About This Guide

This *OmniSwitch AOS Release 8 CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch.

Supported Platforms

The information in this guide applies only to the following products:

- OmniSwitch 6465 Series
- OmniSwitch 6560 Series
- OmniSwitch 6860 Series
- OmniSwitch 6865 Series
- OmniSwitch 6900 Series
- OmniSwitch 9900 Series

Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features can be found in the *OmniSwitch AOS Release 8 Switch Management Guide, OmniSwitch AOS Release 8 Network Configuration Guide, OmniSwitch AOS Release 8 Advanced Routing Configuration Guide,* and *OmniSwitch AOS Release 8 Data Center Switching Guide.* Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

bold text	Indicates basic command and keyword syntax. Example: **show snmp station**
italicized text	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: **no snmp station** *ip_address* Italicized text that is not enclosed with straight brackets (**[ ]**) indicates required information.
[ ] (Straight Brackets)	Indicates optional parameters for a given command. Example: **show aaa server [***server_name***]** Here, you can enter either of the following options: **show aaa server** **show aaa server** *server_name* (where *server_name* is the user-specified server name, e.g., **show aaa server myserver1**) Note that this example includes *italicized text*. The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: **port mirroring {enable | disable}** Here, you must choose one of the following: **port mirroring enable** or **port mirroring disable**
| (Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string **show health threshold [rx | txrx | memory | cpu]** separates the choices **rx**, **txrx**, **memory,** and **cpu**. Examples: **show health threshold rx** **show health threshold txrx** **show health threshold memory** **show health threshold cpu**
“ ” (Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: **vlan 2 “new test vlan”**

Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process.The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

Stage 1: Using the Switch for the First Time

Pertinent Documentation: *OmniSwitch Hardware Users Guide*
Release Notes

This guide provides all the information you need to get your switch up and running the first time. It provides information on unpacking the switch, rack mounting the switch, installing NI modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

Stage 2: Gaining Familiarity with Basic Switch Functions

Pertinent Documentation: *OmniSwitch Hardware Users Guide*
OmniSwitch AOS Release 8 Switch Management Guide

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the *OmniSwitch Hardware Users Guide*. This guide provide specifications, illustrations, and descriptions of all hardware components, such as chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

The *OmniSwitch AOS Release 8 Switch Management Guide* is the primary users guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

Stage 3: Integrating the Switch Into a Network

Pertinent Documentation: *OmniSwitch AOS Release 8 Network Configuration Guide*
OmniSwitch AOS Release 8 Advanced Routing Configuration Guide
OmniSwitch AOS Release 8 Data Center Switching Guide

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *OmniSwitch AOS Release 8 Network Configuration Guide* contains overview information, procedures, and examples on how standard networking technologies are configured on the OmniSwitch.

The *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies (OSPF and BGP) and multicast routing protocols (DVMRP and PIM-SM).

The *OmniSwitch AOS Release 8 Data Center Switching Guide* includes configuration information for data center networks using virtualization technologies, such as Data Center Bridging (DCB) protocols, Virtual eXtensible LAN (VxLAN), and Fibre Channel over Ethernet (FCoE) network convergence.

Anytime

The *OmniSwitch AOS Release 8 CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

Related Documentation

The following are the titles and descriptions of all the related OmniSwitch user manuals:

- *OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900 Hardware Users Guides*

  Describes the hardware and software procedures for getting an OmniSwitch up and running as well as complete technical specifications and procedures for all OmniSwitch chassis, power supplies, fans, and Network Interface (NI) modules.

- *OmniSwitch AOS Release 8 CLI Reference Guide*

  Complete reference to all CLI commands supported on the OmniSwitch. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- *OmniSwitch AOS Release 8 Switch Management Guide*

  Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- *OmniSwitch AOS Release 8 Network Configuration Guide*

  Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP and IPX), security options (authenticated VLANs), Quality of Service (QoS), link aggregation, and server load balancing.

- *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*

  Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP).

- *OmniSwitch AOS Release 8 Data Center Switching Guide*

  Includes an introduction to the OmniSwitch data center switching architecture as well as network configuration procedures and descriptive information on all the software features and protocols that support this architecture. Chapters cover Data Center Bridging (DCB) protocols, Virtual Network Profile (vNP), VxLAN, and FCoE/FC transit and gateway functionality.

- *OmniSwitch AOS Release 8 Transceivers Guide*

  Includes SFP and XFP transceiver specifications and product compatibility information.

- *OmniSwitch AOS Release 8 Specifications Guide*

  Includes Specifications table information for the features documented in the Switch Management Guide, Network Configuration Guide, Advanced Routing Guide, and Data Center Switching Guide.

- Technical Tips, Field Notices

  Includes information published by Alcatel-Lucent Enterprise's Customer Support group.

- *Release Notes*

  Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

Technical Support

An Alcatel-Lucent Enterprise service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent Enterprise product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners.

With 24-hour access to Alcatel-Lucent Enterprise's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent Enterprise's technical support, open a new case or access helpful release notes, technical bulletins, and manuals.

Access additional information on Alcatel-Lucent Enterprise's Service Programs:

1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports. This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

Filename: ALCATEL-IND1-PORT-MIB.mib
Module: alcatelIND1PortMIB

Filename: EtherLike-MIB.mib
Module: etherMIB

A summary of the available commands is listed here.

Interfaces commands	**interfaces** **interfaces speed** **interfaces crossover** **interfaces duplex** **interfaces alias** **clear interfaces** **interfaces max-frame-size** **interfaces inter-frame-gap** **interfaces flood-limit** **interfaces flood-limit action** **interfaces ingress-bandwidth** **interfaces pause** **interfaces link-trap** **interfaces ddm** **interfaces ddm-trap** **interfaces wait-to-restore** **interfaces wait-to-shutdown** **interfaces eee** **interfaces primary-port split-mode** **interfaces fec** **interfaces hybrid-mode** **interfaces loopback** **clear violation** **show interfaces** **show interfaces alias** **show interfaces status** **show interfaces capability** **show interfaces accounting** **show interfaces counters** **show interfaces counters errors** **show interfaces flood-rate** **show interfaces traffic** **show interfaces ingress-rate-limit** **show interfaces ddm** **show interfaces split-mode** **show transceivers** **show violation**
Interface violation commands	**violation recovery-maximum** **violation recovery-time** **violation recovery-trap** **show violation** **show violation-recovery-configuration** **clear violation**
Link monitoring commands	**interfaces link-monitoring admin-status** **interfaces link-monitoring time-window** **interfaces link-monitoring link-flap-threshold** **interfaces link-monitoring link-error-threshold** **interfaces clear-link-monitoring-stats** **show interfaces link-monitoring config** **show interfaces link-monitoring statistics**

Time Domain Reflectometry (TDR) commands	**interfaces tdr** **show interfaces tdr-statistics**
Link fault propagation commands	**link-fault-propagation group** **link-fault-propagation group source** **link-fault-propagation group destination** **link-fault-propagation group wait-to-shutdown** **show link-fault-propagation group**
LED beacon commands	**interfaces beacon** **show interfaces beacon**
IEEE 1588 Precision Time Protocol (PTP) commands	**interfaces ptp admin-state** **interfaces port ptp p2p** **show interfaces ptp config**
MAC Security commands	**interfaces macsec admin-state** **show interfaces macsec** **show interfaces macsec static** **show interfaces macsec dynamic** **show interfaces macsec statistics** **clear interfaces macsec statistics**

interfaces

Enables or disables auto negotiation or administrative status on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} {admin-state | autoneg | epp} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
admin-state enable	Enables administrative state.
admin-state disable	Disables administrative state.
autoneg enable	Enables auto negotiation.
autoneg disable	Disables auto negotiation.
epp enable	Enables Enhanced Port Performance.
epp disable	Disables Enhanced Port Performance.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If auto negotiation is disabled, auto MDIX, flow control, auto speed, and auto duplex are not accepted. See the **interfaces crossover** command on page 1-8 and the **interfaces duplex** command on page 1-10 for more information.
- When EPP is enabled the fiber port receiver performance is enhanced by increasing its sampling rate. This enhancement can help with port link connection reliability or CRC problems that may occur with direct copper cable interfaces.
- Autonegotiation cannot be disabled on 10GBase-T ports.
- The 2.5G capable ports will advertise either 2.5G or 1G when auto-negotiation is enabled depending on the port's configured speed. The default is 2.5G.
- Autonegotiation is disabled for 10G port types and optical transceivers. It is enabled for 25G, 40G, and 100G direct-attached cables.

Examples

```
-> interfaces port 1/3/1 autoneg disable
-> interfaces slot 1/3 autoneg disable
-> interfaces port 1/3/1-4 autoneg disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces speed	Configures interface speed.
interfaces crossover	Configures crossover port settings.
interfaces duplex	Enables or disables flow (pause).
show interfaces alias	Displays interface line settings.
show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgAutoNegotiation
```

interfaces speed

Configures interface line speed.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port* **[-***port2***]} speed {10 | 100 | 1000 | 2500 | 10000 | 40000 | 100000 | 2000 | 4000 | 8000 | auto | max {100 | 1000 | 4000 | 8000}}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
auto	The switch automatically sets the line speed to match the attached device (auto-sensing).
10	Sets the interface to 10 Mbps.
100	Sets the interface to 100 Mbps.
1000	Sets the interface to 1000 Mbps (1 Gigabit).
2500	Sets the interface to 2500 Mbps (2.5 Gigabits).
10000	Sets the interface to 40000 Mbps (10 Gigabits).
40000	Sets the interface to 10000 Mbps (40 Gigabits).
100000	Sets the interface to 100000 Mbps (100 Gigabits).
2000	Sets the interface to 2000 Mbps for FibreChannel.
4000	Sets the interface to 4000 Mbps for FibreChannel.
8000	Sets the interface to 8000 Mbps for FibreChannel.
max 100	Sets the maximum speed to 100 Mpbs.
max 1000	Sets the maximum speed to 1000 Mbps (1 Gigabit).
max 4000	Sets the maximum speed to 4000 Mbps for FibreChannel.
max 8000	Sets the maximum speed to 8000 Mbps for FibreChannel.

Defaults

parameter	default
auto	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The changing of a port's speed, when changing between 100M/1G and 2.5G or vice-versa, is applied in port pairs. Meaning, changing the speed of one port of a pair will cause the other port's speed to change as well. The port pairs are 17/18, 19/20, 21/22, 23/24. This does not apply when changing the speed between 100M and 1G.

Examples

```
-> interfaces slot 1/3 speed auto
-> interfaces port 1/3/1 speed 100
-> interfaces port 1/3/2-8 speed 1000
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgSpeed
```

interfaces crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} crossover {auto | mdix | mdi}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
auto	The interface automatically detects the crossover settings.
mdix	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
mdi	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

Defaults

parameter	default
auto | mdix | mdi	**auto**

Platforms Supported

Not supported in this release.

Usage Guidelines

- If auto negotiation is disabled, then automatic crossover is also disabled. See the **interfaces** command for more information.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.

Examples

```
-> interfaces slot 1/3 crossover mdi
-> interfaces port 1/3/1 crossover mdix
-> interfaces port 1/3/1-4 crossover auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgCrossover
```

interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} duplex {full | half | auto}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
full	Sets interface to full duplex mode.
half	Sets interface to half duplex mode.
auto	Switch automatically sets both the duplex mode settings to auto-negotiation.

Defaults

parameter	default
full | half | auto	**full**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You can only configure one slot at a time. Repeat the command to configure additional slots.
- The OmniSwitch OS6860(E)/6865/6900 do not support 10/100 half-duplex.
- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- Gigabit and 10 Gigabit fiber ports only support full duplex.

Examples

```
-> interfaces port 1/3/1 duplex auto
-> interfaces slot 1/3 duplex half
-> interfaces port 1/3/1-4 auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces	Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.
show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortAutoDuplexMode
```

interfaces alias

Configures a description (alias) for a single port.

interfaces port *chassis/slot/port* **alias** *description*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number.
description	A description for the port, which can be up to 64 characters long. Description tags with spaces must be enclosed within quotes (e.g., “IP Phone”).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You can only configure one port at time. You cannot configure an alias for multiple ports.
- To remove an alias use a description consisting of two quotes without any spaces (e.g., "").

Examples

```
-> interfaces port 1/3/1 alias "switch port"
-> interfaces port 1/2/2 alias "IP Phone"
-> interfaces port 1/3/1 alias ""
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces alias	Displays port status (up or down) and any aliases for a port.

MIB Objects

```
ifXTable
   ifAlias
```

clear interfaces

Resets all Layer 2 statistics counters or Time Domain Reflectometry (TDR) statistics counters.

clear interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***] {l2-statistics [cli] | tdr-statistics}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
cli	Clears the CLI statistics only.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- TDR is supported only on the OmniSwitch 6860.
- There is no global clear statistics command for TDR. The highest level granularity supported for clearing statistics is per *chassis/slot*.

Examples

```
-> clear interfaces port 1/1/20 l2-statistics
-> clear interfaces port 1/1/30 l2-statistics cli
-> clear interfaces port 1/1/40 tdr-statistics
```

Release History

Release 7.1.1; command introduced.
Release 8.1.1; **tdr-statistics** parameter added.

Related Commands

show interfaces counters	Displays general interface information, including when statistics were last cleared.
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
alcetherStatsTable
   alcetherClearStats
esmTdrPortTable
   esmTdrPortClearResults
```

interfaces max-frame-size

Configures the maximum frame size for Gigabit Ethernet interfaces.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]} max-frame-size** *bytes*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
bytes	Maximum frame size, in bytes. Valid range is 1518–9216.

Defaults

parameter	default
bytes (Gigabit Ethernet Packets)	9216
bytes (Ethernet Packets)	1553

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> interfaces port 1/3/1 max-frame-size 1518
-> interfaces slot 1/3 max-frame-size 1518
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgMaxFrameSize
```

interfaces inter-frame-gap

Configures the inter-frame gap.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2*]} **inter-frame-gap** *bytes*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2*]	The port number. Use a hyphen to specify a range of ports.
bytes	Number of bytes for the inter-frame gap. Valid range is 8-31 bytes.

Defaults

parameter	default
bytes	12

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> interfaces port 1/1/1 inter-frame-gap 15
```

Release History

Release 8.4.1.R01; command was introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

N/A

interfaces flood-limit

Configures the flood rate settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} flood-limit {bcast | mcast | uucast | all} rate {pps** *pps_num*| **mbps** *mbps_num* **| cap%** *cap_num* **| enable | disable | default} [low-threshold** *low_num***]**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
bcast	Specifies broadcast flood limit.
mcast	Specifies multicast flood limit.
uucast	Specifies unicast flood limit.
all	Specifies flood limit for all types of traffic.
pps_num	Packets per second.
mbps_num	Megabits per second.
cap_num	Percentage of port's capacity.
enable	Enables flood rate limits.
disable	Disables flood rate limits.
default	Sets default flood rate limits
low_num	Specifies the low threshold value, which must be lower than the high threshold value set for the *pps_num*, *mbps_num*, or *cap_num* value.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The packets-per-second (**pps**) setting is based on a 512 byte frame size. When configuring the threshold value as a percentage (**cap%**) or in megabits-per-second (**mbps**), only approximate limits can be achieved because values are always estimated based on the packet-per-second size (512 bytes).
- The **low-threshold** parameter is set to help with the auto-recovery of a port that was shutdown because of a STORM violated state. The shutdown action is configured through the **interfaces flood-limit action** command.

Examples

```
-> interfaces slot 1/2 flood-limit all rate cap% 50
-> interfaces slot 1/3 flood-limit bcast rate mbps 100
-> interfaces port 1/1/1 flood-limit bcast rate mbps 60 low-threshold 40
-> interfaces port 1/1/5 flood-limit mcast rate pps 2000 low-threshold 1000
```

Release History

Release 7.1.1; command introduced.
Release 8.2.1; **default** and **low-threshold** parameters added.

Related Commands

show interfaces flood-rate	Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
   esmPortCfgFlow
dot3PauseTable
   dot3PauseAdminMode
```

interfaces flood-limit action

Configures the action on a single port, a range of ports, when the port reaches the storm violated state.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} flood-limit {bcast | mcast | uucast | all} action {shutdown | trap | default}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to configure.
port	Port number of the interface to configure.
port2	Last port number in a range of ports to configure.
bcast	Broadcast flood limit.
mcast	Multicast flood limit.
uucast	Unicast flood limit.
all	Flood limit for all types of traffic.
shutdown	When the high threshold is violated, port is put into a blocked state.
trap	When the high threshold is crossed, trap is sent with the violation reason.
default	When traffic reaches the high threshold, packets above that rate will be dropped.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When high threshold is violated, and the port needs to be put in blocked state, set the action as "**shutdown**".
- Use the **low-threshold** parameter of the **interfaces flood-limit** command to assist with auto-recovery of a port that was shutdown.
- When high threshold is crossed, and a trap has to be sent with violation reason, set the action as "**trap**".
- When traffic reaches high threshold, and the packets above that rate needs to be dropped, set the action as "**default**".

Examples

```
-> interfaces port 1/1/1 flood-limit bcast action shutdown
-> interfaces port 1/1/4 flood uucast action trap
-> interfaces port 1/1/11 flood-limit all action shutdown
-> interfaces port 1/1/14 flood mcast action default
```

Release History

Release 8.2.1; command introduced.

Related Commands

interfaces flood-limit	Configures the high and low threshold values for flood rate limiting.
show interfaces flood-rate	Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
   esmPortBcastThresholdAction
   esmPortMcastThresholdAction
   esmPortUucastThresholdAction
```

interfaces ingress-bandwidth

Configures the ingress bandwidth settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} ingress-bandwidth {mbps| enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
mbps	Specifies the ingress bandwidth in mbps.
enable	Enables ingress bandwidth limiting.
disable	Disables ingress bandwidth limiting.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> interfaces slot 1/3 ingress-bandwidth enable
-> interfaces slot 1/3 ingress-bandwidth mbps 30
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces ingress-rate-limit	Displays the ingress-rate-limit set for each interface port.

MIB Objects

```
esmConfTable
   esmPortIngressRateLimitEnable
```

interfaces pause

Configures whether or not the switch will transmit and/or honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} pause {tx | rx | tx-and-rx | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
tx	Allows interface to transmit PAUSE frames to peer switches.
rx	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer.
tx-and-rx	Allows the interface to transmit and honor PAUSE frames to/from peer switches.
disable	Disables flow control on the interface.

Defaults

By default, flow control is disabled on all switch interfaces.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported. In addition, flow control is not supported across a virtual fabric link (VFL).
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings override the configured settings as long as autonegotiation and flow control are both enabled for the interface.
- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.

Examples

```
-> interfaces port 1/2/4 pause rx
-> interfaces port 1/1/11 pause tx
-> interfaces port 1/2/1 pause tx-and-rx
-> interfaces port 1/2/1-6 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces status	Displays interface line settings.

MIB Objects

```
esmConfTable
   esmPortCfgPause
```

interfaces link-trap

Enables trap link messages. If enabled, a trap is generated whenever the port changes state.

interfaces [slot *chassis/slot* | **port** *chassis/slot/port* **[**-*port2***]] link-trap {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
enable	Port link up/down traps are displayed on the NMS.
disable	Port link up/down traps are not displayed on the NMS.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> interfaces port 1/2/1 link-trap enable
-> interfaces slot 1/3 link-trap enable
-> interfaces port 1/1/1-6 link-trap enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces status	Displays interface line settings.

MIB Objects

```
esmConfigTable
   esmPortSlot
   esmPortIF
```

interfaces ddm

Configures the Digital Diagnostics Monitoring (DDM) administrative status.

interfaces ddm {enable | disable}

Syntax Definitions

enable	Enables DDM functionality.
disable	Disables DDM functionality.

Defaults

parameter	default
ddm	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm enable
-> interfaces ddm disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the interface DDM status.

MIB Objects

```
ddmConfiguration
   ddmConfig
```

interfaces ddm-trap

Configures the Digital Diagnostics Monitoring (DDM) administrative status or trap capability.

interfaces ddm-trap {enable | disable}

Syntax Definitions

enable	Enables DDM trap functionality.
disable	Disables DDM trap functionality.

Defaults

parameter	default
ddm-trap	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm-trap enable
-> interfaces ddm-trap disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the interface DDM status.

MIB Objects

```
ddmConfiguration
   ddmTrapConfig
   ddmNotificationType
```

interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} wait-to-restore** *num*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
num	The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5 seconds.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 wait-to-restore 30
-> interfaces port 1/1/1 wait-to-restore 10
-> interfaces port 1/1/1-7 wait-to-restore 250
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonWaitToRestoreTimer
```

interfaces wait-to-shutdown

Configures the wait to shutdown timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link down event is detected. Other applications are notified of the link down event only after the wait to shutdown timer has elapsed.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} wait-to-shutdown** *num*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
num	The number of milliseconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 10msec.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command can be used to reduce port flapping. If the port comes back up before the timer expires then the timer will be canceled and other applications will not be notified of the link down event.
- Set the wait-to-shutdown timer to zero to disable the timer.
- The WTS timer is not started when the switch is first booted. But administratively disabling the port will start the timer if enabled.
- The link-status of the remote port will be down when the WTS timer is running. This is due to the port being physically down and only the link-down event not being communicated to other applications.

Example

```
-> interfaces slot 1/1 wait-to-shutdown 30
-> interfaces port 1/1/1 wait-to-shutdown 10
-> interfaces port 1/1/1-7 wait-to-shutdown 250
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonWaittoShutdownTimer
```

interfaces eee

Enables or disabled Energy Efficient Ethernet.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} eee {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
enable	Enables EEE functionality.
disable	Disables EEE functionality.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- EEE is only supported on copper ports.
- Enabling EEE will start advertising EEE capability to peer ports. Disabling EEE will stop advertising EEE capability to peer ports.

Examples

```
-> interfaces port 1/1/1 eee enable
-> interfaces slot 1/1 eee disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

N/A

interfaces primary-port split-mode

Configures the mode of splitter cable capable ports.

interfaces primary-port *chassis/slot/port* **split-mode {auto | 4X25G | 4X10G | 40G | 100G}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
port	The port number.
auto	Automatically detects if a splitter cable is connected.
4x10g	Sets the port to the 4X10G splitter functionality.
4x25g	Sets the port to the 4X25G splitter functionality.
40g	Sets the port to 40G functionality.
100g	Sets the port to 100G functionality.

Defaults

parameter	default
enable | disable	**auto**

Platforms Supported

OmniSwitch 6900, 9900

Usage Guidelines

- This command is only supported on ports and platforms that support the splitter cable functionality.
- The proper cable should be used based on the port's configuration. For example, if set to 4X10G with a 40G cable connected, the port will only operate as a 10G port.

Examples

```
-> interfaces primary-port 1/1/1 split-mode 4X10G
```

Release History

Release 7.3.4; command was introduced.
Release 8.5R2; **primary-port** keyword added.

Related Commands

show interfaces split-mode	Displays the configured and operational state of the splitter cable capable ports.

MIB Objects

```
esmPortModeTable
  esmConfiguredMode
```

interfaces fec

Configures the Reed Solomon (RS-FEC) and Fire Code (FC-FEC) FEC also known as BASE-R FEC.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2*]} **fec {disable | auto | fc | rs}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2*]	The port number. Use a hyphen to specify a range of ports.
disable	Disables FEC.
auto	Automatically determines the FEC.
fc	FC-FEC is forced.
rs	RS-FEC is forced.

Defaults

parameter	default
fec	auto

Platforms Supported

OmniSwitch 9900, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- This command is only supported on modules that support FEC configuration.
- For 10G/40G the FEC will default to FC-FEC. For 25G/100G the FEC will default to RS-FEC.

Examples

```
-> interfaces port 1/1/1 fec fc
-> interfaces slot 1/2 fec auto
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

show interfaces status	Displays the configured and operational state of the ports.

MIB Objects

```
esmPortModeTable
  esmConfiguredMode
```

interfaces hybrid-mode

Configures the mode of a combo port to either fiber or copper.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2***]} hybrid-mode {fiber | copper}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
fiber	Enables the fiber combo port.
copper	Enables the copper combo port.

Defaults

parameter	default
hybrid-mode	fiber
Fiber/Copper Speed	1000Mbps/auto
Fiber/Copper Duplex	Full/auto
Fiber/Copper Autoneg	Enabled/Enabled

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Each combo port can be set to either fiber or copper but not both at the same time.
- When the mode is changed on a port the speed, duplex and auto-negotiation parameters will be set to the default for that port type (see table above). Other port settings will remain the same (i.e. admin status, flood limits, alias, etc.)

Examples

```
-> interfaces port 1/1/9 hybrid-mode copper
-> interfaces port 1/1/10 hybrid-mode fiber
```

Release History

Release 8.6R1; command introduced.

Related Commands

interfaces speed	Configures interface speed.
interfaces crossover	Configures crossover port settings.
interfaces duplex	Enables or disables flow (pause).
show interfaces status	Displays interface line settings.
show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgHybridActiveType
   esmPortCfgHybridMode
   esmPortOperationalHybridType
```

interfaces loopback

Enables or disables the loopback mode for the specified front-panel port. Enable the port loopback mode to support L3 VPN inline routing for an IP over Shortest Path Bridging (SPB) configuration.

interfaces port *chassis/slot/port***[**-*port2***] loopback**

no interfaces port *chassis/slot/port***[**-*port2***] loopback**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

By default, the port loopback mode is disabled.

Platforms Supported

OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to disable the port loopback mode.
- This command applies only to front-panel ports. A single port can provide the loopback function or the port can be assigned to a static link aggregate that is also configured to run in loopback mode.
- When the loopback mode is enabled, the port can be configured as a bridge and access port to provide the loopback functionality on the same port (no external cable required). However, other switch functionality is not supported on loopback ports.
- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide.*

Examples

```
-> interfaces port 1/1/1 loopback
-> interfaces port 1/1/2-5 loopback
-> no interfaces port 1/1/1 loopback
```

Release History

Release 8.6R2; command introduced.

Related Commands

linkagg static agg loopback	Configures a link aggregate to run in the loopback mode.
show interfaces status	Displays the interface line settings (for example, speed and mode).
show interfaces	Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

MIB Objects

```
alaPortXTable
   alaPortXLoopbackStatus
```

clear violation

Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation. This includes applying an existing application configuration.

clear violation {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
*agg_id***[**-*agg_id2***]**	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When a violation is set on a physical port that is part of a link aggregate, the violation is set for the whole link aggregate. All ports on that link aggregate are brought down. When this command is applied to a link aggregate ID, all member ports of the link aggregate are activated.
- When this command is applied, all MAC addresses known to the port are cleared from the MAC address table for the switch.

Examples

```
-> clear violation port 1/10
-> clear violation port 2/1-5
-> clear violation linkagg 5
-> clear violation linkagg 10-20
```

Release History

Release 7.1.1; command introduced.

Related Commands

show violation	Displays the address violations that occur on ports with LPS restrictions.

MIB Objects

```
portViolationTable
   portViolationClearPort
```

violation recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation recovery-maximum {infinite | *max_attempts***}**

violation [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] recovery-maximum {infinite | default |** *max_attempts***}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
infinite	Sets the recovery attempt to infinite auto recovery.
default	Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.
max_attempts	The maximum number of recovery attempts. Valid range is 0-50.

Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

parameter	default
max_attempts	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
- When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.
- When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

- The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.
- Once an interface is permanently shut down, only the **clear violation** command can be used to recover the interface.
- The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The FTW = 2 * maximum recovery number * recovery timer. For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds (2 * 4 * 5=40).

Examples

```
-> violation recovery-maximum 25
-> violation slot 1/2 recovery-maximum 10
-> violation port 1/2/3 recovery-maximum 20
-> violation port 1/2/4-9 recovery-maximum 50
-> violation port 1/2/4-9 recovery-maximum default
-> violation port 1/2/3 recovery-maximum 0
-> violation recovery-maximum infinite
-> violation recovery-maximum 0
```

Release History

Release 8.2.1; command was introduced.

Related Commands

violation recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.
show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryMaximum
```

violation recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation recovery-time *seconds*

violation [slot *chassis/slot* **| port** *chassis/slot/port***[**-*port2***]] recovery-time {***seconds* | **default}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of port.
seconds	The number of seconds after which a port is reactivated. The valid range is 30-600 seconds.
default	Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the **clear violation** command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.
- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.

- When configuring the time for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

Examples

```
-> violation recovery-time 600
-> violation slot 1/2 recovery-time 100
-> violation port 1/2/3 recovery-time 200
-> violation port 1/2/4-9 recovery-time 500
-> violation port 1/2/4-9 recovery-time default
```

Release History

Release 8.2.1; command introduced.

Related Commands

violation recovery-maximum	Configures the maximum number of recovery attempts before a port is permanently shut down.
show violation	Displays the violation and recovery status for the specified port.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryTime
```

violation recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

violation recovery-trap {enable | disable}

Syntax Definitions

enable	Enables the ports to send violation recovery traps.
disable	Disables the ports from sending violation recovery traps.

Defaults

By default, sending of a violation recovery trap is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

This is a global command that is applied to all ports on all modules.

Examples

```
-> violation recovery-trap enable
-> violation recovery-trap disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

violation recovery-time	Configures the time interval to automatically re-enable the ports that were shutdown due to a violation.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
esmViolationRecovery
   esmViolationRecoveryTrap
```

show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

show interfaces [slot *chassis/slot* | **port** *chassis/*slot/*port***[-***port2***]]**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The Link-Quality parameter and Enhanced Port Performance capabilities are only supported on the OmniSwitch 6900.
- EEE will be appended to the Autonegotiation output when EEE is enabled (EEE is supported only on the OmniSwitch 6860, 6865, 6900).

Examples

```
-> show interfaces port 1/1/2
Chassis/Slot/Port 1/1/2  :
  Operational Status     : up,
  Last Time Link Changed : Mon Jan  5 17:09:30 2019,
  Number of Status Change: 1,
  Port-Down/Violation Reason: None,
  Type                   : Ethernet,
  SFP/XFP                : GBIC_SX,
  Interface Type         : Fiber,
  EPP                    : Disabled,
  Link-Quality           : Good
  MAC address            : 00:d0:95:b2:39:85,

```

output definitions

Slot/Port	Interface slot and port.
Operational Status	Interface status: up - port is operationally up. down - port is operationally down dormant - SFP/SFP+ transceiver is inserted into a port configured for Fibre Channel or Fibre Channel transceiver in inserted into a port configured for Ethernet and the link has become active.
Last Time Link Changed	The last time the configuration for this interface was changed.
Number of Status Change	The total number of times that the configuration of this interface has changed.
Port-Down/Violation Reason	This is displayed if the port is down. If the port is down due to software reasons or violations the reason is displayed. If it is down due to physical fault, “None” is displayed. The reason displayed applies only to the physical port, for a link aggregate use the **show violation** command.
Type	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
SFP/XFP	The type of transceiver detected.
Interface Type	The type of interface for this port. (Copper, Fiber, Combo-Copper, Combo-Fiber)
EPP	Enhanced Port Performance setting.
Link-Quality	The link quality of the connection: **GOOD** - The port will connect with no problems and transfer data with no errors. **FAIR** - The port may have intermittent problems connecting and maintaining its connection to a remote port and/or intermittent CRC's could occur. **POOR** - The port will have problems connecting and maintaining a connection with remote port. If the ports connect, it’s likely CRC errors will occur. **N/A** - The port link quality is either very poor or the port type does not support the Link Quality capability.
MAC address	Interface MAC address.
WWPN	OmniSwitch 64-bit World Wide Port Name (WWPN) for each Fibre Channel port.
Bandwidth	Bandwidth (in megabits).
Duplex	Duplex mode (Half/Full/Auto).
Autonegotiation	The auto negotiation settings for this interface.

output definitions (continued)

Long Accept	Long Frames status (enable/disable).
Runt Accept	Runt Frames status (enable/disable).
Long Frame Size	Long Frame Size (in Bytes).
Runt Size	Runt Frame Size (in Bytes).
Inter Frame Gap	Inter-packet gap (in Bytes).
loopback mode	The loopback mode for the port (**N/A** or **SPB-VPN**). Ports are configured to run in the loopback mode to support L3 VPN inline routing for an IP over Shortest Path Bridging (SPB) configuration.
Bytes Received	Number of Bytes received.
Rx Unicast Frames	Number of unicast frames received.
Rx Broadcast Frames	Number of broadcast frames received.
Rx M-cast Frames	Number of multicast frames received.
Rx Undersize Frames	Number of undersized frames received.
Rx Oversize Frames	Number of oversized frames received.
Rx Lost Frames	Number of Lost Frames received.
Rx Error Frames	Number of error frames received.
Rx CRC Error Frames	Number of CRC error frames received. Only applies to frames that are less than or equal to Max/Long Frame Size. Frames larger than Long Frame Size are counted as OverSizeFrames.
Rx Alignments Err	Number of Alignments Error frames received.
Bytes Xmitted	Number of Bytes transmitted.
Tx Unicast Frames	Number of unicast frames transmitted.
Tx Broadcast Frames	Number of broadcast frames transmitted.
Tx M-cast Frames	Number of multicast frames r transmitted.
Tx Undersize Frames	Number of undersized frames transmitted.
Tx Oversize Frames	Number of oversized frames transmitted.
Tx Lost Frames	Number of Lost Frames transmitted.
Tx Collided Frames	Number of collision frames received or transmitted.
Tx Error Frames	Number of error frames transmitted.

Release History

Release 7.1.1; command introduced.
Release 8.6R2; “Port-Down Reason/Violation Reason”, “Interface Type”, and “loopback mode” output fields added.

Related Commands

show interfaces accounting	Displays interface accounting information (e.g., packets received/ transmitted).
show interfaces counters	Displays interface counter information (e.g., unicast packets received/transmitted).
show interfaces status	Displays the interface line settings (e.g., speed and mode).
show interfaces traffic	Displays interface traffic statistics (input/output bytes and packets).

show interfaces alias

Displays interface line settings (e.g., speed and mode).

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] alias**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot/port numbers are entered, line settings for all slots/ports on the switch are displayed.

Examples

```
-> show interfaces port 1/1/2 alias
Legends:WTS - Wait to shutdown
# - WTS Timer is Running & port is in wait-to-shutdown state
Chas/
Slot/    Admin     Link    WTR   WTS   Alias
Port     Status   Status   (sec) (msec)
-----+----------+---------+-----+----+---------------------------------
1/1/2   disable    down    5     #10  ""
```

output definitions

Chas/Slot/Port	Interface chassis/slot/port number.
Admin Status	The administrative status of the port.
Link Status	The link status of the port.Autonegotiation status (Enable/Disable).
WTS (msec)	The wait-to-shutdown configuration time.
WTR (sec)	The wait-to-restore configuration time.
Alias	The configured alias for the port.

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces alias	Configures the port alias.

MIB Objects

```
ifXTable
   ifAlias
```

show interfaces status

Displays interface line settings (for example, speed and mode).

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] status**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot/port numbers are entered, line settings for all slots/ports on the switch are displayed.

output definitions

Chas/Slot/Port	Interface chassis/slot/port number.
Admin Status	The administrative status of the port. Configured through the **interfaces** command.
AutoNego	Autonegotiation status (Enable/Disable). Configured through the **interfaces** command.
Detected Speed	Detected line speed in Mbps.
Detected Duplex	Detected line duplex (Half duplex/Full duplex/Auto).
Detected Pause	Detected pause control configuration.
FEC Det	The detected FEC settings (DIS, FC, RS).
Configured Speed	Configured line speed (10/100/Auto/1000/10000 Mbps). Configured through the **interfaces speed** command.
Configured Duplex	Configured line duplex (Half duplex/Full duplex/Auto). Configured through the **interfaces duplex** command.
FEC Cfg	The configured FEC settings (Disable, Auto, FC, RS).
Configured Pause	Detected pause control configuration. Configured through the **interfaces pause** command.
Link Trap	Link Trap status. Configured through the **interfaces link-trap** command.
EEE	Energy Efficient Ethernet configuration (dis/ena).

Release History

Release 7.1.1; command introduced.
Release 8.4.1.R03; **FEC Det** and **FEC Cfg** fields added.

Related Commands

interfaces	Configures interface line speed, sets speed, and duplex mode to auto-sensing.
interfaces duplex	Configures interface duplex mode.
interfaces fec	Configures the Reed Solomon (RS-FEC) and Fire Code (FC-FEC) FEC also known as BASE-R FEC.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
   esmPortAutoSpeed
   esmPortAutoDuplexMode
   esmPortCfgAutoNegotiation
   esmPortCfgSpeed
   esmPortCfgDuplexMode
   esmPortCfgPause
   esmPortLinkUpDownTrapEnable
```

show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] capability**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Displays defaults settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

Examples

```
-> show interfaces capability
                                                                          Macsec

```

output definitions

Cha/Slot/Port	The chassis/slot/port identifier.
AutoNeg	In the row labeled **CAP,** the field displays the valid auto negotiation configurations for the port. In the row label **DEF,** the field displays the default auto negotiation settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).
Pause	In the row labeled **CAP,** the field displays the valid pause configurations for the port. In the row label **DEF,** the field displays the default pause settings for the port.
Crossover	In the row labeled **CAP,** the field displays the valid cross over configurations for the port. In the row label **DEF,** the field displays the default cross over settings for the port. The possible values are **Auto**, **MDI/X/Auto** (MDI/MDIX/Auto), or **--** (not configurable and/or not applicable).
Speed	In the row labeled **CAP,** the field displays the valid line speed configurations for the port. In the row label **DEF,** the field displays the default line speed settings for the port. The possible values are **10/100**, **100**, **1G**, **10/100/1G**, **10G**, or **Auto**.
Duplex	In the row labeled **CAP,** the field displays the valid duplex configurations for the port. In the row label **DEF,** the field displays the default duplex settings for the port. The possible values are **Full**, **Full/Half**, or **Auto**.
Macsec Supported	The status of MACsec on the interface.

Release History

Release 7.1.1; command introduced.
Release 8.5 R1; **Macsec Supported** field added.

Related Commands

interfaces	Enables and disables auto negotiation.
interfaces crossover	Configures crossover port settings.
interfaces	Configures interface speed.
interfaces duplex	Configures duplex settings.
show interfaces alias	Displays interface line settings.

MIB Objects

```
esmConfTable
   esmPortCfgAutoNegotiation
   esmPortCfgFlow
   esmPortCfgCrossover
   esmPortCfgSpeed
   esmPortAutoDuplexMode
```

show interfaces accounting

Displays interface accounting information (e.g., packets received/transmitted and deferred frames received).

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] accounting**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*slot/port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If no slot/port numbers are entered, accounting information for all slots/ports on the switch is displayed.
- The OmniSwitch 9900 supports different packet size ranges than the other OmniSwitch platforms. All packets sized 1024 octets or larger are classified into the “1024 to MAX” category. As a result, this command displays a different output on the OmniSwitch 9900.

Examples

The following command example shows the fields that are displayed on all OmniSwitch platforms, except for the OmniSwitch 9900:

```
-> show interfaces accounting
1/1/39:
   Rx Undersize            =                  0, Tx Undersize    =           0,
   Rx Oversize             =                  0, Tx Oversize     =           0,
   Rx Jabber               =                  0,
   Rx/Tx 64 Octets         =          312890503,
   Rx/Tx 65 ~ 127 Octets   =           10496825,
   Rx/Tx 128 ~ 255 Octets  =             189426,
   Rx/Tx 256 ~ 511 Octets  =              39328,
   Rx/Tx 512 ~ 1023 Octets =                756,
   Rx/Tx 1024 ~ 1518 Octets =              48551,
   Rx/Tx 1519 ~ 4095 Octets =                  0,
   Rx/Tx 4096 ~ MAX Octets  =                  0
```

The following command example shows the fields that are displayed on an OmniSwitch 9900 (the “Rx/Tx 1024 - MAX Octets” field replaces the “Rx/Tx 1024 - 1518 Octets”, “Rx/Tx 1519 - 4095 Octets”, and “Rx/Tx 4096 - MAX Octets” fields that are displayed on the other platforms:

```
-> show interfaces accounting
1/4/38:
  Rx Undersize            =                  0, Tx Undersize    =            0,
  Rx Oversize             =                  0, Tx Oversize     =            0,
  Rx Jabber               =                  0,
  Rx/Tx 64 Octets         =          361616757,
  Rx/Tx 65 ~ 127 Octets   =           20510941,
  Rx/Tx 128 ~ 255 Octets  =             377413,
  Rx/Tx 256 ~ 511 Octets  =              45391,
  Rx/Tx 512 ~ 1023 Octets =               2319,
  Rx/Tx 1024 ~ MAX Octets =              63555,
```

output definitions

Rx Undersize	Number of undersized packets received.
Tx Undersize	Number of undersized packets transmitted.
Rx oversize	Number of oversized packets received.
Tx oversize	Number of oversized packets transmitted.
Rx Jabber	Number of Jabber packets received (longer than 1518 octets).
Rx/Tx Octets	Number of packets received and transmitted in each listed octet range.

Release History

Release 7.1.1; command introduced.
Release 8.3.1; display updated for OmniSwitch 9900.

Related Commands

interfaces ddm	Displays general interface information (e.g., hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (e.g., unicast packets received/transmitted).

show interfaces counters

Displays interface counters information (e.g., unicast, broadcast, and multi-cast packets received/ transmitted).

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] counters**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot/port numbers are entered, counter information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces port 1/3/1 counters
1/3/1 ,
InOctets      = 54367578586897979,  OutOctets     = 5.78E19,
InUcastPkts   = 55654265276,        OutUcastPkts  = 5.78E20,
InMcastPkts   = 58767867868768777,  OutMcastPkts  = 5465758756856,
InBcastPkts   = 576567567567567576, OutBcastPkts  = 786876,
InPauseFrames = 567798768768767,    OutPauseFrames= 786876,
```

output definitions

InOctets	Number of octets received.
OutOctets	Number of octets transmitted.
InUcastPkts	Number of unicast packets received.
OutUcastPkts	Number of unicast packets transmitted.
InMcastPkts	Number of multicast packets received.
OutMcastPkts	Number of unicast packets transmitted.
InBcastPkts	Number of broadcast packets received.
OutBcastPkts	Number of unicast packets transmitted.
InPauseFrames	Number of MAC control frames received.
OutPauseFrames	Number of MAC control frames transmitted.

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces counters errors	Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

```

show interfaces counters errors

Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] counters errors**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot/port numbers are entered, counter error information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces port 1/2/1 counters errors
1/2/1 ,
  Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
  IfInErrors        = 6435346,  IfOutErrors = 5543,
  Undersize pkts    = 867568, Oversize pkts = 5.98E8
```

output definitions

Chas/Slot/Port	Interface chassis, slot, and port number.
Alignments Errors	Number of Alignments errors.
FCS Errors	Number of Frame Check Sequence errors.
IfInErrors	Number of received error frames.
IfOutErrors	Number of transmitted error frames.
Undersize pkts	Number of undersized packets.
Oversize pkts	Number of oversized packets (more than 1518 octets).

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces counters	Displays interface counters information (e.g., unicast, broadcast, and multi-cast packets received/transmitted).

```

show interfaces flood-rate

Displays interface peak flood rate settings.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] flood-rate**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show interfaces flood-rate
 Chas/
 Slot/  Bcast    Bcast   Bcast   Ucast    Ucast   Ucast    Mcast   Mcast   Mcast
 Port   Value     Type  Status   Value     Type  Status    Value    Type  Status
-----+----------+-----+-------+----------+-----+-------+----------+-----+--------
1/1/1        496  mbps  enable        496  mbps  enable        496  mbps disable
1/1/2        496  mbps  enable        496  mbps  enable        496  mbps disable
1/1/3        496  mbps  enable        496  mbps  enable        496  mbps disable
1/1/4        496  mbps  enable        496  mbps  enable        496  mbps disable
1/1/5        496  mbps  enable        496  mbps  enable        496  mbps disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Value	The value set based on the type of flood limiting.
Type	The type of flood limiting: mbps, pps, or %
Status	Status of the type of flood-limiting: enbaled or disabled.

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces flood-limit	Configures the peak flood rate for an interface.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
   esmPortMaxFloodRate
   esmPortFloodMcastEnable
```

show interfaces traffic

Displays interface traffic statistics.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] traffic**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no slot/port numbers are entered, traffic settings for all slots/ports on the switch are displayed.

Examples

```
-> show interfaces traffic
 Ch/Slot/Port   Input packets     Input bytes      Output packets    Output bytes
------------+-----------------+-----------------+-----------------+--------------
 1/1/2               322             20624             5125            347216
 1/3/2               322             20620             5133            347764
```

output definitions

Ch/Slot/Port	Interface chassis, slot, and port numbers.
Input packets	Input packets detected.
Input bytes	Input bytes detected.
Output packets	Output packets detected.
Output bytes	Output bytes detected.

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces ddm	Displays general interface information (e.g., hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (e.g., unicast packets received/transmitted).

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
ifXTable
   ifHCInOctets
   ifHCInUcastPkts
   ifHCInMulticastPkts

   ifHCOutUcastPkts
   ifHCOutMulticastPkts
   ifHCOutBroadcastPkts
```

show interfaces ingress-rate-limit

Displays the ingress-rate-limit set for each interface port.

show interfaces [slot *chassis/slot*| **port** *chassis/slot/port***[**-*port1***]] ingress-rate-limit**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[**-*port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If the slot number is not specified, then the switch back pressure feature must be enabled or disabled on an entire chassis.

Examples

```
-> show interfaces port 1/1/1-4 ingress-rate-limit
 Chas/
 Slot/ Rate Limit Burst Size Status
 Port    (Mbps)     (MB)
------+----------+----------+-------
 1/1/1       496         19  disable
 1/1/2       496         19  disable
 1/1/3       496         19  disable
 1/1/4       496         19  disable
```

output definitions

Chas/Slot/Port	Interface chassis, slot, and port numbers.
Rate Limit (Mbps)	Rate limit in Megabits.
Burst Size (MB)	Burst size in Megabytes.
Status	Status of rate limiting.

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces duplex	Configures the ingress-rate-limit.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
```

show interfaces ddm

Displays the Digital Diagnostics Monitoring (DDM) information for the specified transceivers.

show interfaces [slot *chassis/slot*| **port** *chassis/slot/port***[**-*port1***]] ddm [w-low | w-high | status | a-low | a-high | actual]**

Syntax Definitions

chassis	The chassis identifier.
slot	Display all the transceivers on the specified slot.
*port***[**-*port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.
w-low	Display the transceivers Warning Low value.
w-high	Display the transceivers Warning High value.
status	Display the administrative status of DDM.
a-low	Display the transceivers Alarm Low value.
a-high	Display the transceivers Alarm High value.
actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If the threshold values of the transceiver are ‘0’ then NS (Not Supported) will be displayed in the DDM output display.

Examples

```
-> show interfaces ddm w-low
Chas/
Slot/Port   Temp (C)   Voltage (V)   Tx Bias (mA)   Output (dBm)   Input (dBm)

-> show interfaces ddm status
DDM Status      : enable
DDM Trap Status : disable
```

output definitions

Chas/Slot/Port	Interface chassis, slot, and port numbers.
Temp C	The transceiver temperature, in degrees centigrade.
Voltage (V)	The transceiver supply voltage, in volts.
Tx Bias (mA)	The transceiver transmit bias current, in milliamps.
Output (dBm)	The transceiver output power, in decibels.
Input (dBm)	The transceiver received optical power, in decibels.
N/A	Indicates the transceiver does support DDM.
N/S	Indicates the transceiver does not support the DDM attribute.
Actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
Alarm High (AH)	Indicates the value at which the transceiver's functionality may be affected.
Warning High (WH)	Indicates the transceiver is approaching the High Alarm value.
Warning Low (WL)	Indicates the transceiver is approaching the Low Alarm value.
Alarm Low (AL)	Indicates the value at which the transceiver's functionality may be affected.
DDM Status	The administrative status of DDM.
DDM Trap Status	The administrative status of DDM traps.

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces ddm	Configures the DDM administrative status or trap capability.

show interfaces split-mode

Displays the configured and operational state of the 4X10G capable ports.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[**-*port1***]] split-mode**

Syntax Definitions

chassis	The chassis identifier.
slot	Display all the ports on the specified slot.
*port***[**-*port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

By default, information for all ports that support the splitter cable functionality is displayed.

Platforms Supported

OmniSwitch 6900, 9900

Usage Guidelines

The output is only displayed for those ports that support the splitter cable functionality.

Examples

```
-> show interfaces split-mode
 Ch/                                          Ch/
 Slot/                  Split-Mode            Slot
 Primary-Port     Configured   Operational     Member-Port
--------------+--------------+-------------+---------------
 1/1/1A               4X10         4X10G     1/1/1A-1/1/1D
 1/1/2A               AUTO         40G       1/1/2A-1/1/2D
 1/1/3A               40G          40G       1/1/3A-1/1/3D
 1/1/4A               AUTO         None      1/1/4A-1/1/4D
<output truncated>
```

output definitions

Ch/Slot/Port	The chassis, slot, and port.
Configured	The configured split-mode of the port. (AUTO/4X10G/4X25G/40G/ 100G)
Operational	The current operational split-mode of the port. (AUTO/4X10G/4X25G/ 40G//100G/None)

Release History

Release 7.3.4; command introduced.

Related Commands

interfaces primary-port split-mode	Configures the mode of the splitter cable capable ports.

MIB Objects

```
esmPortModeTable
   esmConfiguredMode
```

show transceivers

Displays transceiver manufacturer and status information.

show transceivers [slot *chassis/slot* **[transceiver** *transceiver_num***]]**

Syntax Definitions

chassis	The chassis identifier.
slot	Display all the ports on the specified slot.
transceiver_num	The number of the transceiver to display.

Defaults

By default, information is displayed for all transceivers.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a chassis/slot number to display transceiver information for a specific module.
- Specify a transceiver model number to display information for a specific transceiver.

Examples

```
-> show transceivers
Chassis ID 1
Slot 1 Transceiver 53
  ALU Model Name:               QSFP-40G-C1M   ,
  ALU Model Number:             120387-90   ,

  Admin Status:                 POWER ON,
  Operational Status:           UP
```

output definitions

Manufacturer Name	The name of the transceiver's manufacturer.
Part Number	The part number of the transceiver.
Hardware Revision	The hardware revision of the transceiver.
Serial Number	The serial number of the transceiver.
Manufacture Date	The manufacture date of the transceiver.
Laser Wave Length	The laser wavelength of the transceiver.
Admin Status	The administrative status of the transceiver.
Operational Status	The operational status of the transceiver.

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the DDM administrative status or trap capability.

MIB Objects

N/A

show violation

Displays the violation conditions that exist on specific ports or link aggregates.

show violation [port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]]**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.
*agg_id***[-***agg_id2***]**	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

NA

Examples

In the following example, the **admin down** action for link aggregate 2 indicates that a port violation has occurred on one of the ports related to the link aggregate group with ID 2.

```
-> show violation
* = Link Agg ID
 LAG ID/                                                    Recovery     Recovery
 Port       Source         Action            Reason      WTR   Time      Max/Remain
----------+----------+-----------------+--------------+-----+---------+----------
  1/1/1    src lrn    simulated down      lps shutdown     0      300      10/5
  1/1/1    src lrn    simulated down      lps restrict     0      300      10/10
 *0/2      qos        admin down          policy           0      300      10/10
```

output definitions

Port	The slot and port numbers or link aggregate IDs on which violations occurred.
Source	Specifies the source application that detected the violation.
Action	Specifies the action that is taken when the violation is detected on the port. There are two types of actions: **admin down** - deactivates the physical port. **simulated down** - the port is put in blocking state.
Reason	Specifies the reason for the violation.

output definitions\

WTR	The wait-to-restore timer value. Specifies the number of seconds the switch waits before notifying other applications that the link is up. Configured through the **interfaces wait-to-restore** command.
Recovery Time	The amount of time after which the port is automatically re-activated if the port was shutdown. Configured through the **violation recovery-time** command.
Recovery Max/Remain	The maximum number of recovery attempts allowed and the number of attempts remaining. Configured through the **violation recovery-maximum** command.

Release History

Release 7.1.1; command introduced.

Related Commands

clear violation	Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

MIB Objects

```
portViolationTable
   portViolationSource
   portViolationEntry
   portViolationTrap
   portViolationSource
   portViolationReason
   portViolationAction
   portViolationTimer
   portViolationTimerAction
```

show violation-recovery-configuration

Displays the global violation recovery configuration details (recovery trap, recovery maximum, and recovery time.

show violation-recovery-configuration {slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

NA

Examples

```
-> show violation-recovery-configuration
Global Violation Trap         : enable
Global Recovery Maximum       : 20
Global Recovery Time          : 200

Port    Recovery Max    Recovery Time
------+---------------+---------------
1/1/1   10                    300
1/1/2   10                    300

-> show violation-recovery-configuration port 3/1/1-2
Global Recovery Trap          : enable
Global Recovery Maximum       : 20
Global Recovery Time          : 200

Port   Recovery Max      Recovery Time
------+---------------+---------------
3/1/1   10                    300
3/1/2   10                    300
```

output definitions\

Global Violation Trap	Displays the global status of the violation trap recovery.
Global Recovery Maximum	Displays the global value set for the maximum violation recovery.
Global Recovery Time	Displays the global value set for the recovery time.

output definitions\

Port	Displays the chassis, slot and port numbers or link aggregate IDs on which address violations occurred.
Recovery Max	Displays the maximum number of retry configured.
Recovery Time	Displays the duration taken for recovery.

Release History

Release 8.2.1; command introduced.

Related Commands

clear violation	Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.
violation recovery-maximum	Configures the maximum number of recovery attempts allowed before the port is permanently shut down.
violation recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation.
violation recovery-trap	Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

MIB Objects

```
portViolationTable
   alaPvrGlobalTrapEnable
   alaPvrGlobalRetryTime
   alaPvrGlobalRecoveryMax
   alaPvrRetryTime
   alaPvrRecoveryMax
```

interfaces link-monitoring admin-status

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2***]} link-monitoring admin-status {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
enable	Enables link monitoring for the specified port.
disable	Disables link monitoring for the specified port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.
- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.
- Enter a slot number to configure link monitoring for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.
- Link Monitoring can be enabled on the member ports of the link aggregate, but not on the entire link aggregate. Link Monitoring is not supported on the VFL ports.

Example

```
-> interfaces slot 1/1 link-monitoring admin-status enable
-> interfaces port 1/1/1 link-monitoring admin-status enable
-> interfaces port 1/1/1-7 link-monitoring admin-status enable
-> interfaces port 1/2/5 link-monitoring admin-status disable
-> interfaces port 1/2/5-20 link-monitoring admin-status disable
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces ddm	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonStatus
```

interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2***]} link-monitoring time-window** *seconds*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
seconds	The length of time during which the link is monitored. The valid range is 0–3600 seconds.

Defaults

By default, the time window value is set to 300 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring time-window 20
-> interfaces port 1/1/1 link-monitoring time-window 40
-> interfaces port 1/1/1-7 link-monitoring time-window 2500
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonTimeWindow
```

interfaces link-monitoring link-flap-threshold

Configures the number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[**-*port2***]} link-monitoring link-flap-threshold** *link_flaps*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.
link_flaps	The number of link flaps. The valid range is 2-10.

Defaults

By default, the number of link flaps allowed is set to 5.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to configure the number of link flaps allowed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of link flaps allowed for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring link-flap-threshold 6
-> interfaces port 1/1/1 link-monitoring link-flap-threshold 3
-> interfaces port 1/1/1-7 link-monitoring link-flap-threshold 10
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces ddm	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkFlapThreshold
```

interfaces link-monitoring link-error-threshold

Configures the number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown. MAC errors refer to lost frames, error frames, alignment frames and cyclic redundancy check (CRC).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} link-monitoring link-error-threshold** *mac_errors*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.
mac_errors	The number of MAC errors. The valid range is 1-100.

Defaults

By default, the number of MAC errors allowed is set to 5.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring link-error-threshold 30
-> interfaces port 1/1/1 link-monitoring link-error-threshold 10
-> interfaces port 1/1/1-7 link-monitoring link-error-threshold 35
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces ddm	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkErrorThreshold
```

interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} clear-link-monitoring-stats**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 clear-link-monitoring-stats
-> interfaces port 1/1/1 clear-link-monitoring-stats
-> interfaces port 1/1/1-7 clear-link-monitoring-stats
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces ddm	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonStatsTable
   alaLinkMonStatsClearStats
```

show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

show interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} link-monitoring config**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces slot 1/1 link-monitoring config
Ch/
Slot/   Status   Time     Link-flap    Link-error
Port             Window   Threshold    Threshold
                 (sec)
------+--------+--------+------------+-----------
1/1/1  enabled     10        5           10
1/1/2  disabled    10        5           10
1/1/3  disabled   200        8           20
.
.
1/1/24 disabled   150        2           99

-> show interfaces port 1/1/1-3 link-monitoring config
Ch/

1/1/1  enabled     10          5           10

-> show interfaces port 1/1/2 link-monitoring config
Ch/
Slot/   Status    Time     Link-flap    Link-error
Port              Window   Threshold    Threshold
                  (sec)
------+--------+--------+------------+------------
1/1/2  disabled    10         5            10
```

output definitions

Ch/Slot/Port	Interface chassis, slot, and port number.
Status	Link monitoring status (enable/disable).
Time Window	Time interval, in seconds, for which the link is monitored.
Link-flap threshold	Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
Link-error threshold	Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays information of the interface port status.
show interfaces link-monitoring statistics	Displays the Link Monitoring statistics.
interfaces link-monitoring admin-status	Enables or disables link monitoring.
interfaces link-monitoring time-window	Configures the monitoring of the time-window of the link.
interfaces link-monitoring link-flap-threshold	Configures the number of link flaps that are allowed before the port is shutdown.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonStatus
   alaLinkMonTimeWindow
   alaLinkMonLinkFlapThreshold
   alaLinkMonLinkErrorThreshold
```

show interfaces link-monitoring statistics

Displays the Link Monitoring statistics for a specific slot, port, or a range of specified ports.

show interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} link-monitoring statistics**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces slot 1/1 link-monitoring statistics
Ch/
Slot/   State     Current  Current  Current   Current  Current  Total  Total
Port              Flap     Error    CRC       Lost     Align    Flap   Error

   alaLinkMonStatsTotalLinkFlaps
   alaLinkMonStatsTotalLinkErrors
```

interfaces tdr

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

interfaces port *chassis/slot/port* **tdr enable**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
port	The port number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

Examples

```
-> interfaces port 1/1/1 tdr enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

clear interfaces	Clears the statistics of the last test performed on the port
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
esmTdrPortTable
   esmTdrPortTest
```

show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] tdr-statistics**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[-***port2***]**	The port number. Use a hyphen to specify a range of ports.

Defaults

By default, TDR statistics are shown for all ports on all modules

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces port 1/1/3 tdr-statistics
 Ch/
 Slot/  No of Fuzzy Pair1 Pair1 Pair2 Pair2 Pair3 Pair3 Pair4 Pair4  Test
 Port   Pairs Len   State Len   State Len   State Len   State Len   Results
-------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+--------
1/1/1     4   10    Open  0     Open  0     Open  0     Open  0     Success

Pair Length Accuracy may vary +/- Fuzzy Length
Legend: Pair 1 - Orange and White
        Pair 2 - Green and White
        Pair 3 - Blue and White
        Pair 4 - Brown and White
```

output definitions

Ch/Slot/Port	The interface chassis, slot, and port number.
No of pairs	The number of pairs in the cable for which the test results are valid.
Fuzzy Length	The error in the estimated length of the cable.

output definitions (continued)

Cable State	State of a cable as returned by the TDR test. The state of the cable wire. (a) **OK** - Wire is working properly (b) **Open** - Wire is broken (c) S**hort** - Pairs of wire are in contact with each other (d) **Crosstalk** - Signal transmitted on one pair of wire creates an undesired effect in another wire. (e) **Unknown** - Cable diagnostic test unable to find the state of a cable.
Pair1 State	The state of the Pair 1 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair1 Length	The length of the Pair 1 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair2 State	The state of the Pair 2 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair2 Length	The length of the Pair 2 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair3 State	The state of the Pair 3 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair3 Length	The length of the Pair 3 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair4 State	The state of the Pair 4 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair4 Length	The length of the Pair 4 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Test Result	The status of the TDR test performed, success or fail.
Legend	Eight-conductor data cable contains 4 pairs of twisted Pair Copper Cable wires. Each pair consists of a solid (or predominantly) colored wire and a white wire with a strip of the same color. The pairs are twisted together.

Release History

Release 8.1.1 command was introduced.

Related Commands

interfaces tdr	Initiates the cable diagnostics on a port.
clear interfaces	Clears the statistics of the last test performed on the port.

```

link-fault-propagation group

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

link-fault-propagation group *group_id* **[admin-status {enable | disable}]**

no link-fault-propagation group {*group_id***[-***group_id2***]}**

Syntax Definitions

group_id	A group ID number. The valid range is 1–8.
*group_id***[-***group_id2***]**	A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.
enable	Enables LFP for the specified group.
disable	Disables LFP for the specified group.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

Example

```
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupRowStatus
```

link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **source {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

no link-fault-propagation group *group_id* **source {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
chassis	The chassis identifier.
slot	The slot number for a specific module.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports and/or a space to specify multiple port entries.
agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported, regardless of the number of ports in each aggregate in a group.
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
- If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 source port 1/2
-> link-fault-propagation group 1 source port 1/2-5 2/3
-> link-fault-propagation group 1 source linkagg 1
```

```
-> link-fault-propagation group 1 source linkagg 1-3
-> link-fault-propagation group 1 source port 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 3/1-5 destination linkagg 6
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
alaLFPConfigTable
   alaLFPConfigPort
   alaLFPConfigPortType
   alaLFPConfigRowStatus
```

link-fault-propagation group destination

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **destination {port** *chassis/slot/port[-port2]* **| linkagg** *agg_id[-agg_id2]***}**

no link-fault-propagation group *group_id* **destination {port** *chassis/slot/port[-port2]* **| linkagg** *agg_id[-agg_id2]***}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
chassis	The chassis identifier.
*port***[**-*port2***]**	The port number. Use a hyphen to specify a range of ports and/or a space to specify multiple port entries.
agg_i*d***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported regardless of the number of ports in each aggregate in a group.
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
- A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.
- If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 destination port 1/4
-> link-fault-propagation group 1 destination port 1/5-8 2/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/2 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 1/2 2/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/6 1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/9
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
alaLFPConfigTable
   alaLFPConfigPort
   alaLFPConfigPortType
   alaLFPConfigRowStatus
```

link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

link-fault-propagation group *group_id* **wait-to-shutdown** *seconds*

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
seconds	The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

Example

```
-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupWaitToShutdown
   alaLFPGroupRowStatus
```

show link-fault-propagation group

Displays information for the specified Link Fault Propagation (LFP) group.

show link-fault-propagation group [*group_id***]**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all existing LFP groups.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a LFP group ID number with this command to display information for a specific group.
- If a virtual port such as a link aggregate is configured as a source or destination port it will be displayed instead of the physical ports.

Example

```
-> show link-fault-propagation group
Group Id : 2
  Source Port(s)          : 0/1-2 1/1/1-5 1/1/7,
  Destination Port(s)     : 0/3 1/1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10

Group Id : 7
  Source Port(s)          : 1/1/1 1/1/3,
  Destination Port(s)     : 0/3 1/1/5 1/1/7 1/1/11 1/1/13 1/1/15 1/1/17 1/1/19 1/1/
21 1/1/23,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 100

-> show link-fault-propagation group 2
Group Id : 2
  Source Port(s)          : 0/1-2 1/1/1-5 1/1/7,
  Destination Port(s)     : 0/3 1/1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10
```

Release History

Release 7.3.2; command introduced.

      alaLFPGroupWaitToShutdown
```

interfaces beacon

Configures the LED color and behavior for a port or group of ports.

interfaces {slot *chassis/slot* **| port** *chassis/slot/port[-port2]***} beacon [admin-status {enable | disable}] [led-color** *color***] [led-mode {solid | activity}]**

no interfaces {slot *chassis/slot* **| port** *chassis/slot/port[-port2]***} beacon**

Syntax Definitions

chassis	The chassis ID for the switch on which the LEDs are being configured. For standalone switches, use **1**.
slot	The slot ID for the switch on which the LEDs are being configured. For standalone switches, use **1**.
port	The port number of the interface LED you want to configure.
-port2	The last port number in a range of interface LEDs you want to configure. Be sure to insert a hyphen between port range numbers (for example, **7-10**)
led-mode	Indicates that LED behavior (activity or solid) is being configured for the corresponding interface LEDs.
activity	The LEDs will blink when traffic is detected on the corresponding ports.
solid	The LEDs will remain solid whether or not traffic is detected on the corresponding ports.
led-color	Indicates that the LED color is being configured for the corresponding port(s).
color	The color to be displayed on the corresponding port LED(s). Options include **yellow**, **white**, **red**, **magenta**, **green**, **blue**, **aqua** and **off**.
admin-status	Indicates that the beacon LED administrative status is being configured for the corresponding port(s).
enable	Enables the beacon function on the corresponding port(s).
disable	Disables the beacon function on the corresponding port(s).
no	Adding the no syntax to the beginning of the command clears all information stored in the beacon settings table. Refer to Usage Guidelines below for more information.

Defaults

parameter	default
led-mode	activity
led-color	magenta
admin-status	enable

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Supported on the OmniSwitch 6900-Q32 and X72 models only.
- The **no interfaces beacon** command syntax clears the beacon settings from the **show interfaces beacon** table and resets LEDs to original factory-set behavior. (Once stored beacon settings are cleared, they can no longer be retrieved and beacon settings must be reconfigured.)
- The **interfaces beacon** command is supported on all Ethernet ports on the switch. However, when specifying a range in the command line, please note that The Beacon LED feature is not supported on sub-ports 'b', 'c', or 'd' when an interface is operating in 4X10G mode. Additionally, only Solid mode is supported on sub-port 'a' for 4X10G interfaces.

Examples

```
-> interfaces port 1/1/7-10 beacon led-mode solid admin-status enable led-color
aqua
-> interfaces slot 1/1 beacon led-color magenta
-> no interfaces slot 1/1/1 beacon
```

Release History

Release 7.3.4; command introduced.

Related Commands

```

show interfaces beacon

Displays current interface beacon settings.

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[**-*port2***]] beacon**

Syntax Definitions

chassis	The chassis ID for the switch on which beacon settings are being shown. For standalone switches, use **1**.
slot	The slot ID for the switch on which beacon settings are being shown. For standalone switches, use **1**.
port	The port number for which beacon settings are being shown.
-port2	The last port number in a range for which beacon settings are being shown. Be sure to insert a hyphen between port range numbers (for example, **7-10**)

Defaults

N/A

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

Supported on the OmniSwitch 6900-Q32 and X72 models only.

Examples

```
-> show interfaces beacon
 Ch/Slot/Port   Admin-Stat   LED-Color    LED-Mode
------------+-------------+--------------+------------
 1/1/1A          Disable     Magenta      Solid
 1/1/2A          Disable     Blue         Activity
 1/1/30A         Enable      Magenta      Solid
 1/1/31A         Enable      Off          Solid
```

output definitions

Ch/Slot/Port	The chassis/slot/port ID for the switch on which beacon settings are being shown.
Admin-Stat	The beacon administrative status (Enable/Disable).
LED-Color	The LED color being displayed on the corresponding interface LED. Options include **yellow**, **white**, **red**, **magenta**, **green**, **blue**, **aqua** and **off**.
LED-Mode	The current LED behavior on the corresponding interface LED. Options include **solid** or **activity** (default).

Release History

Release 7.3.4; command introduced.

