **show test-oam group** **show test-oam group statistics** **clear test-oam group statistics**

test-oam

Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.

test-oam *string* **[descr** *description***]**

no test-oam *string*

Syntax Definitions

string	The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.
description	The description to assign to the test name, an alphanumeric string between 1 and 32 characters.

Defaults

parameter	default
description	DEFAULT

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test configuration.
- This command creates a new CPE test profile that is identified by the test name. Make sure the name specified does not exist in the switch configuration.
- A maximum of 32 tests can be configured.
- Only one test can be active on the switch at any given time.

Examples

```
-> test-oam Test1
-> test-oam Test2 descr second-test
-> no test-oam Test2
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.
show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigTestDescription
   alaTestOamConfigRowStatus
```

test-oam direction

Configures the CPE test direction.

test-oam *string* **[direction {unidirectional | bidirectional}]**

Syntax Definitions

string	The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.
direction	The direction of the CPE test.

Defaults

parameter	default
unidirectional | bidirectional	unidirectional

Platforms Supported

OmniSwitch 6465

Usage Guidelines

This command assigns the direction to the CPE test.

Examples

```
-> test-oam Test1 direction unidirectional
-> test-oam Test1 direction bidirectional
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.
show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigDirection
```

test-oam src-endpoint dst-endpoint

Configures the source and destination endpoints for the specified test.

test-oam *string* **[src-endpoint** *src-string***] [dst-endpoint** *dst-string***]**

Syntax Definitions

string	The name of an existing CPE test. The string can be of length 1to 32 characters.
src-string	This represents the local or transmitting device. The management IP address or DNS host name of the switch that will transmit test traffic. In case of bidirectional test this also identifies the analyzer device. The string can be of length 1to 32 characters.
dst-string	This represents the remote device. The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done. For unidirectional test this represents the analyzer device. For bidirectional test this identifies the device on which the loopback mode must be active. The string can be of length 1to 32 characters.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- The end point can be set as switch hostname or switch management IP address.
- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- This command automatically overwrites the source and destination endpoint values previously configured for the specified CPE test.
- Multicast and broadcast address must not be configured for bidirectional test.

Examples

```
-> test-oam Test1 src-endpoint SW1 dst-endpoint SW2
-> test-oam Test1 src-endpoint SW1
-> test-oam Test1 dst-endpoint SW2
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam port	Configures the port on which the CPE test will run.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigSourceEndpoint
   alaTestOamConfigDestinationEndpoint
```

test-oam port

Configures the port on which the CPE test will run. Use this command on the switch that will generate the test traffic. If the switch is going to receive test traffic, configuring a test port is not necessary.

test-oam *string* **port** *chassis/slot/port*

Syntax Definitions

string	The name of an existing CPE test.
chassis/slot/port	The port on which the CPE test will generate traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- In an Ethernet Service environment, the UNI port is designated as the test port on the generator switch to simulate traffic coming in on the port as if it was sent from a test head device. This will subject the test traffic to the SAP profile.
- Note that the customer traffic is disrupted on ports configured as CPE test ports. Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This must be considered when test results are analyzed.
- This command automatically overwrites the port value previously configured for the specified CPE test.

Examples

```
-> test-oam Test1 port 1/1/2
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam vlan test-frame	Configures the source mac-address, destination mac-address, and the SVLAN for the test-frame used in the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigPort
```

test-oam vlan test-frame

Configures the SVLAN and the source and destination MAC addresses for the test frame. Use this command to configure these test parameters on both the generator (local) switch and the analyzer (remote) switch for the specified CPE test.

test-oam *string* **[vlan** *svlan***] [[test-frame [src-mac** *src-address***] [dst-mac** *dst-address***]]**

Syntax Definitions

string	The name of an existing CPE test.
svlan	The service VLAN ID. This is used for traffic analysis and test-frame accounting.
src-address	Source mac-address of the test-frame.
dst-address	Destination mac-address of the test-frame.

Defaults

parameter	default
src-address	00:00:00:00:00:00
dst-address	00:00:00:00:00:00

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Although the source and destination MAC addresses are optional parameters with this command, the test will not run if these addresses are set to all zeros (the default).
- Make sure that routing is disabled on the specified SVLAN.
- Avoid configuring any IEEE reserved MAC addresses as the destination MAC address for the test.
- This command automatically overwrites the SVLAN, source MAC, or destination MAC values previously configured for the specified CPE test.

Examples

```
-> test-oam Test1 vlan 100 test-frame src-mac 00:01:02:00:00:02 dst-mac
00:00:01:00:00:90
-> test-oam Test1 vlan 100
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02 dst-mac 00:00:01:00:00:90
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02
-> test-oam Test test-frame dst-mac 00:00:01:00:00:90
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam role	Configures the switch as a generator or analyzer for the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigVlan
   alaTestOamConfigFrameSrcMacAddress
   alaTestOamConfigFrameDstMacAddress
```

test-oam role

Configures the role the switch will perform for the specified CPE test. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) or loopback test frames.

test-oam *string* **role {generator | analyzer | loopback}**

Syntax Definitions

string	The name of an existing CPE test.
generator	Configures the switch as the test generator.
analyzer	Configures the switch as the test analyzer.
loopback	Configures the switch as loopback.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use this command on the switch that will perform the specified role.
- Configuring a generator and an analyzer switch for each test is required.
- Only one role can be assigned to the switch for a particular test.
- This command automatically overwrites the previously configured switch role for the specified CPE test.

Examples

```
-> test-oam Test1 role generator
-> test-oam Test2 role analyzer
-> test-oam Test2 role loopback
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam duration rate packet-size	Configures the test frame duration, rate and packet-size for the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigRole
```

test-oam duration rate packet-size

Configures the duration, rate, and packet-size for the specified test. Use this command to configure these test parameters on the generator switch.

test-oam *string* **[duration** *secs***] [rate** *rate***] [packet-size** *bytes***]**

Syntax Definitions

string	The name of an existing CPE test.
secs	The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 1–3600 seconds
rate	The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.
bytes	The packet size, in bytes. The valid range is 64–9212 bytes.

Defaults

Parameter	Default
secs	5 secs
rate	8 k
bytes	64 byte

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- This command automatically overwrites any duration, rate, and packet size parameter values previously configured for the specified CPE test.
- The status of the CPE test will change to “ended” when the test duration time expires.
- This command automatically overwrites the duration, rate, or packet size values previously configured for the specified CPE test.

Examples

```
-> test-oam Test1 duration 10 rate 8k packet-size 64
-> test-oam Test1 rate 8m
-> test-oam Test1 duration 10
-> test-oam Test1 packet-size 64
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam frame	Configures the test frame parameter values for the CPE test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigDuration
   alaTestOamConfigGeneratorBandwidth
   alaTestOamConfigGeneratorPacketSize
```

test-oam frame

Configures the test frame parameter values for the specified CPE test. Use this command on the switch that will generate the test frame traffic.

test-oam *string* **frame**
[vlan-tag *vlan-id* **priority** *priority* **drop-eligible {true | false}}]**
ether-type {*hex-num* | **ipv4 {src-ip** *src-ipv4* **dst-ip** *dst-ipv4* **[ttl** *ttl***] [tos** *tos***] [protocol {udp | tcp} {src-port** *src-port* **dst-port** *dst-port***}]}]} [data-pattern** *pattern***]**

Syntax Definitions

string	The name of an existing CPE test.
vlan-id	The VLAN ID of the frame.
priority	The priority value. The valid range is 0–7.
true	Sets the drop-eligible bit to true.
false	Sets the drop-eligible bit to false.
hex-num	The hexadecimal ethertype value. The valid range is 0x600–0xfffe.
src-ipv4	The source IP address for an IPv4 test frame.
dst-ipv4	The destination IP address for an IPv4 test frame.
ttl	The time-to-live value. The valid range is 0–255.
tos	The type-of-service value for QoS features. The valid range is 0x0–0xff.
udp	Specifies the UDP protocol.
tcp	Specifies the TCP protocol.
src-port	The source port of the generated test frame.
dst-port	The destination port of the generated test frame.
pattern	The data pattern present in the generated test frame. The valid range is 0x0000–0xffff.

Defaults

Parameter	Default
priority	7
drop-eligible	false
ttl	64
tos	0x0
pattern	0x0000

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Specify the Ether type in hexadecimal format to configure a Layer 2 test frame.
- Specify **ipv4** as the Ether type to configure a Layer 3 test frame. When this option is selected, entering a source and destination IP address is required.
- Do not specify reserved Ether type values.
- This command automatically overwrites the test packet parameter values previously configured for the specified CPE test.

Examples

If the ether-type is a hexadecimal number (Layer 2 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type 0x0100
data-pattern 0x0010
```

If the ether-type is IPV4 (Layer 3 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type ipv4
src-ip 1.1.1.1 dst-ip 2.2.2.2 ttl 4 tos 0x01 protocol udp src-port 2000 dst-port
3000 data-pattern 0x0010
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam l2-saa	Start or stop the CPE test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
alaTestOamEtherConfigTable
alaTestOamIpv4ConfigTable
```

test-oam l2-saa

Configures to run SAA tests in parallel with test streams.

test-oam *string* **l2-saa [priority** *vlan-priority***] [count** *num-pkts***] [interval** *inter-pkt-delay***] [continuous] [size** *size***] [drop-eligible {true | false}]**

no test-oam *string* **l2-saa**

Syntax Definitions

string	The name of an existing CPE test.
vlan-priority	Specify the internal priority of MAC ping and 802.1p value on the VLAN tag header.
num-pkts	The number of packets sent in one ping iteration. Valid range is 1 to 10.
inter-pkt-delay	The delay between packets sent during a ping iteration (milliseconds). Valid range is 100 to 1000, in multiples of 100.
continuous	Allows the SAA session to run continuously until the test-oam session ends.
size	The payload size to be used for MAC ping iteration. Must be within 1500 bytes.
drop-eligible	Specify the drop precedence of the MAC ping and the Canonical Format Indicator (CFI) bit on the VLAN tag header.

Defaults

Parameter	Default
vlan-priority	0
num-pkts	5
inter-pkt-delay	1000 ms
size	36 bytes
drop-eligible	false

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- The L2-SAA test derives the source MAC, destination MAC, and the VLAN ID from the test OAM configuration of the individual test frames.
- The default L2-SAA configuration values will be applied if no optional parameters are configured.
- To run the L2-SAA session until the test-oam session ends, use the **continuous** parameter.
- Different SAA profiles can be configured for each individual test stream.

- Use the **no** form of this command to remove the L2-SAA configuration for the test.

Examples

```
-> test-oam test1 l2-saa priority 5 count 5 interval 1000 size 100 drop-eligible
false
-> test-oam test1 l2-saa continuous
-> no test-oam test1 l2-saa
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam	Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamSaaConfigDropEligible
   alaTestOamSaaConfigPayloadSize
   alaTestOamSaaConfigNumPkts
   alaTestOamSaaConfigInterPktDelay
   alaTestOamSaaContinuous
```

test-oam start stop

Starts or stops the CPE test operation.

test-oam *string* **{[vlan** *vlan-id***] [port** *chassis/slot/port***] [packet-size** *bytes***] start | stop} [fetch-remote-stats]**

Syntax Definitions

string	The name of an existing CPE test.
vlan-id	The service VLAN ID. This value is required only for traffic analysis and test frame accounting and is not related to the VLAN tag specified for the actual test frame.
chassis/slot/port	The switch port on which the test is run.
bytes	The size of the test packet, in bytes. The valid packet size range is 64–9212 bytes.
start	Starts the CPE test operation.
stop	Stops the CPE test operation.
fetch-remote-stats	Triggers the test at the remote device from the generator. The statistics are collected from the remote device and the test is stopped after receiving the test results.

Defaults

Parameter	Default
bytes	64

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Ensure that routing is disabled on the specified service VLAN.
- The optional **vlan**, **port,** and **packet-size** parameters specify “active” parameter values that are applied when the specified CPE test is started. If these same parameters are defined within a CPE test profile, they are considered “configured” parameter values. Active parameter values override configured parameter values when the test is started.
- If no active parameter values are specified with this command, the test is started using the configured values defined in the CPE test profile. However, if active parameter values are not specified and the CPE test does not contain any configured values for these parameters, the test will not run.
- Specifying any of the optional parameter values does not change the configured values associated with the CPE test.
- If the specified port resides on a switch that will transmit test traffic, the port will generate the test frames. However, if the switch is an analyzer switch, specifying a port is not required.

- Start the specified test on the analyzer switch first and then on the generator switch.
- The test will stop when the test duration time expires or when the test is manually stopped using the **test-oam stop** command.
- Manually restart the test if the test is interrupted by a takeover, restart, or hot swap.
- The previous statistics related to the test will be cleared automatically once the test is started.
- Use the **fetch-remote-stats** parameter to collect the test statistics from the remote device. This parameter must be used to start the bidirectional test.

Examples

```
-> test-oam Test1 start
-> test-oam Test1 vlan 100 start
-> test-oam Test1 port 1/1/1 start
-> test-oam Test1 packet-size 100 start
-> test-oam Test1 vlan 100 port 1/1/1 packet-size 100 start
-> test-oam Test1 stop
-> test-oam Test1 start fetch-remote-stats
-> test-oam "test2" port 1/1/2 start fetch-remote-stats
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigVlan
   alaTestOamConfigPort
   alaTestOamConfigGeneratorPacketSize
   alaTestOamConfigTestIdState
   alaTestOamConfigRemoteStatsFetch
```

test-oam remote-sys-mac

Configures the system MAC address of the remote device to receive test OAM messages.

test-oam *string* **remote-sys-mac** *string*

Syntax Definitions

string	The name of an existing CPE test.
remote-sys-mac	The system MAC address of the remote device.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use this command on the generator switch to set the system MAC address of the remote device to receive the test OAM messages.
- remote-sys-mac must be the primary CMM MAC address of the remote device. Use the **show cmm** command on the remote device to know the chassis MAC address of the device.
- remote-sys-mac is not applicable for analyzer or loopback.
- Configuring the Remote Sys MAC is mandatory for bidirectional test and optional for unidirectional test.

Examples

```
-> test-oam Test1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigRemoteSysMacAddress
```

test-oam statistics flash-logging

Enable or disable the option to save the statistics of the test on the file in the flash directory of the switch. The test information is appended at the end of the default text file (testoamActiveStats.txt) in the flash.

test-oam statistics flash-logging {enable | disable}

Syntax Definitions

N/A

Defaults

Parameter	Default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Use the **more** command to read the test results stored on the switch.

Examples

```
-> test-oam statistics flash-logging enable
-> test-oam statistics flash-logging disable
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.
show test-oam saa statistics	Clears the statistics for all CPE tests or for a specific test name.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigStatsSave
```

show test-oam

Displays the CPE test configuration and status.

show test-oam [tests | *string***]**

Syntax Definitions

tests	Displays information for all the CPE tests**.**
string	The name of an existing CPE test.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **tests** parameter to display information for all CPE tests configured on the switch.
- Use the *string* parameter to display detailed information for a specific CPE test.

Examples

```
-> show test-oam tests
Total Test-Ids: 1
Test-Id Port       Src-Mac        Dst-Mac         Vlan     Direction     Status         Remote-Sys-Mac
-------+-----+-----------------+-----------------+-----+--------------+-----------+----------------------
Test1   none  00:00:00:00:00:00  00:00:00:00:00:00 none  unidirectional  not-started  00:00:00:00:00:00
```

output definitions

Test-Id	The CPE test name (ID). Configured through the **test-oam** command.
Port	The port on which the test is run. Configured through the **test-oam port** command.
Src-Mac	The source MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Dst-Mac	The destination MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Vlan	The service VLAN (SVLAN) associated with the test. Configured through the **test-oam vlan test-frame** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test.
Remote-Sys-Mac	The MAC address of the remote device configured through the **test-oam remote-sys-mac** command.

```

output definitions

Source Endpoint	The host name for the source (generator) switch. Configured through the **test-oam direction** command.
Destination Endpoint	The host name for the destination (analyzer) switch. Configured through the **test-oam direction** command.
Test Description	Description for the test name. Configured through the **test-oam** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Source MAC	The source MAC address for the test frame. Configured through the **test-oam vlan test-frame** command.
Destination MAC	The destination MAC address for the test frame. Configured through the **test-oam vlan test-frame** command.
Remote Sys MAC	The MAC address of the remote device configured through the **test-oam remote-sys-mac** command.
Duration	The amount of time the test will run. Configured through the **test-oam duration rate packet-size** command.
Vlan	The service VLAN (SVLAN) associated with the test. Configured through the **test-oam vlan test-frame** command.
Role	The role of the switch for this test (**generator** or **analyzer**). Configured through the **test-oam role** command
Port	The port on which the test is run. Configured through the **test-oam port** command.
Tx Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam duration rate packet-size** command.
Frame Size	The size of the test frame. Configured through the **test-oam duration rate packet-size** command.
State	The administrative state of the test (**stop** or **start**). Configured through the **test-oam l2-saa** command.
Status	The operational status of the test (**running**, **ended**, **stopped**, or **not started**).
Frame Configuration	The test frame type (**ether** or **ipv4**) and associated parameter values. Configured through the **test-oam frame** command.
L2-SAA Configuration	Displays the L2 SAA configuration.

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

MIB Objects

```

```

show test-oam statistics

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

show test-oam [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test.

Defaults

By default, statistics are displayed for all CPE tests.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

Examples

```
-> show test-oam Test1 statistics

Test-Id   TX-Ingress   TX-Egress    RX-Ingress      Remote-Stats  Throughput(Mbps)
--------+------------+------------+---------------+--------------+---------------
Test1    19017        19017         19017             19017         9.98

-> show test-oam statistics
Test-Id      TX-Ingress   TX-Egress    RX-Ingress Remote-Stats Throughput(Mbps)
------------+------------+------------+----------+------------+---------------
Test1        1200366      1200366          0       1200366      8
Test2          0             0          1200366    1200366      8
```

output definitions

Test-Id	The CPE test name (ID).
TX-Ingress	The number of ingress test packets generated on the ingress UNI.
TX-Egress	The number of egress test packets transmitted on the egress NNI.
RX-Ingress	The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test.

output definitions

Remote-Stats	The number of test frames received by the analyzer and fetched by the generator device.
Throughput (Mbps)	Displays the traffic throughput of the test.

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam statistics flash-logging	Displays the CPE test configuration and status.
clear test-oam statistics	Clears CPE test statistics.

MIB Objects

```
alaTestOamStatsTable
   alaTestOamConfigTestId

   alaTestOamTxEgressCounter
   alaTestOamRxIngressCounter
   alaTestOamRemoteStatsCounter
   alaTestOamBandwidthThroughputStr
```

show test-oam saa statistics

Displays the SAA test statistics for all CPE tests or for a specific test name.

show test-oam [*string*] saa statistics

Syntax Definitions

string	The name of an existing CPE test.

Defaults

By default, statistics are displayed for all CPE tests.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Use the *string* parameter with this command to display SAA statistics for a specific CPE test.

Examples

```
-> show test-oam Test1 saa statistics

Test    Time of Last-Run       RTT    RTT    RTT   Jitter Jitter Jitter  Packets    Description

```

clear test-oam statistics

Clears the statistics for all CPE tests or for a specific test name.

clear test-oam [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test.

Defaults

By default, statistics are cleared for all CPE tests.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Use the *string* parameter with this command to clear the statistics for a specific CPE test.

Examples

```
-> clear test-oam Test1 statistics
-> clear test-oam statistics
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam statistics	Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.
show test-oam saa statistics	Displays the SAA test statistics for all CPE tests or for a specific test name.

MIB Objects

```
alaTestOamStatsTable
   alaTestOamConfigTestId
   alaTestOamStatsClearStats
```

test-oam group

Configures the CPE test group name and an optional description. The group name is used to identify and configure a CPE test group.

test-oam group *string* **[descr** *description***]**

no test-oam group *string*

Syntax Definitions

string	The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test-oam group.
description	The description to assign to the CPE test group, an alphanumeric string between 1 and 32 characters.

Defaults

parameter	default
description	DEFAULT

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test group.
- This command creates a CPE test group that is identified by the test-oam name. Make sure the name specified does not exist in the switch configuration.
- To configure a CPE test group, the individual test must be configured.
- A maximum of four tests can be configured to run concurrently.
- Only one CPE test group can be active on the switch at any given time.

Examples

```
-> test-oam group Testgroup1
-> test-oam group Testgroup2 descr second-testgroup
-> no test-oam group Testgroup1
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group statistics	Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.
show test-oam group	Displays the statistics for all CPE test groups or for a specific CPE test group.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamConfigGroupDescription
   alaTestOamGroupConfigRowStatus
```

test-oam group tests

This defines the list of CPE test group tests that need to be added in the test-oam group.

test-oam group *string* **[tests** *string1.....string8***]**

test-oam group *string* **[no tests** *string1.....string8***]**

Syntax Definitions

string	The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test group.
string1.....string8	The name of the configured test-oam tests.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- This command defines the list of test-oam tests that need to run concurrently.
- The test must exist, while configuring the test-oam list.
- A maximum of four tests can be configured to run concurrently.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- use the **no** form of the command to remove the test-oam tests from the CPE test group.

Examples

```
-> test-oam test1
-> test-oam test2
-> test-oam test3
-> test-oam test4
-> test-oam test5
-> test-oam test6
-> test-oam test7
-> test-oam test8
-> test-oam group Testgroup1 descr first-testgroup
-> test-oam group Testgroup1 tests test1 test2 test3 test4 test5 test6 test7 test8
-> test-oam group Testgroup1 no tests test1 test2 test3
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.
show test-oam group	Displays the SAA statistics for all CPE test groups or for a specific CPE test group if mentioned.

MIB Objects

```
alaTestOamGroupFlowConfigTable
   alaTestOamConfigGroupId
   alaTestOamConfigTestId
   alaTestOamGroupFlowConfigRowStatus
```

test-oam feeder

This configures the feeder port globally in the system for CPE test group to feed the test traffic to generator port.

test-oam feeder-port *chassis/lot/port*

no test-oam feeder-port

Syntax Definitions

chassis/slot/port	The port to be used to feed the test traffic only to generator port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- This command configures the feeder port globally in the system.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification to the feeder port shall not be allowed.
- use the **no** form of the command to remove the feeder port from the system for CPE test group.

Examples

```
-> test-oam feeder-port 1/1/4
-> no test-oam feeder-port
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam group port	Configures the port on which the CPE test group will run.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGlobalFeederPort
```

test-oam group src-endpoint dst-endpoint

Configures the source and destination endpoints for the CPE test group.

test-oam group *string* **[src-endpoint** *src-string* **dst-endpoint** *dst-string***] [src-endpoint** *src-string***] [dst-endpoint** *dst-string***]**

Syntax Definitions

string	The name of an existing CPE test group.
src-string	The management IP address or DNS host name of the switch that will transmit test traffic.
dst-string	The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done.

Defaults

parameter	default
src-endpoint	DEFAULT
dst-endpoint	DEFAULT

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 src-endpoint SW1 dst-endpoint SW2
-> test-oam group Testgroup1 src-endpoint SW1
-> test-oam group Testgroup1 dst-endpoint SW2
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.

show test-oam group Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigSourceEndpoint
   alaTestOamGroupConfigDestinationEndpoint
```

test-oam group role

Configures the role the switch will perform for the specified CPE test group. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) test frames.

test-oam group *name* **role {generator | analyzer | loopback}**

Syntax Definitions

name	The name of an existing CPE test group.
generator	Configures the switch as the test generator.
analyzer	Configures the switch as the test analyzer.
loopback	Configures the switch as loopback.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 role generator
-> test-oam group Testgroup2 role analyzer
-> test-oam group Testgroup2 role loopback
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigRole
```

test-oam group port

Configures the port on which the CPE test group will run. Use this command on the switch that will generate the test traffic.

test-oam group *string* **port** *chassis/slot/port*

Syntax Definitions

string	The name of an existing CPE test group.
chassis/slot/port	The port on which the CPE test will generate traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- This command automatically overwrites the port value previously configured for the specified CPE test group.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 port 1/1/2
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam group start stop	Starts the traffic test for the CPE test group on the configured port or the given port.
test-oam group remote-sys-mac	Stops the traffic test for the CPE test group on the configured port or the given port.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigPort
```

test-oam group direction

Configures the test direction of the test-oam group.

test-oam group *string* **[direction {unidirectional | bidirectional}]**

Syntax Definitions

string	The name of an existing CPE test group.
direction	The direction of the CPE test group.

Defaults

parameter	default
direction	unidirectional

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 direction unidirectional
-> test-oam group Testgroup2 direction bidirectional
```

Release History

Release 8.6R1; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigDirection
```

test-oam group duration rate

Configures the duration and rate for the specified test-oam group. Use this command to configure these test parameters on the generator switch.

test-oam group *string* **[duration** *secs***] [rate** *rate***]**

Syntax Definitions

string	The name of an existing CPE test group.
secs	The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 5–3600 seconds.
rate	The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.

Defaults

Parameter	Default
secs	5 secs
rate	8 k

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- This command automatically overwrites any duration and rate parameter values previously configured for the specified CPE test group.
- The status of the CPE test group will change to “ended” when the test duration time expires.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 duration 10
-> test-oam group Testgroup1 rate 8m
-> test-oam group Testgroup1 duration 10 rate 8m
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigDuration
   alaTestOamGroupConfigGeneratorBandwidth
```

test-oam group start stop

Starts or stops the traffic test for the test-oam group on the configured port or the given port.

test-oam group *string* **{[port** *chassis/slot/port***] start | stop} [fetch-remote-stats]**

Syntax Definitions

string	The name of an existing CPE test group.
chassis/slot/port	The port on which the CPE test group will generate traffic.
start	Enables the test.
stop	Disables the test.
fetch-remote-stats	Triggers the group test at the remote device from the generator. The statistics are collected during the test and the test is stopped after receiving the test results.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- Use the fetch-remote-stats parameter to collect the test statistics from the remote device.

Examples

```
-> test-oam group Testgroup1 port 1/1/2 start
-> test-oam group Testgroup2 start
-> test-oam group Testgroup1 start fetch-remote-stats
-> test-oam group testgroup2 port 1/1/2 start fetch-remote-stats
-> test-oam group Testgroup1 stop
-> test-oam group Testgroup2 stop
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigPort
   alaTestOamGroupConfigState
   alaTestOamGroupConfigRemoteStatsFetchState
```

test-oam group remote-sys-mac

Configures the system MAC address of the remote device to receive test OAM messages.

test-oam group *string* **remote-sys-mac** *string*

Syntax Definitions

string	The name of an existing CPE test group.
remote-sys-mac	The system MAC address of the remote device.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use this command on the switch to set the system MAC address of the remote device to receive the test OAM messages.
- remote-sys-mac must be the primary CMM MAC address of the remote device.
- remote-sys-mac is not applicable for analyzer or loopback.

Examples

```
-> test-oam group Testgroup1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamGroupConfigRemoteSysMacAddress
```

clear test-oam group statistics

This clears the statistics of the CPE test group.

clear test-oam group *string* **statistics**

Syntax Definitions

string	The name of an existing CPE test group.
statistics	Clears the statistics for the give CPE test group.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> clear test-oam group Testgroup1 statistics (Clears the statistics for the
specified test-oam group)
-> clear test-oam group statistics (Clears the statistics for all the test-oam
groups)
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group statistics	Displays the statistics for all test-oam groups or for a specific CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigStatsClear
   alaTestOamGlobalGroupClearStats
```

show test-oam group

Displays the configuration and status of the CPE test groups.

show test-oam group [tests | *string***]**

Syntax Definitions

tests	Displays information for all the CPE test groups**.**
string	The name of an existing CPE test group.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **tests** parameter to display information for all CPE test groups configured on the switch.
- Use the *string* parameter to display detailed information for a specific CPE test group.

Examples

```
-> show test-oam group tests

Total Test-Groups: 2
Feeder Port      : none
Test-Group  Port  Duration     Rate    Nb of   Direction      Status        Remote-Sys-Mac
                   (secs)             Flows
----------+-----+----------+---------+-----+--------------+------------+--------------------
Testgroup1 none    5          -         2    unidirectional  not-started  00:00:00:00:00:00
Testgroup2 none    5          -         3    unidirectional  not-started  00:00:00:00:00:00
```

output definitions

Test-Groups	The CPE test group. Configured through the **test-oam group** command.
Port	The port on which the test is run.
Duration	The amount of time the test will run.
Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam group duration rate** command.
Nb of Flows	Number of test flows configured for the respective CPE test group.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test.
Remote-Sys-Mac	The MAC address of the remote device configured through the **test-oam group remote-sys-mac** command.

```
-> show test-oam group Testgroup1
Legend: Port: * = Inactive port

TEST Parameters for Testgroup1:
  Source Endpoint         : SW1,
  Destination Endpoint    : SW2,
  Test Group Description  : first-testgroup,

L2-SAA Continuous   : yes
```

output definitions

Test-Groups	The CPE test group. Configured through the **test-oam group** command.
Port	The port on which the test is run.
Source Endpoint	The host name for the source (generator) switch. Configured through the **test-oam group src-endpoint dst-endpoint** command.
Destination Endpoint	The host name for the destination (analyzer) switch. Configured through the **test-oam group src-endpoint dst-endpoint** command.
Source Mac	The source MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Destination Mac	The destination MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Remote Sys Mac	The MAC address of the remote device configured through the **test-oam group remote-sys-mac** command.
Duration	The amount of time the test will run.
Role	The role of the switch for this test (**generator** or **analyzer**). Configured through the **test-oam role** command.
Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam group duration rate** command.
Frame Size	The size of the test frame. Configured through the **test-oam group duration rate** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test.
L2-SAA Count	Specifies the number of packets sent in one MAC ping iteration.
L2-SAA Interval	Specifies the delay between two consecutive packets transmitted during a MAC ping iteration.
L2-SAA DE	Specifies if the drop enable bit value is used.
L2-SAA Payload Size	Specifies the size of the MAC ping payload used for the MAC ping operation.
L2-SAA Priority	Specifies the priority value set for the L2 SAA frames.
L2-SAA Continuous	Specifies the SAA session will run continuously until the test-oam session ends.

Release History

Release 8.6R1; command was introduced.

show test-oam group saa statistics

Displays the SAA test statistics for all CPE test groups or for a specific test name.

show test-oam group [*string*] saa statistics

Syntax Definitions

string	The name of an existing CPE test group.

Defaults

By default, statistics are displayed for all CPE test group.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Use the *string* parameter with this command to display SAA statistics for a specific CPE test group.

Examples

```
-> show test-oam group Test1 saa statistics

```

output definitions

Test-group	The CPE test group name (ID).
Flow	Displays the flow identifier for the test.
Time of Last-Run	Displays the date and time on which the test was last run.
RTT Min	Displays the minimum round trip time.
RTT Avg	Displays the average round trip time.
RTT Max	Displays the maximum round trip time.
Jitter Min	Displays the minimum jitter value.

output definitions

Jitter Avg	Displays the average jitter value.
Jitter Max	Displays the maximum jitter value.
Packets Sent	Displays the number of packets sent during a single MAC ping.
Packets Rcvd	Displays the number of packets received during a single MAC ping.
Description	Displays the description for each provided by the user during the test creation. By default it is displayed as “DEFAULT”.

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.

show test-oam group statistics

Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

show test-oam group [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test group.

Defaults

By default, statistics are displayed for all CPE test groups.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test group.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

Examples

```
-> show test-oam group TestGroup4 statistics
Test-Group   Flow     TX-Ingress    TX-Egress       RX-Ingress   Remote-Stats
-----------+--------+-------------+---------------+------------+-----------
TestGroup4   flow1     19017         19017             0           19017

```

output definitions

Test-Group	The CPE test group.
TX-Ingress	The number of ingress test packets generated on the ingress UNI.
TX-Egress	The number of egress test packets transmitted on the egress NNI.

output definitions

RX-Ingress	The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test.
Remote-Stats	The number of test frames received by the analyzer and fetched by the generator device.
Throughput(Mbps)	Displays the traffic throughput of the test.

Release History

Release 8.6R1; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.
test-oam group remote-sys-mac	Clears the statistics of the CPE test group.