Related Commands

interfaces beacon	Allows network administrators to change LED color and behavior from a remote location.

```

interfaces ptp admin-state

Enables or disables IEEE 1588 Precision Time Protocol (PTP) on all the interfaces

interfaces ptp admin-state {enable | disable} [loopback-portlist <*chassis/slot/port*> <*chassis/slot/port*>**] [***chassis/slot/port***] [priority {***num* **| default}]**

Syntax Definitions

enable	Enables the PTP end-to-end transparent clock on all the interfaces.
disable	Disables the PTP end-to-end transparent clock on all the interfaces.
chassis	The chassis identifier.
slot/port	The slot and port number (for example, 3/1).
num	Set the internal priority for the incoming PTP packet. Valid range is 1–7.
default	Sets the internal priority to the default value 5.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6860, 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- This command enables PTP end-to-end transparent clock across all ports.
- PTP end-to-end transparent clock is supported in a standalone mode (virtual chassis of one) and virtual chassis of two. PTP end-to-end on a virtual chassis of two is supported only on OmniSwitch 6900-X72.
- Single loopback port per chassis is required to support PTP in a virtual chassis of two.
- Loopback ports dedicated for PTP must not be used by any other feature. Ensure PTP is configured on unused ports.
- PTP on a virtual chassis of two is not supported on chassis ID 1.
- IGMP snooping must not be configured on PTP reserved IPv4 and IPv6 multicast addresses.
- The two 10G ports, 1/1/27 and 1/1/28 on OmniSwitch 6465-P28 does not support PTP.

Examples

```
-> interfaces ptp admin-state enable
-> interfaces ptp admin-state disable
-> interfaces ptp admin-state enable priority 4
-> interfaces ptp admin-state enable priority default
-> interfaces ptp admin-state enable loopback-portlist 2/1/12 3/1/23
WARNING: User ports 2/1/12 and 3/1/23 will be out of service for users.
```

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; OmniSwitch 6860, 6865 support for PTP added.
Release 8.5R1; OmniSwitch 6465 support for PTP added.
Release 8.5R2; **loopback-portlist** keyword added.

Related Commands

show interfaces ptp config	Displays the current IEEE 1588 Precision Time Protocol (PTP) status on the switch.

MIB Objects

```
alaPtpConfiguration
alaPtpConfigAdminStatus
alaPtpConfigPriority
alaPtpConfigMode
alaPtpLoopBackPort1
alaPtpLoopBackPort2
alaPtpLoopBackPort3
alaPtpLoopBackPort4
alaPtpLoopBackPort5
alaPtpLoopBackPort6
alaPtpLoopBackPort7
alaPtpLoopBackPort8
```

interfaces port ptp p2p

Enables or disables IEEE 1588 PTP peer-to-peer transparent clock on an interface.

interfaces port *chassis/slot/port* **ptp p2p admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (for example, 3/1).
enable	Enables the PTP peer-to-peer transparent clock on an interface.
disable	Disables the PTP peer-to-peer transparent clock on an interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- PTP must be enabled globally for PTP peer-to-peer support.
- PTP peer-to-peer supports only one-step mode.
- When peer-to-peer is enabled on a port, link delay will be computed dynamically for the corresponding link.
- Ensure Loopback0 IP interface is configured on the switch as loopback0 interface address will be used as the source IP for peer delay measurement packets. If loopback0 IP interface is not configured, then peer delay measurement feature will not work.

Examples

```
-> interfaces port 1/1/1 ptp p2p admin-state enable
-> interfaces port 1/1/1 ptp p2p admin-state disable
```

Release History

Release 8.6R1; command introduced.

Related Commands

interfaces ptp admin-state	Enables or disables IEEE 1588 Precision Time Protocol (PTP) end-to-end transparent clock on the switch.
show interfaces ptp config	Displays the current IEEE 1588 Precision Time Protocol (PTP) status on the switch.

MIB Objects

```
alaPtpPortAdminStatus
AlaIpServiceSourceIpAppIndex
```

show interfaces ptp config

Displays the current PTP status on the switch.

show interfaces ptp config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

N/A

Examples

```
-> show interfaces ptp config

End-to-End TC:
------------------
Admin-state                    : Enabled
Priority                       : 5
Chassis-connected              : 2
LoopBack-PortList              : 2/1/12, 3/1/23

Peer-to-Peer TC:
-----------------------
Pkt source-ip      : 1.1.1.1
Port       Admin State
--------+--------------
1/1/5      Enabled
```

output definitions

End-to-End TC:	
Admin State	The PTP end-to-end administrative status on the switch (Enable/ Disable).
Priority	The internal priority configured for the incoming PTP packet.
Chassis-connected	Number of chassis connected in a virtual chassis.
LoopBack-PortList	Configured loopback ports to support PTP end-to-end on a virtual chassis of two.
Peer-to-Peer TC:	
Pkt source-ip	Loopback0 IP interface used as the source IP for peer delay measurement packets.

output definitions (continued)

Port	The chassis, slot, and port number.
Admin State	The PTP peer-to-peer administrative status on the switch (Enable/ Disable).

Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; OmniSwitch 6860, 6865 support for PTP added.
Release 8.5R1; OmniSwitch 6465 support for PTP added.
Release 8.5R2; End-to-End and Peer-to-Peer transparent clock fields added.

Related Commands

interfaces ptp admin-state	Enables or disables IEEE 1588 Precision Time Protocol (PTP) end-to-end transparent clock on the switch.
interfaces port ptp p2p	Enables or disables IEEE 1588 PTP peer-to-peer transparent clock on an interface.

MIB Objects

N/A

interfaces macsec admin-state

This command enables or disables MACsec on a physical port or a port range.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port* **[**-*port2***]} macsec admin-state {enable | disable} [mode {static sci-rx [***hex-num***] key-chain** *keychain_id* **[encryption] sci-tx [***hex-num]* **key-chain** *keychain_id* **[encryption] | dynamic {keychain** *cak_keychain_id* **[server-priority** *priority***] | radius}} [transmit-interval** *tx_interval***] [encryption]]**

no interfaces {slot *chassis/slot*| **port** *chassis/slot/port* **[**-*port2***]} macsec [sci-rx [***hex-num***] [sci-tx] [keychain] [encryption]**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
admin-state enable	Enables MACsec on a physical port or port range.
admin-state disable	Disables MACsec on a physical port or port range.
static	Sets the SA (secure association) mode to static. This is enabled by default.
dynamic	Sets the SA (secure association) mode to dynamic.
hex-num	The SCI (Secure Channel Identifier) value (up to 8 bytes in length) for Tx and Rx channel in the hexadecimal format (0xhex). The default SCI value is '0' (implicit SCI value).
keychain_id	The keychain ID associated to Tx/Rx channel.
encryption	Enable or disable the encryption option on the Tx/Rx channel. By default, the 'encryption' is disabled.
cak_kc	The keychain ID for Static-CAK (Connectivity Association Key).
priority	Specifies the server priority in the range 0 to 255.
tx_interval	Specifies the transmit interval for MKPDU in the range 2 to 10 seconds.

Defaults

parameter	default
enable | disable	enable
priority	5, 10, 15, and 15 respectively on OmniSwitch 9900, OmniSwitch 6860, OmniSwitch 6465, and OmniSwitch 6560. *Note: Lower the priority value, higher the precedence.*
tx_interval	2 seconds
encryption	disabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 9900

Usage Guidelines

- Use this command to,
  - Enable or disable MACsec on a physical port or port range.
  - Set the MACsec mode: Static SA Mode or Dynamic SA Mode
- For Static SA Mode - MACsec with Static Secure Association Key (static-SAK), following configurations can be configured:
  - Set the MACsec mode to Static.
  - Create MACsec Tx and Rx channels.
  - Specify the SCI value for Tx and Rx channels.
  - Associate the keychain ID for Tx and Rx channel. For more information on keychain configuration, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
  - Enable or disable encryption on Tx and Rx channel (optional).
- Dynamic SA Mode has two variations - Dynamic SAK using pre-shared keys and Dynamic SAK using Extensible Authentication Protocol (EAP).
  - For Dynamic SAK using pre-shared keys, following configurations can be configured:
    - > Set the MACsec mode to Dynamic.
    - > Configure the keychain for Static-CAK. For more information on keychain configuration, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
    - > Configure key server priority (optional).
    - > Configure transmit interval for MKPDUs (optional).
    - > Enable or disable encryption on dynamic secure channel (optional).
  - For Dynamic SAK using EAPs, the following configurations can be configured:
    - > Set the MACsec mode to Radius.
    - > Configure transmit interval for MKPDUs (optional).
    - > Enable or disable encryption on dynamic secure channel (optional).

- By default, the MACsec mode is set to ‘static’. For static mode configuration, manually configured SA keys are used to secure traffic on the point-to-point link between two nodes. For MACsec mode ‘static’, following are the configuration guidelines:
  - Only one Tx and one Rx channel can be configured per interface.
  - Each node that expects to receive traffic sent in a particular transmit secure channel must configure a 'matching' receive secure channel, with an SCI corresponding to the SCI of the transmit secure channel of the peer. MACsec supports one secure channel for Tx and one secure channel for Rx configuration on an interface.
  - The secure channel for both Tx and Rx on an interface can be configured with SCI value of 8 bytes long. It can be provided in short form (that is, 0x01) or full form (0x0000000000000001). 0x00 (all zeros) and 0xFFFFFFFFFFFFFFFF SCI value are not valid.
  - The secure channel for both Tx and Rx on an interface can be configured without specifying a SCI value. In this case, the default value will be considered.
  - The keychain associated with the SCI-Tx and SCI-Rx must have four keys supporting ‘AES-GCM-128’ algorithm, and the number of keys in the keychain associated with both SCI-Tx and SCI-Rx on an interface must be equal.
  - Addition/deletion of keys to/from a keychain already associated with a SCI-Tx and SCI-Rx under MACsec would not be allowed by Security Keychain module. The keychain also cannot be deleted.
  - MACsec cannot be administratively enabled on an interface until both SCI-Tx and SCI-Rx are configured on the interface.
  - The Tx/Rx secure channel cannot be removed without disabling MACsec on the interface.
  - The **encryption** option on the Tx/Rx channel can either be enabled or disabled. By default, the ‘encryption’ is disabled. Enabling ‘encryption’ option ensures that the data in the Ethernet frame cannot be viewed by anyone monitoring traffic on the link. Use the **no** form of the command to disable encryption on Tx/Rx channel.
  - MACsec SCI-Tx/SCI-Rx values cannot be updated at run-time. The SCI-Tx/Rx values must be unconfigured and re-configured. Only ‘keychain ID’ and ‘encryption’ parameters can be updated at run-time.
  - During run-time, upon enabling or disabling MACsec on the port, the interface will get re-initialized (interface will be brought down and up), which will result in temporary traffic loss.
  - MACsec mandates specifying SCI-Tx and SCI-Rx value (for configured explicit SCI) while updating its ‘keychain ID’ and ‘encryption’ parameters on an interface.
  - While unconfiguring ‘keychain ID’ and ‘encryption’ parameters on an interface, it is not mandatory to provide MACsec SCI-Tx value, whereas, MACsec mandates specifying SCI-Rx value (for explicit SCI).
- For MACsec mode ‘dynamic’- dynamic SAK using pre-shared keys, following are the configuration guidelines:
  - The keychain or pre-shared key for Static-CAK must have the key mapped to ‘AES-CMAC-128’ algorithm.
  - If there are multiple pre-shared keys configured in the keychain, only the first key would be used for CAK.
  - Key server priority would be in the range 0-255, with lower value having higher precedence.
  - Enabling or disabling Encryption enables or disables encryption on dynamic Secure-Channel (SC).
- For MACsec mode ‘radius’ - dynamic SAK using EAP, following are the configuration guidelines:
  - Dynamic mode using RADIUS server requires the switch end port connecting a host (supplicant) to be enabled with UNP and configured for 802.1x-authentication, and MSK/Key-Name received from Server as part of the authentication. The authentication method must be either EAP-TLS or PEAP authentication framework.
  - The switch end port connecting a host (supplicant) must be enabled with UNP and configured for 802.1x-authentication.

  - The MACsec mode dynamic on UNP is supported in single supplicant mode only, that is, the UNP port can learn only one supplicant on the MACsec enabled interface. Also, there cannot be any non-supplicant learned on the same port.
  - Flushing the supplicant MAC on UNP port would purge the existing MACsec MKA session, and the port would be unsecured until the supplicant is learned again.
  - Re-authentication of supplicant may change the UNP profile or VLAN and the policy applied to the MAC. The existing MACsec session established (if any) would remain intact if the re-authentication results in the same MSK/Key-Name from RADIUS server. Otherwise, the existing MKA session would be purged and a new session is established using the new MSK/Key-Name.
  - Captive portal authentication, BYOD, and LTP (location/time policy) is not supported on MACsec enabled UNP ports.
  - MACsec mode dynamic using ‘radius’ will not be supported on UNP Linkagg.

- MACsec is supported on the following platforms:
  - OmniSwitch 6465
    - All models support MACsec on all ports.
    - OmniSwitch 6465-P28 - supported on all ports, except ports 27 and 28.
  - OmniSwitch 6560
    - OmniSwitch 6560-P24X4/24X4 - supported on 1G ports 1-24
    - OmniSwitch 6560-P48X4/48X4 - supported on 1G ports 1-48. Supports only MACsec mode ‘dynamic’ on ports 49-50 on 1G ports, and on ports 51-52 on 10G ports.
    - OmniSwitch 6560-P48Z16 (part number 904044-90 only) - supported on 1G ports 1-32 and on ports 33-48 on 2.5G ports. Supports only MACsec mode ‘dynamic’ on ports 49-52 on 10G ports.
    - OmniSwitch 6560-X10 - supports only MACsec mode ‘dynamic’ on ports 1-8 on 10G ports.
  - OmniSwitch 6860 and OmniSwitch 6860E
    - All models support MACsec on 10G ports.
    - OmniSwitch 6860-P24 - supported on 1G and 10G ports.
    - OmniSwitch 6860-P24Z8 - supported on 1G and 10G ports (not supported on 2.5G ports).
  - OmniSwitch 9900
    - MACsec is supported on OS99-CMM (4X10G mode only), OS99-GNI-48/P48, OS99-XNI-48/P48/U48, P48Z16.
    - MACsec is not supported on the OS99-CNI-U8, OS99-GNI-U48, and OS99-CMM in 40G mode.
- MACsec must be enabled on all ports (on a per physical port basis) that are part of the same link aggregation.
- MACsec mode cannot be changed if MACsec is already administratively enabled. To change MACsec mode, administratively disable MACsec first.
- Use the **no** form of this command to disable encryption on Tx/Rx channel, remove keychain configuration on Tx/Rx channel, remove Tx/Rx channel.
- To confirm MACsec support on the interface, use the **show interfaces capability** command. MACsec support is listed in the **MACsec Supported** field.

Examples

```
-> interface port 1/1/1 macsec admin-state enable mode static sci-Tx 0x1 key-chain
1 encryption sci-rx 0x1 key-chain 1 encryption
```

```
-> interface port 1/1/1 macsec admin-state enable mode dynamic key-chain 1 server-
priority 10 transmit-interval 3

-> interface port 1/1/1 macsec admin-state enable mode dynamic radius

-> no interface port 1/1/1 macsec sci-rx 0x2 keychain
-> no interface port 1/1/1 macsec sci-tx encryption
```

Release History

Release 8.4.1 R03; command introduced.
Release 8.5R2; Dynamic SA Mode - Dynamic SAK using Pre-Shared Key and Dynamic SAK using EAP support added.

Related Commands

show interfaces macsec

Displays the MACsec configuration on a physical port or port range.

show interfaces macsec [*chassis/slot/port* **[-***port2***]**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

By default, the MACsec configuration on all ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 9900

Usage Guidelines

Enter a port number with this command to display the MACsec configuration for a specific port.

Examples

```
-> show interfaces macsec
Chas/Slot/Port   Admin-State     Mode          Encryption
---------------+-------------+------------+-----------------
     1/1/1       Enabled        Static         Enabled
     1/1/2       Disabled       Static         Disabled
     1/1/3       Disabled       Static         TX Enabled
     1/1/3       Disabled       Static         RX Enabled
     1/1/4       Enabled        Dynamic        Enabled
     1/1/5       Enabled        Dynamic        Disabled

-> show interfaces macsec 1/1/1
 Chas/Slot/Port  Admin-State     Mode          Encryption
---------------+-------------+------------+-----------------
     1/1/1       Enabled        Static         Enabled

-> show interfaces macsec 1/1/1-2
 Chas/Slot/Port  Admin-State     Mode          Encryption
---------------+-------------+------------+-----------------
     1/1/1       Enabled        Static         Enabled
     1/1/2       Disabled       Static         Disabled
```

output definitions

Chas/Slot/Port	The chassis/slot/port identifier.
Admin-State	The interface administrative status.

output definitions (continued)

Mode	The MACsec mode.
Encryption	Status of encryption on Tx/Rx channel. Encryption field will display "Enabled" or "Disabled" if it is enabled or disabled respectively on both Tx/Rx. However, if encryption is enabled only on Tx or only on Rx, it would be disabled as "Tx Enabled" or "Rx Enabled" respectively.

Release History

Release 8.4.1.R03; command introduced.

```

output definitions

Chas/Slot/Port	The chassis/slot/port identifier.
Admin-State	The interface administrative status.
Mode	The MACsec mode. ‘Keychain’, ‘Radius’ keyword denotes dynamic MACsec using pre-shared key or EAP (RADIUS server) respectively.
Keychain	The keychain ID associated to Tx/Rx channel.
Encryption	Status of encryption on Tx/Rx channel.
Server Priority	The priority configured for the key server.
Transmit Interval(Sec)	The transmit interval configured for MKPDU (in seconds).
Key Server	Indicates the key server.
Operation Status	The MACsec operational status.
SCI	The SCI value dynamically generated for Tx and Rx channel in the hexadecimal format (0xhex).
Type	Specifies the secure channel type: Tx/Rx.
In-use SA	Identifier for currently active Association Number (SA) in use for Tx/Rx channel on the interface.
PN	The packet number of the last packet received on the MACsec interface.

Release History

Release 8.5R2; command introduced.

Related Commands

interfaces macsec admin-state	This command enables or disables MACsec on a physical port or a port range.

MIB Objects

NA

show interfaces macsec statistics

Displays the MACsec statistics collected for a physical port.

show interfaces macsec statistics [*chassis/slot/port* **[-***port2***]**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

- If chassis/slot/port is not specified, the output will be displayed in tabular format but only important statistics will be displayed.
- If chassis/slot/port is specified, the output will not be displayed in tabular format but all statistics will be displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 9900

Usage Guidelines

N/A

Examples

```
-> show interfaces macsec statistics

```

output definitions

Chas/Slot/Port	Interface chassis, slot and port.
Bytes Xmitted	Number of Bytes transmitted.
TX Untagged Pkts	Number of untagged packets transmitted.
TX Too-Long Pkts	Number of long packets transmitted.
Bytes Received	Number of Bytes received.
RX Untagged Pkts	Number of untagged packets received.
RX Bad-Tag Pkts	Number of bad tag packets received.
Unknown SCI RX Pkts	Number of unknown packets received.
Overrun RX Pkts	Number of packets overrun.
TX Protected Pkts	Number of protected packets transmitted.
TX Encrypted Pkts	Number of encrypted packets transmitted.
TX Octets Protected	Number of packets protected in each listed octet range.
TX Octets Encrypted	Number of packets encrypted in each listed octet range.
RX Unused SA Pkts	Number of unused SA packets received.
RX No Using SA Pkts	Number of SA packets not used.
RX Late Pkts	Number of late packets received.
RX Not Valid Pkts	Number of discarded packets.
RX Invalid Pkts	Number of invalid packets.
RX Delayed Pkts	Number of delayed packets received.
RX Unchecked Pkts	Number of unchecked packets received.
RX OK Pkts	Number of valid packets.
RX Octets Validated	Number of packets validated in each listed octet range.
RX Octets Decrypted	Number of packets decrypted in each listed octet range.

Release History

Release 8.4.1 R03; command introduced.

clear interfaces macsec statistics

Clears the MACsec statistics globally on all MACsec enabled interfaces.

clear interfaces {slot *chassis/slot* **| port [***chassis/slot/port* **[-***port2***] |all} macsec-statistics**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number to display information about all ports on a specific slot.
*port***[-***port2***]**	The port number of a specific interface to display. Use a hyphen to specify a range of ports.
all	Displays information on all MACsec enabled interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 9900

Usage Guidelines

This command is used to clear MACsec statistics on a slot, port, port-range, or on all interfaces globally.

Examples

```
-> clear interface port 1/1/1 macsec-statistics
-> clear interface port 1/1/1-2 macsec-statistics
-> clear interface slot 1/1 macsec-statistics
-> clear interface all macsec-statistics
```

Release History

Release 8.4.1 R03; command introduced.
Release 8.5 R1; **all** keyword added.

Related Commands

interfaces macsec admin-state	This command enables or disables MACsec on a physical port or a port range.

MIB Objects

```

   alaSecyIfPortClearStats
```

2 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch PoE-capable switches. Refer to the *OmniSwitch Hardware Users Guide* for further details.

Note on Terminology. There are several general terms used to describe this feature. The terms *Power over Ethernet (PoE), Power over LAN (PoL), Power on LAN (PoL),* and *Inline Power* are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the *OmniSwitch AOS Release 8 CLI Reference Guide* refer to the feature as *Power over Ethernet (PoE).*

Additional terms, such as *Powered Device (PD)* and *Power Source Equipment (PSE)* are terms that are not synonymous, but are directly related to PoE.

- *PD* refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- *PSE* refers to the actual hardware source of the electrical current for PoE (e.g., OmniSwitch PoE-capable switches.

PoE commands documented in this section comply with IEEE 802.3, 802.af, and 802.3at.

MIB information for the PoE commands is as follows:

Filename: ALCATEL-IND1-INLINE-POWER-MIB.mib
Module: alcatelIND1INLINEPOWERMIB

Filename: POWER-ETHERNET-MIB.mib
Module: powerEthernetMIB

A summary of the available commands is listed here:

lanpower service

show lanpower update-from

lanpower service

Activates or stops PoE service on all ports in a specified slot.

lanpower {chassis *chassis* **| slot** *chassis/slot* **} service {start | stop}**

Syntax Definitions

chassis	The chassis on which the PoE power is being turned on or off.
chassis/slot	The slot on which the PoE power is being turned on or off.
start	Activates PoE on all ports in the specified slot.
stop	Turns off PoE on all ports in the specified slot.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

The OmniSwitch 6465 cannot auto-detect the type of power supply connected. The type of power supply connected must be configured so that the system and PoE power information is correctly displayed and utilized. Use the **powersupply type** type command to configure the power supply.

Examples

```
-> lanpower slot 2/1 service start
-> lanpower chassis 1 service stop
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower port admin-state	Activates or stops PoE service on an individual port.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseAdminStatus
```

lanpower port admin-state

Activates or stops PoE service on an individual port.

lanpower port *chassis/slot/port* **admin-state {enable | disable}**

Syntax Definitions

chassis/slot/port	The individual port on which the PoE power is being turned on or off.
enable	Activates PoE on the specified port.
stop	Turns off PoE on the specified port.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> lanpower port 2/1/1 admin-state enable
-> lanpower port 1/1/12 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower service	Activates or stops PoE service on all ports in a specified slot.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortAdminEnable
```

lanpower type

Assigns a user-defined port type to a specific port (when *chassis/slot/port* values are entered) or across all ports in a chassis or slot.

lanpower {chassis *chassis* | **slot** *chassis/slot* | **port** *chassis/slot/port***} type** *string*

Syntax Definitions

chassis	The chassis on which a port type is being defined.
chassis/slot	The slot on which a port type is being defined.
chassis/slot/port	The specific port on which a port type is being defined.
string	A user-defined text string of up to nine (9) characters. This text string will be listed in the "Type" column in the **lanpower update-from** command output.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> lanpower slot 1/1 type test
-> lanpower port 1/1/23 type PDs
-> lanpower chassis 1 type test
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortType
```

lanpower power

Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a chassis or slot.

lanpower {chassis *chassis* | **slot** *chassis/slot* | **port** *chassis/slot/port***} power** *milliwatts*

Syntax Definitions

chassis	The chassis on which the port power is being defined.
chassis/slot	The slot on which the port power is being defined.
chassis/slot/port	The specific port on which the port power is being defined.
milliwatts	The maximum amount of power for a specified port or slot. Refer to default and range information below.

Defaults

Refer to the *OmniSwitch Hardware Users Guide* for default power settings.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.
- To globally specify the amount of inline power available to all ports in a slot, refer to the **lanpower maxpower** command on page 2-8.
- Be sure that the value specified complies with specific power requirements for all attached PDs.
- Note that the power value for the **lanpower power** command is specified in milliwatts (mW); the related command, **lanpower maxpower**, is specified in watts (W).

Examples

```
-> lanpower slot 3/1 power 3200
-> lanpower port 1/1/24 power 25000
-> lanpower chassis 1 power 3000
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower maxpower	Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethPsePortTable
   alaPethPsePortPowerMaximum
```

lanpower maxpower

Specifies the maximum amount of power, in watts, assigned to a specified slot.

lanpower {chassis *chassis* | **slot** *chassis/slot* **} maxpower** *watts*

Syntax Definitions

chassis	The chassis containing PoE ports on which the maximum amount of inline power allowed is being configured.
chassis/slot	The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.
watts	The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the *OmniSwitch Hardware Users Guide* for additional PoE specifications.

Defaults

installed power supply	default	range
920W Power Supply (OS6860)	780W	37-780
600W Power Supply (OS6860)	450W	37-450

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- To specify the maximum amount of inline power available to a single port, refer to the **lanpower power**.
- Note that the power value for the **lanpower maxpower** command is specified in watts (W); the related command, **lanpower power**, is specified in milliwatts (mW).

Examples

```
-> lanpower slot 3/1 maxpower 400
-> lanpower chassis 1 maxpower 400
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower power	Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseMaxPower
```

lanpower priority

Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered). Levels include critical, high, and low.

lanpower {chassis *chassis* | **slot** *chassis/slot* | **port** *chassis/slot/port***} priority {critical | high | low}**

Syntax Definitions

chassis	The chassis on which the PoE power priority is being set.
chassis/slot	The slot on which the PoE power priority is being set.
chassis/slot/port	The specific port on which the PoE power priority is being set.
critical	Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical ports is maintained as long as possible.
high	Intended for ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, power to high-priority ports is given second priority to critical devices.
low	Intended for ports that have low-priority devices attached. In the event of a power management issue, power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

Defaults

parameter	default
low | high | critical	low

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

Examples

```
-> lanpower slot 2/1 priority low
-> lanpower port 1/1/6 priority critical
-> lanpower chassis 1 priority low
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower priority-disconnect	Enables or disables the priority disconnect function on all ports in a specified slot.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortPowerPriority
```

lanpower ni-priority

Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.

lanpower {chassis *chassis* | **slot** *chassis/slot* **} ni-priority {critical | high | low}**

Syntax Definitions

chassis	The chassis on which the NI priority is being set.
chassis/slot	The slot on which the NI priority is being set.
critical	Intended for modules that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical NIs is maintained as long as possible.
high	Intended for modules that have important, but not mission-critical, devices attached. If other NIs in the chassis have been configured as critical, power to high-priority modules is given second priority to critical devices.
low	Intended for modules that have low-priority devices attached. In the event of a power management issue, power to low-priority modules is interrupted first (i.e., before critical- and high-priority NIs).

Defaults

parameter	default
low | high | critical	low

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

Examples

```
-> lanpower slot 2/1 ni-priority low
-> lanpower chassis 1 ni-priority low
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show lanpower ni-priority	Displays current Network Interface (NI) modules status for a specified chassis or slot.

MIB Objects

N/A

lanpower priority-disconnect

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device.

lanpower {chassis *chassis* | **slot** *chassis/slot***} priority-disconnect {enable | disable}**

Syntax Definitions

chassis	The chassis on which the priority disconnect function is being enabled or disabled.
chassis/slot	The particular slot on which the priority disconnect function is being enabled or disabled.
enable	Enables priority disconnect on a specified port. When this function is enabled *and* a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power.
disable	Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to *any* incoming PD, regardless of its priority status.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> lanpower slot 2/1 priority-disconnect enable
-> lanpower chassis 1 priority-disconnect disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower priority	Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.
show lanpower priority-disconnect	Displays current priority disconnect status for a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPsePriorityDisconnect
```

lanpower power-rule

Specifies user-defined power rules that can be assigned to PoE ports.

lanpower power-rule *rule-name* **[admin-state {enable | disable}] [power {on | off}] [at {minutes** *mm* **| time** *hh:mm***}] [days {all |** *day [day...]* **| date** *[date...]***} [months {all |** *month***}] [timezone {local-server | utc | originator-server}]**

no lanpower power-rule *rule-name* **[admin-state {enable | disable}] [power {on | off}] [at {minutes** *mm* **| time** *hh:mm***}] [days {all |** *day [day...]* **| date** *[date...]***} [months {all |** *month***}] [timezone {local-server | utc | originator-server}]**

Syntax Definitions

rule-name	A user-defined name (up to 128 characters) for the power rule being configured.
admin-state	Specifies the admin-state for the power rule.
enable	Enables the power rule.
disable	Disables the power rule.
power	Specifies the power status (**on** or **off**) for devices connected to ports within the power rule.
on	Powers on devices on ports for which the rule is assigned.
off	Powers off devices on ports for which the rule is assigned.
at	Activates a a power rule timer. Power rules are triggered on a specified date or day of the week or at a particular time, or after a specified amount of time has elapsed.
minutes	Sets a timer. Power rules will take effect when a specified number of minutes have elapsed.
mm	The number of minutes that will elapse before the power rules take effect.
time	Sets a timer. Power rules will take effect at a specified time of day.
hh:mm	The time of day that the power rule will take effect.
days	Specifies that the power rule will take effect on a particular day of the week.
all	Specifies that the power rule will take effect on all days of the week (Monday through Sunday).
day	Specifies a particular day of the month or week the power rule will take effect. When entering a day of the month, enter one or more numbers from **1** to **31**. When entering a day of the week, use three-digit abbreviations (e.g., **mon**, **tue**, **wed**, **thu**, **fri**, **sat** and **sun**). Any combination of days may be entered in any order. Refer to command line examples for more information.
month	Specifies that the power rule will take effect during a particular month.
all	Specifies that the power rule will take effect during all months of the year (January through December).

month	Specifies a particular month of the year the power rule will take effect. When entering a month, use three-digit abbreviations (e.g., **jan**, **feb**, **mar**, **apr**, **may**, **jun**, **jul**, **aug**, **sep**, **oct**, **nov** and **dec**). Any combination of months may be entered in any order. Refer to command line examples for more information.
timezone	Sets a timezone in which timer-based power rules will take effect.
local-server	Time as specified by a local server.
utc	Specifies that timer-based rules fall under Universal Time Coordinated (UTC) time.
originator-server	Time as specified via the network.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

Before a power rule can take effect, the rule must first be assigned to particular slots or ports via the **lanpower power-policy** command.

Examples

```
->lanpower power-rule RuleTest2 admin-state enable power on at minutes 10 days fri
thu tue months all timezone utc
-> lanpower power-rule new power on at time 18:30 days all months all timezone utc
->lanpower power-rule OutgoingPDs power off at time 6:00 days 1 2 3 6 9 12 31
months all timezone utc
-> lanpower power-rule NewRule admin-state enable power off at minutes 4 days all
months all timezone utc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-policy	Allows users to bind existing power rules to particular slots or ports.
show lanpower power-rule	Displays current PoE power rule settings.
show lanpower power-policy	Displays existing power policies assigned to a slot, port or rule.

MIB Objects

```
alaPethPowerRuleTable
   alaPethPowerRuleAdminStatus
   alaPethPowerRulePowerStatus
   alaPethPowerRuleAtMinute
   alaPethPowerRuleAtTime
   alaPethPowerRuleDaysOfMonth
   alaPethPowerRuleDaysOfWeek
   alaPethPowerRuleMonths
   alaPethPowerRuleTimezone
   alaPethPowerRuleRowStatus
```

lanpower power-policy

Allows users to bind existing power rules to particular slots or ports.

lanpower [slot *chassis/slot* | **port** *chassis/slot/port-port***] power-policy** *policy-name* **[power-rule** *rule-name***]**

no lanpower power-policy *name*

Syntax Definitions

chassis/slot	The slot on which the power policy (with its associated power rule) is being assigned. This syntax is used the first time the **lanpower power-policy** command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.
chassis/slot/port-port	The specific slot on which the power policy (with its associated power rule) is being assigned. Port values may be entered as a single port or range of ports. This syntax is used the first time the **lanpower power-policy** command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information
policy-name	A user-defined name (up to 128 characters) for the power policy being configured (or assigned to an existing power rule).
rule-name	This syntax is used the second time the **lanpower power-policy** command is entered, where a policy is being assigned to an existing power rule. See Usage Guidelines below for more information.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- One or more power rules must be created before using the **lanpower power-policy** command. For information on creating power rules, see the **lanpower power-rule** command on page 2-16.
- Using the **lanpower power-policy** command is a two-step process. First, use the command to assign the policy to specific slots or ports. For example:

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower port 1/1/1-12 power-policy NewPolicy
```

  Next, run the command again to assign the policy (with its associated slots or ports) to an existing power rule. For example:

```
-> lanpower power-policy NewPolicy power-rule NewRule
```

- When assigning a policy to a slot or port, be sure to use the syntax, **"slot"** or **"port",** before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.

Examples

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower power-policy NewPolicy power-rule NewRule
-> no lanpower power-policy NewPolicy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-rule	Specifies user-defined power rules that can be assigned to PoE ports.
show lanpower power-rule	Displays current PoE power rule settings.
show lanpower power-policy	Displays existing power policies assigned to a slot, port or rule.

MIB Objects

```
alaPethPowerPolicyTable
   alaPethPowerPolicyRowStatus
alaPethPowerPortTable
   alaPethPowerPortPolicyName
   alaPethPowerPortRowStatus
```

lanpower class-detection

Enables or disables class detection of attached devices. When class detection is enabled, attached devices will automatically be limited to their class power, regardless of port power configuration.

lanpower {chassis *chassis* | **slot** *chassis/slot***} class-detection {enable | disable}**

Syntax Definitions

chassis	The chassis on which class detection is being enabled or disabled.
chassis/slot	The particular slot on which class detection is being enabled or disabled.
enable	Enables class detection on the specified slot.
disable	Disables class detection on the specified slot.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- Although class-detection is disabled by default, the OmniSwitch 6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> lanpower slot 1/1 class-detection enable
-> lanpower chassis 1 class-detection disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

show lanpower class-detection	Displays class detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseClassDetection
```

lanpower capacitor-detection

Enables or disables the capacitor detection method.

lanpower {chassis *chassis* | **slot** *chassis/slot***} capacitor-detection {enable | disable}**

Syntax Definitions

chassis	The chassis on which class detection is being enabled or disabled.
chassis/slot	The particular slot on which class detection is being enabled or disabled.
enable	Enables the capacitor detection method on the specified slot.
disable	Disables the capacitor detection method on the specified slot.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is *not* compatible with IEEE specifications. Please contact your Alcatel-Lucent Enterprise sales engineer or Customer Support representative to find out which Alcatel-Lucent Enterprise IP phones models need capacitive detection enabled.

Examples

```
-> lanpower slot 3/1 capacitor-detection enable
-> lanpower chassis 1 capacitor-detection disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

show lanpower capacitor-detection	Displays capacitor detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseCapacitorDetect
```

lanpower usage-threshold

Tells the switch to watch for a user-defined, slot-wide threshold for PoE power usage, in percent. When the usage threshold is reached or exceeded, a notification is sent to the user.

lanpower {chassis *chassis* | **slot** *chassis/slot***} usage-threshold** *num*

Syntax Definitions

chassis	The chassis for which usage threshold monitoring is being set.
chassis/slot	The slot for which usage threshold monitoring is being set.
num	The percentage of allowed usage from attached PoE devices before a notification is sent to the user.

Defaults

parameter	default
num	99

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

The **lanpower slot usage-threshold** does not affect the amount of PoE power allocated to a particular slot. The command is a monitoring method that tells the switch to send a “specified usage exceeded” notification (i.e., trap) only when a specified percentage has been reached.

Examples

```
-> lanpower slot 1/1 usage-threshold 50
-> lanpower chassis 1 usage-threshold 99
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

show lanpower usage-threshold	Displays current usage threshold, in percent.

MIB Objects

```
pethMainPseTable
   pethMainPseUsageThreshold
```

lanpower dynamic-power-mgmt

Enables dynamic power management for a chassis or slot.

lanpower {chassis *chassis* | **slot** *chassis/slot***} dynamic-power-management {enable | disable}**

Syntax Definitions

chassis	The chassis on which dynamic power management is being enabled or disabled.
chassis/slot	The particular slot on which dynamic power management is being enabled or disabled.
enable	Enables dynamic power management on the specified chassis or slot.
disable	Disables dynamic power management on the specified chassis or slot.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Enabling this feature allows the unused allocated PoE power of an NI to be allocated to other NIs.
- Slot ranges are supported in the command line syntax.

Examples

```
-> lanpower slot 1/1 dynamic-power-mgmt enable
-> lanpower chassis 1 dynamic-power-mgmt disable
```

Release History

Release 8.3.1; command was introduced.

MIB Objects

N/A

lanpower update-from

This command is used to update the PoE microcontroller firmware.

lanpower slot {*chassis/slot* | **all}** **update-from** *filename*

Syntax Definitions

chassis/slot	The slot to be updated.
all	Update all the chassis in a virtual chassis.
filename	The file name of the PoE firmware.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- The binary file must be placed in the ***/flash*** directory of the Master.
- Once started, console messages will be displayed during the update procedure which may take up to 10 minutes.
- The lanpower service must be disabled during the update and minimal load should be placed on the switch. The update process must be allowed to finish prior to unplugging or configuring the units.

Examples

```
-> lanpower slot 1/1 update-from poe_binary_version.bin
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show lanpower update-from	Displays current PoE firmware update status.

MIB Objects

N/A

lanpower 4pair

This command is used to configure 2-pair or 4-pair PoE mode.

lanpower {slot *chassis/slot* | **port** *chassis/slot/port-port*} **4pair {enable | disable}**

Syntax Definitions

chassis/slot	The slot on which to configure the PoE mode.
chassis/slot/port-port	The port(s) on which to configure the PoE mode.

Defaults

parameter	default
enable | disable	enabled

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- This command is applicable for 4-pair high power PoE ports to deliver 60 watts or more.
- When 4-pair mode is enabled the switch will consider Alt-A and Alt-B pairs for PoE.
- When 4-pair mode is disabled the switch will only consider Alt-A pairs for PoE.
- When 4-pair mode is disabled the maximum PoE power for the port is 30W.

Examples

```
-> lanpower slot 1/1 4pair enable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

show lanpower slot	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethPsePort4PairStatus
```

lanpower power-over-hdmi

This command is used to configure power over HDMI (PoH).

lanpower {slot *chassis/slot* | **port** *chassis/slot/port-port*} **power-over-hdmi {enable | disable}**

Syntax Definitions

chassis/slot	The slot on which to configure PoH.
chassis/slot/port-port	The port(s) on which to configure PoH.

Defaults

parameter	default
enable | disable	OS6860E-P24Z8 - enabled All other platforms - disabled

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is only support on OS6860E models and only on 4-pair HPoE ports.
- This command is used for supporting IEEE802.3bt specific Aruba AP5xx access points on OS6860E 4-pair ports.

Examples

```
-> lanpower slot 1/1 power-over-hdmi enable
-> lanpower port 1/1/1 power-over-hdmi enable
```

Release History

Release 8.6R2; command was introduced.

Related Commands

show lanpower slot	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethPowerPortTable
   alaPethPsePortPowerOverHdmi
```

lanpower 802.3bt

This command is used to enable IEEE 802.3bt functionality.

lanpower {slot *chassis/slot*} **802.3bt {enable | disable}**

Syntax Definitions

chassis/slot	The slot on which to enable or disable 802.3bt.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6560

Usage Guidelines

- This command can only be executed when the lanpower service is stopped.
- Only applicable on a slot basis, 802.3bt cannot be configured on individual ports.

Examples

```
-> lanpower slot 1/1 802.3bt enable
```

Release History

Release 8.6R2; command was introduced.

Related Commands

show lanpower slot	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alapethMainPseDot3bt
```

show lanpower slot

Displays the PoE status and related statistics for all ports in a specified slot.

show lanpower slot *chassis/slot*

Syntax Definitions

chassis	The virtual chassis ID for which current inline power status and related statistics are to be displayed.
slot	The slot for which current inline power status and related statistics are to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1
Port Maximum(mW) Actual Used(mW)   Status    Priority   On/Off   Class   Type
----+-----------+---------------+-----------+---------+--------+-------+----------
  1     60000            0       Powered Off    Low      OFF       .
  2     60000            0       Powered Off    Low      OFF       .
  3     60000            0       Powered Off    Low      OFF       .
  4     60000            0       Powered Off    Low      OFF       .
  5     30000            0       Powered Off    Low      OFF       .
  6     30000            0       Powered Off    Low      OFF       .
  7     30000            0       Powered Off    Low      OFF       .
  8     30000            0       Powered Off    Low      OFF       .
  9     30000            0       Powered Off    Low      OFF       .
 10     30000            0       Powered Off    Low      OFF       .
...
 45     30000            0       Powered Off    Low      OFF       .
 46     30000            0       Powered Off    Low      OFF       .
 47     30000            0       Powered Off    Low      OFF       .
 48     30000            0       Powered Off    Low      OFF       .

ChassisId 1 Slot 1 Max Watts 780
0 Watts Total Power Budget Used
750 Watts Total Power Budget Available
1 Power Supplies Available
BPS power: Not Available
```

output definitions

Port	A PoE port for which current status and related statistics are being displayed.
Maximum (mW)	The current maximum amount of power available to the corresponding PoE port, in milliwatts. For more information on this parameter, including default values and changing the settings, refer to the **lanpower power** command.
Actual Used (mW)	The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.
Status	Displays the port's current operational status. Options include **Powered On**, **Powered Off**, **Searching**, **Fault**, **Deny** and **Test**. **Powered On** indicates that PoE power activation is complete and the attached device is receiving power. **Powered Off** indicates that no PoE device is attached and/or the port is not receiving PoE power. **Searching** indicates that PoE activation has started and a powered device PD has been detected, but activation or class detection is incomplete. **Fault** indicates that PoE activation or class detection has failed. **Deny** indicates that PoE power management has denied power to the port due to priority disconnect or over subscription. **Test** indicates that the port has been forced on and will remain on until it is forced off by RTP functions.
Priority	The current priority level for the corresponding PoE port. Options include **Critical**, **High**, and **Low**. **Critical** should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. **High** indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. **Low** priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports). The default value is Low. Priority levels can be changed using the **lanpower priority** command.
On/Off	Displays whether a port has been manually turned on or off by the user. **ON** indicates that the port has been turned on by the user via the **lanpower service** command. **OFF** is the default value and can also indicate that the port has been turned off by the user via the **lanpower service** command.
Class	PoE class detected on the attached Powered Device. See the **lanpower class-detection** command on page 2-21 for more information.
Type	A user-defined name port type (i.e., text string) for the port. See the **lanpower type** command on page 2-5 for more information.
Max Watts	The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the **lanpower maxpower** command.
Actual Power Consumed	The amount of power being used by attached PoE devices.

output definitions (continued)

Actual Power Budget Remaining	The amount of power budget remaining for PoE. If the total power budget remaining is exceeded, a power error will occur and the switch's chassis management software will begin shutting down power to PoE ports according to their priority levels.
Total Power Budget Available	The total amount of power budget available for PoE.
Power Supplies Available	The number of power supplies currently installed and operating in the switch.
*****	An asterisk indicates a 4-pair PoE port is operating in 2-pair mode.

Release History

Release 8.1.1; command was introduced.

show lanpower power-rule

Displays current PoE power rule settings.

show lanpower power-rule [*name***]**

Syntax Definitions

name	The name of an existing power rule.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

Entering the **show lanpower power-rule** command without the *name* string provides top-level information for all existing power rules. To view detailed information for a particular rule (e.g., timer and timezone settings, etc.), specify the *name* string in the command line.

Examples

```
-> show lanpower power-rule
Power-Rule                          Admin-state   Power
-----------------------------------+------------+--------------------
test                                 Disabled      Off

-> show lanpower power-rule test
                Power-Rule                :     test
                Admin-state               :     Disabled
                Power                     :     Off
                At HH:MM                  :     00:00
                Day-of-Week               :     All
                Month-of-Year             :     All
                Timezone                  :     Local
```

output definitions

Power-Rule	The name(s) of existing PoE power rule(s).
Admin-state	The port PoE status assigned to the rule. Refer to page 2-16 for more information.
Power	The PoE power status assigned to the rule. Refer to page 2-16 for more information.
At HH:MM	The time of day the power rule takes effect. Refer to page 2-16 for more information.

output definitions (continued)

Day-of-Week	The day of the week the power rule takes effect. Refer to page 2-17 for more information.
Month-of-Year	The month of year the power rule takes effect.Refer to page 2-17 for more information.
Timezone	The timezone under which the power rule takes effect. Options include **local-server**, **originator-server** and **utc**. Refer to page 2-17 for more information.

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-rule	Specifies user-defined power rules that can be assigned to PoE ports.

MIB Objects

N/A

show lanpower power-policy

Displays existing power policies assigned to a slot, port or rule.

show lanpower power-policy [*policy-name* **slot** | *policy-name* **power-rule** | *policy-name* **port**]

Syntax Definitions

policy-name	The text string for an existing power policy.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

Entering the **show lanpower power-policy** command without the *policy-name* string provides top-level information for all existing policies, including associated power rules (if any). To view detailed information for a particular policy, specify the *policy-name* string in the command line, along with the policy's associated slot, port or rule. See Examples below for additional information.

Examples

```
-> show lanpower power-policy
Power-Policy name                   Power-rules
-----------------------------------+-----------------------------------
Mar25                               RuleTest2

-> show lanpower power-policy Mar25 power-rule
            Power-Policy name             : Mar25
                  Power-rules             : RuleTest2
```

output definitions

Power-Policy name	The names of existing PoE power policies.
Power-rules	The power rules associated with the existing power policies.

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-policy	Allows users to bind existing power rules to particular slots or ports.

MIB Objects

N/A

show lanpower class-detection

Displays class detection status on a specified slot.

show lanpower {chassis *chassis* | **slot** *chassis/slot* **} class-detection**

Syntax Definitions

chassis	The chassis for which class detection is being displayed.
chassis/slot	The slot for which class detection is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

- Although class-detection is disabled by default, the OmniSwitch 6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> show lanpower slot 1/1 class-detection
Class Detection disabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower class-detection	Enables or disables class detection of attached devices.

MIB Objects

N/A

show lanpower capacitor-detection

Displays capacitor detection status on a specified slot.

show lanpower {chassis *chassis* | **slot** *chassis/slot* **} capacitor-detection**

Syntax Definitions

chassis	The chassis for which capacitor detection is being displayed.
chassis/slot	The slot for which capacitor detection is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1 capacitor-detection
Capacitor Detection disabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower capacitor-detection	Enables or disables the capacitor detection method.

MIB Objects

N/A

show lanpower priority-disconnect

Displays current priority disconnect status for a specified slot.

show lanpower {chassis *chassis* | **slot** *chassis/slot* **} priority-disconnect**

Syntax Definitions

chassis	The chassis on which priority disconnect status is being displayed.
chassis/slot	The particular slot on which priority disconnect status is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower priority-disconnect	Enables or disables the priority disconnect function on all ports in a specified slot.

MIB Objects

N/A

show lanpower ni-priority

Displays current Network Interface (NI) modules status for a specified chassis or slot.

show lanpower {chassis *chassis* | **slot** *chassis/slot* **} ni-priority**

Syntax Definitions

chassis	The chassis on which NI priority is being displayed.
chassis/slot	The particular slot on which NI priority is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

Release History

Release 8.3.1; command was introduced.

Related Commands

lanpower ni-priority	Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.

MIB Objects

N/A

show lanpower usage-threshold

Displays current usage threshold, in percent.

show lanpower {chassis *chassis* | **slot** *chassis/slot* **} usage-threshold**]

Syntax Definitions

chassis	The chassis on which priority disconnect status is being displayed.
chassis/slot	The particular slot on which priority disconnect status is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1 usage-threshold
Usage Threshold 99% on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower usage-threshold	Sets a slot-wide threshold for PoE power usage, in percent.

MIB Objects

N/A

show lanpower update-from

Displays the PoE firmware update status.

show lanpower slot {*chassis/slot* **| all} update-from**

Syntax Definitions

chassis/slot	Display the update status for a slot.
all	Display the update status for all chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 9900

Usage Guidelines

This command can be used to display the update progress from a remote session such as Telnet or SSH.

Examples

```
-> show lanpower slot all update-from
Tue Apr  8 16:48:16 : lpCmm LanCmm info message:
+++ Reprogramming Sequence Started  0 chassisId 1 slot 1
+++ Reprogramming Sequence Started  0 chassisId 2 slot 1

Tue Apr  8 16:48:19 : lpCmm LanCmm info message:
+++ Controller Memory Sequence Begining 0 chassisId 1 slot 1
+++ Controller Memory Sequence Begining 0 chassisId 2 slot 1

Tue Apr  8 16:48:33 : lpCmm LanCmm info message:
+++ Controller Memory Please Wait... 0 chassisId 1 slot 1
+++ Controller Memory Please Wait... 0 chassisId 2 slot 1

Tue Apr  8 16:52:22 : lpCmm LanCmm info message:
+++ Reprogram Pass 0 chassisId 1 slot 1
+++ Reprogram Pass 0 chassisId 2 slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower update-from	This command is used to update the PoE microcontroller firmware.

MIB Objects

3 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, and so on. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

Filename: ALCATEL-IND1-UDLD-MIB.mib
Module: alcatelIND1UDLDMIB

A summary of available commands is listed here:

Configuration procedures for UDLD are explained in "Configuring UDLD," *OmniSwitch AOS Release 8 Network Configuration Guide*.

udld

Globally enables or disables UDLD protocol on the switch.

udld {enable | disable}

Syntax Definitions

enable	Globally enables UDLD on the switch.
disable	Globally disables UDLD on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Auto-negotiation should be disabled on both ends of the link for UDLD to operate properly.
- The port shutdown by this command can be reset by using the **interfaces admin** command.

Examples

```
-> udld enable
-> udld disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld port	Enables or disables UDLD status on a specific port or a range of ports.
show udld configuration	Displays the global status of UDLD configuration.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
   alaUdldGlobalConfigUdldStatus
```

udld port

Enables or disables UDLD status on a specific port or a range of ports.

udld port *chassis/slot/port***[**-*port2***] {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number.
enable	Enables UDLD status on a port.
disable	Disables UDLD status on a port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Auto-negotiation should be disabled on both ends of the link for UDLD to operate properly.
- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is supported on link aggregate member ports.

Examples

```
-> udld port 1/1/3 enable
-> udld port 1/1/6-10 enable
-> udld port 1/2/4 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldStatus
```

udld mode

Configures the UDLD operational mode on a specific port, a range of ports, or all ports.

udld [port [*chassis/slot/port***[-***port2***]] mode {normal | aggressive}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number.
normal	Specifies UDLD operation in the normal mode.
aggressive	Specifies UDLD operation in the aggressive mode.

Defaults

parameter	default
normal | aggressive	**normal**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- In case of faulty cable connection, the port which is configured in normal mode of operation is considered to be in the shutdown state.

Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/1/3 mode aggressive
-> udld port 1/2/4 mode normal
-> udld port 1/2/9-18 mode aggressive
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldMode
```

udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all ports. Probe messages are transmitted periodically after this timer expires.

udld [port [*chassis/slot/port***[-***port2***]] probe-timer** *seconds*

no udld [port [*chassis/slot/port***[-***port2***]] probe-timer**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number.
seconds	The probe-message transmission interval, in seconds.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

Examples

```
-> udld probe-timer 20
-> udld port 1/1/3 probe-timer 16
-> udld port 1/1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/1/3 probe-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldProbeIntervalTimer
```

udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

udld [port [*chassis/slot/port***[-***port2***]] echo-wait-timer** *seconds*

no udld [port [*chassis/***]***slot/port***[-***port2***]] echo-wait-timer**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number.
seconds	The echo based detection period, in seconds.

Defaults

parameter	default
seconds	8

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

Examples

```
-> udld echo-wait-timer 9
-> udld port 1/1/5 echo-wait-timer 12
-> udld port 1/1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/1/3 echo-wait-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldDetectionPeriodTimer
```

clear udld statistics port

Clears the UDLD statistics for a specific port or for all the ports.

clear udld statistics [port *chassis/slot/port***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

Examples

```
-> clear udld statistics port 1/1/4
-> clear udld statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld statistics port	Displays the UDLD statistics for a specific port.

MIB Objects

```
alaUdldGlobalClearStats
```

show udld configuration

Displays the global status of UDLD configuration.

show udld configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show udld configuration

Global UDLD Status                : disabled,
Global UDLD Mode                  : normal,
Global UDLD Probe Timer (Sec)     : 15,
Global UDLD Echo-Wait Timer (Sec) : 8
Global UDLD Status : Disabled
```

output definitions

Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.
Global UDLD Mode	Indicates the UDLD mode on the switch. Options include **normal** or **aggressive**.
Global UDLD Probe Timer (Sec)	A probe-message is expected after this time period.
Global UDLD Echo-Wait Timer (Sec)	The detection of neighbor is expected with in this time period.
Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
   alaUdldGlobalConfigUdldStatus
```

show udld configuration port

Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

show udld configuration port [*chassis/slot/port***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number.

Defaults

By default, a list of all UDLD ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show udld configuration port

Slot/Port    Admin State    Oper Mode    Probe-Timer    Echo-Wait-Timer

Probe Timer (Sec)            : 77,
Echo-Wait Timer (sec)        : 8
```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
UDLD-State	Indicates the state of interface determined by UDLD operation, which can be **notapplicable, shutdown, undetermined** or **bidirectional**.
Oper-Mode	Indicates the operational mode of UDLD protocol. Options include **normal** or **aggressive**.
Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.
Port UDLD Status	Indicates the UDLD status on a port. Options include **enable** or **disable**.
Probe Timer	A probe-message is expected after this time period.
Echo-Wait Timer	The detection of neighbor is expected with in this time period.

Release History

Release 7.1.1; command introduced.

Related Commands

udld mode	Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.
udld probe-timer	Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports.
udld echo-wait-timer	Configures the echo based detection timer on a specific port, a range of ports, or all the ports.

```

4 Source Learning Commands

The Source Learning capability of OmniSwitch is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

Filename: ALCATEL-IND1-MAC-ADDRESS-MIB.mib
Module: alcatelIND1MacAddressMIB

A summary of the available commands is listed here:

mac-learning

Configures the status of source MAC address learning on a VLAN, a single port, a range of ports, or on a link aggregate of ports.

mac-learning {vlan *vlan***[-***vlan2***] | port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***} {enable | disable}**

Syntax Definitions

*vlan***[-***vlan2***]**	The VLAN ID number. Use a hyphen to specify a range of VLAN IDs.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate ID number.
enable	Enables source learning.
disable	Disables source learning.

Defaults

By default, source learning is enabled on all ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Configuring source learning is not supported on Learned Port Security (LPS) and Universal Network Profile (UNP) ports, as well as individual ports that are members of a link aggregate.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source learning is disabled on a port or link aggregate, dynamic learning of MAC addresses is stopped.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates on which source learning is disabled.
- Disabling source learning on a port or link aggregate is useful on a ring configuration, where switch A does not have to learn MAC addresses from switch B, or for a Transparent LAN Service, where service provider does not require the MAC addresses of the customer network.
- Disabling source learning on a port or link aggregate is not supported on the OmniSwitch 9900.

Examples

```
-> mac-learning port 1/2 enable
-> mac-learning linkagg 10 disable
-> mac-learning vlan 10 disable
```

Release History

Release 7.1.1; command added.

Related Commands

show mac-learning learning-state	Displays the source learning status of a port or link aggregate on the switch.

MIB Objects

```
slMacLearningVlanControlTable
   slMacLearningVlanControlStatus
slMacLearningControlTable
   slMacLearningControlStatus
```

mac-learning flush

Clears the specified MAC addresses from the Source Learning MAC Address Table on the local switch.

mac-learning flush {dynamic | static | multicast} [mac-address *mac_address***]**

Syntax Definitions

dynamic	Clears dynamically learned MAC addresses.
static	Removes static MAC addresses.
multicast	Removes static multicast MAC addresses.
mac_address	Enter the MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c).

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table.
- Static unicast and static multicast addresses are removed. This command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush dynamic
-> mac-learning flush dynamic mac-address 00:00:39:59:f1:0c
-> mac-learning flush static
-> mac-learning flush static mac-address 00:00:39:59:f1:0d
-> mac-learning flush multicast
-> mac-learning flush multicast mac-address 01:25:9a:5c:2f:10
```

Release History

Release 7.3.1; command added.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
alaSlMacAddressGlobalTable
   slMacAddressGblManagement
   slMacAddressGblRowStatus
```

mac-learning flush domain all

Clears the specified MAC addresses from the Source Learning MAC Address Table for all learning domains on the local switch.

mac-learning flush domain all {dynamic | static}

Syntax Definitions

dynamic	Clears dynamically learned MAC addresses from all of the domains.
static	Removes static MAC addresses from all of the domains.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for all domains.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain all dynamic
-> mac-learning flush domain all static
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
mac-learning flush domain l2gre	Clears MAC addresses from the L2 GRE tunnel learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
alaSlMacAddressGlobalTable
   slMacAddressGblManagement
   slMacAddressGblRowStatus
```

mac-learning flush domain vlan

Clears the specified MAC addresses from the Source Learning MAC Address Table for the VLAN learning domain on the local switch.

mac-learning flush domain vlan {vlan *vlan_id***} {port** *chassis/slot/port* **| linkagg** *agg_id***} | {dynamic | static | static-multicast} [mac-address** *mac_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	Enter a link aggregate ID number.
dynamic	Clears dynamically learned MAC addresses from the VLAN domain.
static	Removes static MAC addresses from the VLAN domain.
static-multicast	Removes static multicast MAC addresses from the VLAN domain.
mac_address	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the VLAN domain.
- Static unicast and static multicast addresses are removed.
- The **static-multicast** parameter is *not* available for use with the following **mac-learning flush** commands:
  - **mac-learning flush domain all**
  - **mac-learning flush domain spb**
  - **mac-learning flush domain vxlan**
  - **mac-learning flush domain l2gre**
  - **mac-learning flush domain local**
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain vlan vlan 20 port 1/2 dynamic
-> mac-learning flush domain vlan static
-> mac-learning flush domain vlan linkagg 10 static
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
mac-learning flush domain l2gre	Clears MAC addresses from the L2 GRE tunnel learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
alaSlMacAddressGlobalTable
   slMacAddressGblManagement
   slMacAddressGblRowStatus
```

mac-learning flush domain spb

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Shortest Path Bridging (SPB) learning domain on the local switch.

mac-learning flush domain spb {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| isid** *instance_id***} {dynamic | static} [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing SPB service ID.
chassis	The chassis identifier.
slot/port:encap	The SPB access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for an SPB Service Access Point (SAP).
sdp_id[:*service_id*]	Clears MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are cleared.
instance_id	An SPB backbone service instance identifier (I-SID).
dynamic	Clears dynamically learned MAC addresses from the SPB domain.
static	Removes static MAC addresses from the SPB domain.
mac_address	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the SPB domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain spb dynamic
-> mac-learning flush domain spb sap 1/12:0 dynamic
-> mac-learning flush domain spb serviceid 10 isid 1500 dynamic
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
mac-learning flush domain l2gre	Clears MAC addresses from the L2 GRE tunnel learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
alaSlMacAddressGlobalTable
   slMacAddressGblManagement
   slSvcISID
   slMacAddressGblRowStatus
```

mac-learning flush domain vxlan

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Virtual eXtensible LAN (VXLAN) learning domain on the local switch.

mac-learning flush domain vxlan {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| vnid** *vxlan_id***} {dynamic | static} [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing VXLAN service ID.
chassis	The chassis identifier.
slot/port:encap	The VXLAN access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for a VXLAN Service Access Point (SAP).
sdp_id[:*service_id*]	Clears MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
vxlan_id	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1– 2147483647 (or 000.000.001–255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).
dynamic	Clears dynamically learned MAC addresses from the VXLAN domain.
static	Removes static MAC addresses from the VXLAN domain.
mac_address	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the VXLAN domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain vxlan dynamic
-> mac-learning flush domain vxlan sap 1/12:0 dynamic
-> mac-learning flush domain vxlan serviceid 10 vnid 23000 dynamic
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
mac-learning flush domain l2gre	Clears MAC addresses from the L2 GRE tunnel learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

   slVxLanVnID
   slMacAddressGblRowStatus
```

mac-learning flush domain l2gre

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Layer 2 Generic Routing Encapsulation (L2 GRE) learning domain on the local switch.

mac-learning flush domain l2gre {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| vpnid** *vpn_id***} {dynamic | static} [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing L2 GRE service ID.
chassis	The chassis identifier.
slot/port:encap	The access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for an L2 GRE Service Access Point (SAP).
sdp_id[:*service_id*]	Clears MAC addresses learned on an L2 GRE Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
vpn_id	A tunnel ID that identifies a GRE tunnel VPN.
dynamic	Clears dynamically learned MAC addresses from the L2 GRE domain.
static	Removes static MAC addresses from the L2 GRE domain.
mac_address	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6860, 6865, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the L2 GRE tunnel domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain l2gre dynamic
-> mac-learning flush domain l2gre sap 1/1/12:0 dynamic
-> mac-learning flush domain l2gre serviceid 10 vpnid 200 dynamic
```

Release History

Release 8.4.1.R02; command introduced.

mac-learning flush domain local

Clears the specified MAC addresses from the Source Learning MAC address table for the local service learning domain.

mac-learning flush domain local serviceid *service_id* **[sap** *chassis/slot/port:encap***] static [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing service ID.
chassis	The chassis identifier.
slot/port:encap	The service access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for a Service Access Point (SAP).
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the service domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain local serviceid 10 static
-> mac-learning flush domain local serviceid 20 sap 1/1/13:20 static
```

Release History

Release 7.3.1; command added.

mac-learning static mac-address

Configures a static destination unicast MAC address. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured MAC address, then they are forwarded to the specific MAC address port.

mac-learning {vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***}} static mac-address** *mac_address* **[bridging | filtering]**

mac-learning flush [vlan *vlan_id* **[port** *chassis/slot/port* | **linkagg** *agg_id***]] static [mac-address** *mac_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1) that is assigned to the static MAC address.
agg_id	Enter a link aggregate ID number. See Chapter 12, "Link Aggregation Commands."
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.

Defaults

parameter	default
bridging | filtering	bridging

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static addresses are removed.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.

- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c bridging
-> mac-learning vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01 filtering
-> mac-learning flush vlan 500 static
-> mac-learning flush vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c
-> mac-learning flush vlan 20 linkagg 5 static
-> mac-learning flush static
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1: **mac-learning flush** command replaced the **no mac-learning** command.

Related Commands

mac-learning domain vlan static mac-address

Configures a static destination unicast MAC address in the VLAN source learning domain. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured static MAC address, then they are forwarded to the specific MAC address port.

mac-learning domain vlan vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *agg_id***} static mac-address** *mac_address* **[bridging | filtering]**

mac-learning flush domain vlan [vlan *vlan_id* **[port** *chassis/slot/port* | **linkagg** *agg_id***]] static [mac-address** *mac_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1) that is assigned to the static MAC address.
agg_id	Enter a link aggregate ID number. See Chapter 12, "Link Aggregation Commands."
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.

Defaults

parameter	default
bridging | filtering	bridging

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static addresses are removed.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.

- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning domain vlan vlan 10 port 1/1/10 static mac-address
00:00:39:59:f1:0c bridging
-> mac-learning domain vlan vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01
filtering
-> mac-learning flush domain vlan vlan 500 static
-> mac-learning flush domain vlan vlan 10 port 1/1/10 static mac-address
00:00:39:59:f1:0c

mac-learning flush domain spb {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| isid** *instance_id***} static [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing SPB service ID.
instance_id	An SPB backbone service instance identifier (I-SID).
chassis	The chassis identifier.
slot/port:encap	The SPB access port and encapsulation (**0**, *qtag*, or *outer_qtag.inner_qtag*) for an SPB Service Access Point (SAP).
sdp_id:*service_id*	The SPB Service Distribution Point (SDP) ID number and service ID number for a specific binding.
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.

Defaults

parameter	default
bridging | filtering	bridging

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static addresses are removed.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.

- If a packet received on an access port associated with the same SAP contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning domain spb serviceid 10 sap 1/1/12:0 static mac-address
00:00:39:59:f1:0c bridging
-> mac-learning domain spb isid 1500 sap 1/1/12:0 static mac-address
00:00:39:59:f1:0c filtering
-> mac-learning flush domain spb static
-> mac-learning flush domain spb sap 1/1/12:0 static mac-address 00:00:39:59:f1:0c
-> mac-learning flush domain spb serviceid 10 isid 1500 static
```

Release History

Release 7.3.1; command added.

mac-learning domain vxlan static mac-address

Configures a static destination unicast MAC address in the Virtual eXtensible LAN (VXLAN) source learning domain

mac-learning domain vxlan {serviceid *service_id* **{sap** *chassis/slot/port:encap* **| vnid** *vxlan_id* **[sap** *chassis/slot/port:encap***]} static mac-address** *mac_address* **[bridging | filtering]**

mac-learning domain vxlan vnid *vxlan_id* **sap** *chassis/slot/port:encap* **static mac-address** *mac_address* **[bridging | filtering]**

mac-learning flush domain vxlan {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| vnid** *vxlan_id***} static [mac-address** *mac_address***]**

Syntax Definitions

service_id	An existing VXLAN service ID.
chassis	The chassis identifier.
slot/port:encap	The VXLAN access port and encapsulation (*qtag*, or *outer_qtag.inner_qtag*) for a VXLAN Service Access Point (SAP).
vxlan_id	A 24-bit numerical value that identifies an existing VXLAN segment (a VXLAN network ID).
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.
sdp_id[:*service_id*]	Use this parameter with the **mac-learning flush** command to specify a VXLAN Service Distribution Point (SDP) ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are cleared.

Defaults

parameter	default
bridging | filtering	bridging

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC address table. Note that If no parameters are specified with this command, then all static addresses are removed.

- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.
- If a packet received on an access port associated with the same SAP contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning domain vxlan serviceid 10 sap 1/1/12:10 static mac-address
00:00:39:59:f1:0c bridging
-> mac-learning domain vxlan vnid 23000 sap 1/1/12:10 static mac-address
00:00:39:59:f1:0c filtering
-> mac-learning flush domain vxlan static
-> mac-learning flush domain vxlan sap 1/12:0 static
-> mac-learning flush domain vxlan serviceid 10 vnid 23000 static
```

mac-learning multicast mac-address

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

mac-learning {vlan *vlan_id* **{port** *chassis/slot/port* **| linkagg** *agg_id* **}} multicast mac-address** *multicast_address* **[group** *group_id***]**

mac-learning flush [vlan *vlan_id* **[port** *chassis/slot/port* **| linkagg** *agg_id* **]] multicast [mac-address** *multicast_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The egress slot and port number (3/1) that is assigned to the static multicast MAC address.
agg_id	Enter a link aggregate ID number. See Chapter 12, "Link Aggregation Commands."
multicast_address	Enter the destination multicast MAC Address to add to the MAC Address Table (for example, 01:00:39:59:f1:0c).
group_id	*This keyword cannot be user defined.*

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **mac-learning flush** command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, and so on, are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-learning vlan multicast mac-address** command. Also note that multicast addresses within the following ranges are not supported:

  01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
  01:80:C2:XX.XX.XX
  33:33:XX:XX:XX:XX

- The configured (static) multicast MAC address is assigned to a fixed switch port or link aggregate ID and VLAN.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **boot.cfg** file includes the "**group** *group_id*" as the additional syntax for the **mac-learning static-multicast** command. The "**group** *group_id*" indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance.
- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **boot.cfg** file.

Examples

```
-> mac-learning vlan 1500 port 1/10 multicast mac-address 01:25:9a:5c:2f:10
-> mac-learning vlan 355 port 4/2-10 multicast mac-address 01:25:9a:5c:2f:11
-> mac-learning vlan 455 linkagg 10 multicast mac-address 01:25:9a:5c:2f:12
-> mac-learning flush vlan 500 multicast
-> mac-learning flush vlan 1500 port 1/10 multicast mac-address 01:25:9a:5c:2f:10
-> mac-learning flush vlan 455 linkagg 10 multicast mac-address 01:25:9a:5c:2f:12
-> mac-learning flush multicast
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **mac-learning flush** command replaced the **no mac-learning command**.

Related Commands

   slMacAddressGblDisposition
```

mac-learning aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

mac-learning aging-time {*seconds* **| default}**

no mac-learning aging-time

Syntax Definitions

seconds	Aging time value (in seconds). Do not use commas in value.
default	The aging time is set to the default value of 300 seconds.

Defaults

By default, the aging time is set to 300 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **default** parameter to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported.
- Note that an inactive MAC address can take up to twice as long as the aging time value specified to be removed from the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC address ages out any time between 60 and 120 seconds of inactivity.
- When a new MAC aging time is set, the aging process could take up to 3 aging cycles to age out the inactive macs. This only applies to the first time the aging time is set. Subsequent aging processes can take up to twice as long as the aging time value as described above.
- The MAC address table aging time is also used as the timeout value for the Address Resolution Protocol (ARP) table. This timeout value determines how long the switch retains dynamically learned ARP table entries.

Examples

```
-> mac-learning aging-time 1200
-> mac-learning aging-time default
```

Release History

Release 7.1.1; command introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.
show mac-learning aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

mac-learning mode

Specifies the source learning mode for the chassis.

mac-learning mode [centralized | distributed]

Syntax Definitions

centralized	Enables centralized MAC source learning mode.
distributed	Enables distributed MAC source learning mode.

Defaults

By default, centralized MAC source learning mode is enabled for the chassis.

Platforms Supported

Not supported in this release.

Usage Guidelines

After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.

Examples

```
-> mac-learning mode centralized
-> mac-learning mode distributed
```

Release History

Release 7.1.1; command introduced.

Related Commands

show mac-learning mode	Displays the current status of the MAC source learning mode.

MIB Objects

```
slDistributedMacMode
```

show mac-learning

Displays Source Learning MAC Address Table information for the switch.

show mac-learning [summary | dynamic | static | multicast | bmac] [port *chassis/slot/port***] [linkagg** *agg_id***] [mac-address** *mac_address***] [remote [mac-address** *mac_address***]]**

Syntax Definitions

summary	Displays a summary of all the MAC address information.
dynamic	Displays only dynamically learned MAC addresses.
static	Displays only static MAC addresses with a permanent status.
multicast	Displays only multicast MAC addresses.
bmac	Displays only backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a Shortest Path Bridging (SPB) switch.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all MAC addresses contained in the table.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurence, a “&” will appear to the right of the address in the **show mac-learning** command display.

Examples

```
-> show mac-learning summary
Mac Address Table Summary:

   Domain       Static     Static-Multicast       Bmac        Dynamic

output definitions

Domain	The domain in which the MAC address was learned or statically configured (**VLAN**, **SPB, VXLAN, L2GRE**).
Vlan/ServcId/[ISId/vnID]	This field contains one of the following values depending on the domain type associated with the MAC address: • The VLAN ID number. • The SPB or VXLAN service ID number. • The ISID number associated with the SPB service ID number. • The VXLAN Network ID (VNID) number associated with the VXLAN service ID. • The GRE tunnel VPN ID number associated with the L2 GRE tunnel service ID.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (**dynamic, static, bmac).**
Operation	The disposition of the MAC address (**bridging**, **filtering**, **servicing**).
Interface	The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29). In the service domain, the Service Access Point (SAP) or the Service Distribution Point (SDP) associated with the MAC address is displayed.

Release History

Release 7.1.1; command introduced.
Release 7.3.1; show command display modified to include domain and service information.
Release 7.3.4; **vnID** field added.

Related Commands

```

show mac-learning domain all

Displays MAC Address Table information for all source learning domains.

show mac-learning domain all [summary]

Syntax Definitions

summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain all summary

show mac-learning domain vlan

Displays MAC Address Table information for the VLAN source learning domain.

show mac-learning domain vlan [vlan *vlan_id***] [port** *chassis/slot/port* **| linkagg** *agg_id***] [dynamic | static | static-multicast | bmac] [mac-address** *mac_address***] [summary]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1) that is assigned to the static MAC address.
agg_id	A link aggregate ID number.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
static-multicast	Displays static multicast MAC addresses. This parameter applies only to the VLAN domain.
bmac	Displays backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a SPB switch. This parameter applies only to the VLAN domain.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the VLAN domain are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain vlan summary
Mac Address Table Summary:

   Domain       Static     Static-Multicast       Bmac        Dynamic
------------+------------+------------------+-----------+------------
    VLAN               0                  0          12           17

Total MAC Address In Use  = 29

-> show mac-learning domain vlan
Legend: Mac Address: * = address not valid,

        Mac Address: & = duplicate static address,

Domain Vlan/SrvcId/[ISId/vnID]   Mac Address      Type    Operation    Interface

```

output definitions

Domain	The domain in which the MAC address was learned or statically configured.
Vlan/ServcId/[ISId/vnID]	The VLAN ID number associated with the MAC address.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (**dynamic, static, bmac).**
Operation	The disposition of the MAC address (**bridging**, **filtering**, **servicing**).
Interface	The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).

Release History

Release 7.1.1; command introduced.
Release 7.3.1; show command display modified to include domain information.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information for the switch.
show mac-learning domain spb	Displays MAC Address Table information for the Shortest Path Bridging (SPB) source learning domain.
show mac-learning domain vxlan	Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.
show mac-learning domain l2gre	Displays MAC Address Table information for the L2 GRE tunnel source learning domain.
show mac-learning aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
alaSlMacAddressGlobalTable
   slMacDomain

```

show mac-learning domain spb

Displays MAC Address Table information for the Shortest Path Bridging (SPB) source learning domain.

show mac-learning domain spb [isid *instance_id* | **serviceid** *service_id* **[isid** *instance_id***]] [sap** *chassis/slot/port:encap* | **bind-sdp** *sdp_id***[:***service_id***]] [dynamic | static] [mac-address** *mac_address***] [summary]**

Syntax Definitions

instance_id	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
service_id	An existing SPB service ID.
chassis/slot/port:encap	The SPB access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for an SPB Service Access Point (SAP). For example, 1/1/2:10.
mesh_id	A SPB service distribution point (SDP) ID.
*sdp_id***[:***service_id***]**	Displays MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the SPB domain are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```

show mac-learning domain vxlan

Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.

show mac-learning domain vxlan [vnid *vxlan_id* | **serviceid** *service_id* **[vnid** *vxlan_id***]] [sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id***[:***service_id***]] [dynamic | static] [mac-address** *mac_address***] [summary]**

Syntax Definitions

vxlan_id	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1– 2147483647 (or 000.000.001–255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).
service_id	An existing VXLAN service ID.
chassis/slot/port:encap	The VXLAN service access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for a VXLAN Service Access Point (SAP). For example, 1/1/2:10.
*sdp_id***[:***service_id***]**	Displays MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the VXLAN domain are displayed.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

show mac-learning domain l2gre

Displays MAC Address Table information for the Layer 2 Generic Routing Encapsulation (L2 GRE) source learning domain.

show mac-learning domain l2gre {serviceid *service_id* **| sap** *chassis/slot/port:encap* **| bind-sdp** *sdp_id*[:*service_id*] **| vpnid** *vpn_id***} {dynamic | static} [mac-address** *mac_address***] [summary]**

Syntax Definitions

service_id	An existing L2 GRE service ID.
chassis	The chassis identifier.
slot/port:encap	The access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for an L2 GRE Service Access Point (SAP).
sdp_id[:*service_id*]	Displays MAC addresses learned on an L2 GRE Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
vpn_id	A tunnel ID that identifies a GRE tunnel VPN.
dynamic	Displays dynamically learned MAC addresses from the specified domain.
static	Displays static MAC addresses from the specified domain.
mac_address	A specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned in the L2 GRE tunnel domain are displayed.

Platforms Supported

OmniSwitch 6860, 6865, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

```

output definitions

Domain	The domain in which the MAC address was learned or statically configured.
Vlan/ServcId/[ISId/vnID]	The L2 GRE service ID number and the GRE tunnel VPN ID number associated with the L2 GRE service ID.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (**dynamic, static, bmac).**
Operation	The disposition of the MAC address (**bridging**, **filtering**, **servicing**).
Interface	The L2 GRE tunnel Service Access Point (SAP) or Service Distribution Point (SDP) associated with the MAC address.

Release History

Release 8.4.1.R02; command introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information for the switch.

show mac-learning domain local

Displays MAC Address Table information for the local service source learning domain.

show mac-learning domain local [serviceid *service_id***] [sap** *chassis/slot/port:encap* **| dynamic | static | mac-address** *mac_address***] [summary]**

Syntax Definitions

service_id	An existing service ID.
chassis/slot/port:encap	The service access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for an SPB Service Access Point (SAP). For example, 1/1/2:10.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the local domain are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain local summary
Mac Address Table Summary:

   Domain       Static     Static-Multicast       Bmac        Dynamic
------------+------------+------------------+------------+------------

   slMacAddressGblRowStatus
   slMacAddressGblGroupField
   slSvcISID
```

show mac-learning aging-time

Displays the current aging time value for the Source Learning MAC Address Table.

show mac-learning aging-time

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Note that the aging time is the same for all VLANs because it is not configurable on a per-VLAN basis. The aging time value on this platform is a global parameter that applies to all VLANs.

Examples

```
-> show mac-learning aging-time
Mac Address Aging Time (seconds) = 300
```

Release History

Release 7.1.1; command introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

show mac-learning learning-state

Displays the source learning status of a VLAN, port, or link aggregate.

show mac-learning learning-state [vlan *vlan***[**-*vlan2***]** | **port** *chassis/slot/port* **| linkagg** *agg_id***]**

Syntax Definitions

vlan	The VLAN ID number.
-vlan2	The last VLAN ID in a range of VLAN IDs.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
agg_id	Specifies the link aggregate identifier.

Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** or **linkagg** keywords along with the port ID and link aggregate ID to display the source learning status for a specific port or link aggregate ID.
- Use the **vlan** keyword along with the VLAN ID or a range of VLAN IDs to display the source learning status for the specified VLAN or range of VLANs.
- Output display for a range of port IDs is supported with this command. However, output display for a range of link aggregate IDs is not supported.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, the source learning status cannot be configured on individual ports which are members of the link aggregate.

Example

```
-> show mac-learning learning-state

port  source-learning
-----+----------------
1/1    disabled
1/2    enabled
1/3    disabled
```

```
-> show mac-learning learning-state port 1/2

port  source-learning
-----+---------------
1/2    enabled

-> show mac-learning learning-state linkagg 10

port  source-learning
-----+---------------
0/10     disabled
```

output definitions

port	The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).
source-learning	The source learning status of the port or link aggregate (**enabled** or **disabled**). Configured through the **mac-learning** command.

```
-> show mac-learning learning-state vlan 1-5

    Vlan        Learning State
------------+--------------------
       1         Enabled
       5         Enabled
```

output definitions

Vlan	The VLAN ID numbers of the VLANs that are active.
Learning State	The MAC learning state of the VLANs.

Release History

Release 7.1.1; command introduced

Related Commands

mac-learning	Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

MIB Objects

```
slMacAddressTable
   slMacLearningControlTable
   slMacLearningControlEntry
   slMacLearningControlStatus
```

show mac-learning mode

Displays the current source learning mode (centralized or distributed) for the switch.

show mac-learning mode

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

N/A

Examples

```
-> show mac-learning mode
MAC Learning Mode Configuration = CENTRALIZED
New Configured MAC Learning Mode After Reboot = DISTRIBUTED

-> show mac-learning mode
MAC Learning Mode Configuration = DISTRIBUTED
```

Release History

Release 7.1.1; command introduced.

Related Commands

mac-learning mode	Enables or disables the distributed MAC source learning mode.

MIB Objects

```
slMacAddressTable
   slDistributedMacMode
```

mac-ping

Configure a MAC address ping for testing Layer 2 connectivity.

mac-ping dst-mac *mac_address* **vlan** *vlan_id* **[priority** *vlan_priority***] [drop-eligible** {**true** | **false**}**] [count** *count***] [interval** *delay***] [size** *size***] [isid-check** *isid***]**

Syntax Definitions

mac	The destination MAC address to ping.
vlan-id	The VLAN on which the packets will be sent out.Valid range is 1-4094.
vlan-priority	Specifies both the internal priority of the Mac ping and the 802.1p value on the vlan tag header. Valid range is 0-7.
true | **false**	Specifies both the internal drop precedence of the MAC ping and the CFI bit on the vlan tag header. Default is false.
count	The number of packets to send in one ping iteration.Valid range is 1–5.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
size	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
isid	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Defaults

parameter	default
vlan-priority	0
drop-eligible	false
count	5
delay	1000 ms
size	36 bytes

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The timeout for each ping request packet is one second. This value is not configurable.
- Destination MAC cannot be a broadcast, multicast, or NULL address.
- Enable the Network Time Protocol (NTP) using the NTP client command for a MAC address ping to work correctly across Virtual Chassis.

Examples

```
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10 count 5 size 100
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 1001 isid-check 1002
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

5 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP), add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

MIB information is as follows:

Filename: ALCATEL-IND1-VLAN-MGR-MIB.mib
Module: alcatelIND1VLANManagerMIB

A summary of the available commands is listed here:

VLAN Management Commands	**vlan** **vlan members untagged** **vlan members tagged** **vlan mtu-ip** **show vlan** **show vlan members**
Private VLAN Commands	**pvlan** **pvlan secondary** **pvlan members** **show pvlan** **show pvlan mapping** **show pvlan members**

vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

vlan *vlan_id* **[admin-state {enable | disable}] [name** *description***]**

no vlan *vlan_id*

Syntax Definitions

vlan_id	A numeric value that uniquely identifies an individual VLAN. This value becomes the VLAN ID for the new VLAN.
enable	Enable VLAN administrative status.
disable	Disable VLAN administrative status.
description	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration.
- All VLAN ports and routers are detached before the VLAN is removed. If the VLAN deleted is a default VLAN on the port, the port returns to default VLAN 1.
- If the VLAN deleted is not a default VLAN, then the ports are directly detached from the VLAN.
- A VLAN is not operationally active until at least one of the member ports of the VLAN is active and can forward traffic.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries (for example, **vlan 10-15**).
- When a VLAN is administratively disabled, static port assignments are retained but traffic is not forwarded from these ports.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.

Examples

```
-> vlan 200 name “Corporate VLAN”
-> vlan 720 admin-state disable
-> no vlan 1020
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan members untagged	Statically assigns ports to a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

vlan members untagged

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

vlan *vlan_id***[-***vlan_id***] members {port** *chassis/slot/port***[-***port1***] | linkagg** *agg_id***[-***agg_id***]} untagged**

no vlan *vlan_id***[-***vlan_id***] members {port** *chassis/slot/port***[-***port1***]| linkagg** *agg_id***[-***agg_id***]}**

Syntax Definitions

chassis	The chassis identifier.
vlan_id	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
*slot/port***[-***port1***]**	The slot number for the module and the physical port number (for example, 3/1 specifies port 1 on slot 3) or a range of physical port numbers on that module (for example, 3/1-16).
*agg_id***[-***agg_id***]**	The link aggregate ID number or range of IDs to be assigned to the specified VLAN.

Defaults

VLAN 1 is the default VLAN for all ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- This command configures the port or link aggregate to send and receive untagged packets for the specified VLAN ID, which becomes the default VLAN of the port.
- Every switch port or link aggregate has only one configured default VLAN. The 802.1Q tagged ports, however, can have additional VLAN assignments, which are often referred to as *secondary* VLANs.

Examples

```
-> vlan 20 members port 4/1-24 tagged
-> vlan 20 members linkagg 2-4 untagged
-> no vlan 1-4 members port 4/1-24
-> no vlan 20 members linkagg 2-4
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vpaTable
   vpaVlanNumber
   vpaIfIndex
   vpaType
   vpaState
   vpaStatus
```

vlan members tagged

Configures a port or link aggregate ID to send and receive 802.1q-tagged packets with the specified VLAN ID.

vlan *vlan_id***[-***vlan_id***] members {port** *chassis/slot/port***[-***port***] | linkagg** *agg_id***[-***agg_id***]} tagged**

no vlan *vlan_id***[-***vlan_id***] members {port** *chassis/slot/port***[-***port***] | linkagg** *agg_id***[-***agg_id***]}**

Syntax Definitions

vlan_id	The VLAN ID number for a pre-configured VLAN that will handle the 802.1Q-tagged traffic for this port. Use a hyphen to specify a range of VLAN IDs (for example, **vlan 10-15**). The valid range is 1–4094.
chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
*agg_id***[-***agg_id***]**	A link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

By default, all ports are untagged (they only carry untagged traffic for the default VLAN to which the port belongs).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- A port or link aggregate cannot be tagged with its own default VLAN ID.

Examples

```
-> vlan 100 members port 3/1 tagged
-> vlan 100 members port 4/1-10 tagged
-> vlan 100 members linkagg 10 tagged
-> vlan 100 members linkagg 1-4 tagged
-> no vlan 100 members port 3/1
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members untagged	Configures the default VLAN for the specified port or link aggregate.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
qPortVlanTable
   qPortVlanSlot
   qPortVlanPort
   qPortVLanStatus
   qPortVlanTagValue
   qPortVlanDescription
   qAggregateVlanTagValue
   qAggregateVlanAggregateId
   qAggregateVlanStatus
   qAggregateVlanDescription
```

vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

vlan *vlan_id* **mtu-ip** *size*

Syntax Definitions

vlan_id	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
size	Packet size value specified in bytes.

Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, Gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. If the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).
- The maximum MTU size value for a VLAN is 9198.

Examples

```
-> vlan 200 mtu-ip 1280
-> vlan 1503 mtu-ip 9198
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.

MIB objects

```
vlanTable
   vlanMtu
```

show vlan

Displays a list of VLANs configured on the switch.

show vlan [*vlan_id***]**

Syntax Definitions

vlan_id	VLAN ID number.

Defaults

By default, a list of all VLANs is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show vlan 10-15**). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.

Examples

```
-> show vlan

 vlan  type  admin  oper  ip   mtu   name
-----+------+-----+-----+-----+-----+------------
1     std     Ena   Dis   Dis  1500   Finance IP
10    unpd    Ena   Dis   Dis  1500   UNP-DYN-VLAN
11    std     Ena   Dis   Dis  1500   VLAN 11
400   spb     Ena   Dis   Dis  1524   VLAN 500
500   fcoe    Ena   Dis   Dis  1500   VLAN 500
600   pvlan-p Ena   Dis   Dis  1500   PVLAN 600
601   pvlan-c Ena   Dis   Dis  1500   PVLAN 601
602   pvlan-i Ena   Dis   Dis  1500   PVLAN 602
```

output definitions

vlan	The numerical VLAN ID. Use the **vlan** command to create or remove VLANs.
type	The type of VLAN (**mtp, vcm, std, unpd, spb, fcoe, pvlan-p, pvlan-c, pvlan-i**). This field also displays the VLANs created through other applications, such as Shortest Path Bridging (SPB), VLAN Stacking, Fibre Channel over Ethernet (FCoE), and Private VLANs (PVLAN).
admin	VLAN administrative status: **Ena** specifies that VLAN functions are enabled; **Dis** specifies that VLAN functions are disabled. Use the **vlan** command to change the VLAN administrative status.

output definitions (continued)

oper	VLAN operational status: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.
ip	IP router interface status: **Ena** (IP interface exists for the VLAN) or **Dis** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
mtu	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit. Configured through the **vlan mtu-ip** command.
name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified. Configured through the **vlan** command.

```
-> show vlan 600
Name                    : PVLAN 600,
Type                    : PVLAN Primary vlan,
Administrative State    : enabled,
Operational State       : disabled,
IP Router Port          : disabled,
IP MTU                  : 1500
MAC Tunneling           : disabled,
```

output definitions

Name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified.
Type	The type of VLAN (such as **Static VLAN, MTP VLAN, VCM IPC, VIP VLAN, UNP Dynamic VLAN, Backbone VLAN, Fibre Channel over Ethernet VLAN**, **PVLAN Primary vlan**)
Administrative State	VLAN administrative status: **enabled** VLAN functions are enabled; **disabled** specifies that VLAN functions are disabled. Use the **vlan** command to change the VLAN administrative status.
Operational State	VLAN operational status: **enabled** or **disabled**. The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow.
IP Router Port	IP router port status: **enabled** (IP interface exists for the VLAN) or **disabled** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
IP MTU	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit.
MAC Tunneling	MAC tunneling status for the VLAN Stacking SVLAN: **enabled** or **disabled**. Use the **ethernet-service svlan mac-tunneling** to change the MAC tunneling status for the SVLAN.

Release History

Release 7.1.1; command introduced.
Release 8.6R1; “MAC Tunneling” field added.

Related Commands

show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanRouterStatus
   vlanType
   vlanMtu
   vlanMacTunneling
```

show vlan members

Displays VLAN-port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port.

show vlan [*vlan_id***[-***vlan_id***]] members [port** *chassis/slot/port***[-***port***]| linkagg** *agg_id***[-***agg_id***]]**

Syntax Definitions

vlan_id	VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, **vlan 10-15**).
chassis	The chassis identifier.
*slot/port***[-***port***]**	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id***]**	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the *vlan_id* is specified without a *slot/port* or *agg_id*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *agg_id* is specified without a *vlan_id*, then all VLAN assignments for that port are displayed.
- If both the *vlan_id* and *slot/port* or *agg_id* are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show vlan 10-15 port**). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.
- The following types of VPAs may appear in the “type” field based on the switch configuration:

VPA Type	Description
default	Statically configured default VLAN assignment for the port.
qtagged	Statically configured 802.1Q tagged secondary VLAN assignment for the port.
dynamic	VPA created dynamically as learned by MVRP.
mirror	Port is mirroring the VLAN assignment of another port created according to rules/policies.

VPA Type	Description
mirrored	VPA created dynamically for remote port mirroring.
spb	Port is associated with a Shortest Path Bridging (SPB) Backbone VLAN (BVLAN). When a port is configured as an SPB interface, the port is dynamically assigned to all BVLANs in the switch configuration.
UNP Untagged	Untagged VPA created dynamically for UNP.
UNP QTagged	802.1Q tagged VPA created dynamically for UNP.

Examples

```
-> show vlan members
 vlan   port     type      status
+-----+-------+---------+------------+
  1      1/1    default   inactive
  2      1/2    default   blocking
        11/4    qtagged   forwarding
  3      1/2    qtagged   blocking
        11/4    default   forwarding
         2/5    dynamic   forwarding

-> show vlan 10 members
  port   type      status
+------+--------+------------+
  1/1   default   forwarding
  1/2   qtagged   forwarding

-> show vlan members port 3/2
 vlan     type      status
+------+---------+------------+
   1     default   forwarding
   2     qtagged   forwarding
   5     dynamic   blocking
   3     qtagged   blocking

-> show vlan 1-11 members port 1/3
type       : default,
status     : inactive,
vlan admin : enabled,
vlan oper  : disabled,
```

output definitions

vlan	Numerical VLAN ID. Identifies the VLAN assignment of the port.
port	The slot number for the module and the physical port number on that module (for example 3/1 specifies port 1 on slot 3).
type	The type of VPA: **default** (configured default VLAN assignment for the port), **qtagged** (802.1Q-tagged secondary VLAN assignment for the port), **mirror** (port is mirroring the VLAN assignment of another port), **dynamic (**dynamically configured VLAN assignment for the port).

output definitions

status	The VPA status: **inactive** (port is not active), **forwarding** (traffic is forwarding on this VPA), **blocking** (traffic is not forwarding on this VPA)
vlan admin	VLAN administrative status: **enabled** enables VLAN functions to operate; **disabled** disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
vlan oper	VLAN operational status: **enabled** or **disabled**. The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

Release History

Release 7.1.1; command introduced.

Related Commands

show vlan	Displays list of VLANs configured on the switch.
show ip interface	Displays IP router information.

MIB Objects

vlanMgrVpa
vpaTable
   vpaVlanNumber
   vpaIfIndex
   vpaType
   vpaState
   vpaStatus
vlanMgrVlan
vlanTable
   vlanAdmStatus
   vlanOperStatus
```

pvlan

Creates a new Private VLAN (PVLAN) with the specified VLAN ID and an optional description. The specified VLAN ID will serve as the Primary VLAN for the PVLAN configuration.

pvlan *vlan_id***[-***vlan_id***] [admin-state {enable | disable}] [name** *description***] mtu-ip** *size*

no pvlan *vlan_id***[-** *vlan_id***]**

Syntax Definitions

vlan_id	A numeric value that uniquely identifies the PVLAN. The valid range 2–4094.
enable	Enable the VLAN administrative status.
disable	Disable VLAN administrative status.
description	An alphanumeric string. Optional name description for the PVLAN.
size	The Maximum Transfer Unit (MTU) size for the PVLAN.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Specify a VLAN ID that does not already exist in the switch configuration.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- Enclose the description in double quotes if it contains more than one word with a space in between each word.

Examples

```
-> pvlan 200 name “Corporate PVLAN”
-> pvlan 200 admin-state disable
-> pvlan 300-302 admin-state enable
-> no pvlan 200
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan secondary	Creates a new Secondary VLAN and associates it with the Primary VLAN in a PVLAN configuration.
pvlan members	Assigns ports or link aggregates to a Primary or Secondary VLAN in a PVLAN configuration.
show pvlan	Displays a list of PVLANs configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanTable
   alaPrivateVlanID
   alaPrivateVlanAdminState
   alaPrivateVlanName
   alaPrivateVlanType
   alaPrivateVlanMtuIp
```

pvlan secondary

Creates a new Secondary VLAN and associates it with the Primary VLAN in a Private VLAN (PVLAN) configuration.

pvlan *vlan_id* **secondary** *vlan_id***[-***vlan_id***] type {isolated | community}**

no pvlan *vlan_id* **secondary** *vlan_id***[-** *vlan_id***]**

Syntax Definitions

pvlan *vlan_id*	A numeric value that uniquely identifies the Primary VLAN. The valid range is 2–4094.
secondary *vlan_id*	A numeric value that uniquely identifies the Secondary VLAN to assign to the specified Primary VLAN. The valid range is 2–4094.
isolated	Configures the secondary VLAN as an Isolated VLAN.
community	Configures the secondary VLAN as a Community VLAN.

Defaults

parameter	default
N/A	

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of the command to remove the Secondary VLAN assignment.
- The Primary VLAN ID must already exist.
- The Secondary VLAN ID must not already exist.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- There can only be one Isolated Secondary VLAN associated with a Primary VLAN.

Examples

```
-> pvlan 200 secondary 250 type isolated
-> pvlan 200 secondary 251 type community
-> no pvlan 200 secondary 251
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan members	Assigns ports or link aggregates to a Primary or Secondary VLAN in a PVLAN configuration.
show pvlan	Displays a list of PVLANs configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanMappingTable
   alaPrivateVlanMappingPrimaryVlanID
   alaPrivateVlanMappingSecondaryVlanID
   alaPrivateVlanMappingSecondaryVlanType
```

pvlan members

Configures a tagged or untagged VLAN-port association (VPA) between ports or link aggregates and the specified VLAN ID in a Private VLAN (PVLAN) configuration.

pvlan *vlan_id* **members {port** *chassis/slot/port***[**-*port***] | linkagg** *agg_id***[**-*agg_id***]} {tagged | untagged} | isl}**

no pvlan *vlan_id* **members {port** *chassis/slot/port***[**-*port***] | linkagg** *agg_id***[**-*agg_id***]}**

Syntax Definitions

vlan_id	A numeric value that uniquely identifies a Primary VLAN or Secondary VLAN in a PVLAN configuration. The valid range is 2–4094.
chassis	The chassis identifier.
*slot/port***[**-*port***]**	The slot and port number.
*agg_id***[**-*agg_id***]**	The link aggregate ID number or range of IDs. The ID must be in the range 1 to 128.
tagged	Configures the port or link aggregate ID to send and receive 802.1q-tagged packets with the specified PVLAN ID.
untagged	Configures the port or link aggregate ID to send and receive non-802.1q-tagged packets.
isl	Configures the port as an inter-switch link (ISL) port capable of carrying PVLAN traffic for all the VLANs that are members of a PVLAN between PVLAN-aware switches.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from the specified VLAN ID.
- The VLAN ID must already exist in the switch configuration.
- An ISL port can only be assigned to a Primary VLAN.
- When a port is assigned to a PVLAN configuration, the port type is determined by the type of VLAN to which the port is assigned. For example:
  - Ports assigned to a Primary VLAN are designated as promiscuous ports.
  - Ports assigned to a Secondary VLAN configured as a Community VLAN are designated as community ports.
  - Ports assigned to a Secondary VLAN configured as an Isolated VLAN are designated as isolated ports.

- A port or link aggregate can only belong to one Primary VLAN or one Secondary VLAN at any given time. The exception to this is on the OmniSwitch 9900, where multiple VPAs for one port are allowed with the following conditions:
  - Each VLAN tagged on the port must be of the same PVLAN type. For example, port 1/1/2 must belong to either all Primary VLANs, all Isolated Secondary VLANs, or all Community Secondary VLANs.
  - Each VLAN tagged on the port must belong to a different PVLAN domain. For example, porrt 1/1/2 can be tagged with Primary VLAN 200 and Primary VLAN 300 because both VLANs are in separate PVLAN domains.
- Only one untagged VPA is allowed per port.
- On ports with only tagged VPAs, all untagged traffic is dropped.

Examples

```
-> pvlan 200 members port 1/1/1-5 tagged
-> pvlan 200 members linkagg 2-4 untagged
-> pvlan 200 members port 1/1/20 isl
-> no pvlan 200 members port 1/1/1
-> no pvlan 200 members linkagg 2
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan	Displays a list of PVLANs configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanPortAssociationTable
   alaPrivateVlanPortAssociationVlanID
   alaPrivateVlanPortAssociationPortIfIndex
   alaPrivateVlanPortAssociationVlanOption
   alaPrivateVlanPortAssociationPortType
```

show pvlan

Displays a list of Private VLANs (PVLANs) configured on the switch.

show pvlan [*vlan_id***[-***vlan_id]***]**

Syntax Definitions

vlan_id	PVLAN ID number.

Defaults

By default, a list of all PVLANs is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify a VLAN ID with this command to display information about a specific VLAN in a PVLAN configuration.

Examples

```
-> show pvlan
pvlan    type      admin   oper    mtu          name
------+----------+-------+------+------+-----------------
200    Primary    Ena     Dis    1500   PVLAN 200
250    Isolated   Ena     Dis    1500   PVLAN 250
251    Community  Ena     Dis    1500   PVLAN 251
```

output definitions

pvlan	The PVLAN ID.
type	The type of PVLAN (**Primary, Isolated, Community)**
admin	PVLAN administrative status: **Ena** specifies that PVLAN functions are enabled; **Dis** specifies that PVLAN functions are disabled.
oper	PVLAN operational status: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active port is assigned to the PVLAN. When the operational status is enabled, then PVLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A PVLAN must have an enabled administrative status before it can become operationally enabled.
mtu	The Maximum Transmission Unit size. Specifies the size of the largest data packet that the PVLAN port can transmit.
name	The user-defined text description for the PVLAN. By default, the PVLAN ID is displayed if the PVLAN description is not specified.

```
-> show pvlan 200
Name                    : PVLAN 200,
Type                    : PVLAN Primary vlan,
Administrative State    : enabled,
Operational State       : disabled,
IP MTU                  : 1500
```

output definitions

Name	The user-defined text description for the PVLAN. By default, the PVLAN ID is displayed if the PVLAN description is not specified.
Type	The type of PVLAN (**Primary, Isolated, Community)**
Administrative State	PVLAN administrative status: **enabled** or **disabled**.
Operational State	PVLAN operational status: **enabled** or **disabled**. The operational status remains disabled until an active port is assigned to the PVLAN.
IP MTU	The Maximum Transmission Unit size. Specifies the size of the largest data packet that the PVLAN port can transmit.

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan mapping	Displays the Primary VLAN and Secondary PVLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanPrimaryVlanID
alaPrivateVlanType
alaPrivateVlanAdminState
alaPrivateVlanOperState
alaPrivateVlan
alaPrivateVlanName
```

show pvlan mapping

Displays the Primary VLAN and Secondary PVLAN mapping in a Private VLAN (PVLAN) configuration.

show pvlan [*vlan_id***] mapping**

Syntax Definitions

vlan_id	PVLAN ID number.

Defaults

If no parameters are specified with this command, the mapping for all PVLANs is displayed by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify a VLAN ID with this command to display information about a specific VLAN in a PVLAN configuration.

Examples

```
-> show pvlan mapping
Primary    Secondary
VLAN       VLAN       Type
----------+----------+------------
200        250        Isolated
200        251        Community
```

output definitions

Primary VLAN	The VLAN ID of a Primary VLAN.
Secondary VLAN	The VLAN ID of a Secondary VLAN that is mapped to the Primary VLAN ID.
Type	The type of Secondary VLAN (**Primary, Isolated, Community).**

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan	Displays a list of PVLANs configured on the switch.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanMappingPrimaryVlanID
alaPrivateVlanMappingSecondaryVlanID
alaPrivateVlanMappingSecondaryVlanType
```

show pvlan members

Displays the VLAN-port associations (VPAs) for all or specific VLANs in a Private VLAN (PVLAN) configuration.

show pvlan [*vlan_id***[-***vlan_id***]] members**

Syntax Definitions

vlan_id	VLAN ID or range of IDs.

Defaults

If no parameters are specified with this command, a list of all PVLANs and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify a VLAN ID or the range of VLAN IDs with this command to display information about a specific VLAN or for the range of VLAN IDs.

Examples

```
-> show pvlan members
pvlan   port      type               status       port-type
-------+---------+------------------+------------+------------
200     1/10      default            inactive     promiscuous
200     1/11      qtagged            inactive     isl
250     1/15      qtagged            inactive     isolated
251     1/16      default            inactive     community
251     0/10      qtagged            inactive     community

-> show pvlan 200 members
port      type               status       port-type
---------+------------------+------------+------------
1/10      default            inactive     promiscuous
1/11      qtagged            inactive     isl
0/10      qtagged            inactive     promiscuous
```

output definitions

pvlan	The PVLAN ID.
port	The port number.
type	The type of VPA: **default** (configured default VLAN assignment for the port) **qtagged** (802.1Q-tagged secondary VLAN assignment for the port)

output definitions

status	The VPA status: **inactive** (port is not active), **forwarding** (traffic is forwarding on this VPA) **blocking** (traffic is not forwarding on this VPA)
port-type	The PVLAN port type: **Promiscuous**—A port which is a member of a Primary VLAN. **ISL**—A port carrying VLAN traffic for all the VLANs that are members of a PVLAN between "PVLAN-aware" switches. (Isolated, Community, and Promiscuous). **Community—**A port which is a member of a Community VLAN. **Isolated—**A port which is a member of an Isolated VLAN.

Release History

Release 8.3.1; command introduced.

Related Commands

```

6 High Availability VLAN Commands

High availability (HA) VLANs send traffic intended for a single destination MAC address to multiple switch ports. The OmniSwitch HA VLAN feature provides an elegant and flexible way to connect server cluster nodes directly to the ingress network. This involves multicasting the service requests on the configured ports. The multicast criteria is configurable based on destination MAC and destination IP address. Egress ports can be statically configured on a server cluster or they can be registered by IGMP reports. The HA VLAN server cluster feature multicasts the incoming packets based on the server cluster configuration on the ports associated with the server cluster.

An HAVLAN is configured by specifying the match criteria, a VLAN and a port list. Match criteria is used to identify the incoming traffic that has to be processed by the HA VLAN server-clusters. The specified VLAN is an ingress and egress VLAN in the case of a L2 server-cluster. In the case of a L3 server-cluster, the VLAN is not configured explicitly, but the IP address specified in the match criteria determines the VLAN. The port list specifies the egress switch ports within the VLAN. The cluster is connected to these switch ports.

There are typically two modes of implementation of server clusters in HA VLAN.

Layer 2 - The server cluster is attached to a L2 switch on which the frames destined to the cluster MAC address are to be flooded on all interfaces.

Layer 3 - The server cluster is attached to a L3 switch on which the frames destined to the server cluster IP address are to be routed to the server cluster IP and then flooded on all interfaces.

For more information, see the application examples in Chapter 28, “Configuring High Availability VLANs” in the *OmniSwitch AOS Release 8 Network Configuration Guide.*

MIB information is as follows:

Filename: ALCATEL-IND1-VLAN-MGR-MIB.mib
Module: alcatelIND1VLANManagerMIB

Filename: ALCATEL-IND1-MAC-ADDRESS-MIB.mib
Module: alcatelIND1MacAddressMIB

A summary of the available commands is listed here:

server-cluster

Configures a cluster with an ID, name, mode and the administrative state.

server-cluster *cluster_id* **[name** *cluster_name***] [mode {L2 | L3}] [admin-state {enable | disable}]**

no server-cluster *cluster_id*

Syntax Definitions

cluster_id	A numerical identifier of the cluster. The valid range is 1–16.
cluster_name	Specifies a name (up to 32 characters) to represent the cluster.
L2	Specifies L2 for the cluster mode.
L3	Specifies L3 for the cluster mode.
enable	Enables the administrative state of the cluster.
disable	Disables the administrative state of the cluster.

Defaults

parameter	default
mode	**L2**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use **no** form of this command to remove the cluster ID from the switch configuration.
- Once the cluster mode is set, the mode cannot be changed.
- Use the **admin-state disable** parameter option to disable an existing cluster before attempting to modify any of the cluster parameters.

Examples

```
-> server-cluster 1
-> server-cluster 1 mode l2
-> server-cluster 1 name l2_cluster mode l2
-> server-cluster 2 name l3_cluster mode l3
-> no server-cluster 1
```

Release History

Release 7.2.1; command was introduced.

Related Commands

vlan	Creates and deletes VLANs.
server-cluster mac-address	Configures a MAC address, VLAN of the specified cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterName
   alaHAVlanClusterAdminStatus
   alaHAVlanClusterMode
   alaHAVlanClusterRowStatus
```

server-cluster vlan

Configures a VLAN assignment for the specified cluster. This command is used to assign VLANs to an L2 cluster.

server-cluster *cluster_id* **vlan** *vlan_id*

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
vlan_id	The VLAN identifier to assign to the cluster. The valid range is 1–4094.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- If the specified VLAN ID does not exist in the switch configuration, the cluster will remain operationally disabled.
- Modifying the existing VLAN assignment for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 vlan 10
-> server-cluster 5 vlan 10
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterVlan
   alaHAVlanClusterMacAddress
   alaHAVlanClusterRowStatus
```

server-cluster mac-address

Configures a MAC address assignment for the specified cluster. This command is used to assign a MAC address to an L2 cluster.

server-cluster *cluster_id* **mac-address** *mac_address*

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
mac_address	The MAC address of the cluster.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- Modifying the existing MAC address assignment for a cluster is only allowed when the cluster is administratively disabled.
- The MAC address that is assigned to a cluster can be a unicast, L2 multicast, or IP multicast address. However reserved multicast MAC addresses cannot be assigned to the cluster.
- The multicast addresses within the following reserved ranges are not supported:
  - 01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
  - 01:80:C2:XX.XX.XX
  - 33:33:XX:XX:XX:XX

Examples

```
-> server-cluster 1 vlan 10 mac-address 00 :11 :22 :33 :44
-> server-cluster 5 vlan 10
-> server-cluster 5 mac-address 01:
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterVlan
   alaHAVlanClusterMacAddress
   alaHAVlanClusterRowStatus
```

server-cluster ip

Configures an IP address and ARP entry for the specified cluster. This command is used to assign an IP address to an L3 cluster.

server-cluster *cluster_id* **ip** *ip_address* **[mac-address {static** *mac_address* **| dynamic}]**

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
ip_address	The unicast IP address to assign to the cluster.
mac_address	The MAC address for the static ARP entry.
dynamic	Dynamically resolve the ARP entry for the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address and ARP entry MAC address. Each cluster should have a unique IP address.
- Reserved MAC address cannot be configured as an ARP.
- Modifying the existing IP address parameters for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 ip 10.135.33.203 mac-address static 00 :11 :22 :33 :44
-> server-cluster 3 ip 10.135.33.205 mac-address dynamic
-> server-cluster 5 ip 10.135.33.207
-> server-cluster 6 mac-address dynamic
-> server-cluster 7 mac-address static 00 :11 :22 :33 :44
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster mac-address	Configures a MAC address of the specified cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster igmp mode

Configures the IGMP mode status for specified cluster.

server-cluster *cluster_id* **igmp-mode {enable | disable}**

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
enable	Enables IGMP mode for cluster ports.
disable	Disables IGMP mode for cluster ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- When the IGMP mode is enabled for the cluster, the port list is dynamically learned using the IGMP protocol for the configured IP multicast address.
- For HA VLAN IGMP to work, IGMP must be enabled globally on the switch using the command **ip multicast admin-state enable** command.

Examples

```
-> server-cluster 4 igmp-mode enable
-> server-cluster 4 igmp-mode disable
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster ip-multicast

Configures a multicast IP address for the specified cluster. This command configures an IP multicast address for an L3 cluster.

server-cluster *cluster_id* **ip-multicast** *ipm_address*

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
ipm_address	The multicast IP address to assign to the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a uniqueIP-address. IP address is configurable only for L3 clusters
- Cluster parameters like IP, multicast IP and MAC address can be modified only when the cluster admin status is disabled.

Examples

```
-> server-cluster 2 ip-multicast 226.0.0.12
-> server-cluster 4 ip-multicast 226.0.0.14
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster port

Configures a port port assignment for the port list of the specified cluster.

server-cluster *cluster_id* **port {***chassis/slot/port***[-***port2***] | all}**

no server-cluster *cluster-id* **port {***chassis/slot/port***[-***port2***] | all}**

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number to assign to the cluster port list. Use a hyphen to specify a range of ports (1/15-20).
all	Assigns all of the ports that belong to the associated VLAN and NOT all ports on the NI. This parameter applies only to L3 clusters.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a port from the specified cluster port list.
- The cluster ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.
- The **all** parameter does not apply to L2 clusters.

Examples

```
-> server-cluster 1 port 1/21
-> server-cluster 2 port 1/21-23
-> server-cluster 5 port all
-> no server-cluster 1 port 1/21
-> no server-cluster 2 port 1/21-23
-> no server-cluster 3 port all
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable
   alaHAVlanClusterId
   alaHAVlanClusterPortIfIndex
   alaHAVlanClusterPortRowStatus
```

server-cluster linkagg

Configures a link aggregate assignment for the port list of the specified cluster.

server-cluster *cluster_id* **linkagg** *agg_id***[-***agg_id2***]**

no server-cluster *cluster_id* **linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
*agg_id***[-***agg_id2***]**	The link aggregate ID number to assign to the cluster port list. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a link aggregate ID from the specified cluster port list.
- The cluster ID and link aggregate ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.

Examples

```
-> server-cluster 3 linkagg 1
-> server-cluster 4 linkagg 1-3
-> no server-cluster 3 linkagg 1
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable
   alaHAVlanClusterId
   alaHAVlanClusterPortIfIndex
   alaHAVlanClusterPortRowStatus
```

show server-cluster

Displays the cluster configuration information for the switch. If the cluster configuration is set up to run over a Multi-Chassis Link Aggregation (MCLAG) configuration, this command also provides the status of the MCLAG link for the specified cluster.

show server-cluster [*cluster_id* **[port]]**

Syntax Definitions

cluster_id	The numerical identifier of an existing server cluster.
port	Displays the ports and/or link aggregates assigned to a specific cluster.

Defaults

Displays a list of all server clusters configured for the switch.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Specify a cluster ID with this command to display information for a single cluster.
- Use the **port** parameter with the *cluster_id* parameter to display information about the ports assigned to the specified cluster.
- An asterisk (*) is displayed to indicate invalid cases, as shown in the command example.

Examples

```
-> show server-cluster
Legend:   * = operational state: disabled
Cluster Id Mode Vlan   Mac Address      Ip Address   IGMP Address Loopback Status Name
----------+----+----+-----------------+------------+------------+--------------+------
* 10       L2   100  01:10:11:22:33:44     -             -         N/A           c-1
  11       L2   100  01:10:11:22:33:44     -             -         N/A           c-2

10         1/21        Dynamic
10         0/2         Dynamic
```

output definitions

Cluster	The numerical identifier of a cluster.
Mode	Displays the cluster mode as **L2** or **L3**.
Vlan	Displays the VLAN identifier of the cluster.
MAC-Address	The MAC address associated with the cluster.
IP Address	The IP address associated with the cluster.
IGMP Address	The IGMP address associated with the cluster.
Loopback Status	The status of Loopback for the cluster, **Enabled** or **Disabled.**
Name	The name representing the cluster.
Port	Displays the port list of the cluster.
Port Type	Displays the port type, **Static** or **Dynamic**.

```
-> show server-cluster 10
Cluster Id                        : 10,

Multi-Chassis OutOfSync Reason    : -,
VFL Status                        : Used
```

output definitions

Cluster ID	The numerical identifier of a cluster.
Cluster Name	The name representing the cluster.
Cluster Mode	Displays the cluster mode as **L2** or **L3**.
Cluster IP	The IP address associated with the cluster.
Cluster Mac Type	The type of cluster, **Static** or **Dynamic**.
Cluster Mac-Address	The MAC address associated with the cluster.
IGMP-mode	Specifies the status of IGMP-mode, **Enabled** or **Disabled**.
Cluster Multicast IP	The multicast IP address associated with the cluster.
Loopback Status	The status of Loopback for the cluster, **Enabled** or **Disabled.**
Administrative State	Specifies the administrative status of the cluster, **Enabled** or **Disabled**.
Operational State	Specifies the operational status of the cluster, **Enabled** or **Disabled**.
Operational Flag	Specifies the reason the cluster is operationally down.
Multi-Chassis Status	Whether or not the HAVLAN configuration is consistent between two MCLAG peer switches (**InSync** or **OutOfSync**).
Multi-Chassis OutOfSync Reason	Indicates one of the following reasons the HAVLAN is out of sync between the two MCLAG peer switches: • **Multi-Chassis Down** • **Cluster Operational State Down** • **Server Cluster Mode Mismatch** • **VLAN Mismatch** • **MAC Address Mismatch** • **IP Address Mismatch** • **ARP Type Mismatch** • **IGMP Status Mismatch** • **Multicast IP Address Mismatch** • **All-port Mode Not Supported** • **Sync In Progres** • **Non-VIP-VLAN Not Supported In L3 Mode**
VFL Status	Indicates whether the MCLAG Virtual Fabric Link (VFL) is **Used** or **Not-used** for the cluster.

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02: **Multi-Chassis Status**, **Multi-Chassis OutOfSync Reason**, **VFL Status** fields added.

7 VLAN Stacking Commands

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

Filename: ALCATEL-IND1-E-SERVICE-MIB.mib
Module: alcatelIND1EServiceMIB

Filename: ALCATEL-IND1-VLAN-MGR-MIB.mib
Module: alcatelIND1VLANManagerMIB

A summary of the available commands is listed here:

VLAN Stacking Service Mode	**ethernet-service svlan** **ethernet-service service-name** **ethernet-service nni** **ethernet-service svlan nni** **ethernet-service sap** **ethernet-service sap uni** **ethernet-service sap cvlan** **ethernet-service sap-profile** **ethernet-service sap sap-profile** **ethernet-service uni-profile** **ethernet-service uni-profile inbound 802.1ab** **ethernet-service uni uni-profile** **ethernet-service custom-L2-protocol** **ethernet-service uni-profile custom-L2-protocol** **ethernet-service mac-tunneling** **ethernet-service svlan mac-tunneling** **ethernet-service transparent-bridging** **show ethernet-service vlan** **show ethernet-service** **show ethernet-service sap** **show ethernet-service port** **show ethernet-service nni** **show ethernet-service nni l2pt-statistics** **clear ethernet-service nni l2pt-statistics** **show ethernet-service uni** **show ethernet-service uni l2pt-statistics** **clear ethernet-service uni l2pt-statistics** **show ethernet-service uni-profile** **show ethernet-service custom-l2-protocol** **show ethernet-service uni-profile l2pt-statistics** **clear ethernet-service uni-profile l2pt-statistics** **show ethernet-service mac-tunneling** **show ethernet-service sap-profile**
Wire-rate Hardware Loopback Test	**loopback-test** **show loopback-test** **clear loopback-test counters**

ethernet-service svlan

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic.

ethernet-service svlan {*svlan_id***[-***svlan_id2***]} [admin-state {enable | disable}] [name** *description***]**

no ethernet-service svlan {*svlan_id* **[-***svlan_id2***]}**

Syntax Definitions

*svlan_id***[-***svlan_id2***]**	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
enable	Enables the SVLAN administrative status.
disable	Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
description	An alphanumeric string. Use quotes around the string if the VLAN name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

By default, the Spanning Tree status is enabled in both the **per-vlan** and **flat** mode when the SVLAN is created

parameter	default
enable | disable	**enable**
description	VLAN ID number

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the *svlan_id* specified already exists as a standard VLAN.

Note. Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.

Examples

```
-> ethernet-service svlan 1001-1005 admin-state enable name “Customer ABC”
-> no ethernet-service svlan 1001
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ethernet-service vlan	Displays a list of SVLANs configured from the switch

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanType
   vlanAdmStatus
   vlanStatus
```

ethernet-service service-name

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

ethernet-service service-name *service_name* **svlan** *svlan_id*

no ethernet-service service-name *service_name* **svlan** *svlan_id*

Syntax Definitions

service_name	The name of the VLAN Stacking service; an alphanumeric string. Use quotes around string if the service name contains multiple words with spaces between them (for example, “ALE Engineering”).
svlan_id	The VLAN ID number that identifies an existing SVLAN to associate with the VLAN Stacking service.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN association with that service is also removed.
- If the VLAN Stacking service is associated with a Service Access Point (SAP), then remove the SAP associations before attempting to remove the VLAN Stacking service.
- Each VLAN Stacking service is associated with one SVLAN. Specifying an additional VLAN ID for an existing service is not allowed.

Examples

```
-> ethernet-service service-name Marketing svlan 10
-> no ethernet-service service-name Marketing svlan 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates an SVLAN for customer traffic, a management VLAN for provider traffic for multicast traffic.

MIB Objects

```
alaEServiceTable
   alaEServiceID
   alaEServiceSVLAN
   alaEServiceRowStatus
```

ethernet-service nni

Configures a switch port or link aggregate as a VLAN Stacking Network Network Interface (NNI) and optionally specifies the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).

ethernet-service nni {port *chassis/slot/port* **[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} [tpid** *tpid_value***] [[stp | mvrp] legacy-bpdu {enable | disable}]**

no ethernet-service nni {port *chassis/slot/port* **[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
slot/port **[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
*agg_id***[-***agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
tpid_value	Specifies the TPID value of the port.
enable	Enables the specified legacy BPDU support.
disable	Disables the specified legacy BPDU support.

Defaults

parameter	default
tpid_value	0x8100
stp legacy-bpdu enable | disable	**disable**
mvrp legacy-bpdu enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to revert the VLAN Stacking NNI port or link aggregate back to a conventional switch port or aggregate.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN cannot be configured using standard VLAN management commands.
- NNI ports can be 802.1q tagged with normal VLANs. In this case, the TPID of the packets tagged with a normal VLAN must always be 0x8100 (regardless of the TPID of the NNI port). This allows the NNI port to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.
- Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches can cause flooding or an unstable network.

- If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.
- Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP MAC used:

STP	
Customer MAC	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}
Provider MAC address (802.1ad/D6.0)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}
Provider MAC address (Legacy MAC)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}

- STP legacy BPDU are supported only when the **flat** Spanning Tree mode is active on the switch.

Examples

```
-> ethernet-service 10 nni port 1/1/3-5
-> ethernet-service 255 nni port 1/2/1-5 tpid 88a8
-> ethernet-service 500 nni port 1/1/3-5 stp legacy-bpdu enable
-> no ethernet-service 10 nni port 1/1/3
-> no ethernet-service 255 nni linkagg 12-15
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Associates a switch port or link aggregate with a SVLAN.

MIB Objects

```
alaEServicePortTable
   alaEServicePortID
   alaEServicePortType
   alaEServicePortVendorTpid
   alaEServicePortLegacyStpBpdu
   alaEServicePortRowStatus
```

ethernet-service svlan nni

Associates an NNI port with an SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

ethernet-service svlan {*svlan_id***[-***svlan_id2***]} nni {port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

no ethernet-service svlan {*svlan_id***[-***svlan_id2***]} nni {port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

*svlan_id***[-***svlan_id2***]**	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
chassis	The chassis identifier.
slot/por **[-***port2***]**	The slot and port number (3/1) of an NNI port. Use a hyphen to specify a range of ports (3/1-5).
*agg_id***[-***agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove an association between an NNI port and an SVLAN.
- Only SVLAN IDs are accepted with this command. This SVLAN ID specified must already exist in the switch configuration.
- This command only applies to ports or link aggregates configured as VLAN Stacking NNI ports.
- NNI ports can be tagged with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.

Examples

```
-> ethernet-service svlan 10 nni port 1/1/3
-> ethernet-service svlan 255 nni port 1/2/1-5
-> ethernet-service svlan 500 nni linkagg 31-35
-> no ethernet-service svlan 10 nni port 1/1/3
-> no ethernet-service svlan 255 nni port 1/2/5
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates an SVLAN for tunneling customer traffic.
ethernet-service nni	Configures a switch port or link aggregate as a VLAN Stacking NNI.

MIB Objects

```

ethernet-service sap

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

ethernet-service sap *sap_id* **service-name** *service_name*

no ethernet-service sap *sap_id*

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.
service_name	The name of the service to associate with this SAP.

Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to delete a VLAN Stacking SAP. When a SAP is deleted, all port and CVLAN associations with the SAP are also deleted.
- The service name specified with this command must already exist in the switch configuration. Use the **ethernet-service service-name** command to create a service to associate with the SAP.
- Each SAP ID is associated with only one service; however, it is possible to associate one service with multiple SAP IDs.

Examples

```
-> ethernet-service sap 10 service-name CustomerA
-> no ethernet-service sap 11
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service service-name	Creates a VLAN Stacking service and associates the service with an SVLAN.
ethernet-service sap-profile	Creates a VLAN Stacking SAP profile.
ethernet-service sap sap-profile	Associates a SAP profile with a SAP ID.

MIB Objects

```
alaEServiceSapTable
   alaEServiceSapID
   alaEServiceSapServiceID
   alaEServiceSapProfile
   alaEServiceSapRowStatus
```

ethernet-service sap uni

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

ethernet-service sap *sap_id* **uni {port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]}**

no ethernet-service sap *sap_id* **uni {port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.
chassis	The chassis identifier.
slot/por **[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- Only fixed ports can be configured as UNI ports.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the **ethernet-service sap cvlan** command.

Examples

```
-> ethernet-service sap 10 uni port 1/1/3
-> ethernet-service sap 10 uni port 1/2/1-5
-> ethernet-service sap 10 uni linkagg 31-40
-> no ethernet-service sap 10 uni port 1/2/1-5
-> no ethernet-service sap 10 uni linkagg 31
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
ethernet-service uni-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.

MIB Objects

```
alaEServiceSapUniTable
   alaEServiceSapUniSap
   alaEServiceSapUniUni
   alaEServiceSapUniRowStatus
```

ethernet-service sap cvlan

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

ethernet-service sap *sap_id* **cvlan {all** | *cvlan_id***[**-*cvlan_id2***]** | **untagged}**

no ethernet-service sap *sap_id* **cvlan {all** | *cvlan_id***[**-*cvlan_id2***]** | **untagged}**

Syntax Definitions

sap_id	The SAP ID number.
all	Applies the SAP profile to tagged and untagged frames.
*cvlan_id***[**-*cvlan_id2***]**	Applies the SAP profile to frames tagged with the specified CVLAN ID. Use a hyphen to specify a range of CVLAN IDs (for example, 10-12 applies the SAP profile to frames tagged with CVLAN 10, 11, or 12).
untagged	Applies the SAP profile only to untagged frames.

Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from an SAP configuration, the SAP is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic *and* traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Configuring the **all** and **untagged** parameters for the same SAP is not allowed. Specify only one of these two parameters per SAP.
- Either the **all** or **untagged** parameters can be configured for the SAP. In such an instance, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the SAP related service.
- Only one SAP, with the **all** or **untagged** option, is allowed per UNI. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** parameter or a CVLAN ID is allowed for SAP 20.
- If you do not specify **all** or **untagged** options with a UNI, then the default VLAN 4095 is set for the UNI and all untagged, untagged control traffic and unmatched tag traffic is dropped.

Examples

```
-> ethernet-service sap 10 cvlan 200
-> ethernet-service sap 10 cvlan all
-> ethernet-service sap 11 cvlan 100-150
-> ethernet-service sap 11 cvlan untagged
-> no ethernet-service sap 10 cvlan 200
-> no ethernet-service sap 10 cvlan all
-> no ethernet-service sap 10 cvlan 100-150
```

Release History

Release 7.1.1; command introduced.

Related Commands

   alaEServiceSapCvlanSapId
   alaEServiceSapCvlanCvlan
   alaEServiceSapCvlanMapType
   alaEServiceSapRowStatus
```

ethernet-service sap-profile

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

ethernet-service sap-profile *sap_profile_name* **[bandwidth not-assigned] [[shared | not-shared] ingress-bandwidth** *mbps* **] [cvlan-tag {preserve | translate}] priority [not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed** *value***][egress-bandwidth** *mbps***]**

no ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

sap_profile_name	An alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).
bandwidth not-assigned	Specifies that the SAP profile does not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).
shared	Shares the ingress bandwidth limit across all SAP ports and CVLANs.
not shared	Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.
ingress bandwidth *mbps*	The maximum amount of bandwidth to be allowed for SAP ports, for the incoming traffic, in megabits per second. This parameter can be used only along with the shared option or not-shared option.
preserve	Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).
translate	Replaces the customer VLAN ID with the SVLAN ID.
priority not-assigned	Specifies that the SAP profile is not assigned with a priority value or priority mapping.
map-inner-to-outer-p	Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.
map-dscp-to-outer-p	Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.
fixed *value*	Sets the SVLAN (outer tag) priority bit to the specified value.
egress-bandwidth *mbps*	The maximum amount of bandwidth to be allowed for SAP ports, for the outgoing traffic, in megabits per second. *This parameter is not supported on an OmniSwitch 6900.*

Defaults

parameter	default
shared | not shared	**shared**
mbps	0
preserve | translate	**preserve**
not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed *value*	**fixed** 0

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the **ethernet-service sap sap-profile** command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- Configure the **ingress-bandwidth** or **egress-bandwidth** parameters to define rate limiting values for the SAP.

Examples

```
-> ethernet-service sap-profile video1 egress-bandwidth 10 cvlan-tag translate
priority map-inner-to-outer-p
-> ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan-tag
preserve
-> ethernet-service sap-profile voice2 shared ingress-bandwidth 10
-> no ethernet-service sap-profile video1
```

Release History

Release 7.1.1; command introduced.

ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

ethernet-service sap *sap_id* **sap-profile** *sap_profile_name*

no ethernet-service sap *sap_id*

Syntax Definitions

sap_id	The SAP ID number.
sap_profile_name	The name of the SAP profile to associate with this SAP ID.

Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command along with the SAP ID to remove the SAP profile.
- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Do not specify a service name; doing so returns an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

Examples

```
-> ethernet-service sap 10 sap-profile CustomerC
-> ethernet-service sap 11 sap-profile CustomerD
-> ethernet-service sap 11 sap-profile default-sap-profile
```

Release History

Release 7.1.1; command introduced.

ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

ethernet-service uni-profile *uni_profile_name* **[tunnel-mac** *mac_address***] [l2-protocol** *protocol***] {peer | discard | tunnel | mac-tunnel}**

no ethernet-service uni-profile *uni_profile_name*

Syntax Definitions

uni_profile_name	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).
mac_address	The tunnel MAC address to use when configuring MAC tunneling. *This parameter is not supported on the OmniSwitch 6900.*
protocol	The protocol to which the specified action is applied. Refer to the table in the “Usage Guidelines” section of this command page for a list of protocol keywords to select.
peer	Allows the UNI port to participate in the specified protocol.
discard	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.
mac-tunnel	Changes the destination MAC address to either the configured or default tunnel MAC address before forwarding. *This parameter is not supported on the OmniSwitch 6900.*

Defaults

By default, the tunnel MAC address is set to 01:00:0c:cd:cd:d0. Refer to the table in the “Usage Guidelines” section of this command page for the default action settings for each protocol parameter.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to delete a UNI profile. Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- If a user-configured UNI profile is *not* associated with a UNI port, then the default profile (*default-uni-profile*) is used to process control packets ingressing on the port.
- The following table provides the default and supported profile actions for each protocol parameter:

Protocol Keyword	Reserved DA MAC Address	Default Action	peer	discard	tunnel	mac-tunnel
stp	01:80:c2:00:00:00	**tunnel**	no	yes	yes	yes
802.1x	01:80:c2:00:00:03	**discard**	no	yes	yes	yes
802.3ad	01:80:c2:00:00:02	**peer**	yes	yes	yes	yes
802.1ab	01:80:c2:00:00:0e	**discard**	yes	yes	yes	yes
mvrp	01:80:c2:00:00:21	**tunnel**	no	yes	yes	yes
amap	00:20:da:00:70:04	**discard**	no	yes	yes	yes
oam	01:80:c2:00:00:02	**peer**	yes	yes	yes	yes
lacpmarker	01:80:c2:00:00:02	**peer**	yes	yes	yes	yes
udld	01:00:0c:cc:cc:cc	**peer**	yes	yes	yes	yes
pagp	01:00:0c:cc:cc:cc	**discard**	no	yes	yes	yes
cdp	01:00:0c:cc:cc:cc	**discard**	no	yes	yes	yes
vtp	01:00:0c:cc:cc:cc	**discard**	no	yes	yes	yes
dtp	01:00:0c:cc:cc:cc	**discard**	no	yes	yes	yes
pvst	01:00:0c:cc:cc:cd	**discard**	no	yes	yes	yes
vlan	01:00:0c:cd:cd:ce	**discard**	no	yes	yes	yes
uplink	01:00:0c:cd:cd:cd	**discard**	no	yes	yes	yes

- The **oam**, **lacpmarker**, **udld**, **pagp**, **cdp**, **vtp**, **dtp**, **pvst**, **vlan**, and **uplink** protocol keywords are not supported with this command on the OmniSwitch 6900.
- To specify how to process tagged and untagged 802.1AB control frames, use the **ethernet-service uni-profile inbound 802.1ab** command.
- Up to five unique UNI profile combinations, including the default and built-in profiles, are allowed per switch.

Examples

```
-> ethernet-service uni-profile uni_1 l2-protocol mvrp discard
-> ethernet-service uni-profile uni_2 tunnel-mac 01:00:0c:cd:cd:cd l2-protocol pagp
mac-tunnel
-> ethernet-service uni-profile uni_3 l2-protocol uplink tunnel
ERROR: Only 5 profiles are allowed for this type
-> no ethernet-service uni-profile uni_1
-> no ethernet-service uni-profile uni_2
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **tunnel-mac** address and protocol parameters added, **mac-tunnel** action parameter added.

ethernet-service uni-profile inbound 802.1ab

Configures the treatment of Layer 2 tagged and untagged 802.1AB control frames that are received on UNI ports. Use this command to specify a different action (peer, drop, or tunnel) based on the tagged and untagged state of an 802.1AB control frame.

ethernet-service uni-profile *uni_profile_name* **inbound {tagged | untagged | both} l2-protocol 802.1ab {peer | discard | tunnel}**

no ethernet-service uni-profile *uni_profile_name*

Syntax Definitions

uni_profile_name	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).
tagged	The specified action is applied only to tagged 802.1AB control frames.
untagged	The specified action is applied only to untagged 802.1AB control frames.
both	The specified action is applied to both tagged and untagged 802.1AB control frames.
peer	Allows the UNI port to participate in the 802.1AB protocol.
discard	Discards 802.1AB PDUs.
tunnel	Tunnels 802.1AB PDUs across the provider network.

Defaults

By default, tagged and untagged 802.1AB control frames are dropped.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to delete a UNI profile. Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- When only the **tagged** keyword is used, the specified action is applied to tagged traffic and the default action (**discard**) is applied to untagged traffic.
- When only the **untagged** keyword is used, the specified action is applied to untagged traffic and the default action (**discard**) is applied to tagged traffic.
- Only the **tunnel** and **discard** actions can be configured for tagged control frames.
- Only the **peer** and **discard** actions can be configured for untagged control frames.
- The treatment of 802.1AB control frames received on access ports can either be mixed (different for tagged, different for untagged) or the same for both tagged and untagged control frames. To switch between mixed and the same, set the action for tagged and untagged frames back to the default (**discard**).

- Use the **ethernet-service uni-profile** command to configure the treatment for other protocol control frames. This command applies only to 801.1AB frames.

Examples

```
-> ethernet-service uni-profile lldp-tagged inbound tagged l2-protocol 802.1ab
tunnel
-> ethernet-service uni-profile lldp-untagged inbound untagged l2-protocol 802.1ab
peer
-> ethernet-service uni-profile lldp-diff inbound tagged l2-protocol 802.1ab tunnel
inbound untagged l2-protocol 802.1ab peer
-> ethernet-service uni-profile lldp-both inbound both l2-protocol 802.1ab discard

-> no ethernet-service uni-profile lldp-tagged
-> no ethernet-service uni-profile lldp-untagged
-> no ethernet-service uni-profile lldp-diff
-> no ethernet-service uni-profile lldp-both
```

```

ethernet-service uni uni-profile

Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

ethernet-service uni {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} uni-profile** *uni_profile_name*

Syntax Definitions

chassis	The chassis identifier.
slot/por **[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
*agg_id***[**-*agg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
uni_profile_name	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

The default profile (*default-uni-profile*) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- This UNI profile name specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter “default-uni-profile” with this command.
- On the OmniSwitch 6465, OmniSwitch 6860, and OmniSwitch 6865, there are also two built-in UNI profiles (*ieee-fwd-all* and *ieee-drop-all*) that can be assigned to a UNI port. Use one of the profiles to tunnel or discard all IEEE multicast MAC address traffic received on the UNI port.
  - When a UNI port is assigned to the *ieee-fwd-all* profile, all L2 protocol control packets destined for 01:80:C2:00:00:XX are forwarded as normal data. However, control packets with a destination MAC address of 01:80:C2:00:00:01, 01:80:C2:00:00:04, or 01:80:C2:00:00:08 are not forwarded end-to-end.
  - When a UNI port is assigned to the *ieee-drop-all* profile, all L2 protocol control packets destined for 01:80:C2:00:00:XX are discarded.
  - When a UNI port is assigned to either one of the built-in profiles (*ieee-fwd-all* or *ieee-drop-all*), tunneled L2 protocol control packets (tagged packets with SVLAN ID) received on NNI ports are forwarded as normal data.

Examples

```
-> ethernet-service uni port 1/1/3 uni-profile uni_1
-> ethernet-service uni linkagg 1-5 uni-profile uni_2
-> ethernet-service uni port 1/2/1-5 uni-profile default-uni-profile
-> ethernet-service uni port 1/1/6 uni-profile ieee-fwd-all
-> ethernet-service uni port 1/1/7 uni-profile ieee-drop-all
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

ethernet-service custom-L2-protocol

Creates a custom L2 protocol MAC address entry with an optional mask, EtherType, or SSAP/DSAP protocol identifier. A custom L2 protocol entry is configured for a proprietary protocol with a destination multicast MAC address and is assigned to a UNI profile for specific packet control.

ethernet-service custom-L2-protocol *custom_protocol_name* **mac** *mac_address* **[mask** *mask* **| ether-type** *ethertype* **[subtype** *subtype***] | ssap/dsap** *ssap/dsap* **pid** *pid***]**

no ethernet-service custom-L2-protocol *name*

Syntax Definitions

custom_protocol_name	An alphanumeric string (up to 32 characters) that identifies the custom L2 protocol entry.
mac_address	A multicast MAC address for the custom L2 protocol entry (for example, 01:80:c2:00:11:11).
mask	A mask defines a range of MAC addresses for the custom L2 protocol MAC address entry (for example, ff:ff:ff:ff:ff:00).
ethertype	An integer value to specify a generic EtherType.
subtype	An integer value to specify a Sub-Type for the EtherType.
ssap/dsap	Source service access point and destination service access point specific to LLC/SNAP in numerical or hexadecimal format.
pid	Protocol identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the configured custom L2 protocol entry. A custom L2 protocol entry cannot be deleted if the entry is assigned to a UNI profile that is assigned to a UNI port.
- Consider the following command guidelines when configuring a custom L2 protocol:

When configuring a custom L2 protocol with ...	The ...
a MAC address and no mask	MAC address cannot be: • a reserved IPv4/IPv6 multicast address. • a MAC-specific control protocol (01-80-C2-00-00-01 or 01-80-C2-00-00-04). • a Service OAM address (01-80-C2-00-00-30 to 01-80-C2-00-00-3F). • used in another custom L2 protocol without a mask.

When configuring a custom L2 protocol with ...	The ...
a MAC address with a mask	MAC address range cannot overlap with: • reserved IPv4/IPv6 multicast address ranges. • a MAC address range configured for another custom L2 protocol. Only nested ranges are allowed.
an EtherType and optional Sub-Type	The EtherType/Sub-Type value cannot be: • configured if a mask was specified for the MAC address. • configured for another custom L2 protocol. • a well-known L2 protocol ((0x8809/1, 0x8809/2, 0x8809/3, 0x888E, 0x88CC, 0x88F5).
an optional SSAP/DSAP and PID	The SSAP/DSAP PID value cannot be: • configured if a mask or EtherType value was specified for the MAC address. • configured for another custom L2 protocol.

- The MAC address, mask, EtherType, Sub-Type, SSAP/DSAP, and PID cannot be modified once the custom L2 protocol is created. The custom L2 protocol must be deleted and created again with the new values required.
- A custom L2 protocol is assigned to an existing UNI L2 protocol profile using the **ethernet-service uni-profile custom-L2-protocol** command. The action for the custom L2 protocol entry is specified when the entry is assigned to a UNI L2 protocol profile.

Examples

```
-> ethernet-service custom-L2-protocol tunnel-mac mac 01:80:c2:00:11:11
-> ethernet-service custom-L2-protocol tunnel-mac-range mac 01:80:c2:00:11:11 mask
ff:ff:ff:ff:ff:00
-> ethernet-service custom-L2-protocol tunnel-mac-ethertype mac 01:80:c2:00:11:11
ethertype 0x5555
-> ethernet-service custom-L2-protocol tunnel-mac-ethersubtype mac
01:80:c2:00:11:11 ethertype 0x5556 subtype 120
-> ethernet-service custom-L2-protocol tunnel-mac-ssap mac 01:80:c2:00:11:11 ssap/
dsap 43/43 pid 3
-> ethernet-service custom-L2-protocol discard-mac-range mac 01:80:c2:00:11:11 mask
ff:ff:ff:00:ff:ff
```

Release History

Release 8.6R1; command introduced.

Related Commands

ethernet-service uni-profile custom-L2-protocol	Assigns a custom L2 protocol entry to a UNI profile.
show ethernet-service custom-l2-protocol	Displays the custom L2 protocol configuration for the switch.

MIB Objects

   alaEServiceCustomL2ProtocolName
   alaEServiceCustomL2ProtocolMac
   alaEServiceCustomL2ProtocolMask
   alaEServiceCustomL2ProtocolEtherType
   alaEServiceCustomL2ProtocolEtherSubType
   alaEServiceCustomL2ProtocolSsap
   alaEServiceCustomL2ProtocolDsap
   alaEServiceCustomL2ProtocolId
   alaEServiceCustomL2ProtocolRowStatus
```

ethernet-service uni-profile custom-L2-protocol

Assigns a custom L2 protocol entry to a UNI profile.

ethernet-service uni-profile *uni_profile_name* **custom-L2-protocol** *custom_protocol_name* **{tunnel | discard | mac-tunnel}**

no ethernet-service uni-profile *uni_profile_name* **custom-L2-protocol** *custom_protocol_name*

Syntax Definitions

uni_profile_name	Name of the configured UNI profile.
custom_protocol_name	Name of the configured custom L2 protocol entry to assign to the specified UNI profile.
tunnel	Tunnels packets with a destination MAC address that matches the MAC address configured for the custom L2 protocol. The MAC address of the packet is not changed.
discard	Discards packets with a destination MAC address that matches the MAC address configured for the custom L2 protocol.
mac-tunnel	Changes the destination MAC address of a packet to the configured tunnel MAC address for the specified UNP profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the custom L2 protocol entry from the UNI profile.
- If the specified UNI profile is already assigned to a UNI port, then a custom L2 protocol entry cannot be assigned or deleted from the UNI profile.
- The **tunnel** and **discard** actions apply to all traffic matching a custom L2 protocol entry.
- The **mac-tunnel** action applies only to traffic matching a custom L2 protocol entry that was configured with an EtherType and optional Sub-Type value or an SSAP/DSAP PID value.
- More than one custom L2 protocol entry can be assigned to a UNI profile, but not in the same command line. Configure each custom L2 protocol assignment one at a time; a separate command for each entry.

Examples

```
-> ethernet-service uni-profile uni-prof1 custom-L2-protocol tunnel-mac tunnel
-> ethernet-service uni-profile uni-prof2 custom-L2-protocol tunnel-mac-range
tunnel
-> ethernet-service uni-profile uni-prof3 custom-L2-protocol tunnel-mac-ethertype
```

```
mac-tunnel
-> ethernet-service uni-profile uni-prof4 custom-L2-protocol tunnel-mac-
ethersubtype tunnel
-> ethernet-service uni-profile uni-prof5 custom-L2-protocol tunnel-mac-ssap mac-
tunnel
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-range
discard
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-ethertype
discard
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-ssap
discard
-> ethernet-service uni-profile uni-prof7 custom-l2-protocol tunnel-mac tunnel
ERROR: A profile that is bound to a UNI cannot be modified

-> no ethernet-service uni-profile uni-prof1 custom-L2-protocol tunnel-mac-
ethertype
-> no ethernet-service uni-profile uni-prof7 custom-l2-protocol tunnel-mac
ERROR: UNI Profile must be unused by any UNI port before disassociation of a Custom
L2 Protocol
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ethernet-service uni-profile	Displays the UNI profile configuration for the switch, which includes any custom L2 protocol assignments.

MIB Objects

```
alaEServiceUNIProfileL2CustomProtocolTable
   alaEServiceUNIProfileL2CustomID
   alaEServiceUNIProfileL2CustomProtocolID
   alaEServiceUNIProfileL2CustomProtocolType
   alaEServiceUNIProfileL2CustomProtocolRowStatus
```

ethernet-service mac-tunneling

Configures the global MAC tunneling status. When enabled (the default), MAC tunneling is active for all UNI profile protocols that are configured with the MAC tunneling action.

ethernet-service mac-tunneling {enable | disable}

Syntax Definitions

enable	Globally enables the MAC tunneling status.
disable	Globally disables the MAC tunneling status.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

- The status of MAC tunneling can be configured on a global or per-SVLAN basis.
  - When MAC tunneling is enabled globally, the per-SVLAN MAC tunneling configuration is not active.
  - When MAC tunneling is disabled globally, the per-SVLAN MAC tunneling configuration is active.
- Any changes to the global MAC tunneling status requires a switch reload to activate.
- The global tunnel MAC address is set to 01:00:0C:CD:CD:D0 by default, which is the CISCO tunnel MAC address that is used for Generic Bridge PDU Tunneling (GBPT). A different tunnel MAC address can also be configured for a specific UNI profile and will apply only to packets processed by that profile.
- When L2 protocol packets are received on a UNI port and the associated UNI profile for that port is configured with a MAC tunnel action for that protocol, the destination MAC address for the packets is changed to the tunnel MAC address. The packets are then sent out the NNI port associated with the SVLAN.
- When L2 tunneled packets (with a tunnel MAC as the destination address) are received on an NNI port, the tunnel MAC address is replaced with the protocol MAC address. The packets are then forwarded to the respective UNI port associated with the SVLAN.

Examples

```
-> ethernet-service mac-tunneling disable
INFO :Changed mac-tunnel feature status will take effect if command is saved on
next switch reboot
-> ethernet-service mac-tunneling enable
```

Release History

Release 8.6R1; command introduced.

Related Commands

ethernet-service svlan mac-tunneling	Configures the MAC tunneling status for an SVLAN.
show ethernet-service mac-tunneling	Displays the global status of MAC tunneling for the switch.

MIB Objects

```
alaEServiceGlobals
   alaEServiceGlobalMacTunneling
```

ethernet-service svlan mac-tunneling

Configures the MAC tunneling status on a per-SVLAN basis. Enabling MAC tunneling for specific SVLANs limits the trapping of GBPT packets for processing to only those SVLANs.

ethernet-service svlan *svid1***[-***svid2***] mac-tunneling {enable | disable}**

Syntax Definitions

*svlan_id***[-***svlan_id2***]**	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
enable	Enables the MAC tunneling status for the specified SVLAN.
disable	Disables the MAC tunneling status for the specified SVLAN.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

- Enabling MAC tunneling on a per-SVLAN basis or on a global basis is mutually exclusive; make sure MAC tunneling is globally disabled before attempting to enable MAC tunneling for the specified SVLAN.
- When MAC tunneling is enabled globally, all GBPT packets are trapped for processing even if there is no MAC tunneling action configured for the associated UNI profile. This limits the rate at which these packets are forwarded.
- Enabling MAC tunneling for specific SVLANs limits the trapping of GBPT packets to only those SVLANs where it is needed for MAC tunneling; other SVLANs forward the traffic without trapping the GBPT packets.
- Use the **show ethernet-service vlan** command to display the MAC tunneling status for the SVLAN ID.
- A maximum of four SVLANs can have MAC tunneling enabled at the same time.

Examples

```
-> ethernet-service svlan 1000 mac-tunneling enable
-> ethernet-service svlan 2000-2005 mac-tunneling enable
-> ethernet-service svlan 1000 mac-tunneling disable

-> show ethernet-service vlan 2000
Name                    : VLAN 2000,
Type                    : Service Vlan,
Administrative State    : enabled,
```

```
Operational State        : disabled,
IP Router Port           : disabled,
IP MTU                   : 1500
MAC Tunneling            : enabled,
```

Release History

Release 8.6R1; command introduced.

Related Commands

ethernet-service mac-tunneling	Configures the global MAC tunneling status.
show ethernet-service vlan	Displays a list of VLANs and their attributes configured on the switch.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanMacTunneling
```

ethernet-service transparent-bridging

Configures transparent bridging which associates NNI ports with all VLANs even if they are not created on the switch.

ethernet-service transparent-bridging [nni port *chassis/slot/port***[-***port2***] | nni linkagg** *agg_id***[-***agg_id2***] {enable | disable}]**

Syntax Definitions

chassis	The chassis identifier.
slot/port **[-***port2***]**	The slot and port number.
*agg_id***[-***agg_id2***]**	The link aggregate ID.
enable	Enables the specified legacy BPDU support.
disable	Disables the specified legacy BPDU support.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Transparent bridging supports both global and port level enable/disable commands.
- Port level configuration is not accepted if transparent bridging is not enabled globally.
- If transparent bridging is disabled globally, all the port level transparent bridging configuration are deleted. The port level configuration must be re-configured after re-enabling transparent-bridging globally.
- Port level transparent bridging is allowed only when there is at least one SVLAN configure on NNI port.
- Transparent bridge is only supported on NNI ports.
- Transparent bridge can only be configured when STP is configured in flat mode.
- Transparent bridging cannot be configured when STP protocol mode set to MSTP.
- DHL and transparent bridging are not supported on the same NNI port.

Examples

```
-> ethernet-service transparent-bridging enable
-> ethernet-service nni port 1/1/5 transparent-bridging enable
-> ethernet-service nni linkagg 5 transparent-bridging enable
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ethernet-service vlan

Displays a list of VLANs configured on the switch. Use this command to identify VLAN Stacking SVLANs.

show ethernet-service vlan [*vlan_id***-[***vlan_id2***]]**

Syntax Definitions

vlan_id-**[***vlan_id2***]**	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).

Defaults

By default, all VLANs are displayed if a VLAN or range of VLANs is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

Specify a single VLAN ID or a range of VLAN IDs to display configuration information for the specific VLANs.

Examples

```
-> show ethernet-service vlan
 vlan    type   admin   oper    ip    mtu          name

1003   vstk      Ena     Dis   Dis    1500    VLAN 1003
```

output definitions

vlan	The VLAN ID number identifying the instance.
type	The type of VLAN.
admin	The administrative state of the VLAN. (**Ena** or **Dis**).
oper	The operation status of the VLAN (**Ena** or **Dis**).
ip	The status of the IP router port (**Ena** or **Dis**).
mtu	The IP MTU value configured for the VLAN.
name	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the description.

```
-> show ethernet-service vlan 1001
Name                     : VLAN 1001,
Type                     : Service Vlan,
Administrative State     : enabled,
Operational State        : disabled,
IP Router Port           : disabled,
IP MTU                   : 1500
MAC Tunneling            : disabled,
```

output definitions

Name	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the description.
Type	The type of VLAN.
Administrative State	The administrative state of the VLAN (**enabled** or **disabled**).
Operational State	The operational status of the VLAN (**enabled** or **disabled**).
IP Router Port	The IP router interface status (**enabled** = IP router interface exists for the VLAN or **disabled** = no IP router port exists for the VLAN).
IP MTU	The IP MTU value configured for the VLAN.
MAC Tunneling	The MAC tunneling status for the VLAN (**enabled** or **disabled**).

Release History

Release 7.1.1; command introduced.
Release 8.6R1; “MAC Tunneling” field added.

Related Commands

ethernet-service svlan	Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic application uses to distribute multicast traffic.
ethernet-service svlan mac-tunneling	Configures the MAC tunneling status on a per-SVLAN basis.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

   vlanMtu
   vlanMacTunneling
```

show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service [service-name *service_name* | **svlan** *svlan_id* | **transparent-bridging]**

Syntax Definitions

service_name	The name of an existing VLAN Stacking service. Use quotes around string if the service name contains multiple words with spaces between them (for example, “ALE Engineering”).
svlan_id	The VLAN ID number that identifies an existing SVLAN.

Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Enter the name of a service to display configuration information for a specific service.
- Enter an SVLAN ID to display configuration information for all services that are associated with a specific SVLAN.

Examples

```
-> show ethernet-service

Service Name : VideoOne
    SVLAN   : 300
    NNI(s)  : 1/2/1, 1/2/2
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3

        sap-profile : sap-video2

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 1/2/1, 1/2/2
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

```
-> show ethernet-service service-name CustomerABC

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 1/2/1, 1/2/2
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile

-> show ethernet-service svlan 300

Service Name : VideoOne
    SVLAN   : 300
    NNI(s)  : 1/2/1, 1/2/2
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : untagged, 40
        sap-profile : sap-video2

-> show ethernet-service transparent-bridging
Global Transparent Bridging               : enabled,
```

output definitions

Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.
Global Transparent Bridging	Displays whether transparent bridging is enabled globally on the switch.

Release History

Release 7.1.1; command introduced.

show ethernet-service sap

Displays configuration information for VLAN Stacking Service Access Points (SAP).

show ethernet-services sap [*sap_id***]**

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.

Defaults

By default, all SAPs are displayed if a SAP ID is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

Specify a single SAP ID to display configuration information for a specific SAP.

Examples

```
-> show ethernet-services sap

   SAP Id  : 10
        UNIs        : 1/2/1, 1/2/1
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile

    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1

    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : 30, 40
        sap-profile : sap-video2

-> show ethernet-service sap 10

 SAP Id  : 10
        UNIs        : 1/2/1, 1/2/1
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

output definitions

SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.

output definitions

CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 7.1.1; command introduced.

Related Commands

   alaEServiceProfileID7
```

show ethernet-service port

Displays configuration information for a VLAN Stacking service port.

show ethernet-service port {*chassis/slot/port* | **linkagg** *agg_id***}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

Specifying a slot/port or link aggregate ID number is required with this command.

Examples

```
-> show ethernet-service port 1/1/10

Interface : 1/1/10
Port Type   : UNI
    UNI Profile   : default-uni-profile
    Default SVLAN : 4095

Service Name : svlan_service
    SVLAN   : 20
    NNI(s)  : No NNIs configured
    SAP Id  : 1
        UNIs        : 1/1/10
        CVLAN(s)    : 200
        sap-profile : translate_profile

-> show ethernet-service port 1/1/22

Interface : 1/1/22
Port Type : NNI

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 1/2/1, 1/2/2
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

```
Service Name : Video-Service
    SVLAN   : 300
    NNI(s)  : 1/1/22, 1/2/3
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : 30, 40
        sap-profile : sap-video2
```

output definitions

Interface	The slot and port number or link aggregate ID for the specified interface.
Port Type	The type of VLAN Stacking port (**UNI** or **NNI**).
Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking SAP.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service nni

Displays configuration information for VLAN Stacking Network Network Interface (NNI) ports.

show ethernet-service nni [port *chassis/slot/port* | **linkagg** *agg_id***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

By default, all NNI ports are displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

Specify a *slot/port* or link aggregate ID number to display information for a single slot/port or link aggregate ID.

Examples

```
-> show ethernet-service nni

  Port     TPID         Legacy BPDU           Transparent Bridging
                      stp         mvrp
--------+--------+----------------------+--------------------------
  1/1/22  0x8100    Disable     Disable             Enable
  1/1/23  0x8100    Disable     Disable             Enable

-> show ethernet-service nni 1/23

  Port     TPID         Legacy BPDU           Transparent Bridging
                      stp         mvrp
--------+--------+----------------------+--------------------------
  1/1/23  0x8100    Disable     Disable              Enable
```

output definitions

Port	The slot/port number or link aggregate ID for the NNI port.
TPID	The vendor TPID value configured for the NNI port.
stp	Whether Spanning Tree legacy BPDU processing is enabled for the NNI port.
mvrp	Whether MVRP legacy BPDU processing is enabled for the port.
Transparent Bridging	Whether transparent bridging is enabled or disabled.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service nni	Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

```

   alaEServicePortVendorTpid
   alaEServicePortLegacyStpBpdu
   alaEServicePortLegacyGvrpBpdu
   alaEServicePortTransBridging
```

show ethernet-service nni l2pt-statistics

Displays statistics collected for Network Network Interface (NNI) ports.

show ethernet-services nni [port *chassis/slot/port* | **linkagg** *agg_id***] l2pt-statistics**

Syntax Definitions

chassis/slot/port	The chassis, slot, and port number (1/1/6).
agg_id	The link aggregate ID number (0–31).

Defaults

By default, statistics for all NNI ports are displayed.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **port** *chassis/slot/port* or **linkagg** *agg_id* parameter to display statistics information for a specific switch port or link aggregate ID.
- Make sure the specified port or link aggregate is configured as an NNI port.

Examples

```
-> show ethernet-service nni l2pt-statistics
  Port   Rx Mac-Tunnel   Mac-tunnel discard
-------+---------------+--------------------
 1/1/23          1234             2
 1/1/24          256              0

-> show ethernet-service nni port 1/1/24 l2pt-statistics
  Port   Rx Mac-Tunnel   Mac-tunnel discard
-------+---------------+--------------------
 1/1/24          256              0

-> show ethernet-service nni port 1/1/5 l2pt-statistics
ERROR: Port (1/1/5) is not bound to any svlan
```

output definitions

Port	The chassis, slot, and port number or link aggregate ID for the NNI port.
Rx Mac-Tunnel	The total number of frames trapped to CPU with tunnel MAC.
Mac-tunnel discard	The total number of discarded frames that are trapped to CPU with tunnel MAC.

Release History

Release 8.6R2; command was introduced.

Related Commands

clear ethernet-service nni l2pt-statistics	Clears all NNI port statistics.
show ethernet-service nni	Displays configuration information for VLAN Stacking NNI ports.

MIB Objects

```

clear ethernet-service nni l2pt-statistics

Clears statistics collected for Network Network Interface (NNI) ports.

clear ethernet-services nni [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] l2pt-statistics**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis, slot, and port number (1/1/6) on which to clear the statistics. Use a hyphen to specify a range of ports (1/1/6-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number on which to clear the statistics. Use a hyphen to specify a range of link aggregate IDs (5-10)

Defaults

By default, the statistics for all NNI ports are cleared if a port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **port** *chassis/slot/port***[**-*port2***]** or **linkagg** *agg_id***[**-*agg_id2***]** parameter to clear statistics information for specific switch ports or link aggregate IDs.
- Make sure the specified port or link aggregate is configured as an NNI port.

Examples

```
-> clear ethernet-service nni l2pt-statistics
-> clear ethernet-service nni port 1/1/6 l2pt-statistics
-> clear ethernet-service nni port 1/1/7-10 l2pt-statistics
-> clear ethernet-service nni port 1/1/5 l2pt-statistics
ERROR: Port 1/1/5 is not a network port

-> clear ethernet-service nni linkagg 10 l2pt-statistics
-> clear ethernet-service nni linkagg 11-15 l2pt-statistics
-> clear ethernet-service nni linkagg 20 l2pt-statistics
ERROR: Port or Linkagg not Vlan Stacking Port
```

Release History

Release 8.6R2; command was introduced.

Related Commands

show ethernet-service nni l2pt-statistics	Displays the statistics information collected for NNI ports.

```

show ethernet-service uni

Displays a list of UNI ports configured for the switch and the profile association for each port.

show ethernet-service uni [port *chassis/slot/port* | **linkagg** *agg_id***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

By default, profile information for all UNI ports is displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

Specify a *chassis/slot/port* or link aggregate ID number to display information for a single port or link aggregate ID.

Examples

```
-> show ethernet-service uni

    Port    UNI Profile
---------+--------------------+
   1/1/1   uni-profile-default
   1/1/2   multi-site
   1/1/3   multi-site

-> show ethernet-service uni port 1/3

    Port    UNI Profile
---------+--------------------+
   1/1/3   multi-site
```

output definitions

Port	The chassis/slot/port number or link aggregate ID for the UNI port.
UNI Profile	The UNI profile associated with the port.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).
ethernet-service uni-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.
show ethernet-service uni-profile	Displays the profile attribute configuration for VLAN Stacking UNI profiles.

MIB Objects

```

   alaEServicePortID
   alaEServicePortProfileID
```

show ethernet-service uni l2pt-statistics

Displays statistics collected for each tunneling protocol on a per-UNI port basis.

show ethernet-service uni [port *chassis/slot/port* | **linkagg** *agg_id***] l2pt-statistics**

Syntax Definitions

chassis/slot/port	The chassis, slot, and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

By default, statistics information for all UNI ports and associated tunneling protocols is displayed.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **port** *chassis/slot/port* or **linkagg** *agg_id* parameter to display statistics information for a specific switch port or link aggregate ID.
- Make sure the specified port or link aggregate is configured as a UNI port.

Examples

```
-> show ethernet-service uni L2PT-statistics
                                                    Mac          Source

-> show ethernet-service uni port 1/1/4 l2pt-statistics
ERROR: Port (1/4) is not a user port
```

output definitions

Slot/Port	Service UNI port associated with an L2 protocol and L2 protocol statistics.
L2 Protocol	The l2 protocol associated with the service UNI port.
Rx	The total number of frames received by the protocol on the port and trapped in CPU.
Peer	The total number of tunneled frames received by the protocol on the port and trapped in CPU and peered.
Mac Tunnel	The total number of tunneled frames received by the protocol on the port and trapped in CPU and MAC tunneled.
Mac De-tunnel	The total number of tunneled frames received by the protocol on the port and trapped in CPU and MAC de-tunneled.
Source MAC	Specifies the source MAC address of the last frame of the protocol on the port trapped in CPU.

Release History

Release 8.6R2; command was introduced.

Related Commands

clear ethernet-service uni l2pt-statistics	Clears the tunneling protocol statistics on UNI ports.
show ethernet-service uni	Displays a list of UNI ports configured for the switch and the profile association for each port.

clear ethernet-service uni l2pt-statistics

Clears tunneling protocol statistics collected for UNI ports.

clear ethernet-service uni [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]] l2pt-statistics**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis, slot, and port number (1/1/6) on which to clear the statistics. Use a hyphen to specify a range of ports (1/1/6-10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number on which to clear the statistics. Use a hyphen to specify a range of link aggregate IDs (5-10)

Defaults

By default, tunneling protocol statistics are cleared on all UNI ports if a port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

- Use the **port** *chassis/slot/port***[**-*port2***]** or **linkagg** *agg_id***[**-*agg_id2***]** parameter to clear statistics information for specific switch ports or link aggregate IDs.
- Make sure the specified port or link aggregate is configured as UNI port.

Examples

```
-> clear ethernet-service uni l2pt-statistics

-> clear ethernet-service uni port 1/1/1 12pt-statistics
-> clear ethernet-service uni port 1/1/7-10 l2pt-statistics
-> clear ethernet-service uni port 1/1/6 l2pt-statistics
ERROR: Port 1/1/6 is not a user port

-> clear ethernet-service uni linkagg 10 l2pt-statistics
-> clear ethernet-service uni linkagg 11-15 l2pt-statistics
-> clear ethernet-service uni linkagg 20 l2pt-statistics
ERROR: Port or Linkagg not Vlan Stacking Port
```

Release History

Release 8.6R2; command was introduced.

Related Commands

show ethernet-service uni l2pt-statistics	Displays tunneling protocol statistics on a per-UNI port.

alaEServiceL2PTProtocolStatisticsClear
   alaEServiceNNIPortL2GlobalClearStatistics
alaEServiceUNIPortL2ProtocolStatisticsTable
   alaEServiceUNIPortL2ClearStats
```

show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

show ethernet-service uni-profile [*uni_profile_name***]**

Syntax Definitions

uni_profile_name	An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Specify a UNI profile name to display attributes for a single UNI profile.
- UNI profile information is displayed based on the switch platform. For example, UNI profile settings to process CISCO control packets and custom L2 protocol assignments for UNI profiles are supported only on the OmniSwitch 6465, OmniSwitch 6860, and OmniSwitch 6865, so that information is displayed only on those switches.

Examples

Sample output on an OmniSwitch 6465, OmniSwitch 6860, and OmniSwitch 6865:

```
-> show ethernet-service uni-profile
Profile Name: default-uni-profile
  Tunnel MAC : 01:00:0c:cd:cd:d0,
  STP : tunnel,     802.1x : drop,       802.3ad : peer,       802.1ab    : drop,

```

```
  tunnel-mac-ethertype                : mac-tunnel

  tunnel-mac-range                    : tunnel
```

output definitions

Profile Name	The name of the UNI profile.
Tunnel MAC	The MAC address used for MAC tunneling.
PROTOCOL: action	The protocol and configured action: **peer—**The UNI port is participating in the specified protocol. **drop—**Discards the specified PDU. **tunnel—**The PDU is tunneled across the provider network without modifying the MAC address. **mac-tunnel—**The PDU is tunneled across the provider network after changing the destination MAC address to the tunnel MAC address.
Custom L2 Protocol	The name of a custom L2 protocol that is assigned to the UNI profile. In the example output shown above, the “tunnel-mac-ethertype” and “tunnel-mac-range” custom L2 protocols are assigned to “uni-prof1”.

Sample output on an OmniSwitch 6900:

```
-> show ethernet-service uni-profile

                                                                  802.1AB 802.1AB 802.1AB
   Profile Name       Stp   802.1x 802.3ad  MVRP    AMAP    Both   Tagged  Untagged
------------------+-------+------+-------+-------+-------+-------+-------+--------
default-uni-profile  tunnel  drop   peer    tunnel  drop    drop     -       -
lldp-tag-untag       tunnel  drop   peer    tunnel  drop     -      tunnel  drop
uprofile-video1      tunnel  drop   peer    drop    tunnel  drop     -       -
```

output definitions

Profile Name	The name of the UNI profile.
PROTOCOL: action	The protocol and configured action: **peer—**The UNI port is participating in the specified protocol. **drop—**Discards the specified PDU. **tunnel—**The PDU is tunneled across the provider network without modifying the MAC address.

Release History

Release 7.1.1; command introduced.
Release 8.6R1; “Tunnel MAC” field added, additional protocol fields added to display action for CISCO PDUs, custom L2 protocol entry names and action included in display output.
Release 8.6R2; “802.1AB Both”, “802.1AB Tagged”, “802.1AB Untagged”, and “802.1AB Mode” fields added.

Related Commands

ethernet-service uni-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni-profile inbound 802.1ab	Configures the treatment of Layer 2 tagged and untagged 802.1AB control frames that are received on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.
ethernet-service custom-L2-protocol	Creates a custom L2 protocol MAC address entry with an optional mask, EtherType, or SSAP/DSAP protocol identifier.
ethernet-service uni-profile custom-L2-protocol	Assigns a custom L2 protocol MAC address entry to a UNI profile.
show ethernet-service uni	Displays the profile associations for VLAN Stacking UNI ports.

show ethernet-service custom-l2-protocol

Displays the custom L2 protocol configuration for the switch.

show ethernet-service custom-l2-profile [*custom_protocol_name***]**

Syntax Definitions

custom_protocol_name	The name of a configured custom L2 protocol entry.

Defaults

By default, all custom L2 protocol entries are displayed if a custom L2 protocol name is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

- Specify a custom L2 protocol name to display attributes for a specific custom protocol entry.
- A custom L2 protocol entry is assigned to a UNI profile. Use the **show ethernet-service uni-profile** command to display the custom L2 protocol entries assigned to a UNI profile.

Examples

```
-> show ethernet-service custom-l2-protocol
 Custom L2 Protocol            Mac                Mask        Ether-Type Sub-Type
                                                                  (or)      (or)
                                                               Ssap/Dsap    Pid
----------------------+------------------+-----------------+----------+----------
tunnel-mac-ethersubtype 01:80:c2:00:11:11       -             0x5556        120
tunnel-mac-ethertype    01:80:c2:00:11:11       -             0x5555         -
tunnel-mac-ssap/dsap    01:80:c2:00:11:11       -             0x43/0x43      3
tunnel-mac              01:80:c2:00:11:11       -                -           -

discard-mac-range       01:80:c2:00:11:11   ff:ff:ff:00:ff:ff    -           -

-> show ethernet-service custom-l2-protocol tunnel-mac-range
 Custom L2 Protocol            Mac                Mask        Ether-Type Sub-Type
                                                                  (or)      (or)
                                                               Ssap/Dsap    Pid
----------------------+------------------+-----------------+----------+----------
tunnel-mac-range        01:80:c2:00:11:11   ff:ff:ff:ff:ff:00    -           -
```

output definitions

Custom L2 Protocol	The name of the custom L2 protocol entry.
Mac	The multicast MAC address for the custom L2 protocol entry.
Mask	The MAC address mask to specify a range of MAC addresses.

output definitions

Ether-Type (or) Ssap/Dsap	The EtherType or SSAP/DSAP value for the MAC address entry.
Sub-Type (or) Pid	The optional Sub-Type value or the PID value for the MAC address entry. • A Sub-Type value is optionally entered when an EtherType value is specified. • A PID value is specified when an SSAP/DSAP value is specified.

Release History

Release 8.6R1; command introduced.

Related Commands

ethernet-service custom-L2-protocol	Creates a custom L2 protocol MAC address entry with an optional mask, EtherType, or SSAP/DSAP protocol identifier.
ethernet-service uni-profile custom-L2-protocol	Assigns a custom L2 protocol entry to a UNI profile.
show ethernet-service uni-profile	Displays the UNI profile configuration for the switch, which includes any custom L2 protocol assignments.

show ethernet-service uni-profile l2pt-statistics

Displays the profile statistics collected for User Network Interface (UNI) profiles. Statistics are collected for all protocol frames (including custom L2 protocols) that are received on all ports that are bound to the UNI profile.

show ethernet-service uni-profile [*uni_profile_name***] l2pt-statistics**

Syntax Definitions

uni_profile_name	The name of the UNI profile.

Defaults

By default, statistics for all UNI profiles are displayed if a UNI profile name is not specified with this command.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Specify a UNI profile name to display the statistics for a single UNI profile.

Examples

```
-> show ethernet-service uni-profile Profile-1 l2pt-statistics
UNI Profile: Profile-1
        Total RX:                                               0,
        L2 Protocol:
                STP

                        Rx:                                     0,
```

```
                Hardware processing:                    DROP,
        802.1ab Untagged
                Rx:                                     0,
                Hardware processing:                    DROP,
```

output definitions

UNI Profile	The UNI profile associated with the port.
Total RX	The total number of protocol frames received on the port that is associated with the UNI profile.
L2 Protocol:	The protocol for which the statistics are collected.
Rx:	The number of frames received for the specific protocol.
Hardware processing:	Displays the configured hardware action.

Release History

Release 8.6R2; command was introduced.

Related Commands

clear ethernet-service uni-profile l2pt-statistics

Clears the protocol statistics collected for UNI profiles.

clear ethernet-service uni-profile [*uni_profile_name***] l2pt-statistics**

Syntax Definitions

uni_profile_name	The name of the UNI profile.

Defaults

By default, statistics are cleared for all UNI profiles.

Platforms Supported

OmniSwitch 6465

Usage Guidelines

Specify a UNI profile name to clear the statistics for a single UNI profile.

Examples

```
-> clear ethernet-service uni-profile uni-profile 1 l2pt-statistics
```

Release History

Release 8.6R2; command was introduced.

Related Commands

show ethernet-service uni-profile l2pt-statistics	Displays the statistics of all protocols configured per UNI port.

MIB Objects

```

show ethernet-service mac-tunneling

Displays the global MAC tunneling status for the switch.

show ethernet-service mac-tunneling

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6860, 6865

Usage Guidelines

Any changes to the global MAC tunneling status requires a switch reload to activate.

Examples

```
-> show ethernet-service mac-tunneling
Mac-Tunneling Feature: enable

-> ethernet-service mac-tunneling disable
INFO :Changed mac-tunnel feature status will take effect if command is saved on
next switch reboot

-> show ethernet-service mac-tunneling
(*=new mac-tunneling feature will be applied after reboot)
Mac-Tunneling Feature: disable*
```

Release History

Release 8.6R1; command introduced.

Related Commands

ethernet-service mac-tunneling Configures the global MAC tunneling status for the switch

MIB Objects

```
alaEServiceGlobals
   alaEServiceGlobalMacTunneling
```

show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

show ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

uni-profile-name	An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

Platforms Supported

OmniSwitch 6465, 6860, 6865, 6900

Usage Guidelines

- Specify a SAP profile name to display attributes for a single SAP profile.
- The ingress bandwidth value is displayed in megabytes.

Examples

```
-> show ethernet-service sap-profile

      Profile Name   Ingr/Egr     Ingr Bw    Inner Tag   Priority   Priority
                        Bw        Sharing      Option    Mapping     Value
-------------------+-----------+-----------+-----------+----------+-----------
default-sap-profile     0/0       Enable      Preserve     fixed       0
map_pbit                0/0       Enable      Preserve     in-out      P
sap1                 24324/0      NA          Preserve     NA          NA
sap_1                   0/0       NA          Preserve     NA          NA

-> show ethernet-service sap-profile sap-video1

   Profile Name       Ingr/Egr    Ingr Bw       Inner Tag  Priority   Priority
                       Bw         Sharing       Option     Mapping     Value
-------------------+----------+-------------+-----------+----------+------------
sap-video1              20         Disable     Preserve     NA          NA
```

output definitions

Profile Name	The name of the SAP profile.
Ingr/Egr Bw	**Ingress Egress Bandwidth** - The maximum amount of ingress and egress bandwidth to allow for SAP ports.

output definitions

Ingr Bw Sharing	**Ingress Bandwidth Sharing -** The status of bandwidth sharing (**enable**, **disable,** or **NA**). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs.
Inner Tag Option	Indicates how the CVLAN tag is processed (**translate** or **preserve**). If set to **preserve**, the CVLAN tag is retained and the SVLAN is added to the frame. If set to **translate**, the CVLAN tag is changed to the SVLAN tag.
Priority Mapping	Indicates how the priority value is configured for the SVLAN (**NA**, **in-out** or **fixed**). If set to **in-out**, the CVLAN priority value is mapped to the SVLAN. If set to fixed, a user-specified priority value is used for the SVLAN priority.
Priority Value	Indicates the priority value mapped to the SVLAN (**NA**, default 0, a number, **P**, or **DSCP**). A number indicates a fixed, user-specified value is used; **P** indicates the CVLAN 802.1p bit value is used; **DSCP** indicates the CVLAN DSCP value is used.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service sap-profile	Creates a profile for a VLAN Stacking Service Access Point (SAP).
ethernet-service sap	Creates a VLAN Stacking SAP and associates the SAP with a service and SAP profile.

   alaEServiceSapProfileFixedPriority
   alaEServiceSapProfileIngressBW
   alaEServiceSapProfileEgressBW
   alaEServiceSapProfileBandwidthShare
```

loopback-test

Configures a wire-rate hardware loopback test profile and enables or disables the activation of the profile. The loopback test profile specifies the switch attributes that are required to conduct an ingress or egress loopback operation on a switch port.

loopback-test *profile_name* **destination-mac** *dest_address* {**port** *chassis/slot/port* **| linkagg** *agg_id*} **source-mac** *src_address* **vlan** *vlan_id* **[type {inward | outward [sap** *sap_id*]**}]**

loopback-test *profile_name* **admin-state {enable | disable}**

no loopback-test *profile_name*

Syntax Definitions

profile_name	Alphanumeric string of up to 31 characters. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
src_address	A unique source MAC address for the test frame.
dest_address	A unique destination MAC address for the test frame.
vlan_id	The VLAN ID of the test frame. Always use the outer VLAN ID.
chassis/slot/port	The switch port number to use for the loopback test.
agg_id	The linkagg ID for the loopback test. *This is currently not supported.*
inward	Sets the type of loopback test to ingress.
outward	Sets the type of loopback test to egress.
sap_id	UNI profile used for egress UNI loopback. *This is currently not supported.*
enable	Enables the loopback test profile.
disable	Disables the loopback test profile.

Defaults

parameter	default
type	**inward**

Platforms Supported

OmniSwitch 6860, 6865, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **no** form of this command to delete a loopback profile.
- Use the **loopback-test admin-state enable** command to enable the loopback test profile on the specified port. When the profile is enabled, the loopback operation is enabled for the port.
- Use the **loopback-test admin-state disable** command to disable the loopback operation for the specified port.

- 'loopback-test <*profile-name*> admin-state enable' command will not be displayed in 'show configuration snapshot'. Similarly, 'loopback-test admin-state <*profile-name*> enable' is not stored in vcboot.cfg.
- When a port is configured as outward loopback port, it goes "out-of-service" and will no longer carry customer traffic but remains active for test frame traffic. However, an inward loopback port remains "in-service" and will continue to carry customer traffic as well as test frame traffic.
- Only Layer 2 loopback tests are supported, so test frames are not routed. As a result, the loopback test operation will only swap the source and destination MAC address of bridged test frames.
- Test frame must be L3 frames and L3 header must be included in test frames.
- Traffic with all the valid CVLANS, which are part of the SVLAN gets looped-back, as hardware loopback cannot identify which CVLAN traffic to loopback.
- During outward loopback test, port will enter MAC-loopback, STP and Source Learning will be disabled on that port.
- In outward UNI/NNI loopback, destination MAC is learned as static MAC on loopback port on **loopback-test enable** and is removed on **loopback-test disable**. This destination MAC is not displayed in 'show mac-learning' command.
- The destination MAC address for the test frame must be unique to the network and must not be used anywhere in the device.

Examples

The following example creates an ingress loopback test profile:

```
-> loopback-test PE1-inward-UNI destination-mac 00:00:00:cc:aa:bb port 1/1/2
source-mac 00:00:00:dd:aa:01 vlan 1001 type inward
```

The following example creates an egress loopback test profile:

```
-> loopback-test PE2-outward-UNI destination-mac 00:00:00:cc:ab:bb port 1/1/2
source-mac 00:00:00:dd:ab:01 vlan 1001 type outward
```

The following command examples enable and disable a loopback test profile:

```
-> loopback-test PE1-outward-UNI admin-state enable
-> loopback-test PE1-outward-UNI admin-state disable
```

Release History

Release 8.6R1; command was introduced.

Related Commands

show loopback-test

Displays the profile configuration for a hardware loopback test profile.

show loopback-test [*profile_name***]** [**counters**]

Syntax Definitions

profile_name	The name of an existing hardware loopback test profile.
counters	Hardware counters for given or all loopback test profiles.

Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6865, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the *profile_name* parameter to display the loopback test configuration for a specific profile.
- Hardware counters is displayed only when the test profile is enabled.

Examples

```
-> show loopback-test
Profile-Name         Src-Mac              Dest-Mac        Vlan    Port     Type    Status

```

output definitions

Profile-Name	The name of the loopback test profile.
Src-Mac	The source MAC address of the test packet.
Dest-Mac	The destination MAC address of the test packet.
Vlan	The VLAN ID of the loopback port.
Port	The UNI or NNI loopback port.

output definitions

Type	The type of loopback test; **Inward** (ingress) or **Outward** (egress).
Status	The status of the loopback test (**Enable**, **Disable**, or **Config**).
Packet Counters	Hardware packet counters for the configured flow.
Byte Counters	Hardware byte counters for the configured flow.

Release History

Release 8.6R1; command was introduced.

Related Commands

8 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the OmniSwitch STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), and 802.1Q 2005 (MSTP).
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- A *per-VLAN* Spanning Tree operating mode that applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

Filename: ALCATEL-IND1-VLAN-STP-MIB.mib
Module: alcatelIND1VLANSTPMIB

A summary of the available commands is listed here:

Bridge commands	**spantree mode** **spantree protocol** **spantree priority** **spantree hello-time** **spantree max-age** **spantree forward-delay** **spantree bpdu-switching** **spantree path-cost-mode** **spantree vlan admin-state** **spantree auto-vlan-containment** **show spantree** **show spantree cist** **show spantree msti** **show spantree vlan** **show spantree mode**
Port commands	**spantree cist** **spantree vlan** **spantree priority** **spantree cist path-cost** **spantree msti path-cost** **spantree vlan path-cost** **spantree cist mode** **spantree loop-guard** **spantree vlan mode** **spantree cist connection** **spantree vlan connection** **spantree cist admin-edge** **spantree vlan admin-edge** **spantree cist auto-edge** **spantree vlan auto-edge** **spantree cist restricted-role** **spantree vlan restricted-role** **spantree cist restricted-tcn** **spantree vlan restricted-tcn** **spantree cist txholdcount** **spantree vlan txholdcount** **show spantree ports** **show spantree cist ports** **show spantree msti ports** **show spantree vlan ports**
MST region commands	**spantree mst region name** **spantree mst region revision-level** **spantree mst region max-hops** **show spantree mst**
MST instance commands	**spantree msti** **spantree msti vlan** **show spantree msti vlan-map** **show spantree cist vlan-map** **show spantree map-msti**
PVST+ commands	**spantree pvst+compatibility**

spantree mode

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

spantree mode {**flat | per-vlan}**

Syntax Definitions

flat	One Spanning Tree instance per switch.
per-vlan	One Spanning Tree instance for each VLAN configured on a switch.

Defaults

By default, the Spanning Tree mode for the switch is set to per-VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.
- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see Chapter 5, “VLAN Management Commands”).

Note. Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

Examples

```
-> spantree mode flat
-> spantree mode per-vlan
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree protocol	Selects the Spanning Tree protocol for the specified instance.
spantree bpdu-switching	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpTable
   vStpNumber
   vStpMode
```

spantree protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance.

spantree [cist | vlan *vlan_id***] protocol {stp | rstp | mstp}**

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1W Rapid Spanning Tree Protocol.
mstp	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol. This protocol is not supported on a per-VLAN basis.

Defaults

By default, the Spanning Tree protocol is set to RSTP.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the optional **cist** or **vlan** parameter is not specified with this command, the protocol is set for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active.

Note. Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).

- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or per-VLAN Spanning Tree mode.
- Deleting all existing MSTIs is required before changing the protocol from MSTP to STP or RSTP.

Note. When the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to the default value. See the **spantree path-cost-mode** command page for more information.

Examples

```
-> spantree protocol mstp
-> spantree cist protocol mstp
-> spantree vlan 5 protocol rstp
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsProtocolSpecification
```

spantree vlan admin-state

Enables or disables the Spanning Tree status for a VLAN.

spantree vlan *vlan_id* **[**-*vlan_id2***] admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[**-*vlan_id2***]**	An existing VLAN ID number. Use a hyphen to specify a range of VLANs (10-15).
enable	Enables Spanning Tree for the specified VLAN.
disable	Disables Spanning Tree for the specified VLAN.

Defaults

By default, the Spanning tree status is enabled for a VLAN instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

VLAN Spanning Tree instances are only active when the switch is running in the per-VLAN mode. However, configuring the VLAN Spanning Tree status is allowed in both modes (per-VLAN and flat).

Examples

```
-> spantree vlan 850-900 admin-state enable
-> spantree vlan 720-750 admin-state disable
-> spantree vlan 500 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

spantree mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree mst region name *name*

no spantree mst region name

Syntax Definitions

name	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example, “ALE Marketing”).

Defaults

By default, the MST region name is left blank.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the MST region name.

Note. It is not necessary to specify the region name to remove it.

- To change the existing region, use this command with a string value that is different than the existing region name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

Examples

```
-> spantree mst region name SalesRegion
-> spantree mst region name “ALE Marketing”
-> no spantree mst region name
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigName
```

spantree mst region revision-level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree mst region revision-level *rev_level*

Syntax Definitions

rev_level	A numeric value that identifies the MST region revision level for the switch.

Defaults

By default, the MST revision level is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An MST region revision level can be assigned to the MST region regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode, using the MSTP.

Examples

```
-> spantree mst region revision-level 1000
-> spantree mst region revision-level 2000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigRevisionLevel
```

spantree mst region max-hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to assign the maximum number of hops a BPDU is allowed to traverse, before it is discarded and related information is aged out.

spantree mst region max-hops *max_hops*

Syntax Definitions

max_hops	A numeric value that designates the maximum number of hops.

Defaults

By default, the maximum number of hops is set to 20.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and is used to determine the size of the region.
- The maximum hop count value is the initial value of the “remaining hops” parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the “remaining hops” count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

Examples

```
-> spantree mst region max-hops 40
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionMaxHops
```

spantree msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

spantree msti *msti_id* **[name** *name***]**

no spantree msti *msti_id* **[name]**

Syntax Definitions

msti_id	A numeric MSTI ID number. A range of VLANs is associated to an MSTI ID number.
name	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example, “ALE Marketing”).

Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the MSTI from the switch configuration.
- Use the **no** form of this command along with the **name** parameter to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- There is always one CIST per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10
-> spantree msti 20 name BldgOneST10
-> no spantree msti 20 name
-> no spantree msti 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstInstanceTable
   vStpMstInstanceNumber
   vStpMstInstanceName
   vStpMstInstanceVlanBitmapAddition
   vStpMstInstanceVlanBitmapDeletion
   vStpMstInstanceVlanBitmapState
```

spantree msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree msti *msti_id* **vlan** *vlan_id***[-***vlan_id2***]**

no spantree msti *msti_id* **vlan** *vlan_id***[-***vlan_id2***]**

Syntax Definitions

msti_id	A numeric MSTI identification number. A range of VLANs are associated to an MSTI ID number.
*vlan_id***[-***vlan_id2***]**	A VLAN ID number. Use a hyphen to specify a range of VLAND IDs (for example, **vlan 10-15**).

Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- To associate multiple VLANS in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10 vlan 100-115
-> spantree msti 20 vlan 122
-> no spantree msti 10 vlan 100-115
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.

MIB Objects

```
vStpMstVlanAssignmentTable
   vStpMstVlanAssignmentVlanNumber
   vStpMstVlanAssignmentEntry
   vStpMstVlanAssignmentMstiNumber
```

spantree priority

Configures the bridge priority value for the Common and Internal Spanning Tree (CIST) instance, a Multiple Spanning Tree Instance (MSTI), or a VLAN instance. This command is also used to configure the priority value for a port or link aggregate associated with the CIST, an MSTI, or a VLAN.

spantree [cist | msti *msti_id* **| vlan** *vlan_id***] [port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id***[-***agg_id2***]] priority** *priority*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
msti_id	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance. This parameter is configurable in both modes (flat or per-VLAN) but only if the flat mode protocol is set to MSTP.
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
priority	A bridge or port priority value. The valid range for the bridge priority is 0–65535. The valid range for the port priority is 0–15. If MSTP is the active flat mode protocol, enter a value that is a multiple of 4096 (for example, 4096, 8192, 12288).

Defaults

- By default, the bridge priority value is set to 32768 for the CIST, an MSTI, and a VLAN instance.
- By default, the port or link aggregate priority value is set to 7.

parameter	default
cist | **msti** *msti_id* | **vlan** *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge. The port priority value is used to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

- The lower the bridge or port priority number assigned, the higher the priority that is associated with the bridge or port.
- If none of the optional instance parameters (**cist**, **msti**, or **vlan**) or **port** and **linkagg** parameters are specified with this command, the bridge priority is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist**, **msti**, and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified priority values are not applied unless the supporting mode (flat for CIST/MSTI or per-VLAN for a VLAN instance) is active.
- To configure the bridge priority with this command, specify the instance (**cist**, **msti**, or **vlan**) and the priority value; do not specify a port number or link aggregate ID.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- When the protocol is changed to/from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address. In regards to the priority for an MSTI, only the four most significant bits are used.
- To configure the port priority with this command, specify the instance (**cist**, **msti**, or **vlan**), a port number or link aggregate ID that is associated with that instance, and the priority value.
- The port priority value configured with this command is only applied to the specified instance. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- The port priority specifies the value of the priority field contained in the first byte of the port ID. The second byte contains the physical switch port number.

Examples

The following command examples set the bridge priority for the specified instance:

```
-> spantree priority 8192
-> spantree cist priority 8192
-> spantree vlan 2 priority 32679
-> spantree msti 1 priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
         8192, 12288, 16384 ... 61440
-> spantree msti 1 priority 8192
```

The following command examples set the port priority for the specified instance:

```
-> spantree port 1/10 priority 10
-> spantree cist port 1/10 priority 10
-> spantree cist linkagg 10 priority 1
-> spantree vlan 200 port 2/1 priority 15
-> spantree vlan 2 linkagg 5 priority 2
-> spantree msti 2 port 1/24 priority 5
-> spantree msti 3 linkagg 6-8 priority 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.
show spantree ports	Displays the Spanning Tree port configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsPriority
   vStpInsBridgeAddress
```

spantree hello-time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

spantree [cist | vlan *vlan_id***] hello-time** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Specifies the Hello time value in seconds. The valid range is 1–10.

Defaults

By default, the bridge hello time value is set to 2 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- If the optional **cist** or **vlan** parameter is not specified with this command, the hello time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified hello time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree hello-time 5
-> spantree cist hello-time 5
-> spantree vlan 10 hello-time 3
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsBridgeHelloTime
```

spantree max-age

Configures the bridge maximum age time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that the Spanning Tree Protocol information learned from the network on any port is retained. This information is discarded when it ages beyond the maximum age value.

spantree [cist | vlan *vlan_id***] max-age** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Max-age time in seconds. The valid range is 6–40.

Defaults

By default, the bridge maximum age time value is set to 20 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A low maximum age time causes the Spanning Tree Algorithm to reconfigure more often.
- If the optional **cist** or **vlan** parameter is not specified with this command, the maximum age time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified maximum age time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the maximum age time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree max-age 10
-> spantree cist max-age 10
-> spantree vlan 10 max-age 30
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsBridgeMaxAge
```

spantree forward-delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

spantree [cist | vlan *vlan_id***] forward-delay** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Forward delay time, in seconds.The valid range is 4–30.

Defaults

By default, the bridge forward delay time value is set to 15 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- If the optional **cist** or **vlan** parameter is not specified with this command, the forward delay time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified forward delay time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree forward-delay 30
-> spantree cist forward-delay 30
-> spantree vlan 5 forward-delay 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsBridgeForwardDelay
```

spantree bpdu-switching

Enables or disables the switching of Spanning Tree BPDU for VLAN and CIST instances if the switch is running in the per-VLAN mode.

spantree {vlan *vlan_id* **| cist} bpdu-switching {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
enable	Enables BPDU switching for the specified instance.
disable	Disables BPDU switching for the specified instance.

Defaults

By default, BPDU switching is disabled for VLAN or CIST instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- Use the **vlan** parameter along with the *vlan_id* to enable or disable BPDU switching for a particular VLAN.
- Use the **cist** parameter to enable or disable BPDU switching for the CIST instance.

Examples

```
-> spantree mode flat
-> spantree bpdu-switching enable
-> spantree bpdu-switching disable
-> spantree cist bpdu-switching enable
-> spantree cist bpdu-switching disable

-> spantree mode per-vlan
-> spantree vlan 10 bpdu-switching enable
-> spantree vlan 10 bpdu-switching disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpInsTable
   vStpInsBpduSwitching
```

spantree path-cost-mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

spantree path-cost-mode {auto | 32bit}

Syntax Definitions

auto	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
32bit	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

Defaults

By default, the path cost mode is set to **auto**.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **spantree path-cost-mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

Examples

```
-> spantree path-cost-mode 32bit
-> spantree path-cost-mode auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree protocol	Configures the protocol for the flat mode CIST instance or a per-VLAN mode VLAN instance.

MIB Objects

```
vStpBridge
   vStpPathCostMode
```

spantree pvst+compatibility

Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

spantree pvst+compatibility {port *chassis/slot/port***] | linkagg** *agg_id***} {enable | disable | auto}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port.
*agg_id***[-***agg_id2***]**	The link aggregate ID number.
enable	Enables the PVST+ mode.
disable	Disables the PVST+ mode.
auto	IEEE BPDUs are used until a PVST+ BPDU is detected.

Defaults

PVST+ is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in per-VLAN mode.
- Specify **pvst+compatibility enable** to enable all the ports on the switch to handle PVST+ BPDUs.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

Examples

```
-> spantree pvst+compatibility enable
-> spantree pvst+compatibility disable
-> spantree port 1/3 pvst+compatibility enable
-> spantree port 2/2 pvst+compatibility auto
-> spantree linkagg 2 pvst+compatibility enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree	Displays Spanning Tree bridge information for all flat mode Common and Internal Spanning Tree (CIST) instance and per-VLAN mode VLAN instance.
show spantree ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a per-VLAN mode VLAN instance.
show spantree cist ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.
show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

```
vStpPortConfigPVST
vStpPortConfigStatePVST
vStpBridgeModePVST
```

spantree auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

spantree [msti *msti_id***] auto-vlan-containment {enable | disable}**

Syntax Definitions

msti_id	An existing MSTI ID number. A range of VLANs are associated to an MSTI ID number.
enable	Enables automatic VLAN containment.
disable	Disables automatic VLAN containment.

Defaults

By default, automatic VLAN containment is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **spantree auto-vlan-containment** command but do not specify an *msti_ id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, specify the *msti_id* for the instance and use the **disable** form of this command.
- Use the **enable** form of this command and specify an *msti_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. However, if the port path cost is administratively set to zero, then the path cost is reset to the default value.
- Note that when AVC is disabled, a port assigned to a VLAN that is not mapped to a specific instance, can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

Examples

```
-> spantree auto-vlan-containment enable
-> spantree auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

```
vStpInsTable
   vStpInsAutoVlanContainment
vStpBridge
   vStpBridgeAutoVlanContainment
```

spantree cist

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

spantree cist {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the CIST instance.
disable	Disables Spanning Tree on the specified port for the CIST instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the CIST instance regardless of which Spanning Tree operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree cist port 4/1 enable
-> spantree cist port 4/2-5 disable
-> spantree cist linkagg 16 disable
-> spantree cist linkagg 22-26 enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan	Configures the Spanning Tree status on a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

spantree vlan

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the specified VLAN instance.

spantree vlan *vlan_id* **[**-*vlan2***] {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the specified instance.
disable	Disables Spanning Tree on the specified port for the specified instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which Spanning Tree operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the per-VLAN mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that when this occurs, ports will *not* bridge BPDU unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree vlan 2 port 4/1 enable
-> spantree vlan 2 port 4/2-5 disable
```

```
-> spantree vlan 3 linkagg 16 disable
-> spantree vlan 3 linkagg 22-25 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist	Configures the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the per-VLAN or flat mode.
spantree vlan admin-state	Enables or disables Spanning Tree instance for the specified VLAN.
spantree bpdu-switching	Enables or disables the switching of Spanning Tree BPDU for all VLAN instances if the switch is running in the per-VLAN mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

spantree cist path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree cist {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} path-cost** *path_cost*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **spantree path-cost-mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If the *path_cost* is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the “Configuring Spanning Tree Parameters” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for a list of values.

Examples

```
-> spantree cist port 4/1 path-cost 19
-> spantree cist port 4/2-5 path-cost 19
-> spantree cist linkagg 16 path-cost 12000
-> spantree cist linkagg 17-20 path-cost 12000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree path-cost-mode	Selects a 32-bit or automatic path cost mode for the switch.
spantree msti path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree msti path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree msti *msti_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} path-cost** *path_cost*

Syntax Definitions

msti_id	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified MSTI regardless of which operating mode (flat or per-VLAN) is active for the switch. However, if MSTP is not the selected flat mode protocol, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti_id* value, the specified path cost value is applied to the CIST instance.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 35000 for MSTI 3.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. Using a 16-bit path cost value is not an option.

- If the *path_cost* is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the "**Configuring Spanning Tree Parameters**" chapter for a list of values.

Examples

```
-> spantree msti 0 port 4/1 path-cost 35000
-> spantree msti 0 port 1/20-24 path-cost 12000
-> spantree msti 2 linkagg 10 path-cost 20000
-> spantree msti 2 linkagg 10-12 path-cost 65000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree vlan path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id* **[**-*agg_id2***]} path-cost** *path_cost*

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **spantree path-cost-mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If the *path_cost* is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the "**Configuring Spanning Tree Parameters**" chapter for a list of values.

Examples

```
-> spantree vlan 200 port 4/1 path-cost 4
-> spantree vlan 200 port 4/2-5 path-cost 4
```

```
-> spantree vlan 300 linkagg 16 path-cost 200000
-> spantree vlan 500 linkagg 24-28 path-cost 20000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.
spantree msti path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree cist mode

Configures manual mode (forwarding or blocking) or dynamic mode to manage the state of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

spantree cist {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} mode {forwarding | dynamic | blocking}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
forwarding	Sets the port state to forwarding.
dynamic	Port state is determined by the Spanning Tree algorithm.
blocking	Sets the port state to blocking.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree cist port 4/1 mode forwarding
-> spantree cist port 4/2-5 mode forwarding
-> spantree cist linkagg 10 mode blocking
-> spantree cist linkagg 15-20 mode forwarding
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree loop-guard	Configures the Spanning Tree mode for a port or a link aggregate of ports for the specified VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

spantree loop-guard

Enables or disables the STP loop-guard on a port or link aggregate.

spantree {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id* **[-***linkagg_id2***]} loop-guard {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (example 10-20).
enable	Enables STP loop-guard.
disable	Disables STP loop-guard.

Defaults

STP loop-guard is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.
- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.
- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.
- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance, the alternate or secondary ports takeover until the root port recovers from the error state.
- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
- If a spanning tree channel is blocked by loop-guard and the channel breaks, spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.

- The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.
- Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.
- When a VLAN is disabled, all the VLAN port associations recover from the error state.
- The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.
- STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

Examples

```
-> spantree port 1/1/2 loop-guard enable
-> spantree linkagg 1 loop-guard enable
-> spantree port 1/1/2 loop-guard disable
-> spantree linkagg 1 loop-guard disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

MIB Objects

```
vStpPortConfigTable
   vStpPortConfigIfIndex
   vStpPortConfigLoopGuard
```

spantree vlan mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or a link aggregate of ports for the specified VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[-***port2***]** | **linkagg** *agg_id* **[-***agg_id2***]} mode {dynamic | blocking | forwarding}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
dynamic	Port state is determined by the Spanning Tree algorithm.
blocking	Sets the port state to blocking.
forwarding	Sets the port state to forwarding.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree vlan 255 port 4/1-4 mode forwarding
-> spantree vlan 355 port 1/24 mode dynamic
-> spantree vlan 450 linkagg 1 mode dynamic
-> spantree vlan 450 linkagg 1-5 mode dynamic
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist mode	Configures the Spanning Tree mode for a port or a link aggregate of ports for the CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

spantree cist connection

Configures the connection type for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port* **[**-*port2***] | linkagg** *agg_id* **[**-*agg_id2***]} connection {noptp | ptp | autoptp}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point to point link.
ptp	Defines port connection type as point to point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree cist port 7/24 connection noptp
-> spantree cist port 7/25-28 connection ptp
```

```
-> spantree cist linkagg 5-10 connection autoptp
-> spantree cist linkagg 5-10 connection autoptp
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree vlan connection

Configures the connection type for a port or a link aggregate of ports for a VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port* **[**-*port2***]** | **linkagg** *agg_id* **[**-*agg_id2***]} connection {noptp | ptp | autoptp}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point to point link.
ptp	Defines port connection type as point to point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree vlan 255 port 7/24 connection noptp
-> spantree vlan 255 port 7/25-27 connection ptp
-> spantree vlan 255 linkagg 3 connection autoptp
-> spantree vlan 255 linkagg 3-7 connection autoptp
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
```

spantree cist admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} admin-edge {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the administrative edge port status for the specified port-CIST instance.
disable	Disables the administrative edge port status for the specified port-CIST instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active on the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> spantree cist linkagg 15 admin-edge enable
-> spantree cist linkagg 4-10 admin-edge enable
-> spantree cist port 8/25 admin-edge disable
-> spantree cist port 2/2-5 admin-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch
spantree vlan admin-edge	Configures the administrative edge port status for a port or a link aggregate of ports for a specific VLAN instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or a link aggregate of ports for the flat mode CIST instance.
spantree vlan auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

spantree vlan admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for a VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} admin-edge {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the administrative edge port status for the specified port-VLAN instance.
disable	Disables the administrative edge port status for the specified port-VLAN instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is configured to run in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 4 linkagg 15 admin-edge enable
-> spantree vlan 5 linkagg 12-14 admin-edge enable
-> spantree vlan 255 port 8/23 admin-edge disable
-> spantree vlan 3 port 2/2-5 admin-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree vlan auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

spantree cist auto-edge

Configures whether or not Spanning Tree automatically determines the operational edge port status of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id* **[**-*agg_id2***]} auto-edge {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree cist linkagg 15 auto-edge enable
-> spantree cist linkagg 10-12 auto-edge disable
-> spantree cist port 8/23 auto-edge disable
-> spantree cist port 2/2-5 auto-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch
spantree vlan auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or aggregate of ports for the specified per-VLAN mode VLAN instance.
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree vlan admin-edge	Configures the administrative edge port status for a port or aggregate of ports for a specific VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAutoEdge
```

spantree vlan auto-edge

Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id* **[**-*agg_id2***]} auto-edge {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled (on).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevent the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 255 port 8/23 auto-edge disable
-> spantree vlan 4 port 2/2-10 auto-edge enable
-> spantree vlan 100 linkagg 10 auto-edge disable
-> spantree vlan 200 linkagg 1-5 auto-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or aggregate of ports for the flat mode CIST instance.
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree vlan admin-edge	Configures the administrative edge port status for a port or aggregate of ports for a specific VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAutoEdge
```

spantree cist restricted-role

Configures the restricted role status for a port or a link aggregate of ports. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a root port is selected, the restricted port is selected as an Alternate Port.

spantree cist {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} restricted-role {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted role status for the specified port.
disable	Disables the restricted role status for the specified port.

Defaults

By default, the restricted role status for the port is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.

Examples

```
-> spantree cist linkagg 15-20 restricted-role enable
-> spantree cist port 8/23 restricted-role disable
-> spantree cist port 8/24-27 restricted-role disable
-> spantree cist linkagg 10 restricted-role disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan restricted-role	Configures the restricted role status for a port or aggregate of ports for the per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedRole
```

spantree vlan restricted-role

Configures the restricted role status for a port or a link aggregate of ports for the specified VLAN instance. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a Root Port is selected, the restricted port is selected as an Alternate Port.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} restricted-role {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted role status for the specified port-VLAN instance.
disable	Disables the restricted role status for the specified port-VLAN instance.

Defaults

By default, the restricted role status for the port is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.
- This command only applies to the VLAN instance specified by the VLAN ID regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted role status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 3 linkagg 15 restricted-role enable
-> spantree vlan 255 port 8/23 restricted-role enable
-> spantree vlan 255 port 8/24-27 restricted-role enable
-> spantree vlan 255 linkagg 11-15 restricted-role enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist restricted-role	Configures the restricted role status for a port or aggregate of ports for the flat mode CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedRole
```

spantree cist restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

spantree cist {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} restricted-tcn {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted TCN status for the specified port-CIST instance.
disable	Disables the restricted TCN status for the specified port-CIST instance.

Defaults

By default, the restricted TCN status for the port is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist linkagg 15 restricted-tcn enable
-> spantree cist port 8/23 restricted-tcn disable
-> spantree cist port 2/2-4 restricted-tcn enable
-> spantree cist linkagg 10-14 restricted-tcn disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan restricted-tcn	Configures the restricted TCN status for a port or aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedTcn
```

spantree vlan restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the specified VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

spantree vlan *vlan_id* **{port** *chassis/slot/port* **[**-*port2***]** | **linkagg** *agg_id* **[**-*agg_id2***]} restricted-tcn {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8)**.**
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted TCN status for the specified port-VLAN instance.
disable	Disables the restricted TCN status for the specified port-VLAN instance.

Defaults

By default, the restricted TCN is set to disable.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted TCN status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 2 linkagg 15 restricted-tcn enable
-> spantree vlan 2 linkagg 16-20 restricted-tcn enable
-> spantree vlan 255 port 8/23 restricted-tcn disable
-> spantree vlan 255 port 8/24-27 restricted-tcn disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist restricted-tcn	Configures the restricted TCN status for a port or aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedTcn
```

spantree cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

spantree cist txholdcount *value*

Syntax Definitions

value	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist txholdcount 5
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan txholdcount	Configures the BPDU transmission rate limit for the specified VLAN instance.

MIB Objects

```
vStpInsTable
   vStpInsBridgeTxHoldCount
```

spantree vlan txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the VLAN instance.

spantree vlan *vlan_id* **txholdcount {***value***}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
value	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified **txholdcount** status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 3 txholdcount 6
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist txholdcount	Configures the BPDU transmission rate limit for the CIST instance.

MIB Objects

```
vStpInsTable
   vStpInsBridgeTxHoldCount
```

show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or the per-VLAN mode VLAN instances.

show spantree

Syntax Definitions

N/A

Defaults

NA

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays a list of VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays a list of MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree

Spanning Tree Path Cost Mode :  32 BIT
Bridge STP Status Protocol Priority(Prio:SysID)
------+----------+--------+--------------------
     1      ON      RSTP   32768 (0x8000:0x0000)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Bridge	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol.
STP Status	The Spanning Tree state for the CIST instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the instance (**STP** or **RSTP**). Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

```
-> spantree mode flat
-> spantree protocol mstp

-> show spantree
  Spanning Tree Path Cost Mode : AUTO
 Msti STP Status Protocol Priority (Prio:SysID)
-----+----------+--------+--------------------
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)
    3      ON      MSTP   32771 (0x8000:0x0003)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**). Configured through the **spantree path-cost-mode** command.
Msti	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the **spantree msti** command. Note that MSTI 0 also represents the CIST instance that is always present on the switch.
STP Status	The Spanning Tree state for the MSTI (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to this instance. Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

```
-> spantree mode per-vlan
-> show spantree
  Spanning Tree Path Cost Mode : AUTO
 Vlan STP Status Protocol Priority
-----+----------+--------+-------------
    1      ON       RSTP   32768 (0x8000)
  200      ON       RSTP   32768 (0x8000)
  500     OFF       RSTP   32768 (0x8000)
 4094     OFF       RSTP   32768 (0x8000)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**). Configured through the **spantree path-cost-mode** command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**). Configured through the **spantree vlan admin-state** command.
Protocol	The Spanning Tree protocol applied to this instance (**STP** or **RSTP**). Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

MIB Objects

```

show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guideline

This command displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode. See the second example below.

Examples

```
-> spantree mode flat
-> show spantree cist
Spanning Tree Parameters for Cist
  Spanning Tree Status :                   ON,

  System Forward Delay (seconds) =      10,
  System Hello Time (seconds)    =       5
```

output definitions

Spanning Tree Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the CIST (**STP, RSTP,** or **MSTP**). Configured through the **spantree protocol** command.
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Auto-Vlan-Containment	The auto VLAN containment status for the instance (**Enabled** or **Disabled**). AVC prevents a port that has no VLANs mapped to a Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Configured through the **spantree auto-vlan-containment** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Last TC Rcvd Port	The port that received the TC Flag Set in RSTP or MSTP protocol BPDU. Default value is None.

output definitions (continued)

Last TC Rcvd Bridge	The adjacent designated bridge ID received from TC Flag Set in RSTP or MSTP BPDU along with Last TC Rcvd Port. This information is provided only for active RSTP and MSTP topologies. Default value is None.
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **spantree max-age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **spantree forward-delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **spantree hello-time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Hello Time	The Hello Time value for the root bridge.
BPDU Switching Enabled	The status of BPDU switching for the instance. This field only appears when BPDU switching is enabled. Configured through the **spantree bpdu-switching** command.

Release History

Release 7.1.1; command introduced.
Release 8.4.1; **Topology Change Port** field added.
Release 8.5R4; **Last TC Rcvd Bridge** field added.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***]**

Syntax Definitions

msti_id	An existing MSTI ID number.

Defaults

By default, displays information for all MSTIs.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This command displays Spanning Tree bridge information for an MSTI regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> spantree mode flat
-> spantree protocol mstp
-> show spantree msti
  Spanning Tree Path Cost Mode : AUTO

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **spantree msti** command.
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).

output definitions (continued)

Protocol	The Spanning Tree protocol applied to the instance (**STP, RSTP,** or **MSTP**). This value is not configurable for an MSTI. Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Spanning Tree Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Auto-Vlan-Containment	The auto VLAN containment status for the instance (**Enabled** or **Disabled**). AVC prevents a port that has no VLANs mapped to a Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Configured through the **spantree auto-vlan-containment** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
TxHoldCount	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Last TC Rcvd Port	The port that received the TC Flag Set in RSTP or MSTP protocol BPDU. Default value is None.
Last TC Rcvd Bridge	The adjacent designated bridge ID received from TC Flag Set in RSTP or MSTP BPDU along with Last TC Rcvd Port. This information is provided only for active RSTP and MSTP topologies. Default value is None.
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.

output definitions (continued)

Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Hello Time	The Hello Time value for the root bridge.
BPDU Switching Enabled	The status of BPDU switching for the instance. This field only appears when BPDU switching is enabled. Configured through the **spantree bpdu-switching** command.

Release History

Release 7.1.1; command introduced.
Release 8.4.1; **Topology Change Port** field added.
Release 8.5R4; **Last TC Rcvd Bridge** field added.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree vlan

Displays Spanning Tree bridge information for a per-VLAN mode VLAN instance.

show spantree vlan [*vlan_id***]**

Syntax Definitions

vlan_id	An existing VLAN ID number.

Defaults

By default, displays information for all VLAN instances.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vlan_id* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- This command displays Spanning Tree bridge information for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

Examples

```
-> spantree mode per-vlan
-> show spantree vlan
 Spanning Tree Path Cost Mode : AUTO

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the VLAN instance (**STP** or **RSTP**). Note that MSTP is not supported for a VLAN instance. Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Spanning Tree Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.

output definitions (continued)

Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Last TC Rcvd Port	The port that received the TC Flag Set in RSTP or MSTP protocol BPDU. Default value is None.
Last TC Rcvd Bridge	The adjacent designated bridge ID received from TC Flag Set in RSTP or MSTP BPDU along with Last TC Rcvd Port. This information is provided only for active RSTP and MSTP topologies. Default value is None.
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **spantree max-age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **spantree forward-delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **spantree hello-time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Hello Time	The Hello Time value for the root bridge.
BPDU Switching Enabled	The status of BPDU switching for the instance. This field only appears when BPDU switching is enabled. Configured through the **spantree bpdu-switching** command.

Release History

Release 7.1.1; command introduced.
Release 8.4.1; **Topology Change Port** field added.
Release 8.5R4; **Last TC Rcvd Bridge** field added.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree msti	Displays the Spanning Tree bridge information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree ports

Displays Spanning Tree port information.

show spantree ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance.

Defaults

parameter	default
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays port information for the VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays port information for the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays port information for the MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree ports

```

output definitions

Bridge, Msti, or Vlan	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode. The MSTI number when MSTP is the active protocol in the flat mode. The VLAN ID number when STP or RSTP is the active protocol in the per-VLAN mode.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper Status	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, learning, and forwarding.

output definitions (continued)

Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree msti path-cost** or **spantree vlan path-cost**command.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate**, and **backup**.
loop-guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port. Configured through the **spantree loop-guard** command.
Note	Displays a note if the port has entered the error violation state (ERR); then the port role of the port instance in that row becomes insignificant.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree cist ports	Displays Spanning Tree port information for the flat mode CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree vlan ports	Displays Spanning Tree port information for VLAN instances when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the CIST instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode.

Examples

```
-> show spantree cist ports

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree vlan path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. The lower the number, the higher the priority.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **spantree vlan path-cost** command.
Config Cost	The configured path cost value for this port. Configured through the **spantree vlan path-cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT.** Configured through the **spantree vlan connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **spantree vlan connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **spantree cist auto-edge** or **spantree vlan auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **spantree cist restricted-tcn** or **spantree vlan restricted-tcn** command.
Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **spantree cist restricted-role** or **spantree vlan restricted-role** command.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree ports	Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***] ports [forwarding | blocking | active | configured]**

Syntax Definitions

msti_id	An existing MSTI ID number.
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the MSTI instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the MSTI instance.
active	Displays a list of active ports associated with the MSTI instance.
configured	Displays Spanning Tree administrative port parameters for the MSTI instance.

Defaults

parameter	default
msti_id	all MSTIs
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This command displays Spanning Tree port information for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```

output definitions

Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **spantree msti** command.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree msti path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
RSTR Role/ Root Guard	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate, master**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.

output definitions (continued)

Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
PVST+ Cfg	Indicates the current PVST+ port configuration (**auto**, **enable** or **disable**).
PVST+ Stat	Indicates the current status of the PVST+ mode (**On** or **Off**).

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. It is a numeric value and the lower the number, the higher the priority. Configured through the **spantree priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** - ENA or **disabled -** DIS.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **spantree vlan path-cost** command.
Config Cost	The configured path cost value for this port. Configured through the **spantree msti path-cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT.** Configured through the **spantree vlan connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **spantree vlan connection** command.

output definitions (continued)

Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **spantree cist auto-edge** or **spantree vlan auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **spantree cist restricted-tcn** or **spantree vlan restricted-tcn** command.
Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **spantree cist restricted-role** or **spantree vlan restricted-role** command.

show spantree vlan ports

Displays Spanning Tree port information for a VLAN instance.

show spantree vlan [*vlan_id***[-***vlan_id2***]] ports [forwarding | blocking | active | configured]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	An existing VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, **vlan 10-15**).
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the VLAN instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the VLAN instance.
active	Displays a list of active ports associated with the VLAN instance.
configured	Displays Spanning Tree administrative port parameters for the VLAN instance.

Defaults

parameter	default
vlan_id	all VLAN instances
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., **show spantree vlan 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- This command displays Spanning Tree port information for a VLAN instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when a VLAN ID is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

output definitions

Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree vlan path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate, master**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port's connection type. See the **spantree vlan connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port's connection type. See the **spantree vlan connection** command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port's segment.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the **spantree priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **spantree vlan** command to enable or disable Spanning Tree on a port.

output definitions (continued)

Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **spantree loop-guard** command.
Config Cost	The configured path cost value for this port. Configured through the **spantree vlan path-cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT**. Configured through the **spantree vlan path-cost** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **spantree vlan connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **spantree cist auto-edge** or **spantree vlan auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **spantree cist restricted-tcn** or **spantree vlan restricted-tcn** command.
Rstr Role/Root Guard	The restricted status of the port: **Yes** indicates that the port is restricted from becoming the root; **No** indicates that the port is not restricted from becoming the root. Configured through the **spantree cist restricted-role** or **spantree vlan restricted-role** command.
PVST+ Cfg	The type of BPDU used on the port: **AUTO** indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; **ENA** indicates that PVST+ BPDUs are used; **DIS** indicates that IEEE BPDUs are used. Configured through the **spantree pvst+compatibility** command.
PVST+ Stat	Indicates whether or not the PVST+ interoperability status is enabled (**ENA**) or disabled (**DIS**) for the port. Configured through the **spantree pvst+compatibility** command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
show spantree cist ports	Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree mode

Displays the current global Spanning Tree mode parameter values for the switch.

show spantree mode

Syntax Definition

N/A

Defaults

NA

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The global parameters for spanning tree can be activated or configured using the related commands.

Examples

```
-> show spantree mode

Spanning Tree Global Parameters
  Current Running Mode  : Per VLAN,
  Current Protocol      : N/A (Per VLAN),
  Path Cost Mode        : 32 BIT,
  Auto Vlan Containment : N/A
  Cisco PVST+ mode      : Disabled
Vlan Consistency check   : Disabled
```

output definitions

Current Running Mode	The spantree mode active on the switch. (**Flat** or **Per VLAN**)
Current Protocol	The spantree protocol active on the switch.
Path Cost Mode	The path cost mode value configured on the switch. (**AUTO** or **32 BIT**)
Auto Vlan Containment	The Auto VLAN containment mode configured on the switch (**Enabled** or **Disabled**).
Cisco PVST+ mode	The PVST+ mode configured on the switch (**Enabled** or **Disabled**).
Vlan Consistency check	Specifies if VLAN consistency check is **Enabled** or **Disabled** on the switch.

Related Commands

spantree mode	Assigns a flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch.
spantree protocol	Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the per-VLAN mode.
spantree path-cost-mode	Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.
spantree pvst+compatibility	Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.
spantree auto-vlan-containment	Enables or disables Auto VLAN Containment (AVC).

show spantree mst

Displays the Multiple Spanning Tree (MST) information for a MST region or the specified port or link aggregate on the switch.

show spantree mst {region | port *chassis/slot/port* | **linkagg** *agg_id***}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port.
*agg_id***[**-*agg_id2***]**	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Specify the port number or link aggregate ID along with the **port** or **linkagg** keyword to get information related to the specified port or link aggregate.

Examples

```
-> show spantree mst region

Configuration Name   = Region 1
Revision Level       = 0
Configuration Digest = 0xac36177f 50283cd4 b83821d8 ab26de62
Revision Max hops    = 20
Cist Instance Number = 0

-> show spantree mst port 1/2

MST  Role  State Pth Cst  Edge Boundary Op Cnx Vlans
---+------+-----+--------+----+--------+------+---------------
  0   DIS    DIS        0   NO    YES     NS    1
 12   DIS    DIS        0   NO    YES     NS
```

```
-> show spantree mst linkagg 4

MST  Role  State Pth Cst  Edge Boundary Op Cnx Vlans
---+------+-----+--------+----+--------+------+--------------
  0  DESG   FORW     6000   NO    NO     NS    1
  1  DESG   FORW        0   NO    NO     NS
  2  DESG   FORW        0   NO    NO     NS
```

output definitions

Configuration Name	An alphanumeric string that identifies the name of the MST region. Use the **spantree mst region name** command to define this value.
Revision Level	A numeric value that identifies the MST region revision level for the switch.
Configuration Digest	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the **spantree msti** and **spantree msti vlan** commands to define VLAN to MSTI associations.
Revision Max hops	The number of maximum hops authorized for region information. Configured through the **spantree mst region max-hops** command.
Cist Instance Number	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch Note that this instance is also known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigDigest
   vStpMstRegionConfigName
   vStpMstRegionConfigRevisionLevel
   vStpMstRegionCistInstanceNumber
   vStpMstRegionMaxHops
```

show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***] vlan-map**

Syntax Definitions

msti_id	An existing MSTI ID number.

Defaults

By default, the VLAN to MSTI mapping is displayed for all MSTIs.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an *msti_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

Examples

```
-> show spantree msti vlan-map

 Cist
 Name                :
 VLAN list           : 1-9,14-4094

 Msti 1
 Name                :
 VLAN list           : 10-11

 Msti 2
 Name                :
 VLAN list           : 12-13

-> show spantree msti 2 vlan-map

 Msti 2
 Name                : MS1,
 VLAN list           : 12-13
```

output definitions

Cist Instance	Identifies MSTI VLAN mapping information for the CIST instance.
Msti	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.

output definitions (continued)

Name	An alphanumeric value that identifies an MSTI name. Use the **spantree msti** command to define an MSTI name.
VLAN list	The range of VLAN IDs that are associated with this MSTI.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```

show spantree cist vlan-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

Examples

```
-> show spantree cist vlan-map

 Cist
 Name           : CIST1,
 VLAN list      : 1-9,14-4094
```

output definitions

Name	An alphanumeric value that identifies the name of the CIST. Use the **spantree msti** command to define a name for this instance.
VLAN list	The range of VLAN IDs that are associated with the CIST instance.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.
show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```

   vStpMstVlanAssignmentVlanNumber
   vStpMstVlanAssignmentMstiNumber
```

9 Shortest Path Bridging Commands

The OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. SPB-M uses the Provider Backbone Bridge (PBB) network model to encapsulate (using IEEE 802.1ah headers) and tunnel customer traffic through the network backbone. The shortest path trees (SPTs) upon which the PBB network infrastructure operates are determined using a version of the Intermediate System-to-Intermediate System (IS-IS) link state protocol that supports TLV extensions for SPB (ISIS-SPB).

The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free, SPTs through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the 802.1ah MAC-in-MAC method for data encapsulation. SPBM services transport the encapsulated traffic over the ISIS-SPB infrastructure.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the ISIS-SPB backbone. For commands used to configure and verify the SPBM services layer, see Chapter 10, “Service Manager Commands.”

MIB information for the SPB commands is as follows:

Filename: ALCATEL-IND1-ISIS-SPB-MIB.mib
Module: alcatelIND1IsisSpbMib

Filename: ALCATEL-IND1-VLAN-MGR-MIB.mib
Module: alcatelIND1VLANMgrMIB

A summary of the available commands is listed here:

spb bvlan

Configures an SPB backbone VLAN (BVLAN).

spb bvlan {*bvlan_id***[-***bvlan_id2***]} [admin-state {enable | disable}] [name** *description***]**

no spb bvlan *bvlan_id*

Syntax Definitions

*bvlan_id***[-***bvlan_id2***]**	A numeric value that uniquely identifies an individual BVLAN. The valid ID range is 1–4094. Use a hyphen to specify a range of BVLAN IDs (10-20).
enable	Enables the VLAN administrative status.
disable	Disables the VLAN administrative status.
description	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable | disable	**enable**
description	**VLAN ID**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a BVLAN from the switch configuration. All BVLAN ports are detached before the BVLAN is removed.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with a space in between.
- The BVLAN configuration must be the same on each SPB bridge to ensure proper ISIS-SPB neighbor discovery and shortest path calculations throughout the provider backbone bridge (PBB) network.
- BVLANs differ from standard VLANs as follows:
  - No Spanning Tree control—the Spanning Tree protocol is automatically disabled on each BVLAN, and all ports associated with each BVLAN will remain in a forwarding state. However, Spanning Tree can remain operational on other types of VLANs.
  - No source MAC address learning—normal hardware learning is disabled on BVLANs. Instead, the forwarding database (FDB) is populated by the ISIS-SPB protocol.
  - There is no flooding of unknown destination or multicast frames.
  - Ingress filtering based on the source MAC address—frames received on ports that do not have an incoming source MAC address pre-programmed by ISIS-SPB are discarded.
- All BVLANs are automatically associated with all ISIS-SPB interfaces. Adding or removing BVLANs from a specific SPB interface is not allowed.

- The maximum number of BVLANs supported is four.
- BVLANs and standard VLANs can co-exist on the same bridge ports.

Examples

```
-> spb bvlan 200 name BVLAN-200
-> spb bvlan 720 admin-state disable
-> spb bvlan 500 name BVLAN-500 admin-state enable
-> no spb bvlan 1020
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb isis control-bvlan	Configures a control BVLAN
spb isis bvlan ect-id	Assigns an equal cost tree (ECT) algorithm ID to the specified BVLAN.
spb isis bvlan tandem-multicast-mode	Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN).
spb isis interface	Configures ISIS-SPB network interfaces.
show spb isis bvlans	Displays the BVLAN configuration for the switch.

```

spb isis bvlan ect-id

Configures the equal cost tree (ECT) identifier for the specified SPB backbone VLAN (BVLAN). The ECT ID assigns a tie-breaking algorithm to the BVLAN that is used for shortest path tree (SPT) calculations.

spb isis bvlan *bvlan_id* **ect-id** *ect_id*

Syntax Definitions

bvlan_id	An existing BVLAN ID.
ect_id	An ECT algorithm ID. The valid range is 1–16.

Defaults

By default, the next available ECT ID number is automatically assigned to a BVLAN when the BVLAN is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to change the existing ECT ID number for the specified BVLAN on each SPB brdige, as necessary, to make sure the specified BVLAN uses the same ECT ID throughout the network.
- The BVLAN ID specified with this command must already exist in the switch configuration.

Examples

```
-> spb isis bvlan 200 ect-id 5
-> spb isis bvlan 720 ect-id 10
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb bvlan	Creates a SPB backbone VLAN (BVLAN).
show spb isis bvlans	Displays the SPB BVLAN configuration for the switch.

MIB Objects

```
alcatelIND1IsisSpbEctStaticTable
   alcatelIND1IsisSpbEctStaticEntryBaseVid
```

spb isis control-bvlan

Designates an existing BVLAN that will serve as the control BVLAN for the bridge. Only one BVLAN per bridge is designated as the control BVLAN, which is used to exchange ISIS-SPB control packets with neighboring SPB bridges on behalf of all the BVLANs configured for that bridge.

spb isis control-bvlan *bvlan_id*

Syntax Definitions

bvlan_id	An existing BVLAN ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The control BVLAN ID is the VLAN tag that is applied to ISIS-SPB control frames.
- Configuring an existing BVLAN as the control BVLAN does not exclude that VLAN from carrying data traffic for the SPB domain. In other words, a single VLAN can serve as both a regular BVLAN and the control BVLAN at the same time.