55 PPPoE Intermediate Agent

Point-to-Point Protocol over Ethernet (PPPoE) provides the ability to connect a network of hosts to a Remote Access Concentrator. For example, Broadband Network Gateway over a simple bridging access device. In PPPoE model, each host utilizes its own Point-to-Point Protocol (PPP) stack and the user is presented with a familiar user interface. By using PPPoE, Access control, billing, and type of service can be configured on a per-user, rather than a per-site, basis.

PPPoE Intermediate Agent (PPPoE-IA) solution is designed for the PPPoE access method and is based on the Access Node implementing a PPPoE-IA function to insert access loop identification in PPPoE discovery packets (PADI/PADR/PADT) received from the user side.

MIB information for the PPPoE-IA commands is as follows:

Filename: alcatel-ind1-pppoe-ia-mib.mib
Module: ALCATEL-IND1-PPPOEIA-MIB

A summary of the available commands is listed here.

pppoe-ia
pppoe-ia {port | linkagg}
pppoe-ia {trust | client}
pppoe-ia access-node-id
pppoe-ia circuit-id
pppoe-ia remote-id
clear pppoe-ia statistics
show pppoe-ia configuration
show pppoe-ia {port | linkagg}
show pppoe-ia statistics

Configuration procedures for PPPoE-IA are explained in the “Configuring PPPoE Intermediate Agent” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*.

pppoe-ia

Enable or disable PPPoE-IA globally on the switch.

pppoe-ia {enable | disable}

Syntax Definitions

enable	Enable PPPoE-IA.
disable	Disable PPPoE-IA.

Defaults

By default, PPPoE-IA is disabled globally on the switch.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

All PPPoE-IA parameters are configurable irrespective of the global status of PPPoE-IA.

Examples

```
-> pppoe-ia enable
-> pppoe-ia disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia {port | linkagg}	Enable or disable PPPoE-IA on a port or a link aggregate port.
pppoe-ia {trust | client}	Configures a port or a link aggregate port as trust or client port for PPPoE-IA.
pppoe-ia access-node-id	Globally configures a format to form an identifier that uniquely identifies an access node.
pppoe-ia circuit-id	Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop on which the PADI/PADR/PADT is received from the user side.
pppoe-ia remote-id	Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.
clear pppoe-ia statistics	Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia {port | linkagg}	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAGlobalStatus
```

pppoe-ia {port | linkagg}

Enable or disable PPPoE-IA on a port or a link aggregate port. Link aggregate can be either static or dynamic.

pppoe-ia {port *chassis/slot/port*[*-port2*] **| linkagg** *agg_num***} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for the module.
port	Port number of the interface to be configured.
port2	Last port number in a range of ports to be configured.
linkagg *agg_num*	The link aggregate identification number.
enable	Enable PPPoE-IA on a port.
disable	Disable PPPoE-IA on a port.

Defaults

By default, PPPoE-IA is disabled on all ports.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of the per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- PPPoE-IA is not supported on port mirroring destination ports. However, the configurations are accepted.
- PPPoE-IA is not supported on aggregable ports.

Examples

```
-> pppoe-ia port 1/1/1 enable
-> pppoe-ia port 1/1/4 disable
-> pppoe-ia linkagg 1 enable
```

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia {port | linkagg}	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAPortConfigTable
   alaPPPoEIAPortConfigStatus
```

pppoe-ia {trust | client}

Configures a port or a link aggregate port as trusted or client port for PPPoE-IA.

A trust port is a port that is connected to the Broadband Network Gateway whereas a client port is connected to the host.

pppoe-ia {port *chassis/slot/port*[*-port2*] **| linkagg** *agg_num***} {trust | client}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for the module.
port	Port number of the interface to be configured.
port2	Last port number in a range of ports to be configured.
linkagg *agg_num*	Specifies the link aggregate identification number.
trust	Specifies the mode of the port as trust.
client	Specifies the mode of the port as client.

Defaults

By default, all ports are client ports.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- For PPPoE-IA to work, it must be enabled on a client port as well as a trusted port.
- PPPoE-IA is not supported on aggregable ports.
- PPPoE-IA is not supported on port mirroring destination ports; however, the configurations are accepted.

Examples

```
-> pppoe-ia port 1/1 /1
-> pppoe-ia port 1/1/2-4 client
-> pppoe-ia linkagg 7 trust
-> pppoe-ia linkagg 0 client
```

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
pppoe-ia {port | linkagg}	Enable or disable PPPoE-IA on a port or a link aggregate port.
pppoe-ia {trust | client}	Configures a port or a link aggregate port as trust or client port for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia {port | linkagg}	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAPortConfigTable
   alaPPPoEIAPortConfigTrustMode
```

pppoe-ia access-node-id

Globally configures a format to form an identifier that uniquely identifies an access node.

pppoe-ia access-node-id {base-mac | system-name | mgnt-address | user-string *string***}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The configured name of the switch.
mgnt-address	The IP address of the management interface of the switch.
string	The value of user configured string.

Defaults

By default, PPPoE-IA uses the base MAC address of the switch as the Access-Node-Identifier.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

- The access-node-identifier can have a maximum of 32 characters. The access-node-identifier longer than 32 characters is truncated to 32 characters.
- The access-node-identifier when configured as user-string must not contain spaces.
- The value of user string must not be NULL.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address ‘0.0.0.0’ is used as management address.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.

Examples

```
-> pppoe-ia access-node-id base-mac
-> pppoe-ia access-node-id user-string accessnode1
```

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
pppoe-ia {port | linkagg}	Enables or disables PPPoE-IA on a port or a link aggregate port.
pppoe-ia {trust | client}	Configures a port or a link aggregate port as trust or client port for PPPoE-IA.
clear pppoe-ia statistics	Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia {port | linkagg}	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAGlobalAccessNodeIDFormatType
alaPPPoEIAGlobalAccessNodeIDStringValue
```

pppoe-ia circuit-id

Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop that receives the PPPoE Active Discovery Initiation (PADI) or PPPoE Active Discovery Request (PADR) or PPPoE Active Discovery Terminate (PADT) from the user end.

pppoe-ia circuit-id {default [atm] ascii [base-mac | system-name | interface | vlan | cvlan | interface-alias | user-string *string* **| delimiter** *char***]}**

Syntax Definitions

default	The default value of the Circuit-ID used for the Ethernet parameter.
atm	When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.
ascii	Circuit-ID format used to configure Circuit-ID string using the five parameters and delimiter. Maximum five parameters can be selected from the given seven options: base-mac, system-name, interface, vlan, cvlan, interface-alias, and user-string.
base-mac	The base MAC address of the switch.
system-name	Name configured for the switch.
interface	The interface on which the PPPoE message is received.
vlan	VLAN interface on which the PPPoE message is received.
cvlan	Inner-VLAN or customer VLAN of the PPPoE message.
interface-alias	Configured alias of the interface on which the PPPoE message is received.
string	The value of user configured string.
delimiter	A user configurable delimiter used to separate the fields of an ASCII string forming the Circuit-ID.
char	The value (a character) of the user configurable delimiter.

Defaults

parameter	default
char	**:**

By default, “:” (colon) is used as the delimiter.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

- Circuit-ID identification is configurable only globally and cannot be configured on a per-port or per-VLAN basis.

- To configure ethernet default parameter, use “default” in the CLI command.
- To configure default parameter as “atm”, use “default ATM” in the CLI command.
- When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.
- By default, the value of the Circuit-ID is "access-node-id eth slot/port[:vlan-id]". For example, if the value of access-node-id is "vxTarget", the default value of Circuit-ID is "vxTarget eth 1/1:10", if the packet is received on the interface 1/1 in vlan 10.
- By default, the delimiter used is “:”. The available delimiters are: “:” (colon), “|” (pipe), “/” (forward slash), “\” (backward slash), “-” (hyphen), “'_” (underscore), “ ” (space), “#” (hash), “.” (full stop), “,” (comma), “;” (semicolon).
- The Circuit-ID can have a maximum of 63 characters. The Circuit-ID longer than 63 characters is truncated to 63 characters.
- At most, five fields out of the available seven is encoded for the Circuit-ID in the order specified by the user.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.
- You can configure the same Circuit-ID format multiple times (for example, base MAC address of the switch can be configured multiple times in ASCII format of Circuit-ID).
- If the Circuit-ID format is default, irrespective of the ASCII fields (if configured), the Circuit-ID configuration is not visible in **show pppoe-ia configuration** output.

Examples

```
-> pppoe-ia circuit-id default
-> pppoe-ia circuit-id default atm
-> pppoe-ia circuit-id ascii base-mac vlan
-> pppoe-ia circuit-id ascii system-name interface user-string cid1
-> pppoe-ia circuit-id ascii system-name delimiter #
```

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
pppoe-ia {trust | client}	Configures a port or a link aggregate port as trust or client port for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia {port | linkagg}	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

pppoe-ia remote-id

Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.

pppoe-ia remote-id {base-mac | system-name | mgnt-address | user-string *string***}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The name configured for the switch.
mgnt-address	The management IP address of the switch.
string	The value configured for user string.

Defaults

By default, the base MAC address of the switch is used as the format for Remote-ID.

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

- Remote-ID is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- Remote-ID can have a maximum of 63 characters. The Remote-ID longer than 63 characters is truncated to 63 characters.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address ‘0.0.0.0’ is used as management address.
- If the Remote-ID is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.

Examples

```
-> pppoe-ia remote-id base-mac
-> pppoe-ia remote-id user-string remoteuser1
```

Release History

Release 8.6R1; command introduced.

Related Commands

output definitions

Chassis/Slot/Port	Chassis, slot and port number.
Status	PPPoE-IA enabled or disabled port.
Mode	Port configured as trust or client port for PPPoE-IA.

Release History

Release 8.6R1; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
pppoe-ia {trust | client}	Configures a port or a link aggregate port as trust or client port for PPPoE-IA.
clear pppoe-ia statistics	Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

show pppoe-ia statistics

Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

show pppoe-ia {port {*chassis/slot/port*[*-port2*] **| linkagg** *agg_num***} statistics**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for the module.
port	Port number of the interface to be configured.
port2	Last port number in a range of ports to be configured.
linkagg *agg_num*	Specifies the link aggregate identification number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6865

Usage Guidelines

56 Service Assurance Agent Commands

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video. Use SAAs to verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. The SAA feature uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). Use ETH-LB/DMM to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

Filename: Alcatel-IND1-ETHERNET-OAM-MIB.mib
Module: alcatelIND1EoamMIB

Filename: IEEE8021-CFM-MIB.mib
Module: ieee8021CfmMib

Filename: ALCATEL-IND1-SAA-MIB.mib
Module: alcatelIND1SaaMIB

A summary of the available commands is listed here:

SAA Commands	**saa** **saa start** **saa stop**
EthOAM SAA Commands	**saa type ethoam-loopback** **saa type ethoam-two-way-delay**
IP SAA Command	**saa type ip-ping**
Layer 2 SAA Command	**saa type mac-ping**
SPB SAA Commands	**saa spb** **saa spb reset** **saa spb flush** **show saa spb**
XML SAA Commands	**saa xml** **show saa xml**
SAA Show Commands	**show saa** **show saa type config** **show saa statistics**

saa

Configures a Service Assurance Agent (SAA).

saa *string* **[descr** *description***] [interval** *interval***] [jitter-threshold** *jitter_thresh***] [rtt-threshold** *rtt_thresh***]**

no saa *string*

Syntax Definitions

string	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (for example “SAA 10”).
description	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing SAA”).
interval	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10 to 1500.
jitter_thresh	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
rtt_thresh	The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

Defaults

parameter	default
description	DEFAULT
interval	150 minutes
jitter_thresh	0 (disabled)
rtt_thresh	0 (disabled)

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.
- The **desc** and **interval** parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.
- If the **desc** and/or **interval** parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.
- If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.

- If none of the optional parameters are specified and the given SAA exists, the CLI will return an error message, as duplicate entries are not allowed.
- Any number of SAAs can be configured (MAX 127). It is recommended not to start many aggressive SAAs (having session interval <= 10). To achieve proper scheduling of all the started SAA (aggressive and relaxed) it is recommended not to start more than 50 SAAs.
- Ensure the interval value is greater than the execution time (number of packets * inter packet delay).
- When SAA processes an iteration of a session, it will compare the results against the following criteria to see if an SNMP trap should be sent. A trap with the session name is sent if:
  - At least one packet is lost.
  - Warning: Average RTT/Jitter crosses 90% of threshold.
  - Critical: Average RTT/Jitter at or above threshold.

Examples

```
-> saa saa1 descr “saa for ip-ping”
-> saa saa1 jitter-threshold 100 rtt-threshold 500
-> saa saa2 descr “Monitoring Default VRF-interface” interval 160
-> saa saa2 interval 120
-> no saa saa1
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.2; **jitter-threshold** and **rtt-threshold** parameters added.

   alaSaaCtrlInterval
   alaSaaCtrlJitterThreshold
   alaSaaCtrlRTTThreshold
```

saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

saa *string* **type ip-ping destination-ip** *ip_address* **source-ip** *ip_address* **type-of-service** *tos* **[num-pkts** *count***] [inter-pkt-delay** *delay***] [payload-size** *size***]**

Syntax Definitions

string	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).
destination-ip *ip_address*	The IPv4 address of the destination to ping.
source-ip *ip_address*	The IPv4 address of the source.
tos	The type of service. Valid range is 0 – 255.
count	The number of packets to send in one ping iteration. The valid range is 1–100.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
size	The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.

Defaults

parameter	default
count	5
delay	1000 ms
size	24 bytes

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The **num-pkts**, **inter-pkt-delay,** and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay (**number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a ‘started’ state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.

- Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.
- The timeout for each ping request packet is 1 sec. This value is not configurable.

Examples

```
-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-
of-service 4
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-
of-service 5
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-
of-service 8 inter-pkt-delay 1000
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-
of-service 2 num-pkts 5
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-
of-service 35 payload-size 1000
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-
of-service 5 inter-pkt-delay 1000 num-pkts 8 pkt-size 1000
```

Release History

Release 7.3.1; command was introduced.

```

saa type mac-ping

Configure SAA for a MAC address including the VLAN, VLAN ID, number of packets and inter-packet delay parameters.

saa *string* **type mac-ping destination-mac** *mac_address* **vlan** *vlan_id* **[vlan-priority** *vlan_priority***] [drop-eligible {true | false}] [data** *data***] [num-pkts** *count***] [inter-pkt-delay** *delay***] [payload-size** *size***] [isid-check** *isid***]**

Syntax Definitions

string	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).
mac_address	The destination MAC address to ping.
vlan_id	The VLAN on which the L2 SAA Packets will be sent out.Valid range is 1-4094.
vlan_priority	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
true	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
false	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
data	User specified string to be included in the packet (Data TLV).
count	The number of packets to send in one ping iteration.The valid range is 1–100.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
size	The size of the ICMP payload to be used for the ping iteration. Valid range is 36–1500 bytes.
isid	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Defaults

parameter	default
vlan_priority	0
true | **false**	false
count	5
delay	1000 ms
size	36 bytes

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay (**number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- The timeout for each ping request packet is 1 sec. This value is not configurable.
- If data-TLV is specified and payload size is not specified, then payload size will be increased internally to accommodate the data TLV.
- If data TLV and payload size both are specified and payload size is less than [dataTLV + 36] bytes (for time-stamping and other packet info), then the CLI will be rejected.
- Destination-MAC cannot be broadcast/multicast address.
- Timeout for each ping request packet is 1 sec. This value is non-configurable.

Examples

```
-> saa saa1 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10
-> saa saa4 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 inter-pkt-delay
100
-> saa saa5 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 num-pkts 10
-> saa saa6 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 payload-size
400
-> saa saa8 type mac-ping destination-mac 00:11:11:11:11:11 vlan 1001 isid-check
1002
```

Release History

Release 7.3.1; command was introduced.
Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

   alaSaaMacCtrlIsid
```

saa spb

Configures session parameters for the Shortest Path Bridging (SPB) SAA. The SPB feature dynamically discovers SPB-enabled switches. Each discovered switch is identified by the pairing of a SPB VLAN (BVLAN) and the backbone MAC address (BMAC) for the switch. SPB advertises these BVLAN-BMAC pairs to the SAA feature, which in turn creates and starts MAC ping sessions based on the parameters configured with this command.

saa spb [auto-create] [auto-start] [interval *interval***] [vlan-priority** *vlan_priority***] [drop-eligible** {**true** | **false**}**] [data** *data***] [num-pkts** *count***] [inter-pkt-delay** *delay***] [payload-size** *size***] [jitter-threshold** *jitter_thresh***] [rtt-thresh** *rtt_thresh***] [keep]**

Syntax Definitions

auto-create	Automatically creates a SPB SAA session for each discovered BVLAN-BMAC pair.
auto-start	Automatically starts each SPB SAA session.
interval	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10–1500.
vlan_priority	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
true	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
false	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
data	User specified string to be included in the packet (Data TLV).
count	The number of packets to send in one ping iteration of the test.Valid range is 1–100.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.
size	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
jitter_thresh	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
rtt_thresh	The round-trip time threshold value, in microseconds. A trap is generate when this value is crossed. The valid range is 0–1000000.
keep	Retains SPB SAA session information even when SPB signals that a BMAC or BVLAN no longer exists.

Defaults

parameter	default
auto-create	off
auto-start	off
interval	150 minutes
vlan-priority	0
drop-eligible {true | **false}**	false
data	null
count	5
delay	1000 ms
size	32 bytes
jitter_thresh	0 (disabled)
rtt-thresh	0 (disabled)
keep	off

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- The **auto-create** and **auto-start** parameters enable the SPB SAA functionality required to automatically create and start this type of SAA session.
- Ensure the interval value is greater than the execution time (number of packets * inter-packet delay).
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay (**number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- SPB SAA sessions cannot be modified but are automatically configured with “SPB” as the owner of the session so they can be easily identified within the applicable SAA **show** command displays.
- The SAA ID for an SPB SAA is the prefix SPB- combined with the BVLAN and BMAC pairing used to generate the session. For example, SPB-*bvlan-bmac* (SPB-4000-e8-e7-32-07-98-cd).

Examples

```
-> saa spb auto-create auto-start interval 160 num-pkts 50 inter-pkt-delay 100 keep
-> saa spb auto-create auto-start jitter-threshold 100 rtt-threshold 500
-> saa spb keep
```

Release History

Release 7.3.2; command was introduced.
Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

Related Commands

show saa spb	Displays the SAA configuration for the SPB SAA.
saa spb flush	Clears all SPB SAA sessions and rebuilds the sessions based on the information learned from SPB.
saa spb reset	Resets all SPB SAA session parameters back to their default values.

MIB Objects

```
alaSaaSpbFeature

   alaSaaSpbJitterThreshold
   alaSaaSpbRTTThreshold
   alaSaaSpbKeep
```

saa spb reset

Resets all of the SPB SAA session parameters to their default values.

saa spb reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

When this command is used, the SPB SAA session parameters are set to the following default values:

parameter	default
auto-create	off
auto-start	off
interval	150 minutes
vlan-priority	0
drop-eligible	false
data	null
count	5
delay	1000 ms
size	32 bytes
jitter_thresh	0 (disabled)
rtt-thresh	0 (disabled)
keep	off

Examples

```
-> saa spb reset
```

Release History

Release 7.3.2; command was introduced.
Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

Related Commands

show saa spb	Displays the SAA configuration for the SPB SAA.
saa spb flush	Clears all SPB SAA sessions and rebuilds the sessions based on the information learned from SPB.
saa spb	Configures SPB SAA session parameters.

MIB Objects

```
alaSaaSpbFeature
   alaSaaSpbReset
```

saa spb flush

Clears all SPB SAA sessions and rebuilds the sessions based on the information learned from SPB.

saa spb flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

This command does *not* stop the automatic creation or start of SPB sessions or change any of the SPB SAA session parameters.

Examples

```
-> saa spb flush
```

Release History

Release 7.3.2; command was introduced.

Related Commands

   alaSaaSpbReset
```

saa type ethoam-loopback

Configures the SAA for ETH-LB, including the number of packets and inter-packet delay parameters.

saa *string* **type ethoam-loopback {target-endpoint** *t_mepid* **| target-mac address** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **vlan-priority** *vlan_priority* **[drop-eligible {true | false}] [data** *data***] [num-pkts** *num***] [inter-pkt-delay** *delay***]**

Syntax Definitions

string	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).
t_mepid	The ID of the destination MEP.
mac_address	The MAC address of the destination.
s_mepid	The ID of the source MEP.
md_name	The domain to which the source MEP belongs.
ma_name	The association to which the source MEP belongs.
vlan_priority	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
true	Sets the drop eligibility bit in the VLAN tag to true.
false	Sets the drop eligibility bit in the VLAN tag to false.
data	User specified string that is included in the packet.
num	The number of packets to send during loopback. Valid range is 1– 100.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

Defaults

parameter	default
drop-eligible {true | false}	false
num-pkts *num*	5
delay	1000

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When **target-endpoint** is specified then it must be learned before initiating loopback.
- When **target-endpoint** is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **data**, **num-pkts,** and **inter-pkt-delay** are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** can be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay (**number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a ‘started’ state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.
- The **data** parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.

Examples

```
-> saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1
association ma1
-> saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association ma1 data « monitor association ma1 » num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1
association ma1 data « monitor association ma1 » num-pkts 6
-> saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association ma1 inter-pkt-delay 500
```

Release History

Release 7.3.1; command was introduced.
Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

   alaSaaEthoamCtrlVlanPriority
```

saa type ethoam-two-way-delay

Configures SAA for ETH-DMM, including the number of packets and inter-packet delay parameters.

saa *string* **type {ethoam-two-way-delay} {target-endpoint** *t_mepid* **| target-mac address** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **vlan-priority** *vlan_priority* **[num-pkts** *num***] [inter-pkt-delay** *delay***]**

Syntax Definitions

string	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).
t_mepid	The ID of the destination MEP.
mac_address	The MAC address of the destination.
s_mepid	The ID of the source MEP.
md_name	The domain to which the source MEP belongs.
ma_name	The association to which the source MEP belongs.
vlan_priority	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
num	The number of packets to send during loopback. Valid range is 1– 100.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

Defaults

parameter	default
num	5
delay	1000

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The SAA should exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- The source MEP-ID, MD, and MA must be created before initiating DMM.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When the **target-endpoint** parameter is specified, then it must be learned before initiating DMM.
- When the **target-endpoint** parameter is specified and learned, ETH-DMM will be transmitted irrespective of whether the RMEP state is OK or failed.

- The **num-pkts** and **inter-pkt-delay** parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** values can be modified, but the **pkt-size** value cannot be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay (**number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.
- The timeout for each DMM packet is 1 sec. This value is not configurable.

Examples

```
-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain
md1 association ma1
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association ma1 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain
md1 association ma1 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association ma1 inter-pkt-delay 500
```

Release History

Release 7.3.1; command was introduced.
Release 8.6R1; **vlan-priority** parameter deprecated.

   alaSaaEthoamCtrlVlanPriority
```

saa start

Starts the SAA test.

saa *string* **start [at** *yyyy-mm-dd,hh:mm:ss.ds***]**

Syntax Definitions

string	An existing SAA ID string.
yyyy-mm-dd,hh:mm:ss.ds	The date and time to start the SAA.

Defaults

By default, the SAA test is started immediately.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the **saa stop** command to stop an SAA test that is already running.
- Use the **at** option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another **saa start** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the **saa start** command is given after an SAA is started, then the CLI will return error.
- If the SAA type is configured with a source IP that does not exist or is not active, then the packet will not be transmitted and no error will be returned. Swlogs will be updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an SAA of type ‘ip-ping’ is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the SAA type is configured with a source MEP that does not exist or is not active (admin down), then the packet will not be transmitted and no error will be returned on the CLI console. Swlogs will be updated.
- It is recommended that all the SAAs be rescheduled if the system time is being changed.

Examples

```
-> saa saa2 start at 2009-09-12,09:00:00
-> saa saa4 start
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show saa	Displays SAA configuration information.
show saa statistics	Displays SAA statistics.

MIB Objects

```
alaSaaCtrlTable
   alaSaaCtrlTestIndex
   alaSaaCtrlStartAt
```

saa stop

Stops the SAA test.

saa *string* **stop [never | at** *yyyy-mm-dd,hh:mm:ss.d*s**]**

Syntax Definitions

string	An existing SAA ID string.
never	Specifies that the SAA test will not be stopped unless the **saa stop** command is used with the **at** option.
yyyy-mm-dd,hh:mm:ss.ds	The date and time to start the SAA.

Defaults

By default, the test is stopped immediately.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a ‘started’ state before giving the command unless the start and stop times are scheduled. If the SAA is not in a ‘started’ state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

Examples

```
-> saa saa1 stop
-> saa saa2 stop never
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show saa	Displays SAA configuration information.

saa xml

Configures SAA XML parameters that determine when and where an SAA XML history file is created.

saa xml [file-name *xml_filename* **[interval** *interval***] [admin-state {enable | disable}]**

Syntax Definitions

xml_filename	The name of the file where SAA history entries are stored. This file must reside in the **/flash/network** directory on the local switch.
interval	The amount of time, in minutes, between each generation of the XML history file. Valid range is from 1–15000.
enable	Enables XML history file generation.
disable	Disables XML history file generation.

Defaults

parameter	default
xml_filename	saa.xml
interval	20 minutes
admin-state {enable | disable}	Disabled

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When this function is enabled, SAA will periodically generate an XML file containing the following entries:
  - SAA name and ID
  - Iteration number
  - Last run time
  - Reason
  - Packets sent/Received
  - RTT min/avg/max
  - Jitter min/avg/max
  - Subports

Examples

```
-> saa xml interval 60 admin-state enable
-> saa xml file-name switch1_saa.xml interval 120 admin-status enable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show saa xml	Displays the SAA XML file generation parameters.

MIB Objects

```
alaSaaXmlFeature
   alaSaaXmlStatus
   alaSaaXmlFilename
   alaSaaXmlInterval
```

show saa

Displays SAA session information.

show saa [*string* | {**descr** *description*}**] [owner** *saa_owner***]**

Syntax Definitions

string	An existing SAA ID.
description	An existing SAA description string.
saa_owner	The owner name associated with the SAA session.

Defaults

By default, information is displayed for all SAA sessions.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the *string* or **descr** *description* parameter to display information for a specific SAA.
- Use the **owner** *saa_owner* parameter to display only those sessions initiated by a specific owner. The owner of an SAA session is not user configurable, but identifies the entity that created the session.
- When an SAA is created, an owner name is assigned to the agent. This name is based on the Alcatel-Lucent Enterprise application that generated the SAA and is not configurable. For example:
  - CLI SAA owner name = “USER”
  - OmniVista owner name = “OV”
  - Shortest Path Bridging owner name = “SPB” (SAA ID is SPB-*bvlan-bmac*)

Examples

```
-> show saa
Legend: eth-lb  = ethoam-loopback
        eth-dmm = ethoam-two-way-delay

show saa type config

Displays the SAA configuration for the specified SAA type.

show saa [*string***] type {mac-ping | ip-ping | ethoam-loopback | ethoam-two-way-delay} config**

Syntax Definitions

string	An existing SAA ID.
mac-ping	Displays MAC Ping SAAs.
ip-ping	Displays IP Ping SAAs.
ethoam-loopback	Displays ETH-LB SAAs.
ethoam-two-way-delay	Displays ETH-DMM SAAs.

Defaults

By default, all SAAs with the specified type are displayed.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the *string* parameter to display information for a specific SAA
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.

Examples

```
-> show saa type ip-ping config

show saa spb

Displays the SAA configuration for the Shortest Path Bridging (SPB) SAA.

show saa spb

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

This command displays the SAA parameters that are applied to SPB SAA sessions. Use the **show saa** command to get specific session status and information.

Examples

```
-> show saa spb

SPB creation parameters:
  Auto-create           : Disabled,
  Auto-start            : Disabled,
  Interval(minutes)     : 150,

show saa xml

Displays the SAA XML file generation parameter configuration.

show saa xml

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show saa xml

XML file creation parameters:
Admin status  : Disabled,
File          : saa.xml,
Interval      : 20
```

output definitions

Admin status	The status (Enabled or Disabled) of SAA XML history file generation.
File	The name of the XML file to which SAA writes session history entries.
Interval	The amount of time, in minutes, between each generation of the XML history file.

Release History

Release 7.3.2; command was introduced.

Related Commands

saa xml	Configures SAA XML file generation parameters.

MIB Objects

```
alaSaaXmlFeature
   alaSaaXmlStatus
   alaSaaXmlFilename
   alaSaaXmlInterval
```

show saa statistics

Display SAA statistics.

show saa [*string***] statistics [aggregate | history]**

Syntax Definitions

string	An existing SAA ID string.
aggregate	Displays aggregate results for the specified SAA.
history	Displays a results history for the specified SAA.

Defaults

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations of each SAA test and in each SAA history, iteration information of first 20 received packets are stored.
- Specify the SAA ID to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

Examples

```
-> show saa statistics
Legend: eth-lb  = ethoam-loopback
        eth-dmm = ethoam-two-way-delay
        - = Delay or jitter value not available

57 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

Filename: ALCATEL-IND1-CHASSIS-MIB.mib
Module: alcatelIND1ChassisMIB

Filename: ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS.mib
Module: alcatelIND1ConfigMgrMIB

A summary of available commands is listed here:

reload secondary

Reloads the secondary CMM from the ***certified*** directory.

reload [chassis-id *chassis***] secondary [in [***hours***:] ***minutes* **| at** *hour***:***minute* **[***month day* | *day month***]]**

reload secondary cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day | *day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
cancel	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   csEntPhysicalIndex
   chasEntPhysAdminStatus
chasControlRedundantTable
   chasControlDelayedRebootTimer
```

reload all

Reloads both Chassis Management Modules (CMMs) from the ***certified*** directory.

reload [chassis-id *chassis***] all [in [***hours***:]** *minutes* **|** **at** *hour***:***minute* **[***month day* | *day month***]]**

reload all cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day | *day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
cancel	Cancels a pending time delayed reload.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Can be issued from the Primary CMM only.

Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads a specific NI module.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
chasGlobalControl
   chasGlobalControlDelayedResetAll
```

reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

reload [chassis-id *chassis***] from** *image_dir* **{rollback-timeout** *minutes* **| no rollback-timeout [in [***hours:***]** *minutes* **| at** *hour:minute***] [redundancy-time** *minutes***]}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
image_dir	The directory that contains the image files to be loaded onto the switch.
rollback-timeout *minutes*	Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the ***certified*** directory. The valid range of rollback timeout minutes is 1–15.
no rollback-timeout	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
redundancy-time *minutes*	Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the ***certified*** directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.
- If the **redundnacy-time** parameter is entered, any reboot of the Primary CMM prior to the redundnacy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

Examples

```
-> reload working rollback-timeout 5
-> reload working no rollback-timeout
-> reload working no rollback-timeout in 50
-> reload working rollback-timeout 10 at 12:50
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload all	Reboots both CMMs from the ***certified*** directory.

MIB Objects

```
chasControlModuleTable
   chasControl
   chasControlVersionMngt
   chasControlActivateTimeout
   chasControlRedundancyTime
   chasControlDelayedActivateTimer
   chasControlWorkingVersion
   chasControlNextRunningVersion
```

reload slot

Reloads the NI in the specified slot using the current running image.

reload slot *chassis/slot*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number to be reloaded.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

Can be issued from Primary CMM only.

Examples

```
-> reload slot 1/2
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
```

reload chassis-id

Reloads the specified chassis id when running in virtual chassis mode.

reload chassis-id *chassis* **[all] [in [***hours***:]** *minutes* **| at** *hour***:***minute* **[***month day* | *day month***]]**

reload chassis-id cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day | *day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
cancel	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload chassis-id 1
-> reload chassis-id 1 in 15:25
-> reload chassis-id 1 at 15:25 august 10
-> reload chassis-id 1 at 15:25 10 august
-> reload chassis-id 1 cancel
```

Release History

Release 7.3.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   csEntPhysicalIndex
   chasEntPhysAdminStatus
chasControlRedundantTable
   chasControlDelayedRebootTimer
```

copy certified

Copies the contents of the ***certified*** directory to the specified directory.

copy certified *image_dir* **[make-running-directory]**

Syntax Definitions

image_dir	The directory that the contents of the ***certified*** directory will be copied to.
make-running-directory	Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.
- This command does not affect the synchronization status of the running configuration.
- To synchronize the running and saved configuration, use the **write memory** command.

Examples

```
-> copy certified mydir
-> copy certified mydir make-running-directory
```

Release History

Release 7.1.1; command introduced.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
   chasControlWorkingVersion
```

issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

issu from *image_dir* **[redundancy-time** *minutes***]**

Syntax Definitions

image_dir	Specifies the pathname for the directory that contains the image files.
redundancy-time *minutes*	This parameter is not supported with the **issu** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

Examples

```
-> issu from myissu
```

Release History

Release 7.1.1; command introduced.