Examples

```
-> spb isis control-bvlan 200
-> spb isis control-bvlan 720
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb bvlan	Configures an SPB BVLAN.
show spb isis bvlans	Displays the BVLAN configuration for the bridge.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysControlBvlan
```

spb isis bvlan tandem-multicast-mode

Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN). This mode is only applicable to associated SPB service instances that are configured to use the tandem replication mode for multicast traffic.

spb isis bvlan *bvlan_id* **tandem-multicast-mode {sgmode | gmode}**

Syntax Definitions

bvlan_id	An existing BVLAN ID.
sgmode	Specifies the source and group (S,G) mode for the BVLAN.
gmode	Specifies the any source and group (*,G).

Defaults

By default, BVLANs are configured to use the (S,G) mode.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The (S,G) mode identifies a source-specific multicast distribution tree.
- The (*,G) mode identifies a shared multicast distribution tree.

Examples

```
-> spb isis bvlan 200 tandem-multicast-mode gmode
-> spb isis bvlan 720 tandem-multicast-mode sgmode
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb bvlan	Creates a SPB backbone VLAN (BVLAN).
show spb isis bvlans	Displays the SPB BVLAN configuration for the switch.

```

spb isis bridge-priority

Configures the bridge priority value for the SPB bridge. This value is used to rank an SPB bridge in relation to other bridges.

spb isis bridge-priority *priority*

Syntax Definitions

priority	A bridge priority value. The valid range is 0–65535.

Defaults

By default, the bridge priority value for the switch is set to 32768.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The lower the bridge priority number assigned, the higher the priority that is associated with the bridge.
- The bridge priority value makes up the upper two bytes of the eight-byte SPB bridge ID. The lower six bytes of the Bridge ID contain the system ID, which is the dedicated bridge MAC address of the SPB bridge.
- Setting a different bridge priority value on different SPB bridges will override the system identifier significance during the shortest path tree (SPT) calculation.

Examples

```
-> spb isis bridge-priority 15
-> spb isis bridge-priority 32768
```

Release History

Release 7.3.1; command introduced.

Related Commands

show spb isis info	Displays the status and configuration information for the SPB bridge.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysBridgePriority
```

spb isis interface

Configures the specified port or link aggregate as an ISIS-SPB interface on which protocol data units (PDUs) are sent and received to detect neighbors and form adjacencies with other SPB bridges in the network.

spb isis interface {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [admin-state {enable | disable} [hello-interval** *seconds***] [hello-multiplier** *count***] [metric** *metric***]**

no spb isis interface [port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Administratively enables the SPB interface.
disable	Administratively disables the SPB interface.
seconds	The amount of time, in seconds, to wait between each transmission of a hello packet from this interface. The valid range is 1–20000.
count	An integer value that is multiplied by the hello interval time to determine the amount of time, in seconds, a receiving bridge holds onto the hello packets transmitted from this interface. The valid range is 2–100.
metric	An integer value that specifies the link cost to reach the destination BMAC. The valid range is 1–16777215.

Defaults

parameter	default
enable | disable	**enable**
seconds	**9**
count	**3**
metric	**10**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the ISIS-SPB interface.
- When configuring a link aggregate as an SPB interface, make sure the link aggregate ID number already exists in the switch configuration.

- All SPB interfaces are automatically assigned to all existing BVLANs. There is one ISIS-SPB instance per switch, and each BVLAN and SPB interface are associated with that instance.
- If the SPB interface metric value is set to a different value for each side of a link, the highest metric value is applied to the entire link.
- Administratively enabling ISIS-SPB on the switch triggers ISIS hello packet transmissions on all SPB interfaces.
- SPB interfaces are typically the Network Network Interface (NNI) ports that carry encapsulated customer data traffic through the Provider Backbone Bridging (PBB) network.
- Note that configuring a port or link aggregate as an SPB interface does not prevent configuration of other VLAN tagging on that port. In other words, the SPB interface can forward regular traffic for other VLAN types in addition to encapsulated SPBM traffic.

Examples

```
-> spb isis interface port 4/7
-> spb isis interface port 4/7 hello-interval 60
-> spb isis interface linkagg 3
-> spb isis interface linkagg 3 hello-multiplier 10
-> spb isis interface port 1/10 hello-interval 20 hello-multiplier 5 metric 2
-> no spb isis interface port 4/7
-> no spb isis interface linkagg 3
```

Release History

Release 7.3.1; command introduced.

   alcatelIND1IsisSpbAdjStaticEntryIfAdminState
```

spb ipvpn bind

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IP gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

spb ipvpn bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ip_address* **{all-routes | import-route-map** *route_map_name***}**

no spb ipvpn bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ip_address*

Syntax Definitions

vrf_name | **default**	The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter **default** to specify the default VRF instance.
instance_id	An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.
ip_address	The IPv4 address of an IP interface that is associated with the specified VRF instance.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.
- The specified VRF name, ISID, gateway IP address, and optional route map name must already exist in the local switch configuration. In addition, the specified route map must exist in the default VRF instance.
- Only one ISID can be bound to a single VRF/gateway IP instance.
- The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IP address is associated with an active IP interface that is associated with the VRF instance.
- An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IP routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IP address as the next hop.

- IP routing over SPB requires an L3 VPN interface that serves as an IP gateway to access remote networks. There are two options for defining an L3 VPN interface:
  - Configuring a service-based IP interface for in-line routing (OmniSwitch 9900 only).
  - Configuring an external loopback port configuration in which a pair of loopback ports provide connectivity between VRFs and SPB service access points (SAPs).

Examples

```
-> spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1 all-routes
-> spb ipvpn bind vrf2 isid 2000 gateway 20.2.2.1 import-route-map rm_vrf2
-> no spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1
```

Release History

Release 7.3.2; command introduced.

Related Commands

spb ipvpn redist	Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.
show spb ipvpn bind	Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

```

spb ipvpn redist

Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

spb ipvpn redist {source-vrf {*vrf_name* **| default} | source-isid** *instance_id***} destination-isid** *instance_id* **{all-routes | route-map** *route_map_name***}**

no spb ipvpn redist {source-vrf *vrf_name* **| source-isid** *instance_id***} destination-isid** *instance_id*

Syntax Definitions

vrf_name | **default**	The source VRF instance from which routes are redistributed. Enter **default** to specify the default VRF instance.
source-isid *instance_id*	The source ISID from which routes are redistributed.
destination-isid *instance_id*	The destination ISID to which routes from either the source VRF or source ISD are redistributed.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering routes that are redistributed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.
- The difference between a bind entry and a redistribution entry is as follows:
  - A bind entry binds only one I-SID to one VRF/gateway IP instance. IP VPN routes are then imported and exported bidirectionally between the VRF and I-SID.
  - A redistribution entry allows multiple VRFs to redistribute routes into one I-SID. However, IP VPN routes are only redistributed into the I-SID; there is no bidirectional exchange of routes between the VRF and I-SID. Redistribution is mainly used when routing between I-SIDs is required.

Examples

```
-> spb ipvpn redist source-isid 1000 destination-isid 2000 all-routes
-> spb ipvpn redist source-isid 2000 destination-isid 1000 all-routes
-> spb ipvpn redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000
```

```
-> no spb ipvpn redist source-vrf vrf1 destination-isid 3000
-> no spb ipvpn redist source-isid 2000 destination isid 1000
```

Release History

Release 7.3.2; command introduced.

show spb ipvpn bind

Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

show spb ipvpn bind [vrf {*vrf_name* **| default}] [isid** *instance_id***]**

Syntax Definitions

vrf_name | **default**	The name of a VRF instance that is associated with an SPB IPVPN binding. Enter **default** to specify the default VRF instance.
instance_id	An ISID number that is associated with an SPB IPVPN binding.

Defaults

By default, all SPB IPVPN bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **vrf** and **isid** parameters to display the configuration for specific bindings.

Examples

```
-> show spb ipvpn bind
Legend: * indicates bind entry is active
SPB IPVPN Bind Table:
       VRF              ISID            Gateway                 Route-Map
--------------------+------------+---------------------+----------------------
* ospf                  4001         1.1.1.2
* ospf1                 4003         2.2.2.2

Total Bind Entries: 2
```

output definitions

VRF	The name of the VRF instance associated with this binding.
ISID	The ISID number associated with this binding.
Gateway	The gateway IP address associated with this binding. This is the IP address specified for an IP interface that is associated with the VRF in this binding.
Route-Map	The name of an IP route map or **All Routes**.

Release History

Release 7.3.2; command introduced.

Related Commands

spb ipvpn bind	Binds a VRF instance, an ISID, and an IP gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.
show spb ipvpn redist	Displays the SPB IP VPN redistribution configuration for the switch.

```

show spb ipvpn redist

Displays the SPB IPVPN redistribution configuration for the switch. This configuration controls the redistribution of IP VPN routes from ISID to ISID or from VRF to ISID.

show spb ipvpn redist [vrf | [isid]

Syntax Definitions

vrf	Displays the VRF redistribution table.
isid	Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **isid** parameter to display the contents of the ISID redistribution table (ISID to ISID).
- Use the **vrf** parameter to display the contents of the VRF redistribution table (VRF to ISID).

Examples

```
-> show spb ipvpn redist
Legend: * indicates redist entry is active
SPB IPVPN Redist ISID Table:
  Source-ISID           Destination-ISID     Route-Map

Routes: 30
```

output definitions

ISID	The ISID number associated with this route.
Destination	Destination IP address. Also includes the prefix length notation after the address to indicate the number of bits that are significant in the IPv6 address (mask).
Gateway	IP address of the gateway from which this route was learned.
Source Bridge (Name : BMAC)	The name and BMAC address of the SPB BEB switch that advertised the route.
Metric	The metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

Release History

Release 7.3.2; command introduced.

spb ipvpn6 bind

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IPv6 gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

spb ipvpn6 bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ipv6_address* **{all-routes | import-route-map** *route_map_name***}**

no spb ipvpn6 bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ipv6_address*

Syntax Definitions

vrf_name | **default**	The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter **default** to specify the default VRF instance.
instance_id	An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.
ipv6_address	The IPv6 address of an IPv6 interface that is associated with the specified VRF instance.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.
- The specified VRF name, ISID, gateway IPv6 address, and optional route map name must already exist in the local switch configuration. In addition, the specified route map must exist in the default VRF instance.
- Only one ISID can be bound to a single VRF/gateway IPv6 instance.
- The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IPv6 address is associated with an active IPv6 interface that is associated with the VRF instance.
- An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IPv6 routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IPv6 address as the next hop.

- IPv6 routing over SPB requires an L3 VPN interface that serves as an IPv6 gateway to access remote networks. There are two options for defining an L3 VPN interface:
  - Configuring a service-based IPv6 interface for in-line routing (OmniSwitch 9900 only).
  - Configuring an external loopback port configuration in which a pair of loopback ports provide connectivity between VRFs and SPB service access points (SAPs).

Examples

```
-> spb ipvpn6 bind vrf1 isid 1000 gateway 1000::1 all-routes
-> spb ipvpn6 bind vrf2 isid 2000 gateway 2000::1 import-route-map rm_vrf2
-> no spb ipvpn6 bind vrf1 isid 1000 gateway 1000::1
```

Release History

Release 8.5R2; command introduced.

Related Commands

spb ipvpn6 redist	Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.
show spb ipvpn6 bind	Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

```

spb ipvpn6 redist

Configures the redistribution of IPv6 routes from a VRF to an ISID or from one ISID to another ISID.

spb ipvpn6 redist {source-vrf {*vrf_name* **| default} | source-isid** *instance_id***} destination-isid** *instance_id* **{all-routes | route-map** *route_map_name***}**

no spb ipvpn6 redist {source-vrf *vrf_name* **| source-isid** *instance_id***} destination-isid** *instance_id*

Syntax Definitions

vrf_name | **default**	The source VRF instance from which routes are redistributed. Enter **default** to specify the default VRF instance.
source-isid *instance_id*	The source ISID from which routes are redistributed.
destination-isid *instance_id*	The destination ISID to which routes from either the source VRF or source ISD are redistributed.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering routes that are redistributed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.
- The difference between a bind entry and a redistribution entry is as follows:
  - A bind entry binds only one I-SID to one VRF/ IPv6 gateway instance. IPv6 VPN routes are then imported and exported bidirectionally between the VRF and I-SID.
  - A redistribution entry allows multiple VRFs to redistribute routes into one I-SID. However, IPv6 VPN routes are only redistributed into the I-SID; there is no bidirectional exchange of routes between the VRF and I-SID. Redistribution is mainly used when routing between I-SIDs is required.

Examples

```
-> spb ipvpn6 redist source-isid 1000 destination-isid 2000 all-routes
-> spb ipvpn6 redist source-isid 2000 destination-isid 1000 all-routes
```

```
-> spb ipvpn6 redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000
-> no spb ipvpn6 redist source-vrf vrf1 destination-isid 3000
-> no spb ipvpn6 redist source-isid 2000 destination isid 1000
```

show spb ipvpn6 bind

Displays VRF-to-ISID bindings that enable the import and export of IPv6 routes between VRFs and ISIDs.

show spb ipvpn6 bind [vrf {*vrf_name* **| default}] [isid** *instance_id***]**

Syntax Definitions

vrf_name | **default**	The name of a VRF instance that is associated with an SPB IPv6 VPN binding. Enter **default** to specify the default VRF instance.
instance_id	An ISID number that is associated with an SPB IPv6 VPN binding.

Defaults

By default, all SPB IPv6 VPN bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **vrf** and **isid** parameters to display the configuration for specific bindings.

Examples

```
-> show spb ipvpn6 bind
Legend: * indicates bind entry is active
SPB IPVPN Bind Table:
       VRF              ISID            Gateway                 Route-Map
--------------------+------------+----------------------+----------------------
* ospf                   4001         1000::1
* ospf1                  4003         2000::1

Total Bind Entries: 2
```

output definitions

VRF	The name of the VRF instance associated with this binding.
ISID	The ISID number associated with this binding.
Gateway	The gateway IPv6 address associated with this binding. This is the IPv6 address configured for an IPv6 interface that is associated with the VRF in this binding.
Route-Map	The name of an IPv6 route map or **All Routes**.

Release History

Release 8.5R2; command introduced.

Related Commands

```

show spb ipvpn6 redist

Displays the SPB IPv6 VPN redistribution configuration for the switch. This configuration controls the redistribution of IPv6 VPN routes from ISID to ISID or from VRF to ISID.

show spb ipvpn6 redist [vrf | [isid]

Syntax Definitions

vrf	Displays the VRF redistribution table.
isid	Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **isid** parameter to display the contents of the ISID redistribution table (ISID to ISID).
- Use the **vrf** parameter to display the contents of the VRF redistribution table (VRF to ISID).

Examples

```
-> show spb ipvpnv6 redist
Legend: * indicates redist entry is active

spb isis admin-state

Enables or disables the administrative status of ISIS-SPB instance for the switch.

spb isis admin-state {enable | disable}

Syntax Definitions

enable	Administratively enables ISIS-SPB for the switch.
disable	Administratively disables ISIS-SPB for the switch.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the ISIS-SPB status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> spb isis admin-state enable
-> spb isis admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysAdminState
```

spb isis area-address

Configures the area address for the ISIS-SPB instance.

spb isis area-address *area_address*

Syntax Definitions

area_address	A 3-byte integer that specifies the ISIS-SPB area address to join.

Defaults

By default, the area address is set to 0.0.0. for ISIS-SPB.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The area address is entered in decimal format with this command but is converted and sent out as a hex value on the wire. For example, if the decimal value entered is “73.00.00”, then the hex value actually sent out on the wire is “49.00.00”.
- The default setting of 0.0.0 is the area address typically used for ISIS-SPB.
- Changing the area address with this command is allowed, but make sure to configure each bridge that will participate in the ISIS-SPB instance with the same area address value.
- ISIS-SPB and ISIS-IP instances may co-exist on the same bridge.

Examples

```
-> spb isis area-address 1.1.1
-> spb isis area-address 0.0.0
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysAreaAddress
```

spb isis source-id

Configures the shortest path (SP) source identifier value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in multicast tandem replication mode.

spb isis source- id {*source_id* **| auto}**

Syntax Definitions

source_id	A source identifier entered as *xx-xx-xx*, where *xx* is a hexadecimal value.
auto	Changes the source ID back to the default value.

Defaults

By default, the last three least significant bytes of the system ID is used for the source ID.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The source ID is the high order 3 bytes for the Group Address DA for the SPB bridge. Note that only 20 bits are used; the top 4 bits are not used.

Examples

```
-> spb isis source-id 00-2a-1d
-> spb isis source-id 07-0b-d3
-> spb isis source-id auto
```

Release History

Release 7.3.1; command introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbmSysSPSourceId
```

spb isis control-address

Changes the ISIS-SPB control MAC address, which is used as the destination address for ISIS-SPB control packets.

spb isis control-address {alll1 | alll2 | allis}

Syntax Definitions

alll1	All Level 1 Intermediate Systems **(**01:80:C2:00:00:14).
alll2	All Level 2 Intermediate Systems (01:80:C2:00:00:15).
allis	All Intermediate Systems (09:00:2B:00:00:05).

Defaults

By default, the control MAC address is set to AllL1.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Changing the ISIS-SPB control MAC address on the OmniSwitch can enhance interoperability with third-party ISIS-SPB devices.

Examples

```
-> spb isis control-address alll1
-> spb isis control-address alll2
-> spb isis control-address allis
```

Release History

Release 7.3.2; command introduced.

Related Commands

show spb isis info	Displays the status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysControlAddr
```

spb isis spf-wait

Configures the time intervals between the first, second, and subsequent ISIS-SPB shortest path first (SPF) calculations.

spb isis spf-wait [initial-wait *milliseconds* **| second-wait** *milliseconds***| max-wait** *milliseconds***]**

Syntax Definitions

initial-wait *milliseconds*	Specifies the number of milliseconds to wait before triggering an initial SPF calculation after a topology change. The valid range is 10–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait *milliseconds*	Specifies the minimum number of milliseconds to wait between the first and second SPF calculation. The valid range is 1–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
max-wait *milliseconds*	Specifies the maximum number of milliseconds to wait between two consecutive SPF calculations. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.

Defaults

parameter	default
max-wait *milliseconds*	1000
initial-wait *milliseconds*	100
second-wait *milliseconds*	300

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset all three of the SPF wait time intervals back to their default values, use the **spb isis spf-wait** command without specifying any parameters.
- Subsequent SPF calculations, if required, are generated at exponentially increasing intervals of the SPF **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 1000 milliseconds, then the next SPF calculation is triggered after 2000 milliseconds and the next SPF calculation after that is triggered at 4000 milliseconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the SPF wait interval will stay at the maximum value until there are no more SPF calculations scheduled during that interval. After a full interval without any SPF calculations, the SPF wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis spf-wait max-wait 2500 initial-wait 1000 second-wait 1500
-> spb isis spf-wait max-wait 5000
-> spb isis spf-wait initial-wait 1000
-> spb isis spf-wait second-wait 2000
-> spb isis spf-wait
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis lsp-wait	Configures the time intervals between the first, second, and subsequent generation of link state PDUs (LSPs).
show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbProtocolConfig
   alcatelIND1IsisSpbProtocolSpfMaxWait
   alcatelIND1IsisSpbProtocolSpfInitialWait
   alcatelIND1IsisSpbProtocolSpfSecondWait
```

spb isis lsp-wait

Configures the time intervals between the first, second and subsequently generated link state PDU (LSP).

spb isis lsp-wait {max-wait *milliseconds* **| initial-wait** *milliseconds* **| second-wait** *milliseconds***}**

Syntax Definitions

max-wait *milliseconds*	Specifies the maximum number of seconds to wait between two consecutively generated LSPs. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.
initial-wait *milliseconds*	Specifies the number of seconds to wait before triggering an initial LSP generation after a topology change. The valid range is 0–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait *milliseconds*	Specifies the minimum number of seconds to wait between the first and second generated LSPs. The valid range is 1000–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

Defaults

parameter	default
max-wait *milliseconds*	1000
initial-wait *milliseconds*	0
second-wait *milliseconds*	300

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset all three of the LSP wait time intervals back to their default values, use the **spb isis lsp-wait** command without specifying any parameters.
- Subsequent LSP, if required, are generated at exponentially increasing intervals of the LSP **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 10 seconds, then the next LSP is generation is triggered after 20 seconds and the next LSP generated after that is triggered at 40 seconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the LSP wait interval will stay at the maximum value until there are no more LSP generations during that interval. After a full interval without any LSP generations, the LSP wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis lsp-wait max-wait 2000 initial-wait 1000 second-wait 1500
-> spb isis lsp-wait max-wait 5000
-> spb isis lsp-wait initial-wait 2500
-> spb isis lsp-wait second-wait 3000
-> spb isis lsp-wait
```

Release History

Release 7.3.1; command was introduced.

```

spb isis rapid-lsp-converge

Configures the status of ISIS-SPB rapid link state PDU (LSP) convergence and reserves an SPB I-SID to identify a multicast domain. When rapid LSP convergence is enabled (the default) and a topology event occurs, LSP frames are flooded on the multicast domain to all participating SPB bridges to expedite network notification and convergence time.

spb isis rapid-lsp-converge {isid *instance_id* **| admin-state {enable | disable}}**

Syntax Definitions

instance_id	An SPB service instance identifier (I-SID). The valid range is 256–16777214 (or 0.1.0–255.255.254 in dot-decimal notation format).
enable	Enables rapid LSP convergence.
disable	Disables rapid LSP convergence.

Defaults

By default, rapid LSP convergence is enabled for the switch and the I-SID number is set to 16776961 or 255.255.1.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- The reserved I-SID is always associated with the control BVLAN and is only modifiable when rapid LSP convergence is disabled.
- When changing the default I-SID value, make sure the new value specified is not associated with any SPB service. The specified I-SID will be reserved only for rapid LSP convergence.

Examples

```
-> spb isis rapid-lsp-convergence admin-state disable
-> spb isis rapid-lsp-convergence isid 4001
-> spb isis rapid-lsp-convergence isid 220.1.1
-> spb isis rapid-lsp-convergence admin-state enable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

show spb isis rapid-lsp-converge-info	Displays the ISIS-SPB rapid LSP convergence information for the switch.
show spb isis rapid-lsp-converge-table	Displays the multicast forwarding information for all of the SPB bridges that are participating in rapid LSP convergence.

MIB Objects

```
alcatelIND1ISISSpbRapidLspConvergence
   alcatelIND1ISISSpbRapidLspConvergenceAdminStatus
   alcatelIND1ISISSpbRapidLspConvergenceIsid
```

spb isis overload

Configures the LSP database overload state for the local ISIS-SPB switch and optionally specifies the amount of time the switch remains in this state. When the overload state is enabled, the switch signals to other ISIS-SPB switches that it is not able to accept transit traffic.

spb isis overload [timeout *seconds***]**

no spb isis overload

Syntax Definitions

seconds	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router (for example, it will not be used for other transit traffic).
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> spb isis overload timeout 70
-> no spb isis overload
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis overload-on-boot	Configures the ISIS-SPB instance to operate in an overload state during bootup for a specified time period.
show spb isis info	Displays status and configuration information for the ISIS-SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSysSetOverload
alcatelIND1IsisSpbSysOverloadTimeout
alcatelIND1IsisSpbSysOverloadStatus
```

spb isis overload-on-boot

Configures the ISIS-SPB switch to operate in the overload state after a system bootup for the specified amount of time.

spb isis overload-on-boot [timeout *seconds***]**

no spb isis overload-on-boot

Syntax Definitions

seconds	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the ISIS-SPB switch will not operate in the overload state after a bootup.

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the switch from entering the overload state after bootup.
- This command configures the switch to operate in the overload state after a bootup and until the timeout value expires or the **no** form of this command is used.
- The **no spb isis overload** command does not influence the overload-on-boot function.

Examples

```
-> spb isis overload-on-boot timeout 80
-> no spb isis overload-on-boot
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis overload	Sets the ISIS-SPB switch to operate in the overload state.
show spb isis info	Displays status and configuration information for the ISIS- SPB instance.

MIB Objects

   alcatelIND1IsisSpbSysOverloadOnBootTimeout
   alcatelIND1IsisSpbSysOverloadStatus
```

spb isis graceful-restart

Configures graceful restart of the bridge. It allows ISIS-SPB to reconverge faster, minimizing service interruption.

spb isis graceful-restart

no spb isis graceful-restart

Syntax Definitions

N/A

Defaults

By default, the graceful restart functionality is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the SPB bridge.
- When graceful restart is enabled, the bridge can either be a helper (which helps a neighbor router to restart) or a restarting router, or both.

Examples

```
-> spb isis graceful-restart
-> no spb isis graceful-restart
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis graceful-restart helper	Configures the helper mode of routers for graceful restart.
show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbProtocolConfig
   alcatelIND1IsisSpbProtocolGracefulRestart
```

spb isis graceful-restart helper

Administratively enables and disables the ISIS-SPB bridge to operate in the helper mode in response to a bridge performing a graceful restart.

spb isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the bridge.
disable	Disables the helper mode on the bridge.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When graceful restart is enabled, the helper mode is enabled by default.

Examples

```
-> spb isis graceful-restart helper disable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis graceful-restart	Configures graceful restart on the bridge.

```

output definitions

System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
System Hostname	The system name assigned to the SPB bridge. Configured through the **system name** command.

output definitions (continued)

SPSourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode. Configured through the **spb isis source-id** command.
SPBM System Mode	Indicates if the SP source ID was manually set (**manual**) using the **spb isis source-id** command or automatically allocated (**auto**) using the last three least significant bytes of the System ID.
BridgePriority	The bridge priority value assigned to the SPB bridge. Configured through the **spb isis bridge-priority** command.
MT ID	The IS-IS Multi Topology ID.
Control BVLAN	The SPB base VLAN assigned to exchange ISIS-SPB control traffic with other SPB bridges. Configured through the **spb isis control-bvlan** command.
Area Address	The IS-IS area address for this ISIS-SPB instance. Configured through the **spb isis area-address** command.
Level Capability	The level capability of the bridge. Only Level 1 **(L1**) is supported.
Admin State	The state of the SPB instance for the bridge (**Up** or **Down**). Configured through the **spb isis admin-state** command.
LSDB Overload	The LSP database overload state of the switch. Configured through the **spb isis overload** command.
Last Enabled	The date and time when the ISIS-SPB instance was last enabled for the bridge.
Last SPF	The date and duration of the last shortest path first (SPF) calculation.
SPF Wait	The SPF wait time intervals used to trigger SPF calculations after a topology change. Configured through the **spb isis spf-wait** command.
LSP Lifetime	The Lifetime of the LSP, in seconds.
LSP Wait	The LSP wait time intervals used to trigger LSP generations. Configured through the **spb isis lsp-wait** command.
Graceful Restart	Indicates if graceful restart is **Enabled** or **Disabled**. Configured through the **spb isis graceful-restart** command.
GR helper-mode	Indicates if the graceful restart helper mode is **Enabled** or **Disabled**. Configured through the **spb isis graceful-restart helper** command.
# of L1 LSPs	The number of LSPs for Level-1 adjacency.
Control Address	The destination MAC address used for ISIS-SPB control frames. Configured through the **spb isis control-address** command.

Release History

Release 7.3.1; command was introduced.
Release 7.3.2; **Control Address** field added.

Related Commands

show spb isis spf	Displays the shortest path first (SPF) information to all known SPB bridges for a specific BVLAN.

```

show spb isis bvlans

Displays the ISIS-SPB backbone VLAN (BVLAN) configuration for the bridge.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command also displays the equal cost tree (ECT) algorithm that is assigned to each BVLAN.

Examples

```
-> show spb isis bvlans
SPB ISIS BVLANS:
                              Services Num    Tandem     Root Bridge

------+-------------+-------+--------+-----+----------+--------------------
   501  00-80-c2-01   NO      NO          0  GMODE      BRIDGE-3:00:d1:95:00:30:02
   502  00-80-c2-02   NO      NO          0  SGMODE
   503  00-80-c2-03   YES     NO          4  SGMODE
   504  00-80-c2-04   YES     NO          4  SGMODE

BVLANs:     4
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN. Configured through the **spb bvlan** command.
ECT-algorithm	The equal cost tree (ECT) algorithm index (**1–16**) assigned to the BVLAN. Configured through the **spb isis bvlan ect-id** command.
In Use	Indicates whether or not the BVLAN is in use.
Services Mapped	Indicates whether or not any local services are mapped to the BVLAN.
Num ISIDS	The number of services known to the BVLAN.
Tandem Multicast	The tandem multicast mode (**SGMODE** or **GMODE**) for the BVLAN. Configured through the **spb isis bvlan tandem-multicast-mode** command.
Root Bridge (Name : MAC Address)	The system name and bridge MAC address of the root bridge. This value is displayed only for GMODE configurations.

Release History

Release 7.3.1; command was introduced.

Related Commands

 1/10            L1      9        DOWN   UP      10        9       3

Interfaces : 8
```

output definitions

Interface	The slot/port or link aggregate ID of the SPB interface.
Level	The IS-IS Area Level (L1) for the interface.
CircID	The circuit ID of the interface.
Oper-state	The operational state of the interface (**UP** or **DOWN**).
Admin-state	The administrative state of the interface (**UP** or **DOWN**).
Link Metric	The metric value of the router for the corresponding area level.

output definitions

Hello Interval	The number of seconds the interface waits between Hello PDU transmissions.
Hello Multiplier	The number that is multiplied by the Hello Interval to determine the hold time.

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis interface	Creates an ISIS-SPB network interface.

show spb isis adjacency

Displays information about the ISIS-SPB adjacencies created for the SPB bridge.

show ip isis adjacency [detail]

Syntax Definitions

detail	Displays additional information about the ISIS-SPB adjacencies.

Defaults

By default, a summary list of adjacency information is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip isis adjacency
SPB ISIS Adjacency:
 System
 (Name : SystemId)                    Type State  Hold  Interface
-------------------------------------+----+------+-----+---------
         bridge2 :  00d0.9506.4c62     L1    UP    27       1/1
         bridge3 :  00d0.9507.9732     L1    UP    20       1/2

Adjacencies : 2
```

output definitions

Name	The system name assigned to the adjacent SPB bridge.
SystemId	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
Type	The level (**LI**) of the adjacent bridge.
State	The state of the adjacency (**UP** or **DOWN**).
Hold	The adjacency hold time, in seconds.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
Adjacencies	The total number of adjacent SPB bridges.

```
-> show ip isis adjacency detail

Adjacencies : 1
```

output definitions

SystemID	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
B-MAC	The backbone MAC address (system ID) of the adjacent bridge. This is the address that is used as the source address for encapsulated customer traffic that is tunneled through SPB services.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
State	The state of the adjacency (**UP** or **DOWN**).
Hold Time	The adjacency hold time, in seconds.
Adj Level	The adjacency level (**L1**) of the SPB bridge.
ExtLocalCktId(YES)	The circuit ID that the peer bridge has assigned to this adjacency.
Restart Support	Indicates if graceful restart is **Enabled** or **Disabled**.
Restart Status	Indicates whether the adjacent SPB bridge is helping the local bridge to restart (**Not currently being helped** or **Currently being helped**).
Restart Suppressed	Indicates whether or not the advertisement of LSPs is suppressed per the request of adjacent SPB bridge (**Enabled** or **Disabled**).
Hostname	The system name assigned to the adjacent SPB bridge.
Up Time	Indicates the time period in seconds, during which the SPB bridge was in the adjacency.
Priority	The bridge priority value of the adjacent SPB bridge.

output definitions

Max Hold	Indicates the maximum hold time of the adjacent SPB bridge.
NLPIDs	The Network Layer Protocol ID (NLPID) of the adjacent bridge (SPB NLPID = 0xC1).

Release History

Release 7.3.1; command was introduced.

Related Commands

show spb isis database	Displays ISIS-SPB topology information maintained in the link state database (LSDB).
show spb isis nodes	Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

N/A

show spb isis database

Displays ISIS-SPB topology information maintained in the link state database (LSDB).

show ip isis database [lsp-id *lsp_id***}]**

Syntax Definitions

lsp_id	The LSP ID.

Defaults

By default, the entire LSDB is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *lsp-id* parameter with this command to view database information for a specific link state packet (LSP).

Examples

```
-> show spb isis database
      Legends : P    = The Partition repair bit is set
                OV   = The overload bit is set
                ATT  = The Attach bit is set
                L1   = Specifies a Level 1 IS type
                L2   = Specifies a Level 2 IS type
      SPB ISIS LSP Database:
       LSP ID                 Sequence    Checksum   Lifetime   Attributes
      ----------------------+-----------+----------+----------+------------
       00d1.9500.3002.00-00  0x000000a8     0x9bdc        862   L1

      Level-1 LSP count : 3
```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the LSDB of all the SPB bridges.
Attributes	The level capability of the bridge. This implementation of ISIS-SPB only supports Level 1 (L1).
LSP Count	The number of LSPs in the LSDB.

Release History

Release 7.3.1; command was introduced.
Release 8.5R2; display output updated to include SPB IPv6 VPN information.

Related Commands

show spb isis adjacency	Displays information about the ISIS-SPB adjacencies created for the SPB bridge.
show spb isis nodes	Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

```
N/A
```

show spb isis nodes

Displays the discovered node-level parameter values for all of the ISIS-SPB switches participating in the topology.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the system name, system ID, SPsource ID, and bridge priority parameter values for the bridges discovered within the ISIS-SPB topology.

Examples

```
-> show spb isis nodes
SPB ISIS Nodes:
 System Name          System Id      SourceID BridgePriority
--------------------+--------------+--------+---------------
 Bridge-1             00e0.b1e7.0188  0x70188  32768 (0x8000)
 Bridge-2             00e0.b1e7.0bd3  0x70bd3  32768 (0x8000)
 Bridge-4             e8e7.3200.2a1d  0x02a1d  32768 (0x8000)
 Bridge-5             e8e7.3233.1891  0x31891  32768 (0x8000)
 Bridge-6             e8e7.3233.199d  0x3199d  32768 (0x8000)
 Bridge-7             e8e7.3233.1a29  0x31a29  32768 (0x8000)
 Bridge-8             e8e7.3233.1c81  0x31c81  32768 (0x8000)
```

output definitions

System Name	The system name assigned to the SPB bridge.
System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
SourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode.
BridgePriority	The bridge priority value assigned to the SPB bridge.

Release History

Release 7.3.1; command was introduced.

Related Commands

show spb isis adjacency	Displays information about the ISIS-SPB adjacencies created for the SPB bridge.
show spb isis info	Displays status and configuration information for the SPB instance

MIB Objects

N/A

show spb isis unicast-table

Displays the unicast forwarding information for the specified BVLANs. Use this command to verify unicast addresses were learned correctly on each SPB switch in the ISIS-SPB backbone topology.

show spb isis unicast-table [bvlan *bvlan_id***]**

Syntax Definitions

bvlan_id	The VLAND ID of an existing BVLAN.

Defaults

By default, the forwarding information for all BVLANs in the SPB topology is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **bvlan** *bvlan_id* parameter to display information for a specific BVLAN.

Examples

```
-> show spb isis unicast-table
SPB ISIS Unicast MAC Table:
        Destination                                Outbound

MAC Addresses: 6
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN.
System (Name : BMAC)	The system name of the destination SPB bridge, and the destination unicast BMAC address for that bridge.
Outbound Interface	The interface (port or link aggregate) on which the destination system is reached.

Release History

Release 7.3.1; command was introduced.

Related Commands

show spb isis bvlans	Displays status and configuration information for the SPB instance.
show spb isis multicast-table	Displays the multicast forwarding information for the specified service instance identifier (I-SID).

MIB Objects

N/A

show spb isis services

Displays the service instance identifier (I-SID) mapping for bridges participating in the SPB topology. This command provides a network-wide view of existing services to help verify that SPB services are correctly advertised and learned by ISIS-SPB.

show spb isis services [isid *instance_id* **| bvlan** *bvlan_id***]**

Syntax Definitions

instance_id	An existing I-SID number.
bvlan_id	The VLAND ID of an existing BVLAN.

Defaults

By default, the mapping for all I-SIDs in the SPB topology is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **isid** *instance_id* number to display information for a specific service instance.
- Use the **bvlan** *bvlan_id* parameter to display information for a specific BVLAN.

Examples

```
-> show spb isis services
Legend: * indicates locally configured ISID

MIB Objects

N/A

show spb isis ingress-mac-filter

Displays the ingress MAC filter for multicast traffic for a given BVLAN operating in the (*,G) mode.

show spb isis ingress-mac-filter [port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*] | bvlan *bvlan_id* **| bmac** *mac_address*]

Syntax Definitions

chassis	The chassis identifier.
slot/port[-*port2*]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
agg_id[-*agg_id2*]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
bvlan_id	The VLAND ID of an existing BVLAN.
mac_address	The source MAC address of the multicast traffic allowed on the specified BVLAN and physical port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the optional command parameters to display specific information with this command.
- Each of the optional command parameters can be combined with any of the other optional parameters within the same command line.

Examples

```
-> show spb isis ingress-mac-filter
SPB ISIS Ingress MAC Table (for GMODE bvlans only):
        Inbound     Multicast source MAC
 BVLAN  Interface   (Name : MAC Address)
------+-----------+---------------------------------------
   40        1/1    BRIDGE-1            : 00:d0:95:04:8d:92

MAC Addresses: 1
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN.
Inbound Interface	The interface (port or link aggregate) on which the multicast source MAC was received.
System (Name : BMAC)	The system name and MAC address of the multicast traffic source.

10 Service Manager Commands

The OmniSwitch supports the following service types:

- Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free paths through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the MAC-in-MAC method for data encapsulation. An SPBM service transports the encapsulated traffic over the ISIS-SPB infrastructure.
- Virtual eXtensible LAN (VXLAN), as defined in the IETF "VXLAN: A Framework for Overlaying Layer 2 Virtualized Networks over Layer 3 Networks" standard. VXLAN is a Layer 2 overlay network that is used to segment and tunnel device traffic. The backbone (control plane) layer is built through a flooding and learning process. A VXLAN service transports encapsulated traffic through the network. This allows Layer 2 communication between local and remote devices over a Layer 3 network.
- Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel. Similar to the OmniSwitch VXLAN implementation, L2 GRE provides a Layer 2 overlay network that is used to isolate and tunnel device traffic between tunnel end points over the underlying IP network.
  - L2 GRE assumes that the tunnel end points (IP addresses) are reachable for tunneling traffic; configuring static routes or routing protocols (such as RIP or OSPF) to ensure end point reachability is required. The BFD protocol can be used to learn the ARP of the next-hop gateway.
  - On switches that will operate as a tunnel aggregation switch, L2 GRE services and associated service objects are configured through Service Manager commands to create multiple tunnel end points.
  - On switches that will operate as a tunnel access switch, a single tunnel end point is created by configuring a UNP profile that defines L2 GRE service parameters. When qualifying traffic is assigned to the profile, the necessary L2 GRE service objects are dynamically created. See Chapter 39, "Access Guardian Commands," for information about how to configure an L2 GRE UNP profile.

The OmniSwitch Service Manager application provides the ability to configure and manage a service-based architecture consisting of the following logical entities that are required to provision a service:

- **Access Port**—A port or link aggregate configured as a service access port. This type of port defines the point at which traffic from other provider networks or traffic directly from customer networks enters the network infrastructure. The access port is also associated with a Layer 2 profile that specifies how to process protocol control frames received on the port.
- **SPBM, VXLAN, or L2 GRE Service—**A flooding domain for network traffic. A service defines a Virtual Forwarding Instance (VFI) that is capable of learning device MAC addresses from the access side and from the network side and then switching the traffic based on this information.
- **Service Access Point (SAP)—**A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID, a VXLAN service ID, or an L2 GRE service ID and

specifies the type of customer traffic (untagged, single-tagged, double-tagged, or all) to encapsulate and tunnel through the network infrastructure.

- **Service Distribution Point (SDP)**—An SDP provides a logical point at which customer traffic is directed from one backbone edge switch to another. SDPs are used to set up distributed services, which consist of at least one SAP on a local node, one SAP on a remote node, and an SDP binding the service on both nodes.
- **Bind-SDP**—Represents the binding of a service instance to an SDP. The SDP then distributes the service connectivity to other backbone edge switches.
- **Service Instance Identifier (I-SID)**—An SPB backbone service instance that will tunnel the encapsulated data traffic through the network infrastructure. The I-SID is bound to an SPB backbone VLAN (BVLAN) ID and a Service Manager SPB service ID when the service is created.
- **Virtual Network Identifier (VNID)**—The VNID is a 24-bit segment ID (also referred to as a VXLAN segment ID) that is used to identify encapsulated VM frames. A VNID is bound to a Service Manager VXLAN service ID when the service is created.
- **Virtual Private Network ID (VPNID)**—An L2 GRE tunnel ID that identifies a segment of a ~~guest~~ tunnel service and is used in the GRE encapsulation header. A VPNID is bound to a Service Manager L2 GRE service ID when the service is created.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the service-based architecture. For commands used to configure and verify the ISIS-SPB backbone, see Chapter 9, “Shortest Path Bridging Commands.”

MIB information for the Service Manager commands is as follows:

Filename: ALCATEL-IND1-SERVICE-MGR-MIB.mib
Module: alcatelIND1ServiceMgrMIB

A summary of the available commands is listed here:

Service Commands	**service spb** **service vxlan** **service l2gre** **service description** **service multicast-mode** **service stats** **service vlan-xlation** **service admin-state** **service remove-ingress-tag** **service vxlan udp-port** **service vxlan vrf** **service local-vrrp** **service l2gre reserved-vlan** **show service** **show service ports** **show service spb sap** **show service debug-info** **show service info**

service spb

Configures a Shortest Path Bridging (SPB) service and associates that service with a backbone service instance identifier (I-SID) and BVLAN. An SPB service connects multiple customer sites together across a provider-managed core network by creating a virtual zero-hop, Layer 2 switched domain.

This section describes the base command along with the other optional command keywords that are used to configure SPB service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

service *service_id***[-***service_id2***] spb isid** *instance_id***[-***instance_id2***] bvlan** *bvlan_id***[***:x***]**
[description *desc_info***]**
[multicast-mode {head-end | tandem | hybrid}]
[stats {enable | disable}]
[vlan-xlation {enable | disable}]
[admin-state {enable | disable}]

no service *service_id* **spb**

Syntax Definitions

*service_id***[-***service_id2***]**	A unique numerical value to identify a specific SPB service. The valid service ID range is 1–32767. Use a hyphen to configure a range of SPB service IDs (10-13).
*instance_id***[-***instance_id2***]**	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214. Use a hyphen to configure a range of I-SIDs (300-303).
*bvlan_id***[***:x***]**	The VLAN ID number of an existing SPB BVLAN. To specify a range of BVLANs to assign to a range of services, append the "*:x*" syntax, where "*x*" is the number of BVLANs to assign in sequence (for example, 4000:4 would assign BVLANs 4000, 4001, 4002, and 4003).

Defaults

When an SPB service is created without specifying any of the optional parameter values, the service is created with the following default values:

parameter	default
tandem | head-end | hybrid	**head-end**
description *desc_info*	no description added
stats {enable | disable}	**disable**
vlan-xlation {enable | disable}	**disable**
admin-state {enable | disable}	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To remove an SPB service, administratively disable the service (including any associated SAPs and SDPs) then use the **no** form of this command and specify the service ID of the disabled service.
- SPB services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the SPB service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- An SPB service provides E-LAN connectivity for customer traffic and is identified by an I-SID. Services are bound to service access ports (SAPs) on the access side. On the network side they are automatically bound to service distribution points by the ISIS-SPB protocol.
- Each SPB service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (Mesh SDP) and then switching the traffic based on this information.

Examples

```
-> service 100 spb isid 1000 bvlan 4001
-> service 200 spb isid 2000 bvlan 4001 vlan-xlation enable multicast-mode head-end
description "SPB service for ISID 2000 in Head-end mode"
-> service 1-100 spb isid 1000-1100 bvlan 4000:4 multicast-mode tandem description
"100 SPB Services with ISIDs from 1000-1100 and BVLANs from 4000-4003"
-> no service 100 spb
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for specifying a range of IDs, ISIDs, and BVLANs added.

Related Commands

service description	Modifies the description information for the service.
service multicast-mode	Modifies the multicast replication mode for the service.
service stats	Modifies the status of statistics collection for the service.
service vlan-xlation	Modifies the status of VLAN translation for the service.
service admin-state	Modifies the administrative status for the service.
show service	Displays the service configuration for the bridge.

service vxlan

Configures a Virtual eXtensible LAN (VXLAN) service. This section describes the base command along with the other optional command keywords that are used to configure VXLAN service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

service *service_id***[-***service_id2***] vxlan vnid {***vxlan_id***[-***vxlan_id2***] |** *xxx.xxx.xxx***[-***xxx.xxx.xxx***]}**
[description *desc_info***]**
[multicast-mode [tandem | head-end | hybrid]
[stats {enable | disable}]
[vlan-xlation {enable | disable}]
[admin-state {enable | disable}]
[remove-ingress-tag {enable | disable}]

no service *service_id* **vxlan**

Syntax Definitions

*service_id***[-***service_id2***]**	A unique numerical value to identify a specific VXLAN service. The valid service ID range is 1–32767. Use a hyphen to specify a range of VXLAN services.
*vxlan_id***[-***vxlan_id2***]**	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).

Defaults

When a VXLAN service is created without specifying any of the optional parameter values, the service is created with the following default values:

parameter	default
description *desc_info*	no description added
tandem | head-end | hybrid	**hybrid**
stats {enable | disable}	**disable**
vlan-xlation {enable | disable}	**disable**
admin-state {enable | disable}	**disable**

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- To remove a VXLAN service, administratively disable the service then use the **no** form of this command and specify the service ID of the disabled service.

- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.
- VXLAN services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the VXLAN service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- A VXLAN service provides E-LAN connectivity for customer traffic and is bound to a Service Access Ports (SAP) on the access side. On the network side, the service is bound to a unicast or multicast Service Distribution Point (SDP).
- Each VXLAN service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (mesh SDP) and then switching the traffic based on this information.

Examples

```
-> service 10 vxlan vnid 1000 description "VxLAN service for VNID 1000 in hybrid
multicast mode" admin-state enable
-> service 20 vxlan vnid 2000 multicast-mode head-end description "VxLAN Service
for VNID 2000 in headend mode only" admin-state enable
-> service 30 vxlan vnid 3.173.104 multicast-mode tandem description "VxLAN Service
for VNID 3000 in tandem mode only" admin-state enable
-> service 1-100 vxlan vnid 1000-1100 stats enable description "100 VxLAN Services
with VNIDs from 1000-1100"
-> no service 20 vxlan
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service description	Modifies the description information for the service.
service multicast-mode	Modifies the multicast replication mode for the service.

```

service l2gre

Configures a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service. This type of service is used to define an L2 GRE tunnel endpoint. The service is created and bound to a SAP on an OmniSwitch that will serve as a tunnel aggregation switch.

This section describes the base command along with the other optional command keywords that are used to configure L2 GRE tunnel service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

service *service_id* **l2gre vpnid {***vpn_id***}**
[description *desc_info***]**
[stats {enable | disable}]
[vlan-xlation {enable | disable}]
[admin-state {enable | disable}]
[remove-ingress-tag {enable | disable}]

no service *service_id* **l2gre**

Syntax Definitions

service_id	A unique numerical value to identify a specific L2 GRE tunnel service. The valid service ID range is 1–32767. Use a hyphen to specify a range of services.
vpn_id	A GRE tunnel Virtual Private Network (VPN) ID. This value should match the VPN ID value used to create the GRE tunnel endpoint on the Guest Tunneling access switch.

Defaults

When an L2 GRE tunnel service is created without specifying any of the optional parameter values, the service is created with the following default values:

parameter	default
description *desc_info*	no description added
stats {enable | disable}	**disable**
vlan-xlation {enable | disable}	**disable**
admin-state {enable | disable}	**enable**
remove-ingress-tag {enable | disable}	**disable**

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- To remove an L2 GRE tunnel service, administratively disable the service then use the **no** form of this command and specify the service ID of the disabled service.
- L2 GRE tunnel services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the L2 GRE service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- An L2 GRE tunnel service provides connectivity for customer traffic and is bound to a SAP on the access side. On the network side, the service is bound to a unicast Service Distribution Point (SDP).
- Each L2 GRE tunnel service is basically a Virtual Forwarding Instance (VFI) that is capable of encapsulating customer MAC addresses from the access side (SAPs) and from the network side (mesh SDP) and then tunneling the traffic through the network.
- L2 GRE tunneling services do not support multicast modes. All Broadcast, Unknown Unicast, and Multicast (BUM) traffic is replicated; a copy is sent to each far-end node over unicast SDPs (similar to the head-end multicast mode).
- On switches that will operate as a tunnel aggregation switch, L2 GRE services and associated service objects are configured through the **service l2gre**, **service sap**, **service sdp l2gre**, and **service bind-sdp** commands.
- On switches that will operate as a tunnel access switch, the L2 GRE service objects are dynamically created based on the specified configuration for a UNP L2 GRE service profile when qualifying device traffic is assigned to that profile. Refer to Chapter 39, “Access Guardian Commands,” in this guide for information about how to configure a UNP L2 GRE service profile.

Examples

```
-> service 10 l2gre vpnid 1000 description "L2GRE service for VPNID 1000” admin-
state disable
-> service 20 l2gre vpnid 2000 description "L2GRE service for VPNID 2000" vlan-
xlation enable admin-state enable
-> service 30 l2gre vpnid 3000 description "L2GRE service for VPNID 3000” remove-
ingress-tag enable admin-state enable
-> service 40 l2gre vpnid 4000 description "L2GRE service with VPNID 4000" stats
enable admin-state enable
-> service 40 l2gre vpnid 4000 admin-state disable
-> no service 40
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

service description	Modifies the description information for the service.
service stats	Modifies the status of statistics collection for the service.
service vlan-xlation	Modifies the status of VLAN translation for the service.
service admin-state	Modifies the administrative status for the service.
service remove-ingress-tag	Configures whether or not the customer VLAN tag is removed from ingress packets for the specified service.
service sdp l2gre	Manually configures an L2 GRE SDP.
service bind-sdp	Binds L2 GRE services to L2 GRE SDPs.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcType
   alaSvcVpnId
   alaSvcDescription
   alaSvcAdminStatus
   alaSvcAllocationType
   alaSvcStatsAdminStatus
   alaSvcSapVlanXlation
```

service description

Configures a description for the specified service.

service {*service_id* **| all} description** *desc_info*

no service {*service_id* **| all} description**

Syntax Definitions

service_id	An existing service ID number.
all	Applies this command to all service ID numbers.
desc_info	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the service is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified service ID.
- This command adds or modifies a description for an existing service. However, the **description** parameter is also used to specify a description at the time the service is created.

Examples

Adding or modifying a description for an existing service:

```
-> service 100 description "SPB service for ISID 1234"
-> service 200 description “VXLAN service for VNID 24000”
-> service 300 description “L2GRE service for VPNID 30”
-> no service 200 description
```

Configuring a new service with a description:

```
-> service 100 isid 1234 bvlan 3000 description "SPB service for ISID 1234"
-> service 200 vxlan vnid 24000 description “VXLAN service for VNID 24000”
-> service 300 l2gre vpnid 30 description “L2GRE service for VPNID 30”
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service stats	Configures the statistics collection status for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcDescription
```

service multicast-mode

Configures the multicast replication mode for the specified service.

service {*service_id* **| all} multicast-mode {head-end | tandem | hybrid}**

Syntax Definitions

service_id	An existing service ID number.
all	Applies this command to all service ID numbers.
tandem	Specifies the tandem replication mode for the service.
head-end	Specifies the head-end replication mode for the service.
hybrid	Specifies the hybrid replication mode for the service. This mode uses both the head-end and tandem methods.

Defaults

By default, an SPB service is configured to use the head-end mode and a VXLAN service is configured to use the hybrid mode.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When an SPB service is configured to use the head-end mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- When configuring IP Multicast Switching (IPMS) for an SPB service, make sure the service was configured to use the head-end multicast mode; IPMS is not supported on SPB services that are configured to use the tandem mode.
- Make sure that the same multicast mode is used across all nodes for a given SPB BVLAN. Tandem nodes and head-end nodes cannot communicate with each other.
- The following multicast mode functionality is supported for VXLAN services:
  - **Tandem**: In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This requires the manual configuration of a multicast SDP object (an SDP configured with a multicast group address) to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
  - **Head-end**: In this mode, unicast SDP objects (SDPs configured with a far-end IP address) are also manually configured to tunnel traffic to the far-end nodes. In this case, however, PIM multicast routing is not required. Any broadcast, unknown unicast, and multicast (BUM) traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
  - **Hybrid**: In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.

- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.
- L2 GRE tunneling services do not support multicast modes. All Broadcast, Unknown Unicast, and Multicast (BUM) traffic is replicated; a copy is sent to each far-end node over unicast SDPs (similar to the head-end multicast mode).
- This command configures the multicast mode for an existing service. However, the **multicast-mode {head-end | tandem | hybrid}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the multicast mode for an existing service:

```
-> service 100 multicast-mode hybrid
-> service 150 multicast-mode head-end
-> service all multicast-mode tandem
```

Configuring the multicast mode for a new service:

```
-> service 100 spb isid 2345 bvlan 3000 multicast-mode tandem
-> service 150 vxlan vnid 24000 multicast-mode head-end
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service stats	Configures the statistics collection status for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcMulticastMode
```

service stats

Configures ingress and egress statistics collection for packets flowing through the service access point (SAP) or service distribution point (SDP) bindings associated with the specified service.

service {*service_id* **| all} stats {enable | disable}**

Syntax Definitions

service_id	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Administratively enables statistics gathering for the service.
disable	Administratively disables statistics gathering for the service.

Defaults

By default, statistics collection is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

This command configures statistics collection for an existing service. However, the **stats {enable | disable}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring statistics collection for an existing service:

```
-> service 100 stats enable
-> service all stats enable
-> service 100 stats disable
-> service all stats disable
```

Configuring statistics collection for a new service:

```
-> service 200 isid 2345 bvlan 3000 stats enable
-> service 200 isid 3456 bvlan 2000 stats disable
-> service 300 vxlan vnid 24000 stats enable
-> service 300 vxlan vnid 24000 stats disable
-> service 400 l2gre vpnid 40 stats enable
-> service 400 l2gre vpnid 40 stats disable
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcStatsAdminStatus
```

service vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.

service {*service_id* **| all} vlan-xlation {enable | disable}**

Syntax Definitions

service_id	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Enables VLAN translation for the service.
disable	Disables VLAN translation for the service.

Defaults

By default, VLAN translation is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.
- Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended.
- This command configures the VLAN translation status for an existing service. However, the **vlan-xlation {enable | disable}** parameter is also used to specify the status at the time a service is created.

Examples

Configuring the status for an existing service:

```
-> service 100 vlan-translation enable
-> service all vlan-translation enable
-> service 100 vlan-translation disable
-> service all vlan-translation disable
```

Configuring the status for a new service:

```
-> service 200 isid 2345 bvlan 3000 vlan-translation enable
-> service 200 isid 3456 bvlan 2000 vlan-translation disable
-> service 300 vxlan vnid 24000 vlan-translation enable
-> service 300 vxlan vnid 24000 vlan-translation disable
-> service 400 l2gre vpnid 40 vlan-translation enable
-> service 400 l2gre vpnid 40 vlan-translation disable
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcSapVlanXlation
```

service admin-state

Configures the administrative status of the specified service.

service {*service_id* **| all} admin-state {enable | disable}**

Syntax Definitions

service_id	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Administratively enables the service.
disable	Administratively disables the service.

Defaults

By default, the administrative status is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Disable the administrative status of the service and any associated service access points (SAPs) and service distribution points (SDPs) before attempting to remove a service.
- Disabling the administrative status does not remove the service configuration from the bridge.
- This command configures the administrative status for an existing service. However, the **admin-state {enable | disable}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the status for an existing service:

```
-> service 100 admin-state enable
-> service all admin-state enable
-> service 100 admin-state disable
-> service all admin-state disable
```

Configuring the status for a new service:

```
-> service 200 isid 2345 bvlan 3000 admin-state enable
-> service 200 isid 3456 bvlan 2000 admin-state disable
-> service 300 vxlan vnid 24000 admin-state enable
-> service 300 vxlan vnid 24000 admin-state disable
-> service 400 l2gre vpnid 40 admin-state enable
-> service 400 l2gre vpnid 40 admin-state disable
```

Release History

Release 7.3.1; command was introduced.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcAdminStatus
```

service remove-ingress-tag

Configures whether or not the customer VLAN tag is removed from ingress packets for the specified Virtual eXtensible LAN (VXLAN) or Layer 2 Generic Routing Encapsulation (L2 GRE) service.

service *service_id* **remove-ingress-tag {enable | disable}**

Syntax Definitions

service_id	An existing service ID number.
enable	Customer VLAN tag is removed from ingress packets.
disable	Customer VLAN tag is not removed from ingress packets.

Defaults

By default, this functionality is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Removing the customer VLAN tag from ingress packets is particularly useful for services that may forward packets to third-party devices that require untagged packets.
- When this function is enabled, the customer VLAN tag is removed before the packet is encapsulated with a header. The packet is then untagged when the header is removed. For example:
  - The remove ingress tag function is enabled for service 10.
  - Service 10 is associated with SAP 1/2:20 (port 1/2, VLAN tag 20) and SAP 9:30 (link aggregate 9, VLAN tag 30).
  - When a customer packet with VLAN tag 20 enters port 1/2, the packet is classified for service 10 and the VLAN 20 tag is removed before the header is added to the untagged packet.
  - When a customer packet with VLAN tag 30 enters link aggregate 9, the packet is classified for service 10 and the VLAN 30 tag is removed before the header is added to the untagged packet.
- This command configures the status of the remove ingress tag functionality for an existing service. However, the **remove-ingress-tag {enable | disable}** parameter is also used to specify the status at the time a service is created.

Examples

Configuring the status for an existing service:

```
-> service 100 remove-ingress-tag enable
-> service 100 remove-ingress-tag disable
```

Configuring the status for a new service:

```
-> service 200 vxlan vnid 24000 remove-ingress-tag enable
-> service 200 vxlan vnid 24000 remove-ingress-tag disable
-> service 300 l2gre vpnid 25000 remove-ingress-tag enable
-> service 300 l2gre vpnid 25000 remove-ingerss-tag disable
```

Release History

Release 7.3.4; command was introduced.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

```

service vxlan udp-port

Configures the UDP destination port for all encapsulated VXLAN frames on the gateway switch. Use this command to support previous implementations of the VXLAN functionality that did not use the well-known UDP port 4789. Note that only gateway devices using the same destination UDP port number can exchange encapsulated VXLAN frames.

service vxlan udp-port {*udp_port_num* **| default}**

Syntax Definitions

udp_port_num	The UDP destination port number to use for VXLAN traffic.
default	Use the well-known UDP destination port number (4789) for VXLAN traffic.

Defaults

By default, the well-known UDP port number 4789 is used in the default VRF instance.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.
- Configuring a VXLAN service on an OmniSwitch 6900-V72 and OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.

Examples

```
-> service vxlan udp-port 8472
-> service vxlan udp-port default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service vxlan vrf	Configures the VRF instance for the VXLAN segment.
service vxlan	Configures a VXLAN service.
show service info	Displays the destination UDP port value applied to VXLAN traffic.

MIB Objects

```
alaSvcMgrSysTable
   alaSvcMgrVxlanDestUdpPort
```

service vxlan vrf

Configures the current VRF instance for the VXLAN gateway.

service vxlan vrf {*vrf_name* **| default}**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
default	Use the default VRF instance.

Defaults

By default, the default VRF instance is used.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- Administratively disable all configured SDPs first before changing the VRF instance for the VXLAN segment.
- If the VRF instance that is associated with a VXLAN segment is removed, the VXLAN segment is automatically assigned to the default VRF instance.
- Avoid configuring the same Loopback0 address in multiple VRF' instances. Each VRF instance should have a unique Loopback0 address.
- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.

Examples

```
-> service vxlan vrf IpVxlan
-> service vxlan vrf default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service vxlan	Configures a VXLAN service.
show service info	Displays the current VRF instance for the VXLAN network.

service local-vrrp

Configures whether or not the customer VLAN tag is removed from VRRP packets received on SPB service access ports. When enabled, the VLAN tag is automatically removed from the VRRP packets. This is particularly useful when a switch is going to route VRRP packets using IP over SPB.

service local-vrrp {enable | disable}

Syntax Definitions

enable	Enables the TCAM rule (VLAN tag is stripped from VRRP packets received on access ports).
disable	Disables the TCAM rule (VLAN tag is not stripped from VRRP packets received on access ports).

Defaults

By default, the customer VLAN tag is removed from VRRP packets received on SPB service access ports.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This command is a global configuration command; the status applies to all access ports on the switch.
- This functionality is enabled to facilitate the processing of VRRP packets received on service access ports on a switch that participates in an IP over SPB routing configuration. When this function is disabled, the customer VLAN tag is not removed from VRRP packets are trapped to the switch for local VRRP processing and are not routed through the IP over SPB configuration.
- When this functionality is enabled (the default), one of the following actions is required based on the switch configuration:
  - If the switch is participating in an IP over SPB routing configuration, enable VLAN translation on all access ports and associated SPB services. This ensures that the VLAN tag is added back into the VRRP packets egressing the access ports.
  - If the switch serves as a transit switch that receives VRRP traffic from another OmniSwitch or a third-party device, use the **service local-vrrp** command with the **disable** option to prevent the switch from removing the customer VLAN tag. This helps to avoid having to enable VLAN translation on every single access port and SPB service on the switch.
- When VLAN translation is enabled, a Service Access Point (SAP) with the encapsulation value set to ":all" (all tagged and untagged packets not already assigned) will not work. The ":all" encapsulation value is treated as a ":0" encapsulation value (untagged packets only; tagged packets are dropped) for VLAN translation.

Examples

```
-> service local-vrrp disable
-> service local-vrrp enable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

service access	Configures a switch port or link aggregate as an access port.

```

service l2gre reserved-vlan

Configures a reserved VLAN to activate L2 GRE service domain learning on an L2 GRE tunnel access switch.

service l2gre reserved-vlan *vlan_id***[-***vlan_id2***]**

no service l2gre reserved-vlan *vlan_id***[-***vlan_id2***]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	A VLAN ID number to configure as an L2 GRE reserved VLAN. Use a hyphen to specify a range of VLAN IDs. The valid range is 2–4092. Up to 8 reserved VLANs can be configured.

Defaults

By default, there is no L2 GRE reserved VLAN configured for the switch.

Platforms Supported

OmniSwitch 6560

Usage Guidelines

- This command is required only on an OmniSwitch 6560 that serves as an L2 GRE tunnel access switch. A reserved VLAN is not required for other supported OmniSwitch platforms.
- If there is no reserved VLAN configured, UNP does not learn users in the L2 GRE service domain. When a reserved VLAN is created, any blocked users are then learned.
- Use the **no** form of this command to remove an L2 GRE reserved VLAN from the switch configuration. Make sure there are no L2 GRE service objects (SAP, SDP, SDP bindings) configured before attempting to remove the reserved VLAN.
- Specify a VLAN ID that does not already exist in the switch configuration. Use the **show vlan** command to display the VLAN configuration and verify the L2 GRE reserved VLAN configuration.
- The reserved VLAN is used only for L2 GRE learning purposes; other VLAN management operations do not apply to this type of VLAN.

Examples

```
-> service l2gre reserved-vlan 4000
-> service l2gre reserved-vlan 4005-4008
-> no service l2gre reserved-vlan 4000
-> no service l2gre reserved-vlan 4005-4008

-> service l2gre reserved-vlan 4008-4020
ERROR: VLAN range should be less than or equal to 8.

-> service l2gre reserved-vlan 200
ERROR: Vlan 200 exists. Can not create the vlan!
```

```
-> show vlan
 vlan    type   admin   oper    ip    mtu          name
------+-------+-------+------+------+------+-----------------
1      std       Ena     Dis   Ena    1500    VLAN 1

4094   vcm       Ena     Dis   Dis    1500    VCM IPC
```

Release History

Release 8.5R4; command was introduced.
Release 8.6R1; configuring a range of L2 GRE reserved VLANs allowed.

Related Commands

show service info	Displays the Service Manager configuration for the local switch.

MIB Objects

```
alaSvcMgrSysTable
   alaSvcMgrReservedL2greVlan
```

service l2profile

Configures a Layer 2 profile that is applied to an access (customer facing) port. This profile is used to specify how to process Layer 2 control frames ingressing on the access port.

service l2profile *l2profile_name* **[stp | 802.1x | 802.3ad | 802.1ab | mvrp | gvrp | amap] [peer | drop | tunnel]**

no service l2profile *profile-name*

Syntax Definitions

l2profile_name	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "ALE Engineering").
stp	Specifies how to process Spanning Tree BPDU.
802.1x	Specifies how to process 802.1x control frames.
802.3ad	Specifies how to process 802.3ad control frames.
802.1ab	Specifies how to process 802.1AB control frames. To specify how to process tagged and untagged 802.1AB control frames separately, use the **service l2profile inbound 802.1ab** command.
mvrp	Specifies how to process Multiple VLAN Registration Protocol packets.
gvrp	Specifies how to process GARP VLAN Registration Protocol packets.
amap	Specifies how to process Alcatel-Lucent Enterprise Management Adjacency Protocol packets.
peer	Allows the access port to participate in the specified protocol. Control packets are not sent to the network side of the node.
drop	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.

Defaults

If no parameters are specified with this command, the new profile inherits all the following protocol settings from the default profile (**def-access-profile** or **unp-def-access-profile**):

parameter	def-access-profile	unp-def-access-profile
stp	**tunnel**	**drop**
802.1x	**drop**	**peer**
802.3ad	**peer**	**peer**
mvrp	**tunnel**	**tunnel**
gvrp	**tunnel**	**tunnel**
amap	**drop**	**drop**
802.1ab	**drop**	**drop**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a Layer 2 profile. Removing the **def-access-profile** or the **unp-def-access-profile** is not allowed.
- Remove any profile associations with access ports before attempting to modify or delete the profile.
- Not all of the control protocols are currently supported with the **peer**, **tunnel**, and **drop** parameters. Use the following table to determine the parameter combinations that are supported:

Protocol	Reserved MAC	peer	drop	tunnel
STP	01-80-C2-00-00-00	no	yes	yes
802.1x	01-80-C2-00-00-03	yes	yes	yes
802.3ad	01-80-C2-00-00-02	yes	no	no
MVRP	01-80-C2-00-00-21	no	yes	yes
GVRP	01-80-C2-00-00-21	no	yes	yes
AMAP	00-20-DA-00-70-04	yes	yes	yes
802.1ab	01-80-C2-00-00-0E	yes	yes	yes

- If a user-configured Layer 2 profile is *not* associated with a service access port, then the **def-access-profile** is used to process control packets that ingress on the service access port.
- If a user-configured Layer 2 profile is *not* associated with a UNP access port, then the **unp-def-access-profile** is used to process control packets that ingress on the UNP access port.

Examples

```
-> service l2profile sap_1_profile stp drop
-> no service l2profile sap_1_profile
-> service l2profile DropL2
-> service l2profile DropL2 stp drop gvrp drop 802.1ab drop
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

service access	Configures a switch port or link aggregate as an access port.

   alaServiceMgrPortProfile8023ADTreatment
```

service l2profile inbound 802.1ab

Configures the treatment of Layer 2 tagged and untagged 802.1AB control frames that are received on access (customer facing) ports. Use this command to specify a different action (peer, drop, or tunnel) based on the tagged and untagged state of an 802.1AB control frame.

service l2profile *l2profile_name* **inbound {tagged |untagged | both} 802.1ab {peer | drop | tunnel}**

no service l2profile *profile-name*

Syntax Definitions

l2profile_name	The name of an existing or new Layer 2 profile.
tagged	The specified action is applied only to tagged 802.1AB control frames.
untagged	The specified action is applied only to untagged 802.1AB control frames.
both	The specified action is applied to both tagged and untagged 802.1AB control frames.
peer	Allows the access port to participate in the 802.1AB protocol. Control packets are not sent to the network side of the node.
drop	Discards 802.1AB PDUs.
tunnel	Tunnels 802.1AB PDUs across the provider network.

Defaults

By default, tagged and untagged 802.1AB control frames are dropped.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the specified Layer 2 profile. Remove any profile associations with access ports before attempting to modify or delete the profile.
- When only the **tagged** keyword is used, the specified action is applied to tagged traffic and the default action (**drop**) is applied to untagged traffic.
- When only the **untagged** keyword is used, the specified action is applied to untagged traffic and the default action (**drop**) is applied to tagged traffic.
- Only the **tunnel** and **drop** actions can be configured for tagged control frames.
- Only the **peer** and **drop** actions can be configured for untagged control frames.
- The treatment of 802.1AB control frames received on access ports can either be mixed (different for tagged, different for untagged) or the same for both tagged and untagged control frames. To switch between mixed and the same, set the action for tagged and untagged frames back to the default (**drop**).
- Use the **service l2profile** command to configure the treatment for other protocol control frames. This command applies only to 801.1AB frames.

Examples

```
-> service l2profile lldp-tagged inbound tagged 802.1ab tunnel
-> service l2profile lldp-untagged inbound untagged 802.1ab peer
-> service l2profile lldp-diff inbound tagged 802.1ab tunnel inbound untagged
802.1ab peer
-> service l2profile lldp-both inbound both 802.1ab drop

-> no service l2profile lldp-tagged
-> no service l2profile lldp-untagged
-> no service l2profile lldp-diff
-> no service l2profile lldp-both
```

Release History

Release 8.6R2; command introduced.

Related Commands

```

service access

Configures a switch port or link aggregate as an access port on which device traffic enters or leaves a service domain.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [description** *port_description***]**

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} no description**

no service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
port_description	An alphanumeric string (1–128 characters).

Defaults

parameter	default
port_description	No description

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the port mode back to a regular switch port or link aggregate. Make sure the access port is not associated with any Service Access Points (SAPs) before attempting to change the port mode.
- Use the **no** form of the **description** parameter to remove only the description information from the access port. This option does not remove the access port designation, just the description text that was assigned to the port.
- Before configuring a port or link aggregate as an access port, make sure there is *no* IP interface configured for the default VLAN of the port. If there is, configuring the port as an access port is not allowed. For example, if VLAN 10 has an IP interface and is the default VLAN for port 1/1/1, then configuring port 1/1/1 as an access port is not supported.
- Access ports are required to configure a SAP. A SAP is the point at which customer traffic enters and exits the service. SAPs are not configurable on other port types.

Examples

```
-> service access port 1/1/3-10
-> service access linkagg 10-12
```

```
-> service access port 1/1/6 description "Voice Access Port"
-> service access port 2/1/6 description "L3 VPN Loopback Port"
-> service access linkagg 100 description "Server Access Port"
-> service access port 2/1/6 no description
-> no service access port 1/1/3
-> no service access linkagg 10

-> vlan 100
-> ip interface v100 address 10.10.10.1 vlan 100
-> vlan 100 members port 1/1/1 untagged
-> service access port 1/1/1
ERROR: A vlan with IP interface attached to this port is not supported!
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.2; **description** parameter added.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

show service access	Displays the access (customer-facing) port configuration for the bridge.

MIB Objects

```
alaServiceMgrPortTable
   alaServiceMgrPortID
   alaServiceMgrPortMode
   alaServiceMgrPortDescription
```

service access l2profile

Assigns an existing Layer 2 profile to the specified service access port. This profile determines how Layer 2 protocol frames received on the access port are processed.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} l2profile {default |** *profile-name***}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
default	Assigns the default profile to the specified port.
profile-name	The name of an existing Layer 2 profile.

Defaults

By default, the default Layer 2 profile (**def-access-profile**) is assigned when a port is configured as a service access port.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **default** parameter with this command to revert the associated profile back to the default profile settings.
- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- Specify a profile name that already exists in the switch configuration.
- To assign a Layer 2 profile to a UNP access port, use the **unp l2-profile** command.

Examples

```
-> service access port 1/3 l2profile sap_1_profile
-> service access linkagg 10 l2profile sap_1_profile
-> service access port 1/3 l2profile default
-> service access linkagg 10 l2profile default
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

service l2profile	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.
show service access	Displays the access (customer-facing) port configuration for the switch.

MIB Objects

```
alaServiceMgrPortTable
   alaServiceMgrPortID
   alaServiceMgrPortMode
   alaServiceMgrPortPortProfileID
```

service access vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} vlan-xlation {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables VLAN translation for the specified port.
disable	Disables VLAN translation for the specified port.

Defaults

By default, VLAN translation is disabled when a port or link aggregate is configured as an access port.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to interfaces configured as network ports.
- Enabling VLAN translation on a access port implicitly enables translation for all SAPs associated with that port. However, translation must also be enabled for the services associated with these SAPs. This ensures that all SAPs associated with a service will apply VLAN translation.