Related Commands

issu slot	Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

MIB Objects

```
chasEntModuleTable
   chasControlWorkingVersion
   chasControlRedundancyTime
```

issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

issu slot *num*

Syntax Definitions

num	Specifies the slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 9900

Usage Guidelines

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

Examples

```
-> issu slot 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

issu from	Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

```
chasEntPhysicalTable
   entPhysicalIndex
```

write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

write memory [flash-synchro]

Syntax Definitions

flash-synchro	Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM ***certified*** directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the ***certified*** directory. Use the **show running-directory** command to check where the switch is running from.
- During flash synchronization configuration changes may time out causing error messages to be displayed. Once the synchronization is complete configuration changes can resume.

Examples

```
-> write memory
-> write memory flash-synchro
```

Release History

Release 7.1.1; command introduced.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
configManager
   configWriteMemory
```

copy running certified

Copies the current RUNNING DIRECTORY configuration to the ***certified*** directory on both CMMs.

copy running certified [flash-synchro]

Syntax Definitions

flash-synchro	Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to overwrite the contents of the ***certified*** directory with the configuration from the RUNNING DIRECTORY. This should only be done if the running configuration has been verified.
- This command only synchronizes the image and configuration files in the RUNNING DIRECTORY, no other directories, such as the **switch** or **network** directories, are synchronized.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM ***certified*** directory with the contents of the primary CMM ***certified*** directory. Beginning in 7.3.1 the flash-synchro functionality is done automatically; entering the **flash-synchro** parameter is no longer required.
- In 7.3.3 the flash-synchro parameter will display an error on the OS6900 is there is no secondary CMM.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the ***certified*** directory. To view where the switch is running from, see the **show running-directory** command.
- This command may take up to two minutes to complete.

Examples

```
-> copy running certified
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **flash-synchro** parameter no affect; the functionality is performed automatically.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
   chasControlWorkingVersion
```

modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

modify running-directory *image_dir*

Syntax Definitions

image_dir	The directory name to become the new RUNNING DIRECTORY.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

Examples

```
-> modify running-directory user-config1
-> write memory
```

Release History

Release 7.1.1; command introduced.

Related Commands

write memory	Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

MIB Objects

```
chasControlModuleTable
   CurrentRunningVersion
```

copy flash-synchro

Copies the ***certified*** directory version of the primary CMM software to the ***certified*** directory of the secondary CMM.

copy flash-synchro

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is used to synchronize the ***certified*** directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.
- This command is a shorter version of the '**copy running certified flash-synchro**' command. Beginning in 7.3.1 the flash-synchro functionality is done automatically; this command is no longer required.

Examples

```
-> copy flash-synchro
-> configure copy flash-synchro
```

Release History

Release 7.1.1; command introduced.

Related Commands

copy running certified	Copies the RUNNING DIRECTORY configuration to the ***certified*** directory on the primary CMM.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
```

takeover

Forces the current secondary CMM to assume the role of the primary CMM.

takeover [*chassis***]**

Syntax Definitions

chassis	The chassis identifier.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.
- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the **takeover** command.
- For information on synchronizing the primary and secondary CMM software before issuing the **takeover** command, see the **copy flash-synchro** command.

Examples

```
-> takeover
```

Release History

Release 7.1.1; command introduced.

Related Command

reload all	Reboots the switch.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
```

show running-directory

Shows the current state of version and configuration management for a CMM.

show running-directory

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Once a switch boots up and is running, it runs either from the ***working, certified***, or a *user-defined* directory. If the switch is running from the ***certified*** directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.
- Depending on the switch configuration there may be a small delay before the information is displayed.

Examples

```
-> show running-directory

CONFIGURATION STATUS
  Running CMM              : PRIMARY,
  CMM Mode                 : MONO CMM,
  Current CMM Slot         : A,
  Running configuration    : CERTIFIED,
  Certify/Restore Status   : CERTIFIED,
SYNCHRONIZATION STATUS
  Flash Between CMMs       : SYNCHRONIZED
  Running Configuration    : SYNCHRONIZED
BOOT STATUS
  Machine State            : SHUTDOWN
```

output definitions

Running CMM	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
CMM Mode	Whether there are one or two CMMs installed or Virtual Chassis mode.
Current CMM Slot	The slot of the primary CMM, A or B.
Running Configuration	The current RUNNING DIRECTORY.
Certify/Restore Status	Indicates if the CMM has been certified.

output definitions (continued)

Flash Between CMMs	**SYNCHRONIZED**: Flash between CMMs is identical. **NOT SYNCHRONIZED**: Flash between CMMs is not identical.
Running Configuration	**SYNCHRONIZED**: RUNNING CONFIGURATION has been saved to the RUNNING DIRECTORY. **NOT SYNCHRONIZED**: RUNNING CONFIGURATION has not been saved to the RUNNING DIRECTORY.
Machine State	**SHUTDOWN -** When in VC mode, this indicates the chassis has shutdown due to the 'virtual-chassis shutdown' command or when the chassis has shutdown due to a VC error. It is only displayed if the chassis is in the shutdown state.

Release History

Release 7.1.1; command introduced.

Related Commands

reload all	Reboots the switch.
copy flash-synchro	Copies the ***certified*** directory version of the primary CMM software to the ***certified*** directory of the secondary CMM.

MIB Objects

```
chasControlModuleTable
   chasControlSynchronizationStatus
   chasControlCertifyStatus
   chasControlRunningVersion
chasEntPhysicalTable
   chasEntPhysOperStatus
   entPhysicalIndex
chasControlReloadTable
   chasControlReloadStatus
```

show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

show reload [[chassis-id *chassis***] [status | all status]**

Syntax Definitions

chassis	The chassis identifier.
status	Displays whether or not either of the CMMs are scheduled for a reload.
all status	Displays whether or all the modules are scheduled for a reload.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload secondary	Reboots the primary or secondary CMM to its startup software configuration.
reload from	Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

MIB Objects

```
chasControlModuleTable
   chasControlDelayedActivateTimer
chasGlobalControl
   chasGlobalControlDelayedResetAll
```

show microcode

Displays microcode versions installed on the switch.

show microcode [working | certified | loaded | issu | *image_dir***]**

Syntax Definitions

working	Specifies the ***working*** directory.
certified	The chassis identifier when running in virtual chassis mode.
loaded	Specifies the loaded (i.e., currently-active) microcode versions.
issu	Specifies the ***issu*** directory.
image_dir	Specifies the *user-defined* directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no additional parameters are entered microcode information for the RUNNING CONFIGURATION is displayed.

Examples

```
-> show microcode
Package           Release       Size     Description
------------------+---------------+--------+----------------------------------
Ros.img           7.1.1.403.R01    1828255 Alcatel-Lucent OS
Reni.img          7.1.1.403.R01    1359435 Alcatel-Lucent NI
```

output definitions

Package	File name.
Release	Version number.
Size	File size.
Description	File description.

Release History

Release 7.1.1; command introduced.

Related Commands

usb	Displays the archive history for microcode versions installed on the switch.

MIB Objects

N/A

usb

Enables access to the device connected to the USB port.

usb {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Must use an Alcatel-Lucent Enterprise certified USB device.
- If an Alcatel-Lucent Enterprise certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

usb auto-copy	Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected
usb backup admin-state	Enables or disables USB backup on the switch.

MIB Objects

```
systemServices
   systemServicesUsbEnable
```

usb backup admin-state

Enables or disables USB backup on the switch.

usb backup admin-state {enable | disable} [key *string* **| hash-key** *string***]**

Syntax Definitions

enable	Enables Administrative control to USB backup on the switch
disable	Disables Administrative control to USB backup on the switch
key	Keyword which will be used for encryption. *This parameter is only supported on the OmniSwitch 6465.*
hash-key	Keyword which will be decrypted and then used for encryption. *This parameter is only supported on the OmniSwitch 6465.*

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- When this command is enabled, the images and configuration from certified and running directories are copied into */uflash/6860/certified* and */uflash/6860/running* directories.
- When **write memory** is executed and backup is enabled, the configuration files and images from */flash/running-directory* are copied to */uflash/6860/running-directory name*
- When **usb backup admin-state** is enabled and **copy running certified** and **write memory flash-synchro** commands are executed, the configuration and images from */flash/certified* will be copied to */uflash/6860/certified.*
- Encryption is supported only on the OmniSwitch 6465.
  - When a key or hash key is specified, all of the configuration files and images will be encrypted and copied to the USB device.
  - If a key or hash key is not specified, all of the configuration files and images will be copied as is to the USB device.
  - Maximum length of key should be 32 characters. Minimum key length should be 8 characters.
  - If the user has gone through one back up cycle of encryption and wants to disable encryption, then the user must disable the USB back up and enable it again with no password.
- On the OmniSwitch 6465, when power supply configurations are added by the **powersupply enable** command, the power supply configurations are backed up in */uflash/6465/system* folder when backup is enabled.

- Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.

Examples

```
-> usb backup admin-state enable
-> usb backup admin-state disable
-> usb backup admin-state enable key “abc12345”
-> usb backup admin-state enable hash-key “a05234d”
```

Release History

Release 8.5R1; command was introduced.
Release 8.5R2; **key** and **hash-key** parameter added.

Related Commands

usb auto-copy	Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected
usb	Enables access to the device connected to the USB interface.

MIB Objects

```
systemServices
   systemServicesUsbBackupAdminState
   systemServicesUsbBackupKey
   systemServicesUsbBackupHashkey
```

usb auto-copy

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

usb auto-copy {enable | disable} copy-config {enable| disable} [key *string* **| hash-key** *string* **]**

Syntax Definitions

enable	Enables Administrative control to USB auto copy on the switch
disable	Disables Administrative control to USB auto copy on the switch
key	Keyword which will be used for encryption. *This parameter is only supported on the OmniSwitch 6465.*
hash-key	Keyword which will be decrypted and then used for encruption. *This parameter is only supported on the OmniSwitch 6465.*

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- If the automatic copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/6465/working* or */uflash/6860/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.
- If **copy-config** is enabled, configuration files will also be copied in addition to image files to the */flash/working* directory from */uflash/6860/working* directory.
- Encryption is supported only on the OmniSwitch 6465.
  - When a key or hash key is specified, all of the configuration files and images will be decrypted and copied to the AOS flash.
  - If a key or hash key is not specified, all of the configuration files and images will be copied as is to the AOS flash.
  - Maximum length of key should be 32 characters. Minimum key length should be 8 characters.

- On the OmniSwitch 6465, when power supply configurations are added by the **powersupply enable** command, the power supply configurations are backed up in */uflash/6465/system* folder when backup is enabled.
- Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.

Examples

```
-> usb auto-copy enable copy-config enable
-> usb auto-copy enable copy-config disable
-> usb auto-copy enable copy-config enable key “abc12345”
-> usb auto-copy enable copy-config enable hash-key “a05234d”
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; **copy-config** parameter added.
Release 8.5R2; **key** and **hash-key** parameter added.

Related Commands

usb	Enables access to the device connected to the USB interface.
usb backup admin-state	Enables or disables USB backup on the switch.

MIB Objects

```
systemServices
   systemServicesUsbCopyConfig
   systemServicesUsbBackupKey

```

mount

Mounts a USB device on /uflash.

mount [/uflash]

Syntax Definitions

/uflash	The name of the file-system to mount.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

Once the USB device is mounted most file and directory commands associated with the **/flash** file system can be used with **/uflash** such as: mkdir, rmdir, cd, rm, cp, ls.

Examples

```
-> mount /uflash
-> ls /uflash
```

Release History

Release 7.1.1; command was introduced.

Related Commands

umount	Unmounts the /uflash file system from AOS.

MIB Objects

```
systemServicesAction
   systemServicesArg1
```

umount

Unmounts the /uflash file system from AOS.

umount /uflash

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

This command unmounts the USB drive and should be used prior to unplugging the USB drive to prevent possible data corruption.

Examples

```
-> umount /uflash
```

Release History

Release 7.1.1; command was introduced.

Related Commands

mount	Mounts the /uflash file system from AOS.

MIB Objects

```
systemServicesAction
   systemServicesArg1
```

show usb statistics

Displays the status USB setting and features.

show usb statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> show usb statistics
Filesystem           1K-blocks      Used Available Use% Mounted on
/dev/sdb1               500732    261216    239516  52% /vroot/uflash
   Host scsi6: usb-storage
       Vendor: Alcatel-Lucent
      Product: USB
Serial Number: AA04012700031693
     Protocol: Transparent SCSI
   Transport: Bulk
         usb: enabled
usb auto-copy: disable
auto-copy in progress: No
```

output definitions

usb	Status of USB device interface.
usb auto-copy	Status of USB auto-copy feature.
auto-copy in progress	Is the switch currently in the process of performing an auto-upgrade.

Release History

Release 7.1.1; command was introduced.

Related Commands

usb	Enables access to the device connected to the USB interface.
usb auto-copy	Allows backup files from the USB device to be automatically copied to the switch switch immediately after the USB device is connected.
mount	Mounts the /uflash file system.

MIB Objects

```
systemServices
   systemServicesUsbEnable
   systemServicesUsbAutoCopyEnable
   systemServicesUsbDisasterRecoveryEnable
```

show issu status

Displays the status of ISSU.

show issu status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show issu status
Slot     ISSU-Status
-------+-----------------+
 1       ISSU Pending
 2       ISSU Pending
 3       ISSU Pending

-> show issu status
Slot     ISSU-Status
-------+-----------------+
 1       ISSU Complete
 2       ISSU Complete
 3       ISSU Complete
```

output definitions

Slot	Specifies the slot number.
ISSU-Status	Indicates the ISSU status for a slot: **Pending** - Slot has not been reset; upgrade is not complete. **Complete** - Slot has been reset; upgrade is complete.

Release History

Release 7.1.1; command was introduced.

Related Commands

issu from	Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

N/A

auto-config-abort

Aborts the Automatic Remote Configuration download process.

auto-config-abort

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to stop the Automatic Remote Configuration download process.

Examples

```
-> auto-config-abort
```

Release History

Release 7.3.4; command was introduced.

Related Commands

N/A

MIB Objects

N/A

image integrity check

Verifies whether the SHA256 hash key of an image file located in the specified directory matches the SHA256 hash key in the specified key file.

image integrity check *image_dir* **key-file** *filename*

Syntax Definitions

image_dir	The directory on the switch that contains the image file to verify. Enter the name of the directory in "/flash" or include the full path (for example, "working" or "/flash/working").
filename	The name of the file that contains the key for the image file in the specified directory. Enter the name of the key file or include the full path (for example, "hash.txt" or "/flash/hash.txt").

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the name of the key file is specified without the directory path, the switch will look for the key file in the same directory specified for the image file.
- The following format is used to store the hash key values in the key file:
  Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

Example

```
-> image integrity check /flash/working key-file /flash/hash.txt
This operation may take several minutes...

Success: Key matched.
```

Release History

Release 8.3.1; command introduced.

Related Commands

image integrity get-key	Calculates and displays the SHA256 key for image files.

MIB Objects

```
systemServicesAction
systemServicesArg1
systemServicesArg2
```

image integrity get-key

Displays the SHA256 hash key of the image present in the specified location.

image integrity get-key *image_dir*

Syntax Definitions

image_dir	The directory on the switch that contains the image file. Enter the name of the directory in "/flash" or include the full path (for example, "working" or "/flash/working").

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When this command is entered, the SHA256 hash of the image files in the specified directory is calculated and displayed. It can be manually verified against the hash provided in the file.
- To store the hash key value in a text file that can be used with the **image file integrity check** command, use the following format:
  Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

Example

```
-> image integrity get-key /working
This operation may take several minutes...

Image Name                  SHA256 Key
----------------+-----------------------------------------
Uos.img           c64d6b23312a6f9c4b99642b31ed0e87e600bce58d6fdd089d09e1f8077bd208

-> image integrity get-key /flash/certified
This operation may take several minutes...

Image Name                  SHA256 Key
----------------+-----------------------------------------
Uos.img           3d4d488a73eb798325bacb5793ef0d67bdf377527278a6732270d3a4801bb44b
```

Release History

Release 8.3.1; command introduced.

Related Commands

image integrity check	Verifies the SHA256 hash key for the image file matches the key specified in a text file.

58 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

Additional Information. Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

MIB information for the Chassis Management and Monitoring commands is as follows:

Filename: ALCATEL-IND1-CHASSIS-MIB.mib
Module: alcatelIND1ChassisMIB

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

Filename: ALCATEL-IND1-CAPMAN-MIB.mib
Module: alcatelIND1CapManMIB

A summary of available commands is listed here:

Management Commands	**system contact** **system name** **system location** **system date** **system time** **system timezone** **system daylight-savings-time** **update uboot** **update fpga-cpld** **reload slot** **power slot** **powersupply enable** **powersupply powersave** **powersupply type** **hash-control** **bluetooth** **capability profile** **capability profile tcam mode** **capability trap-threshold**
Monitoring Commands	**capability trap-threshold** **show system** **show hardware-info** **show chassis** **show cmm** **show slot** **show module** **show module long** **show module status** **show powersupply** **show fan** **show fantray** **show temperature** **show hash-control** **show bluetooth status** **show me** **show tcam utilization** **show tcam utilization detail** **show tcam app-groups** **show capability profile** **show pmd-files** **show tech-support** **show capability trap-threshold**
Licensing Commands	**license apply file** **show license-info**
Key Management Commands	**security key-chain gen-random-key** **security key** **security key-chain** **security key-chain key** **show security key** **show security key-chain**

Alarm Relay Commands	**alarm in** **alarm event** **alarm out** **alarm map** **alarm duration** **alarm clear status** **show alarm input config** **show alarm event config** **show alarm status**
Application Manager Commands	**appmgr** **appmgr list** **appmgr commit** **pkgmgr** **pkgmgr list** **pkgmgr commit**

system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

system contact *text_string*

Syntax Definitions

text_string	The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"Jean Smith Ext. 477 jsmith@company.com"**.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"
-> system contact engineering-test@company.com
```

Release History

Release 7.1.1; command introduced.

Related Commands

system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.
capability trap-threshold	Displays the basic system information for the switch.

MIB Objects

```
system
   systemContact
```

system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

system name *text_string*

Syntax Definitions

text_string	The new system name. The system name can range from 1 to 32 characters in length. No spaces are allowed in the system name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Spaces are not allowed in the system name.

Examples

```
-> system name OmniSwitch6900
-> system name OS6900
```

Release History

Release 7.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact of the switch (for example, an individual or a department).
system location	Specifies the current physical location of the switch.
capability trap-threshold	Displays the basic system information for the switch.

MIB Objects

```
system
   systemName
```

system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

system location *text_string*

Syntax Definitions

text_string	The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"NMS Test Lab"**.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> system location "NMS Test Lab"
-> system location TestLab
```

Release History

Release 7.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact of the switch (for example, an individual or a department).
system name	Modifies the current system name of the switch.
capability trap-threshold	Displays the basic system information for the switch.

MIB Objects

```
system
   systemLocation
```

system date

Displays or modifies the current system date on the switch.

system date [*mm/dd/yyyy***]**

Syntax Definitions

mm/dd/yyyy	The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the **system timezone** command on page 58-9.

Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

Release History

Release 7.1.1; command introduced.

Related Commands

system time	Displays or modifies the current system time on the switch.
system timezone	Displays or modifies the time zone for the switch.

MIB Objects

```
systemServices
   systemServicesDate
```

system time

Displays or modifies the switch current system time.

system time [*hh:mm:ss***]**

Syntax Definitions

hh:mm:ss	The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If you do not specify a new system time in the command line, the current system time is displayed.
- Setting the year to 1970 is not supported. The system interprets 1970 as meaning the internal clock has never been set and will reset to the year 2014.

Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

Release History

Release 7.1.1; command introduced.

Related Commands

system date	Displays or modifies the current system date on the switch.
system timezone	Displays or modifies the time zone for the switch.

MIB Objects

```
systemServices
   systemServicesTime
```

system timezone

Displays or modifies the time zone for the switch.

system timezone [*timezone_abbrev***]**

Syntax Definitions

timezone_abbrev	Specifies a time zone for the switch and sets the system clock to run on UTC. If you specify a time zone abbreviation, the hours offset from UTC is automatically calculated by the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

Examples

```
-> system timezone mst
```

Release History

Release 7.1.1; command introduced.

Related Commands

system date	Displays or modifies the current system date on the switch.
system time	Displays or modifies the current system time on the switch.

MIB Objects

```
systemServices
   systemServicesTimezone
   systemServicesTimezoneStartWeek
   systemServicesTimezoneStartDay
   systemServicesTimezoneStartMonth
   systemServicesTimezoneStartTime
   systemServicesTimezoneOffset
   systemServicesTimezoneEndWeek
   systemServicesTimezoneEndDay
   systemServicesTimezoneEndMonth
   systemServicesTimezoneEndTime
   systemServicesEnableDST
```

system daylight-savings-time

Displays the Daylight Savings Time (DST) setting for the configured timezone.

system daylight-savings-time [enable | disable]

Syntax Definitions

enable | disable enable

Defaults

parameter	default
Timezone supports DST	enabled
Timezone does not support DST	disabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the configured timezone supports DST it is automatically enabled.
- If the configured timezone does not support DST it is automatically disabled.

Examples

```
-> system daylight-savings-time
Daylight Savings Time (DST) is ENABLED.
```

Release History

Release 7.1.1; command introduced.

Related Commands

system time	Displays or modifies the current system time on the switch.
system timezone	Displays or modifies the timezone for the switch.
system date	Displays or modifies the current system date on the switch.

MIB Objects

```
systemServices
   systemServicesTimezone
   systemServicesEnableDST
```

update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update uboot {cmm *slot* **| ni {all |** *slot***} file** *filename***}**

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM)**.**
all	Specifies that the update is performed for all slots within a chassis.
slot	Specifies the slot number of the module within a chassis.
filename	Specifies the path and name of the upgrade file.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

Examples

```
-> update uboot ni all file 9999.tar.gz
-> update uboot cmm 1 file /flash/temp/9999.tar.gz
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

update fpga-cpld

Updates the FPGA/CPLD versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update fpga-cpld {cmm {*chassis/cmm* |*all*} **| ni {***chassis/ni* **| daughter** *num***} file** *filename***}**

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM)**.**
daughter	Specifies the number of the daughter board on the NI module.
ni	Specifies the slot number of the module within a chassis.
filename	Specifies the path and name of the upgrade file.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.
- When updating CMMs with the **all** option an “fpga_kit” file must be used. If upgrading a CMM using the *chassis/cmm* option, a “vme” file must be used.

Examples

```
-> update fpga-cpld ni 4 file 9999.vme
-> update fpga-cpld cmm 1/1 file /flash/OS6865_U28X_CPLD_V11.vme
-> update fpga-cpld cmm all file fpga_kit_4960
```

Release History

Release 7.1.1; command introduced.
Release 7.3.4; **fpga** parameter changed to **fpga-cpld.**

Related Commands

reload slot	Reloads the specified NI module.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

reload slot

Reloads or reboots a specified Network Interface (NI) module.

reload slot *slot*

Syntax Definitions

slot	Specifies the slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The **reload slot** command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected

Examples

```
-> reload slot 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.
power slot	Turns the power on or off for a specified Network Interface (NI) module.
show slot	Shows the hardware information and the current status for Network Interface (NI) modules currently running in the chassis.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
   reset
```

power slot

Turns the power on or off for a specified Network Interface (NI) module.

power slot *chassis/slot*

no power slot *chassis/slot*

Syntax Definitions

chassis	The chassis identifier.
slot	The chassis slot number containing the NI module being powered on or off.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the **no** form of this command to power off an NI module.

Examples

```
-> power slot 1
-> power slot 7
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.
show slot	Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
   powerOn
   powerOff
```

powersupply enable

Enables the power supply unit identified by the PSU-ID.

powersupply enable [*slot***]**

no powersupply enable [*slot***]**

Syntax Definitions

slot	Slot number of power supply.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

N/A

Release History

Release 7.1.1; command introduced.

Related Commands

power slot	Turns the power on or off for a specified Network Interface (NI) module.

MIB Objects

N/A

powersupply powersave

Enables the power saving functionality on the switch.

powersupply powersave {enable | disable}

Syntax Definitions

enable | disable	Enables or disables the power saving functionality.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

Not supported in this release.

Usage Guidelines

- When enabled unneeded power-supplies are shut down to conserve energy, only the power supplies required to provide N+1 redundancy remain on.
- If enabled and power is lost to all active power supplies simultaneously the switch will lose power since N+1 redundancy applies only to the active power supplies.
- If the power-save mode is disabled, all available power supplies are switched on at all times.

Examples

```
-> powersupply powersave disable
-> powersupply powersave enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show powersupply	Displays the hardware information and current status for chassis power supplies.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
```

powersupply type

Configures the type of power supply that is connected to the chassis.

powersupply *num* **name** *string* **type {ALE {lo-ac | hi-ac} | phoenix-contact {48VDC | 24VDC} | third-party wattage** *num***}** [**chassis-id** *chassis-id*]

Syntax Definitions

num	Power supply connector ID.
string	The descriptive name of the power supply.
lo-ac | hi-ac	The type of ALE power supply.
phoenix-contact 48VDC | 24VDC	The type of Phoenix Contact power supply.
third-party wattage *num*	The wattage value of the attached third-party power supply

Defaults

parameter	default
N/A	

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- The OmniSwitch 6465 cannot auto-detect the type of power supply connected. This command is used to configure the type of power supply that is connected.
- Refer to the OmniSwitch 6465 Hardware User Guide for chassis power requirements when using third-party power supplies.
- Refer to the OmniSwitch 6465 Hardware Users Guide for power supply specifications using the power supply part number mapping below. A power supply may be associated with multiple part numbers depending on ALE branding, ordering part number or manufacturer part number.
  - **lo-ac** (OS6465-BPN, PS-I75AC, SDR-75-48)
  - **hi-ac** (O6465-BPN-H, PS-I185AC-P, SDR-240-55)

Examples

```
-> powersupply 1 name ALE-75W-ps1 type ale lo-ac
-> powersupply 2 name ALE-75W-ps2 type ale lo-ac
-> powersupply 1 name third-party-ps type third-party wattage 75
```

Release History

Release 8.5 R1; command introduced.

Related Commands

show powersupply	Displays the hardware information and current status for chassis power supplies.

MIB Objects

N/A

hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}

hash-control extended no udp-tcp-port

Syntax Definitions

brief	Sets hashing to brief mode.
extended	Sets hashing to extended mode.
udp-tcp-port	Sets extending hashing to use UDP/TCP ports.
enable | disable	Enables or disables the load balancing of non-unicast traffic on a link aggregate.

Defaults

parameter	default
hash-control	brief (OS6465, OS6900) extended (OS6560, OS6860, OS6865, OS9900)
udp-tcp-port	disabled
non-ucast	disabled

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

show hash-control	Displays the current hash control setting for the switch.

MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUCHashControl
```

bluetooth

Enables or disables USB adapter with Bluetooth technology connectivity and configures the power level.

bluetooth {admin-state [enable | disable] | transmit-power [low | high]}

Syntax Definitions

enable | disable	Enables or disables USB adapter with Bluetooth technology connectivity.
low | high	Configures the power level to low or high.

Defaults

parameter	default
enable | disable	**enable**
low | high	**low**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

This command will configure all USB adapters with Bluetooth technology in a virtual chassis.

Examples

```
-> bluetooth admin-state enable
-> bluetooth transmit-power high
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show bluetooth status	Displays the current USB adapter with Bluetooth technology settings.
show me	Executes an LED blink pattern for 10 seconds that is used by the USB adapter with Bluetooth technology to identify the connected switch.

MIB Objects

```
systemServices
   systemServicesUsbEnable
   systemServicesBluetoothTxPower
```

capability profile

Configures the mode of the switch to be either *switch* or *router*.

capability profile {switch | router}

Syntax Definitions

switch | router Configures the *switch* or *router* profile.

Defaults

parameter	default
switch | **router**	**switch**

Platforms Supported

OmniSwitch 6900-V72, 6900-C32, OmniSwitch 6900-X72

Usage Guidelines

- Use this command to change the mode of a switch between *switch* and a *router*. This will adjust the L2 and L3 table entries based on the network requirements.
- The *switch* profile provides more L2 entries. The *router* profile provides more LPM entries. Refer to the Specifications Guide for details on the L2 and L3 entries.
- The switch must be rebooted for the configured profile to take effect.

Examples

```
-> capability profile router
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show capability profile Displays the active and configured profile settings.

MIB Objects

```
alaCapManProfile
   alaCapManProfileMode
```

capability profile tcam mode

Configures the TCAM (Ternary Content Addressable Memory) mode of the switch to support source IPv6 filtering.

capability profile tcam mode {source-ipv6 | dest-ipv6}

Syntax Definitions

source-ipv6	Selects the source IPv6 (enhanced) mode.
dest-ipv6	Selects the destination IPv6 mode.

Defaults

By default, the TCAM mode supports destination IPv6 filtering only; source IPv6 filtering is not allowed.

Platforms Supported

OmniSwitch 6560

Usage Guidelines

- Setting the TCAM mode to source IPv6 filtering is required to support DHCPv6 Snooping IPv6 source filtering on an OmniSwitch 6560.
- When the TCAM mode is changed, a warning message is displayed (see command examples below).
- After the TCAM mode is changed and the configuration is saved with the **write memory** command, reboot the switch to activate the specified mode.
- When the TCAM mode is set to source IPv6 filtering, the TCAM will operate in an enhanced mode to support the use of source IPv6 conditions in QoS policy rules.
- The following functionality is *not* supported when the source IPv6 filtering mode is active:
  - Destination IPv6 source filtering.
  - ISSU
  - QoS anti-spoofing
  - Fewer QoS policy rules supported.

Examples

```
-> capability profile tcam mode source-ipv6
WARNING: Source ipv6 tcam mode would not support : QoS policy with destination ipv6
address / destination network group / ipv6 Tcpflags.
Reboot is needed for the capability profile tcam mode to use source-ipv6

-> capability profile tcam mode dest-ipv6
WARNING: Destination ipv6 tcam mode would not support : QoS policy with source ipv6
address / source network group.
Reboot is needed for the capability profile tcam mode to use dest-ipv6
```

Release History

Release 8.6R1; command was introduced.

Related Commands

dhcpv6-snooping ipv6-source-filter	Configures the IPv6 source filtering capability for a port, link aggregate, or VLAN using the DHCPv6 Snooping binding table.
show tcam utilization detail	Displays additional TCAM usage information, such as application usage.
show capability profile	Displays the active and configured profile settings.

MIB Objects

```
alaCapManProfile
   alaCapManProfileTcamMode
```

capability trap-threshold

Configures the MAC and ARP table utilization high and low values for generating the associated traps.

capability trap-threshold {MAC | ARP} {HIGH *num* **| LOW** *num***}**

Syntax Definitions

MAC	Configures the MAC table threshold.
ARP	Configures the ARP table threshold.

Defaults

parameter	default
HIGH *num*	95
LOW *num*	90

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the table utilization reaches the configured HIGH value a trap will be sent indicating the usage has reached the HIGH value. The trap will continue to be periodically sent until the usage drops below the configured HIGH value.
- Once the usage drops to the configured LOW value a trap will be sent indicating the usage has dropped below the configured LOW value.
- The minimum LOW value is 5% and the maximum HIGH value is 95%. It is recommended to have a difference of at least 5% between LOW and HIGH values.

Examples

```
-> capability trap-threshold ARP HIGH 90 LOW 80
-> capability trap-threshold MAC HIGH 88 LOW 80
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show capability trap-threshold Displays the capability trap-threshold configured values.