Examples

```
-> service access port 1/3 vlan-xlation enable
-> service access linkagg 10 vlan-xlation enable
-> service access port 1/3-10 vlan-xlation disable
-> service access linkagg 10-15 vlan-xlation disable
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service vlan-xlation	Configures the status of egress VLAN translation for the specified service.

   alaServiceMgrPortID
   alaServiceMgrPortMode
   alaServiceMgrPortVlanXlation
```

service sap

Configures a Service Access Point (SAP) by associating a SAP ID with a Shortest Path Bridging (SPB) service, a Virtual eXtensible LAN (VXLAN) service, or a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of network traffic to map to the associated service.

This section describes the base command along with the other optional command keywords that are used to configure SAP parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

service *service_id* **sap {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**
[*sap_id***]**
[description *desc_info***]**
[trusted | un-trusted [*priority***]]**
[stats {enable | disable}]
[admin-state {enable | disable}]

no service *service_id* **sap {port** *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [***sap_id***]**

Syntax Definitions

service_id	An existing SPB, VXLAN, or L2 GRE service ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
sap_id	The SAP ID (chassis/slot/port:encapsulation). Refer to the table in the "Usage Guidelines" section of this command page for a list of encapsulation values to select for the SAP ID.

Defaults

When a SAP is created without specifying any optional parameter values, the SAP is created with the following defaults:

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)
description *desc_info*	No description added
trusted | un-trusted [*priority***]**	**trusted**
stats enable | disable	**disable**
admin-state enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a SAP from the specified service.
- To define the SAP ID that will be associated with the SPB or VXLAN service, enter the access port or link aggregate number followed by one of the following encapsulation values (for example, service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID):

SAP ID Encapsulation	Customer Traffic Forwarded by the SAP
:0	Specifies a null encapsulation value for the SAP. All untagged traffic is mapped to the SAP; tagged traffic is dropped.
:all	Specifies a wildcard SAP. All tagged and untagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
*:qtag***[-***qtag2***]**	Specifies a VLAN ID tag for ingress traffic on the access port. Only traffic with this 802.1Q tag is mapped to the SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for ingress traffic on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

- The **:all** (wild card) parameter is also configurable as the inner tag value for double-tagged packets (for example, “10:all” specifies double-tagged packets with an outer tag equal to VLAN 10 and an inner tag with any VLAN ID value).
- When VLAN translation is enabled, a Service Access Point (SAP) with the encapsulation value set to ":all" (all tagged and untagged packets not already assigned) will not work. The ":all" encapsulation value is treated as a ":0" encapsulation value (untagged packets only; tagged packets are dropped) for VLAN translation.
- Specify only ports or link aggregates that are configured as service access ports (see **service access**). This command does not apply to network ports.
- Configuring SAPs with different encapsulation types for the same access port is allowed.
- When specifying a range of VLAN IDs with this command on an OmniSwitch 6900-Q32 or OmniSwitch 6900-X72, consider the following guidelines:
  - Each service access port supports a maximum of 8 SAPs that are created with a range of VLANs.
  - A total of 255 service access ports can support a range of VLANs at any given time.
  - The range of VLANs specified for the SAPs of a service access port cannot overlap each other.
  - For double-tagged SAPs, separate range commands can be specified for both outer and inner VLAN tags.
  - The outer VLAN range space is shared with the same space as QTAG SAP. The combined limit is 8 unique ranges per service access port. This is in addition to the 8 unique inner VLAN range per service access port.
- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.

- When configuring a SAP for an L2 GRE tunnel, consider the following:
  - A SAP is manually configured on a tunnel aggregation switch through the **service sap** command.
  - Configuring a SAP on a tunnel aggregation switch is supported on the OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.
  - A SAP is dynamically created on a tunnel access switch based on the L2 GRE tunnel service parameters mapped to the UNP profile when qualifying device traffic is assigned to the profile. Refer to Chapter 39, "Access Guardian Commands," for information about how to configure a UNP L2 GRE service profile.

Examples

```
-> service 100 sap port 1/1/1:0
-> service 100 sap port 1/1/1:50 description “Server1 to VXLAN10 SAP”
-> service 100 sap port 1/2/10:100.200 admin-state enable
-> service 100 sap port 1/2/10:500.all untrusted stats enable
-> service 100 sap linkagg 5:10
-> service 200 sap linkagg 2:20.30
-> service 200 sap linkagg 9:all untrusted 3 stats enable admin-state enable
-> no service 100 sap port 1/1/1:50 description
-> no service 100 sap port 1/2/10:100.200
-> no service 200 sap linkagg 9:all

-> service 10 sap port 1/1/11-20:21-30 description "SAPs on ports 1/1/11 to 1/1/20
with tag 21 to 30"
-> service 20 sap linkagg 1-10:100 un-trusted description "Untrusted SAPs for lag
1-10 with tag 100"
-> service 30 sap port 1/1/2:10-20 description "SAP on port 1/1/2 with only one VP
for tag 10-20"
-> service 30 sap linkagg 11:10-20 description "SAP on lag 11 with only one VP for
tag 10-20"
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, link aggregates, and VLAN ID tags added; VXLAN service support added).
Release 8.4.1.R02; support for L2 GRE tunnel services added.

```

service sap description

Configures a description for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service *service_id* **sap {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} {:0 | :all | :**qtag**[**-*qtag2***]** | **:***outer_qtag.inner_qtag***} description** *desc_info*

no service *service_id* **sap {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} [:0 | :all | :**qtag**[**-*qtag2***]** | **:***outer_qtag.inner_qtag***] description**

Syntax Definitions

service_id	An existing SPB, VXLAN, or L2 GRE service ID number.
chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
*:qtag***[**-*qtag2***]**	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
desc_info	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the SAP is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified SAP.
- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service 10 sap port 1/2:10 description “CE1 to SPB10 SAP”
-> service 13 sap linkagg 20:100.200 description “CE2 to SPB13 SAP”
```

```
-> service 15 sap port 1/11-20:21-30 description "SAPs on ports 1/11 to 1/20 with
tag 21 to 30"
-> service 30 sap port 1/2:10-20 description "SAP on port 1/2 with only one VP for
tag 10-20"
-> service 10 sap port 1/2:10 no description
-> service 13 sap linkagg 20:100.200 no description
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapDescription
   alaSapSvcId
```

service sap trusted

Configures the trust mode for the specified Service Access Port (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

A trusted SAP can accept 802.1p values in incoming packets; an untrusted SAP will set any 802.1p values to zero in incoming packets, unless an 802.1p value is configured with this command.

service *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_num***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***] {trusted | un-trusted [***priority***]}**

Syntax Definitions

service_id	An existing SPB, VXLAN, or L2 GRE service ID number.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
*:qtag***[-***qtag2***]**	Specifies a VLAN ID tag for traffic received on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic received on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
trusted	Allows the SAP to use the priority value obtained from tagged packets received on the SAP port. Untagged packets use the default port priority value.
un-trusted	Sets the priority value to zero for tagged and untagged packets received on the SAP. This is the priority assigned to tagged and untagged packets received on an untrusted SAP.
priority	The priority value to set for tagged and untagged packets received on an untrusted SAP. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

By default, the SAP is trusted with the priority set to best effort (zero). These default values are set when a port is configured as an access port and then associated with the SAP.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **un-trusted** and the *priority* parameter options to assign an 802.1p priority value to ingress packets processed by the SAP. When the **un-trusted** parameter is used without specifying a priority value, a value of zero is automatically assigned to the ingress packets.
- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
- Administratively disabling the SAP is not required to change the trust mode for the SAP.
- When the trust mode is changed from untrusted to trusted, the priority value is automatically set to the default best effort priority value (zero).
- Note that untagged Layer 2 control packets (for example, BPDU, GVRP, and AMAP) are always tunneled (if enabled) through the provider backbone bridge (PBB) network with the default EXP bits set to 7, so that they can arrive at the destination bridge at the highest COS queue of 7. As a result, trusted and untrusted SAPs configured on the access ports will not affect the Layer 2 control packets ingressing on the access ports.
- Configuring the trust mode on an access port is not allowed. These settings are configured for the SAP to which the access port is associated.
- Configuring the trust mode for a SAP is not supported on the OmniSwitch 9900.

Examples

```
-> service 10 sap port 1/1/2:10 trusted
-> service 13 sap linkagg 20 trusted
-> service 10 sap port 1/1/2:10 un-trusted
-> service 13 sap linkagg 20 un-trusted 5
-> service 20 sap linkagg 1-10:100 un-trusted
-> service 30 sap linkagg 11:10-20 trusted
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

   alaSapPortId
   alaSapEncapValue
   alaSapTrusted
   alaSapPriority
   alaSapSvcId
```

service sap stats

Configures ingress and egress statistics collection for packets flowing through the specified SAP ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service *service_id* **sap {port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} {:0 | :all |** *:qtag***[-***qtag2***] | :***outer_qtag.inner_qtag***} stats {enable | disable}**

Syntax Definitions

service_id	An existing SPB, VXLAN, or L2 GRE service ID number.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
*:qtag***[-***qtag2***]**	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables statistics collection for the SAP.
disable	Disables statistics collection for the SAP.

Defaults

By default, statistics collection is disabled for the SAP.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Specify the service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service 100 sap port 1/1/2:10 stats enable
-> service 101 sap linkagg 20:all stats enable
-> service 100 sap port 1/1/2:10 stats disable
-> service 101 sap linkagg 20:all stats disable
-> service 10 sap port 1/1/11-20:21-30 stats enable
```

```
-> service 30 sap linkagg 11:10-20 stats disable
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

Related Commands

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapStatsAdminStatus
   alaSapSvcId
```

service sap admin-state

Configures the administrative status for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service *service_id* **sap {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} {:0 | :all |** *:qtag***[**-*qtag2***] | :***outer_qtag.inner_qtag***} admin-state {enable | disable}**

Syntax Definitions

service_id	An existing SPB, VXLAN, or L2 GRE service ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
*:qtag***[**-*qtag2***]**	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables the administrative status for the SAP.
disable	Disables the administrative status for the SAP.

Defaults

By default, the administrative status of the SAP is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
- Disabling the SAP administrative status does not remove the SAP configuration from the bridge.
- If an access port goes down, all SAPs associated with that port are operationally taken down as well.

Examples

```
-> service 10 sap port 1/2:10 admin-state enable
-> service 13 sap linkagg 20 admin-state enable
-> service 10 sap port 1/2:10 admin-state disable
-> service 13 sap linkagg 20 admin-state disable
-> service 10 sap port 1/11-20:21-30 admin-state enable
-> service 30 sap linkagg 11:10-20 admin-state disable
```

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapAdminStatus
   alaSapSvcId
```

service sdp vxlan

Configures a Service Distribution Point (SDP) for Virtual eXtensible LAN (VXLAN) traffic. This type of SDP is used to tunnel unicast or multicast traffic between VXLAN Tunnel End Points (VTEPs). Configuring an SDP is automatically done for Shortest Path Bridging (SPB) services; this command is only for VXLAN services.

service sdp *sdp_id* **vxlan {far-end** *ip_address* **| multicast-group** *mc_group_address***} [ttl {***ttl_num* **| default}] [description** *desc_info***] [admin-state {enable | disable}]**

no service sdp *sdp_id* **[description]**

Syntax Definitions

sdp_id	The ID number to assign to the SDP object.
ip_address	The IP address of the Loopback0 interface for the far-end VTEP node. The Loopback0 address is required on every VTEP node.
mc_group_address	The multicast IP address of the group to which this service will join. *This parameter is not supported on an OmniSwitch 6900-V72* or an OmniSwitch 6900-C32.
ttl_num	A Time-to-Live (TTL) value that is inserted into the TTL field of the IP header when the VXLAN encapsulated frames are sent from this node. The valid range is 1–255.
default	Sets the TTL value to the default value of 64.
desc_info	An ASCII text string up to 160 characters in length.
enable	Enables the administrative status of the SDP.
disable	Disables the administrative status of the SDP.

Defaults

parameter	default
ttl {default | *ttl_num***}**	64
description *desc_info*	No description.
admin-state {enable | disable}	enable

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete the SDP object, only if the SDP is not bound to any services. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP.
- When the **far-end** option is used, this command specifies a single destination unicast IP address that identifies the far-end VTEP node to which the SDP will tunnel traffic. This IP address is the Loopback0 address configured on every VTEP node. The SDP is then bound to a VXLAN service to

direct one-way VXLAN encapsulated traffic to that single far-end node. This object is similar to the unicast SDP in SPB.

- When the **multicast-group** option is used, this command specifies the multicast group address to which all broadcast, unknown unicast, and multicast (BUM) traffic is sent to the VTEP nodes that subscribe to the PIM multicast group will receive this type of traffic. In this mode, the **ttl** parameter value is included in the IP header of the VXLAN encapsulation header:
- If the IP address of a VTEP node is learned, thus creating a dynamic unicast SDP through the discovery process, the unicast traffic is sent to the VTEP node that is associated with that learned IP address. This object is similar to multicast SDP in SPB.
- The administrative status of the VXLAN SDP affects all SDP bindings that are bound to this object.
- Configuring a VXLAN service on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. As a result, creating an SDP with a multicast group address is also not supported (tandem mode services are bound to multicast SDPs).

Examples

```
-> service sdp 10 vxlan multicast-group 224.2.1.1 ttl 20 description "PIM Group
224.2.1.1"
-> service sdp 10 ttl 5
-> service sdp 20 far-end 10.10.10.2 description "Unicast to NodeB"
-> service sdp 20 admin-state disable
-> no service sdp 10 description
-> no service sdp 10
```

Release History

Release 7.3.4; command was introduced.

   alaSdpAdminStatus
   alaSdpAllocationType
   alaSdpDynamicType
   alaSdpAdminTTL
```

service sdp l2gre

Configures a Service Distribution Point (SDP) for Layer 2 Generic Routing Encapsulation (L2 GRE) traffic. This type of SDP is used to tunnel encapsulated GRE traffic between two L2 GRE tunnel end points. Manual configuration of an L2 GRE SDP is required on a switch serving as a tunnel aggregation switch.

service sdp *sdp_id* **l2gre far-end** *ip_address* **[ttl {***ttl_num* **| default}] [description** *desc_info***] [admin-state {enable | disable}]**

no service sdp *sdp_id* **[description]**

Syntax Definitions

sdp_id	The ID number to assign to the SDP object.
ip_address	The IP address of the Loopback0 interface for the far-end Guest Tunnel access switch. The Loopback0 address is required on every Guest Tunnel endpoint.
ttl_num	A Time-to-Live (TTL) value that is inserted into the TTL field of the GRE header when the GRE encapsulated frames are sent from this node. The valid range is 1–255.
default	Sets the TTL value to the default value of 64.
desc_info	An ASCII text string up to 160 characters in length.
enable	Enables the administrative status of the SDP.
disable	Disables the administrative status of the SDP.

Defaults

parameter	default
ttl {default | *ttl_num***}**	64
description *desc_info*	No description.
admin-state {enable | disable}	enable

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **no** form of this command to delete the SDP object, only if the SDP is not bound to any services. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP.
- The **far-end** IP address value specifies a single destination unicast IP address that identifies the far-end L2 GRE tunnel access switch to which the SDP will tunnel traffic. This IP address is the Loopback0 interface address configured on every tunnel end point. The SDP is then bound to an L2 GRE service to direct one-way GRE encapsulated traffic to that single far-end tunnel access switch. This object is

similar to the unicast SDP in SPB, however, multicast SDPs are not configurable for L2 GRE tunneling.

- The administrative status of the L2 GRE SDP affects all SDP bindings that are bound to this object.
- When L2 GRE automatic SDP discovery is enabled (the default), manual configuration of the SDP and SDP binding is not required on the L2 GRE tunnel aggregation switch (see the **service l2gre auto-discover** command for more information).

Examples

```
-> service sdp 20 l2gre far-end 192.168.0.10 admin-state enable description "Guest
SDP to access switch 192.168.0.10"
-> service sdp 20 ttl 5
-> service sdp 20 admin-state disable
-> no service sdp 20 description
-> no service sdp 20
```

```

service bind-sdp

Configures the binding of a Virtual eXtensible LAN (VXLAN) service or a Layer 2 Generic Encapsulation Routing (L2 GRE) tunnel service to a Service Distribution Point (SDP).

service *service_id* **bind-sdp** *sdp_id1* **[***sdp_id2 sdp_id3* **...] [description** *desc_info***]**

service *service_id***[-***service_id2***] bind-sdp** *sdp_id* **[description** *desc_info***]**

no service *service_id* **bind-sdp** *sdp_id* **[description]**

Syntax Definitions

*service_id***[-***service_id2***]**	An existing VXLAN service ID or an L2 GRE tunnel service ID to bind to the SDP. Use a hyphen to specify a range of services to bind to the SDP.
sdp_id	An existing SDP ID number to bind to the service. Use a space to specify additional SDP IDs to bind to the specified service (for example, 10 20 30 40 50).
desc_info	An ASCII text string up to 160 characters in length.

Defaults

parameter	default
description *desc_info*	No description.

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72, 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to delete the SDP binding. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP binding.
- There is no control of the SDP administrative status; this type of service object is always enabled.
- Only static SDPs (created with an SDP ID between 1–32767) can be manually bound to a VXLAN service or an L2 GRE tunnel service; otherwise, an error message is returned.
- When configuring an SDP binding for a VXLAN service, consider the following:
  - VXLAN is only supported on the OmniSwitch 6900-V72, OmniSwitch 6900-C32, OmniSwitch 6900-Q32, and OmniSwitch 6900-X72.
  - An SDP binding is defined to allow VXLAN traffic to reach other nodes in the same group (multicast SDP) or reach a single node (unicast SDP).
  - A tandem mode VXLAN service can be bound only to one multicast SDP (not supported on an OmniSwitch 6900-V72 or OmniSwitch 6900-C32).
  - A head-end mode VXLAN service can be bound only to unicast SDPs.
  - A hybrid mode service can be bound with one multicast SDP for a group of member VTEPs and

with many unicast SDPs for VTEPs that do not participate in a multicast group.

- On an OmniSwitch 6900-V72 and OmniSwitch 6900-C32, only head-end mode VXLAN services are supported. As a result, creating an SDP bind for a tandem mode service is not supported on this platform. If the service is configured to use the hybrid multicast mode, then the service can only be bound to a unicast SDP.

- When configuring an SDP binding for an L2 GRE tunnel service, consider the following:
  - An SDP and SDP binding is defined on a tunnel aggregation switch to allow L2 GRE tunnel traffic to reach a single tunnel access switch (unicast SDP).
  - One SDP and SDP binding is configured for each tunnel access switch that will tunnel traffic to the tunnel aggregation switch.
  - When L2 GRE automatic discovery is enabled (the default), manual configuration of the SDP and SDP binding is not required on the L2 GRE tunnel aggregation switch (see the **service l2gre auto-discover** command for more information).

Examples

```
-> service 1 bind-sdp 10 description "Bind to PIM Group 224.2.1.1"
-> service 2 bind-sdp 20 description "Unicast Bind to 1.1.1.20 VTEP"
-> service 4 bind-sdp 30 description “Unicast Bind to 10.2.2.1 Guest Access Switch:
-> service 5 bind-sdp 40 50 60 70 80 90
-> service 1-100 bind-sdp 10 description "Bind Services 1-100 to PIM Group
225.2.1.1"
-> service 200-250 bind-sdp 20 description "Bind Services 200-250 to 1.1.1.20 VTEP"
-> service 300-350 bind-sdp 30 description “Bind Services 300-350 to 10.2.2.1 Guest
Access Switch”
-> no service 1 bind-sdp 10 description
-> no service 2 bind-sdp
```

Release History

Release 7.3.4; command was introduced.
Release 8.4.1.R02; support for binding L2 GRE tunnel services to unicast SDPs added.

Related Commands

service l2gre auto-discover

Configures the status of L2 GRE automatic SDP discovery on a tunnel aggregation switch. When enabled, the switch discovers the SDPs of remote tunnel end points for a configured L2 GRE service. Once discovered, the switch will dynamically create local SDP and SDP bindings for the remote tunnel end points of the L2 GRE service.

service l2gre auto-discover {enable | disable}

Syntax Definitions

enable	Enables automatic discovery of L2 GRE edge switches.
disable	Disables automatic discovery of L2 GRE edge switches.

Defaults

By default, automatic discovery is enabled on an L2 GRE tunnel aggregation switch.

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- When L2 GRE automatic discovery is enabled (the default), the detection of SDPs for remote tunnel end points is based on the traffic received from these end points. If the destination IP address of the remote traffic is the IP address of the local Loopback0 interface and the VPNID of the traffic matches the VPNID of a local L2 GRE service, an SDP and SDP binding is dynamically created for the remote tunnel end point.
- When L2 GRE automatic discovery is disabled, manual configuration of an SDP and SDP binding for a remote tunnel end point is required using the **service sdp l2gre** and **service sdp-bind** commands.
- L2 GRE automatic discovery on the tunnel aggregation switch is similar to how tunnel access switches automatically define unicast SDPs to the aggregation switch.

Examples

```
-> service l2gre auto-discover disable
-> service l2gre auto-discover enable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

service sdp l2gre	Configures an SDP for L2 GRE tunnel traffic.
service bind-sdp	Configures the binding of an L2 GRE tunnel service to an SDP

MIB Objects

```
alaSvcMgrSysTable
   alaSvcMgrSdpAutoCreateAdminState
```

service rfp local-endpoint

Configures a local end point for an SPB Remote Fault Propagation (RFP) domain. Creating a local RFP end point identifies the local switch as a Maintenance End Point (MEP) in the RFP domain.

service rfp *rfp_id* **local-endpoint** *lep_id* **[admin-state {enable | disable}] [ccm-interval {interval100ms | interval1s** | **interval10s** | **interval1m** | **interval10m | interval-invalid}] [level** *number***] type spb**

no service rfp *rfp_id* **[local-endpoint** *lep_id***]**

Syntax Definitions

rfp_id	A unique numerical value to identify an RFP domain that maps to a reserved OAM domain. The valid RFP ID range is 1–32767.
lep_id	A numerical value to identify an end point of the specified RFP domain ID on the local switch. The valid range is 1–8191. This value serves as the virtual UP MEP ID for the RFP end point.
enable	Administratively enables the local end point.
disable	Administratively disables the local end point.
interval100ms	Send a Continuity Check Messages (CCM) every 100 milliseconds.
interval1s	Send a CCM every 1 second.
interval10s	Send a CCM every 10 seconds.
interval1m	Send a CCM every minute.
interval10m	Send a CCM every 10 minutes.
interval-invalid	Send a CCM by a MEP.
number	A unique numerical value to assign as the OAM domain level for the RFP domain. The valid range is 0-7.

Defaults

When a local end point is created for an RFP domain without specifying any of the optional parameter values, the end point is created with the following default values:

parameter	default
enable | disable	**enable**
ccm-interval	**interval1s**
number	7

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the RFP domain configuration from the switch (for example, **no service rfp 1**). To remove the local end point ID only, use the **no** form of this command with the **local-endpoint** parameter (for example, **no service rfp local-endpoint**).

- An RFP domain consists of a local end point configured with this command and a remote end point list configured with the **service rfp remote-endpoint** command. An SPB service is bound to the remote end point list to identify the Service Access Point (SAP) to monitor.
- The local end point ID number identifies local BEB devices in the RFP domain; this is also the number used as the virtual UP MEP ID.
- Creating more than one RFP domain with the same domain level value is not allowed. Up to eight RFP domains are allowed as long as they each are created with a different level number. Each RFP domain created counts towards the maximum limit of Ethernet OAM domains allowed.
- When this command is used to create an RFP end point, the switch automatically creates the following reserved Ethernet OAM elements that are mapped to each RFP domain:
  - Maintenance Domain (MD) named “RFP_OVER_SPB_DOMAIN_LEVEL7”, where the level number is the value specified with this command. Each time an RFP end point is created, a new maintenance domain is created with the level number specified with this command.
  - Maintenance Association (MA) named “RFP_OVER_SPB_ASSOCIATION”. The same MA name is used for all RFP domains.
  - A primary VLAN, where the VLAN ID used is the SPB control BVLAN. This same VLAN is used as the primary VLAN for all RFP domains.
  - Virtual UP Maintenance End Point (MEP) that will advertise CCM to the network. Each CCM contains a proprietary OUI TLV that specifies I-SID information and the state of the port associated with the I-SID. CCM packets are sent using the CCM interval value specified with this command. The local end point ID specified with this command serves as the virtual UP MEP ID.

Examples

```
-> service rfp 1000 local-endpoint 1 ccm-interval INTERVALS1s type SPB
-> service rfp 1000 local-endpoint 1 admin-status enable
-> service rfp 2000 local-endpoint 1 admin-status enable ccm-interval INTERVALS1s
level 6 type SPB
-> service rfp 300 local-endpoint 40 ccm-interval INTERVALS1s type level 5 SPB
-> service rfp 300 local-endpoint 40 admin-status enable
-> no service rfp 1 local-endpoint 1000
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service rfp remote-endpoint	Configures a remote end point that is associated with the local end point through the RFP ID.
show service rfp	Displays the configuration and status of RFP for SPB domains.
show service rfp configuration	Displays the RFP OAM domain configuration for the bridge.

MIB Objects

   alaRfpSpbLocalEndPointRfp
   alaRfpSpbLocalEndPoint
   alaRfpSpbLocalEndPointCcmInterval
   alaRfpSpbLocalEndPointAdminStatus
   alaRfpSpbLocalEndPointLevel
   alaRfpSpbLocalEndPointCBVlan
   alaRfpSpbLocalEndPointMaintDomain
   alaRfpSpbLocalEndPointMaintAssociation
```

service rfp remote-endpoint

Configures a remote end point list for an SPB Remote Fault Propagation (RFP) domain. The list consists of the MEP IDs on remote BEBs and local SPB service ID numbers. This command triggers the sending of a Continuity Check Message (CCM) to advertise the status of the specified local SPB services to the specified remote MEP IDs.

service rfp *rfp_id* **remote-endpoint** *rep_id* **service-id** *service_id***[-***service_id2***]**

no service rfp *rfp_id* **remote-endpoint** *rep_id* **[service-id** *service_id***[-***service_id2***]]**

Syntax Definitions

rfp_id	An existing RFP ID number.
rep_id	A numerical value to identify the MEP ID of a remote BEB. The valid range is 1–8191.
*service_id***[-***service_id2***]**	An existing SPB service ID to bind to the RFP domain. Use a hyphen to specify a range of SPB services (for example, 10-12 specifies services 10, 11, and 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the RFP end point or an SPB service ID from the end point list.
- To identify a BEB as a participating member of an RFP domain, first configure a local RFP end point with the **service rfp local-endpoint** command to create the RFP domain ID then use this command to configure the remote end point. Both types of end points use the same RFP ID, but the RFP ID specified for the remote end point must already exist.
- The MEP ID specified with this command is the end-point ID configured on the remote BEB using the **service rfp local-endpoint** command.
- One or more SPB services are bound to the RFP remote end point to identify the Service Access Point (SAP) to monitor within the RFP domain. An SPB service is associated with an SPB service instance ID (I-SID); the service is then associated with a SAP. A SAP binds together the service and the access port on which device traffic enters the SPB service domain.
- Each SPB service bound to an RFP domain identifies the SAP information (such as access port status and I-SID) that is advertised in the proprietary TLV of CCM packets. Each CCM may contain information for multiple SPB services.
- Although binding multiple SPB services to an RFP domain is allowed, monitoring SAPs associated with only one SPB service is recommended.

Examples

```
-> service rfp 1000 remote-endpoint 2 service-id 10-14
-> service rfp 1000 remote-endpoint 3 service-id 20
-> no service rfp 1000 remote-endpoint 2 service-id 10
-> no service rfp 1000 remote-endpoint 2
-> no service rfp 1000

Example when the RFP ID does not exist because a local end point with that ID was
not created:
-> service rfp 2000 remote-endpoint 2 service-id 10
ERROR: RFP Domain (2000) does not exist
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service rfp local-endpoint	Configures a local end point that is associated with the remote end point through the RFP ID.
show service rfp	Displays the configuration and status of RFP for SPB domains.

```

show service l2profile

Displays the Layer 2 profile configuration information for the bridge. This type of profile is applied to access (customer-facing) ports and specifies how to process Layer 2 protocol frames received on this type of port.

show service l2profile [*profile_name***]**

Syntax Definitions

profile_name	An existing Layer 2 profile name. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *profile-name* parameter to display information for a specific profile. Entering a profile name is case sensitive.
- If there are no profiles configured for the bridge, this command will still display the information for the default profiles (def-access-profile and unp-def-access-profile). These profiles are applied to service access ports that are not associated with a specific profile.
- An asterisk (*) appears after a profile name when the profile is assigned to UNP access ports.

Examples

```
-> show service l2profile
Legend: (*) in-use by UNP
                                                                    802.1AB 802.1AB 802.1AB
   Profile Name          STP   802.1X  802.3AD  MVRP    GVRP    AMAP   Both   Tagged Untagged

DropL2                 drop    drop    drop    tunnel  drop    drop   drop     -       -
```

output definitions

Profile Name	The name of the Layer 2 profile.
Stp	Indicates how Spanning Tree traffic control packets are processed.
802.1x	Indicates how IEEE 802.1x control packets are processed.
802.3ad	Indicates how IEEE 802.3ad control packets are processed.
MVRP	Indicates how Multiple VLAN Registration Protocol packets are processed.
GVRP	Indicates how GARP VLAN Registration Protocol packets are processed.
AMAP	Indicates how Alcatel-Lucent Enterprise Mapping Adjacency Protocol packets are processed.
802.1AB Both	Indicates how tagged *and* untagged IEEE 802.1AB control packets are processed.
802.1AB Tagged	Indicates how tagged IEEE 802.1AB control packets are processed.
802.1AB Untagged	Indicates how untagged IEEE 802.1AB control packets are processed.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1; Layer 2 profiles for UNP access ports included in the output display.
Release 8.4.1.R02; L2 GRE tunnel service support added.
Release 8.6R2; “802.1AB Both”, “802.1AB Tagged”, and “802.1AB Untagged” fields added.

Related Commands

show service access

Displays the access (customer-facing) port configuration for the bridge.

show service access [port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]] [sap]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
sap	Displays the Service Access Points (SAPs) associated with the specified access port.

Defaults

By default, all service access ports are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** and **linkagg** parameters to display the configuration for a specific port or link aggregate.
- Use the **sap** parameter to display the SAPs associated with the specified port.

Examples

```
-> show service access
Port     Link  SAP     SAP   Vlan
Id      Status Type    Count Xlation L2Profile              Description

1/13    Down   Dynamic 100   N       unp-def-access-profile UNP Dynamic Access Port

Total Access Ports: 1
```

output definitions

Port Id	The access port number or link aggregate ID number.
Link Status	The status of the link connection to the access port (**Up** or **Down**).
SAP Type	Whether or not the SAP associated with the access port was created statically or dynamically (**Manual** or **Dynamic**).
SAP Count	The number of service access points (SAPs) that are associated with the access port.
VLAN Xlation	Whether or not VLAN translation is enabled on the access port.
L2Profile	The name of the Layer 2 profile associated with the access port. Configured through the **service l2profile** command.
Description	An optional description configured for the access port. By default, the description is blank.

```
-> show service access port 1/23 sap
Legend: * denotes a dynamic object
                                                                  Vlan
Identifier       Adm  Oper Stats T:P  ServiceId   Isid/Vnid Xlation Sap Description
---------------+----+----+-----+----+-----------+---------+-------+---------------

Total SAPs: 3
```

output definitions

Identifier	The SAP identifier, which consists of the access port and encapsulation value.
Adm	The administrative state of the SAP (**Up** or **Down**).
Oper	The operational state of the SAP (**Up** or **Down**).
Stats	Whether or not statistics collection is enabled for the SAP (**Yes** or **No**).
T:P	Whether or not the 802.1p priority value of traffic mapped to this SAP is trusted. (**Y** or **N**). If this value is set to untrusted (**N**), then the traffic is marked with the specified 802.1p priority value. For example, **Y:x** indicates traffic priority is trusted; **N:3** indicates traffic priority is untrusted and should be marked with an 802.1p value of 3.
ServiceId	The ID number of the service associated with the SAP.
Isid/Vnid	An SPB service instance identifier (ISID), VXLAN network identifier (VNID), or an L2 GRE Virtual Private Network (VPN) identifier. The value of this field depends on whether an SPB service, a VXLAN service, or an L2 GRE tunnel service is associated with the SAP.
Vlan Translation	Whether or not VLAN translation is enabled for the SAP (**Yes** or **No).**
Sap Description	An optional description configured for the SAP. By default, the description is blank.

Release History

Release 7.3.1; command was introduced.
Release 7.3.2; **description** field added.
Release 7.3.4; **sap** parameter added; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

show service

Displays information about the services configured on the switch.

show service [spb | vxlan | l2gre | *service_id***]**

Syntax Definitions

spb	Displays only the Shortest Path Bridging (SPB) services.
vxlan	Displays only the Virtual eXtensible LAN (VXLAN) services.
l2gre	Displays only the Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.
service_id	An existing service ID number. Displays additional details about the specified service.

Defaults

By default, a list of all services is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **spb** parameter to display additional information about SPB services.
- Use the **vxlan** parameter to display additional information about VXLAN services. This parameter is supported only on the OmniSwitch 6900-Q32, OmniSwitch 6900-X72, OmniSwitch 6900-V72, and OmniSwitch 6900-C32.
- Use the **l2gre** parameter to display additional information about L2 GRE tunnel services. This parameter is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.
- The service ID is a unique number that identifies a specific service. Information associated with the service ID is displayed.

Examples

```
-> show service
Legend: * denotes a dynamic object

output definitions

Service Id	The service identifier.
Description	An optional description configured for the service. By default, the description is blank.
ISID	The service instance identifier (I-SID) number for the SPB service. This field is only displayed for SPB services.
BVlan	The VLAN ID number for the SPB backbone VLAN (BVLAN). This field is only displayed for SPB services.
VNID	The VXLAN network identifier for the VXLAN segment. This field is only displayed for VXLAN services.
VPNID	A GRE tunnel Virtual Private Network (VPN) ID. This field is only displayed for L2 GRE tunnel services.
Multicast-Mode	The multicast replication mode for the specified service (**tandem**, **headend**, or **hybrid**). This field is not displayed for L2 GRE tunnel services.
Tx/Rx Bits	The number of bits transmitted and received for this service. This field is only displayed for SPB services.
Admin Status	The administrative state of the service (**Up** or **Down**).
Oper Status	The operational state of the service (**Up** or **Down**).
Stats Status	Whether statistics collection is enabled for the service (**Yes** or **No**).
Vlan Translation	Whether VLAN translation is enabled for the service (**Yes** or **No).**
Service Type	The type of service (**SPB**, **VXLAN**, or **L2GRE**).
Allocation Type	Whether the service was manually or dynamically created (**Static** or **Dynamic**).
MTU	The largest frame size, in octets, that the service can handle.
SAP Count	The number of SAPs associated with this service.
SDP Bind Count	The number of SDPs bound to this service.
RemoveIngressTag	Whether the customer VLAN tag is removed before the packet is encapsulated for the service (**Yes** or **No**).
Port Isolation	The status of port isolation for an L2 GRE tunnel service. When enabled, traffic between L2 GRE tunnel SAPs is dropped. Port isolation is implicitly enabled and is not configurable in this release.
Ingress Pkts	The number of packets that have ingressed on this SAP.
Ingress Bytes	The number of bytes that have ingressed on this service.
Egress Pkts	The number of packets that have egressed on this service.
Egress Bytes	The number of bytes that have egressed on this service.
Mgmt Change	The date and time of the last configuration change for this service.
Status Change	The date and time of the last operational status change for this service.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **vxlan** parameter added.

Release 8.4.1.R02; **l2gre** parameter added.
Release 8.6R1; “Port Isolation” field added for L2 GRE tunnel services.

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service l2gre	Configures an L2 GRE tunnel service.
show service sdp	Displays the SDP configuration for the bridge.
show service bind-sdp	Displays the Mesh SDP bindings for the bridge.

show service ports

Displays the virtual ports associated with the specified Shortest Path Bridging (SPB) service, Virtual eXtensible LAN (VXLAN) service, or Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service.

show service {*service_id* **| isid** *instance_id* **| vnid** *vxlan_id* **| vpnid** *vpn_id***} ports**

Syntax Definitions

service_id	An existing service ID number.
instance_id	Displays the virtual ports associated with the specified SPB service instance identifier (I-SID) number. The valid range is 256–16777214.
vxlan_id	Displays the virtual ports associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
vpn_id	Displays the virtual ports associated with the specified L2 GRE tunnel Virtual Private Network (VPN) ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A Service Access Point (SAP) and a Service Distribution Point (SDP) serve as virtual ports that carry traffic for the specified SPB service, VXLAN service, or L2 GRE tunnel service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the SPB service, VXLAN service, or L2 GRE tunnel service.
- Displaying virtual port information for VXLAN services is supported only on the OmniSwitch 6900-Q32, OmniSwitch 6900-X72, OmniSwitch 6900-V72, and OmniSwitch 6900-C32.
- Displaying virtual port information for L2 GRE tunnel services is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.

Total Ports: 3
```

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Adm	The administrative state of the virtual port (**Up** or **Down**).
Oper	The operational state of the virtual port (**Up** or **Down**).
Stats	Whether or not statistics collection is enabled for the virtual port.
Sap Trusted:Priority	Whether or not the Service Access Point (SAP) virtual port associated with the service is trusted or assigns a priority value.
Sdp FarEnd Addr	The Loopback0 IP address of the far-end Guest Tunnel access switch that is associated with the service.
Intf	The bridge interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service.
Description	An optional description configured for the service.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **vnid** parameter added for VXLAN services.
Release 8.4.1.R02; **vpnid** parameter added for L2 GRE tunnel services.

Related Commands

show service	Displays the service configuration for the bridge.
show service spb sap	Displays the service access point (SAP) configuration for a specific SAP associated with the specified SPB service.

MIB Objects

N/A

show service spb sap

Displays the configuration information for the specified Service Access Point (SAP) ID associated with the specified service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

show service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_num***} [:0 | :all | :***qtag1* **| :***outer_qtag.inner_qtag***]**

Syntax Definitions

service_id	An existing service ID number.
chassis/slot/port	The slot and port number of the Service Access Port.
agg_id	The link aggregate ID number (0–31) of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A SAP is a type of virtual port that is associated with the specified service.
- A SAP determines which traffic (untagged, single-tagged, or double-tagged) is mapped to the service associated with this SAP.

Examples

```
-> show service spb 525 sap port 1/11:2524
SAP Detailed Info
  SAP Id           : 1/11:2524,           Description      : ,

```

output definitions

SAP Id	The access port and encapsulation associated with the service.
Description	An optional description configured for the SAP. By default, the description is blank.
Admin Status	The administrative state of the SAP (**Up** or **Down**).
Oper Status	The operational state of the SAP (**Up** or **Down**).
Stats Status	Whether statistics collection is enabled for the SAP (**Yes** or **No**).
Vlan Translation	Whether VLAN translation is enabled for the SAP (**Yes** or **No).**
Service Type	The type of service associated with this SAP (**SPB** or **VXLAN**).
Allocation Type	Whether the service was manually or dynamically created (**Static** or **Dynamic**).
Trusted	Whether the SAP is trusted (**Yes** or **No**).
Priority	The 802.1p priority assigned to traffic mapped to this SAP. Applied only when the SAP is not trusted and a priority is specified.
Ingress Pkts	The number of packets that have ingressed on this SAP.
Ingress Bytes	The number of bytes that have ingressed on this SAP.
Egress Pkts	The number of packets that have egressed on this SAP.
Egress Bytes	The number of bytes that have egressed on this SAP.
Mgmt Change	The date and time of the last configuration change for this SAP.
Status Change	The date and time of the last operational status change for this SAP.

Release History

Release 7.3.4; command was introduced.

Related Commands

show service	Displays the service configuration for the bridge.
show service ports	Displays the virtual ports (SAP and SDPs) associated with the specified SPB or VXLAN service.

show service sdp

Displays the Service Distribution Point (SDP) configuration for the bridge. An SDP is a logical service entity that tunnels traffic from one switch to another switch in the network.

show service sdp [*sdp_id***]**

Syntax Definitions

sdp_id	An existing SDP ID number.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *sdp_id* parameter to display information about a specific SDP.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDPs are not saved to the switch configuration file.
- Manual configuration of SDPs and SDP bindings is required for VXLAN services.
- The status of automatic discovery for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the **show service sdp l2gre** command for more information.
- Displaying the SDP configuration for L2 GRE services is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.
- Displaying the SDP configuration for VXLAN services is supported only on the OmniSwitch 6900-Q32, OmniSwitch 6900-X72, OmniSwitch 6900-V72, and OmniSwitch 6900-C32.

Examples

```
-> show service sdp

Total SDPs: 5
```

output definitions

SdpId	A unique SDP identification number, dynamically generated by ISIS-SPB or manually configured for VXLAN services or L2 GRE tunnel services.
FarEnd/Group Addr	The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses.
FarEnd SysId:BVlan	The System ID (bridge MAC address) and associated BVLAN of the far-end SPB node of the tunnel defined by this SDP.
Adm	The administrative state of the SDP (**Up** or **Down**).
Oper	The operational state of the SDP (**Up** or **Down**).
Svc Type	The type of service traffic that this SDP will tunnel (**SPB**, **VxLAN**, or **L2GRE**).

```
-> show service sdp 10

Allocation Type : Dynamic,               SDP Bind Count : 1,
Mgmt Change     : 10/15/2016 18:38:33,   Status Change  : 10/15/2016 18:40:23
```

SDP-Id	A unique SDP identification number manually configured for VXLAN services.
Description	An optional ASCII text description for this SDP.
Service Type	The type of service traffic that this SDP will tunnel (**SPB**, **VxLAN**, or **L2GRE**).
FarEnd/Group	The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses
Admin Status	The administrative state of the SDP (**Up** or **Down**).
Oper Status	The operational state of the SDP (**Up** or **Down**).
TTL	The time-to-live (TTL) value for this SDP.

Allocation Type	Whether the SDP was statically or dynamically created. An SDP for an SPB service is generated dynamically; an SDP for a VXLAN or L2GRE tunnel service is generated statically or dynamically through the UNP feature.
SDP Bind Count	The number of services bound to this SDP.
Mgmt Change	The date and time of the last manual change to this SDP.
Status Change	The date and time of the last status change to this SDP.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN fields added.
Release 8.4.1.R02; L2 GRE fields added.

Related Commands

show service sdp spb	Displays SDP information specific to SPB services.
show service sdp vxlan	Displays SDP information specific to VXLAN services.
show service sdp l2gre	Displays SDP information specific to L2 GRE tunnel services.

show service sdp spb

Displays the Service Distribution Point (SDP) configuration for SPB services.

show service sdp spb [sysid *mac_address* **| bvlan** *bvlan_id***]]**

Syntax Definitions

mac_address	The System ID (BMAC) of the far-end SPB node of the service tunnel defined by this SDP.
bvlan_id	The VLAN ID number of an existing SPB BVLAN.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **sysid** and **bvlan** parameters to display additional information about SPB SDPs.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDPs are not saved to the switch configuration file.

output definitions

SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB.
FarEnd SysId:BVlan/ GroupMac	The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
SourceId	The shortest path (SP) source ID of the bridge.
Oper	The operational state of the SDP (**Up** or **Down**).
Intf/Isid	The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.
Bind Count	The number of services bound to this SDP.
FarEnd SystemName / PortList	The system name and port list of the far-end SPB node.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **sysid** and **bvlan** parameters added.

Related Commands

show service sdp vxlan

Displays the Service Distribution Point (SDP) configuration for Virtual eXtensible LAN (VXLAN) services.

show service sdp vxlan [far-end *ip_address* | **multicast-group** *mc_group_address***]]**

Syntax Definitions

ip_address	The IP address of the Loopback0 interface for the far-end VXLAN Tunnel End Point (VTEP) node. The Loopback0 address is required on every VTEP node.
mc_group_address	The multicast IP address of the group to which the service will join. *This parameter is not supported on an OmniSwitch 6900-V72 or an OmniSwitch 6900-C32*.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Use the **far-end** and **multicast-group** parameters to display only VXLAN SDPs associated with a specific far-end IP address or a specific multicast group IP address.
- Manual configuration of SDPs and SDP bindings for VXLAN services is required.

Examples

```
-> show service sdp vxlan
Legend: (*) dyn unicast object

show service sdp l2gre

Displays the Service Distribution Point (SDP) configuration for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.

show service sdp l2gre [far-end *ip_address***]**

Syntax Definitions

ip_address	The IP address of the Loopback0 interface for the far-end L2GRE tunnel endpoint. The Loopback0 address is required on every VTEP node.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **far-end** parameter to display only L2 GRE SDPs associated with a specific far-end IP address; multicast group IP addresses are not supported.
- The status of automatic SDP discovery for L2 GRE tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the **service l2gre auto-discover** command for more information.
  - If L2 GRE automatic discovery is enabled (the default), then SDPs are automatically created and bound to L2 GRE services.
  - If L2 GRE automatic discovery is disabled, then manual configuration of SDPs and SDP bindings is required for L2 GRE services.
- This command is also supported on an OmniSwitch 6560 to display dynamically configured L2 GRE service objects, such as SDPs.

Examples

```
-> show service sdp l2gre
Legend: (*) dyn unicast object
L2GRE SDP Info

```

SdpId	A unique SDP identification number manually configured for L2 GRE services.
FarEnd Addr	The IP address (Loopback0 interface) associated with the far-end L2 GRE tunnel endpoint of this SDP.
Adm	The administrative state of the SDP (**Up** or **Down**).
Oper	The operational state of the SDP (**Up** or **Down**).
Intf	The interface on which the L2 GRE tunnel endpoint was discovered for a unicast SDP.
Bind Count	The number of services bound to this SDP.
ttl	The time-to-live (TTL) value for this SDP.
Description	An optional ASCII text description for this SDP.

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

service sdp l2gre	Configures an SDP for an L2 GRE tunnel service.
show service sdp	Displays the SDP configuration for the switch.
show service sdp spb	Displays SDP information specific to SPB services.
show service sdp vxlan	Displays SDP information specific to VXLAN services.
show service	Displays the service configuration for the bridge.
show service bind-sdp	Displays the Mesh SDP configuration for the bridge.

show service bind-sdp

Displays the Service Distribution Point (SDP) binding configuration for the switch.

show service bind-sdp [*sdp_id***[:***service_id***]]**

Syntax Definitions

*sdp_id***[:***service_id***]**	Displays SDP bindings with the specified SDP ID and/or service ID number.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDP bindings are not saved to the switch configuration file.
- Manual configuration of SDPs and SDP bindings is required for VXLAN services.
- The status of automatic SDP discovery for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the **show service bind-sdp l2gre** command for more information.
- Displaying the SDP binding configuration for VXLAN services is supported only on the OmniSwitch 6900-Q32, OmniSwitch 6900-X72, OmniSwitch 6900-V72, and OmniSwitch 6900-C32.
- Displaying the SDP binding configuration for L2 GRE services is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.

output definitions

SvcId	The ID number of the service that is bound to the SDP.
Bind-SDP	The unique SDP identification number that is bound to the service number. For example, 220:3 represents SDP 220 bound to service 3.
Vnid or Vpnid	A 24-bit numerical value that identifies a VXLAN segment ID (Vnid) or an L2 GRE tunnel segment ID (Vpnid).
FarEnd/Group Addr	The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses
Oper	The operational state of the SDP binding (**Up** or **Down**).
Intf	The VXLAN or L2 GRE interface on which the SDP binding was configured.
Intf Name	The name assigned to the VXLAN or L2 GRE interface.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN fields added.
Release 8.4.1.R02; L2 GRE fields added.

Related Commands

show service bind-sdp spb

Displays the Service Distribution Point (SDP) binding configuration for Shortest Path Bridging (SPB) services.

show service bind-sdp [spb | isid *instance_id***]**

Syntax Definitions

spb	Displays SPB SDP bindings.
instance_id	Displays SPB SDP bindings associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **spb** parameter to display information for all SPB bindings.
- Use the **isid** parameter to display information for a specific SPB service instance.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDP bindings are not saved to the switch configuration file.

Examples

```
-> show service bind-sdp spb

Total Bind-SDPs: 10
```

output definitions

SvcId	The ID number of the SPB service that is bound to the SDP.
SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB and bound to the service number.
Isid	The service instance identifier (I-SID) number for the SPB service.
FarEnd SysId:BVlan	The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
Oper	The operational state of the SDP binding (**Up** or **Down**).
Intf	The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.
FarEnd SystemName	The system name of the far-end SPB node.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **isid** parameter added.

Related Commands

show service bind-sdp vxlan

Displays the Service Distribution Point (SDP) binding configuration for Virtual eXtensible LAN (VXLAN) services.

show service bind-sdp [vxlan | vnid *vxlan_id***]**

Syntax Definitions

vxlan	Displays VXLAN SDP bindings.
vxlan_id	An existing VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 6900-Q32, 6900-X72, OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Use the **vxlan** parameter to display information for all VXLAN bindings.
- Use the **vnid** parameter to display information for a specific VNID.
- Manual configuration of SDPs and SDP bindings for VXLAN services is required.

Examples

show service bind-sdp l2gre

Displays the Service Distribution Point (SDP) binding configuration for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.

show service bind-sdp [l2gre | vpnid *vpn_id***]**

Syntax Definitions

l2gre	Displays L2 GRE SDP bindings.
vpn_id	An existing VPN ID for an L2 GRE tunnel segment.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 9900, OmniSwitch 6900-Q32, 6900-X72

Usage Guidelines

- Use the **l2gre** parameter to display information for all L2 GRE bindings.
- Use the **vpnid** parameter to display information for a specific L2 GRE VPN segment.
- The status of automatic SDP discovery for L2 GRE tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the **service l2gre auto-discover** command for more information.
  - If L2 GRE automatic discovery is enabled (the default), then SDPs are automatically created and bound to L2 GRE services.
  - If L2 GRE automatic discovery is disabled, then manual configuration of SDPs and SDP bindings is required for L2 GRE services.
- This command is also supported on an OmniSwitch 6560 to display dynamically configured L2 GRE service objects, such as SDP bindings.

Examples

```
-> show service bind-sdp l2gre
Legend: * denotes a dynamic object
L2GRE Bind-SDP Info
SvcId    Bind-Sdp         Vpnid     FarEnd/Group Addr    Oper Intf     Intf Name

Total Bind-SDPs: 1
```

SvcId	The ID number of the service that is bound to the SDP.
Bind-SDP	The unique SDP identification number that is bound to the service number. For example, 220:3 represents SDP 220 bound to service 3.
Vpnid	The VPN ID for an L2 GRE tunnel segment.
FarEnd/Group Addr	The IP address (Loopback0 interface) associated with the far-end L2 GRE tunnel endpoint of the SDP.
Oper	The operational state of the SDP binding (**Up** or **Down**).
Intf	The L2 GRE interface on which the SDP binding was configured.
Intf Name	The name assigned to the L2 GRE interface.

Release History

Release 8.4.1.R02; command was introduced.

show service debug-info

Displays debug information for the virtual ports associated with the service.

show service {*service_id* **| isid** *instance_id* **| vnid** *vxlan_id* **| vpnid** *vpn_id***} debug-info**

Syntax Definitions

service_id	An existing service ID number.
instance_id	Displays debug information for the SPB service associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.
vxlan_id	Displays debug information for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
vpn_id	Displays debug information for the L2 GRE tunnel service associated with the specified Virtual Private Network (VPN) ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the service.
- Use the **isid** parameter to display debug information for the SPB service associated with the I-SID.
- Use the **vnid** parameter to display debug information for the VXLAN service associated with the VNID. This parameter is supported only on the OmniSwitch 6900-Q32, OmniSwitch 6900-X72, OmniSwitch 6900-V72, and OmniSwitch 6900-C32.
- Use the **vpnid** parameter to display debug information for the L2 GRE tunnel service associated with the VPNID. This parameter is supported on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, OmniSwitch 6900-X72, and OmniSwitch 9900.

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Adm	The administrative state of the virtual port (**Up** or **Down**).
Oper	The operational state of the virtual port (**Up** or **Down**).
Stats	Whether statistics collection is enabled for the virtual port.
Sap Trusted : Priority	Whether the Service Access Point (SAP) virtual port associated with the service is trusted or assigns a priority value.
Sdp SystemId : BVlan	The system ID (base MAC) and associated BVLAN for a Service Distribution Point (SDP) virtual port associated with the service. This value is displayed only for SPB services.
Sdp FarEnd/Group	The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or the L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses. This value is displayed only for VXLAN and L2 GRE services.

output definitions

Intf	The switch interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service.
Sap Description	The description for the SAP that is associated with the service.
Sdp Systemname	The system name for the SDP bridge that is associated with the service. This value is displayed only for SPB services.
Sdp Intf Name	The name assigned to the VXLAN or L2 GRE tunnel interface. This value is displayed only for VXLAN and L2 GRE services.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **vnid** parameter and display fields added for VXLAN.
Release 8.4.1.R02; **vpnid** parameter and display fields added for L2 GRE.

Related Commands

show service ports	Displays the virtual port (SAP and SDP) configuration for the specified service.
show service	Displays the service configuration for the bridge.
show service access	Displays the service access port configuration for the switch.

MIB Objects

N/A

show service info

Displays the Service Manager configuration for the local switch.

show service info

Syntax Definitions

N/A

Defaults

By default, the UDP port value is set to 4789.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The display output of this command also includes SPB and VXLAN information, such as the system MAC address and name used by SPB and the UDP port and VRF used by VXLAN.
- Layer 2 Generic Routing Encapsulation (L2 GRE) information is displayed based on the switch platform. For example, the status of automatic discovery and the reserved VLAN ID is displayed only on those switches that support that functionality.

Examples

Sample output on an OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900, and OmniSwitch 9900:

```
-> show service info
Service Manager System Info
  SPB System Id    : 00e0.b1e7.09a3,       SPB System Name  : OS6860,
  Service Trap     : Disable,              SAP Trap         : Disable,
  SDP Trap         : Disable,              Bind Trap        : Disable,
  Trap Rate Per Min: 60,                   VRRP TCAM Rule   : Enable,
  Stats Admin State: Enable,               Stats Owner      : SvcMgr,
  VxLAN Udp Port   : 4789,                 VxLAN Current VRF: Default,
  Mgmt Change      : 07/01/2018 11:05:04,  Status Change    : 06/24/2018 13:36:28
  SDP auto-create  : Enable
```

Sample output on an OmniSwitch 6560:

```
-> show service info
Service Manager System Info
  SPB System Id    : 2cfa.a2a2.e93f,       SPB System Name  : OS6560,
  Service Trap     : Disable,              SAP Trap         : Disable,
  SDP Trap         : Disable,              Bind Trap        : Disable,
  Trap Rate Per Min: 60,                   VRRP TCAM Rule   : Enable,
  Stats Admin State: Disable,              Stats Owner      : Available,
  VxLAN Udp Port   : 4789,                 VxLAN Current VRF: Default,
  Mgmt Change      : 07/17/2018 10:21:56,  Status Change    : 07/17/2018 10:21:56,
  L2GRE Rsvd VLAN  : 4000, 4005, 4006, 4007, 4008, 4015, 4016, 4017
```

output definitions

SPB System Id	The base MAC address of the local switch.
SPB System Name	The system name associated with the local switch.
Service Trap	The status (**Enable** or **Disable**) of trap generation for service status changes.
SAP Trap	The status (**Enable** or **Disable**) of trap generation to for SAP status changes.
SDP Trap	The status (**Enable** or **Disable**) of trap generation for SDP status changes.
Bind Trap	The status (**Enable** or **Disable**) of trap generation for service bind status changes.
Trap Rate Per Min	The maximum number of traps that can be sent per minuter.
VRRP TCAM Rule	The status (**Enable** or **Disable**) of how the switch processes VRRP packets (destination VRRP MAC address) received on access ports. When enabled, the customer VLAN tag is removed from VRRP packets. When disabled, the customer VLAN tag is *not* removed from VRRP packets. Configured through the **service local-vrrp** command.
Stats Admin State	The administrative status (**Enable** or **Disable**) of the statistics collection function. Configured through the **service stats** command.
Stats Owner	The system application in control of statistics collection.
VxLAN Udp Port	The UDP destination port for the Virtual eXtensible Local Area Network (VXLAN) feature. Configured through the **service vxlan udp-port** command.
VxLAN Current VRF	The name of the VRF instance for the VXLAN feature. Configured through the **service vxlan vrf** command.
Mgmt Change	The date and time of the last administrative status change.
Status Change	The date and time of the last operational status change.
SDP auto-create	The status (**Enable** or **Disable**) of automatic edge switch discovery on an L2 GRE tunnel aggregation switch. Configured through the **service l2gre auto-discover** command. *Supported only on the OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900, and OmniSwitch 9900.*
L2GRE Rsvd VLAN	The reserved VLAN IDs for L2 GRE tunnel services. Configured through the **service l2gre reserved-vlan** command *Supported only on the OmniSwitch 6560.*

Release History

Release 7.3.4; command was introduced; VXLAN fields added.
Release 8.3.1.R02; **VRRP TCAM Rule** field added.
Release 8.5R2; **L2GRE auto-disc** and **L2GRE Rsvd VLAN** fields added for L2 GRE tunnel services.
Release 8.5R4; **L2GRE auto-disc** field name changed to **SDP auto-create**.
Release 8.6R1; **L2GRE Rsvd VLAN** field allows display of multiple L2 GRE reserved VLANs.

Related Commands

show service	Displays information about the services configured on the switch.

show service counters

Displays the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified service.

show service {*service_id* **| vnid** *vxlan_id* **| vpnid** *vpn_id***} counters**

Syntax Definitions

service_id	An existing service ID number.
vxlan_id	Displays statistics for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
vpn_id	Displays statistics for the L2 GRE tunnel service associated with the specified Virtual Private Network (VPN) ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Enter an existing service ID number to display statistics for a specific service.
- Use the **vnid** parameter to display statistics for a specific VXLAN network identifier. A VNID identifies a specific VXLAN network segment. This parameter is supported only on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.
- Use the **vpnid** parameter to display statistics for a specific L2 GRE VPN segment. This parameter is supported only on the OmniSwitch 6560, OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900-Q32, and OmniSwitch 6900-X72.

```

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Ing Pkts	The number of packets received on the virtual port.
Ing Byte Count	The ingress packet byte count for the virtual port.
Egr Pkts	The number of packets sent on the virtual port.
Egr Byte Count	The egress packet byte count for the virtual port.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **vnid** parameter added for VXLAN.
Release 8.4.1.R02; **vpnid** parameter added for L2 GRE.

Related Commands

show service	Displays the service configuration for the bridge.
show service ports	Displays the virtual ports associated with the specified service.
clear service counters	Clears the traffic statistics for the specified service and associated virtual ports.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcIngressPacketCount
   alaSvcIngressByteCount
   alaSvcEgressPacketCount
   alaSvcEgressByteCount
```

clear service counters

Clears the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified service.

clear service [*service_id***] [sap {port** *chassis/slot/port* | **linkagg** *agg_id***}[:0 | :all | :***qtag* **| :***outer_qtag.inner_qtag***] | mesh-sdp** *sdp_id***] counters**

Syntax Definitions

service_id	An existing SPB service ID number.
chassis	The chassis identifier.
slot/port	The slot and port number of the service access port.
agg_id	The link aggregate ID number (0–31) of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wild-card SAP. All tagged traffic that is not classified into another SAP is mapped to the wild-card SAP.
:qtag	Specifies a VLAN ID tag for traffic that ingresses on the access port. Only traffic with this tag is mapped to this SAP.
:*outer_qtag.inner_qtag*	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic that ingresses on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
sdp_id	An existing mesh SDP ID.

Defaults

By default, all statistics counters for the specified service are cleared.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **sap** parameter options with this command to clear the statistics for a specific SAP ID. A SAP ID is comprised of an access port (*slot*/*port* or *agg_id*) and an encapsulation value (**:0**, **:all**, **:***qtag*, or **:***outer_qtag.inner_qtag*) that is used to identify the type of customer traffic to map to the associated service.
- Use the **mesh-sdp** *sdp_id* parameter to clear the statistics for a specific mesh SDP.

Examples

```
-> clear service counters
-> clear service 100 counters
-> clear service sap 8/2:all counters
-> clear service mesh-sdp counters
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.

Related Commands

show service counters	Displays the traffic statistics for the specified SPB service and associated virtual ports.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcClearCounters
alaSapBaseInfoTable
   alaSapClearCounters
```

show service rfp

Displays the configuration and status of SPB Remote Fault Propagation (RFP) domains.

show service rfp [*rfp_id* **[local-sap-status]]**

Syntax Definitions

rfp_id	An existing RFP ID number.
local-sap-status	Displays information about the local SPB service elements that are bound to the specified RFP ID.

Defaults

By default, information for all RFP domains is displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Enter an existing RFP ID number to display statistics for a specific RFP domain.
- Use the **local-sap-status** parameter to display SPB service information for the specified RFP ID.

Examples

```
-> show service rfp

Local system (Name: SystemId) = bridge1 : E8:E7:32:B8:9C:98

```

output definitions

RFP	The RFP ID number. Configured through the **service rfp local-endpoint** command.
Remote EndPoint	The ID number for the RFP remote end point. Configured through the **service rfp remote-endpoint** command.
RMEP Status	The status of the remote Maintenance End Point (MEP).
System (Name: SystemId)	The name and bridge MAC address of the remote SPB switch.
B-VLAN	The SPB backbone VLAN that serves as the primary VLAN for the RFP domain. The SPB control BVLAN is automatically used for each RFP OAM domain.
ISID	The SPB service instance ID. The ISID is bound to an SPB service ID, which in turn is bound to an SPB access port. This binding creates a Service Access Point (SAP), which is configured through the **service sap** command.
Service Id	An SPB service ID number. Configured through the **service spb** command and associated with the RFP ID through the **service rfp remote-endpoint** command.
Admin State	The administrative status (**Enable** or **Disable**) of the SAP port on the local chassis.

```

50      sap:2/13:10     Enable  Down      4        RMEP_FAILED
```

Local endpoint ID	The ID number of the local RFP end point.
Local system (Name: SystemId)	The name and bridge MAC address of the local SPB switch.
Service Id	An SPB service ID number. Configured through the **service spb** command and associated with the RFP ID through the **service rfp remote-endpoint** command.
Sap	The Service Access Point to which the SPB service ID is associated through the configured through the **service sap** command
Admin State	The administrative status (**Enable** or **Disable**) of the SAP.
Oper	The operation status (**Up**, **Down**, **Violation**) of the SAP.
Remote EndPoint	The ID number for the RFP remote end point. Configured through the **service rfp remote-endpoint** command.
R-Endpoint Status	The status of the remote Maintenance End Point (MEP).

Release History

Release 7.3.4; command was introduced.

Related Commands

show service rfp configuration Displays the RFP OAM domain configuration for the bridge.

MIB Objects

N/A

show service rfp configuration

Displays the RFP OAM domain configuration for the bridge. When an RFP domain is created, an Ethernet OAM domain is automatically configured on the switch and mapped to the RFP domain.

show service rfp configuration [*rfp_id***]**

Syntax Definitions

rfp_id	An existing RFP ID number.

Defaults

By default, information for all RFP OAM domains is displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Enter an existing RFP ID number to display the OAM domain configuration for a specific RFM domain.
- For each RFP domain created, a separate OAM domain is also created and mapped to the RFP domain.

Examples

```
-> show service rfp configuration
Total Number of RFP domains - 2

RFP domain Number      : 1000
Admin status           : Enabled
Level                  : 7
Type                   : SPB
Maintenance Domain     : RFP_OVER_SPB_DOMAIN_LEVEL7
Maintenance Association: RFP_OVER_SPB_ASSOCIATION
Control B-VLAN         : 1000
Virtual UP MEP ID      : 10
CCM interval           : 100 millisecond
Remote Endpoint service ID
---------------+----------
1               10,11

2                20
3-9              40
```

output definitions

RFP domain number	The RFP ID number. that is mapped to the OAM domain.
Admin State	The administrative status (**Enable** or **Disable**) of the RFP domain.
Level	The Maintenance Domain (MD) level.
Type	The type of RFP domain (SPB is the only type currently supported).
Maintenance Domain	The name of the reserved MD assigned to the RFP domain.
Maintenance Association	The name of the Maintenance Association (MA) for the RFP (MD). The same MA name is used for all RFP domains.
Control B-VLAN	The SPB control BVLAN that serves as the primary VLAN for the RFP OAM domain.
Virtual UP MEP ID	The local end point ID for the RFP domain.
CCM interval	The time interval at which a Continuity Check Message (CCM) is sent for this domain.
Remote Endpoint	The RFP ID number for the remote end point.
service ID	The SPB service ID number associated with the remote end point ID.

11 Loopback Detection Commands

Loopback Detection (LBD) automatically detects the loop and shutdown the port involved in the loop. This prevents forwarding loops on ports that have forwarded network traffic which has looped back to the originating switch. LBD detects and prevents Layer 2 forwarding loops on a port either in the absence of other loop detection mechanisms such as STP/RSTP/MSTP, or when these mechanisms cannot detect it (for example, a client's equipment may drop BPDUs, or the STP protocol may be restricted to the network edge). On a linkagg port, if one port of linkagg is getting shutdown due to LBD, then all the ports of linkagg will go to shutdown state.

Loopback Detection is enabled system wide and on a per-port basis. Once a loop is discovered, the port from which the loop originated is placed into an “Inactive” state and when the two ports of a switch is connected to each other through a hub, either the ports will be shutdown or it will be in normal state.

A provider network with a set of multiple switches interconnected together can be logically viewed as a large single switch. The large single switch provides service access points to customers' networks. Configuration faults in customer networks can result in loops spanning both provider and customer networks. This can result in broadcast storms. In order to protect provider's network from broadcast storms, loops that involve SAP ports need to be detected and broken.

The LBD can detect and break loops created on the service-access interface.

For a service-access interface, LBD can be enabled for a specific port or linkagg. LBD for service-access points allows shutting down only the specific interface of the link involved in the loop.

When loopback occurs, a trap is sent and the event is logged. The port which is shutdown due to LBD is automatically recovered if autorecovery-timer is set or the port can manually be enabled again when the problem is resolved.

MIB information for the Loopback Detection commands is as follows:

Filename: ALCATEL-IND1-LBD-MIB
Module: alcatelIND1LBDMIB

A summary of available commands is listed here:

loopback-detection

Enables or disables Loopback Detection (LBD) or remote origin LBD globally on the switch.

loopback-detection [remote-origin] {enable | disable}

Syntax Definitions

enable	Enables LBD on the switch.
disable	Disables LBD on the switch.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- LBD can be enabled globally and per port without any dependency but loopback-detection will be operational only if LBD is enabled globally and also on the specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- Enabling the **remote-origin** LBD option allows the switch to process the LBD frames originated from a remote system. The port from which the LBD frames originated will be shut down.

Examples

```
-> loopback-detection enable
-> loopback-detection disable
-> loopback-detection remote-origin enable
-> loopback-detection remote-origin disable
```

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; **remote-origin** parameter added.

Related Commands

loopback-detection port	Enables or disables LBD on a specific port.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
```

loopback-detection port

Enables or disables LBD or remote-origin LBD on a specific bridge port.

loopback-detection port *chassis/slot/port***[-***port2***] [remote-origin] {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables LBD on the specified port.
disable	Disables LBD on the specified port.

Defaults

parameter	default
enable | **disable**	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Loopback Detection must be enabled globally to enable LBD functionality on a specific port.
- For per-port remote origin LBD to work, both LBD and remote origin LBD must be enabled globally.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- When a LBD port joins a link aggregate, the LBD configuration on the joined port is removed.

Examples

```
-> loopback-detection port 1/1/1 enable
-> loopback-detection port 1/1/1-8 enable
-> loopback-detection port 1/1/2 remote-origin enable
-> loopback-detection port 1/1/3-5 remote-origin enable
-> loopback-detection port 1/1/2 remote-origin disable
-> loopback-detection port 1/1/3-5 remote-origin disable
```

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; **remote-origin** parameter added.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.
show loopback-detection port	Displays LBD port configuration information.

MIB Objects

```
alaLbdPortConfigTable
   alaLbdPortConfigEntry
   alaLbdPortConfigIndex
   alaLbdPortConfigLbdAdminStatus
   alaLbdPortConfigLbdOperStatus
   alaLbdPortRemoteConfigAdminStatus
```

loopback-detection service-access

Enables or disables LBD on a specific service access port or link aggregate or on a range of ports or link aggregates. When enabled, LBD can detect and break loops created on a service access interface.

loopback-detection service-access {port *chassis/slot/port*[*-port2*] | **linkagg** *agg_id***[-***agg_id2***]} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables LBD on the specified port or linkagg.
disable	Disables LBD on the specified port or linkagg.

Defaults

parameter	default
enable | **disable**	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Before configuring LBD using the **service-access** option, the port or linkagg must be configured for service access. Use the **service access** command to configure the port or linkagg for service access.
- The **service-access** option allows shutting down only the specific interface of the link involved in the loop.
- The linkagg must be formed by ports with same path cost.
- LBD is applicable on a linkagg only if the linkagg is configured as a service access interface.
- LBD cannot be configured on a linkagg that has member ports running LBD configuration and vice versa.
- When a linkagg is in violation or shutdown state, the member ports cannot be deleted from the linkagg.

Examples

```
-> loopback-detection service-access port 1/1/1 enable
-> loopback-detection service-access port 1/1/1-8 enable
-> loopback-detection service-access linkagg 1 enable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.
show loopback-detection port	Displays LBD port configuration information.
show loopback-detection linkagg	Displays LBD configuration information for a service access link aggregate.

MIB Objects

```
alaLdbPortConfigTable
   alaLdbPortConfigLdbAdminStatus
   alaLbdUserPortConfigLbdInterfaceType
```

loopback-detection transmission-timer

Configures the LBD transmission timer on the switch.The transmission time is the time period between the consecutive LBD packet transmissions.

loopback-detection transmission-timer *seconds*

Syntax Definitions

seconds	The time period in seconds between LBD packet transmissions. The valid range is from 5 to 600 seconds.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the timer value is not configured, the default value of 30 seconds is assigned to the transmission period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection transmission-timer 200
```

Release History

Release 7.3.4; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGLobalConfigTransmissionTimer
```

loopback-detection autorecovery-timer

Configures the LBD autorecovery timer on the switch.The autorecovery time is the time period in which the switch is recovered from the shutdown state.

loopback-detection autorecovery-timer *seconds*

Syntax Definitions

seconds	The time period in seconds in which the switch is recovered from the shutdown state. The valid range is from 30 to 86400 seconds.

Defaults

parameter	default
seconds	300

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the timer value is not configured, the default value of 300 seconds is assigned to the autorecovery period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection autorecovery-timer 200
```

Release History

Release 7.3.4; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigAutorecoveryTimer
```

show loopback-detection

Displays the global LBD configuration information for the switch.

show loopback-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To view information for a specific port or service access link aggregate, use the **show loopback-detection port** or **show loopback-detection linkagg** command.

Examples

```
-> show loopback-detection
Global LBD Status                : enabled,
Global Remote-origin LBD Status  : disabled,
Global LBD Transmission Timer    : 30 sec,
Global LBD Auto-recovery Timer   : 300 sec,
```

output definitions

Global LBD Status	The current status of LBD of the switch (**enabled** or **disabled**).
Global Remote-origin LBD Status	The current status of remote-origin LBD of the switch (**enabled** or **disabled**).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time in which the switch recovered from the shutdown state.

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; “Global Remote-origin LBD Status” field added.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for bridge and service access ports on the switch.
show loopback-detection linkagg	Displays LBD configuration information for a service access link aggregate.
show violation	Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
alaLbdGlobalConfigTransmissionTimer
alaLbdGlobalConfigAutorecoveryTimer
```

show loopback-detection port

Displays the LBD configuration information for the specified bridge or service access port.

show loopback-detection port [*chassis*/*slot/port*]

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).

Defaults

By default, the LBD configuration for all ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The command can be used only on an LBD enabled port.

- Use the **loopback-detection port** command to enable LBD on a bridge port.
- Use the **loopback-detection service-access** command to enable LBD on a service access port or link aggregate.