MIB Objects

```
alaCapManTrapThreshold
   alaCapManTrapThresholdMacLow
   alaCapManTrapThresholdMacHigh
   alaCapManTrapThresholdArpLow
   alaCapManTrapThresholdArpHigh
```

license apply file

Activates the license for licensed protocols on the switch.

license apply {file *file_name* | **key** *license_key***}** [**order-id** *order_id*]

Syntax Definitions

file_name	The name of the license file containing the license keys.
license_key	Enter the individual license key. The license key can contain special characters, the key must encase using single quote character (").
order_id	The order ID for the MACsec license.

Defaults

By default, licensed protocols are not activated on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The license file can have any name.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- Using **key** option, the license key can be directly entered in the command. The license key can contain special characters; it is required to encase the key using single quote character ("). The **key** input is needed only for applying MACsec license.
- The switch must be rebooted to reflect the licensed feature set. For MACsSec and 10G license, a reboot is not required.
- A 10G license can be installed on the OmniSwitch 6560-24X4/P24X4/48X4/P48X4 models to upgrade ports 25/26 (24-port models) or ports 49/50 (48-port models) from 1G to 10G. There is no reboot required after applying this license, but the ports should be administratively disabled and re-enabled.
- The module type will continue to display as ‘U16L’ even after upgrading a ‘U16’ to a ‘U16E’.
- Order-id parameter is mandatory for MACsec license but it is not applicable for other licenses.
- The MACsec license is a site license and does not use the serial number and the MAC address of the switch. However, **order-id** is required for the license generator to generate MACsec license. The order ID value entered in this command is validated against the order ID in the license file. If this value does not match with the value stored in license file, MACsec license will not be installed.
- The order ID is a seven digit number and the license generation process appends the digit 0 at the beginning implicitly. Hence, it is required to provide eight digits (0 + 7 digits of the order ID) to install the license successfully.

Examples

```
-> license apply file /flash/swlicense.txt
```

```
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y

-> license apply file \flash\swlicense.dat order-id "07766551"

-> license apply key 'hasJ-i{v!-[qVW-YPrt-t@YK' order-id "01234567"
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.1; **key** and **deactivate** parameters deprecated.
Release 8.6R1; MACsec site-wide license and OmniSwitch 6560 10-Gigabit port license support added.
Release 8.6R2; **key** parameter added.

Related Commands

show license-info	Displays all the licensed applications installed on the switch.

```

output definitions

System Description	The description for the current system. This description shows the current software version and the system date.
System Object ID	The SNMP object identifier for the switch.
System Up Time	The amount of time the switch has been running since the last system reboot.
System Contact	An user-defined administrative contact for the switch. This field is modified using the **system contact** command.
System Name	A user-defined text description for the switch. This field is modified using the **system name** command.

output definitions (continued)

System Location	The user-defined physical location of the switch. This field is modified using the **system location** command.
System Services	The number of current system services.
System Date & Time	The current system date and time. This field is modified using the **system date** and **system time** commands.
Flash Space: Primary CMM: Available (bytes)	The available flash memory space available on the *primary* management module of the switch.
Flash Space: Primary CMM: Comments	Comments regarding the available flash memory space available on the primary management module of the switch, if applicable.

Release History

Release 7.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact for the switch(for example, an individual or a department).
system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.

MIB Objects

```
system
   systemContact

CPLD Revision Register            : 06
XFP Module ID                     : 02
```

output definitions

CPU Type	The manufacturer and model number of the CPU used on the CMM.
Flash Manufacturer	The manufacturer of the flash memory used on the CMM.
Flash size	The total amount of flash memory (file space) on the CMM. This field specifies the total flash memory size only and does not indicate the amount of memory free or memory used.
RAM Manufacturer	The manufacturer of the RAM memory used on the CMM.
RAM size	The total amount of RAM memory on the CMM. This field specifies the total RAM memory only and does not indicate the amount of memory free or memory used.

output definitions (continued)

NVRAM Battery OK	The current status of the NVRAM battery. If the battery is OK, YES is displayed in this field. If the battery charge becomes low, NO is displayed in this field.
BootROM Version	The current BootROM version.
Backup Miniboot Version	The current backup miniboot version.
Default Miniboot Version	The current default miniboot version.
Product ID Register	The register number of the product ID.
Hardware Revision Register	The register number of the hardware revision.
CPLD Revision Register	The register number of the CPLD revision.
XFP Module ID	The ID number of the XFP module.

Release History

Release 7.1.1; command introduced.

  Power Left:                   1540,
  Number Of Resets:             28,
  MAC Address:                  2c:fa:a2:13:e4:02
```

output definitions

Model Name	The factory-set model name for the switch. This field cannot be modified.
Description	The factory-set description for the switch. This field cannot be modified.
Part Number	The part number for the chassis.
Hardware Revision	The hardware revision level for the chassis.
Serial Number	The serial number for the chassis.
Manufacture Date	The date the chassis was manufactured.
Admin Status	The current power status of the chassis. Chassis information is obtained from a running CMM. Hence the value is always POWER ON.

output definitions (continued)

Operational Status	The current operational status of the chassis.
Free Slots	The number of free slots available for NIs.
Power Left	The power remaining for additional NIs.
Number of Resets	The number of times the CMM has been reset (reloaded or rebooted) since the last cold boot of the switch.
MAC Address	The base MAC address of the chassis.

Release History

Release 7.1.1; command introduced.

Related Commands

show hardware-info	Displays the current system hardware information.

show fan	Displays the current operating status of chassis fans.

MIB Objects

```
chasChassisTable
   chasFreeSlots
   chasPowerLeft
```

show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch.

show cmm [*slot***]**

Syntax Definitions

slot	Specifies the CMM by slot number or letter.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

Examples

```
-> show cmm
Chassis ID 1 Module in slot CMM-A
  Model Name:                     OS99-CMM,
  Module Type:                    0x7100101,
  Description:                    MGMT MODULE,
  Part Number:                    903754-90,
  Hardware Revision:              C06,
  Serial Number:                  U1820028,
  Manufacture Date:               May 10 2016,
  FPGA - Control:                 2.0.0,
  FPGA - Power:                   0.8,
  Admin Status:                   POWER ON,
  Operational Status:             UP,
  Max Power:                      64,
  CPU Model Type:                 Intel Atom C2518,
  MAC Address:                    2c:fa:a2:13:e4:02,
  Coreboot Version:               8.3.1.103.R01
```

output definitions

Model Name	The model name of the switch.
Model Type	A unique module ID specific to the type of module.
Description	A factory-defined description of the associated board.
Part Number	The part number for the board.
Hardware Revision	The hardware revision level for the board.
Serial Number	The serial number for the board.
Manufacture Date	The date the board was manufactured.

output definitions (continued)

FPGA - Control	FPGA version.
FPGA - Power	FPGA version
Admin Status	The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON.
Operational Status	The current operational status of the CMM.
Max Power	The maximum power for the CMM.
CPU Model Type	The CPU Model type.
MAC Address	The MAC address assigned to the chassis.
Coreboot Version	The boot version number for the CMM.

Release History

Release 7.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.
show slot	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
show module	Displays the basic information for either a specified module or all the modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.
capability trap-threshold	Displays the status and configuration of Switch Fabric Modules (SFMs) on chassis-based switches.

MIB Objects

N/A

show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

show slot [*slot***]**

Syntax Definitions

slot	The slot number for a specific NI module installed in the chassis. If no slot number is specified, information for all the NI modules is displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as ‘UNKNOWN’.

Examples

```
-> show slot 1
Module in slot 1
  Model Name:                   OS10-GNI-C48,
  Description:                  10-1000 RJ45,
  Part Number:                  902434-90,
  Hardware Revision:            A07,
  Serial Number:                H03Q0008,
  Manufacture Date:             JAN 31 2007,
  FPGA - Physical 1:            007,
  Daughter FPGA - Physical 1:   002,
  Daughter FPGA - Physical 2:   002,
  Admin Status:                 POWER ON,
  Operational Status:           UP,
  Power Consumption:            200,
  CPU Model Type   :            Motorola MPC854
  MAC Address:                  00:d0:95:01:04:
  ASIC - Physical 1:            BCM56620_A1,
  ASIC - Physical 2:            BCM56620_A1,
  ASIC - Physical 3:            BCM56620_A1,
  ASIC - Physical 4:            BCM56620_A1,
  ASIC - Physical 5:            BCM56620_A1,
  ASIC - Physical 6:            BCM56620_A1,
  UBOOT Version:                7.1.1.412.R01,
```

output definitions

Model Name	The NI module name. For example, OS9-GNI-C24 indicates a twenty four-port 10/100/1000BaseT Ethernet module.
Description	A general description of the NI. For example, 24pt 10/100/1000BaseT Mod indicates a twenty four-port 10/100/1000BaseT Ethernet module.
Part Number	The part number for the NI.
Hardware Revision	The hardware revision level for the NI.
Serial Number	The serial number for the NI printed circuit board (PCB).
Manufacture Date	The date the NI was manufactured.
FPGA/Daughter FPGA	The FPGA versions.
Admin Status	The current power status of the NI. Options include POWER ON or POWER OFF.
Operational Status	The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
Power Consumption	The current power consumption for the module.
CPU Model Type	The CPU model type.
MAC Address	The MAC address assigned to the NI.
ASIC - Physical	General information regarding the NI module ASICs.
UBOOT Version	UBOOT version of the NI.

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.
power slot	Turns the power on or off for a specified Network Interface (NI) module.
show module	Displays the basic information for either a specified module or all modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

```
chasEntPhysOperStatus
```

show module

Displays the basic information for either a specified module or all modules installed in a standalone switch chassis.

show module [*slot*]

Syntax Definitions

slot	The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show module
                                      HW    Mfg
Slot     Part-Number     Serial #    Rev   Date       Model Name
-------+--------------+------------+---+-----------+---------------------------
CMM-A    902271-10      E23L9059     002 JUN 08 2004  OS10-CPM
SLOT-1   902271-10      E23L9059     002 JUN 08 2004  OS10-GNI-C48
```

output definitions

Slot	The chassis slot position of the module.
Part-Number	The part number for the module.
Serial #	The serial number for the module.
Rev	The hardware revision level for the module.
Date	The date the module was manufactured.
Model Name	The descriptive name for the module.

Release History

Release 7.1.1; command introduced.

Related Commands

show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

N/A

show module long

Displays the detailed information for either a specified module or all the modules installed in a standalone switch chassis.

show module long [*slot***]**

Syntax Definitions

slot	The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

```

output definitions

Model Name	The NI module name.
Description	A general description of the NI.
Part Number	The part number for the NI.
Hardware Revision	The hardware revision level for the NI.
Serial Number	The serial number for the NI printed circuit board (PCB).
Manufacture Date	The date the NI was manufactured.
FPGA/Daughter FPGA	The FPGA versions.
Admin Status	The current power status of the module. Options include POWER ON or POWER OFF.
Operational Status	The operational status of the module. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
Max Power	The maximum power consumption for the module.
CPU Model Type	The CPU model type.
MAC Address	The MAC address assigned to the module.
ASIC - Physical	General information regarding the module ASICs.
UBOOT Version	UBOOT version of the module.
POE-Software Version	The PoE controller firmware/hardware revision.

Release History

Release 7.1.1; command introduced.

Related Commands

show module	Displays the basic information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

N/A

show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

show module status [*slot***]**

Syntax Definitions

slot	The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

Examples

```
-> show module status
       Operational                Firmware
Slot     Status      Admin-Status   Rev           MAC
------+-------------+------------+---------+-----------------
CMM-A    UP           POWER ON      N/A     00:d0:95:a3:e5:09
SLOT-1   UP           POWER ON      N/A     00:d0:95:a3:e5:0b
```

output definitions

Slot	The chassis slot position of the module. For detailed slot numbering information, refer to the "Chassis and Power Supplies" chapter of the *Hardware User Guide*. Refer to page 58-37 for additional information on CMM callouts.
Operational Status	The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
Admin-Status	The current power status of the module. Options include POWER ON or POWER OFF.
Firmware Rev	The firmware version for module ASICs.
MAC	For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.

Release History

Release 7.1.1; command introduced.

Related Commands

show module	Displays the basic information for either a specified module or all the modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all the modules installed in the chassis.

MIB Objects

N/A

show powersupply

Displays the hardware information and current status for chassis power supplies.

show powersupply [*slot***]**

Syntax Definitions

slot	The slot number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.
powersave status	Displays the status of the power saving functionality.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show powersupply
           Total     Power    Input     PS
Slot  PS   Power     Used     Voltage   Type     Status   Location
----+----+---------+--------+---------+--------+--------+----------
      1     2400      0        0         AC       UP       Internal
      2     2400      0        0         AC       UNPLUG   Internal
      3     2400      564      226       AC       UP       Internal
      4     2400      504      226       AC       UP       Internal

      2     450       50       AC       UP         Internal    Front to Rear
```

```
-> show powersupply 1

Module in slot PS-1
 Model Name:                     YM-2451DDR,
 Module Type:                    DC/DC Power Supply, Front to Rear Airflow
 Description:                    OS-PS-450W-D
 Hardware Revision:              B0,
 Serial Number:                  1020000417,
 Manufacture Date:               May 14 2010,
 Operational Status:             UP,
 Power Provision:                450W
```

output definitions

Model Name	The power supply model number.
Description	A description of the associated power supply. This field reflects the model name in most cases.
Part Number	The part number for the power supply.
Hardware Revision	The hardware revision level for the power supply.
Serial Number	The serial number for the power supply.
Manufacture Date	The date the power supply was manufactured.
Operational Status	The operational status of the power supply. Options include UP or DOWN.
Power Provision	The number of watts provided by this power supply.
PS	The slot number of the power supply.
Total Power	The number of watts provided by this power supply.
Power Used	The number of watts being used by this power supply.
Input Voltage	The input line voltage of this power supply.
PS type	The type of power supply. AC or DC.
Operational Status	The operational status of the power supply. Options include UP, DOWN, or UNPLUG.
Location	The location of the power supply. Options include Internal or External. Slots 5-8 are for the optional power shelf.
Airflow	Direction of airflow.

Release History

Release 7.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.

MIB Objects

N/A

show fan

Displays the current operating status of chassis fans.

show fan [*slot***]**

Syntax Definitions

slot	Specifies the slot number of the fantray.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guideline

N/A

Examples

```
-> show fan
Chassis Fan  Status
-------+---+-----------
   1     1   Running
   1     2   Running
   1     3   Running
   1     4   Not Running
```

output definitions

Chassis/Tray	The chassis/tray ID.
Fan	The fan number describing the fan position.
Status/Functional	The current operational status of the corresponding fan.
Speed	The speed of the fan.
Airflow	-

Release History

Release 7.1.1; command introduced.

Related Commands

show fantray	Displays the current operating status of chassis fantrays.

MIB Objects

N/A

show fantray

Displays the current operating status of chassis fantrays.

show fantray [*slot***]**

Syntax Definitions

slot	Specifies the slot number of the fantray.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guideline

N/A

Examples

```
-> show fantray
              | Working |  Fan
Tray | Status |  Fans   | Load %
-----+--------+---------+--------
  1     ON         4        50
```

output definitions

Chassis/Tray	The chassis/Tray ID.
Status	The current operational status of the fantray.
Working Fans	The number of working fans.
Fan Load %	The load of the fantray.

Release History

Release 7.1.1; command introduced.

Related Commands

show fantray	Displays the current operating status of chassis fantrays.

MIB Objects

```
N/A
```

show temperature

Displays the internal operating temperature of the chassis, as well as current temperature threshold settings.

show temperature [fabric [*index***] | slot [***index***] | fantray [***index***] | cmm [***index* | *cmm_letter***] | chassis-id** *chassis***]**

Syntax Definitions

index	Specifies the index number.
cmm_letter	Specifies the CMM letter.
chassis	The ID number of the chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays the internal operating temperature, not the ambient temperature, of the current operating chassis as well as current temperature threshold settings.
- Refer to the appropriate *Hardware Users Guide* for detailed information about temperature thresholds for a specific OmniSwitch model.

Examples

```
-> show temperature
Chassis/Device | Current |  Range  |  Danger | Thresh |  Status
---------------+---------+---------+---------+--------+-----------------
 1/CMMA            48     -45 to 93      98       93     UNDER THRESHOLD
```

output definitions

Chassis/Device	The device being measured (CMM, Fabric, or NI)
Current	The current CPU temperature in Celsius.
Range	The supported threshold range.
Danger	The danger threshold value. This value is based on the switch model and is not configurable.
Thresh	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.
Status	Whether the current temperature has reached the threshold.

Release History

Release 7.1.1; command introduced.

Related Commands

show fan	Shows the hardware information and current status for the chassis fans.

MIB Objects

```
chasChassisTable
   chasHardwareBoardTemp
   chasHardwareCpuTemp
   chasTempRange
   chasTempThreshold
   chasDangerTempThreshold
```

show hash-control

Displays the current hash control settings for the switch.

show hash-control [non-ucast]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

N/A

Examples

```
-> show hash-control
Hash Mode    = brief,
Udp-Tcp-Port = disabled

-> show hash-control non-ucast
Hash Status = Enabled,
Hash Mode : Normal
```

output definitions

Hash Mode	The current Hash Mode.
Udp-Tcp-Port	Status of UDP/TCP hashing.
Non-ucast Hash Status	Status of Non-ucast Hash status.

Release History

Release 7.2.1; command introduced.

Related Commands

powersupply type	Configures the hash mode of the switch.

MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUCHashControl
```

show license-info

Displays all the licensed applications installed on the switch.

show license-info

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.
- The module type will continue to display as ‘U16L’ even after upgrading a ‘U16’ to a ‘U16E’.

Examples

```
-> show license-info
                                                Time (Days)     Upgrade        Expiration
VC   device   License            Type          Remaining       Status         Date
----+------+--------------+--------------+--------------+--------------+----------------
3       0    Advanced           PERM            NA             NA             NA
3       0    10G                PERM            NA             NA             NA
4       0    Advanced           PERM            NA             NA             NA
4       0    10G                PERM            NA             NA             NA
5       0    Advanced           PERM            NA             NA             NA
5       0    10G                PERM            NA             NA             NA
6       0    Advanced           PERM            NA             NA             NA
6       0    10G                PERM            NA             NA             NA
```

output definitions

VC	Virtual chassis identifier.
Device	Slot number of NI.
License	Displays the feature license installed on the switch. Advanced, Data Center, U16L
Type	The type of license: Demo or Permanent.
Time (Days) Remaining	Time of days remaining for a demo license. Display as ‘NA’ for permanent licenses.
Upgrade Status	Status of the upgrade.
Expiration Date	Date of license expiry.

Release History

Release 7.2.1; command was introduced.
Release 8.6R1; **Upgrade Status** and **Expiration Date** fields added.

Related Commands

license apply file	Activates the license for licensed protocols on the switch.

MIB Objects

   alaVcLicensedvcSlot
   alaVcLicensedMask
   alaVcLicenseType
   alaVcTimeRemain
```

show bluetooth status

Displays the current USB adapter with Bluetooth technology configuration.

show bluetooth status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guideline

N/A

Examples

```
-> show bluetooth status
Admin Status       : disabled,
Transmit Power     : low,

Chassis      Operational Status
----------+--------------------------
 1          Not Present
```

output definitions

Admin Status	Whether the USB adapter with Bluetooth technology is enabled or disabled.
Transmit Power	Whether transmit power is high or low.
Chassis	The chassis identifier.
Operational Status	notPresent - No USB adapter with Bluetooth technology present. connectionInactive - USB adapter with Bluetooth technology present but inactive. connectionActive - USB adapter with Bluetooth technology present and active.

Release History

Release 8.1.1; command introduced.

Related Commands

bluetooth	Enables or disables a USB adapter with Bluetooth technology and configures the power level.

MIB Objects

N/A

show me

Executes an LED blink pattern for 10 seconds that is used by the USB adapter with Bluetooth technology to identify the connected switch.

show me

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, OmniSwitch 6900-V72, 6900-C32

Usage Guideline

Use this command in a virtual chassis to identify which switch currently has USB adapter with Bluetooth technology connectivity.

Examples

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

Release History

Release 8.1.1; command introduced.

Related Commands

bluetooth	Enables or disables a USB adapter with Bluetooth technology and configures the power level.

MIB Objects

N/A

show tcam utilization

Displays runtime information about the Ternary Content Addressable Memory (TCAM) utilization for each stage of each TCAM on each slot of the switch.

show tcam utilization [*chasiss/slot***] [***chasiss/slot/tcam***]**

Syntax Definitions

chassis/slot	A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.
chasiss/slot/tcam	A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

Defaults

By default, TCAM utilization is displayed for the entire switch.

Platforms Supported

OmniSwitch 6465, 6560, 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- The utilization is represented in terms of the minimum-sized entry supported by the TCAM.
- This command replaces the **show qos slice** command on the supported OmniSwitch platforms listed above; the **show qos slice** command, however, is still available on the other OmniSwitch platforms.

Examples

```
-> show tcam utilization

show tcam utilization detail

Displays the Ternary Content Addressable Memory (TCAM) utilization of each application (or application group) for each stage of each TCAM on each slot of the switch.

show tcam utilization [*chasiss/slot***] [***chasiss/slot/tcam***] detail**

Syntax Definitions

chassis/slot	A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.
chasiss/slot/tcam	A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

Defaults

By default, the detailed TCAM utilization is displayed for the entire switch.

Platforms Supported

OmniSwitch 6465, 6560, 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

The utilization is represented in terms of the minimum-sized entry supported by the TCAM.

Examples

```
-> show tcam utilization detail

show capability profile

Displays the active and configured profile settings.

show capability profile

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, OmniSwitch 6900-V72, 6900-C32, OmniSwitch 6900-X72

Usage Guidelines

- The switch must be rebooted for the configured profile to take effect.
- On the OmniSwitch 6900-V72, 6900-C32, and OmniSwitch 6900-X72, this command displays the configured and active mode to indicate if the switch is operating in the router or switch mode. The configured mode is changed using the **capability profile** command.
- On the OmniSwitch 6560, this command displays the configured and active TCAM mode (source or destination IPv6 filtering). The configured TCAM mode is changed using the **capability profile tcam mode** command.

Examples

Sample output on the OmniSwitch 6900-V72, 6900-C32, and OmniSwitch 6900-X72:

```
-> show capability profile
Configured  Profile :      Router
Active  Profile     :      Switch
```

Sample output on the OmniSwitch 6560:

```
-> show capability profile
Configured  TCAM Mode :      dest-ipv6
Active  TCAM mode     :      dest-ipv6
```

Release History

Release 8.5R2; command introduced.
Release 8.6R1; TCAM mode display added.

Related Commands

capability profile	Configures the mode of the switch to be either switch or router.
capability profile tcam mode	Configures the source IPv6 filtering or destination IPv6 filtering TCAM mode for the switch.

Release History

Release 8.4.1.R03; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.

MIB Objects

N/A

show capability trap-threshold

Displays the capability trap-threshold configured values.

show capability trap-threshold

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the configured High and Low trap-threshold table utilization values.

Examples

```
-> show capability trap-threshold
 Name       High    Low
----------+------+-------
MAC           95     90
ARP           95     90
```

Release History

Release 8.6R1; command introduced.

Related Commands

capability trap-threshold	Configures the MAC and ARP table utilization high and low values for generating the associated traps.

MIB Objects

```
alaCapManTrapThreshold
   alaCapManTrapThresholdMacLow
   alaCapManTrapThresholdMacHigh
   alaCapManTrapThresholdArpLow
   alaCapManTrapThresholdArpHigh
```

show tech-support

Creates a log or tar file gathering important switch information that can be used by technical support.

show tech-support [layer2 | layer3 | eng [complete]]

Syntax Definitions

layer2	Gathers layer 2 switch configuration information.
layer3	Gathers layer 3 switch configuration information.
eng [complete]	Gathers all relevant switch information from flash such as log files, configuration files, directories and creates an archive file with all the information.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Running the command with no parameters creates a **tech_support.log** file.
- The **layer2** parameter creates a **tech_support_layer2.log** file.
- The **layer3** parameter creates a **tech_support_layer3.log** file.
- The **eng** parameter creates a **tech_support_eng.tar** file. The **complete** parameter creates a **tech_support_complete.tar** file with information from all switches in a VC along with the log files.

Examples

```
-> show tech-support
-> show tech-support layer2
-> show tech-support layer3
-> show tech-support eng
-> show tech-support eng complete
```

Release History

Release 7.3.4.R02; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.

MIB Objects

N/A

security key-chain gen-random-key

Generates a 32-byte random key.

security key-chain gen-random-key

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

The generated key can be used as an input value for hex-key or encrypt-key while creating a security key.

Examples

```
-> security key-chain gen-random-key
0x0102030405060708090A0B0C0D0E0F
```

Release History

Release 8.4.1 R03; command introduced.

Related Commands

security key	This command creates an authentication key into the system.

MIB Objects

N/A

security key

Creates an authentication key into the system.

security key *key_id* **algorithm {sha256 {encrypt-key** *encrypt_key* **| key** *simple_key***} start-time** *mm/dd/yyyy* **[***hh:mm***] [lifetime** *days* **[***hh:mm***]] | aes-gcm-128 {hex-key** *hex_key* **| encrypt-key {***hex* **|** *num***}} | aes-cmac-128 {hex-key** *hex_key* **| encrypt-key {***hex* **|** *num***}} keyed-name** *hex-kn***}**

no security key *key_id* [*-key_id2***]**

Syntax Definitions

key_id	The key ID. This can be in the range 1-256.
sha256	Specifies that the SHA256 authentication algorithm is used as authentication key.
encrypt_key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. The key can range from 16 to 512 characters in length.
simple_key	Key will be plain text ASCII up to 118 characters. Use quotes ("") around the string if the key contains multiple words with spaces between them. Plain text key can range from 16 to 118 characters in length.
mm/dd/yyyy	Key activation time. Granularity is up to minutes. Enter the start time in the format mm/dd/yyyy hh:mm where mm is the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. For example, 08/08/2005 14:30
days	Validity duration of the key in terms of days and time. Lifetime can be in the range 1 - 9125 days.
aes-gcm-128	Specifies that the aes-gcm-128 authentication algorithm is used as authentication key.
aes-cmac-128	Specifies that the aes-cmac-128 authentication algorithm is used as authentication key.
hex-key *hex_key*	The key value in hexadecimal format (0xhex) for aes-gcm-128 or aes-cmac-128 algorithm. Configuration snapshot displays the authentication key in the encrypted form. The key can range from 1 to 32 characters in length (16 byte).
encrpt-key *hex*	The key in hexadecimal format for aes-gcm-128 or aes-cmac-128 algorithm. The key can range from 1 to 32 characters in length (16 byte).
encrpt-key *num*	The key in numerical format for aes-gcm-128 or aes-cmac-128 algorithm. The key can range from 1 to 32 characters in length (16 byte).
hex-kn	The Connectivity Association Key Name (CKN) value in hexadecimal format (0xhex). The key name can range from 1 to 64 characters in length (32 byte).

Defaults

parameter	default
lifetime *days*	180 days

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

- The switch can have a maximum of 256 keys.
- Current active key is determined based on the lowest numerical key ID. When the current active key expires, if the keychain has multiple active keys, the switch will switchover to active key having lowest key ID.
- When the current active key expires, if the keychain does not have any other active key, the switch will bring down all the adjacencies formed using that keychain.
- Parameters of a key can be modified if the key is not in use. Once the key is attached to any of the keychains, no more modification is allowed.
- Use the **no** form of this command to delete a key.
- To delete a key, first disassociate the keychain from a user application, and detach the key from the keychain.
- The show commands will always display the key-string in an encrypted format.
- Use the command **security key-chain gen-random-key** to generate a the hex-key to be configured for the aes-gcm-128 or aes-cmac-128 algorithm.
- For aes-gcm-128 or aes-cmac-128 algorithm, the key value in hexadecimal format (hash-key or encrypt-key) can range from 1 to 32 characters in length. For key size greater than 32 characters, an error message is displayed. Any key size lesser than 16 byte is accepted and preceded with 0s to make it 32 characters.
- For aes-cmac-128 algorithm, the length of the key name in hexadecimal format can range from 1 to 64 characters in length. For key name size greater than 64 characters, an error message is displayed. Any key name size lesser than 64 characters is accepted and preceded with 0s to make it 64 characters.
- A keychain using the aes-gcm-128 authentication algorithm must be attached only to MACsec interface for its static-SAK configured under MACsec mode "static" only.
- A keychain using the aes-cmac-128 authentication algorithm must be attached only to MACsec interface for its Static Connectivity Association Key (static-CAK) using Pre-Shared key configured under MACsec mode "dynamic" only.

Examples

```
-> security key 5 algorithm sha256 key "passwordstring123" start-time 1/31/2017
00:00 life-time 180 10:30
-> security key 5 algorithm sha256 key "passwordstring123" start-time 5/2/2017
life-time 150
-> security key 1 algorithm aes-gcm-128 hex-key 0x0102030405060708090A0B0C0D0E0F
```

```
-> security key 1 algorithm aes-cmac-128 hex-key 0x0102030405060708090A0B0C0D0E0F
keyed-name 0x0102030405060708090A0B0C0D0FFF

-> no security key 5
```

Release History

Release 8.4.1; command introduced.
Release 8.4.1 R03; **aes-gcm-128** keyword added.
Release 8.5R2; **aes-cmac-128** keyword added.

Related Commands

show security key	This command displays the configured keys in the system.

MIB Objects

```
alaSecKeyIdalaSecKeyAlgorithm
alaSecKeyType
alaSecKeyAuthKey
alaSecKeyStartTime
alaSecKeyLifeTime
alaSecKeyRowStatus
```

security key-chain

This command creates a system level security keychain.

security key-chain *key_chain_id* **[name** *key_chain_name***]**

no security key-chain *key_chain_id1* **[-***key_chain_id2***]**

Syntax Definitions

key_chain_id	The keychain ID. This can be in the range 1-32.
key_chain_name	The keychain name. The keychain name can range from 1 to 16 characters in length.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

- There can be a maximum of 32 keychains in the device, and each of them can hold multiple keys of the same algorithm type.
- Use the **no** form of this command to delete a keychain.
- To delete a keychain, first disassociate the keychain from the user application.
- Deleting a keychain will not delete the keys associated with the keychain. Keys will subsequently remain configured, but will not be associated to any keychain, until reassociation.
- The keychain ID is associated to user applications such as ISIS, OSPF. The authentication information is carried in the Hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines should have same current key ID and same authentication type.
- Changing the switch system clock impacts the status of the keys.

Examples

```
-> security key-chain 1 globalKeyChain
-> no security key-chain 1-3
-> no security key-chain 4
```

Release History

Release 8.4.1; command introduced.

Related Commands

show security key-chain	This command displays the configured keychains in the system.

MIB Objects

```
alaSecKeyChainId
alasecKeyChainName
```

security key-chain key

This command associates a key into the specified keychain.

security key-chain *key_chain_id* **key** *key_id* [*-key_id2*]

no security key-chain *key_chain_id1* **[**-*key_chain_id2*]}

Syntax Definitions

key_chain_id	The keychain ID.
key_id	The key ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

- A keychain can be configured with multiple keys of the same algorithm type.
- Use the **no** form of this command to disassociate a key from a security keychain.
- To disassociate a key from the keychain, first disassociate the keychain from the user application, and detach the key from the keychain.

Examples

```
-> security key-chain 1 key 5
-> no security key-chain 1
```

Release History

Release 8.4.1; command introduced.

Related Commands

show security key

This command displays the configured keys in the system.

show security key [*key_id* [*-key_id2*]**]**

Syntax Definitions

key_id	The key ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

If key ID is not provided, information of all the keys is displayed.

Examples

```
-> show security key
ID    Status    Algorithm       Start-time           Life-time
                              (mm/dd/yyyy hh:mm)     (day hh:mm)
----+--------+------------+----------------------+--------------
1     expired   sha256       01/31/2016 10:30        100 00:00
2     valid     sha256       01/31/2016              1000 00:15
10    future    sha256       01/31/2017              180 (default)
24    valid     sha256       01/31/2016 05:00        0    12:20
```

output definitions

ID	The key ID.
Status	The status of the key.
Start-time	Key activation time.
Life-time	Validity duration of the key in terms of days and time.

Release History

Release 8.4.1; command introduced.

show security key-chain [*key_chain_id***]**

Syntax Definitions

key_chain_id	The keychain ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900, 9900

Usage Guidelines

If keychain ID is not provided, information of all the keychains is displayed.

Examples

```
-> show security key-chain
ID        Name             current      Associated           User
                            key          keys              applications
----+------------------+--------+------------------+-------------------------
1     globalKeychain         5          1,3,5-8,10      isis,isis_abc,ospf
2     vlan10Keychain         22         20,22           isis_123
```

output definitions

ID	The keychain ID.
Name	The keychain name.
Current Key	The current active key.
Associated Keys	The keys associated with the keychain.
User Applications	The keychain associated with the user application.

Release History

Release 8.4.1; command introduced.

Related Commands

security key-chain	This command creates a system level security keychain.
security key-chain key	This command associates a key into the specified keychain.

MIB Objects

```
alaSecKeyChainId
alasecKeychainName
```

alarm in

Configures an alarm input. For an alarm input, action can be configured to either send an SNMP trap, log a SWLog message locally, or set alarm output.

alarm in *alr_in_name* **[chassis-in** *chassis_id_in***] action {swlog | trap | alarm-out} [admin-state {enable | disable}]**

no alarm *alr_in_name*

Syntax Definitions

alr_in_name	Name of the alarm input (1 to 32 characters).
chassis_id_in	Chassis identifier where alarm input is connected.
swlog | trap | alarm-out	Specify the action to be sent on the alarm output.
enable	Enable the alarm input.
disable	Disable the alarm input.

Defaults

parameter	default
enabled | disabled	disable

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- By default, alarm is disabled for all actions.
- If the chassis ID is not configured, by default, local chassis is considered for the alarm input.
- Use the **no** form of this command to remove the alarm input.
- OmniSwitch 6465 switch has a single alarm input.

Examples

```
-> alarm in "temperature-sensor" action alarm-out
-> alarm in "door-sensor" chassis-in 1 action alarm-out admin-state enable
-> alarm in "smoke-sensor" chassis-in 2 action trap swlog alarm-out admin-state
enable

-> no alarm temperature-sensor
```

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm clear status	Clears the status of the specified alarm.
show alarm input config	Displays the alarm input configuration.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alaAlarmInpmutConfigTable
   alaAlarmInputConfigName
   alaAlarmInputConfigChassis
   alaAlarmConfigInputTrapActionEnable
   alaAlarmConfigInputSwlogActionEnable
   alaAlarmConfigInputAlarmOutputActionEnable
   alaAlarmConfigAdminStatus
   alaAlarmInputConfigRowStatus
```

alarm event

Configures the listed system events or any trap for alarm output.

alarm event *alr_event_name* **{event {vc-status-change | temperature | system-health | power-supply | port-violation network-port** *userport* **[-***userport2*] **| port-health | link-down network-port** *userport* **[-***userport2*] **| authentication-failure} | trapid** *id***}} [chassis-in** *chassis_id_in***] [admin-state {enable | disable}]**

no alarm *alr_event_name*

Syntax Definitions

alr_event_name	Name of the alarm event or trap (1 to 32 characters).
userport	Network port of the switch.
id	Trap ID.
chassis_id_in	Chassis identifier where alarm input is connected.
enable	Enable the alarm event.
disable	Disable the alarm event.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- By default, alarm output action is disabled for all the alarm events.
- System events corresponds to critical failures of the switch. Alarm event can be configured for any of these supported system events.
- Trap ID corresponds to the SNMP traps supported in the switch. Use **show snmp-trap config** command to view the supported traps. Alarm event can be configured for any of these supported traps.
- Both event as well as trap cannot be configured for the same alarm event. If configured, the later is ignored with an error message.
- Alarm event of the single chassis can be mapped to multiple alarm outputs on different chassis for redundancy.
- Alarm events from multiple chassis can be mapped to alarm output on the single chassis.
- Same network port can be configured for both link down as well as port violation event but with a different event name.

- A network port that falls in the network port range, which is already configured to an event cannot be configured to another event.
- If the chassis ID is not configured, by default, local chassis is considered for the alarm event.
- Use the **no** form of this command to remove the alarm event.

Examples

```
-> alarm event system-fail event system-health
-> alarm event link-failure-critical event link-Down network-port 10-15 chassis-in
1 admin-state enable

-> no alarm system-fail
```

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm clear status	Clears the status of the specified alarm.
show alarm event config	Displays the alarm system event configuration.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alarmEventConfigTable
   alarmEventConfigTable
   alarmEventConfigName
   alarmEventConfigEvent
   alarmEventConfigTrapId
   alarmEventConfigNetworkPortStart
   alarmEventConfigNetworkPortEnd
   alarmEventConfigInputChassis
   alarmEventConfigAdminStatus
   alaAlarmEventConfigRowStatus
```

alarm out

Configures the alarm output relay of a chassis.

alarm out *alr_out_name* **[chassis-out** *chassis_id_out***] [admin-state {enable | disable}]**

no alarm out *alr_out_name*

Syntax Definitions

alr_out_name	Name of the alarm output (1 to 32 characters).
chassis_id_out	Chassis identifier where alarm output is connected.
enable	Enable the alarm output.
disable	Disable the alarm output.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- If the chassis ID is not configured, by default, local chassis is considered for the alarm output.
- Use the **no** form of this command to remove the alarm output.
- OmniSwitch 6465 switch has single alarm output.

Examples

```
-> alarm out "critical-fault-detector"
-> alarm out "minor-fault-detector" chassis-out 2 action admin-state enable
-> alarm out "critical-fault-detector"
```

Release History

Release 8.5 R1; command introduced.

Related Commands

show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alaAlarmOutputConfigTable
   alaAlarmOutputConfigName
   alaAlarmOutputConfigChassis
   alaAlarmOutputConfigRowStatus
```

alarm map

Maps an alarm input or event with an alarm output within a chassis or any other chassis in the VC.

alarm map *alarm_name* **out** *alr_out_name*

no alarm map *alarm_name*

Syntax Definitions

alarm_name	Name of the alarm input or system event (1 to 32 characters).
alr_out_name	Name of the alarm output (1 to 32 characters)

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Alarm input or event of the single chassis can be mapped to multiple alarm outputs on different chassis for redundancy.
- Alarm input or event from multiple chassis can be mapped to alarm output on the single chassis.
- Use the **no** form to unmap the alarm input from alarm output.

Examples

```
-> alarm map "temperature-sensor" out "critical-fault-detector"
-> no alarm map "temperature-sensor"
```

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm in	Configures an alarm input.
alarm event	Configures the listed system events or any trap for alarm output.
alarm out	Configures the alarm output relay of a chassis.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alaAlarmMappingConfigTable
   alaAlarmInputConfigName
   alaAlarmOutputConfigName
   alaAlarmMappingConfigRowStatus
```

alarm duration

Configure the duration of an alarm.

alarm duration [[*hour*] **[***min*] | **[default]]**

Syntax Definitions

hour	Duration of the alarm in hours.
min	Duration of the alarm in minutes.
default	Sets the alarm duration to 24 hours 0 minutes.

Defaults

By default, the alarm duration is set to 24 hours 0 minutes.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- In a virtual chassis (VC) setup, alarm duration configuration applies to all the chassis of the VC.
- A minimum alarm duration of five minutes and a maximum alarm duration of 48 hours can be configured.
- An alarm is switched off for an input or event after the configured duration. If there are multiple events or input, alarm is switched off after the elapsed duration of all the events and input.
- Use **alarm clear status** command to force stop the alarm before the set alarm duration for any alarm event or input.
- Modification or updated duration is applied only to those alarms raised after the configuration change. Alarms which are in progress are not impacted.
- Use **default** option to reset the alarm duration to 24 hours 0 minutes.

Examples

```
-> alarm duration 2
-> alarm duration default
```

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm clear status	Clears the status of the specified alarm.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alarmDurationConfigHour
alarmDurationConfigMin
```

alarm clear status

Clears the status of the specified alarm.

alarm clear status [*alarm_name***]**

Syntax Definitions

alarm_name	Name of the alarm input or alarm event.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- The command does not disable or remove the alarm.
- The command can be used to forcibly stop the alarm and clear the status.
- If the output alarm is ON for multiple events or input, all the alarms have to be cleared to switch off the alarm output.
- If the alarm name is not specified, all the configured alarms are cleared.

Examples

```
-> alarm clear status temperature-sensor
-> alarm clear status
```

Release History

Release 8.5 R1; command introduced.

Related Commands

show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alarmStatusTable
   alarmStatusInputName
   alarmStatusOutputName
   alarmStatusInputChassis
   alarmStatusOutputChassis
   alarmStatusTimeStamp
   alarmStatusTrapid
```

show alarm input config

Displays the alarm input configuration.

show alarm input config chassis *chassis_id*

Syntax Definitions

chassis_id	Chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

The command displays configuration of all the chassis if chassis ID is not specified.

Examples

```
-> show alarm input config
Alarm Duration 5 hrs 30 Mins

Alarm-Name         Chassis-in    Action       Alarm-Output-Name      Chassis-out    Admin-State
-----------------+----------+-------------+----------------------+--------------+-------------
Temperature Sensor     1       Alarm-Output  critical-fault-detector      1           enable
fire Sensor            1       trap              N/A                      N/A         enable
Temperature Sensor     1       Alarm-Output   minor-fault-detector        2           enable
door Sensor            1       Alarm-Output   minor-fault-detector        2           enable
```

output definitions

Alarm-Name	Name of the alarm.
Chassis-in	Chassis identifier where alarm input is connected.
Action	The action sent on the alarm output.
Alarm-Output-Name	Name of the alarm output.
Chassis-out	Chassis identifier where alarm output is connected.
Admin-State	Status of the alarm.

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm in	Configures an alarm input.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```

```

show alarm event config

Displays the alarm system event configuration.

show alarm event config chassis *chassis-id*

Syntax Definitions

chassis_id	Chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- The command displays configuration of all the chassis if chassis ID is not specified.
- Network port is only applicable for link-down and port violation event.

Examples

```
-> show alarm event config
Alarm Duration 5 hrs 30 Mins

Alarm-Name     Chassis-In   Network-Port Trap-Id   Event-Name    Alarm-Output-Name    Chassis_out  Admin-State
-------------+------------+-------------+-------+-------------+--------------------+------------+------------
system-fail       1            N/A        N/A    system-health  minor-fault-detector      2          enable
power-fail        1            N/A        N/A    power-supply   minor-fault-detector      2          enable
login-failure     2            N/A         5      N/A           minor-fault-detector      2          enable
```

output definitions

Alarm-Name	Name of the alarm.
Chassis-in	Chassis identifier where alarm input is connected.
Network-Port	Network port of the chassis.
Trap-ID	Trap ID.
Event-Name	Name of the system event.
Alarm-Output-Name	Name of the alarm output.
Chassis-out	Chassis identifier where alarm output is connected.
Admin-State	Status of the alarm.

Release History

Release 8.5 R1; command introduced.

Related Commands

alarm event	Configures the listed system events or any trap for alarm output.
show alarm status	Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

```
alarmEventConfigTable
   alarmEventConfigName
   alarmEventConfigEvent
   alarmEventConfigTrapId
   alarmEventConfigNetworkPortStart
   alarmEventConfigNetworkPortEnd
   alarmEventConfigInputChassis
   alarmEventConfigAdminStatus
   alaAlarmEventConfigRowStatus
alaAlarmOutputConfigTable
   alaAlarmOutputConfigName
   alaAlarmOutputConfigChassis
   alaAlarmOutputConfigRowStatus
alaAlarmMappingConfigTable
   alaAlarmInputConfigName
   alaAlarmOutputConfigName
   alaAlarmMappingConfigRowStatus
```

show alarm status

Displays all the traps, system events, or alarm input for which the alarm output is raised. For a VC, the alarm status for each chassis is displayed.

show alarm status chassis *chassis-id*

Syntax Definitions

chassis_id	Chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Network port displays the status on the port range or a specific port.
- If the same failure (input or event or trap) is repeated, the data structure is updated with the latest failure.

Examples

```
-> show alarm status chassis-id 2

Alarm-Name    Chassis-In     Time-Stamp         Network-Port  Trap-Id Event-Name   Alarm-Output     Chassis-Out
------------+----------+---------------------+------------+--------+----------+-----------------+-----------
login-failure    2        09/31/2017 : 14:30:00      N/A        5       N/A      minor-fault-detector   2
```

output definitions

Alarm-Name	Name of the alarm.
Chassis-in	Chassis identifier where alarm input is connected.
Time-Stamp	The system time of the switch where the alarm occurred.
Network-Port	Network port of the chassis.
Trap-ID	Trap ID.
Event-Name	Name of the system event.
Alarm-Output	Name of the alarm output.
Chassis-out	Chassis identifier where alarm output is connected.

Release History

Release 8.5 R1; command introduced.

Related Commands

show alarm input config	Displays the alarm input configuration.
show alarm event config	Displays the alarm system event configuration.

   alarmStatusClear
```

appmgr

Use this command to start the tasks for AOS Micro Services (AMS).

appmgr {start | stop | restart} [ams *broker* **| config-sync | config-dbase] [ams-apps iot-profiler**]

Syntax Definitions

start	Starts the specified application from package.
stop	Stops the specified application from package.
restart	Starts and stops the specified application from package.
broker	Broker instance of AMS
config-sync	An AMS component application which is used to synchronize the configuration in the network.
config-dbase	Another AMS component application that helps to store and replay the configuration to new nodes in the network.
iot-profiler	An AMS-app application, responsible for sharing the IoT profiled data with OmniVista for the integrated IoT OV-Switch solution.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

Enter **appmgr** without any parameters to see the command syntax.

Examples

```
-> appmgr start ams broker
-> appmgr start ams config-sync
-> appmgr start ams config-dbase
-> appmgr commit
-> appmgr list
Legend: (+) indicates application is not saved across reboot

  Application    Status    Package Name        User/Group            Status Time Stamp
---------------+---------+------------------+--------------------+--------------------
broker           started   ams              admin/user          Tue Nov 26 13:28:27 2019
config-sync      started   ams              admin/user          Tue Nov 26 13:28:27 2019
config-dbase     started   ams              admin/user          Tue Nov 26 13:28:27 2019
iot-profiler     started   ams              admin/user          Tue Nov 26 13:28:27 2019

-> appmgr start ams-apps iot-profiler -args -h 10.10.10.1 -p 1883
Success to start iot-profiler
```

appmgr commit	Use this command to save the configuration across reboots.

MIB Objects

N/A

appmgr commit

Use this command to save the configuration across reboots.

appmgr commit

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

Enter **appmgr** without any parameters to see the command syntax.

Examples

```
-> appmgr commit
```

Release History

Release 8.6R2; command introduced.

Related Commands

appmgr	Use this command to start the tasks for AOS Micro Services (AMS).
appmgr list	Displays the application currently started/stopped/committed.

MIB Objects

N/A

pkgmgr

Use this command to install Debian packages for non-AOS software applications (like AMS and WebView 2.0).

pkgmgr {[install | verify] *package_file_name* **| remove** *package_name***}**

Syntax Definitions

install	Extracts and installs the contents of the package to system memory.
remove	Removes all the files of this package from system memory.
verify	Verifies the ALE signature and the checksums for the Debian package.
package_file_name	Name of the Debian package file
package_name	Name of the package displayed in output of **pkgmgr list** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Enter **pkgmgr** without any parameters to see the command syntax.
- The Debian package must be downloaded from the service and support website (businessportal2.alcatel-lucent.com).
- The Debian package file must be copied to the *pkg* in the running directory. For example, if working is the running directory, then copy to */flash/working/pkg* directory of the switch.
- Use the **pkgmgr verify** command to verify the contents of the package.
- Use the **pkgmgr install** command to install the package.
- After the package is installed successfully, use the **pkgmgr commit** command to save the installation permanently.
- If the switch restricts installation of the package due to memory threshold, use the **health threshold memory** command to increase the RAM memory of the switch.
- Use the **pkgmgr remove** command to remove the package.

Note. In a Virtual Chassis environement, if this **pkgmgr** command is successful on Master unit, it will be automatically executed on all units of the Virtual Chassis.

Examples

```
-> pkgmgr verify ams-8.6.R02-6235.deb
CLI output:
Verifying MD5 checksum.. OK

-> pkgmgr install ams-8.6.R02-6235.deb

Verifying MD5 checksum.. OK
System Memory check.. PASS
Preparing to replace ams-8.6.R02-6235 (using /flash/working/pkg/ams-8.6.R02-
6235.deb)...
Setting up ams (8.6.R02-6235.deb)...
Extracting control files for package ams-8.6.R02-6235.deb .. OK
Installing package ams-8.6.R02-6235.deb .. OK

-> pkgmgr commit

-> pkgmgr remove ams
CLI output:
Purging ams (8.6.R02-6235)...
Removing package ams.. OK

-> pkgmgr verify package-webview-8.6.R02-168.deb
CLI output:
Verifying MD5 checksum.. OK

-> pkgmgr install package-webview-8.6.R02-168.deb
Verifying MD5 checksum.. OK
System Memory check.. PASS
Preparing to replace package-webview-8.6.R02-168.deb (using /flash/working/pkg/
package-webview-8.6.R02-168.deb)...
Setting up webview (package-webview-8.6.R02-168.deb)...
Extracting control files for package package-webview-8.6.R02-168.deb .. OK
Installing package package-webview-8.6.R02-168.deb .. OK

-> pkgmgr commit

-> pkgmgr remove webview
CLI output:
Purging webview (package-webview-8.6.R02-168.deb)...
Removing package webview.. OK
```

Release History

Release 8.6R2; command introduced.

Related Commands

59 Chassis MAC Server (CMS) Commands

The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:

- Base chassis MAC address
- Ethernet Management Port (EMP)
- VLAN router ports

Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.

The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.

MIB information for the Chassis MAC Server commands is as follows:

Filename: ALCATEL-IND1-MAC-SERVER-MIB.mib
Module: alcatelIND1MacServerMIB

A summary of the available commands is listed here:

mac-range eeprom
show mac-range
show mac-range alloc

mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

Note. Use caution when modifying the default MAC range. Improper use of this command can disable your system and adversely affect your network. Contact Alcatel-Lucent Enterprise Customer Support for further assistance.

mac-range eeprom *start_mac_address count*

Syntax Definitions

start_mac_address	The first MAC address in the modified range. Enter the MAC address in the following format: **xx:xx:xx:xx:xx:xx**, where **x** is a hex value (0–f).
count	Specifies the number of MAC addresses in the range (1–256).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Because the factory-installed 32 MAC addresses are sufficient for most network configurations, this command should only be used by qualified network administrators for special network requirements.
- After modifying a MAC address range by using the **mac-range eeprom** command, you must reboot the switch. Otherwise, MAC addresses for existing VLAN router ports will not be allocated properly.
- All MAC addresses in a range must be contiguous (i.e., there cannot be any gaps in the sequence of MAC addresses).

Examples

```
-> mac-range eeprom 00:20:da:23:45:35 32
```

Release History

Release 7.1.1; command introduced.

Related Commands

show mac-range	Displays the MAC range table.

MIB Objects

```
chasMacAddressRangeTable
   chasMacRangeIndex
   chasGlobalLocal
   chasMacAddressStart
   chasMacAddressCount
```

show mac-range

Displays the MAC range table.

show mac-range [*index***]**

Syntax Definitions

index	Identifies the MAC range by referring to its position in the MAC range table.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Because the switch currently supports one MAC address range only, index position 1 displays.

Examples

```
-> show mac range

 Mac                    Local/
Range  Row Status       Global   Start Mac Addr     End Mac Addr
-----+----------------+--------+-----------------+-----------------

01     ACTIVE           GLOBAL   00:d0:95:6a:79:6e  00:d0:95:6a:79:8d
```

output definitions

Mac Range	The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.
Row Status	The current status of the MAC range. The status **ACTIVE** refers to MAC addresses that are available for allocation to VLAN router ports and other applications.
Local/Global	The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as *EEPROM* MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays.
Start Mac Addr	The first MAC address in the MAC address range.
End Mac Addr	The last MAC address in the MAC address range.

Release History

Release 7.1.1; command introduced.

Related Commands

mac-range eeprom	Modifies the default MAC range on the switch's EEPROM.

MIB Objects

```
chasMacAddressRangeTable
   chasMacRangeIndex
   chasGlobalLocal
   chasMacAddressStart
   chasMacAddressCount
   chasMacRowStatus
```

show mac-range alloc

Displays all allocated addresses from the MAC range table.

show mac-range [*index***] alloc**

Syntax Definitions

index	Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show mac-range alloc
Range    Mac Address         Application     Id
-----+-----------------+--------------------+---
01    00:d0:95:6b:09:40 CHASSIS              0
01    00:d0:95:6b:09:41 802.1X               0
01    00:d0:95:6b:09:5f CHASSIS              1
```

output definitions

Range	The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to page 59-4 for more information.
Mac Address	Current MAC address allocated for a specific application.
Application	The application for which the allocated MAC address is being used. Current options include **VLAN, 802.1X**, and **CHASSIS**. VLAN refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. CHASSIS refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).

output definitions (continued)

Id	An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

Release History

Release 7.1.1; command introduced.

Related Commands

mac-range eeprom	Modifies the default MAC range on the switch’s EEPROM.

MIB Objects

```
ChasMacAddressAllocTable
   chasAppId
   chasObjectId
   chasAllocMacRangeIndex
   chasAllocMacAddress
```

60 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

Filename: ALCATEL-IND1-NTP-MIB.mib
Module: alcatelIND1NTPMIB

A summary of available commands is listed here:

ntp server
ntp server synchronized
ntp server unsynchronized
ntp client
ntp src-ip preferred
ntp broadcast
ntp broadcast-client
ntp broadcast-delay
ntp key
ntp key load
ntp authenticate
ntp master
ntp interface
ntp max-associations
ntp broadcast
ntp peer
ntp vrf-name
show ntp status
show ntp client
show ntp client server-list
show ntp server client-list
show ntp server status
show ntp keys
show ntp peers
show ntp server disabled-interfaces

ntp server

Specifies an NTP server from which the switch will receive updates.

ntp server {*ip_address* | *server_name*} **[key** *key_id* **| | minpoll** *poll* | **maxpoll** *poll* | **version** *version* | **prefer | burst | iburst | preempt]**

no ntp server *ip_address*

Syntax Definitions

ip_address	The IP address of the NTP server to be added or deleted to the client's server list.
server_name	Fully qualified NTP server domain name.
key_id	The key identification number that corresponds to the specified NTP server. The value ranges from 0 to 65534. 0 can be used to unconfigure the key ID.
minpoll *poll*	It specifies the minimum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 3 (8 s) and an upper limit of 17 (36.4h).
maxpoll *poll*	It specifies the maximum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the maximum poll time would be 16 seconds ($2^4 = 16$). The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4 h) and a lower limit of 3 (8 s). The maxpoll must not be less than the minpoll value.
version	The version of NTP being used. This will be 1, 2, 3, or 4.
prefer	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.
burst	Enables burst mode. The burst mode allows the exchange of eight NTP messages (instead of one) when the server is reachable and at each poll interval to achieve faster synchronization. The spacing between the first and the second packet is 16 seconds to allow a modem call to complete, while the spacing between the remaining packets is 2 seconds.
iburst	Enables initial burst (iburst) mode. The iburst mode allows immediate exchange of eight NTP messages (instead of one) when the server is unreachable and at each poll interval, to achieve faster initial synchronization acquisition. The spacing between the packets is 16 seconds to allow a modem call to complete. Once the server is reachable, the spacing between the packets is 2 seconds.
preempt	Enables the preemption mode for the server rather than the default persistent.

Defaults

Parameter	Default
version	4
minpoll *poll*	6
maxpoll *poll*	10
prefer	not preferred
burst	no burst
iburst	no iburst

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The client will poll the server for a time update when the **minpoll** time is exceeded.
- Use the **maxpoll** keyword to specifies the maximum polling interval for NTP messages. This number is determined by raising 2 to the power of the number entered. The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4 h) and a lower limit of 3 (8 s). The maxpoll must not be less than the minpoll value.
- NTP authentication must be disabled before adding or removing an NTP server.
- Burst mode of operation improves timekeeping quality with the server command and iburst mode of operation is designed to speed the initial synchronization acquisition with the server command.
- When preempt is enabled, the specified server is marked unavailable for selection if any error (authentication failure) is detected on a connection between the local device and reference clock. The

server is marked available for selection if no other connections are available and no error is detected on the connection between the local device and reference clock.

Examples

```
-> ntp server 1.1.1.1
-> ntp server 0.pool.ntp.org
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server 0.pool.ntp.org minpoll 5
-> ntp server 0.pool.ntp.org maxpoll 6
-> ntp server 1.1.1.1 burst
-> ntp server 1.1.1.1 iburst
-> ntp server 1.1.1.1 prempt
-> no ntp server 1.1.1.1
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4: **server name**, **maxpoll, burst**, **iburst, prempt** keywords added.

Related Commands

ntp client	Enables or disables NTP operation on the switch.
show ntp client server-list	Displays a list of the servers with which the NTP client synchronizes.
show ntp server status	Displays the basic server information for a specific NTP server or a list of NTP servers.

MIB Objects

```
alaNtpConfig
   aalaNtpPeerIpAddress
   alaNtpPeerType
   alaNtpPeerAuth
   alaNtpPeerVersion
   alaNtpPeerMinpoll
   alaNtpPeerPrefer
   alaNtpPeerAdminalaNtpPeerName
   alaNtpPeerBurst
   alaNtpPeerIBurst
   alaNtpPeerPreempt
   alaNtpPeerMaxpoll
```

ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

ntp server synchronized

Syntax Definitions

N/A

Defaults

By default, NTP synchronization is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

Examples

```
-> ntp server synchronized
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.

Related Commands

ntp server unsynchronized	Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

MIB Objects

```
alaNtpConfig
   alaNtpPeerTests
```

ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

ntp server unsynchronized

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

Examples

```
-> ntp server unsynchronized
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.

Related Commands

ntp server synchronized	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

MIB Objects

```
alaNtpConfig
   alaNtpPeerTests
```

ntp client

Enables or disables NTP time synchronization discipline.

ntp client admin-state {enable | disable}

Syntax Definitions

enable	Enables NTP.
disable	Disables NTP.

Defaults

NTP protocol is disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the **ntp server** command. Up to 12 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.
- NTP client will not synchronize with an unsynchronized NTP server (Stratum 16).

Examples

```
-> ntp client enable
-> ntp client disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp server	Specifies an NTP server from which the switch will receive updates.

MIB Objects

```
alaNtpEnable
```

ntp src-ip preferred

Configures a source IP address to use as the source for NTP packets.

ntp src-ip preferred {default | no-loopback0 | *ip_address***}**

no ntp src-ip preferred

Syntax Definitions

default	The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the EMP-VC IP address will be used. If no EMP-VC IP address is configured, the preferred IP address will be used. If no preferred IP address is configured the first available IP address on the switch will be used.
no-loopback0	The Loopback0 address will not be used for the source IP address field and either the preferred IP address (if configured) or the first available IP address on the switch will be used.
ip_address	The IP address to be used in the source IP field.

Defaults

By default, the NTP source IP preferred setting is set to the **default** parameter.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default The Loopback0 address, if configured, will be used for the source IP address.
- If no Loopback0 is configured, the VC-EMP IP address will be used for the source IP address.
- If no VC-EMP IP address is configured, the preferred IP address will be used for the source IP address.
- If no preferred IP address is configured the first available IP address on the switch will be used as the source IP address.
- When configuring a preferred IP address, that address must already exist on the switch.
- If the configured preferred IP address is the same as the IP address that would have been automatically chosen by the switch, then the ‘ntp src-ip preferred’ command will not be included in the output of the ‘configuration snapshot’ command since only non-default settings are included in the output.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

Examples

```
-> ntp src-ip preferred 192.168.10.1
-> ntp src-ip preferred no-loopback0
-> ntp src-ip preferred default
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; command deprecated.

Related Commands

show ntp status	Displays the NTP configuration and status.

MIB Objects

N/A

ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

ntp broadcast-client {enable | disable}

Syntax Definitions

enable	Enables the client broadcast mode.
disable	Disables the client broadcast mode.

Defaults

Broadcast mode is disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp broadcast-delay	Sets the broadcast delay time in microseconds.

MIB Objects

```
alaNtpBroadcastEnable
```

ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

ntp broadcast-delay *microseconds*

Syntax Definitions

microseconds	The number of microseconds for the broadcast delay.

Defaults

parameter	default
microseconds	4000

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp broadcast	Enables or disables the client's broadcast mode.

MIB Objects

```
alaNtpBroadcastDelay
```

ntp key

Labels the specified authentication key identification as trusted or untrusted.

ntp key *key* **[trusted | untrusted]**

Syntax Definitions

key	The key number matching an NTP server.
trusted	Signifies that the specified key is trusted and can be used for authentication.
untrusted	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

Defaults

By default, all authentication key are untrusted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used.The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to ‘trusted’ status to allow NTP to use the key for authentication.

Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp key	Sets the public key the switch uses when authenticating with the specified NTP server.
ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpAccessKeyIdTable
   alaNtpAccessKeyIdKeyId
   alaNtpAccessKeyIdTrust
```

ntp key load

Loads the current key file into memory.

ntp key load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

Examples

```
-> ntp key load
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp key	Labels the specified authentication key identification as trusted or untrusted.
ntp server	Specifies an NTP server from which this switch will receive updates.

MIB Objects

```
alaNtpAccessRereadkeyFile
```

ntp authenticate

Enables or disables the authentication on a configured NTP server.

ntp authenticate {enable | disable}

Syntax Definitions

enable	Enables authentication for NTP server.
disable	Disables authentication for NTP server.

Defaults

By default, NTP authentication is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using **ntp client** command.
- Before enabling the NTP operation, NTP server must be specified using the **ntp server** command.
- NTP authentication must be disabled before adding or removing an NTP server.

Examples

```
-> ntp authenticate enable
-> ntp authenticate disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ntp status	Displays the information about the current NTP status.

MIB Objects

```
alaNtpAuthenticate
```

ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

ntp master *stratum_number*

Syntax Definitions

stratum_number	Integer value ranging from 2 to 16.

Defaults

Parameter	Default
stratum_number	16

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

Examples

```
-> ntp master 4
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpConfig
   alaNtpSysStratum
```

ntp interface

Enables or Disables NTP server functionality for an interface.

ntp interface {*interface_ip***} {enable | disable}**

Syntax Definitions

interface_ip	IP address of an interface on which NTP server functionality is to be disabled.
enable	Enables NTP server functionality on an interface.
disable	Disables NTP sever functionality on an interface.

Defaults

By default, NTP server functionality is enabled on all the interfaces.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

Examples

```
-> ntp interface 10.10.10.1 disable
-> ntp interface 10.10.10.1 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpAccessRestrictedTable
   alaNtpAccessRestrictedIpAddress
```

ntp max-associations

Configures the maximum number of associations on the switch.

ntp max-associations *number*

Syntax Definitions

number	Maximum no of client/server and peer associations. Integer value ranging from 0 to 512.

Defaults

By default, 32 associations are allowed on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 512.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

Examples

```
-> ntp max-associations 20
```

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; max value increased to 512.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpConfig
   alaNtpMaxAssociation
```

ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

ntp broadcast {*broadcast_addr***} [version** *version***] [minpoll** *poll_interval***]**

no ntp broadcast {*broadcast_addr***}**

Syntax Definitions

broadcast_addr	Subnet for which broadcast updates are regularly sent.
version	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
poll_interval	Polling interval for NTP broadcast message. This value is measured in seconds.