Examples

```
-> show loopback-detection port
Slot/Port   Admin State Remote-origin Status OperState       Time-to-recovery (sec)
-----------+-----------+--------------------+---------------+----------------------
1/1/1       enabled     enabled              Remote ShutDown   -
1/1/2       enabled      -                   Normal            -
```

output definitions

Slot/Port	The slot/port number of the LBD port.
Admin State	The administrative state of the port (**enabled** or **disabled**).
Remote-origin Status	The remote-origin LBD status of the port (**enabled** or **disabled**). This field does not apply to LBD service access ports.
OperState	The operational state of the port (**Normal** or **Inactive**).
Time-to-recovery (sec)	The amount of time to recovery during an LBD shutdown.

```
-> show loopback-detection port 1/1/1
Global LBD Status                  : enabled,
Global Remote-origin LBD Status    : enabled,
Global LBD Transmission Timer      : 30 sec,
Global LBD Auto-recovery Timer     : 300 sec,
Port LBD Status                    : enabled,
Port Remote-origin LBD Status      : enabled,
```

```
Port LBD State                    : Remote ShutDown,
Remote Src Mac                    : E8:E7:32:9A:5A:4E,
Remote BridgeId                   : E8:E7:32:9A:5A:3F,
Port LBD Type                     : normal-edge,

-> show loopback-detection port 1/1/2
Global LBD Status                 : enabled,
Global Remote-origin LBD Status   : disabled,
Global LBD Transmission Timer     : 30 sec,
Global LBD Auto-recovery Timer    : 300 sec,
Port LBD Status                   : enabled,
Port Remote-origin LBD Status     : -,
Port LBD State                    : Inactive,
Port LBD Type                     : service-edge,
```

output definitions

Global LBD Status	The current status of LBD of the switch (**enabled** or **disabled**).
Global Remote-origin LBD Status	The current status of remote-origin LBD on the switch (**enabled** or **disabled**).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time interval in seconds in which the switch is recovered from the shut down state.
Port LBD Status	Displays the administrative status of the port.
Port Remote-origin LBD Status	Displays the remote-origin LBD status of the port (**enabled** or **disabled**). This field does not apply to LBD service access ports.
Port LBD State	Displays the current operational state of the port.
Remote Src Mac	Displays the MAC address of the remote system. The Remote Src Mac is displayed only if remote-origin LBD is enabled on the system.
Remote BridgeId	Displays the bridge ID of the remote system. The Remote BridgeId is displayed only if remote-origin LBD is enabled on the system.
Port LBD Type	Displays the type of the interface—whether a normal edge interface or a service access interface.

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; fields added to display LBD remote origin information.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
loopback-detection port	Enables or disables LBD for a bridge port
loopback-detection service-access	Enables or disables LBD for a service access port or link aggregate.
show loopback-detection linkagg	Displays LBD configuration information for a service access link aggregate.
show loopback-detection statistics port	Displays LBD statistics information for a specific port.

MIB Objects

```
   alaLbdGlobalConfigStatus
   alaLbdGlobalRemoteConfigStatus
   alaLbdGlobalConfigTransmissionTimer
   alaLbdGlobalConfigAutorecoveryTimer
alaLbdPortConfigTable
   alaLbdPortConfigLbdAdminStatus
   alaLbdPortConfigLbdOperStatus
   alaLbdPortConfigServiceAccessType
   alaLbdPortRemoteConfigAdminStatus
   alaLbdPortRemoteSrcMacAddr
   alaLbdPortRemoteBridgeID
   alaLbdPortTimeToRecovery
```

show loopback-detection linkagg

Displays the LBD configuration information for the specified link aggregate ID.

show loopback-detection linkagg *agg_id*

Syntax Definitions

agg_id	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The command can be used only on an LBD enabled link aggregate. Use the **loopback-detection service-access** command to enable LBD on a service access link aggregate.

Examples

```
-> show loopback-detection linkagg 10
Global LBD Status                    : enabled,
Global Remote-origin LBD Status      : disabled,
Global LBD Transmission Timer        : 30 sec,
Global LBD Auto-recovery Timer       : 300 sec,
Linkagg LBD Status                   : disabled,
Linkagg LBD State                    : Inactive,
Linkagg LBD Type                     : service-access
```

output definitions

Global LBD Status	The current LBD status for the switch (**enabled** or **disabled**).
Global Remote-origin LBD Status	The current status of remote-origin LBD on the switch (**enabled** or **disabled**). This field does not apply to LBD link aggregates.
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time interval in seconds in which the switch is recovered from the shut down state.
Linkagg LBD Status	Displays the administrative status of the link aggregate.
Linkagg LBD State	Displays the current operational state of the link aggregate.
Linkagg LBD Type	Displays the type of the interface—whether a normal edge interface or a service access interface. LBD supported on service access link aggregates.

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; fields added to display LBD remote origin information.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
loopback-detection service-access	Enables or disables LBD for a service access port or link aggregate.
show loopback-detection statistics port	Displays LBD statistics information for a specific port.

```

show loopback-detection statistics port

Displays LBD statistics information for a specific port on the switch.

show loopback-detection statistics port *chassis*/*slot/port*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The link aggregate ID is not displayed if the link aggregate is operationally down.

Examples

```
-> show loopback-detection statistics port 1/1/1
LBD Port Statistics
LBD Packet Send               : 1,
Invalid LBD Packet Received   : 0,
Member of Link Aggregation    : -

-> show loopback-detection statistics port 1/1/3
LBD Port Statistics
LBD Packet Send                : 1,
Invalid LBD Packet Received    : 0,
Member of Aggregation          : 2
```

output definitions

LBD Packet Send	The number of LBD packet sent from the port.
Invalid LBD Packet Received	The number of invalid LBD packets received on the port.
Member of Aggregation	The linkagg ID in which the port is a member.

Release History

Release 7.3.4; command was introduced.

Related Commands

12 Link Aggregation Commands

Link aggregation combines multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

Filename: ALCATEL-IND1-LAG-MIB.mib
Module: alcatelIND1LAGMIB

A summary of available commands is listed here:

Static link aggregates	**linkagg static agg size** **linkagg static agg name** **linkagg static agg wait-to-restore-time** **linkagg static agg loopback** **linkagg static agg loopback internal** **linkagg static agg admin-state** **linkagg static port agg**
Dynamic link aggregates	**linkagg lacp agg size** **linkagg lacp agg name** **linkagg lacp agg wait-to-restore-time** **linkagg lacp agg admin-state** **linkagg lacp agg actor admin-key** **linkagg lacp agg actor system-priority** **linkagg lacp agg actor system-id** **linkagg lacp agg partner system-id** **linkagg lacp agg partner system-priority** **linkagg lacp agg partner admin-key** **linkagg lacp port actor admin-key** **linkagg lacp port actor admin-state** **linkagg lacp port actor system-id** **linkagg lacp port actor system-priority** **linkagg lacp agg partner admin-state** **linkagg lacp port partner admin system-id** **linkagg lacp port partner admin-key** **linkagg lacp port partner admin system-priority** **linkagg lacp port actor port priority** **linkagg lacp port partner admin-port** **linkagg lacp port partner admin port-priority**
Dual Home Link (DHL) Active-Active	**dhl name** **dhl linka linkb** **dhl admin-state** **dhl vlan-map linkb** **dhl pre-emption-time** **dhl mac-flushing** **show dhl** **show dhl link**
Static and dynamic	**linkagg range** **show linkagg range** **show linkagg** **show linkagg port** **show linkagg accounting** **show linkagg counters** **show linkagg traffic** **clear linkagg-statistics**

linkagg static agg size

Creates a static aggregate group between two switches. A static aggregate group contains static links.

linkagg static agg *agg_id***[-***agg_id2***] size** *size* **[name** *name***] [admin-state {enable | disable}] [multi-chassis active] [hash {source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip | tunnel-protocol}]**

no linkagg static agg *agg_id***[-***agg_id2***]**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
size	The maximum number of links allowed in the aggregate group.
name	The name of the static aggregate group. Can be any alphanumeric string. A group name with spaces must be contained within quotes (for example, “Static Group 1”).
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.
multi-chassis active	*This parameter is not supported.*
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.
source-ip	Selects the source IP hashing option.
destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.
tunnel-protocol	Selects the tunnel protocol (payload based) hashing option.

Defaults

parameter	default
enable | **disable**	enable
hash_option	**source-and-destination-IP** (Layer 3 traffic) **source-and-destination-mac** (Layer 2 traffic)

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group or a range of static aggregate groups from the configuration.
- Link aggregation cannot be configured on an AppMon enabled port.
- If the static aggregate has any attached ports. delete the attached ports with the **no** form of the **linkagg static port agg** command then remove the static link aggregate ID. Delete the attached ports using the **no linkagg static port** command.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended to avoid any loss of traffic.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, when the **source-mac** option is specified for L2 hashing:
  - If the global hash-control is in brief mode, hashing is based on source MAC address only.
  - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.
- For example, when the **source-ip** option is specified for L3 hashing:
  - If the global hash-control is in brief mode, hashing is based on source IP address only.
  - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg lacp agg size** command to create a dynamic aggregation (LACP) group.

Examples

```
-> linkagg static agg 3-10 size 8
-> linkagg static agg 4 size 2 admin-state disable
-> linkagg static agg 4 size 2 hash source-and-destination-ip
-> no linkagg static agg 3-10
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; **tunnel-protocol** parameter added.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) link aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggSize
   alclnkaggAggLacpType
   alclnkaggAggName
   alclnkaggAggAdminState
   alclnkaggAggPortSelectionHash
```

linkagg static agg name

Configures a name for an existing static aggregate group.

linkagg static agg *agg_id***[-***agg_id2***] name** *name*

no linkagg static agg *agg_id***[-***agg_id2***] name**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
name	The name of the static aggregation group, can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Static Group 1”)

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a name from a static aggregate or from a range of static aggregates.
- You must assign names to static link aggregate IDs individually.
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static agg 2 name accounting
-> no linkagg static agg 2-10 name
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

linkagg static agg wait-to-restore-time

Configures the number of minutes to wait before bringing up a link aggregate that is attached to other link aggregates.

linkagg static agg *agg_id***[**-*agg_id2***] wait-to-restore-time** *wtr_minutes*

no linkagg static agg *agg_id***[**-*agg_id2***] wait-to-restore-time**

Syntax Definitions

*agg_id***[**-*agg_id2***]**	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
wtr_minutes	The number of minutes the switch waits to bring a link aggregate up. The range is 0–12 minutes.

Defaults

By default, the wait-to-restore timer is set to 0 (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the wait-to-restore timer for the specified link aggregate or aggregates.
- If a link aggregate is not attached to other links, this timer value is ignored and the aggregate is immediately brought up.

Examples

```
-> linkagg static agg 2 wait-to-restore-time 10
-> linkagg static agg 2 wait-to-restore-time 0
-> linkagg static agg 4 wait-to-restore-time 5
-> no linkagg static agg 4 wait-to-restore-time
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggWTRTimer
```

linkagg static agg loopback

Configures the specified link aggregate group to run in loopback mode. This is required if the link aggregate is going to provide loopback functionality to support L3 VPN inline routing for an IP over Shortest Path Bridging (SPB) configuration.

linkagg static agg *agg_id***[-***agg_id2***] loopback**

Syntax Definitions

*agg_id***[-***agg_id2***]**	An existing link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6900-V72, 6900-C32

Usage Guidelines

- Only front-panel ports that are also configured to run in loopback mode can be assigned to this type of link aggregate.
- Once the loopback mode is enabled for a link aggregate, the link aggregate is dedicated to providing loopback functionality for an SPB L3 VPN inline routing configuration. The loopback mode is disabled only when the link aggregate is deleted.
- Only one link aggregate per switch can be configured to run in loopback mode.
- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

Examples

```
-> linkagg static agg 2 loopback
-> linkagg static agg 10 loopback
ERROR: Internal Loopback aggregate already exists
```

Release History

Release 8.6R2; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
interfaces loopback	Configures a front-panel port to run in the loopback mode.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggLoopbackState
```

linkagg static agg loopback internal

Configures the specified link aggregate group to run in internal loopback mode. This is required if the link aggregate is going to provide loopback functionality to support L3 VPN inline routing for an IP over Shortest Path Bridging (SPB) configuration.

linkagg static agg *agg_id***[-***agg_id2***] loopback**

Syntax Definitions

*agg_id***[-***agg_id2***]**	An existing link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- When the internal loopback mode is enabled, internal ports are assigned to the link aggregate group. These ports are dedicated for this purpose; front-panel ports are not assigned to this type of link aggregate.
- No external cable is required and no front-panel ports are used up to provide the L3 VPN loopback functionality when internal loopback is used to define an L3 VPN gateway interface.
- Only one link aggregate per switch can be configured to run in the internal loopback mode.
- Once the internal loopback mode is enabled for a link aggregate, the link aggregate is dedicated to providing loopback functionality for an SPB L3 VPN inline routing configuration. The internal loopback mode is disabled only when the link aggregate is deleted.
- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide.*

Examples

```
-> linkagg static agg 2 loopback internal
-> linkagg static agg 10 loopback internal
ERROR: Internal Loopback aggregate already exists
```

Release History

Release 8.6R2; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggLoopbackState
```

linkagg static agg admin-state

Enables or disables the administrative state of a static link aggregation group.

linkagg static agg *agg_id***[**-*agg_id2***] admin-state {enable | disable}**

Syntax Definitions

*agg_id***[**-*agg_id2***]**	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

Examples

```
-> linkagg static agg 2 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

linkagg static port agg

Configures a slot and port for a static aggregate group.

linkagg static port *chassis/slot/port***[**-*port2***] agg** *agg_id*

no linkagg static port *chassis/slot/port***[**-*port2***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
agg_id	The ID number corresponding to the static aggregate group.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to the same static aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static port 2/1-5 agg 4
-> no linkagg static port 2/1-5
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg port	Displays information about link aggregation ports.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortLacpType
   alclnkaggAggPortSelectedAggNumber
```

linkagg lacp agg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] size** *size*
[name *name***]**
[admin-state {enable | disable}]
[actor admin-key *actor_admin_key***]**
[actor system-priority *actor_system_priority***]**
[actor system-id *actor_system_id***]**
[partner system-id *partner_system_id***]**
[partner system-priority *partner_system_priority***]**
[partner admin-key *partner_admin_key***]**
[multi-chassis active]
[hash {source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip | tunnel-protocol}]

no linkagg lacp agg *agg_id***[-***agg_id2***] size** *size*

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
size	The maximum number of links that can belong to the aggregate.
name	The name of the dynamic aggregate group. can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Dynamic Group 1”).
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
actor_admin_key	The administrative key value associated with the dynamic aggregate group.
actor_system_priority	The priority of the dynamic aggregate group.
actor_system_id	The MAC address of the dynamic aggregate group on the switch.
partner_system_id	The MAC address of the aggregate group of the remote system which is attached to the aggregate group of the switch.
partner_system_priority	The priority of the remote system to which the aggregation group is attached.
partner_admin_key	The administrative key for the remote partner of the aggregation group.
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.
source-ip	Selects the source IP hashing option.

destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.
tunnel-protocol	Selects the tunnel protocol hashing option.

Defaults

parameter	default
enable | disable	enable
hash_option	**source-and-destination-ip** (Layer 3 traffic) **source-and-destination-mac** (Layer 2 traffic)

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- Link aggregation cannot be configured on an AppMon enabled port.
- You must disable the group with the **linkagg lacp agg admin-state** command before you can delete a dynamic link aggregate group.
- Optional parameters for the dynamic aggregate group can be configured when the aggregate is created. The dynamic aggregate group can be modified after the optional parameters are assigned.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, if the **source-mac** option is specified for L2 hashing:
  - If the global hash-control is in brief mode, hashing is based on source MAC address only.

  - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.

- For example, if the **source-ip** option is specified for L3 hashing:
  - If the global hash-control is in brief mode, hashing is based on source IP address only.
  - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg static agg size** command to create static aggregate groups. See page 12-3 for more information about this command.

Examples

```
-> linkagg lacp agg 2-5 size 4
-> linkagg lacp agg 3 size 2 admin-state disable actor system-priority 65535
-> no linkagg lacp agg 2-5 size 4
```

Release History

Release 7.1.1; command introduced.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggSize
   alclnkaggAggLacpType
   alclnkaggAggName
   alclnkaggAggAdminState
   alclnkaggAggActorAdminKey
   alclnkaggAggActorSystemPriority
   alclnkaggAggActorSystemID
   alclnkaggAggPartnerSystemID
   alclnkaggAggPartnerSystemPriority
   alclnkaggAggPartnerAdminKey
   alclnkaggAggPortSelectionHash
```

linkagg lacp agg name

Configures a name for a dynamic aggregate group.

linkagg lacp agg *agg_id* **name** *name*

no linkagg lacp agg *agg_id***[-***agg_id2***] name**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
name	The name of the dynamic aggregate group. Can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Dynamic Group 1”).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a name from a single or a range of dynamic aggregate groups simultaneously.
- Assign names to individual dynamic link aggregate groups separately.

Examples

```
-> linkagg lacp agg 2 name finance
-> no linkagg lacp agg 2-5 name
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

linkagg lacp agg wait-to-restore-time

Configures the number of minutes to wait before bringing up a dynamic link aggregate that is attached to other link aggregates.

linkagg lacp agg *agg_id***[**-*agg_id2***]** **wait-to-restore-time** *wtr_minutes*

no linkagg lacp agg *agg_id***[**-*agg_id2***]** **wait-to-restore-time**

Syntax Definitions

*agg_id***[**-*agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
wtr_minutes	The number of minutes the switch waits to bring a link aggregate up. The range is 0–12 minutes.

Defaults

By default, the wait-to-restore timer is set to 0 (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the wait-to-restore timer for the specified link aggregate or aggregates.
- If a link aggregate is not attached to other links, this timer value is ignored and the aggregate is immediately brought up.

Examples

```
-> linkagg lacp agg 2 wait-to-restore-time 10
-> linkagg lacp agg 2 wait-to-restore-time 0
-> linkagg lacp agg 4 wait-to-restore-time 5
-> no linkagg lacp agg 4 wait-to-restore-time
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggWTRTimer
```

linkagg lacp agg admin-state

Configures the administrative state of a dynamic aggregate group or a range of dynamic aggregate groups.

linkagg lacp agg *agg_id***[**-*agg_id2***] admin-state {enable | disable}**

Syntax Definitions

*agg_id***[**-*agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the operation of a dynamic aggregate group cannot be performed.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.
- You can also enable or disable the admin-state for a range of link aggregate IDs simultaneously, using this command.

Examples

```
-> linkagg lacp agg 2 admin-state disable
-> linkagg lacp agg 2-10 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregates.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

linkagg lacp agg actor admin-key

Configures the administrative key associated with a dynamic aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] actor admin-key** *actor_admin_key*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor admin-key**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
actor_admin_key	The administrative key value associated with the dynamic aggregate group.

Defaults

parameter	default
actor_admin_key	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

Examples

```
-> linkagg lacp agg 3-5 actor admin-key 2
-> no linkagg lacp agg 3-5 actor admin-key
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorAdminKey
```

linkagg lacp agg actor system-priority

Configures the priority of the dynamic aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] actor system-priority** *actor_system_priority*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor system-priority**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
actor_system_priority	The priority of the dynamic aggregate group of the switch in relation to other aggregate groups.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.
- To assign or remove the actor system-priority for a series of link aggregate IDs, specify the range of link aggregate IDs with the **agg** keyword. Use a hyphen to separate the first and last link aggregate IDs of a range.

Examples

```
-> lacp linkagg 3 actor system-priority 100
-> no lacp linkagg 3 actor system-priority
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemPriority
```

linkagg lacp agg actor system-id

Configures the MAC address of a dynamic aggregate group on the switch.

linkagg lacp agg *agg_id***[-***agg_id2***] actor system-id** *actor_system_id*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor system-id**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the MAC address assignment (actor system ID) from a dynamic link aggregate or a range of dynamic link aggregates simultaneously.
- You can configure the MAC address for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

Examples

```
-> linkagg lacp agg 2 actor system-id 00:20:da:81:d5:b0
-> no linkagg lacp agg 3-10 actor system-id
-> no linkagg lacp agg 11 actor system-id
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemID
```

linkagg lacp agg partner system-id

Configures the MAC address of the dynamic aggregate group of the remote system that is attached to the dynamic aggregate group of the local switch.

linkagg lacp agg *agg_id***[-***agg_id2***] partner system-id** *partner_system_id*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner system-id**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
partner_system_id	The MAC address of the dynamic aggregate group of the remote switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_system_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a partner system ID from a dynamic aggregate group or a range of groups assigned with the same partner system IDs together.
- The *partner_system_id* and the *partner_system_priority* together specify the priority of the remote system.
- You can configure a partner system ID for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

Examples

```
-> linkagg lacp agg 2 partner system-id 00:20:da4:32:81
-> linkagg lacp agg 2-10 partner system-id 00:20:da4:32:82
-> no linkagg lacp agg 2-10 partner system-id
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerSystemID
```

linkagg lacp agg partner system-priority

Configures the priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

linkagg lacp agg *agg_id***[-***agg_id2***] partner system-priority** *partner_system_priority*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner system-priority**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
partner_system_priority	The priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

Defaults

parameter	default
partner_system_priority	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return to the priority value to its default.
- The *partner_system_id* and the *partner_system_priority* together specify the priority of the remote system.
- You can apply the partner system-priority to a range of link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range after the **agg** keyword.

Examples

```
-> linkagg lacp agg 3 partner system-priority 65535
-> linkagg lacp agg 3-6 partner system-priority 65535
-> no linkagg lacp agg 3-6 partner system-priority
```

Release History

Release 7.1.1; command introduced.

Related Commands

   alclnkaggAggNumber
   alclnkaggAggPartnerSystemPriority
```

linkagg lacp agg partner admin-key

Configures the administrative key for the remote partner of the dynamic aggregation group.

linkagg lacp agg *agg_id***[-***agg_id2***] partner admin-key** *partner_admin_key*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner admin-key**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
partner_admin_key	The administrative key for the remote partner of the dynamic aggregation group.

Defaults

parameter	default
partner_admin_key	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a partner admin-key from a dynamic aggregate group.
- The partner admin-key can be assigned for a range of dynamic link aggregate IDs simultaneously.

Examples

```
-> linkagg lacp agg 3-5 partner admin-key 3
-> no linkagg lacp agg 3-10 partner admin-key
```

Release History

Release 7.1.1; command introduced.

Related Commands

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerAdminKey
```

linkagg lacp port actor admin-key

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

linkagg lacp port *chassis/slot/port***[**-*port2***]** **actor admin-key** *actor_admin_key*
[actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor system id *actor_system_id***]**
[actor system priority *actor_system_priority***]**
[partner admin system id *partner_admin_system_id***]**
[partner admin-key *partner_admin_key***]**
[partner admin system priority *partner_admin_system_priority***]**
[partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor port priority *actor_port_priority***]**
[partner admin port *partner_admin_port***]**
[partner admin port priority *partner_admin_port_priority***]**

no linkagg lacp port *chassis/slot/port***[**-*port2***] [actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]**
[actor system id *actor_system_id***]**
[actor system priority *actor_system_priority***]**
[partner admin system id *partner_admin_system_id***]**
[partner admin-key *partner_admin_key***]**
[partner admin system priority *partner_admin_system_priority***]**
[partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor port priority *actor_port_priority***]**
[partner admin port *partner_admin_port***]**
[partner admin port priority *partner_admin_port_priority***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
actor_admin_key	The administrative key associated with this dynamic aggregate group.
actor admin-state	See the **linkagg lacp port actor admin-state** command.
actor_system_id	The MAC address of this dynamic aggregate group on the switch.
actor_system_priority	The priority of the dynamic aggregate group.
partner_admin_system_id	The MAC address of the dynamic aggregate group of the remote switch.
partner_admin_key	The administrative key for the remote partner of the dynamic aggregation group.

partner_admin_system_priority	The priority of the remote system to which the dynamic aggregation group is attached.
partner admin-state	See the **linkagg lacp agg partner admin-state** command.
actor_port_priority	The priority of the actor port.
partner_admin_port	The administrative state of the partner port.
partner_admin_port_priority	The priority of the partner port.

Defaults

parameter	default
[active] [timeout]....	active, timeout, aggregate

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to a dynamic link aggregate must be configured to the same link speed.
- Ports that belong to the same dynamic aggregate group need not be configured sequentially and can be on any Network Interface (NI).

Examples

```
-> linkagg lacp agg 3/1 actor admin-key 0
-> no linkagg lacp agg 3/1 actor admin-key
```

Release History

Release 7.1.1; command introduced.

Related Commands

   alclnkaggAggPortPartnerAdminSystemPriority
   alclnkaggAggPortPartnerAdminState
   alclnkaggAggPortActorPortPriority
   alclnkaggAggPortPartnerAdminPort
   alclnkaggAggPortPartnerAdminPortPriority
```

linkagg lacp port actor admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

linkagg lacp port *chassis/slot/port***[**-*port2***] actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

no linkagg lacp port *chassis/slot/port***[**-*port2***] actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
active	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
collect	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.
expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]....	active, timeout, aggregate
timeout enable	Disabled (OmniSwitch 9900) Enabled (All other platforms)

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin-state is set to **none**, all bit values are restored to their default configurations.
- Enabling the **timeout** parameter configures a 1 second interval (short timeout / fast transmit rate). Disabling the **timeout** parameter configures a 30 second interval (long timeout / slow transmit rate).
- **timeout** option when used sets only the transmit rate. The remote side timeout is 3X the configured transmit rate. For example, if the transmit rate is set to 1 packet per second, the remote side will timeout if it misses 3 packets. In this case, it will timeout in 3 seconds. If the transmit rate is set to 30 packets per second, then the remote side will take 90 seconds to timeout.
- 'no linkagg lacp port actor admin-state timeout' disables the **timeout** parameter, which results in a long timeout, that is, 30 second transmission rate.

Examples

```
-> linkagg lacp port 4/2 actor admin-state synchronize collect distribute
-> no linkagg lacp port 4/2 actor admin-state synchronize collect
-> linkagg lacp port 4/2 actor admin-state none
```

Release History

Release 7.1.1; command introduced.

linkagg lacp port actor system-id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

linkagg lacp port *chassis/slot/port***[**-*port2***] actor system-id** *actor_system_id*

no linkagg lacp port *chassis/slot/port***[**-*port2***] actor system-id**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the actor system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the system ID for a range of local ports simultaneously. Use a hyphen to separate the first and last port IDs of a range after the **port** keyword.

Examples

```
-> linkagg lacp port 3/1-10 actor system-id 00:20:da:06:ba:d3
-> no linkagg lacp port 3/1-10 actor system-id
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

linkagg lacp port actor system-priority

Configures the system priority of the port on the switch that belongs to the dynamic aggregate group.

linkagg lacp port *chassis/slot/port***[**-*port2***] actor system-priority** *actor_system_priority*

no linkagg lacp port *chassis/slot/port***[**-*port2***] actor system-priority**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
actor_system_priority	The priority of the dynamic aggregate group.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an actor system priority value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the actor system-priority to a range of ports simultaneously. Use a hyphen to separate the first and last port of a range after the **port** keyword.

Examples

```
-> linkagg lacp port 3/2-10 actor system-priority 65
-> no linkagg lacp port 3/2-10 actor system-priority
```

Release History

Release 7.1.1; command introduced.

   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorSystemPriority
```

linkagg lacp agg partner admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the remote switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

no linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
active	Specifies that bit 0 in the partner state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the partner state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the partner state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifies that bit 3 in the partner state octet is enabled. When this bit is set, the port is allocated to the correct dynamic aggregation group. If this bit is not enabled, the port is not allocated to the correct aggregation group. By default, this value is disabled.
collect	Specifying this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the partner is using the defaulted actor information administratively configured for the actor.
expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the partner cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate
timeout enable	Disabled (OmniSwitch 9900) Enabled (All other platforms)
timeout enable	Disabled (OmniSwitch 9900) Enabled (All other platforms)

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration for a single port or a range of ports.
- When the partner admin-state is set to **none**, all bit values are restored to their default configurations.
- Configure the system administrative state for a range of ports simultaneously. Use a hyphen to separate the first and last port of a range after the **port** keyword.
- Enabling the **timeout** parameter configures a 1 second interval (short timeout / fast transmit rate). Disabling the **timeout** parameter configures a 30 second interval (long timeout / slow transmit rate).
- **timeout** option when used sets only the transmit rate. The remote side timeout is 3X the configured transmit rate. For example, if the transmit rate is set to 1 packet per second, the remote side will timeout if it misses 3 packets. In this case, it will timeout in 3 seconds. If the transmit rate is set to 30 packets per second, then the remote side will take 90 seconds to timeout.
- 'no linkagg lacp port partner admin-state' disables the **timeout** parameter, which results in a long timeout, that is, 30 second transmission rate.

Examples

```
-> lacp port 4/2-10 partner admin-state synchronize collect distribute
-> no lacp agg 4/2-10 partner admin-state synchronize collect
```

Release History

Release 7.1.1; command introduced.

linkagg lacp port partner admin system-id

Configures the partner administrative system ID for a dynamic aggregate group port.

linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin system-id** *partner_admin_system_id*

no linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin system-id**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
partner_admin_system_id	The MAC address of the remote dynamic aggregate group in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_admin_system_id	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove a partner administrative system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 3/1-10 partner admin system-id 00:20:da:05:f6:23
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp port partner admin-port

Configures the administrative status of a partner port.

linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin-port** *partner_admin_port*

no linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin-port**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
partner_admin_port	The administrative state of the partner port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove a *partner_admin_port* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 partner admin-port 255
-> no linkagg lacp port 2/1-5 partner admin-port
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminPort
```

linkagg lacp port partner admin port-priority

Configures the priority for a partner port.

linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin port-priority** *partner_admin_port_priority*

no linkagg lacp port *chassis/slot/port***[**-*port2***] partner admin port-priority**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
partner_admin_port_priority	The priority of the partner port.

Defaults

parameter	default
partner_admin_port_priority	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove a *partner_admin_port_priority* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 partner admin port-priority 100
-> no linkagg lacp port 2/1-5 partner admin port-priority
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminPortPriority
```

dhl name

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

dhl *dhl_num* **[name** *name***]**

no dhl *dhl_num*

Syntax Definitions

dhl_num	The DHL session ID number. Valid range is 1–1000.
name	The name of the DHL session.

Defaults

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a DHL session ID from the switch configuration.
- Use the optional **name** parameter to specify a name for the DHL session.
- Only one DHL session can be configured on a switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

Examples

```
-> dhl 1 name dhl_session1
-> no dhl 1
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl linka linkb	Associates a pair of links (port or linkagg) with the DHL session.
dhl admin-state	Configures the administrative status of the DHL session.
show dhl	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionIndex
   alaDHLSessionDescr
```

dhl linka linkb

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

dhl *dhl_num* **linka {port** *chassis/slot/port* **| linkagg** *agg_id***} linkb {port** *chassis/slot/port* **| linkagg** *agg_id***}**

no dhl *dhl_num* **linka {port** *chassis/slot/port* **| linkagg** *agg_id***} linkb {port** *chassis/slot/port* **| linkagg** *agg_id***}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
chassis	The chassis ID number.
slot	The slot number to designate as a link for the DHL session.
port	The physical port number to designate as a link for the DHL session.
agg_id	The link aggregate ID number to designate as a link for the DHL session.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA and linkB are associated with each of the VLAN that the DHL session will protect. Any VLAN not associated with both the links or only associated with one of the links is unprotected.
- DHL linkA *and* linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port the is enabled for transparent bridging.
- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.
- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.

- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

Examples

```
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 linka  linkagg 1  linkb port 1/2
-> dhl 1 linka port 1/1 linkb linkagg 1
-> dhl 1 linka  linkagg 1  linkb linkagg 2
-> no dhl 1 linka port 1/1 linkb port 1/2
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl	Displays information about a specific DHL session.
show dhl link	Displays information about a specific link.

MIB Objects

```
AlaDHLLinksTable
   alaDHLLinksSessionIndex
   alaDHLLinkslinkA
   alaDHLLinkslinkB
```

dhl admin-state

Enables or disables the administrative state of a DHL session.

dhl *dhl_num* **admin-state {enable | disable}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
enable	Enables the DHL session.
disable	Disables the DHL session.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state cannot be enabled until a linkA port and a linkB port are associated with the specified DHL session ID number.

Examples

```
-> dhl 1 admin-state enable
-> dhl 1 admin-state disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration or information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionAdminStatus
```

dhl vlan-map linkb

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

dhl *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

no dhl *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

Syntax Definitions

dhl_num	A DHL session ID number.
*vlan_id***[-***vlan_id***]**	A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1–4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- A DHL session has to be created before a VLAN-MAP can be configured.
- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.
- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.
- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.
- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.
- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA are moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
- If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB are moved to linkA.
- If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

Examples

```
-> vlan 10-30
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl 1 name dhl_session1
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 vlan-map linkb 18-20
-> no dhl 1 vlan-map linkb 18-20
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration or information about a specific DHL session.
show dhl link	Displays information about a specific link.

MIB Objects

```
alaDHLVlanMapTable
   alaDHLVlanMapSessionIndex
   alaDHLVlanMapVlanStart
   alaDHLVlanMapVlanEnd
   alaDHLVlanMapRowStatus
```

dhl pre-emption-time

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

dhl *dhl_num* **pre-emption-time** *seconds*

Syntax Definitions

dhl_num	A DHL session ID number.
seconds	The number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0–600.

Defaults

parameter	default
seconds	30 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.
- If the pre-emption timer value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.
- If a link fails when the pre-emption timer is active, that is when the remaining pre-emption time value is not equal to 0, then the timer will be halted.
- When the pre-emption timer is active for a particular link and if the other link goes down, then the VLANs of the link that is down are automatically moved to the port for which the pre-emption timer is active.
- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

Examples

```
-> dhl 1 pre-emption-time 40sec
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
show dhl	Displays the global status of the DHL configuration or information about a specific DHL session.
show dhl link	Displays information about a specific link.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionPreemptionTime
```

dhl mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

dhl *dhl_num* **mac-flushing {none | raw | mvrp}**

Syntax Definitions

dhl_num	A DHL session ID number.
none	Flushing of the MAC address tables does not occur.
raw	Method of flushing when VPAs of the links moved across them due to link up/down or configuration change (VLAN-map). The switch determines the MAC addresses within the affected VLANs
mvrp	Method of flushing when one link fails and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

Defaults

parameter	default
none | raw | mvrp	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden, then changes cannot be made to the MVRP configuration on the dual homed links.
- If the MAC-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the **show dhl** command displays the active MAC-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the MAC-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to ‘forbidden’.
- If VLANs are moved across the dual homed links as a result of configuration changes, then MAC-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly.

Examples

```
-> dhl 1 mac-flushing none
-> dhl 1 mac-flushing raw
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
show dhl	Displays the global status of the DHL configuration or information about a specific DHL session.
show dhl link	Displays information about a specific link.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionMacFlushingtech
```

show dhl

Displays the global status of the DHL configuration or information about a specific DHL session.

show dhl [*dhl_num***]**

Syntax Definitions

dhl_num	A DHL session ID number.

Defaults

By default, the global status of the DHL configuration is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865

Usage Guidelines

Use the *dhl_num* parameter to display information about a specific DHL session.

Examples

```
-> show DHL
 Number  Name   Admin    Oper     Pre-emption    Mac-flushing   Active Mac-flushing
                state    state    time
-------+------+--------+-------+-----------+-----------------+--------------------
  1      DHL-1   UP       UP      30sec          Raw                Raw
```

output definitions

Number	Number of the DHL session.
Name	The user-defined text description of the DHL session.
Admin state	The administrative status of the DHL session.
Oper state	The operational status of the DHL session.
Pre-emption time	The pre-emption time in seconds of the DHL session.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	Mac-flushing technique that is currently active on the DHL session.

```
-> show dhl 1
DHL session name              : Arice,
Admin state                   : Up,
Operational state             : Up,
Pre-emption time              : 40 sec,
Mac-flushing                  : Raw-Flushing,
Active Mac-flushing           : Raw-Flushing,

Protected VLANs               : 10-20,23,25,30-100,600,700,800,

linkA:
```

```

  Active Vlans                :  none,
```

output definitions

DHL session Name	The user-defined text description of the DHL session.
Admin state	The current administrative status of the DHL session.
Operational state	The operational state of the DHL session.
Pre-emption time	The delay-interval in seconds to move the VLANs back to their original links.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	The active Mac-flushing technique that is enabled on the specified DHL session.
Protected VLANs	The common VLANs that contain both the dual homed links, for example linkA and linkB.
LinkA	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkA.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
Active VLANs	The VLANs that are in an active state.
LinkB	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkB.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
VLAN-map	The DHL VLAN map for linkB. This specifies the VLANs that are operational on DHL linkB from the common pool of VLANs between DHL linkA and linkB.
Operational VLANs	The VLANs that are in an operational state.

linkagg range

Modifies the range of standard and MC-LAG link aggregation identifiers.

linkagg range local {*agg_id-agg_id* | **none**} **peer** {*agg_id-agg_id* | **none**} **multi-chassis** {*agg_id-agg_id* | **none**}

Syntax Definitions

agg_id-agg_id	The first or last identifier in the range.
local	The range of standard local aggregate identifiers.
peer	The range of standard peer aggregate identifiers.
multi-chassis	The range of MC-LAG aggregate identifiers.
none	No aggregate identifiers range is specified.

Defaults

parameter	default
local	0-47
peer	48-95
multi-chassis	96-127

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command in conjunction with the MC-LAG feature to change the maximum number of MC-LAG link aggregates that can be configured.
- The switch must be rebooted for the ranges to take affect.
- The maximum number of combined standard and MC-LAG link aggregates is 128.

Examples

```
-> linkagg range local 0-9 peer 10-19 multi-chassis 20-127
-> linkagg range local none peer none multi-chassis 0-127
```

Release History

Release 7.1.1; command introduced.

Related Commands

show linkagg range	Displays the link aggregate ranges.

MIB Objects

```

show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

show linkagg [agg *agg_id***[-***agg_id2***]]**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the aggregate group. Configured through the **linkagg static agg size** or **linkagg lacp agg size** command. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, information for all aggregate groups is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an aggregate number is specified, only the information about the relevant aggregate group is displayed. The fields included in the display depend on whether the aggregate group is static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

Examples

No aggregate group is specified:

```
-> show linkagg

Number  Aggregate     SNMP Id   Size Admin State  Oper State     Att/Sel Ports
-------+-------------+---------+----+------------+--------------+-------------
   1     Static       40000001   8   ENABLED      UP              2   2
   2     Dynamic      40000002   4   ENABLED      DOWN            0   0
   3     Dynamic      40000003   8   ENABLED      DOWN            0   2
   4     Dynamic      40000004   8   ENABLED      UP              3   3
   5     Static       40000005   2   DISABLED     DOWN            0   0
  10     Loopback     40000010   2   ENABLED      DOWN            0   0
```

output definitions

Number	The aggregate group number.
Aggregate	The type of aggregate group (**Static**, **Dynamic**, or **Loopback**).
SNMP Id	The SNMP ID associated with the aggregate group.
Size	The number of links in this aggregate group.

output definitions (continued)

Admin State	The current administrative state of the aggregate group (**ENABLED** or **DISABLED**). Configured through the **linkagg static agg admin-state** command for static aggregate groups and the **linkagg lacp agg admin-state** command for dynamic aggregate groups.
Oper State	The current operational state of the aggregate group (**UP** or **DOWN**).
Att Ports	The number of ports actually attached to this aggregate group.
Sel Ports	The number of ports that could possibly attach to the aggregate group.

A static aggregate is specified:

```
-> show linkagg agg 5

Static Aggregate
  SNMP Id                  : 40000005,
  Aggregate Number         : 5,
  SNMP Descriptor          : Omnichannel Aggregate Number 5 ref 40000005 size 2,
  Name                     : AGG5,
  Admin State              : ENABLED,
  Operational State        : DOWN,

  Wait To Restore Time     : 0 Minutes
```

output definitions

SNMP Id	The SNMP ID associated with this static aggregate group.
Aggregate Number	The group number.
SNMP Descriptor	The standard MIB name for this static aggregate group.
Name	The name of this static aggregate group. Configured through the **linkagg static agg name** command.
Admin State	The administrative state of this static aggregate group (**ENABLED** or **DISABLED**). Configured through the **linkagg static agg admin-state** command.

output definitions (continued)

Operational State	The operational state of this static aggregate group (**UP** or **DOWN**).
Aggregate Size	The number of links configured for this static aggregate group.
Number of Selected Ports	The number of ports that could possibly attach to this static aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this static aggregate group. (**Note**: This field is not relevant for static aggregate groups.)
Number of Attached Ports	The number of ports actually attached to this static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Port Selection Hash	The hashing algorithm used to identify a specific traffic flow to hash.
Wait To Restore Time	The amount of time, in minutes, the switch waits to bring up a link aggregate that is attached to other links. Configured through the **linkagg static agg wait-to-restore-time** command.

A dynamic aggregate group is specified:

```
-> show linkagg agg 1-2

Dynamic Aggregate
  SNMP Id                  : 40000002,
  Aggregate Number         : 2,
  SNMP Descriptor          : Dynamic Aggregate Number 2 ref 40000002 size 4,
  Name                     : AGG 2,
  Admin State              : ENABLED,
  Operational State        : DOWN,
  Aggregate Size           : 4,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port             : NONE,
  Port Selection Hash      : Source Destination Ip,
  Wait To Restore Time     : 0 Minutes
LACP
  MACAddress               : [00:1f:cc:00:00:00],
  Actor System Id          : [00:20:da:81:d5:b0],
  Actor System Priority    : 50,
  Actor Admin Key          : 120,
  Actor Oper Key           : 0,
  Partner System Id        : [00:20:da:81:d5:b1],
  Partner System Priority  : 70,
  Partner Admin Key        : 220,
  Partner Oper Key         : 0
```

output definitions

SNMP Id	The SNMP ID associated with this dynamic aggregate group.
Aggregate Number	The group number of this dynamic aggregate group.
SNMP Descriptor	The standard MIB name for this dynamic aggregate group.

output definitions (continued)

Name	The name of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg name** command (see page 12-20).
Admin State	The administrative state of this dynamic aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **linkagg lacp agg admin-state** command (see page 12-23).
Operational State	The operational state of this dynamic aggregate group, which can be **UP** or **DOWN**.
Aggregate Size	The number of links configured for this dynamic aggregate group.
Number of Selected Ports	The number of ports available to this dynamic aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.
Number of Attached Ports	The number of ports actually attached to this dynamic aggregate group.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Port Selection Hash	The hashing algorithm used to identify a specific traffic flow to hash.
Wait To Restore Time	The amount of time, in minutes, the switch waits to bring up a link aggregate that is attached to other links. Configured through the **linkagg lacp agg wait-to-restore-time** command.
MACAddress	The MAC address associated with the primary port.
Actor System Id	The MAC address of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor system-id** command (see page 12-28).
Actor System Priority	The priority of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor system-priority** command (see page 12-26).
Actor Admin Key	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor admin-key** command (see page 12-25).
Actor Oper Key	The operational key associated with this dynamic aggregate group.
Partner System Id	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg partner system-id** command (see page 12-30).
Partner System Priority	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the **linkagg lacp agg partner system-priority** command (see page 12-32).
Partner Admin Key	The administrative key for the remote partner of the dynamic aggregation. You can modify this parameter with the **linkagg lacp agg partner admin-key** command (see page 12-34).
Partner Oper Key	The operational key of the remote system to which the dynamic aggregation group is attached.

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg accounting	Displays statistics for packet frames received and transmitted on link aggregate member ports.
show linkagg counters	Displays statistics for the number of packet frames and errors received and transmitted on link aggregate member ports.

show linkagg port

Displays information about link aggregation ports.

show linkagg [agg *agg_id***[-***agg_id2***]] port [***chassis/slot/port***]**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number corresponding to the aggregate group. Use a hyphen to specify a range of IDs (10-20).
chassis	The chassis identifier.
slot/port	The slot and port number of the link aggregation port.

Defaults

By default, all link aggregation ports are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a particular slot or port is specified, the fields displayed depend upon whether the port belongs to a static aggregate group or a dynamic (LACP) aggregate group.
- If only a link aggregate or a range of link aggregates is specified along with the **agg** keyword, the ports and related information for only the specified link aggregate IDs are displayed.
- If multi-chassis feature is activated on the switch, the **show** command displays the link aggregates as MC-Static and MC-Dynamic as shown in the second example.

Examples

```
-> show linkagg port

Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
---------+----------+--------+----------+----+----+----+----+----
   2/1    Static        2001  ATTACHED     1  UP   UP   YES
```

Multi-chassis active:

```
-> show linkagg port

Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
---------+----------+--------+----------+----+----+----+----+----
   2/1    MC-Static        2001  ATTACHED     1  UP   UP   YES
```

```
-> show linkagg agg 1-5 port
Slot/Port  Aggregate  SNMP Id    Status        Agg Oper Link Prim
---------+-----------+--------+--------------+------+----+----+----+-----
   1/16  Static       2016     CONFIGURED       1    UP   UP   YES
   1/17  Static       2017     CONFIGURED       2    UP   UP   NO
   3/1   Static       3001     CONFIGURED      3     UP   UP   NO
   3/2   Static       3045     CONFIGURED       4    UP   UP   NO
   3/3   Static       3069     CONFIGURED       5    UP   UP   NO
```

Output fields are defined here:

output definitions

Slot/Port	The slot/port associated with the aggregate group.
Aggregate	The type of aggregate group associated with the port, either **Static** or **Dynamic**.
SNMP Id	The SNMP ID associated with the aggregate group.
Status	The current status of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**.
Agg	The number of the aggregate groups associated with this port.
Oper	The operational status of the port.
Link	The physical link status of the port.
Prim	Specifies if the port is the primary port of the aggregate. The primary port is the lowest numbered port in a link aggregate.

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1

Static Aggregable Port
  SNMP Id                      : 4001,
  Slot/Port                    : 4/1,
  Administrative State         : ENABLED,
  Operational State            : DOWN,
  Port State                   : CONFIGURED,
  Link State                   : DOWN,
  Selected Agg Number          : 2,
  Port position in the aggregate: 0,
  Primary port                 : NONE
```

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port, which can be **ENABLED** or **DISABLED**.
Operational State	The current operational state of the port, which can be **UP** or **DOWN**.
Port State	The current operational state of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**.

output definitions (continued)

Link State	The current operational state of the link from this port to its remote partner, which can be **UP** or **DOWN**.
Selected Agg Number	The number associated with the static aggregate group to which the port is attached.
Port position in the aggregate	The rank of this port within the static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A port that belongs to a static link aggregate is specified:

```
-> show linkagg agg 1

Static Aggregate
SNMP Id                  : 40000001,
  Aggregate Number       : 1,
  SNMP Descriptor        : Omnichannel Aggregate Number 1 ref 40000001 size 4,
  Name                   : ,

Actor Oper State              : act1.tim1.agg1.syn0.col0.dis0.def1.exp0,
Partner Admin State           : act0.tim0.agg1.syn1.col1.dis1.def1.exp0,
Partner Oper State            : act0.tim0.agg1.syn0.col1.dis1.def1.exp0
```

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port, which can be **ENABLED** or **DISABLED**.
Operational State	The current operational state of the port, which can be **UP** or **DOWN**.
Port State	The current operational state of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **AGGREGATED**.
Link State	The current operational state of the link from this port to its remote partner, which can be **UP** or **DOWN**.
Selected Agg Number	The number associated with the dynamic aggregate group to which the port is attached.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Actor System Priority	The actor system priority of this port. You can modify this parameter with the **linkagg lacp port actor system-priority** command (see page 12-43).
Actor System Id	The actor system ID (i.e., MAC address) of this port. You can modify this parameter with the **linkagg lacp port actor system-id** command (see page 12-41).
Actor Admin Key	The actor administrative key value for this port. You can modify this parameter with the **linkagg lacp port actor admin-key** command (see page 12-36).
Actor Oper Key	The actor operational key associated with this port.
Partner Admin System Priority	The administrative priority of the remote system to which this port is attached. You can modify this parameter with the **linkagg lacp port partner admin system-priority** command (see page 12-52).
Partner Oper System Priority	The operational priority of the remote system to which this port is attached.
Partner Admin System Id	The administrative MAC address associated with the system ID of a remote partner. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin system-id** command (see page 12-48).
Partner Oper System Id	The MAC address that corresponds to the system ID of the remote partner.

output definitions (continued)

Partner Admin Key	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin-key** command (see page 12-50).
Partner Oper Key	The current operational value of the key for the protocol partner.
Attached Agg ID	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
Actor Port	The port number locally assigned to this port.
Actor Port Priority	The actor priority value assigned to the port. You can modify this parameter with the **linkagg lacp port actor port priority** command (see page 12-54).
Partner Admin Port	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin-port** command (see page 12-56).
Partner Oper Port	The operational port number assigned to the port by the protocol partner of the port.
Partner Admin Port Priority	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin port-priority** command (see page 12-57).
Partner Oper Port Priority	The priority value assigned to the this port by the partner.
Actor Admin State	The administrative state of the port. You can modify this parameter with the **linkagg lacp port actor admin-state** command (see page 12-39).
Actor Oper State	The current operational state of the port.
Partner Admin State	The administrative state of the partner port. You can modify this parameter with the **linkagg lacp agg partner admin-state** command (see page 12-45).
Partner Oper State	The current operational state of the partner port.

Release History

show linkagg accounting

Displays statistics collected for packets transmitted and received on link aggregate ports.

show linkagg accounting

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Statistics are displayed for all link aggregate IDs configured on the switch.
- Statistics are collected for undersized and oversized packets, packets of a certain size, and Jabber frames.

Examples

```
-> show linkagg accounting

Link Agg 10
rx undersize packets    = 0
tx undersize packets    = 0
rx oversize packets     = 0
tx oversize packets     = 0
rx packets 64           = 3073753
rx packets 65_127       = 678698
rx packets 128_255      = 21616
rx packets 256_511      = 21062
rx packets 512_1023     = 2
rx packets 1024_1518    = 84
rx packets 1519_4095    = 0
rx packets 4096_9216    = 0
rx jabber frames         = 0
```

Release History

Release 8.3.1; command introduced.

Related Commands

show linkagg counters	Displays statistics collected for the type and number of packets transmitted and received on link aggregate ports.
show linkagg traffic	Displays the total number of packets and bytes that are received and transmitted on link aggregate ports.
clear linkagg-statistics	Clears statistics for all link aggregates or for specific aggregate IDs.

   alcRxPackets4095
   alcRxPackets9216
   alcRxJabberFrames
```

show linkagg counters

Displays statistics collected for the type and number of packet frames transmitted and received on link aggregate ports.

show linkagg counters [errors]

Syntax Definitions

errors	Display the number of errors received on the link aggregate member ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Statistics are displayed (in bytes or frame count) for all link aggregate IDs configured on the switch.
- Error statistics include the number of alignment, frame check (FCS), received, and transmitted errors.

Examples

```
-> show linkagg counters

Link Agg 10
InOctets                = 54367578586897979
OutOctets               = 5.78E19

```

clear linkagg-statistics

Clears statistics for all link aggregates or for a specific aggregate ID or range of IDs.

clear linkagg-statistics [agg *agg_id***[**-*agg_id2***]]**

Syntax Definitions

*agg_id***[**-*agg_id2***]**	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared for all link aggregates.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command sets all statistic counters to zero.

Examples

```
-> clear linkagg-statistics
-> clear linkagg-statistics agg 10
-> clear linkagg-statistics agg 11-15
```

Release History

Release 8.3.1; command introduced.

Related Commands

show linkagg accounting	Displays statistics collected for packets transmitted and received on link aggregate ports.
show linkagg counters	Displays statistics collected for the type and number of packets transmitted and received on link aggregate ports.
show linkagg traffic	Displays the total number of packets and bytes that are received and transmitted on link aggregate ports.

MIB Objects

```
alclnkaggAggPortStatsTable
   alclnkaggAggPortStatsLACPDUsRx
   alclnkaggAggPortStatsMarkerPDUsRx
   alclnkaggAggPortStatsMarkerResponsePDUsRx
   alclnkaggAggPortStatsUnknownRx
   alclnkaggAggPortStatsIllegalRx
   alclnkaggAggPortStatsLACPDUsTx
   alclnkaggAggPortStatsMarkerPDUsTx
   alclnkaggAggPortStatsMarkerResponsePDUsTx
```

show linkagg range

Displays information about the configured or operational link aggregate range identifiers for standard and MC-LAG link aggregates.

show linkagg range [operation | config]

Syntax Definitions

operation	Displays the operational ranges.
config	Displays the configured ranges.

Defaults

By default, both the operational and configured ranges are shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **operation** parameter to display only the operational link aggregate identifiers.
- Use the **config** parameter to display only the configured link aggregate identifiers.
- A chassis reboot is required for the configured values to become operational.

Examples

```
-> show linkagg range
                      Operational            Configured
                      Min       Max          Min     Max
--------------------+--------+--------+-------------+-------+
Local                   0       127             0         0
Peer                    0       127             0         0
Multi-Chassis           0       127             0       127
```

output definitions

Operational Min/Max	The currently operational ranges.
Configured Min/Max	The currently configured ranges.
Local	The local link aggregate identifiers.
Peer	The peer link aggregate identifiers.
Multi-Chassis	The multi-chassis link aggregate identifiers.

Release History

Release 7.1.1; command introduced.

Related Commands

```

13 Virtual Chassis Commands

A Virtual Chassis is a group of switches managed through a single management IP address and that behave as a single bridge or router. It provides both node level and link level redundancy for devices connecting to the aggregation layer via dual-homed standard 802.3ad link aggregation mechanisms. The use of Virtual Chassis provides node level redundancy without the need to use redundancy protocols such as STP and VRRP between the edge and the aggregation/core layer.

MIB information for the Virtual Chassis commands is as follows:

Filename: ALCATEL-IND1-VIRTUAL-CHASSIS-MIB.mib
Module: alcatelIND1VirtualChassisMIB

Filename: ALCATEL-IND1-VC-SPLIT-PROTECTION-MIB.mib
Module: alaVCSPMIB

A summary of available commands is listed here:

Virtual Chassis Commands	**virtual-chassis configured-chassis-id** **virtual-chassis chassis-group** **virtual-chassis configured-chassis-priority** **virtual-chassis configured-control-vlan** **virtual-chassis configured-hello-interval** **virtual-chassis vf-link create** **virtual-chassis vf-link member-port** **virtual-chassis vf-link default-vlan** **virtual-chassis hello-interval** **virtual-chassis shutdown** **virtual-chassis vf-link-mode** **virtual-chassis auto-vf-link-port** **vc-takeover** **convert configuration** **show virtual-chassis topology** **show virtual-chassis consistency** **show virtual-chassis vf-link** **show virtual-chassis auto-vf-link-port** **show virtual-chassis chassis-reset-list** **show virtual-chassis slot-reset-list** **show virtual-chassis consistency** **show virtual-chassis neighbors** **show configuration vcm-snapshot chassis-id**
Virtual Chassis Split Protection Commands	**virtual-chassis split-protection admin-state** **virtual-chassis split-protection linkagg** **virtual-chassis split-protection guard-timer** **virtual-chassis split-protection helper admin-state** **virtual-chassis split-protection helper linkagg** **show virtual-chassis split-protection status** **show virtual-chassis split-protection vc-units** **show virtual-chassis split-protection helper status**

virtual-chassis configured-chassis-id

Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual-chassis mode.

virtual-chassis [chassis-id *oper_chassis***] configured-chassis-id** *config_chassis*

no virtual-chassis [chassis-id *oper_chassis***] configured-chassis-id** *config_chassis*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
config_chassis	The configured/next chassis ID number.

Defaults

parameter	default
oper_chassis	0 (standalone mode; no virtual chassis operation is allowed)

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to change the chassis ID back to “0” (the default). When the chassis ID is set to “0”, the switch operates in standalone mode and all virtual chassis related configuration commands are no longer active for the switch.
- The operational chassis identifier parameter is only optional when the switch is running in standalone mode or at start up time, within the *vcsetup.cfg*, when the switch is coming up in virtual chassis mode. The same restrictions apply to the no form of the command.
- The operational chassis identifier is a mandatory parameter whenever the system is running in virtual chassis mode. This prevents modifying the chassis identifier of all switches at the same time and causing a duplicate chassis identifier.
- Two switches that have the same chassis identifier are not allowed to operate in virtual chassis mode. If a duplicate chassis identifier is detected one of the switches will be in an inconsistent role and its status will be set to Duplicate-Chassis-ID.
- The configured chassis identifier will only take effect after the next reboot of the target chassis.
- Virtual chassis is only supported between two switches of the same type. For example, virtual chassis is not supported between an OmniSwitch 6860 and an OmniSwitch 6900.
- The no form of this command can only be used if there are no VFLs configured on the switch.
- Snapshots produced through the **show configuration vcm-snapshot**, **show configuration snapshot virtual chassis** or **write memory** commands always include the operational chassis identifier.

Examples

```
-> virtual-chassis configured-chassis-id 1 //Standalone mode
-> virtual-chassis chassis-id 0 configured-chassis-id 1
-> no virtual-chassis chassis-id 0 configured-chassis-id
-> no virtual-chassis configured-chassis-id
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasId
   virtualChassisConfigChassisId
```

virtual-chassis chassis-group

Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number. The group ID number uniquely identifies switches operating in the same virtual chassis.

virtual-chassis [chassis-id *oper_chassis***] chassis-group** *group*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
group	Virtual chassis group identifier (0-255), which is used to identify a group of chassis belonging to the same virtual chassis.

Defaults

parameter	default
group	Derived from last byte of Master chassis MAC address

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Each virtual chassis domain must use a different group ID number to differentiate the domain within the network environment.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode the chassis group can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode the chassis group can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the same chassis group value is set for all switches that will participate on the same virtual chassis group. Failure to adhere to this recommendation followed by a system reset will prevent the switches whose values are different from joining the same virtual chassis group.
- When determining the chassis group ID the last byte of the Master chassis MAC address is used. For example, if the Master's MAC address is xx:xx:xx:xx:xx:7e, the chassis group will be 126 (equivalent to hex 7e).

Examples

```
-> virtual-chassis chassis-id 1 chassis-group 10
-> virtual-chassis chassid-id 0 chassis-group 10
-> virtual-chassis chassis-group 10 // All switches
```

Release History

Release 7.3.1; command introduced.
Release 7.3.4; Chassis group ID based on Master MAC address introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisGroup
```

virtual-chassis configured-chassis-priority

Sets the configured chassis priority for a chassis specified by its operational chassis identifier.

virtual-chassis [chassis-id *oper_chassis***] configured-chassis-priority** *priority*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
priority	Configured chassis priority (0-255) which defines the user preference above all other election criteria, for the target chassis to become the master of the virtual chassis.

Defaults

parameter	default
priority	OS6900-Q32 - 120 All others - 100

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The greatest configured-chassis-priority will become the Master chassis. Without setting this value the smallest chassis identifier becomes the key parameter used to determine which switch will become the Master.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- The configured chassis priority will only take effect after the next reboot of the target switch.

Examples

Standalone mode:

```
-> virtual-chassis chassis-priority 50
-> virtual-chassis chassis-id 0 chassis-priority 50
```

All switches:

```
-> virtual-chassis configured-chassis-priority 50
-> virtual-chassis chassid-id 0 configured-chassis-priority 50
```

Chassis 2 only:

```
-> virtual-chassis chassis-id 2 configured-chassis-priority 75 //Chassis 2 only
```

Release History

Release 7.3.1.R01; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisConfigPriority
```

virtual-chassis configured-control-vlan

Sets the configured control VLAN for a chassis specified by its operational chassis identifier.

virtual-chassis [chassis-id *oper_chassis***] configured-control-vlan** *vlan*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
vlan	Configured/next virtual chassis control VLAN (2-4094), which is used for all internal control communication between switches over the VFL.

Defaults

parameter	default
vlan	4094

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This configured control VLAN will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the value is for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10
```

All switches:

```
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisConfigControlVlan
```

virtual-chassis configured-hello-interval

Sets the virtual chassis configured hello interval parameter on the switch. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

virtual-chassis [chassis-id *oper_chassis***] configured-hello-interval** *hello*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
hello	Configured/next virtual chassis hello interval in seconds (1-10), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

Defaults

parameter	default
hello	5

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configured value will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode, the configured hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- The hello timeout is a fixed value and defined as 120 seconds. This is the minimum time interval that a switch will wait without receiving any hello packets from a peer switch before declaring that the adjacency towards that switch was lost.
- It is strongly recommended that the hello interval be the same for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10
```

All switches:

```
-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10
```

Release History

Release 7.3.1; command introduced.
Release 7.3.3; command deprecated.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisConfigHelloInterval
```

virtual-chassis vf-link create

Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the virtual chassis operation between the two switches.

virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id* **create**

no virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
vfl_id	The VFL link identifier (0).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Although a virtual fabric link can be configured while the switch is running either in standalone or virtual chassis mode, a VFL can only become operational when the chassis operates in virtual chassis mode.
- Use the no form of this command to remove the VFL configuration from the switch.
- Although the switch supports runtime configuration of the VFL and its member ports, configuring the VFL at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- This command is valid only when the VFL mode is set to static.

Examples

```
-> virtual-chassis vf-link 0 create
-> virtual-chassis chassis-id 0 vf-link 0 create
-> no virtual-chassis vf-link 0
-> no virtual-chassis chassis-id 0 vf-link 0

-> virtual-chassis chassis-id 1 vf-link 0 create
-> virtual-chassis chassis-id 2 vf-link 0 create
-> no virtual-chassis chassis-id 1 vf-link 0
-> no virtual-chassis chassis-id 2 vf-link 0
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisLinkTable
   virtualChassisOperChasID
   virtualChassisLinkID
   virtualChassisVflRowStatus
```

virtual-chassis vf-link member-port

Adds member ports to a given virtual fabric link (VFL).

virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id* **member-port [***oper_chassis/***]***slot/port*

no virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id* **member-port [***oper_chassis/***]***slot/port*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
vfl_id	The VFL link identifier (0).
oper_chassis/slot/port	The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Although virtual-fabric link (VFL) member ports can be configured while the switch is running either in standalone or virtual chassis mode, a configured virtual-fabric link (VFL) member port can only become operational when the chassis operates in virtual chassis mode.
- Use the no form of this command to remove a member port from the virtual-fabric link (VFL).
- When a switch is running in virtual chassis mode, a virtual-fabric link member port must be fully specified including *oper_chassis/slot/port*.
- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches in running in virtual chassis mode, a virtual-fabric link (VFL) member ports can only be created or removed exactly in one switch at a time. In other words, we are not allowed to create or remove a virtual chassis link member port with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.
- A maximum of 16 member ports can be added or assigned to each virtual-fabric link (VFL).
- All virtual-fabric link (VFL) member ports must operate at the same speed.
- Only interfaces that operate at 10 Gbps or 40 Gbps can be added or assigned to a virtual-fabric link. (**Note**: 10GBaseT ports cannot be assigned to a VFL).
- Only interfaces operating in full-duplex mode can be added or assigned to a virtual-fabric link.

- It is recommended to configure virtual-fabric link (VFL) member ports across multiple network interface modules (NI) for resilience reasons.
- Virtual-fabric link (VFL) member ports can only be configured on interfaces that are fixed ports, network ports or priority flow control enabled ports. For instance, interfaces configured as Q-tag ports or ERP ports cannot be configured as virtual-fabric link member ports.
- When a switch is running in virtual chassis mode, the interface related to the last active virtual-fabric link member port cannot be administratively disabled.
- When a switch is running in virtual chassis mode, the last active virtual-fabric link member port cannot be deleted using the no form of the present command.
- When a switch is running in virtual chassis mode, the network interface module (NI) that hosts the last active virtual-fabric link member port cannot be administratively reset or powered off.
- This command is valid only when the VFL mode is set to static.

Examples

```
-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1
-> virtual-chassis chassis-id 1 vf-link 1 member-port 1/2/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> no virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1
-> no virtual-chassis chassis-id 1 vf-link 1 member-port 1/2/1
```

Release History

Release 7.3.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays information about the virtual fabric link on the switch.
show virtual-chassis chassis-reset-list	Displays detailed information about the virtual fabric link member ports on the switch.
show virtual-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisLinkTable
   virtualChassisOperChasID
   virtualChassisLinkId
   virtualChassisVflMemberPortIfindex
   virtualChassisVflMemberPortRowStatus
```

virtual-chassis vf-link default-vlan

Configures the default VLAN for the virtual fabric link (VFL).

virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id* **default-vlan** *vlan*

no virtual-chassis [chassis-id *oper_chassis***] vf-link** *vfl_id* **default-vlan**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
vfl_id	The VFL link identifier (0).
vlan	The default VLAN (1-4094) for the specified VFL.

Defaults

parameter	default
vlan	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This configured VLAN will become the default untagged VLAN for the VFL.
- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- Use the **no** form of this command to set the default VLAN back to 1.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, a virtual-fabric link (VFL) default VLAN can only be configured exactly in one switch at a time. In other words, we are not allowed to configured the virtual chassis link default VLAN with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.
- It is strongly recommended that the user set the same value of default VLAN for all virtual-fabric links on all switches that will participate on the same virtual chassis topology. Failure to adhere to this recommendation may cause end to end connectivity problems in the network.

Examples

Standalone mode:

```
-> virtual-chassis vf-link 0 default-vlan 5
-> virtual-chassis chassis-id 0 vf-link 0 default-vlan 5
-> no virtual-chassis vf-link 0 default-vlan
-> no virtual-chassis chassis-id 0 vf-link 0 default-vlan
```

Chassis 1:

```
-> virtual-chassis chassis-id 1 vf-link 0 default-vlan 5
-> no virtual-chassis chassis-id 1 vf-link 0 default-vlan
```

Release History

Release 7.3.1; command introduced.
Release 7.3.4; command deprecated.

Related Commands

show virtual-chassis vf-link	Displays information about the virtual fabric link on the switch.

MIB Objects

```
virtualChassisLinkTable
   virtualChassisOperChasID
   virtualChassisLinkID
   virtualChassisLinkOperDefaultVlan
```

virtual-chassis hello-interval

Sets the virtual chassis configured hello interval parameter on the chassis. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

virtual-chassis [chassis-id *oper_chassis***] hello-interval** *hello*

Syntax Definitions

oper_chassis	The operational/current chassis ID number
hello	The operational/current virtual chassis hello interval in seconds (1–2000), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

Defaults

parameter	default
hello	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode, the hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the hello interval be the same for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis hello-interval 10
-> virtual-chassis chassis-id 0 hello-interval 10
```

Virtual chassis mode:

```
-> virtual-chassis hello-interval 10 //All chassis
-> virtual-chassis chassis-id 2 configured-hello-interval 10 //Chassis 2 only
```

Release History

Release 7.3.3; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

   virtualChassisOperHelloInterval
```

virtual-chassis shutdown

Disables all front-panel port including the user ports and all the VFL member ports on a chassis isolating the chassis from the rest of the virtual chassis topology.

virtual-chassis shutdown [chassis-id *oper_chassis***]**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command will disable all front panel ports, including the user ports and all virtual-fabric link (VFL) member ports on the specified switch.
- After running this command remote access to the target switch is only possible through the local EMP port on that switch.
- The target switch must be reloaded to bring its ports back to an operational state.
- This command is only functional when executed through the master chassis of a system operating in virtual chassis mode.
- After the shutdown command is executed, the target switch assumes the role of master and remains isolated from all other switches in the virtual chassis topology.

Examples

```
-> virtual-chassis shutdown chassis-id 2
```

Release History

Release 7.3.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

N/A

virtual-chassis vf-link-mode

Configures the Virtual Chassis mode. Virtual Chassis mode determines whether the VFLs are created automatically or statically.

virtual-chassis vf-link-mode {static | auto}

Syntax Definitions

N/A

Defaults

parameter	default
vf-link-mode	**auto** (if no vcsetup.cfg file exists).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- If the chassis boots without a **vcsetup.cfg** file the mode defaults to auto.
- If the chassis boots with a **vcsetup.cfg** file and the 'virtual-chassis vf-link-mode' CLI does not exist, the mode will be set to static. Otherwise, the mode will be set as configured in the **vcsetup.cfg** file.
- Changing the mode is only allowed for all chassis or the local chassis. Specific chassis configuration is not allowed.

Examples

```
-> virtual-chassis vf-link-mode auto
-> virtual-chassis vf-link-mode static
```

Release History

Release 7.3.4; command introduced.

Related Commands

show virtual-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisVflMode
```

virtual-chassis auto-vf-link-port

Configures the port to be an automatic VFL port.

[no] virtual-chassis auto-vf-link-port *chassis/slot/port*

Syntax Definitions

chassis/slot/port	The operational chassis ID, slot, and port.

Defaults

chassis type	default
OS6900-X/T Models	The last 5 ports including ports on expansion slots.
OS6900-Q32	The last 5 ports that have a transceiver or 40G-to-10G splitter cable plugged in.
OS6900-X72	The last 5 ports (50-54). A port that has a 40G-to-10G splitter cable will be counted as four ports.
OS6900-V72/C32	The last 5 ports. A port that has a splitter cable will be counted as four ports.
OS6860 Models	Dedicated VFL ports.
OS6865 Models	None.
OS6560 Models	OS6560-(P)24X4 - Ports 29-30. OS6560-(P)48X4 - Ports 53-54. Dedicated VFL ports. (all other models).
OS9900	None. Supports static VFL ports only.
OS6465	OS6465-P6/P12 - None. OS6465-P28 - Ports 27/28.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

- This command is allowed only if VFL mode is auto.
- Refer to the defaults table above for information on which ports are default automatic VFL ports.
- Transceiver does not have to be present for port to be eligible as a default port.

Examples

```
-> virtual-chassis auto-vf-link-port 1/1/1
-> no virtual-chassis auto-vf-link-port 1/1/1
```

Release History

Release 7.3.4; command introduced.

Related Commands

show virtual-chassis auto-vf-link-port	Displays a summary of the auto VFL ports.

MIB Objects

```
virtualChassisAutoVflPortTable
   virtualChassisAutoVflPortIfindex
   virtualChassisAutoVflPortRowStatus
```

vc-takeover

This command causes a reload of the master chassis from the running configuration in a virtual chassis environment.

vc-takeover

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- For a dual-CMM Master chassis configuration, this command triggers a local CMM takeover on the Master if both the primary and secondary CMMs are up. This will cause the secondary CMM to become the primary CMM and the NIs will remain up. The original Master chassis will remain the Master and the Slave chassis will remain the Slave.
- For a single-CMM Master chassis configuration, this command will reboot the entire Master chassis including the NIs and result in the Slave chassis becoming the Master.

Examples

```
-> vc-takeover
WARNING - Working Changes Will Be Lost, Confirm VC takeover (Y/N) :
```

Release History

Release 7.3.2; command introduced.

Related Commands

reload from	Reloads the master or slave chassis from the specified directory.

MIB Objects

N/A

convert configuration

Converts an existing standalone configuration to a virtual chassis configuration.

convert configuration to *dir* **[reload]**

Syntax Definitions

dir	The name of the directory to store the virtual chassis configuration.
reload	Reloads the switch after converting the configuration.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command will automatically create the new configuration files *vcsetup.cfg* and *vcboot.cfg* within the specified directory. The *vcsetup.cfg* file contains the virtual chassis manager configuration, which is specific to each individual switch. The contents of the *vcsetup.cfg* files are unique to each switch and distinct between switches. The *vcboot.cfg* file contains the generic application configuration, which is global to the entire virtual chassis topology. As a result, the *vcboot.cfg* files should have the same contents between distinct switches.
- This command will automatically copy the image files of the current running directory into the specified dir directory.
- This command is only accepted in standalone mode after a valid chassis identifier (1-6) has been configured on the switch. The command is rejected when executed in a switch already running in virtual chassis mode.
- The directory will be automatically created if it does not exist.
- The current standalone configuration files (e.g. boot.cfg) that may exist in the directory will remain intact.When the switches come up in virtual chassis mode following a conversion using this command, the *vcboot.cfg* files present on distinct switches may be different. However, the *vcboot.cfg* files must be the same on all switches running in virtual chassis mode. As a result, the *vcboot.cfg* file of the master will overwrite the *vcboot.cfg* file on the slave chassis and the slave will automatically reboot.

Examples

```
-> convert configuration to vc_dir
```

Release History

Release 7.3.1; command introduced.

Related Commands

show configuration snapshot	Displays the configured and operational parameters related to the virtual chassis feature on the switch.

MIB Objects

N/A

show virtual-chassis topology

This command is used to provide a detailed status of the virtual chassis topology.

show virtual-chassis [chassis-id {*oper_chassis*}**] topology**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command can be executed on any CMM within any switch of the system.
- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- A chassis-id of 100 or 101 is used to indicate a duplicate chassis-id.