Defaults

Parameter	Default
version	4
poll_interval	6

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers.This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp broadcast	Enables or disables the client's broadcast mode.
ntp broadcast-delay	Sets the broadcast delay time in microseconds

MIB Objects

```
alaNtpPeerTable
   alaNtpPeerType
   alaNtpPeerVersion
   alaNtpPeerMinpoll
```

ntp peer

Configures NTP to operate in the symmetric active peering mode.This also enables the establishment of an active symmetric association with the specified remote peer.

ntp peer {*ip_address***} [key** *key_id***] [version** *version***] [minpoll** *poll_interval***]**

no ntp peer {*ip_address***}**

Syntax Definitions

ip_address	IP address of the remote peer.
key_id	Authentication key for the remote peer.
version	NTP packet version to be used for the peer association.
poll_interval	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

Defaults

Parameter	Default
version	4
poll_interval	6

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode.This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x).
- *ip-address* is the mandatory parameter to be entered in the command while key id is the optional parameter. If key id is not specified, then peering will not be authenticated.

Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ntp peers	Displays current NTP peer association.

MIB Objects

```
alaNtpPeerTable
   alaNtpPeerType
   alaNtpPeerAuth
   alaNtpPeerVersion
   alaNtpPeerMinpoll
```

ntp vrf-name

Sets the VRF to be used for all NTP operations (both client and server).

ntp vrf-name *name*

Syntax Definitions

name	The name of the VRF to be used for all NTP operations.

Defaults

Parameter	Default
name	default

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ntp vrf-name vrf1
```

Release History

Release 7.3.1; command introduced.

Related Commands

show ntp status	Displays the information about the current NTP status.
show ntp client	Displays information about the current client NTP configuration.

MIB Objects

```
alaIpNtpVrfName
```

show ntp status

Displays the information about the current NTP status.

show ntp status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

Example

```
-> show ntp status
Current time:                   Mon, Jan 21 2019  7:31:04.685 (UTC),
Last NTP update:                Mon, Jan 21 2019  7:30:10.160 (UTC),
Server reference:               10.10.10.10,
Client mode:                    enabled,
Broadcast client mode:          disabled,
Broadcast delay (microseconds): 4000,
Stratum:                        4,
Maximum Associations Allowed:   32,
Authentication:                 enabled,
VRF Name:                       default
```

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.

Max-Association	Maximum association on the switch that restricts the number of client/ server and peer association
Authentication	Whether Authentication is enabled or disabled
VRF Name	Name of the VRF.

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **vrf** parameter added.

Related Command

ntp client	Enables or disables NTP operation on the switch.
ntp server	Specifies an NTP server from which the switch will receive updates
ntp server synchronized	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.
ntp max-associations	Configures the maximum number of associations on the switch.
ntp master	Specifies the stratum value for unsynchronized switch
ntp broadcast	Enables or disables the client's broadcast mode.
show ntp client	Displays information about the current client NTP configuration.
show ntp client server-list	Displays a list of the servers with which the NTP client synchronizes
show ntp server client-list	Displays the basic server information for a specific NTP server or a list of NTP servers

MIB Objects

```

show ntp client

Displays information about the current client NTP configuration.

show ntp client

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

Examples

```
-> show ntp client
Current time:                   Mon, Jan 21 2019  7:31:12.505 (UTC),
Last NTP update:                Mon, Jan 21 2019  7:30:10.160 (UTC),
Server reference:               10.10.10.10,
Client mode:                    enabled,
Broadcast client mode:          disabled,
Broadcast delay (microseconds): 4000,
VRF Name:                       default
```

output definitions

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
VRF Name	Name of the VRF.

Release History

Release 7.1.1; command was introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpLocalInfo
alaIpNtpVrfName
```

show ntp client server-list

Displays a list of the servers with which the NTP client synchronizes.

show ntp client server-list

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display tabular information on the current NTP client to server association status.

Examples

```
-> show ntp client server-list
Legends: + active peer, - passive peer, = client, * current system peer,
         ^ broadcast server, ' broadcast client
Mode IP Address       Ver   Key   St   when   poll   reach   Delay   Offset      Disp
--------------------+-----+----+-----+------+------+------+-------+----------+-----------
*    198.206.181.70    4    0     2    895    1024   377     0.167   0.323       0.016
=    198.206.181.123   4    0     16   591    1024   377     0.000   0.000       0.000
```

output definitions

Mode	"+" indicates an active peer "-" indicates a pasive peer "=" indicates a client "*" indicates current system peer "^" indicates a broadcast server "`" indicates a broadcast client
IP Address	The server IP address.
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
When	Number of seconds passed since last response from remote host.
Poll	Polling interval to the remote host in seconds.

output definitions

Reach	This is a shift register used to determine the reachability status of this peer. This register is displayed to the user in octal values instead of binary, decimal or even hex. The maximum value of an eight-bit binary number is 11111111, which is 377 in octal.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; When, Poll, Reach fields added.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpPeerListTable
```

show ntp server client-list

Displays the information about the current NTP clients connected to the server.

show ntp server client-list

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display the tabular information on the current NTP client connected to the server (switch).

Examples

```
-> show ntp server client-list
IP Address           Ver       Key
------------------+-------+----------
172.23.0.201         4          0
10.255.24.121        4          0
```

output definitions

IP Address	The client IP address.
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.

Release History

Release 7.1.1; command was introduced.

Related Command

show ntp status	Displays information about the current client NTP configuration
ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpClientListTable
   alaNtpPeerListAddress
   alaNtpPeerVersion
   alaNtpPeerAuth
```

show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

show ntp server status [*ip_address***]**

Syntax Definitions

ip_address	The IP address of the NTP server to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

Examples

```
-> show ntp server status
IP address         = clock3.ovcirrus.com [123.108.200.124],
Host mode          = client,
Peer mode          = server,
Prefer             = no,
Version            = 4,
Key                = 0,
Stratum            = 2,
Minpoll            = 6 (64 seconds),
Maxpoll            = 10 (1024 seconds),
Poll               = 1024 seconds,
when               = 283 seconds,
Delay              = 0.016 seconds,
Offset             = -180.232 seconds,
Dispersion         = 7.945 seconds
Root distance      = 0.026,
Precision          = -14,
Reference IP       = 209.81.9.7,
Status             = configured : reachable : rejected,
Uptime count       = 1742 seconds,
Reachability       = 1,
Unreachable count  = 0,
Stats reset count  = 1680 seconds,
Packets sent       = 1,
Packets received   = 1,
Duplicate packets  = 0,
Bogus origin       = 0,
Bad authentication = 0,
```

```
Bad dispersion     = 0,

-> show ntp server status 198.206.181.139
IP address         = 198.206.181.139,
Host mode          = client,
Peer mode          = server,
Prefer             = no,
Version            = 4,
Key                = 0,
Stratum            = 2,
Minpoll            = 6 (64 seconds),
Maxpoll            = 10 (1024 seconds),
Poll               = 1024 seconds,
when               = 283 seconds,
Delay              = 0.016 seconds,
Offset             = -180.232 seconds,
Dispersion         = 7.945 seconds
Root distance      = 0.026,
Precision          = -14,
Reference IP       = 209.81.9.7,
Status             = configured : reachable : rejected,
Uptime count       = 1742 seconds,
Reachability       = 1,
Unreachable count  = 0,
Stats reset count  = 1680 seconds,
Packets sent       = 1,
Packets received   = 1,
Duplicate packets  = 0,
Bogus origin       = 0,
Bad authentication = 0,
Bad dispersion     = 0,
Last Event         = peer changed to reachable,
```

output definitions

IP address	The server IP address.
Host mode	The host mode of this remote association.
Peer mode	The peer mode of this remote association.
Prefer	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
Version	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.
Minpoll	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
Maxpoll	The maximum poll time.
When	Number of seconds passed since last response from remote host.
Poll	Polling interval to the remote host in seconds.
Delay	The delay received from the server in its timestamp.

output definitions (continued)

Offset	The offset received from the server in its timestamp.
Dispersion	The dispersion value received from the server in its timestamp.
Root distance	The total round trip delay (in seconds) to the primary reference source.
Precision	The advertised precision of this association.
Reference IP	The IP address identifying the peer's primary reference source.
Status	The peer selection and association status.
Uptime count	The time period (in seconds) during which the local NTP server was associated with the switch.
Reachability	The reachability status of the peer.
Unreachable count	Number of times the NTP entity was unreachable.
Stats reset count	The time delay (in seconds) since the last time the local NTP server was restarted.
Packets sent	Number of packets sent.
Packets received	Number of packets received.
Duplicate packets	Number of duplicated packets received.
Bogus origin	Number of bogus packets.
Bad authentication	Number of NTP packets rejected for not meeting the authentication standards.
Bad dispersion	Number of bad dispersions.
Last Event	The last event.

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; when and poll fields added.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpPeerListTable
   alaNtpPeerShowStatus
```

show ntp keys

Displays information about all authentication keys.

show ntp keys

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

Examples

```
-> show ntp keys
Key       Status
=======+============
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

output definitions

Key	The key number corresponding to a key in the key file.
Status	Whether the key is trusted or untrusted.

Release History

Release 7.1.1; command was introduced.

Related Command

ntp key	Labels the specified authentication key identification as trusted or untrusted.
ntp key load	Loads the current key file into memory.

MIB Objects

```
alaNtpAccessKeyIdTable
```

show ntp peers

Displays the information about the current status on the NTP peer association.

show ntp peers

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

Examples

```
-> show ntp peers
IP Address     Ver   Key   St   When   Poll   Reach   Delay    Offset    Disp
---------------+-----+-----+----+------+------+-------+--------+--------+-------
172.23.0.202    4    0     3    895    1024   377     0.300    0.404    0.0024
10.255.24.120   4    0     3    591    1024   377     0.016    0.250    0.0017
```

output definitions

IP Address	Peer IP Address
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
When	Number of seconds passed since last response from remote host.
Poll	Polling interval to the remote host in seconds.
Reach	This is a shift register used to determine the reachability status of this peer. This register is displayed to the user in octal values instead of binary, decimal or even hex. The maximum value of an eight-bit binary number is 11111111, which is 377 in octal.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; When, Poll, Reach fields added.

Related Command

ntp client	Enables or disables NTP operation on the switch.
show ntp status	Displays the information about the current NTP status.
show ntp server status	Displays the basic server information for a specific NTP server or a list of NTP servers.

MIB Objects

```
alaNtpPeerListTable
   alaNtpPeerListAddress
   alaNtpPeerVersion
   alaNtpPeerAuth
   alaNtpPeerStratum
   alaNtpPeerListDelay
   alaNtpPeerShowOffset
   alaNtpPeerListDispersion
```

show ntp server disabled-interfaces

Displays the ip addresses of the interfaces on which NTP server is not enabled.

show ntp server disabled-interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays ip interfaces on which currently NTP server functionality is disabled.

Examples

```
-> show ntp server disabled-interfaces
IP Address
--------------
172.23.0.202
10.255.24.120
```

output definitions

IP Address	Peer IP Address

Release History

Release 7.1.1; command was introduced.

Related Command

show ntp status	Displays the information about the current NTP status.
show ntp server status	Displays the basic server information for a specific NTP server or a list of NTP servers.

MIB Objects

```
alaNtpAccessRestrictedTable
   alaNtpPeerListAddress
```

61 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

	OmniSwitch
Telnet(v4)	6
FTP(v4)	**4**
SSH + SFTP(v4)	8
HTTP	**4**

MIB information for commands in this chapter are as follows:

Filename: ALCATEL-IND1-SESSION-MGR-MIB.mib
Module: alcatelIND1SessionMgrMIB

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

Filename: ALCATEL-IND1-IP-MIB.mib
Module: alcatelIND1IPMIB

A summary of the available commands is listed here:

session login-attempt
session login-timeout
session banner
session timeout
session prompt
session xon-xoff
show prefix
user profile save
user profile reset
history
command-log
kill
exit
who
whoami
show session config
show session xon-xoff
more
telnet
ssh
ssh login-grace-time
ssh enforce-pubkey-auth
ssh strong-ciphers
ssh strong-hmacs
installsshkey
revokesshkey
show command-log status
show telnet
show ssh

session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

session login-attempt *integer*

Syntax Definitions

integer	The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

Defaults

Default is 3 login attempts.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> session login-attempt 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.
session login-timeout	Sets or resets the amount of time the user can take to accomplish a successful login to the switch.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

```
sessionMgr
   sessionLoginAttempt
```

session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

session login-timeout *seconds*

Syntax Definitions

seconds	The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

Defaults

Login timeout default is 55 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> session login-timeout 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.
session login-attempt	Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

```
sessionMgr
   sessionLoginTimeout
```

session banner

Sets or resets the file name of the user–defined banner. The banner is a welcome banner that appears after the user sucessfully logs onto the switch.

session {cli | ftp | http} banner *file_name*

no session {cli | ftp | http} banner

Syntax Definitions

cli	Creates/modifies the CLI banner file name.
ftp	Creates/modifies the FTP banner file name.
http	Creates/modifies the HTTP banner file name.
file_name	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

Examples

```
-> session cli banner /switch/banner.txt
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   SessionBannerFileName
```

session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

session {cli | http | ftp} timeout *minutes*

Syntax Definitions

cli	Sets the inactivity timeout for CLI sessions.
http	Sets the inactivity timeout for HTTP sessions.
ftp	Sets the inactivity timeout for FTP sessions.
minutes	Inactivity timeout value (in minutes). Valid range 1 to 596523.

Defaults

parameter	default
minutes	4

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

Examples

```
-> session cli timeout 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   SessionInactivityTimerValue
```

session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

session prompt default [*string*]

Syntax Definitions

string	Prompt string. Maximum length 31 characters.

Defaults

parameter	default
string	->

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

Examples

```
-> session prompt default -->
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   sessionDefaultPromptString
```

session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

session xon-xoff {enable | disable}

Syntax Definitions

enable	Enables XON-XOFF on the console port.
disable	Disables XON-XOFF on the console port.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session xon-xoff	Displays whether the console port is enabled or disabled for XON-XOFF.

MIB Objects

```
sessionXonXoffEnable
```

show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

show prefix

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

Examples

```
-> show prefix
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show prefix	This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

MIB Objects

N/A

user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

user profile save

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the **user profile reset** command to set values to their factory defaults.

Examples

```
-> user profile save
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show prefix	Defines substitute command text for the switch's CLI command keywords.
user profile reset	Resets the alias, prompt and more values to their factory defaults.

MIB Objects

N/A

user profile reset

Resets the alias, prompt, and more values to their factory defaults.

user profile reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> user profile reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show prefix	Defines substitute command text for the switch's CLI command keywords.
user profile save	Saves the user account settings for aliases, prompts and the more screen.

MIB Objects

N/A

history

Displays commands that you have recently issued to the switch. The commands are displayed in a numbered list.

history *number*

Syntax Definitions

number	The number of commands to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> history
1 show cmm
2 show fan
3 show sensor
```

output definitions

Index	The index of the commands for this CLI session and the associated command.

Release History

Release 7.1.1; command was introduced.

Related Commands

!	Recalls commands listed in the history buffer and displays them at the CLI prompt.

MIB Objects

N/A

!

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!{! | *n*}

Syntax Definitions

!	Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
n	Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You can use the **history** command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

Examples

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
 vlan  type  admin  oper  ip   mtu   name
-----+------+-----+-----+-----+-----+------------
   1   std    Ena   Ena   Dis  1500   VLAN 1
  10   std    Ena   Ena   Ena  1500   VLAN 10
  12   std    Ena   Ena   Ena  1500   VLAN 12
  14   std    Ena   Ena   Ena  1500   VLAN 14
  30   vip    Ena   Ena   Ena  1500   VIP VLAN 30
  40   vip    Ena   Ena   Ena  1500   VIP VLAN 40
4094   mcm    Ena   Ena   Dis  9198   MCM IPC
```

Release History

Release 7.1.1; command was introduced.

Related Commands

history	Sets the number of commands that will be stored in the CLI history buffer.

MIB Objects

N/A

command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

command-log {enable | disable}

Syntax Definitions

enable	Creates a file called **command.log** in the switch's **/flash** directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
disable	Disables logging of current session commands to the **command.log** file.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

Examples

```
-> command-log enable
-> command-log disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show command-log	Displays the contents of the **command.log** file.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

```
sessionCliCommandLogEnable
```

kill

Kills an active session. The command takes effect immediately.

kill *session_number*

Syntax Definitions

session_number	Number of the session you want to kill.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

Examples

```
-> kill 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

who	Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

MIB Objects

```
SessionMgr
   sessionIndex
   sessionRowStatus
```

exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> exit
```

Release History

Release 7.1.1; command was introduced.

Related Commands

kill	Kills an active session. The command takes effect immediately.

MIB Objects

```
SessionMgr
   sessionIndex
   sessionRowStatus
```

whoami

Displays the current user session.

whoami

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **who** command to display all sessions on the switch.

Examples

```
-> whoami
Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 121.251.17.76,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.
Access type	Type of access protocol used to connect to the switch.
Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Release History

Release 7.1.1; command was introduced.

Related Commands

who	Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).
kill	Kills another user's session.

MIB Objects

```
SessionActive
   sessionIndex
   sessionAccessType
   sessionPhysicalPort
   sessionUserName
   sessionUserReadPrivileges
   sessionUserWritePrivileges
   sessionUserProfileNumber
   sessionUserIpAddress
   sessionRowStatus
```

who

Displays all active login sessions.

who

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You can identify your current login session by using the IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

Examples

```
-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.
Access type	Type of access protocol used to connect to the switch.

output definitions (continued)

Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Possible values for command domains and families are listed here:

Release History

Release 7.1.1; command was introduced.

Related Commands

whoami	Displays current user session.
kill	Kills another user's session.

MIB Objects

```
SessionActive
   sessionIndex
   sessionAccessType
   sessionPhysicalPort
   sessionUserName
   sessionUserReadPrivileges
   sessionUserWritePrivileges
   sessionUserProfileNumber
   sessionUserIpAddress
   sessionRowStatus
```

show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

show session config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

Examples

```
-> show session config

Cli Default Prompt              = ->
Cli Banner File Name            = ,
Cli Inactivity Timer in minutes  = 60
Ftp Banner File Name            = ,
Ftp Inactivity Timer in minutes  = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds          = 60
Maximum number of Login Attempts = 2
```

output definitions

Cli Default Prompt	Default prompt displayed for CLI sessions.
Cli Banner File Name	Name of the file that contains the banner information that will appear during a CLI session.
Cli Inactivity Timer in minutes	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
Ftp Banner File Name	Name of the file that contains the banner information that will appear during an FTP session.
Ftp Inactivity Timer in minutes	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
Http Inactivity Timer in minutes	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

output definitions (continued)

Login Timer in seconds	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
Maximum number of Login Attempts	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

Release History

Release 7.1.1; command was introduced.

Related Commands

session prompt	Configures the default CLI prompt for console and Telnet sessions.
session banner	Sets the file name of the user–defined banner.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface.
session login-attempt	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
session login-timeout	Sets the amount of time the user can take to accomplish a successful login to the switch.

MIB Objects

```
SessionConfigTable
   sessionType
   sessionBannerFileName
   sessionInactivityTimerValue
   sessionDefaultPromptString
```

show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

show session xon-xoff

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the **session xon-xoff** command), traffic to the console port may be stopped.

Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

Release History

Release 7.1.1; command was introduced.

Related Commands

session xon-xoff	Enables/disables the XON-XOFF protocol on the console port.

MIB Objects

```
sessionXonXoffEnable
```

more

Enables the more mode for your console screen display.

more *filename*

Syntax Definitions

filename	The file to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

Examples

```
-> more textfile.txt
-> write terminal | more
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
```

telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

[vrf *name***] telnet {port** [**default** | *service_port*] | **admin-state** [**enable** | **disable**] | *ip_address***}**

Syntax Definitions

name	Name of the VRF.
default	Sets the port back to the default of 23.
service_port	The TCP service port number. Must be 23 or between 20000-20999.
enable | **disable**	Enables or disables telnet access.
ip_address	Specifies the IPv4 or IPv6 address for the Telnet session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The default directory for Telnet is **/flash**.

Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
-> vrf vrf1 telnet admin-state enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

ssh	Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.
show telnet	Displays the current configuration specifying the ports the telnet daemons are listening on.

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
   alaIpTelnetAdminStatus
```

ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

[vrf *name***] ssh {port** [**default |** *service_port*] **| admin-state** [**enable | disable**] | *ip_address***}**

Syntax Definitions

name	Name of the VRF.
default	Sets the port back to the default of 22.
service_port	The TCP service port number. Must be 23 or between 20000-20999.
**enable	disable**	Enables or disables Secure Shell.
ip_address	Specifies the IPv4 or IPv6 address for the Secure Shell.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

You must have a valid username and password for the specified host.

Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:

-> vrf vrf1 ssh admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

telnet	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.
ssh enforce-pubkey-auth	Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.
show command-log	Displays the status of Secure Shell, SCP/SFTP on the switch.
show ssh	Displays the current configuration specifying the ports SSH daemons are listening on.

MIB Objects

```
alaIpSshConfig
   alaIpSshAdminStatus
   alaIpSshPort
```

ssh login-grace-time

Configures the duration in which the user has to enter a login password and authenticate for an SSH session.

ssh login-grace-time *seconds*

Syntax Definitions

seconds	The number of seconds for the grace time period. The range is 30–600.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

By default, the login grace time period is set to 120 seconds.

Examples

```
-> ssh login-grace-time 300
-> ssh login-grace-time 600
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ssh	Displays the current SSH configuration for the switch.

MIB Objects

```
alaIpSshConfig
   alaIpSshLoginGraceTime
```

ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

ssh enforce-pubkey-auth {enable | disable}

Syntax Definitions

enable	Enforces only SSH public key authentication.
disable	Enforces both SSH public key and password authentication.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ssh enforce-pubkey-auth enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

telnet	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

MIB Objects

```
alaIpSshConfig
   alaIpSshPubKeyEnforceAdminStatus
```

ssh strong-ciphers

Enables or disables the enforcement of a Secure Shell (SSH) cipher configuration across a switch reboot.

ssh strong-ciphers {enable | disable}

Syntax Definitions

enable	Enables the enforcement of an SSH cipher configuration.
disable	Disables the enforcement of an SSH cipher configuration.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ssh strong-ciphers enable
-> ssh strong-ciphers disable
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show ssh	Displays the current SSH configuration for the switch.

MIB Objects

```
alaIpSshConfig
   alaIpSshStrongCiphersAdminStatus
```

ssh strong-hmacs

Enables or disables the enforcement of a Secure Shell (SSH) HMAC configuration across a switch reboot.

ssh strong-hmacs {enable | disable}

Syntax Definitions

enable	Enables the enforcement of an HMAC configuration.
disable	Disables the enforcement of an HMAC configuration.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- SSH HMAC refers to message authentication codes that use cryptographic hash functions.
- Enable strong-hmacs will enforce the use of *"hmac-sha1 , hmac-sha2-256, hmac-sha2-512*" in ssh server.
- Disable will select default hmacs in the configuration.

Examples

```
-> ssh strong-hmacs enable
-> ssh strong-hmacs disable
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show ssh	Displays the current SSH configuration for the switch.

MIB Objects

```
alaIpSshConfig
   alaIpSshStrongHmacsAdminStatus
```

installsshkey

Used to install the public key used for SSH onto the switch.

installsshkey *user path*

Syntax Definitions

user	The user that the key will be associated with.
path	The location of the key file.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Be sure the associated private key is stored on the client device.
- Verify that the user that will use SSH is a valid user name on the OmniSwitch.
- Refer to the Switch Management Guide for information on generating the public/private keys.

Examples

```
-> installsshkey new_ssh_user /flash/system/new_ssh_user_rsa.pub
```

Release History

Release 8.3.1; command was introduced.

Related Commands

revokesshkey	Used to revoke a key from an SSH user.
show ssh	Displays the current SSH configuration for the switch.

MIB Objects

N/A

revokesshkey

Used to revoke a key from an SSH user.

revokesshkey *user remote-user*

Syntax Definitions

user	The local user name.
remote-user	The user on the remote client device.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> revokesshkey new_ssh_user remote_ssh_user@192.168.10.1
```

Release History

Release 8.3.1; command was introduced.

Related Commands

installsshkey	Used to install the public key used for SSH onto the switch.
show ssh	Displays the current SSH configuration for the switch.

MIB Objects

N/A

show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to page 61-16.

show command-log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date     : FRI JAN 09 00:20:01
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date     : FRI JAN 09 00:19:44
  Ip Addr  : 128.251.19.240
  Result   : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date     : FRI JAN 09 00:18:49
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS
```

output definitions

Command	The exact syntax of the command, as entered by the user.
UserName	The name of the user session that entered the command. For more information on different user session names, refer to the **user** command on page 38-56, or the "Managing Switch User Accounts" chapter in the *OmniSwitch AOS Release 8 Switch Management Guide*.
Date	The date and time, down to the second, when the command was entered.
IpAddr	The IP address of the terminal from which the command was entered.
Result	The outcome of the command entry. Options include **SUCCESS** and **ERROR**. For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

Release History

Release 7.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

```
sessionCliCommandLogEnable
```

show command-log status

Shows the current status of the command logging function (i.e., enabled or disabled).

show command-log status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show command-log status
CLI command logging : Enable
```

output definitions

CLI command logging	The current status of command logging on the switch. Options include **Disable** and **Enable**.

Release History

Release 7.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
sessionCliCommandLogStatus
```

show telnet

Displays the current configuration specifying the ports the telnet daemons are listening on.

[vrf *name***] show telnet**

Syntax Definitions

name	Name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If VRF is specified, the current status of the telnet daemon for the specified VRF is displayed.

Examples

```
vrf1::-> show telnet
Telnet Admin-State = Enabled
Telnet Port = 23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
alaIpTelnetAdminStatus
alaIpTelnetPort
```

show ssh

Displays the current configuration specifying the ports on which the SSH daemons are listening.

[vrf *name***] show ssh**

Syntax Definitions

name	Name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If VRF is specified, the current status of the SSH daemon for the specified VRF is displayed.

Examples

```
vrf1::-> show ssh
Ssh Admin-State = Enabled
Ssh Port = 22
Ssh Enforce-Pubkey-Auth = Disabled
Ssh Strong-Ciphers = Disabled
Ssh Strong-Hmacs = Disabled
Ssh login-grace-time = 600 seconds
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **Ssh Strong-Ciphers** and **Ssh Strong-Hmacs** fields added.
Release 8.3.1.R02; **Ssh login-grace-time** field added.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
alaIpSshConfig
   alaIpSshAdminStatus
   alaIpSshPort
   alaIpSshPubKeyEnforceAdminStatus
   alaIpSshStrongCiphersAdminStatus
   alaIpSshStrongHmacsAdminStatus
   alaIpSshLoginGraceTime
```

62 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

Filename: ALCATEL-IND1-CHASSIS-MIB.mib
Module: alcatelIND1ChassisMIB

A summary of the available commands is listed here:

File System	**cd** **pwd** **mkdir** **rmdir** **ls** **rm** **cp** **scp** **mv** **chmod** **freespace** **fsck** **newfs**
System Services	**vi** **tty** **show tty** **tftp** **sftp** **ftp** **show ftp**

cd

Changes the current working directory of the switch.

cd [*path***]**

Syntax Definitions

path	Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

Defaults

The default working directory of the switch is **/flash**.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> cd
-> cd /flash/certified
```

Release History

Release 7.1.1; command introduced.

Related Commands

pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesWorkingDirectory
```

pwd

Displays the current working directory of the switch.

pwd

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The **pwd** command can also be used on the secondary CMM.

Examples

```
-> pwd
/flash
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesWorkingDirectory
```

mkdir

Creates a new directory.

mkdir [*options***] [***path***]** */dirname*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
path	The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
dirname	A user-defined name for the new directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: mkdir [OPTIONS] DIRECTORY...

Create DIRECTORY

Options:
        -m      Mode
        -p      No error if exists; make parent directories as needed
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

rmdir

Deletes an existing directory.

rmdir [*options***]** *dirname*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
dirname	The name of the existing directory to be removed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:
        -p|--parents    Include parents
        --ignore-fail-on-non-empty
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

ls

Displays the contents of a specified directory or the current working directory.

ls [*options***] [***path/filename***]**

Syntax Definitions

options	Use the '?' on the command line for a list of options.
filename	Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: ls [-1AacCdeFilnpLRrSsTtuvwxXhk] [FILE]...

List directory contents

Options:
        -1      List in a single column
        -A      Don't list . and ..
        -a      Don't hide entries starting with .
        -C      List by columns
        -c      With -l: sort by ctime
        --color[={always,never,auto}]   Control coloring
        -d      List directory entries instead of contents
        -e      List full date and time
        -F      Append indicator (one of */=@|) to entries
        -i      List inode numbers
        -l      Long listing format
        -n      List numeric UIDs and GIDs instead of names
        -p      Append indicator (one of /=@|) to entries
        -L      List entries pointed to by symlinks
        -R      Recurse
        -r      Sort in reverse order
        -S      Sort by file size
        -s      List the size of each file, in blocks
        -T N    Assume tabstop every N columns
```

```
-t      With -l: sort by modification time
-u      With -l: sort by access time
-v      Sort by version
-w N    Assume the terminal is N columns wide
-x      List by lines
-X      Sort by extension
-h      List sizes in human readable format (1K 243M 2G)
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

rm

Permanently deletes an existing file.

rm [*options***] [***path/filename***]**

Syntax Definitions

options	Use the '?' on the command line for a list of options.
filename	Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: rm [OPTIONS] FILE...

Remove (unlink) FILEs

Options:
        -i      Always prompt before removing
        -f      Never prompt
        -R,-r   Recurse
```

Release History

Release 7.1.1; command introduced.

Related Commands

cp	Copies an existing file or directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

cp

Copies an existing file. This command can also copy a directory if the -r keyword is used.

cp [*options***]** *source destination*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
source	The name of the existing file to be copied.
destination	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
-> cp ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:
        -a      Same as -dpR
        -R,-r   Recurse
        -d,-P   Preserve symlinks (default if -R)
        -L      Follow all symlinks
```

```
-H      Follow symlinks on command line
-p      Preserve file attributes if possible
-f      Force overwrite
-i      Prompt before overwrite
-l,-s   Create (sym)links
```

Release History

Release 7.1.1; command introduced.

Related Commands

mv	Moves an existing file or directory to a new location.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

scp

Copies an existing file in a secure manner.

scp [*options***]** *user_name@remote_ip_addr:***[***path/***]***source* **[***path/***]***target*

scp [*options***] [***path/***]***source user_name@remote_ip_addr:***[***path/***]***target*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
user_name@remote_ip_addr:	The username along with the IPv4 or IPv6 address of the remote switch.
path/	Specifies the path containing the file to be copied and the path where the file will be copied.
source	The name of the file(s) to be copied.
target	The new user-defined file name for the resulting file copy.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:

Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:

Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
-> scp ?
usage: scp [-1246BCpqrv] [-c cipher] [-F ssh_config] [-i identity_file]
           [-l limit] [-o ssh_option] [-P port] [-S program]
           [[user@]host1:]file1 ... [[user@]host2:]file2
```

Release History

Release 7.1.1; command introduced.

Related Commands

mv	Moves an existing file or directory to a new location.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

mv

Moves an existing file or directory to a new location.

mv [*options***]** *source destination*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
source	The name of the existing file to be copied.
destination	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:
        -f      Don't prompt before overwriting
        -i      Interactive, prompt before overwrite
```

Release History

Release 7.1.1; command introduced.

Related Commands

rm	Renames an existing file or directory.
cp	Copies an existing file or directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

chmod

Changes the write privileges for a specified file.

chmod {+w | -w} [*path/***]***file*

Syntax Definitions

+w	Enables read-write privileges for the file.
-w	Disables write privileges for the file—i.e., the file becomes read-only.
path/	The path containing the file for which privileges are being changed.
file	The name of the file for which read-write privileges are being changed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```
-> chmod +w vlan.config
-> chmod -w flash/backup_configs/vlan.config
```

Release History

Release 7.1.1; command introduced.

Related Commands

freespace	Changes the write privileges for a specified file.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

freespace

Displays the amount of free space available in the **/flash** directory.

freespace [/flash | /uflash]

Syntax Definitions

/flash	The amount of free space is shown for the **/flash** directory.
/uflash	The amount of free space is shown for the **/uflash** directory.

Defaults

N/A

Usage Guidelines

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Examples

```
-> freespace /flash
/flash 3143680 bytes free

-> freespace
/flash 3143680 bytes free
```

Release History

Release 7.1.1; command introduced.

Related Commands

fsck	Performs a file system check, including diagnostic information in the event of file corruption. If the **fsck** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

MIB Objects

```
SystemFileSystemTable
   systemFileSystemFreespace
```

fsck

Performs a file system check, including diagnostic information in the event of file corruption.

fsck /uflash {repair | no-repair}

Syntax Definitions

/uflash	Indicates that the file system check will be performed on the **/uflash** directory.
repair	Attempt to repair any problems found.
no-repair	Do not attempt to repair any problems found.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command provides the option to automatically repair errors.

Examples

```
-> fsck /uflash repair

/uflash/  - disk check in progress ..
/uflash/  - Volume is OK

          total # of clusters:  14,773
           # of free clusters:  4,132
            # of bad clusters:  0
              total free space:  8,264 Kb
    max contiguous free space:  5,163,008 bytes
                   # of files:  46
                 # of folders:  3
         total bytes in files:  21,229 Kb
             # of lost chains:  0
   total bytes in lost chains:  0
```

Release History

Release 7.1.1; command introduced.

Related Commands

freespace	Displays the amount of free space available in the **/flash** directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

newfs /uflash

Syntax Definitions

/uflash	This indicates that the complete file system will be replaced.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

Examples

```
-> newfs /uflash
```

Release History

Release 7.1.1; command introduced.

Related Commands

N/A

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

vi [*options***] [***path/***]***filename*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
path/	The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
filename	The name of the existing file being viewed or edited.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: vi [OPTIONS] [FILE]...

Edit FILE

Options:
        -c      Initial command to run ($EXINIT also available)
        -R      Read-only
        -H      Short help regarding available features
```

Release History

Release 7.1.1; command introduced.

Related Commands

tty	Displays current TTY settings.

MIB Objects

```
systemServices
   systemServicesTtyLines
   systemServicesTtyColumns
```

tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

tty *lines columns*

Syntax Definitions

lines	The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.
columns	The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

Defaults

parameter	default
lines	24
columns	80

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

Examples

```
-> tty 10 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show tty	Displays current TTY settings.

MIB Objects

```
systemServices
   systemServicesTtyLines
   systemServicesTtyColumns
```

show tty

Displays current TTY settings.

show tty

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Shows the settings made with the **tty** command.
- This command can also be used on the secondary CMM.

Examples

```
-> show tty
lines = 24, columns = 80
```

Release History

Release 7.1.1; command introduced.

Related Commands

tty	Specifies the number of TTY lines and columns to be displayed.

MIB Objects

```
systemServices
   systemServicesTtyLines
   systemServicesTtyColumns
```

tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

tftp [*options***] *host* [***port***]**

Syntax Definitions

options	Enter a question mark (?) to get a list of options.
host	Specifies the IP address of the TFTP server.
port	Specifies the port for the TFTP transfer.

Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

N/A

sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

sftp [*options***] {***ip_address***}**

Syntax Definitions

options	Enter a question mark (?) to get a list of options.
ip_address	Specifies the IPv4 or IPv6 address for the SFTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

cd path	Change remote path to ‘path’.
lcd path	Change local directory to ‘path’.
chmod mode path	Change permissions of file ‘path’ to ‘mode’.
help	Display command help information.
get remote-path [local path]	Download a file from the remote path to the local path.
lls [path]	Display local directory listing.
ln oldpath newpath	Creates a symbolic link (symlink) to the remote file.
symlink oldpath newpath	Creates a symbolic link (symlink) to the remote file.
lmkdir path	Create local directory.
lpwd	Print local working directory.
ls [path]	Display remote directory listing.
mkdir path	Create remote directory.
put local-path [remote-path]	Upload file.
pwd	Display remote working directory.
exit	Quit the sftp mode.
quit	Exit the sftp mode.
rename oldpath newpath	Rename a remote file.

rmdir path	Remove remote directory.
rm path	Delete remote file.
version	Show the current SFTP version.
?	Synonym for help. Displays command help information.

Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-1Cv] [-B buffer_size] [-b batchfile] [-F ssh_config]
            [-o ssh_option] [-P sftp_server_path] [-R num_requests]
            [-S program] [-s subsystem | sftp_server] host
       sftp [[user@]host[:file [file]]]
       sftp [[user@]host[:dir[/]]]
       sftp -b batchfile [user@]host
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ftp	Starts an FTP session.
ssh	Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
```

ftp

Starts an FTP session.

ftp {port [**default |** *service_port*] | **admin-state [enable | disable] |** *ip_address***}**

[vrf *name***] ftp admin-state [enable | disable]**

Syntax Definitions

name	The name of the VRF.
default	Sets the port back to the default of 21.
service_port	The TCP service port number. Must be 21 or between between 20000-20999.
**enable	disable**	Enables or disables FTP access.
ip_address	Specifies the IPv4 address for the FTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
-> vrf vrf1 ftp admin-state enable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **vrf** parameter added.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
   alaIpFtpAdminStatus
```

show ftp

Displays the current FTP server settings like the port used for FTP, the FTP server's status in the given VRF.

[vrf *name***] show ftp**

Syntax Definitions

name	The name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ftp
Ftp Admin-State = Enabled
Ftp Port = 21
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **vrf** parameter added.

Related Commands

ftp	Starts an FTP session.

MIB Objects

```
alaIpFtpAdminStatus
alaIpFtpPort
```

63 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

Filename: ALCATEL-IND1-WEBMGT-MIB.mib
Module: alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

webview server

Enables or disables the web management server on the switch.

[vrf *name***] webview server {enable | disable}**

Syntax Definitions

name	The name of the VRF.
enable	Enables the web management server on the switch.
disable	Disables the web management server on the switch.

Defaults

parameter	default
WebView Server	Enabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be ‘default’or pre-defined VRF (user-defined).

Examples

```
-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf** parameter added.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtServerStatus
```

webview access

Enables or disables web management access on the switch.

[vrf *name***] webview access {enable | disable}**

Syntax Definitions

name	The name of the VRF.
enable	Enables the web management access on the switch.
disable	Disables the web management access on the switch.

Defaults

parameter	default
WebView Access	Enabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If Web Access is enabled, the WebView Server is automatically enabled.
- VRF name must either be ‘default’or pre-defined VRF (user-defined).

Examples

```
-> webview access enable
-> webview access disable
-> vrf vrf1 webview access enable
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf** parameter added.

Related Commands

webview server	Enables/disables the web server on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtAdminStatus
```

webview force-ssl

Enables or Disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

webview force-ssl {enable | disable}

Syntax Definitions

enable	Enables the requirement to use SSL to access the switch when using WebView.
disable	Disables the requirement to use SSL to access the switch when using WebView.

Defaults

parameter	default
Force SSL	Enabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtSsl
```

webview http-port

Changes the port number for the embedded web management server.

webview http-port {default | port *port***}**

Syntax Definitions

default	Restores the port to its default (80) value.
port	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
port	80

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview http-port port 1025
-> webview http-port default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaIND1WebMgtHttpPort
```

webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

webview https-port {default | port *port***}**

Syntax Definitions

default	Restores the port to its default (443) value.
port	The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
port	443

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview https-port port 1026
-> webview https https-port default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaIND1WebMgtHttpsPort
```

webview ssl-strong-ciphers

Enables or disables support of only SSL strong cipher algorithms in order to prevent client opening connections to the switch using weak algorithms.

webview ssl-strong-ciphers {enable | disable}

Syntax Definitions

enable	Enables the strong cipher requirement.
disable	Disables the strong cipher requirement.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When enabled the following algorithms will not be supported: RC4-SHA, RC4-MD5, ECDHE-RSA-RC4-SHA, IDEA-CBC-SHA, DES-CBC3-SHA, EDH-RSA-DES-CBC3-SHA, ECDHE-RSA-DES-CBC3-SHA, aNULL, eNULL, EXPORT, DES, MD5, PSK, RC4.

Examples

```
-> webview ssl-strong-ciphers enable
-> webview ssl-strong-ciphers disable
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaIND1WebMgtSSLStrongCiphers
```

webview wlan cluster-virtual-ip precedence

Sets the preference for obtaining the cluster virtual IP address for WebView re-direct. The WLAN cluster virtual IP address can be obtained from LLDP or configured manually. The precedence allows to set the preference between the LLDP and manual configuration in case when both are available.

webview wlan cluster-virtual-ip precedence {lldp | configured}

Syntax Definitions

lldp	The preference to obtain the WLAN cluster virtual IP address is set to LLDP.
configured	The preference to obtain the WLAN cluster virtual IP address is set to the manually configured WLAN cluster virtual IP address.

Defaults

parameter	default
lldp | configured	lldp

Platforms Supported

OmniSwitch 6860, 6865, 9900

Usage Guidelines

- Use this command to set the preference for obtaining the cluster virtual IP address for WebView re-direct.
- If more than one cluster virtual IP address is obtained through LLDP on the same port, the recently obtained IP is considered.
- If more than one cluster virtual IP is obtained through LLDP on different ports, the recently obtained IP is considered.
- If the precedence is set for LLDP obtained IP address, but there is no LLDP obtained cluster virtual IP address, then the manually configured cluster virtual IP address will be considered if configured.
- If the precedence is set for manually configured cluster virtual IP address, but there is no configured IP address present, then the LLDP obtained cluster virtual IP address will be considered if received.

Examples

```
-> webview wlan cluster-virtual-ip precedence lldp
-> webview wlan cluster-virtual-ip precedence configured
```

Release History

Release 8.4.1 R02; command was introduced.

Related Commands

show webview wlan config	Displays the AP cluster virtual IP configured on the switch.

MIB Objects

```
alaIND1WebMgtWlanIpPrecedence
```

webview wlan cluster-virtual-ip

Configures the cluster virtual IP address of the Access Point (AP) in the switch. The WebView server on the switch redirects the URL to the AP (Virtual IP Address) URL when the WLAN Management is accessed from WebView.

webview wlan cluster-virtual-ip *virtual-ip-address-of-wlan-cluster*

Syntax Definitions

virtual-ip-address-of-wlan-cluster	Virtual IP address (IPV4) of the AP cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 9900

Usage Guidelines

Use this command to configure the AP cluster virtual IP address to access the OAW-AP web interface from the webview.

Examples

```
-> webview wlan cluster-virtual-ip 10.25.6.8
```

Release History

Release 8.4.1 R02; command was introduced.

Related Commands

show webview wlan config	Displays the AP cluster virtual IP configured on the switch.

MIB Objects

```
alaIND1WebMgtWlanConfiguredIpAddress
```

show webview wlan config

Displays the cluster virtual IP precedence configuration, WLAN AP cluster virtual IP configured on the switch, and WLAN AP cluster virtual IP obtained through LLDP.

show webview wlan config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> show webview wlan config
WebView WLAN Cluster-Virtual-IP Precedence = LLDP
WebView WLAN Cluster-Virtual-IP configured address = 0.0.0.0
WebView WLAN Cluster-Virtual-IP LLDP address = 1.1.1.1
```

output definitions

WebView WLAN Cluster-Virtual-IP Precedence	The precedence set for obtaining the cluster virtual IP address of the AP.
WebView WLAN Cluster-Virtual-IP configured address	The manually configured cluster virtual IP address.
WebView WLAN Cluster-Virtual-IP LLDP address	The cluster virtual IP address obtained from the LLDP packets.

Release History

Release 8.4.1R02; command was introduced.

Related Commands

webview wlan cluster-virtual-ip precedence	Allows to set the preference for the choice of cluster virtual IP address for WebView re-direct.
webview wlan cluster-virtual-ip	Configures the virtual IP address of the Access Point (AP) clusters in the switch.

MIB Objects

```
alaIND1WebMgtWlanIpPrecedence
   alaIND1WebMgtWlanConfiguredIpAddressType
   alaIND1WebMgtWlanConfiguredIpAddress
   alaIND1WebMgtWlanLldpIpAddressType
   alaIND1WebMgtWlanLldpIpAddress
```

show webview

Displays web management configuration information.

[vrf *name***] show webview**

Syntax Definitions

name	The name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

Examples

```
-> show webview

WebView Server = Enabled
WebView Access = Enabled
WebView Force-SSL = Enabled
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled

vrf1::-> show webview
WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled
```

output definitions

WebView Server	Indicates whether web management server is enabled or disabled.
WebView Access	Indicates whether web management access is enabled or disabled.
Force SSL	Indicates whether Force SSL is enabled or disabled. If this is enables it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.
Web Management Https Port	The port configured for a secure HTTP connection (SSL enabled).
Web SSL-Strong-Ciphers	Indicates whether SSL strong cipher requirement is enabled or disabled.

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf** parameter added.

Related Commands

```

64 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

Filename: ALCATEL-IND1-CONFIG-MGR-MIB.mib
Module: alcatelIND1ConfigMgrMIB

A summary of the available commands is listed here:

configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

configuration apply *filename* **[at** *hh:mm month dd* **[***year***]] | [in** *hh***[***:mm***]] [verbose]**

Syntax Definitions

filename	The name of the configuration text file to be applied to the switch (e.g., **newfile1**).
at *hh:mm* **{***dd month* | *month dd***} [***year***]**	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for *hh* range from 00 through 23. Values for *mm* range from 00 through 59. Values for *dd* range from 01 through 31. Values for month range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
in *hh***[***:mm***]**	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for *hh* range from 00 through 23. Values for *mm* range from 00 through 59.
verbose	When verbose is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

Defaults

By default, **verbose** error checking is not performed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.
- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword

represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to page 38-60.

Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

Note. When the **configuration apply** command is entered *without* **at** or **in** syntax information, one or more dots "**.**" is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration syntax-check	Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
   configFileName
   configFileMode
   configFileAction
   configTimerFileName
   configTimerFileTime
```

configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension.When the maximum number of **.err** files is exceeded, any new error file will overwrite the **.err** file with the oldest timestamp.

configuration error-file-limit *number*

Syntax Definitions

number	Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

Defaults

parameter	default
number	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the /flash directory.

Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
configuration cancel	Cancels a pending timer session for a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
   configErrorFileMaximum
```

show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

show configuration status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A timer session can be scheduled using the **configuration apply** command. For more information, refer to page 64-2.
- The screen output **File configuration** <*/path/filename*>**: scheduled at** *dd/mm hh:mm* indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration** <*/path/filename*>**: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the **write memory** command.

Examples

```
-> show configuration status
```

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
configuration cancel	Cancels a pending timer session for a configuration file.
configuration error-file-limit	Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
write memory	Copies the running configuration (RAM) to the working directory.

MIB Objects

```
configTimerFileGroup
   configTimerFileStatus
```

configuration cancel

Cancels a pending timer session for a configuration file.

configuration cancel

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> configuration cancel
```

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
show configuration status	Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

```
configTimerFileGroup
   configTimerClear
```

configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

configuration syntax-check *path/filename* **[verbose]**

Syntax Definitions

path/filename	The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, **/flash/working/asc.1.snap**.
verbose	When **verbose** is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When **verbose** is *not* specified in the command line, cursory information (number of errors and error log file name) will be printed to the console *only if a syntax or configuration error is detected*.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

Examples

```
-> configuration syntax-check vlan_file1
..
```

Note. When the **configuration syntax-check** command is entered, one or more dots "**.**" is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
show configuration status	Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

```
configFileGroup
   configErrorFileName
   configErrorFileMaximum
   configFileMode
   configFileStatus
```

configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

configuration snapshot [*feature_list* **| all} [***path/filename***]**

Syntax Definitions

feature_list	The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Enter a question mark (?) on the command line to get a list of features (**configuration snapshot ?**).
all	Includes all network features in the snapshot.
path/filename	A user-defined name for the resulting snapshot file. For example, **test_snmp_snap**. You may also enter a specific path for the resulting file. For example, the syntax **/flash/working/test_snmp_snap** places the **test_snmp_snap** file in the switch's **/flash/working** directory.

Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

Examples

```
-> configuration snapshot all
-> configuration snapshot qos health aggregation new_file1
-> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q

-> configuration snapshot ?
                          ^

Related Commands

show configuration snapshot Displays the switch's current running configuration.

MIB Objects

```
configManager
   configSnapshotFileName
   configSnapshotAction
   configSnapshotAllSelect
```

show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

show configuration snapshot [*feature_list***]**

Syntax Definitions

feature_list	Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma. Enter a question mark (?) on the command line to get a list of features (**show configuration snapshot ?**).

Defaults

By default, this command shows configuration information for *all* features.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

Related Commands

write terminal	Displays the switch's current running configuration for all features.

MIB Objects

```
configManager
   configSnapshotFileName
   configSnapshotAction
   configSnapshotAllSelect
```

write terminal

Displays the switch's current running configuration for all features.

write terminal

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

Examples

```
-> write terminal
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show configuration snapshot	Displays the switch's current running configuration for all features or for the specified feature(s).

MIB Objects

```

```

configuration apply network-sync

Performs pre-provisioning or runtime network level synchronization for AOS Micro Services (AMS) using the publisher/subscriber model.

configuration apply network-sync *filename* **[community** *community-name* **| local-apply]**

Syntax Definitions

filename	The name of the file with the AOS configuration to be synchronized.
community-name	Performs synchronization only on switches with the corresponding community name.
local-apply	Apply the configuration to the local switch.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **configuration syntax-check** command to validate the configuration file syntax before network synchronization.
- It is recommended to have only global, and not local, level switch configuration information propagated for network level configurations.
- The file name “preprovision.txt” is a pre-defined name used for pre-provisioning purposes. Pre-provisioning applies only to new nodes that join the network, the configuration will not be applied to existing nodes. Refer to the AMS section of the Switch Management Guide for additional information.

Examples

```
-> configuration apply network-sync preprovision.txt
-> configuration apply network-sync adaptive-test
```

Release History

Release 8.6R1; command not supported.

Related Commands

configuration syntax-check	Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

65 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

Filename: SNMP-COMMUNITY-MIB.mib
Module: snmpCommunityMIB

MIB information for Trap Manager commands is a follows:

Filename ALCATEL-IND1-TRAP-MGR-MIB.mib
Module: alcatelIND1TrapMgrMIB

MIB information for SNMP Agent commands is a follows:

Filename: ALCATEL-IND1-SNMP-AGENT-MIB.mib
Module: alcatelIND1SNMPAgentMIB

A summary of the available commands is listed here:

SNMP station commands	**snmp station** **show snmp station**
SNMP engine ID commands	**snmp snmp-engineid-type** **show snmp snmp-engineid**
SNMP community map commands	**snmp community-map** **snmp community-map mode** **show snmp community-map**

snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

snmp station {*ip_address* **|** *ipv6_address* **|** *domain_name***} {[***port***] [***username***] [v1 | v2 | v3 | v3 tsm local-identity** *local_string* **remote-identity** *remote_string*] **[enable | disable]}**

no snmp station {*ip_address* **|** *ipv6_address* **|** *domain_name***}**

Syntax Definitions

ip_address	The IP address to which SNMP unicast traps will be sent.
ipv6_address	The IPv6 address to which SNMP unicast traps will be sent.
domain_name	A Fully Qualified Domain Name (FQDN) to which SNMP unicast traps will be sent. Specify a domain name up to 255 characters in length.
port	A UDP or TLSTCP destination port.
username	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
v1	Specifies that traps are sent using SNMP version 1.
v2	Specifies that traps are sent using SNMP version 2.
v3	Specifies that traps are sent using SNMP version 3.
tsm	The TSM security model for SNMP. The security model can be selected only for SNMP version 3.
local_string	The file name of the local certificate. To be configured when TSM mode is selected.
remote_string	The file name of the remote certificate. To be configured when TSM mode is selected.
enable	Enables the specified SNMP station.
disable	Disables the specified SNMP station.

Defaults

parameter	default
port	162 (for UDP) 10162 (for TLSTCP)
v1 | v2 | v3	**v3**
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove an existing SNMP station.
- When adding an SNMP station, specify an IP address or FQDN *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- A maximum of 50 SNMP sessions can be established in the switch.
- When modifying an SNMP station, specify an IP address or FQDN *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.
- For UDP the default port 162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the UDP destination port configured at the receiving SNMP station(s).
- For TLSTCP the default port 10162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the TLSTCP destination port configured at the receiving SNMP station(s).
- To send SNMP traps over TLS connection, the SNMP station needs to be configured with TSM user along with certificate identities.
- The local_identity and remote_identity are the names of certificate file. If the contents of local or remote certificates are changed, the updated certificates must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.
- When TSM security model is enabled, all the v1/v2/v3 USM requests and traps are discarded.
- When TSM security model is disabled, all v1/v2/v3 (USM and TSM) requests and traps are allowed.
- In TSM security model SNMP requests are supported over IPv4 transport only.

Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1

-> snmp station upam.omnivista.com username2 v1 disable
-> snmp station upam.omnivista.com v2
-> no snmp station upam.omnivista.com
-> snmp station opendaylight.com enable v2 public
ERROR: DNS lookup failed, unknown host opendaylight.com
-> snmp station 168.22.1.1 joe v3 tsm local-identity aluSubagent.crt
remote-identity manager.crt enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; *domain_name* parameter option added.
Release 8.6R1; **tsm**, **local-identity**, and **remote-identity** parameters added**.**

Related Commands

show snmp station	Displays the current SNMP station information.

```

snmp snmp-engineid-type

Configures a unique engine ID for the OmniSwitch SNMP agent.

snmp snmp-engineid-type {text | mac-address | ipv4-address | ipv6-address} snmp-engineid {*text_string* **|** *mac_address* **|** *ipv4_address* **|** *ipv6_address***}**

snmp snmp-engineid-type mac-address snmp-engineid default

Syntax Definitions

text_string	A text string that will be converted to a hexadecimal value. The valid range is 1–27 characters.
mac_address	A specific MAC Address (for example, 00:00:39:59:f1:0c).
ipv4_address	An IPv4 address that will be converted to a hexadecimal value.
ipv6_address	An IPv6 address that will be converted to a hexadecimal value.

Defaults

By default, the SNMP engine ID is set to the base MAC address for the switch appended to the enterprise value for OmniSwitch platforms (for example, if the enterprise value is “8000195603” and the switch base MAC address is “2c:fa:a2:13:e4:02”, then the default engine ID is set to “80001956032cfaa213e402”).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To set the engine ID back to the default value, specify the **mac-address** parameter and the **default** parameter with this command. For example, **snmp snmp-engineid-type mac-address snmp-engineid default**.
- Note that the **snmp-engineid** keyword is entered after the parameter that specifies the type of engine ID format to use and before the actual value that matches the specified parameter type. For example, if the **ipv4-address** parameter is specified, enter the IPv4 address value after the **snmp-engineid** keyword (**snmp snmp-engineid-type ipv4-address snmp-engineid 10.2.2.1**).
- When a text string, an IPv4 address, or an IPv6 address is specified, the value is automatically converted to a hexadecimal value that is then appended to the OmniSwitch enterprise value to form the SNMP engine ID for the switch.

Examples

```
-> snmp snmp-engineid-type text snmp-engineid "test lab"
-> snmp snmp-engineid-type mac-address snmp-engineid 00:2a:95:01:02:03
-> snmp snmp-engineid-type ipv4-address snmp-engineid 168.22.2.2 111
-> snmp snmp-engineid-type mac-address snmp-engineid default
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

MIB Objects

```
snmpAgtEngineIdType
snmpAgtEngineId
```

show snmp snmp-engineid

Displays the current SNMP engine ID value for the switch.

show snmp snmp-engineid

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guideline

N/A

Examples

```
-> show snmp snmp-engineid
snmp engineId type         snmp engineId
------------------+------------------------------
   default Mac               80001956032cfaa213e402
```

output definitions

snmp engineId type	The type of engine ID (**default Mac**, **Text**, **Ipv4**, or **Ipv6**).
snmp engineId	The SNMP engine ID value that uniquely identifies the OmniSwitch SNMP agent. This value is comprised of the OmniSwitch enterprise ID plus the configured SNMP engine ID value, in hexadecimal format.

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

snmp snmp-engineid-type	Configures the type and value of the SNMP engine ID for the switch.

MIB Objects

```
snmpAgtEngineIdType
snmpAgtEngineId
```

snmp community-map

Configures and enables a community string on the switch and maps it to an existing user account name.

snmp community-map {[hash-key *string* **|** *community_string*] **user** *useraccount_name***} [enable | disable]**

no snmp community-map *community_string*

Syntax Definitions

hash-key *string*	The hashed format of a community string.
community_string	A community string in the form of a text string. This string must be between 1 and 32 characters.
useraccount_name	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
enable	Enables SNMP community string mapping.
disable	Disables SNMP community string mapping.

Defaults

By default, SNMP community map authentication is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Community strings are stored in a hashed format in the '**show configuration snapshot snmp**' output. To view community string mappings in plain-text use the **show snmp community-map** command.
- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.
- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

Examples

```
-> snmp community-map community1 user testname1
-> snmp community-map community1 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp community-map mode Enables the local community strings database.

MIB Objects

```
SNMPCommunityTable
   snmpCommunityIndex
   snmpCommunitySecurityName
   snmpCommunityStatus
```

snmp community-map mode

Enables the local community strings database.

snmp community-map mode {enable | disable}

Syntax Definitions

enable	Enables SNMP community map database.
disable	Disables SNMP community map database.

Defaults

parameter	default
Community mode	disabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the **snmp community-map** command.

Examples

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp community-map	Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

```

```

show snmp community-map

Shows the local community strings database.

show snmp community-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guideline

N/A

Examples

```
-> show snmp community-map
Community mode : enabled

status   community string                 user name
--------+--------------------------------+--------------------------------
enabled   test_string1                   bb_usename
enabled   test_string2                   rr_usename
disabled  test_string3                   cc_usename
disabled  test_string4                   jj_usename
```

output definitions

Status	The Enabled/Disabled status of the community string.
Community String	The text that defines the community string.
User Name	The user account name.

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp community-map	Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

N/A

snmp security

Configures SNMP security settings.

snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only | tls {enable | disable}}

Syntax Definitions

no-security	The switch will accept all SNMP v1, v2, and v3 requests.
authentication set	The switch will accept all requests *except* v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
authentication all	The switch will accept all requests *except* v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
privacy set	The switch will accept *only* authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
privacy all	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
trap-only	All SNMP get, get-next, and set requests will be rejected.
tls enable | disable	Unblocks (enable) or blocks (disable) the SNMP TLS port 10161.

Defaults

parameter	default
security	**privacy all**
tls enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	**v1 get v2 get v3 non-auth get/ get-next**	**v3 auth set**	**v3 auth get/ get-next**	**v3 encryp set**	**v3 encryp get/ get-next**
no-security	accepted	accepted	accepted	accepted	accepted	accepted
authentication set	rejected	accepted	accepted	accepted	accepted	accepted
authentication all	rejected	rejected	accepted	accepted	accepted	accepted
privacy set	rejected	rejected	rejected	accepted	accepted	accepted

	v1 set v2 set v3 non-auth set	**v1 get v2 get v3 non-auth get/ get-next**	**v3 auth set**	**v3 auth get/ get-next**	**v3 encryp set**	**v3 encryp get/ get-next**
privacy all	rejected	rejected	rejected	rejected	accepted	accepted
trap-only	rejected	rejected	rejected	rejected	rejected	rejected

Examples

```
-> snmp security no-security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp security	Displays the current SNMP security status.

MIB Objects

```
SNMPAgtConfig
   SnmpAgtSecurityLevel
```

snmp security tsm

Enables or disables TLS encryption for SNMP access.

snmp security tsm [enable | disable]

Syntax Definitions

enable	Enables TLS encryption for SNMP access.
disable	Disables TLS encryption for SNMP access.

Defaults

By default, the TLS encryption for SNMP access is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The TLS encryption can be enabled only for SNMP version 3.
- In Common Criteria mode (CC mode) TLS encryption for SNMP is enabled by default and cannot be disabled.

Examples

```
-> snmp security tsm enable
-> snmp security tsm disable
```

Release History

Release 8.6R1; command was introduced.

Related Commands

snmp tsm-map	Displays the current SNMP security status.

MIB Objects

```
SNMPAgtConfig
   snmpAgtTsmAdminState
```

snmp tsm-map

Allows to map a remote identity or certificate to a user in TSM mode.

snmp tsm-map remote-identity *remote_string* **user** *user_string*

Syntax Definitions

remote_string	File name of remote certificate to be mapped with the user. This string must be between 1 and 128 characters.
user_string	The user name. This string must be between 1 and 32 characters.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The remote identity mapping for user can be done only in TSM mode.
- The remote identity mapping can be done for only one user at a time. It cannot be mapped to multiple users. Mapping it to a different user will replace the existing user.
- If the content of remote certificate is changed, the updated certificate must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.

Examples

```
-> snmp tsm-map remote-identity manager.crt user joe
-> snmp security tsm disable
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show snmp tsm-map	Displays the current SNMP TSM remote identity mapping for a user.

MIB Objects

```
alaSnmpTsmUserTable
   alaSnmpTsmUserRemoteIdentity
   alaSnmpTsmUserName
```

show snmp tsm-map

Displays the current SNMP TSM remote identity mapping for a user.

show snmp tsm-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter the specific file name of the remote certificate to view the mapping related to it.

Examples

```
-> show snmp tsm-map
Remote Identity                    User
-----------------------------------+------------------------------
manager.crt                          adam

-> show snmp tsm-map manager.pem
Remote Identity                    User
-----------------------------------+------------------------------
manager.pem                        joecool
```

output definitions

Remote Identity	Displays the file name of the remote certificate mapped to the user.
User	Displays the user name mapped to the remote identity.

Release History

Release 8.6R1; command was introduced.

Related Commands

snmp tsm-map	Allows to map a remote identity or certificate to a user in TSM mode.

MIB Objects

N/A

show snmp security

Displays the current SNMP security status.

show snmp security [tsm]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Refer to the command on page 65-16 for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.
- Use the optional parameter **tsm** along with the command to display the configured SNMP TSM status.

Examples

```
-> show snmp security
snmp security = no security

-> show snmp security
snmp security = authentication set

-> show snmp security
snmp security = authentication all

-> show snmp security
snmp security = privacy set

-> show snmp security
snmp security = privacy all

-> show snmp security
snmp security = trap only

-> show snmp security tsm
snmp security tsm = disable
```

output definitions

snmp security	Displays the configured SNMP security level.
snmp security tsm	Displays the configured SNMP TLS encryption status.

Release History

Release 7.1.1; command was introduced.
Release 8.6R1; **tsm** parameter added.

Related Commands

snmp security	Configures the SNMP security settings.
snmp security tsm	Enables or disables TLS encryption for SNMP access.

MIB Objects

```

output definitions

From RFCxxxx	Displays the RFC number that defines the SNMP MIB objects listed.
MIB Objects	Name of the MIB object listed as an SNMP statistic.
= (integer)	The number of times the MIB object has been reported to the SNMP management station since the last reset.

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp security	Configures the SNMP security settings.

MIB Objects

```
N/A
```

show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

show snmp mib-family [*table_name***]**

Syntax Definitions

table_name	The name of the MIB table to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

Examples

```
-> show snmp mib-family trapStationTable
MIP ID   MIB TABLE NAME                          FAMILY
-------+---------------------------------------+--------------------
 73733   trapStationTable                        snmp
```

output definitions

MIP ID	Identification number for the MIP associated with this MIB Table.
MIB Table Name	Name of the MIB table.
Family	Command family to which this MIB table belongs.

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap filter-ip	Displays the SNMP trap filter information.

MIB Objects

N/A

snmp-trap absorption

Enables or disables the trap absorption function.

snmp-trap absorption {enable | disable}

Syntax Definitions

enable	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
disable	Disables SNMP trap absorption.

Defaults

By default, trap absorption is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To view the current trap absorption status, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

MIB Objects

```
trapFilterTable
   trapAbsorption
```

snmp-trap to-webview

Enables the forwarding of traps to WebView.

snmp-trap to-webview {enable | disable}

Syntax Definitions

enable	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
disable	Disables WebView forwarding.

Defaults

By default, WebView forwarding is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To view the current WebView forwarding status, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

MIB Objects

```
trapFilterTable
   trapToWebView
```

snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

snmp-trap replay-ip {*ip_address* | *ipv6_address* | *domain_name***} [***seq_id***]**

Syntax Definitions

ip_address	The IP address for the SNMP station to which traps will be replayed from the switch.
ipv6_address	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
domain_name	A Fully Qualified Domain Name (FQDN) for the SNMP station to which traps will be replayed. Specify a domain name up to 255 characters in length.
seq_id	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show snmp station** command on page page 65-6 to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

Examples

```
-> snmp-trap replay-ip 172.12.2.100
-> snmp-trap replay-ip 300::1
-> snmp-trap replay-ip upam.omnivista.com
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; *domain_name* parameter option added.

Related Commands

show snmp station	Displays the current SNMP station status.
show snmp-trap replay-ip	Displays the SNMP trap replay information.

MIB Objects

```
trapStationTable
   trapStationReplay
   trapStationNextSeq
alaTrapInetStationTable
   alaTrapInetStationReplay
   alaTrapInetStationNextSeq
```

snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

snmp-trap filter-ip {*ip_address* **|** *ipv6_address* **|** *domain_name***}** *trap_id_list*

no snmp-trap filter-ip {*ip_address* | *ipv6_address* **|** *domain_name***}** *trap_id_list*

Syntax Definitions

ip_address	The IP address for the SNMP station for which trap filtering is enabled or disabled.
ipv6_address	The IPv6 address for the SNMP station for which trap filtering is enabled or disabled.
domain_name	A Fully Qualified Domain Name (FQDN) for the SNMP station for which trap filtering is enabled or disabled. Specify a domain name up to 255 characters in length.
trap_id_list	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

Defaults

By default, SNMP trap filtering is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip_address trap_id_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip_address trap_id_list*.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> snmp-trap filter-ip upam.omnivista.com 1 3 5
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
```

```
-> no snmp-trap filter-ip 300::1 1 3
-> no snmp-trap filter-ip upam.omnivista.com 1 3 5
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; *domain_name* parameter option added.

Related Commands

show snmp-trap filter-ip	Displays the current SNMP trap filter status.
show snmp-trap config	Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

MIB Objects

```
trapFilterTable
   trapFilterStatus
alaTrapInetFilterTable
   alaTrapInetFilterStatus
```

snmp authentication-trap

Enables or disables SNMP authentication failure trap forwarding.

snmp authentication-trap {enable | disable}

Syntax Definitions

enable	Enables authentication failure trap forwarding. When enabled, the standard authentication failure trap is sent each time an SNMP authentication failure is detected.
disable	Disables authentication failure trap forwarding.

Defaults

By default, authentication failure trap forwarding is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> snmp authentication-trap enable
-> snmp authentication-trap disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp authentication-trap	Displays the current authentication failure trap forwarding status.

MIB Objects

```
snmpGroup
   snmpEnableAuthenTraps
```

show snmp-trap replay-ip

Displays SNMP trap replay information.

show snmp-trap replay-ip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show snmp-trap replay-ip
ipAddress         : oldest replay number
--------------------------------------
199.199.101.200 :       1234
199.199.105.202 :        578
199.199.101.203 :       1638
199.199.101.204 :       2560
upam.omnivista.com:     1849
```

output definitions

IPAddress	IP address or Fully Qualified Domain Name (FQDN) of the SNMP station manager that replayed the trap.
Oldest Replay Number	Number of the oldest replayed trap.

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp-trap replay-ip	Replays stored traps from the switch to a specified SNMP station.

MIB Objects

```
trapStationTable
   trapStationReplay
   trapStationNextSeq
alaTrapInetStationTable
   alaTrapInetStationReplay
   alaTrapInetStationNextSeq
```

show snmp-trap filter-ip

Displays the current SNMP trap filter status.

show snmp-trap filter-ip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

Examples

```
-> show snmp-trap filter-ip
ipAddress            trapId list
------------------------------------------------------------------------------
199.199.101.200 :    0   1   2   3
199.199.101.201 :    no filter
199.199.105.202 :    0   1   2   3   4   5   6   7   8   9  10  11  12  13  14
                     15  16  17  18  19
199.199.101.203 :    20  22  30
199.199.101.204 :    no filter
upam.omnivista.com : 1 3 5
```

output definitions

IPAddress	IP address or Fully Qualified Domain Name (FQDN) of the SNMP management station that recorded the traps.
TrapId List	Identification number for the traps being filtered.

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp-trap filter-ip	Enables or disables SNMP trap filtering.
show snmp-trap config	Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

MIB Objects

```
trapFilterTable
   trapFilterEntry
alaTrapInetFilterTable
   alaTrapInetFilterStatus
```

show snmp authentication-trap

Displays the current authentication failure trap forwarding status (i.e., enable or disable).

show snmp authentication-trap

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Examples

```
-> show snmp authentication-trap
snmp authentication trap = disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp authentication-trap	Enables or disables SNMP authentication failure trap forwarding.

MIB Objects

```
sessionAuthenticationTrap
```

show snmp-trap config

Displays SNMP trap information. Information includes trap ID numbers, trap names, command families, and absorption rate. This command also displays the Enabled/Disabled status of SNMP absorption and the Traps to WebView service.

show snmp-trap config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show snmp-trap config
Absorption service : enabled
Traps to WebView : enabled
Id trapName                           family          absorption
--+-----------------------------------+---------------+------------
 0 coldStart                          chassis         15 seconds
 1 warmStart                          chassis         15 seconds
 2 linkDown                           interface       15 seconds
 3 linkUp                             interface       15 seconds
 4 authenticationFailure              snmp            15 seconds
 5 entConfigChange                    module          15 seconds
30 slPesudoCAMStatusTrap              bridge          15 seconds
31 slbTrapException                   loadbalancing   15 seconds
32 slbTrapConfigChanged               loadbalancing   15 seconds
33 slbTrapOperStatus                  loadbalancing   15 seconds
34 ifMauJabberTrap                    interface       15 seconds
35 sessionAuthenticationTrap          session         15 seconds
-------------------------------------------------------------------
```

output definitions

Id	Identification number for the trap.
Trap Name	Name of the trap.
Family	Family to which the trap belongs.
Absorption	Time needed for the trap to process.

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp mib-family	Displays SNMP MIB information.
snmp-trap absorption	Enables or disables the trap absorption function.
snmp-trap to-webview	Enables or disables the forwarding of SNMP traps to WebView.

MIB Objects

```
trapConfigTable
   trapConfigEntry
```

event-action

Triggers the specified script to run when the specified event occurs.

event-action {trap *trigger_string* **script** *script_string* | **script-time-limit** *num***}**

no event-action trap *name*

Syntax Definitions

trigger_string	The name of the trigger. In the case of a trap, this is the trap name.
script_string	The path and the name of the script to run.
num	The maximum amount of time a script can run (30-600).
name	The name of the trap to remove the event from.

Defaults

parameter	default
script-time-limit	60 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If the prefix for the script is not **/flash/python**, the path will be assumed to be under that directory.
- Each event can only be assigned a single script but a script can be assigned to multiple events.
- Only users that have write privileges for the AAA partition management family can create scripts in the **/flash/python** directory.
- The **show snmp-trap config** command can be used to view the list of traps available on the switch.

Examples

```
-> event-action trap linkDown script /flash/python/link_event.py
-> event-action trap stpNewRoot script stp_event.py
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show event-action	Shows the scripts and statistics associated with the events.

MIB Objects

```
alaEventActionTable
   alaEventActionType
   alaEventActionName
   alaEventActionScriptName
   alaEventActionRowStatus
```

show event-action

Displays the scripts and statistics associated with the events.

show event-action [statistics | trap *name* **[statistics]]**

Syntax Definitions

name	The name of the trap to display statistics for.
statistics	Displays the statistics for all configured events or a specific trap.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

In the case of a virtual-chassis, the event-script can be run independently on the Master or Slave chassis. The Master and slave chassis have separate launch counters and the script launch counter will not be synchronized across chassis.

Examples

```
-> show event-action

 type              name                   script  (/flash/python/…)
------+ ---------------------------------+-----------------------------
trap    linkDown                          link_event.py
trap    stpNewRoot                        stp_event.py
trap    sessionAuthenticationTrap         catchAll.py

-> show event-action statistics
                                                    Script             Launch
 Type                    Name                       Last Launched      Count
------+---------------------------------------+--------------------+----------
trap   linkDown                                 2014-10-23 13:45:34      2
```

output definitions

Type	The type of event trigger.
Name	The name of the event. In the case of a trap, this is the trap name.
Script	The name and location of the script associated with the event.
Script Last Launched	The date and time the script was last run.
Launch Count	The number of times the script has been launched by the event.

Release History

Release 7.3.4; command was introduced.

Related Commands

event-action	This command will cause the specified script to be run when the specified event occurs.

MIB Objects

```
alaEventActionTable
   alaEventActionType
   alaEventActionName
   alaEventActionScriptName
```

66 OmniVista Cirrus Commands

OmniVista Cirrus is a network management solution to deliver zero touch provisioning using cloud.

OmniVista Cirrus solution provides reduced costs, ease of devices provisioning and a unified wired/ wireless management from the cloud. The solution also provides an ability to identify each device uniquely and provide a freemium/premium solution based on the user policy.

Deployment of OmniVista Cirrus provides easy to use management and monitoring tools in a network and the ability to manage the network using devices ranging from workstations to smart phones.

MIB information for the OmniVista Cirrus commands is as follows:

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

A summary of the available commands is listed here.

cloud-agent admin-state

Enables or disables OmniVista Cirrus functionality globally for the switch.

cloud-agent admin-state {enable | disable | disable force | restart}

Syntax Definitions

enable	Enables OmniVista Cirrus for the switch.
disable	Disables OmniVista Cirrus for the switch.
disable force	Disables OmniVista Cirrus for the switch and disconnects from the VPN.
restart	Restart option implicitly triggers "**disable force**" followed by "**enabled**".

Defaults

By default, OmniVista Cirrus is globally enabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- OmniVista Cirrus is globally enabled for the switch only when the switch boots up without a configuration file [*(vc)boot.cfg*] or the configuration file size is zero bytes.
- If the switch boots up with a configuration file, the feature is enabled only if the administrative state of OmniVista Cirrus is explicitly enabled using the **cloud-agent admin-state** command. Hence, the default value is disabled in this case.
- The switch must have access to the DHCP server in the customer network with zero configurations on the devices.
- If the OmniVista Cirrus administrative state is disabled at run-time, it will take effect only after a reboot.
- If the OmniVista Cirrus administrative state is enabled at run-time, it will immediately trigger call-home with the activation server, if a connection was not established prior to that.
- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or established, it will not have any consequences on the switch. If **write memory** is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call-home will be terminated.
- The restart option implicitly triggers the administrative states of **disable force** followed by **enabled**. This will enable a user to restart call-home from OmniVista Cirrus.
- If the switch is in an intermediate state (downloading an image from image server, pre-provisioning, write memory, flash syncro, call-home, etc.), the **cloud agent admin state disable force** will display an error message: "*OV Cloud agent is in progress. Please retry after some time.*"

Examples

```
-> cloud-agent admin-state enable
-> cloud-agent admin-state disable
```

Release History

Release 8.4.1 R03; command introduced.
Release 8.5R1; **restart** parameter added.

Related Commands

cloud-agent discovery-interval	Configures the time interval after which the switch will call-home the activation server, in case of any fatal error.
show cloud-agent status	Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

MIB Objects

```
ovCloudAgent
   ovCloudAgentAdminState
```

cloud-agent discovery-interval

Configures the time interval after which the switch will call-home to the activation server, in case of any error.

cloud-agent discovery-interval *minutes*

Syntax Definitions

minutes	The time interval to call-home after an error. The valid range is 2-3600 minutes.

Defaults

By default, the discovery interval is set to 30 minutes.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- Call-home with the activation server will be immediately triggered when OmniVista Cirrus administrative state is enabled at run-time, if a connection was not established prior to that.
- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or in an established connection, it will not have any consequences on the switch. If **write memory** is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call home will be terminated.
- When trying to connect to the openVPN server, if the connection is not established in 90 seconds, the switch will move to an error state and will call home after the expiry of the discovery interval.

Examples

```
-> cloud-agent discovery-interval 60
-> cloud-agent discovery-interval 90
```

Release History

Release 8.4.1 R03; command introduced.

Related Commands

cloud-agent admin-state	Enables or disables OmniVista Cirrus functionality globally for the switch.
show cloud-agent status	Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

MIB Objects

```
ovCloudAgent
   ovCloudAgentDiscoveryInterval
```

cloud-agent remove-inconsistent-certificate

Removes the certificate received from the OmniVista Activation server on all units in the VC, if the certificate status is inconsistent.

cloud-agent remove-inconsistent-certificate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- When this command is issued, a waning is generated: "*This command may render the switch incapable of connecting with OV-Cloud if not used with caution. Confirm (Y/N):*"
- If accepted by pressing (Y) and the certificate status is not inconsistent, an error message is displayed: "*Certificate status is Consistent. Cannot delete certificate.*" The existing OmniVista Cirrus agent state machine will not be interrupted.

Examples

```
-> cloud-agent remove-inconsistent-certificate
```

Release History

Release 8.5R1; command introduced.

Related Commands

cloud-agent admin-state	Enables or disables OmniVista Cirrus functionality globally for the switch.
show cloud-agent status	Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

MIB Objects

```
ovCloudAgent
   ovCloudAgentRemoveInconsistentCertificate
```

show cloud-agent status

Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

show cloud-agent status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- The command **show cloud-agent status** will be valid only if call-home is enabled. Else, only the default values, if present, will be displayed.
- DHCP address, DHCP IP address mask, Gateway, Activation URL, Proxy URL, Proxy IP will be displayed based on the DHCP response parameters received.
- DNS server, DNS domain will be displayed with the current DNS configuration in the switch, if call-home is enabled.

Examples

```
-> show cloud-agent status
Admin State                    : Enabled,
Activation Server State        : completeOK,

```

show cloud-agent vpn status

Displays the OmniVista Cirrus VPN status.

show cloud-agent vpn status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> show cloud-agent vpn status
   VPN status                     : Connected,
   VPN Assigned IP                : 10.8.0.4,
   VPN DPD time (sec)             : 600
```

output definitions

VPN Status	Refers to OmniVista Cirrus VPN status. The various VPN states are: • **Connecting**—OpenVPN's initial state • **Wait**—Waiting for initial response from server • **Auth**—Authenticating with server • **Get_Config**—Downloading configuration options from server • **Assign_IP**—Assigning IP address to virtual network interface • **Add_Routes**—Adding routes to system • **Connected**—Initialization sequence completed • **Reconnecting**—A restart has occurred • **Exiting**—A graceful exit is in progress
VPN Assigned IP	Displays the VPN server assigned IP for the VPN connection towards the OmniVista Cirrus.
VPN DPD time (sec)	Displays the VPN Dead Peer Detection (DPD) time value in seconds.

Release History

Release 8.4.1 R03; command introduced.

67 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

Filename: ALCATEL-IND1-OPENFLOW-MIB.mib
Module: alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

OpenFlow Commands	**openflow back-off-max** **openflow idle-probe-timeout** **openflow logical-switch** **openflow logical-switch controller** **openflow logical-switch interfaces** **show openflow** **show openflow logical-switch**

openflow back-off-max

Configures the maximum amount of time to wait between Controller connection attempts.

openflow back-off-max *seconds*

Syntax Definitions

seconds	The back-off-max value, in seconds. The valid range is from 0 - 60.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If set to 0, setting is disabled.

Examples

```
-> openflow back-off-max 0
-> openflow back-off-max 32
-> openflow back-off-max 60
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow	Displays global OpenFlow configuration parameters.

MIB Objects

```
alaOpenflowGlobalMIBConfigObjects
   alaOpenflowGlobalBackoffMax
```

openflow idle-probe-timeout

Configures the idle probe timeout value.

openflow idle-probe-timeout *seconds*

Syntax Definitions

seconds	The idle probe timeout value, in seconds. The valid range is 1 - 60.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If set to 0, idle probing is disabled.

Examples

```
-> openflow idle-probe-timeout 0
-> openflow idle-probe-timeout 15
-> openflow idle-probe-timeout 60
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow	Displays global OpenFlow configuration parameters.

MIB Objects

```
alaOpenflowGlobalMIBConfigObjects
   alaOpenflowGlobalIdleProbeTimeout
```

openflow logical-switch

Configures an OpenFlow Logical Switch. An OpenFlow Logical Switch consists of a portion of the switch's resources that are managed by an OpenFlow Controller (or set of Controllers) via the OpenFlow Agent.

openflow logical-switch *name* **[probe-time** *num* | **failure-detect-time** *num* **| tcp-buffer-size** *num* **| dpid** *string***] [admin-state {enable | disable}] [mode {normal | api | pfc-channel}] [version {1.0 | 1.3.1}+] [learned-mac-update {enable | disable}] [vlan** *vlan_id***] [table-miss-action {drop | controller}**

no openflow logical-switch <*name*>

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
probe-time *num*	Configures probe-time for a logical switch in the pfc-channel mode which will override the existing global idle-probe-time for sending echo-requests to the OpenFlow Controller. (1-60)
failure-detect-time *num*	Configures the failure-detect-time for a logical switch in the pfc-channel mode for detecting a disconnection to the OpenFlow Controller if there was no echo reply or message from the controller. (1-60)
tcp-buffer-size *num*	Configures the TCP buffer size for socket connection to OpenFlow controllers configured for the logical-switch in the pfc-channel mode (2–32).
dpid *string*	Configures a unique 8-byte Datapath Identifier (DPID) for a logical switch in pfc-channel mode. Value must be entered in hex format only (starting with 0x) and must be less than 8-bytes.
admin-state enable	Enables the Logical Switch.
admin-state disable	Disables the Logical Switch.
normal	Configures the Logical Switch to run in Normal Mode.
api	Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.
pfc-channel	Configures the Logical Switch for NEC pfc-channel mode.
1.0	Configures the Logical Switch to run OpenFlow Version 1.0.
1.3.1	Configures the Logical Switch to run OpenFlow Version 1.3.1.
learned-mac-update enable	Enables the forwarding of new source learned MAC addresses to a WLAN controller.
learned-mac-update disable	Disables the forwarding of new source learned MAC address to a WLAN controller.
vlan_id	The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093.
drop | controller	Configures whether packets are dropped or sent to the Controller when an OpenFlow Table Miss occurs.

Defaults

parameter	default
probe-time *num*	5 seconds
failure-detect-time *num*	4 seconds
tcp-buffer-size *num*	2 KB
dpid *string*	Top 16-bit unique index of logical switch and bottom 48 bits of router MAC
admin-state enable | disable	enable
normal | api	normal
1.0 | 1.3.1	1.0, 1.3.1
learned-mac-update enable | disable	disable
drop | controller	drop

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Up to three (3) OpenFlow Logical Switches can be configured on an OmniSwitch.
- Use the **no** form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.
- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- “vlan” is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.
- OpenFlow version 1.0 and 1.3.1 use TCP port 6633.
- Enabling learned MAC update only applies if the configured mode for the Logical Switch is API.

Examples

```
-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> openflow logical-switch vswitchnec mode pfc-channel
-> no openflow logical-switch vswitch1
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow logical-switch	Displays information about all of the configured OpenFlow Logical Switches.

   alaOpenflowLogicalSwitchDPID
   alaOpenflowLogicalSwitchTableMissAction
   alaOpenflowLogicalSwitchTCPBufferSizeTx
   alaOpenflowLogicalSwitchTCPBufferSizeRx
```

openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

openflow logical-switch *name* **controller {***ip_address* **|** *domain_name***} [***:port***] [priority** *num***] admin-state {enable | disable}**

no openflow logical-switch *name* **controller {***ip_address* **|** *domain_name***} [***:port***]**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
ip_address	The IP address of Controller.
domain_name	The Fully Qualified Domain Name (FQDN) of the Controller. Specify a domain name up to 255 characters in length.
port	The Controller IP Port (1 - 65535).
priority *num*	Configures the priority value for the specified Controller in pfc-channel mode (0-2). 0 = highest, 2 = lowest.
enable	Enables the connection to the Controller.
disable	Disables the connection to the Controller.

Defaults

parameter	default
port	6633
priority *num*	2
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a Controller for a Logical Switch.
- Specify either the IPv4 address or the FQDN for the Controller. When an FQDN is specified, the switch will resolve the IP address for that domain.
- If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc., continues unaffected while the Controllers are disconnected.
- Use the priority parameter to configure the priority for the specified Controller. If Controllers have the same priority, the one configured first will have priority.

Examples

```
-> openflow logical-switch vswitch1 controller 1.2.3.4
```

```
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 admin-state disable
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 priority 1
-> openflow logical-switch vswitchnec controller opendaylight.abc.com
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635 disable
-> openflow logical-switch vswitchnec controller opendaylight.abc.com priority 1
-> no openflow logical-switch vswitch1 controller 1.2.3.4
-> no openflow logical-switch vswitchnec controller opendaylight.abc.com
```

Release History

Release 7.3.4; command introduced.
Release 8.5R1; *domain_name* parameter option added.

Related Commands

show openflow logical-switch	Displays information about all of the configured OpenFlow Logical Switches.

MIB Objects

```
alaOpenflowControllerTable
   alaOpenflowControllerLogicalSwitch
   alaOpenflowControllerIpType
   alaOpenflowControllerIp
   alaOpenflowControllerPort
   alaOpenflowControllerAdminState
   alaOpenflowControllerPriority
```

openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

openflow logical-switch *name* **interfaces {port** *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***] | [type {trunk | access}] | [native-vlan** *vlan***] | [vlan-tag** *vlan***[**-*vlan2***]]}**

no openflow logical-switch *name* **interfaces {port** *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number.
*agg_id***[**-*agg_id2***]**	The link aggregate ID number.
trunk	Configures the interface type as trunk.
access	Configures the interface type as access.
native-vlan *vlan*	The default VLAN for an interface in the logical switch. Traffic on this port will be untagged for the native VLAN. Traffic on all other VLANs on this port will be tagged. (2-4093)
vlan-tag *vlan*[-vlan2]	The list of allowed tagged VLANs for an interface. Traffic on these allowed VLAN(s) of the ports and Untagged traffic will not carry an 802.1q tag. Traffic on all other VLANs on the port will be dropped. (2-4093)

Defaults

parameter	default
type	**access**

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The **native-vlan** and **vlan-tag** parameters are valid only if the logical switch mode is pfc-channel.

Examples

```
-> openflow logical-switch vswitch1 interfaces port 1/1/1
-> no openflow logical-switch vswitch1 interfaces port 1/1/1
-> openflow logical-switch vswitch2 interfaces linkagg 5
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> openflow logical-switch vswitchnec interfaces port 1/1/20 type trunk
-> openflow logical-switch vswitchnec interfaces port 1/1/20 native-vlan 3
-> openflow logical-switch vswitchnec interfaces port 1/1/20 vlan-tag 4-5
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow logical-switch Displays information about all of the configured Logical Switches.

MIB Objects

```
alaOpenflowInterfaceTable
   alaOpenflowInterfaceLogicalSwitch
   alaOpenflowInterface
```

show openflow

Displays global OpenFlow configuration parameters.

show openflow

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show openflow
Back-off Max       : 60,
Idle Probe Timeout : 15
```

output definitions

Back-off Max	The configured maximum back off time, in seconds, for Controller connection attempts (Range = 1 - 60, Default = 60).
Idle Probe Timeout	The configured idle probe timeout value, in seconds (Range = 1– 60, Default = 15).

Release History

Release 7.3.4; command introduced

Related Commands

openflow back-off-max	Configures the maximum amount of time allowed for Controller connection attempts.
openflow idle-probe-timeout	Configures the idle probe timeout value.

MIB Objects

```
alaOpenflowGlobalBackoffMax
alaOpenflowGlobalIdleProbeTimeout
```

show openflow logical-switch

Displays information about configured OpenFlow Logical Switches.

show openflow logical-switch [*name* **| controllers | interfaces [vlans | port | linkagg] | details]**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
controllers	The controllers assigned to this logical switch.
interfaces	The interfaces assigned to this logical switch.
details	The details of the logical switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Enter a Logical Switch name to display only information about a specific Logical Switch.
- The DPID, TCP-Buffer-Size, Probe-Time, and Failure-Detect-Time are only applicable for a logical switch in PFC mode.

Examples

```
-> show openflow logical-switch
                     Admin                                Learn
   Logical Switch    State  Mode    Versions    VLAN   MAC   Ctrlrs   Intf   Flows
--------------------+-----+------+-----------+------+-----+--------+------+-------
vswitch1             Ena   Norm   1.0             1  Dis         1      4       0
vswitch2             Dis   Norm   1.0, 1.3.1      5  Dis         3      4       2
vswitchnec           Ena   PFC    1.0, 1.3.1    N/A  Dis         1      0       0
```

output definitions

Logical Switch	The Logical Switch name
Admin State	The Logical Switch administrative state (Enabled or Disabled).
Mode	The Logical Switch operational Mode (Normal/API/PFC).
Versions	The OpenFlow versions enabled on the Logical Switch (1.0/1.3.1).
VLAN	The default VLAN for all ports assigned to the Logical Switch. Zero (0) indicates no VLAN configured.
Learn MAC	Whether new source learned MAC addresses are forwarded to a WLAN controller (Enabled or Disabled).

output definitions

Ctrlrs	The number of Controllers configured for the Logical Switch (up to three (3) Controllers can be configured per Logical Switch.
Intf	The number of interfaces (ports and link aggregations) configured for the Logical Switch.
Flows	The number of flows pushed to the Logical Switch by its Controllers.

```
-> show openflow logical-switch controllers
                                                                  Admin    Oper
        Logical Switch                Controller          Role    State    State
------------------------------+----------------------+----------+-----+---------
vswitch1                        192.168.2.9:6633        Master     Ena   Disconn
vswitch2                        192.168.2.9:6633        Master     Ena   Disabled
vswitch2                        192.168.2.10:6633       Equal      Dis   Disabled
vswitch2                        192.168.2.10:6634       Equal      Ena   Active
vswitch2                        192.168.2.9:6634        Slave      Ena   Idle
vswitchnec                      opendaylight.abc.com:66 Master     Ena   Active
```

output definitions

Logical Switch	The Logical Switch name
Controller	The Controller IP address or Fully Qualified Domain Name (FQDN) and port. If the FQDN is longer than 22 characters, the name may appear truncated in this field.
Role	Current role of the Controller (Equal, Master, or Slave).
Admin State	The Logical Switch administrative state (Enabled or Disabled).
Oper State	Current connection state of the Controller (invalid, operDisabled, sendError, init, connecting, backoff, exchangingHello, active, idle, disconnected).

```
-> show openflow logical-switch interfaces
        Logical Switch             Interface     Mode    Type
------------------------------+---------------+-------+--------
vswitch1                        1/1/1         Norm
vswitch2                        1/1/2         Norm
vswitch2                        1/1/3         Norm
vswitch2                        1/1/5         Norm
vswitch2                        1/1/10        Norm
vswitchnec                      1/1/5         PFC     Access
vswitchnec                      0/5           PFC     Access
```

output definitions

Logical Switch	The Logical Switch name
Interface	The interface slot/port or link aggregate ID configured for the Logical Switch.
Mode	The Logical Switch operational Mode (Normal/API/PFC).
Type	The type of interface assigned to the logical switch (Access or Trunk). • Access interfaces support only untagged ports in the native VLAN. • Trunk interfaces support untagged ports in the native VLAN and tagged ports in other VLANs.

```
-> show openflow logical-switch vswitchnec details
Logical-Switch:    vswitchnec
  DPID                = 0x1234567890123456
  TCP-Buffer-Size     = 2 Kilobytes
  Probe-Time          = 5 Sec
  Failure-Detect-Time = 4 Sec
  Table-Miss-Action   = DROP
```

output definitions

Logical Switch	The Logical Switch name
DPID	The DPID configured for the logical switch.
TCP-Buffer-Size	TCP Send Buffer size for socket towards Controller for the logical switch.
Probe-Time	The probe-time configured for the logical switch name.
Failure-Detect-Time	The failure-detect-time configured for the logical switch.
Table-Miss-Action	The action taken when an OpenFlow Table Miss occurs (DROP or CONTROLLER).

Release History

Release 7.3.4; command introduced

Related Commands

68 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

Filename: ALCATEL-IND1-SYSTEM.mib
Module: alcatelIND1SystemMIB

A summary of the available commands is listed here.

ip domain-lookup

Enables or disables the DNS resolver.

ip domain-lookup

no ip domain-lookup

Syntax Definitions

N/A

Defaults

By default, the DNS resolver is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

Examples

```
-> ip domain-lookup
-> no ip domain-lookup
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip name-server	Specifies the IP addresses of up to three servers to query on a host lookup.
ipv6 name-server	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

ip name-server *server_address1* **[***server_address2* **[***server_address3***]]**

Syntax Definitions

server_address1	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
server_address2	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
server_address3	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1
-> ip name-server 10.255.11.66
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS
   systemDNSNsAddr1
   systemDNSNsAddr2
   systemDNSNsAddr3
```

ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

ipv6 name-server *server_ipv6_address1* **[***server_ipv6_address2* **[***server_ipv6_address3***]]**

Syntax Definitions

server_ipv6_address1	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
server_ipv6_address2	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
server_ipv6_address3	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS
   systemDNSNsIPv6Addr1
   systemDNSNsIPv6Addr2
   systemDNSNsIPv6Addr3
```

ip domain-name

Sets or deletes the default domain name for DNS lookups.

ip domain-name *name*

no ip domain-name

Syntax Definitions

name	The default domain name for host lookups.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the default domain name.
- Use this command to set the default domain name for DNS lookups.

Examples

```
-> ip domain-name company.com
-> no ip domain-name
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.

show dns

Displays the current DNS resolver configuration and status.

show dns

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show dns
Resolver is       : enabled
domainName        : company.com
IPv4 nameServer(s): 189.202.191.14
                  : 189.202.191.15
                  : 188.255.19.1
IPv6 nameServer(s): fe2d::2c
                  : f302::3de1:1
                  : f1bc::202:fd40:f3
```

output definitions

Resolver is	Indicates whether the DNS resolver is enabled or disabled.
domainName	Indicates the default domain name assigned to the DNS lookups. This value is set using the **ip domain-name** command.
IPv4 nameServer(s)	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the **ip name-server** command.
IPv6 nameServer(s)	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the **ipv6 name-server** command.

Release History

Release 7.1.1; command was introduced.

A Software License and Copyright Statements

This appendix contains ALE USA, Inc. and third-party software vendor license and copyright statements.

ALE USA, Inc. License Agreement

ALE USA, INC. SOFTWARE LICENSE AGREEMENT

IMPORTANT. Please read the terms and conditions of this license agreement carefully before opening this package.

By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.

1. **License Grant.** This is a license, not a sales agreement, between you (the "Licensee") and ALE USA, Inc. ALE USA, Inc. hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the "Licensed Files") and the accompanying user documentation (collectively the "Licensed Materials"), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee's system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that ALE USA, Inc. products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **ALE USA, Inc.'s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of ALE USA, Inc. and its licensors (herein "its licensors"), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with ALE USA, Inc. and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** ALE USA, Inc. considers the Licensed Files to contain valuable trade secrets of ALE USA, Inc., the unauthorized disclosure of which could cause irreparable harm to ALE USA, Inc.. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold ALE USA, Inc. harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation ALE USA, Inc.'s reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** ALE USA, Inc. warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. ALE USA, Inc. further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to ALE USA, Inc. for either replacement or, if so elected by ALE USA, Inc., refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALE USA, INC. AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** ALE USA, Inc.'s cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to ALE USA, Inc. for the Licensed Materials. IN NO EVENT SHALL ALE USA, INC. BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALE USA, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between ALE USA, Inc. and Licensee, if any, ALE USA, Inc. is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and ALE USA, Inc. has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to ALE USA, Inc. and certifying to ALE USA, Inc. in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. ALE USA, Inc. may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by

ALE USA, Inc., Licensee agrees to return to ALE USA, Inc. or destroy the Licensed Materials and all copies and portions thereof.

10. **Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

11. **Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

12. **No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

13. **Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with ALE USA, Inc.'s reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

14.**Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to ALE USA, Inc. by certain third party licensors. Some third party licensors are third part beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "Third Party Licenses and Notices" on page -4 for the third party license and notice terms.

Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: **/flash/foss**.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used in this release at the following URL: https://github.com/Alcatel-LucentEnterpriseData.