Examples

```
-> show virtual-chassis topology
Legend: Licenses - A: Advanced; B: Data Center
                                        Config

     6         No         2/0->1/4, 1/0->6/0
```

output definitions

Oper-Chassis-ID (Chas)	Operational/current virtual chassis chassis identifier.
Config Chas ID	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Role (Role)	Chassis Role **Unassigned**: Role undefined as election has not completed yet. **Master**: Chassis is central point of management and control. **Slave**: Chassis is an active or functional participant of the virtual chassis topology, but it is not the main entry point for management and control purposes. **Inconsis**: Chassis is not an active or functional participant of the virtual chassis topology due to some inconsistent parameter, which does not match the match the master chassis' settings. **Startup-Err**: Chassis is in start up error mode because it was unable to come up in virtual chassis mode. When a chassis assumes the Startup-Err role, its chassis status will be equal to either Invalid-Chassis-Id or Invalid-License, which are described later in this section.
Previous-Chassis-Role	Previous chassis role before the last transition.

output definitions

Chassis-Status (Status)	Chassis Status **Init**: Status undefined as the chassis has not completed its initialization. **Running**: The chassis is fully operational. **Invalid-Chassis-Id**: The chassis is not operational in virtual chassis mode because no valid chassis identifier has been found in the configuration. Typically this means that the vcsetup.cfg file is corrupted, empty or contains an invalid (e.g. out of range) chassis ID identifier. **Invalid-License**: The chassis is not operational in virtual chassis mode because no valid advanced license has been found. **Hello-Down**: The chassis is isolated from the rest of the virtual chassis topology participants because hello packets have not been received for a period of time greater than the hello timeout. **Duplicate-Chassis**: This chassis is not fully operational because its operational chassis identifier matches the chassis ID of another chassis within the virtual chassis topology. As a result, a new operational chassis identifier from the range (101-102) will be allocated to this chassis. **Mis-Image**: The chassis is not fully operational because its image versions are not consistent with the master chassis' images. In other words, the image version are not compatible and some of the software components running on this chassis are unable to interface with the software operating in the master chassis. **Mis-Chassis-Type**: The chassis is not fully operational because its chassis type (i.e. OS6900, OS6860) is not consistent with the master chassis' type. Different chassis types cannot be mixed in the same virtual chassis topology. **Mis-Hello-Interval**: The chassis is not fully operational because its operational hello interval is not consistent with the master chassis' operational hello interval. **Mis-Control-Vlan**: The chassis is not fully operational because its operational control VLAN is not consistent with the master chassis' operational control VLAN. **Mis-Chassis-Group**: The chassis is not fully operational because its chassis group does not match the master chassis' chassis group and the chassis is connected directly or indirectly to the master chassis through virtual-fabric links. This chassis is unable to join the active virtual chassis topology whose master chassis is part of. **Mis-License-Config**: The chassis is not fully operational because its license settings do not match the master chassis' license configuration. An exact match is required to allow successful operation within the same virtual chassis topology. **Split-Topology**: The chassis is not fully operational and all of its front panel user ports (excluding the virtual-fabric link member ports) are operationally down because a topology split has occurred. This chassis became isolated from the master chassis after all of its active virtual-fabric member ports went down or the virtual chassis manager hello timeout has expired. **Running+**: Element added after last saved topology. **Not-Joined**: Element missing from last saved topology.
Chassis-Group (Group)	virtual chassis group identifier. Used to identify a group of chassis belonging to the same virtual chassis.

output definitions

Chassis-MAC (MAC-Address)	Chassis MAC address.
Up-Time	Chassis up time.
Designated-NI	Designated network interface module (NI), which is the module responsible for managing the inter-process communication infrastructure responsible for control communication between distinct switches within the virtual chassis topology. Only VFL capable network interface modules can be elected as designated NI. When no VFL capable network interface modules are present on a switch, the designated NI is zero (0).
Primary-CMM	Primary CMM slot.
Secondary-CMM	Secondary CMM slot.
Chassis-Type	The switch chassis type (OS6900 or OS6860).
License	The licenses installed on the chassis.
Hello-Interval	The hello-interval configured for the chassis.
Oper-Chassis-Priority (Pri)	Operational/current chassis priority, which defines the user preference, above all other election criteria, for a switch to become the master chassis of the virtual chassis topology. The greater this value the more likely a switch is to be elected as the master chassis.
Config-Chassis-Priority	Configured/next chassis priority, which defines the user preference above all other election criteria.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Number-of-Neighbors	Total number of neighbor switches that are part of the active virtual chassis topology for a given chassis group.
VFLink Mode	The VFLink mode of the chassis: Static or Auto.
Number-of-Direct-Neighbors	Number of directly attached neighbor switches that are part of the active virtual chassis topology for a given chassis group These are switches directly connected to the local switch through a virtual-fabric link (VFL).
Neighbor	The operational chassis identifier of neighbor switch.
Is-Direct	Flag identifying whether a particular neighbor is directly attached to a given switch.
Shortest-Path	The shortest path from a given switch to a neighbor switch using the notation *chassis*/*vfl_id*.

Release History

Release 7.3.1; command introduced.
Release 7.3.4; VFLink mode introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
virtual-chassis chassis-group	Assigns a globally unique chassis group identifier to a switch. Each peer switch in a virtual chassis domain must use the same group ID number.
virtual-chassis configured-chassis-priority	Sets the configured chassis priority for a switch specified by its operational chassis identifier.
virtual-chassis configured-control-vlan	Sets the configured control VLAN for a switch specified by its operational chassis identifier.
virtual-chassis configured-hello-interval	Configures the virtual chassis hello interval parameter on the switch.

show virtual-chassis consistency

This command is used to provide a detailed status of the parameters taken into account to determine the consistency of a group of switches participating in the virtual chassis topology.

show virtual-chassis [chassis-id *oper_chassis***] consistency**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command provides a list of parameters that must be configured consistently on all switches that will participate on the virtual chassis topology to allow correct system operation.
- In order to determine the consistency of a given parameter, the switch will compare the value of such parameters on a given switch with the settings of the master chassis. Therefore consistency is always defined as a comparison with the master chassis.
- The following parameters are considered consistent if they match the settings of the master chassis: chassis type, license, chassis group, operational control VLAN, configured control VLAN, operational hello interval and configured hello interval.
- The configured chassis identifier parameter is considered consistent if it is different than the settings of the master chassis.

Examples

```
-> show virtual-chassis consistency
Legend: * - denotes mandatory consistency which will affect chassis status
        Licenses - A: Advanced; B: Data Center

       Config                                  Oper     Config

```

output definitions

Chassis-ID (Chas)	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
Config-Chassis-ID (Conf Chas ID)	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Type (Chas Type)	The switch chassis type (OS6900 or OS6860).
License	The licenses installed on the chassis.
Chassis-Group (Chas Group)	virtual chassis group identifier. Used to identify a group of chassis belonging to the same active virtual chassis topology.
Hello-Interval	Operational/current hello-interval.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Status	Defines whether a given switch's parameter is considered consistent with the master chassis' settings. The possible values are: **OK**: The switch is operating in virtual chassis mode and the given switch's parameter value is consistent with the settings of the master chassis. **NOK**: The switch is operating in virtual chassis mode and the given switch's parameter value is inconsistent with the settings of the master chassis. **N/A**: The switch is operating in virtual chassis mode, but the virtual chassis topology has not converged and therefore a master chassis is not yet known. **Disabled**: The switch is operating in standalone mode, in which there can be no virtual chassis master and hence the concept of consistency does not apply.

Release History

Release 7.3.1; command introduced.

1/0                1/1/3              Up         Yes
```

output definitions

Chassis/VFLink ID	Pair operational/current virtual chassis chassis identifier and virtual-fabric link (VFL) identifier.
Oper	Virtual-fabric link (VFL) operational status. The possible values are **Up** and **Down**.
Primary Port	Primary port of the virtual-fabric link (VFL) trunk, which is the port where non-unicast packets destined a remote chassis are sent out.
Config Port	Number of ports configured to operate as virtual-fabric link (VFL) member ports, i.e. ports that potentially may join a virtual-fabric link (VFL).
Active Port	Number of virtual-fabric link (VFL) member ports that are operational, i.e. the LACP protocol is fully operational for those ports.
Def Vlan	Operational default VLAN on the virtual-fabric link (VFL).
Chassis/Slot/Port	The operational *chassis/slot/port* tupple identifying a particular virtual-fabric link (VFL) member port.
Is Primary	Indicates is this port is the primary port of the VFL.

Release History

Release 7.3.1; command introduced.
Release 7.3.4; VFLink mode introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
virtual-chassis vf-link create	Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the Virtual Chassis operation between the two switches.
virtual-chassis vf-link member-port	Configures member ports for the virtual fabric link (VFL).
virtual-chassis vf-link default-vlan	Configures the default VLAN for the VFL.

show virtual-chassis auto-vf-link-port

Displays a summary of the auto VFL ports.

show virtual-chassis [chassis-id *oper_chassis***] auto-vf-link-port [***chassis/slot/port***]**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.
oper_chassis/slot/port	The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900

Usage Guidelines

This command can be executed on any switch within the virtual chassis topology.

Examples

```
-> show virtual-chassis auto-vf-link-port
Chassis/Slot/Port    VFL ID            VFL member status
-------------------+-----------------+-----------------------
1/1/1                1/0                Down
1/1/3                1/1                Up
```

output definitions

Chassis/Slot/Port	The chassis/slot/port identifier.
VFL ID	The VFL identifier.
VFL member status	The status of the VFL member port. Up or Down.

Release History

Release 7.3.4; command introduced.

Related Commands

virtual-chassis auto-vf-link-port	Configures the port to be an automatic VFL port.

MIB Objects

```
virtualChassisLinkTable
   virtualChassisOperChasID
   virtualChassisVflMemberPortRowStatus
```

show virtual-chassis chassis-reset-list

This command displays the list of all chassis that must be reset along with a specified chassis in order to prevent a virtual chassis topology split.

show virtual-chassis [chassis-id *oper_chassis***] chassis-reset-list**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
->  show virtual-chassis chassis-reset-list
Chas  Chassis reset list
-----+--------------------
1     1
2     2

-> show virtual-chassis chassis-id 1 chassis-reset-list
Chas  Chassis reset list
-----+--------------------
1     1
```

output definitions

Chas	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
Chassis reset list	A list of operational chassis identifiers, which define which switches must be reset, along with the switch given by Chas in order to prevent a split of the virtual chassis topology.

Release History

Release 7.3.1; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisChassisResetListTable
   virtualChassisOperChasId
   virtualChassisChassisResetList
```

show virtual-chassis slot-reset-list

For a given chassis and network interface module (NI), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split.

show virtual-chassis [chassis-id *oper_chassis***] slot-reset-list**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- On the OmniSwitch 6900, the slot number depicted in this command always refers to the main board of the switch (i.e. slot number 1). In other words, this command does not present the status related to expansion boards.

Examples

```
-> show virtual-chassis slot-reset-list
Chas  Slot    Reset status
-----+-------+--------------
1     1       Split
2     1       Split

-> show virtual-chassis chassis-id 1 slot-reset-list
Chas  Slot    Reset status
-----+-------+--------------
1     1       Split
```

output definitions

Chas	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).

output definitions

Slot	Slot number identifying a particular network interface module (NI). For OS6900 switches, the slot number is always be equal to 1.
Reset Status	For the network interface module (NI) identified by the pair (Chas, Slot), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split according to the following definitions. **Supported**: The network interface module can be reset without splitting the virtual chassis topology. **Split**: Resetting this network interface module will cause a virtual chassis topology split.

Release History

Release 7.3.1; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisSlotResetStatusTable
   virtualChassisOperChasID
   virtualChassisSlotResetStatus
```

show virtual-chassis neighbors

This command displays a list of which neighbors are connected via which VFL for a virtual chassis.

show virtual-chassis [chassis-id *oper_chassis***] neighbors**

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
-> show virtual-chassis neighbors

Chas VFL VFL VFL VFL VFL
 ID   0   1   2   3   4
----+---+---+---+---+---
  1   2   3   4   5   6
  2   1   3   4   5   6
  3   1   2   4   5   6
  4   1   2   3   5   6
  5   1   2   3   4   6
  6   1   2   3   4   5

-> show virtual-chassis chassis-id 2 neighbors

Chas VFL VFL VFL VFL VFL
 ID   0   1   2   3   4
----+---+---+---+---+---
  2   1   3   4   5   6
```

output definitions

Chas ID	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
VFL	The VLF identifier connecting to the remote chassis listed in the table.

Release History

Release 7.3.3; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisVflTable
   virtualChassisOperChasID
   virtualChassisVflId
   virtualChassisVflDirectNeighborChasId
```

show configuration vcm-snapshot chassis-id

Displays a snapshot of the switch specific virtual chassis configuration for a switch running in virtual chassis mode.

show configuration vcm-snapshot chassis-id *oper_chassis*

Syntax Definitions

oper_chassis	The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When a switch operates in standalone mode, this command is not supported. In this case, we must use the **show configuration snapshot virtual chassis** to obtain a snapshot of the switch specific virtual chassis configuration.

Examples

```
-> show configuration vcm-snapshot chassis-id 1
! Virtual Chassis Manager:
virtual-chassis chassis-id 1 configured-chassis-id 1
virtual-chassis chassis-id 1 vf-link 0 create
virtual-chassis chassis-id 1 vf-link 0 member-port 1/8/1
virtual-chassis chassis-id 1 configured-control-vlan 4091
virtual-chassis chassis-id 1 chassis-group 1

! IP:
ip interface local chassis-id 1 emp address 10.255.76.21 mask 255.255.255.0
```

Release History

Release 7.3.1; command introduced.

Related Commands

show configuration snapshot	Displays the configured and operational parameters related to the virtual chassis feature on the switch.

MIB Objects

N/A

virtual-chassis split-protection admin-state

Enable or disables the VC split protection feature.

virtual-chassis split-protection admin-state {enable | disable}

Syntax Definitions

enable	Enables VC split protection.
disable	Disables VC split protection.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- VCSP cannot be enabled before assigning a link aggregate.
- VCSP and the helper functionality can be enabled on the same link aggregate.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection admin-state enable
-> virtual-chassis split-protection admin-state disable
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.
virtual-chassis split-protection linkagg	Assigns a link aggregate for use with VCSP.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPAdminState
```

virtual-chassis split-protection linkagg

Assigns a link aggregate for use with VCSP.

virtual-chassis split-protection linkagg *agg_id*

no virtual-chassis split-protection linkagg

Syntax Definitions

agg_id	The link aggregate ID number to associate with the helper for VCSP support. The valid range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the link aggregate assignment.
- This command must be used to configure VC split protection linkagg before enabling VC split protection.

Examples

```
-> virtual-chassis split-protection linkagg 1
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPLinkaggID
```

virtual-chassis split-protection guard-timer

Configures the timer value for how long the master will wait to receive VCSP PDUs before beginning transmission of VCSP PDUs.

virtual-chassis split-protection guard-timer *time*

Syntax Definitions

time	Time interval to wait on boot up before choosing any state. The valid range is 30–100 seconds.

Defaults

parameter	default
time	30 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Changes to the Guard timer only take affect after reboot or by disabling and re-enabling VC split protection.

Examples

```
-> virtual-chassis split-protection guard-timer 60
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPGuardTimer
```

virtual-chassis split-protection helper admin-state

Enables or disables the helper functionality on the helper device.

virtual-chassis split-protection helper admin-state {enable | disable}

Syntax Definitions

enable	Enables VC split protection helper functionality.
disable	Disables VC split protection helper functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command on the helper device to enable the helper functionality.
- The helper functionality can be enabled on a device that is running VCSP.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection helper admin-state enable
-> virtual-chassis split-protection helper admin-state disable
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

virtual-chassis split-protection helper linkagg	Configures the link aggregate on which to apply the VCSP protocol for the helper device.

MIB Objects

```
alaVCSPHelperGlobalConfig
   alaVCSPHelperAdminState
```

virtual-chassis split-protection helper linkagg

Configures the link aggregate ID on which to apply the VCSP protocol on the helper device.

virtual-chassis split-protection helper linkagg *agg_id*

no virtual-chassis split-protection helper linkagg

Syntax Definitions

agg_id	The link aggregate ID number to associate with the helper for VCSP support. The valid range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the link aggregate assignment.
- Use this command on the helper device to enable the VCSP protocol on the helper link aggregate.

Examples

```
-> virtual-chassis split-protection helper linkagg 1
-> no virtual-chassis split-protection helper linkagg
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays the VCSP Helper status of the Link Aggregation ID assigned.
virtual-chassis split-protection helper admin-state	Enables or disables to helper functionality.

MIB Objects

```

   alaVCSPUptime
   alaVCSPProtectionStateUptime
```

show virtual-chassis split-protection vc-units

Displays the VCSP state of all VC units.

show virtual-chassis split-protection vc-units

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show virtual-chassis split-protection vc-units

CHASSIS     STATE
----------+-----------
 1          ACTIVE
 2          ACTIVE
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

virtual-chassis split-protection admin-state	Enable or disables the VC split protection feature.

MIB Objects

```
alaVCSPStateTable
   alaVCSPTableSlotNiNumber
   alaVCSPTableOperState
```

show virtual-chassis split-protection helper status

Displays the VCSP Helper status of the assigned link aggregation ID.

show virtual-chassis split-protection helper status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show virtual-chassis split-protection helper status
VC Split-Protection Helper Status : Enabled
 Link Aggregation Id            VC Split-Protection Status
------------------------+-------------------------------------------------------
           3                        Enabled
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

virtual-chassis split-protection helper admin-state	Enables or disables the helper functionality.

MIB Objects

```
alaVCSPHelperGlobalConfig
   alaVCSPHelperLinkaggId
   alaVCSPHelperState
```

14 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. The implementation of ERP on the OmniSwitch is based on ERP Version 2 (ITU-T G.8032/Y.1344 to 2010) using the Ring Automatic Protection Switching (R-APS) protocol to coordinate and prevent network loops within a bridged Ethernet ring.

ERPv2 supports multi-rings and ladder to ladder networks. ERPv2 functionalities allow configuration of Sub-Rings within a Master Ethernet Ring, interconnected nodes and shared links between the rings.

MIB information for Ethernet Ring Protection commands is as follows:

Filename: ALCATEL-IND1-ERP-MIB.mib
Module: alcatelIND1ERPMIB

A summary of available commands is listed here:

erp-ring

Creates an Ethernet Ring Protection (ERP) using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring. The specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

erp-ring *ring_id* **port1 {***chassis/slot/port* **| linkagg** *agg_id***} port2 {***chassis/slot/port* **| linkagg** *agg_id***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [wait-to-restore-timer** *wtr_timer***] [enable | disable]**

no erp-ring *ring_id*

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard-timer	The guard timer value, in centi seconds, for the ring node.
wtr-timer	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP ring**.**
disable	Administratively disables the ERP ring.

Defaults

parameter	default
guard_timer	50
wtr_timer	5
**enable	disable**	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Administratively disable the ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of 64 rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- Create an ERP type NNI-SVLAN binding before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 port1 1/1 port2 2/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates an NNI-SVLAN binding.

MIB Objects

```
alaErpRingTable
   alaErpRingServiceVid
   alaErpRingMEGLevel
   alaErpRingStatus
   alaErpRingPort1
   alaErpRingPort2
   alaErpRingWaitToRestore
   alaErpRingGuardTimer
   alaErpRingRowStatus
```

erp-ring rpl-node

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

erp-ring *ring_id* **rpl-node {port** *chassis/slot/port* **| linkagg** *agg_id***}**

no erp-ring *ring_id* **rpl-node**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.

Defaults

NA

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled. RPL configuration applied to the Ethernet ring while it is enabled is rejected.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

Examples

```
-> erp-ring 1 rpl-node port 2/1
-> erp-ring 2 rpl-node linkagg 2
-> no erp-ring 2 rpl-node
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring wait-to-restore	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingPortEntry
   alaErpRingPortIfIndex
   alaErpRingPortType
```

erp-ring wait-to-restore

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

erp-ring *ring_id* **wait-to-restore** *wtr_timer*

no erp-ring *ring_id* **wait-to-restore**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
wtr_timer	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1 to 12.

Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

Examples

```
-> erp-ring 1 wait-to-restore 6
-> no erp-ring 1 wait-to-restore
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring rpl-node	Configures a Ring Protection Link (RPL) port connection.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingWaitToRestoreTimer
```

erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

erp-ring *ring_id* **{enable** | **disable}**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
enable	Enables the specified ring ID.
disable	Disables the specified ring ID.

Defaults

By default, ERP rings are disabled when they are created.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- The specified ring ID must exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

Examples

```
-> erp-ring 1 enable
-> erp-ring 1 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingStatus
```

erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

erp-ring *ring_id* **guard-timer** *guard_timer*

no erp-ring *ring_id* **guard-timer**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
guard_timer	The guard timer value. The valid range is 1–200 centi-secs.

Defaults

parameter	default
guard_timer	50

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingGuardTimer
```

erp-ring sub-ring

Creates an Ethernet Ring Protection (ERP) sub-ring.

erp-ring *ring_id* **sub-ring-port {***chassis/slot/port* **| linkagg** *agg_id***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [wait-to-restore-timer** *wtr_timer***] [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard_timer	The guard timer value, in centi-secs, for the ring node.
wtr-timer	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP sub-ring**.**
disable	Administratively disables the ERP sub-ring.

Defaults

parameter	default
guard_timer	50
wtr_timer	5
**enable	disable**	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** form of this command to remove a sub-ring from the switch configuration. Administratively disable ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.
- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.

- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of four rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding must be created before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 sub-ring-port 1/1 service-vlan 10 level 2 enable
-> erp-ring 2 sub-ring-port linkagg 1 port2 2/10 service-vlan 20 level 2
-> no erp-ring 2
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates a NNI-SVLAN binding.

erp-ring virtual-channel

Enables or disables an Ethernet Ring Protection (ERP) Ring Virtual Channel.

erp-ring *ring_id* **virtual-channel [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables the ERP virtual channel**.** If enabled, Ring Automatic Protection Switching (R-APS) protocol messages are encapsulated and transmitted over a virtual channel configured on the major ring.
disable	Administratively disables the ERP virtual channel. If disabled, R-APS messages are terminated at the interconnection nodes between the rings but not blocked at the Ring Protection Link (RPL) of the sub-ring.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by Ring ID must be created before configuring the virtual channel state for ring node.

Examples

```
-> erp-ring 2 virtual-channel disable
-> erp-ring 1 virtual-channel enable
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingVirtualChannel
```

erp-ring revertive

Enables or Disables revertive mode on the specified node.

erp-ring *ring_id* **revertive [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables Revertive Mode**.** Now, if the RPL is unblocked due to a failure within the ring, the RPL automatically reverts to the “Blocked” state when the failed link recovers.
disable	Administratively Disables Revertive Mode.Now, if the RPL is unblocked due to a failure within the ring, the RPL does not automatically revert to “Blocked” state when the failed link recovers.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by the Ring ID must be created using the **erp-ring** command, before configuring the revertive mode for ring node.

Examples

```
-> erp-ring 1 revertive enable
-> erp-ring 2 revertive disable
```

Release History

Release 7.3.1; command introduced.

Related Commands

show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingRevertive
```

erp-ring clear

Clears any pending state (for example, non-revertive restoring).

erp-ring *ring_id* **clear**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
clear	Clears any pending state on the ring.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 clear
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.

   alaErpRingClearAction
```

erp-ring ethoam-event

Configures a ring port to accept a “loss of connectivity” event from Ethernet OAM for a remote endpoint.

erp-ring *ring_id* **ethoam-event {***chassis/slot/port* **| linkagg** *agg_id***} remote-endpoint** *mep_id*

no erp-ring *ring_id* **ethoam-event {***chassis/slot/port* **| linkagg** *agg_id***}**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.
mep_id	The remote endpoint ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 ethoam-event 1/1 remote-endpoint 10
-> erp-ring 1 ethoam-event linkagg 1 remote-endpoint 10
```

Release History

Release 7.3.1; command introduced.

Related Commands

   alaErpRingId
   alaErpRingPortIfIndex
   alaErpRingPortEthOAMEvent
   alaErpRingPortRmepId
```

clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

clear erp statistics [ring *ring_id* **[port** *chassis/slot/port* **| linkagg** *agg_id***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.

Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/2
-> clear erp statistics ring 5 linkagg 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpClearStats
alaErpRingTable

   alaErpRingClearStats
alaErpRingPortTable
   alaErpRingPortIfIndex
   alaErpRingPortClearStats
```

show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

show erp [ring *ring_id* **| [port** *chassis/slot/port* **| linkagg** *agg_id***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.

Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> show erp

show erp statistics

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

show erp statistics [ring *ring_id* **[port** *chassis/slot/port* **| linkagg** *agg_id***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_id	The link aggregate ID number.

Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> show erp statistics

15 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs.

Filename: ALCATEL-IND1-MVRP-MIB.mib
Module: alcatelIND1MVRPMIB

A summary of the available commands is listed here:

mvrp

Enables or disables MVRP globally on the switch.

mvrp {enable | disable}

Syntax Definitions

enable	Enables MVRP globally on the switch.
disable	Disables MVRP globally on the switch.

Defaults

By default, MVRP is disabled on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Disabling MVRP globally deletes all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the per-VLAN mode.

Examples

```
-> mvrp enable
-> mvrp disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.

MIB Objects

```
alaMvrpGlobalStatus
```

mvrp port

Enables or disables MVRP on specific ports on the switch.

mvrp port *chassis/slot/port***[–***port2***] {enable | disable}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8)
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, MVRP is disabled on all the ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, VLAN Stacking User ports) do not support MVRP.

Examples

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

mvrp linkagg *agg_id***[-***agg_id2***] {enable | disable}**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables MVRP for the specified link aggregate ID.
disable	Disables MVRP for the specified link aggregate ID.

Defaults

By default, MVRP is disabled on all the ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created.

Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp maximum-vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

mvrp maximum-vlan *vlan_limit*

Syntax Definitions

vlan_limit	The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

Defaults

The default value is 256.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learned VLANs, then the new configuration takes effect only after the MVRP is disabled and re-enabled on the switch. The VLANs learned earlier are retained if this operation is not performed.

Examples

```
-> mvrp maximum-vlan 100
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.
show mvrp vlan-restrictions	Displays the list of VLANS learned through MVRP and their details.

MIB Objects

```
alaMvrpMaxVlanLimit
```

mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} registration {normal | fixed | forbidden}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
normal	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
fixed	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
forbidden	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLANs created earlier is de-registered.

Defaults

parameter	default
normal | fixed | forbidden	**normal**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 registration forbidden
-> mvrp port 1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigRegistrarMode
```

mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} applicant {participant | non-participant | active}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
participant	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
non-participant	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
active	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

Defaults

parameter	default
participant | non-participant | active	**active**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 applicant active
-> mvrp port 1/3 applicant participant
-> mvrp port 1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigtable
   alaMvrpPortConfigApplicantMode
```

mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} timer join** *timer_value*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer_value	Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

Defaults

parameter	default
timer-value	600 milliseconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer join 600
-> mvrp port 1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} timer leave** *timer_value*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer-value	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
timer_value	1800 milliseconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (16.66 milliseconds). Leave timer must be at least be greater than twice the join timer plus100 milliseconds.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTime
```

mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} timer leaveall** *timer_value*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer_value	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	30000 milliseconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- LeaveAll timer value must be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer leaveall 30000
-> mvrp port 1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} timer periodic-timer** *timer_value*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer_value	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	*1 second*

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1
-> mvrp linkagg 3-6 timer periodic-timer 1
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} periodic-transmission {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables periodic transmission status on a port.
disable	Disables periodic transmission status on a port.

Defaults

By default, periodic-transmission status is disabled on all the ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 periodic-transmission enable
-> mvrp port 1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigPeriodicTransmissionStatus
```

mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

mvrp {port *chassis/slot/port* **[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-registration vlan** *vlan_list*

no mvrp {port *chassis/slot/port* **[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-registration vlan** *vlan_list*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The VLAN ID or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1 restrict-vlan-registration vlan 6-10
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

mvrp {port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-advertisement vlan** *vlan_list*

no mvrp {port *chassis/***]***slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-advertisement vlan** *vlan_list*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP VLAN advertisement is not restricted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

Release History

Release 7.2.1; command introduced.

Related Commands

mvrp applicant	Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
mvrp timer join	Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

mvrp {linkagg *agg_id***[-***agg_id2***] | port** *chassis/slot/port***[–***port2***]} static-vlan-restrict vlan** *vlan_list*

no mvrp {linkagg *agg_id***[-***agg_id2***] | port** *chassis/slot/port***[–***port2***]} static-vlan-restrict vlan** *vlan_list*

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.

Examples

```
-> mvrp port 1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/2 static-vlan-restrict vlan 5
-> mvrp port 1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/2 static-vlan-restrict vlan 6-9
-> mvrp linkagg 3 static-vlan-restrict vlan 4-5
-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5
```

Release History

output definitions

Port	Displays the slot and port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.
LeaveAll Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.
Periodic Tx Status	The transmission status of MVRP, **enable** or **disable.**

Release History

Release 7.2.1; command introduced.

Related Commands

mvrp port	Enables or disables MVRP on specific ports on the switch.
mvrp	Configures VLAN dynamic registration mode to MVRP and deletes all static configuration of previous mode along with the dynamic data.

MIB Objects

```

   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
   alaMvrpPortConfigPeriodicTransmissionStatus
```

show mvrp linkagg

Displays the MVRP configurations for linkaggs, including timer values, registration and applicant modes.

show mvrp linkagg [*agg_id***[-***agg_id2***]} [enabled | disabled]**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enabled	To display only the enabled ports.
disabled	To display only the disabled ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show mvrp linkagg 1-3

Port Status    Join    Leave LeaveAll Periodic  Registration Applicant  Periodic
               Timer   Timer  Timer    Timer    Mode         Mode       Tx Status

```

show mvrp timer

Displays the timer values configured for all the ports or a specific port.

show mvrp [port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]] timer {join | leave | leaveall | periodic-timer}**

Syntax Definitions

chassis	The chassis identifier when running in virtual chassis mode.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
join	To display only the join timer.
leave	To display only the leave timer.
leaveall	To display only the leaveall timer.
periodic-timer	To display only the periodic-timer.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg_id* or *slot/port* parameter with this command to display the timer values configured for a specific port.

Examples

```
-> show mvrp timer

Port    Join Timer     Leave Timer    LeaveAll Timer   Periodic Timer
        (msec)         (msec)          (sec)             (msec)

```

output definitions

Port	Displays the slot/port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.

output definitions (continued)

LeaveAll Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.

Release History

Release 7.2.1; command introduced.

Related Commands

mvrp timer join	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
mvrp timer leave	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
mvrp timer leaveall	Specifies the frequency with which the LeaveAll messages are communicated.
mvrp timer periodic-timer	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} statistics**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg_id* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 statistics

```

output definitions

New Received	The number of new MVRP messages received on the switch.
Join In Received	The number of MVRP Join In messages received on the switch
Join Empty Received	The number of MVRP Join Empty messages received on the switch.
Leave In Received	The number of MVRP Leave In messages received on the switch.
In Received	The total MVRP messages received on the switch.
Empty Received	The number of MVRP Empty messages received on the switch.
Leave All Received	The number of MVRP Leave All messages received on the switch.

output definitions (continued)

New Transmitted	The number of new MVRP messages sent by the switch.
Join In Transmitted	The number of MVRP Join In messages sent by the switch
Join Empty Transmitted	The number of MVRP Join Empty messages sent by the switch.
Leave Transmitted	The number of MVRP Leave messages sent by the switch.
In Transmitted	The number of MVRP In messages sent by the switch.
Empty Transmitted	The number of MVRP empty messages sent by the switch.
LeaveAll Transmitted	The number of Leave All messages sent by the switch.
Failed Registrations	The number of failed registrations.
Total Mrp PDU Received	The number of total MRP PDUs received by the switch.
Total Mrp Msgs Received	The number of total MRP messages received by the switch.
Total Mrp Msgs Transmitted	The number of total MRP messages sent by the switch.
Invalid Msgs Received	The number of invalid messages received by the switch.

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp configuration	Clears MVRP statistics for all ports, an aggregate of ports, or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} last-pdu-origin**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show mvrp port 1/1-3 last-pdu-origin

Port     Last PDU Origin
--------+------------------
1/1      00:d0:95:ee:f4:64
1/2      00:d0:95:ee:f4:65
1/3      00:d0:95:ee:f4:66

->show mvrp port 1/21 last-pdu-origin

Port     Last PDU Origin
--------+------------------
1/1      00:d0:95:ee:f4:64
```

output definitions

Port	Displays the slot and port number.
Last PDU origin	The source MAC address of the last PDU message received on the specific port.

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortStatsTable
   alaMvrpPortLastPduOrigin
```

show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} vlan-restrictions**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *agg_id* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 vlan-restrictions

VLAN ID             Static      Restricted      Restricted
                 Registration   Registration    Applicant
--------------+--------------+--------------+-----------
     1               LEARN          FALSE          FALSE
     2               LEARN          FALSE          FALSE
     3               LEARN          FALSE          FALSE
     4               LEARN          FALSE          FALSE
     5               LEARN          FALSE          FALSE
     6               LEARN          FALSE          FALSE
     7               LEARN          FALSE          FALSE
    11               RESTRICT       FALSE          FALSE
    12               RESTRICT       FALSE          FALSE
    53               LEARN          TRUE           FALSE
    55               LEARN          FALSE          TRUE
```

output definitions

VLAN ID	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
Static Registration	Indicates if the port is restricted (**RESTRICT**) or not restricted (**LEARN**) from becoming a member of the static VLAN.

output definitions (continued)

Restricted Registration	Indicates if the VLAN is restricted (**TRUE**) or not restricted (**FALSE**) from dynamic registration on the port.
Restricted Applicant	Indicates if the VLAN is restricted for advertisement from the port (**TRUE**) or not (**FALSE**).

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigRestrictedRegistrationBitmap
   alaMvrpPortConfigRestrictedApplicantBitmap
   alaMvrpPortConfigRegistrationToStaticVlan
```

mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

mvrp [port *chassis/slot/port* **[–***port2***] | linkagg** *agg_id***[-***agg_id2***]] clear-statistics**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *agg_id* or *slot/port* parameter with this command to clear MVRP statistics for a specific port.

Examples

```
-> mvrp clear-statistics
-> mvrp port 1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpGlobalClearStats
   alaMvrpPortStatsTable
   alaMvrpPortStatsClearStats
```

16 802.1AB Commands

802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of it. The information is exchanged as an LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

The OmniSwitch version of 802.1AB complies with the following:

- IEEE 802.1AB-2009 Station and Media Access Control Discovery
- ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices.

MIB information for the 802.1AB commands is as follows:

MIB Filename: LLDP-MIB.mib, LLDP-TC-MIB.mib, LLDP-EXT-DOT1-MIB.mib, LLDP-EXT-DOT3-MIB.mib, LLDP-EXT-MED-MIB.mib

*MIB V2 Filenam*es: LLDP-V2-MIB.mib, LLDP-V2-TC-MIB.mib, LLDP-EXT-DOT1-V2-MIB.mib, LLDP-EXT-DOT3-V2-MIB.mib, LLDP-EXT-MED-MIB.mib

Filename: ALCATEL-IND1-LLDP-MED-MIB.mib
Module: alcatelIND1LLDPMEDMIB

Filename: ALCATEL-IND1-LLDP-TRUST-MIB.mib
Module: alcatelIND1LLDPTRUSTMIB

A summary of available commands is listed here:

lldp nearest-edge mode
lldp transmit interval
lldp transmit hold-multiplier
lldp reinit delay
lldp notification interval
lldp lldpdu

show lldp remote-system med
show lldp remote-system application-tlv
show lldp agent-destination-address
lldp trust-agent
lldp trust-agent violation-action
show lldp trusted remote-agent
show lldp trust-agent

Configuration procedures for 802.1AB are explained in “Configuring 802.1AB,” *OmniSwitch AOS Release 8 Network Configuration Guide*.

lldp nearest-edge mode

Enables or disables the nearest-edge mode for the switch. When enabled, the switch will use the LLDP destination MAC address (01:20: DA: 02:01:73) to send LLDPDUs.

lldp nearest-edge mode {enable | disable}

Syntax Definitions

enable	Enables the nearest-edge mode.
disable	Disables the nearest-edge mode.

Defaults

NA

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.
- This mode is used to learn the Management VLAN ID from a centralized Remote Configuration management switch.

Examples

```
-> lldp nearest-edge mode enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

show lldp local-system	Displays local system information.

MIB Objects

```
lldpDestMac
```

lldp transmit interval

Sets the transmit time interval for LLDPDUs.

lldp transmit interval *seconds*

Syntax Definitions

seconds	The transmit interval between LLDPDUs, in seconds. The valid range is 5 - 32768.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The LLDP protocol must be enabled before using this command.

Examples

```
-> lldp transmit interval 40
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp transmit hold-multiplier	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpV2MessageTxInterval
```

lldp transmit hold-multiplier

Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

lldp transmit hold-multiplier *num*

Syntax Definitions

num	The transmit hold multiplier value. The valid range is 2-10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The Time To Live is a multiple of transmit interval and transmit hold multiplier.

Examples

```
-> lldp transmit hold-multiplier 6
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp transmit interval	Sets the transmit time interval for LLDPDUs.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpV2MessageTxHoldMultiplier
```

lldp reinit delay

Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.

lldp reinit delay *seconds*

Syntax Definitions

seconds	The number of seconds to reinitialize the ports status after a status change. The valid range is 1-10.

Defaults

parameter	default
seconds	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The LLDP protocol must be enabled before using this command.

Examples

```
-> lldp reinit delay 4
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp transmit interval	Sets the minimum time interval between successive LLDPDUs transmitted.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpV2ReinitDelay
```

lldp notification interval

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

lldp notification interval *seconds*

Syntax Definitions

seconds	The minimum number of seconds for generating a notification-event. The valid range is 5-3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDP protocol and notification must be enabled before using this command.
- In a specified interval, it is not possible to generate more than one notification-event.

Examples

```
-> lldp notification interval 25
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp notification	Specifies the switch to control per port notification status about the remote device change.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpV2NotificationInterval
```

lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* | **chassis} lldpdu {tx | rx | tx-and-rx | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
tx	Transmits LLDPDUs.
rx	Receives LLDPDUs.
tx-and-rx	Transmits and receives LLDPDUs.
disable	Disables LLDPDUs transmission and reception.

Defaults

parameter	default
tx | rx | tx-and-rx | disable	**tx-and-rx**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The port can be set to receive, transmit, or transmit and receive LLDPDUs using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.

- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 lldpdu tx-and-rx
-> lldp slot 3 lldpdu tx
-> lldp chassis lldpdu disable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp notification	Specifies the switch to control per port notification status about the remote device change.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigIfIndex
   lldpV2PortConfigDestAddressIndex
   lldpV2PortConfigAdminStatus
```

lldp notification

Specifies the switch to control per port notification status about the remote device change.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* | **chassis} notification {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables the notification of local system MIB changes.
disable	Disables the notification.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 notification enable
-> lldp slot 1 notification disable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.
lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

MIB Objects

```
lldpPortConfigTable
   lldpV2PortConfigPortNum
   lldpV2PortConfigDestAddressIndex
   lldpV2PortConfigNotificationEnable
```

lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

lldp network-policy *policy_id* **application {voice | voice-signaling | guest-voice | guest-voice-signaling | softphone-voice | video-conferencing | streaming-video | video-signaling} vlan {untagged | priority-tag |** *vlan-id***} [l2-priority** *802.1p_value***] [dscp** *dscp_value***]**

no lldp network-policy *policy_id* - [*policy_id2*]

Syntax Definitions

policy_id -[*policy_id2*]	A network policy identifier (0-31) which is associated to a port. Supported only with the **no** form of the command
voice	Specifies a voice application type.
voice-signaling	Specifies a voice-signaling application type.
guest-voice	Specifies a guest-voice application type.
guest-voice-signaling	Specifies a guest-voice-signaling application type.
softphone-voice	Specifies a softphone-voice application type.
video-conferencing	Specifies a video-conferencing application type.
streaming-video	Specifies a streaming-video application type.
video-signaling	Specifies a video-signaling application type.
untagged	Specifies that a VLAN port is untagged.
priority-tag	Specifies the internal priority that would be assigned to the VLAN**.**
vlan_id	VLAN identifier. Valid range is 1–4094.
802.1p_value	The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
dscp_value	Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

Defaults

parameter	default
802.1p_value **for voice application**	**5**
802.1p_value **for other applications**	**0**
dscp_value	**0**

By default, the VLAN ID is configured in the voice network profile.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the **no** form of this command.

Examples

```
-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged l2–
priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 l2-priority 2 dscp 43
-> no lldp network-policy 10

-> no lldp network-policy 10-20
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the network policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port.

MIB Objects

```
alaLldpXMedLocMediaPolicyTable
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyAppType
   alaLldpXMedLocMediaPolicyVlanType
   alaLldpXMedLocMediaPolicyVlanID
   alaLldpXMedLocMediaPolicyPriority
   alaLldpXMedLocMediaPolicyDscp
   alaLldpXMedLocMediaPolicyUnknown
   alaLldpXMedLocMediaPolicyTagged
   alaLldpXMedLocMediaPolicyRowStatus
```

lldp med network-policy

Associates an existing network policy per LLDP agent per port, slot, or chassis. Also specifies the LLDP destination MAC address sent in LLDPDUs.

lldp [nearest-bridge | nearest-customer | non-tpmr | all] {port *chassis/slot/port* **| slot** *chassis/slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

no lldp {port *chassis/slot/port* **| slot** *chassis/slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

Syntax Definition

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number for a specific module (3/1).
chassis	Specifies all switch ports.
policy_id - [*policy_id2*]	A network policy identifier (0–31).

Defaults

NA

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disassociate a network policy from a port.
- The network policy must already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

Examples

```
-> lldp chassis med network-policy 22
-> lldp slot 1/1 med network-policy 1-4 5 6
-> lldp por 2/1/3 med network-policy 12
-> no lldp slot 2/3 med network-policy 12
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the MED Network Policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable
   alaLldpXMedLocMediaPolicyPortIfIndex
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyPortRowStatus
```

lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* | **chassis} tlv management {port-description | system-name | system-description | system-capabilities | management-address} {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
port-description	Enables or disables the transmission of port description TLV in LLDPDU.
system-name	Enables or disables the transmission of system name TLV in LLDPDU.
system-description	Enables or disables transmission of system description TLV in LLDPDU.
system-capabilities	Enables or disables transmission of system capabilities TLV in LLDPDU.
management-address	Enables or disables transmission of management address on per port.
enable	Enables management TLV LLDPDU transmission.
disable	Disables management TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 tlv management port-description enable
-> lldp slot 2 tlv management management-address enable
-> lldp slot 3 tlv management system-name disable
-> lldp chassis tlv management system-capabilities enable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
show lldp local-system	Displays local system information.
show lldp local-port	Displays per port information.
show lldp remote-system	Displays per local port and information of remote system.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2LocPortPortNum
   lldpV2PortConfigTLVsTxEnable
lldpV2ConfigManAddrTable
   lldpV2ConfigManAddrPortsTxEnable
```

lldp tlv dot1

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* | **chassis} tlv dot1 {port-vlan | vlan-name} {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
port-vlan	Enables or disables transmission of port VLAN TLV in LLDPDU.
vlan-name	Enables or disables transmission of VLAN name TLV in LLDPDU.
enable	Enables 802.1 TLV LLDPDU transmission.
disable	Disables 802.1 TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- If one TLV is included then the other TLV is automatically included when you use this command.

- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 5/1 tlv dot1 port-vlan enable
-> lldp slot 3 tlv dot1 vlan-name enable
-> lldp slot 3 tlv dot1 vlan-name disable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

   lldpV2Xdot1ConfigVlanNameTxEnable
```

lldp tlv dot3

Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port* **[-***port2***]| slot** *chassis/slot* | **chassis} tlv dot3 mac-phy {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables 802.3 TLV LLDPDU transmission.
disable	Disables 802.3 TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 2/4 tlv dot3 mac-phy enable
-> lldp slot 2 tlv dot3 mac-phy disable
```

Release History

```

lldp tlv med

Specifies the switch to control per port LLDP-MED (Media Endpoint Device) TLVs to be incorporated in the LLDPDUs.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port* **[-***port2***] | slot** *chassis/slot* | **chassis} tlv med {power | capability} {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
capability	Enables or disables transmission of LLDP-MED capabilities TLV in LLDPDU.
enable	Enables LLDP-MED TLV LLDPDU transmission.
disable	Disables LLDP-MED TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command will be lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.

- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp 4/4 tlv med power enable
-> lldp 4/3 tlv med capability enable
-> lldp 4 tlv med power disable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot1	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.
lldp tlv dot3	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigPortNum
lldpV2XMedPortConfigTable
   lldpV2XMedPortConfigTLVsTxEnable
```

lldp tlv proprietary

Allows the switch to advertise the Access Point location through the proprietary TLVs.

lldp {port *chassis/slot/port* **[-***port2***]| slot** *chassis/slot* | **chassis} tlv proprietary {enable | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All switch ports.
enable	Enables proprietary TLVs to advertise AP location.
disable	Disables proprietary TLVs to advertise AP location.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The VLAN information is advertised through 802.1x TLV (i.e, Management VLAN is advertised if the port is a 802.1x port else default VLAN of the port is advertised). The AP location is advertised through proprietary TLV.
- If an AP is detected and authenticated on a 802.1x port, LLDP TLVs are triggered to advertise management VLAN and AP location despite CLI configuration being disabled.
- If an AP is removed from 802.1x port, LLDP receives message from 802.1x port after which LLDP stops advertising of management VLAN and AP location, only if the configuration is disabled explicitly on the port.

Examples

```
-> lldp port 5/1 tlv proprietary enable
-> lldp port 5/1 tlv proprietary disable
-> lldp slot 2 tlv proprietary enable
-> lldp slot 2 tlv proprietary disable
-> lldp chassis tlv proprietary enable
-> lldp chassis tlv proprietary disable
```

Release History

Release 8.4.1.R02; command introduced.

   alaLldpPropAPLocation
```

lldp tlv application

Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port. This TLV is only configurable for the nearest-bridge LLDP agent.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port* **[-***port2***]| slot** *chassis/slot* | **chassis} tlv application {enable | disable}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables Application Priority TLV LLDPDU transmission.
disable	Disables Application Priority TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 2/4 tlv application enable
-> lldp slot 2 tlv application disable
```

Release History

Release 7.3.2; command introduced.

Related Commands

lldp tlv application priority	Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.
show lldp config	Displays per port statistics.

MIB Objects

```
lldpXdot1dcbxConfigApplicationPriorityTable
   lldpXdot1dcbxConfigApplicationPriorityTxEnable
```

lldp tlv application priority

Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.

lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* | **chassis} tlv application {fcoe | iscsi | ethertype** *etype* **| tcp-sctp-port** *protocol* **| udp-dccp-port** *protocol* | **port** *protocol***} priority** *priority*

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
chassis	The chassis identifier when running in virtual chassis mode.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
chassis	Specifies the whole chassis.
fcoe	Advertise the specified priority value to use for FCoE traffic.
iscsi	Advertise the specified priority value to use for SCSI traffic.
etype	Advertise the specified priority value to use for this Ethertype.
protocol	Advertise the specified priority value to use for the specified protocol.

Defaults

parameter	default
enable | disable	**disable**
non-tpmr | nearest-customer | nearest-bridge	**nearest-bridge**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The LLDPDU must be enabled and set to transmit and receive before using this command.
- The Application Priority TLV must be enabled for transmission.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/1/3 tlv application fcoe priority 3
-> lldp port 1/1/3 tlv application tcp-sctp-port 3192 priority 5
```

Release History

Release 7.3.2; command introduced.

Related Commands

lldp tlv application	Enables or disables Application Priority TLV in LLDPDUs.
show lldp config	Displays the LLDP port configuration.

MIB Objects

```
alaXdot1dcbxAdminApplicationPriorityAppTable
   alaXdot1dcbxAdminApplicationPriorityAEPriority
```

show lldp system-statistics

Displays system-wide statistics.

show lldp system-statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show lldp system-statistics
 Local LLDP Agent System Statistics:
  Remote Systems Last Change  = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts  = 2,
  Remote Systems MIB Deletes  = 0,
  Remote Systems MIB Drops    = 0,
  Remote Systems MIB Age Outs = 0
```

output definitions

Remote Systems Last Change	The last change recorded in the tables associated with the remote system.
Remote Systems MIB Inserts	The total number of complete inserts in the tables associated with the remote system.
Remote Systems MIB Deletes	The total number of complete deletes in tables associated with the remote system.
Remote Systems MIB Drops	The total number of LLDPDUs dropped because of insufficient resources.
Remote Systems MIB Age Outs	The total number of complete age-outs in the tables associated with the remote system.

Release History

Release 7.1.1; command introduced.

Related Commands

lldp notification	Specifies the switch to control per port notification status about the remote device change.
lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.

MIB Objects

```
lldpStatistics
   lldpStatsRemTablesLastChangeTime
   lldpStatsRemTablesInserts
   lldpStatsRemTablesDeletes
   lldpStatsRemTablesDrops
   lldpStatsRemTablesAgeouts
```

show lldp statistics

Displays per port statistics.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port *chassis/slot/port* **[-***port2***] slot** *chassis/slot***] statistics**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.

Defaults

By default, statistics for all LLDP ports are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the *slot/port* option is not specified, statistics for the chassis are displayed.
- If the statistics are zero they are not displayed.

Examples

```
-> show lldp statistics
           LLDPDU    LLDPDU   LLDPDU    LLDPDU   LLDPDU     TLV      TLV       Device

```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
LLDPDU Tx	The total number of LLDPDUs transmitted on the port.
LLDPDU Rx	The total number of valid LLDPDUs received on the port.
LLDPDU Errors	The total number of invalid LLDPDUs discarded on the port.
LLDPDU Discards	The total number of LLDPDUs discarded on the port.
TLV Unknown	The total number of unrecognized LLDP TLVs on the port.
TLV Discards	The total number of LLDP TLVs discarded on the port.
Device Ageouts	The total number of complete age-outs on the port.

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

show lldp local-system

Displays local system information.

show lldp local-system

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype          = 4 (MAC Address),
  Chassis ID                  = 00:d0:95:e9:c9:2e,
  System Name                 = OS6900-DC1,
  System Description          = 7.3.2.315.R01 Development, June 03, 2013.,
  Capabilites Supported       = Bridge, Router,
  Capabilites Enabled         = Bridge, Router,
  LLDPDU Transmit Interval    = 30 seconds,
  TTL Hold Multiplier         = 4,
  LLDPDU Transmit Delay       = 2 seconds,
  Reintialization Delay       = 2 seconds,
  MIB Notification Interval   = 5 seconds
  Management Address Type     = 1 (IPv4),
  Management IP Address       = 10.255.11.100,
```

output definitions

Chassis ID Subtype	The subtype that describe chassis ID.
Chassis ID	The chassis ID (MAC address).
System Name	The name of the system.
System Description	The description of the system.
Capabilites Supported	The capabilities of the system.
Capabilites Enabled	The enabled capabilities of the system.
LLDPDU Transmit Interval	The LLDPDU transmit interval.
TTL Hold Multiplier	The hold multiplier used to calculate TTL.

output definitions (continued)

LLDPDU Transmit Delay	The minimum transmit time between successive LLDPDUs.
Reintialization Delay	The minimum time interval before the reinitialization of local port objects between port status changes.
MIB Notification Interval	The minimum time interval between consecutive notifications of local system MIB change.
Management Address Type	The type of management address used in LLDPDU.
Management IP Address	The management IP address. The loopback0 IP address is configured for the management IP address to be transmitted.

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp reinit delay	Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.
lldp transmit hold-multiplier	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
lldp transmit interval	Sets the minimum time interval between successive LLDPDUs transmitted.

show lldp config

Displays the general LLDP configuration information for LLDP ports.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port *chassis/***]***slot/port* **[-***port2***] | slot** *chassis/slot***] config [application-tlv]**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
application-tlv	Displays Application Priority TLV parameters.

Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp config

  1/2   Ethertype                       0x8906        3
  1/2   Tcp/Sctp                       3260          4
  1/20  Tcp/Sctp                       3190          3
  1/20  Udp/Dccp                        300           4
  1/20  Tcp/Udp/Sctp/Dccp               300           4
```

output definitions

Slot/Port	The LLDP slot and port number.
Admin Status	Indicates the Administrative status of the LLDP port. The options are: **Disabled**, **Rx**, **Tx**, and **Rx+Tx**.
Notify Trap	Indicates whether the Notify Trap feature is disabled or enabled on a particular port.
Std TLV Mask	The standard TLV mask set for the port.
Mgmt Address	Indicates whether transmission of the per port IPv4 management address is enabled or disabled.
802.1 TLV	Indicates whether 802.1 TLV status is enabled or disabled on the LLDP port.
802.3 Mask	The standard 802.3 mask set for the port.
MED Mask	The standard MED mask set for the port.
App-Prio TLV	Indicates the Application priority TLV status.
Trust Status	Indicates the Trust Status.
Proprietary TLV	Indicates the proprietary TLV status.

Release History

Release 7.1.1; command introduced.
Release 7.3.2; **App-Prio TLV** field added, **application-tlv** parameter added.
Release 7.3.1; Version 2 (2009) updates implemented.
Release 8.4.1.R02; **Proprietary TLV** output field added.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp notification	Specifies the switch to control per port notification status about the remote device change.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot3	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.
lldp tlv application	Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port.
lldp tlv application priority	Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.

show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

show lldp network-policy [*policy_id***]**

Syntax Definitions

policy_id	Policy identifier for a network policy definition. Valid range is between 0 and 31.

Defaults

By default, all configured policies are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a policy ID with this command to display information for a specific policy.

Examples

```
-> show lldp network-policy
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Network         Application       Vlan    Layer2   DSCP
Policy ID        Type              Id    Priority  Value
-----------+---------------------+------+--------+-------
     1      voice                  4000   7        33
    12      guest-voice               -   -        44
    21      streaming-voice           0   4        11
    31      guest-voice-signaling    23   2        1

-> show lldp network-policy 21
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Network         Application       Vlan    Layer2   DSCP
Policy ID        Type              Id    Priority  Value
-----------+---------------------+------+--------+-------
    21      streaming-voice           0   4        11
```

output definitions

Network Policy ID	Policy identifier for a network policy definition.
Application Type	Indicates the type of application configured on the port or VLAN.
VLAN ID	The VLAN ID assigned to the port on which the network policy is configured.

output definitions

Layer2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

Release History

Release 8.1.1 command introduced.

Related Commands

lldp network-policy	Configures a local network policy on a switch for an application type.

```

show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

show lldp [nearest-bridge | nearest-customer | non-tpmr | all] [slot *chassis/slot*| **port** *chassis/slot/port***] med network-policy**

Syntax Definitions

nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
all	Specifies that all three LLDP agents must be supported.
chassis/slot	The chassis ID and slot number for a specific module (3/1).
*chassis/slot/port***[***-port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

By default, all ports with associated policies are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a slot or slot/port number with this command to display information for a specific slot or port.

Examples

```
-> show lldp slot 1/1 med network-policy

 chassis/slot/port     Network Policy ID
-------------+------------------------
    1/1/1                1 3 5 7 21 23 30 31
    1/1/2                1 2 3 4 7 8 9 10
    .
    .
    .
```

output definitions

Chassis/Slot/Port	Slot number for the module and physical port number on that module.
Network Policy ID	Policy identifier for a network policy definition.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
lldp med network-policy	Configures a local network policy on a switch for an application type.

show lldp remote-system

Displays per local port and information of remote system.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port *chassis/slot/port* **[-***port2***] | slot** *chassis/slot***] remote-system**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.

Defaults

By default, a list of all lldp ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show lldp remote-system
Remote LLDP Agents on Local Slot/Port: 2/47,
  Chassis ID Subtype          = 4 (MAC Address),

show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port *chassis/slot/port* **[-***port2***] | slot** *chassis/slot***] remote-system med {network-policy | inventory}**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.
network-policy	Display network-policy TLVs from remote Endpoint Devices.
inventory	Display inventory management TLVs from remote Endpoint Devices.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp port 2/47 remote-system med network-policy
Slot/  Remote   Application      Unknown    Tagged    Vlan     Layer2   DSCP
Port    ID         Type         Policy Flag Flag       Id     Priority  Value
------+------+---------------+----------+---------+------+----------+------
 1/22   1        Voice(01)         Defined  Untagged   345       4        34
 1/22   2        Guest Voice(4)    Defined  Untagged    50       3        46
```

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.

output definitions (continued)

Application Type	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling
Unknown Policy Flag	Whether the network policy for the specified application type is currently defined or unknown.
Tagged Flag	Whether the specified application type is using a **tagged** or an **untagged** VLAN.
VLAN ID	The VLAN identifier (VID) for the port.
Layer 2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

```
-> show lldp port 2/47 remote-system med inventory
Remote LLDP Agents on Local Slot/Port 1/22:
  Remote ID  1:
    MED Hardware Revision = "1.2.12.3",
    MED Firmware Revision = "7.3.2.1",
    MED Software Revision = "4.2.1.11",
    MED Serial Number        = "32421",
    MED Manufacturer Name = "Manufacturer1",

show lldp remote-system application-tlv

Displays remote system Application Priority TLV information for a single port or all ports on a slot.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port *chassis/slot/port2***[-***port***] | slot** *chassis/slot***] remote-system application-tlv**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot	The slot number for a specific module.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp remote-system application-tlv
Slot/    Remote
 Port      ID        Selector                       Protocol     Priority
------+----------+-------------------------------+-----------+------------+
  1/2           1    Ethertype                       35078         3 [fcoe]
  1/2           1    Tcp/Sctp                        3260          4 [iscsi]
  1/20          1    Tcp/Sctp                        3190          3
  1/20          1    Udp/Dccp                        300           4
  1/20          1    Tcp/Udp/Sctp/Dccp               300           4
```

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.

output definitions (continued)

Selector	The protocol selector.
Protocol	The protocol Ethertype or well-known port.
Priority	The 802.1p priority value for the specified protocol to use.

Release History

Release 7.3.2; command introduced.

Related Commands

lldp tlv application	Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port.
lldp tlv application priority	Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.
show lldp config	Displays the general LLDP configuration information for LLDP ports.

 3       Nearest-Customer-Bridge          00-80-C2-00-00-00
```

output definitions

Lldp Agent	The LLDP agent identifier.
Name	The name of the LLDP agent.
Destination MAC address	The destination MAC address of the LLDP agent.

Release History

Release 7.3.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, slot, or port.

MIB Objects

```
lldpV2DestAddressTable
   lldpV2AddressTableIndex
   lldpV2DestMacAddress
```

lldp trust-agent

Enables or disables the security mechanism globally (chassis level) or for a slot or a single port. By enabling LLDP security mechanism on a port, LLDP CMM task brings the LLDP status of the port as trusted and monitors the port for any LLDP security violation.

lldp {*chassis/slot/port* | *chassis/slot* | **chassis} trust-agent** [**admin-state] {enable** | **disable}] [chassis-id-subtype {chassis-component** | **interface-alias** | **port-component** | **mac-address** | **network-address** | **interface-name** | **locally-assigned** | **any}]**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).
chassis/slot	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis	Specifies all the ports in the chassis.
enable	Enables LLDP security mechanism.
disable	Disables LLDP security mechanism.
chassis-component	The chassis component is used for validating the remote agent.
interface-alias	The alias configured for the interface is used for validating the remote agent.
port-component	The port component is used for validating the remote agent.
mac-address	The MAC address is used for validating the remote agent.
network-address	The network address is used for validating the remote agent.
interface-name	The interface name is used for validating the remote agent.
locally-assigned	The locally assigned component is used for validating the remote agent, that is the chassis information, which can be locally assigned (the local configuration)
any	The remote agent with any chassis ID sub type is accepted as a trust agent.

Defaults

‘**any**’ - If the chassis ID sub type is not configured for validating the remote agent, by default, the first remote agent is accepted as a trust agent considering any of the chassis ID sub types.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By enabling security on chassis/slot level, the ports that come under the respective level are monitored for any LLDP security violation.
- If the chassis ID sub type is not configured for validating the remote agent, then the LLDP learns the first remote agent with available chassis ID TLV (Time, Length, Value) received in the PDU.
- After a link up is received on a LLDP security enabled port, LLDP CMM waits for three times the LLDP timer interval (30 seconds). If no LLDP PDU is received after link up that has no remote agent, the port is moved to a violation state.
- If a trusted remote agent already exists, and if no LLDP remote agent is learned even after three times the LLDP timer interval (30 seconds), the port is moved to a violation state. If a new LLDP remote agent is learned after the link toggle, then the port is moved to a violation state.
- If the same chassis ID and port ID already exist in the trusted remote agent database but on a different port, then the port remote agent is learned and the port is moved to a violation state. If a new LLDP remote agent is learned on a port that has a trusted LLDP remote agent, then the port is moved to a violation state.

Examples

```
-> lldp chassis trust-agent admin-state enable
-> lldp chassis trust-agent chassis-id-subtype chassis-component
```

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.
show lldp trust-agent	Displays information on local LLDP agent or port.

MIB Objects

```
alaLldpTrustAdminStatus
   alaLldpTrustChassisIdSubType
```

lldp trust-agent violation-action

Sets the action to be performed when a violation is detected.

lldp {*chassis/slot/port* | *chassis/slot* | **chassis} trust-agent violation-action {trap-and-shutdown | trap | shutdown}**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).
chassis/slot	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis	All switch ports.
trap-and-shutdown	Shuts down the port and sends a trap notification when a violation is detected.
trap	Sends a trap notification when a violation is detected.
shutdown	Shuts down the port when a violation is detected.

Defaults

By default, trust agent violation action is set to ‘trap’.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the port is in a shutdown state, clear the violation on the port by using the command “**interfaces** *chassis/slot***[***/port***[-***port2***]] clear-violation-all**”
- Clearing the violation on a port does not clear the trusted remote agent existing on that port. To clear the trusted remote agent, disable the LLDP security mechanism on the port.
- If the port is in a shutdown state due to violation and the port link is toggled, only the link goes up. The port still remains in the violation state and the trusted remote agent existing on that port is not cleared.

Examples

```
-> lldp chassis trust-agent violation-action trap
-> lldp slot 3 trust-agent violation-action shutdown
```

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
show lldp trusted remote-agent	Displays information on trusted remote-agents.
show lldp trust-agent	Displays information on local LLDP agent or port.

MIB Objects

```
alaLldpTrustAction
```

show lldp trusted remote-agent

Displays information on trusted remote-agents.

show lldp [*chassis/slot* **|** *chassis/slot/port***] trusted remote-agent**

Syntax Definitions

chassis/slot	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis/slot/port	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the slot/port or slot parameter to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trusted remote-agent** command output.

Examples

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype mac-address

-> show lldp trusted remote-agent

Trusted Remote LLDP Agents on Local Slot/Port: 1/7
  Chassis ID Subtype          = 4 (MAC Address),
  Chassis ID                  = 00:e0:b1:7a:e6:3c,
  Port ID Subtype             = 7 (Locally assigned),
  Port ID                     = 1017
```

output definitions

Trusted Remote LLDP Agents on Local Slot/Port	The slot number to which the remote trusted agent is associated and the physical port number on that module.
Chassis ID Subtype	The sub type that describes the chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID.
Port ID	The port ID (Port MAC).

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trust-agent	Displays information on local LLDP agent/port.

MIB Objects

N/A

show lldp trust-agent

Displays information of the local LLDP agent or port.

show lldp [*chassis/slot* **|** *chassis/slot/port***] trust-agent**

Syntax Definitions

chassis/slot	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis/slot/port	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *slot/port* or *num* (slot number) values to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trust-agent** command output correctly.
- If LLDP security is disabled this command correctly displays the ‘Admin Status’ as ‘Disabled’; however the other output parameters will display their default values.

Examples

```
-> lldp chassis trust-agent enable

-> lldp chassis trust-agent chassis-id-subtype chassis-component

-> show lldp trust-agent

Slot/Port  Admin Status   Violation Action  Violation Status   Chassis Subtype
---------+--------------+-----------------+------------------+-----------------
   1/1     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/2     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/3     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/4     Disabled       Shutdown          Violated           1(Chassis Component)
   1/5     Enabled        Shutdown          Trusted            1(Chassis Component)
   1/6     Enabled        Trap-and-Shutdown Trusted            1(Chassis Component)
   1/7     Disabled       Trap-and-Shutdown Violated           1(Chassis Component)
   1/8     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/9     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/10    Enabled        Trap Only         Trusted            1(Chassis Component)
```

output definitions

Slot/Port	The LLDP slot and port number.
Admin Status	Indicates the administrative status of the LLDP port, **Enabled** or **Disabled**
Violation Action	Indicates the action performed when a violation is detected. The options are - **Trap Only**, **Trap-and-Shutdown**, and **Shutdown Only**.
Violation Status	The violation status of the port, **Trusted** or **Violated**
Chassis Subtype	The sub type that describes the chassis ID.

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.

17 SIP Commands

SIP Snooping feature address the key challenge of real time delivery and monitoring requirements for media streams from SIP devices. SIP snooping feature provides plug and play support to the device, where it automatically identifies the ports used. It also enhances the security of device.

SIP Snooping prioritizes voice and video traffic over non-voice traffic. To summarize, SIP Snooping:

- Identifies and marks the SIP and its corresponding media streams. Each media stream contains Real Time Protocol (RTP) and Real Time Control Protocol (RTCP) flows. Marking is done using the DSCP field in the IP header.
- Provides user configured QOS treatment for SIP/RTP/RTCP traffic flows based on its marking.
- Also snoops voice quality metrics of media streams from their RTCP packets and displays them to the user with knowledge of media reception quality in real time and helps to diagnose the problems on their quality. Also in addition, trap will be generated when voice quality parameters like Jitter, Round trip time, Packet-lost, R-factor and MOS values of media streams crosses user configured threshold.

This chapter includes SIP commands and their descriptions..

MIB information for SIP commands is as follows:

Filename: ALCATEL-IND1-SIP-SNOOPING-MIB.mib
Module: aluSIPSnoopingMIB

A summary of the available commands is listed here:

sip-snooping admin-state

Enables or disables the SIP snooping on the switch.

sip-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables SIP snooping
disable	Disables SIP snooping

Defaults

By default, SIP-snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- If SIP snooping is disabled at the port level, enabling SIP snooping globally will not override the configuration of that port.
- If SIP snooping is disabled and enabled, it is mandatory that the phones re-register for successful DSCP marking.

Examples

```
-> sip-snooping admin-state enable
-> sip-snooping admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

sip-snooping port admin-state	Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate of ports.
show sip-snooping ports	Shows the SIP snooping port level data.
show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

`aluSIPSnoopingStatus`

sip-snooping port admin-state

Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate.

sip-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_num***} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_num	A link aggregate ID number.
enable	Enables SIP snooping to mirror all SIP PDU that ingress on that port
disable	Disables SIP snooping and will not mirror SIP PDU that ingress on that port.

Defaults

By default, SIP snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- SIP snooping must be enabled globally to activate port/linkagg level configuration.
- Even after SIP snooping is globally disabled, port/linkagg level configuration is saved. This configuration will be used when SIP snooping is enabled globally again.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by the linkagg configuration. Port level configuration will be activated if the port leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 admin-state enable
-> sip-snooping linkagg 1 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping ports	Shows the SIP snooping port level data.

MIB Objects

```
aluSIPSnoopingSlotPortIndex
   aluSIPSnoopingRowStatus
```

sip-snooping mode

Configures the SIP snooping mode for the specified port or link aggregate.

sip-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_num***} mode {force-edge | force-non-edge | automatic}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_num	The link aggregate ID number.
force-edge	Media TCAM entries to be created for dialogs that transverse the specific port
force-non-edge	No Media TCAM entries for dialogs that transverse the specific port.
automatic	Sets to default mode. The port's edge/non-edge mode is derived by the switch/router based on LLDP received or not on the port.

Defaults

By default, the SIP snooping mode is set to automatic.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- Force-edge-port/force-non-edge port option to overwrite default port mode learned by either received or not received switch/router capability through LLDP.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 mode force-edge
-> sip-snooping linkagg 1 mode force-non-edge
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping ports	Shows the SIP snooping port level data.

MIB Objects

```
aluSIPSnoopingSlotPortIndex
   aluSIPSnoopingPortConfigPortMode
```

sip-snooping trusted server

Configure the IP addresses of the trusted servers on a switch.

sip-snooping trusted-server [*ip_address1 ip_address2 ip_address ...ip_address8***]**

no sip-snooping trusted-server {*ip_address* **| all}**

Syntax Definitions

*ip_address*1**[-***ip_address2***]**	The IP address of one or more trusted servers.
all	Specifies all the IP addresses.

Defaults

By default, no trusted servers are configured. All SIP based calls using any call server will be supported.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is used to configure the IP addresses of the trusted servers. If a trusted server is configured, then only the calls initiated through those servers will be supported.
- A maximum of 8 trusted servers can be configured.
- If no trust servers are configured, all SIP based calls using any call server will be supported.
- Use the **no** form of the command to remove any trusted IP or all trusted IP addresses.

Examples

```
-> sip-snooping trusted-server 192.254.32.22 192.254.32.33
-> no sip-snooping trusted-server 192.254.32.22
-> no sip-snooping trusted-server all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPTrustedServerIPAddress1
aluSIPSnoopingSIPTrustedServerIPAddress2
aluSIPSnoopingSIPTrustedServerIPAddress3
aluSIPSnoopingSIPTrustedServerIPAddress4
aluSIPSnoopingSIPTrustedServerIPAddress5
aluSIPSnoopingSIPTrustedServerIPAddress6
aluSIPSnoopingSIPTrustedServerIPAddress7
aluSIPSnoopingSIPTrustedServerIPAddress8
```

sip-snooping sip-control

Configures SIP control DSCP marking.

sip-snooping sip-control dscp *num*

sip-snooping sip-control no dscp

Syntax Definitions

num	The DSCP number. The valid range is 1–4 Mbps.

Defaults

By default no marking/prioritizing or rate limit is performed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is used for the SIP control DSCP marking. A built-in rate limiter of 1 Mbps is configured to rate limit SIP PDUs being marked by the switch.
- The packet gets its priority as normal packet, either from the QoS port configuration (trust the packet DSCP or untrusted) or from a user configured QoS policy.
- Use **no** form of the command is to set default mode.

Examples

```
-> sip-snooping sip-control dscp 40
-> sip-snooping sip-control no dscp
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

`aluSIPSnoopingSIPControlDSCP`

sip-snooping sos-call number

Configures the SOS call strings in SIP snooping.

sip-snooping sos-call number *string1 string2* **…** *string4*

no sip-snooping sos-call number {*string* | **all}**

Syntax Definitions

string1 **…** *string4*	Specifies the SOS call string.
all	Specifies all the SOS call strings.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is used for the configuration of the SOS call strings. A maximum of 4 SOS call strings can be configured for an exact match on the “to” URI (user part only)
- No support of regular expression. If no string is specified, no SOS call can be identified in the system.
- Use **no** form of this command to remove existing SOS call strings.

Examples

```
-> sip-snooping sos-call number “911” “2233”
-> no sip-snooping sos-call number “911”
-> no sip-snooping sos-call number all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration.

MIB Objects

```
aluSIPSnoopingSOSCallNumber1
aluSIPSnoopingSOSCallNumber2
aluSIPSnoopingSOSCallNumber3
aluSIPSnoopingSOSCallNumber4
```

sip-snooping sos-call dscp

Configures the SOS-Call RTP/RTCP DSCP marking.

sip-snooping sos-call dscp *num*

Syntax Definitions

num	Specifies the DSCP number.

Defaults

The default configuration is 46 EF.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is used for the configuration of the SOS-Call RTP/RTCP DSCP marking. A built-in rate limiter of 128 kbps is configured to rate limit a uni-direction media stream being marked by the switch.
- SOS calls are identified only for the Audio media type. All other media type calls are considered normal calls.

Examples

```
-> sip-snooping sos-call dscp 56
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration for the switch.

MIB Objects

`aluSIPSnoopingSOSCallRTPDSCP`

sip-snooping udp port

Configures the UDP port for SIP Snooping.

sip-snooping udp-port *udp-port1 udp-port 2* **...** *udp-port 8*

no sip-snooping udp-port {*udp-port* **| all}**

Syntax Definitions

udp-port 1 **...** *udp-port 8*	Specifies the UDP port for SIP snooping.
all	Specifies all the UDP ports designated for SIP snooping.

Defaults

By default no UDP ports and SIP mirroring is performed with the method name and SIP2.0 strings.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- A maximum of 8 UDP ports can be configured on a switch.
- Use **no** form of this command to remove any UDP port configured earlier.

Examples

```
-> sip-snooping udp-port 5260 5060
-> no sip-snooping udp-port 5260
-> no sip-snooping udp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPUDPPort1
aluSIPSnoopingSIPUDPPort2
aluSIPSnoopingSIPUDPPort3
aluSIPSnoopingSIPUDPPort4
aluSIPSnoopingSIPUDPPort5
aluSIPSnoopingSIPUDPPort6
aluSIPSnoopingSIPUDPPort7
aluSIPSnoopingSIPUDPPort8
```

sip-snooping tcp port

Configures the Server listening TCP ports for SIP Snooping.

sip-snooping tcp-port *tcp-port1 tcp-port 2* **...** *tcp-port 8*

no sip-snooping tcp-port {*tcp-port* **| all}**

Syntax Definitions

tcp-port 1 **...** *tcp-port 8*	Specifies the TCP port for SIP snooping.
all	Specifies all the SOS call strings.

Defaults

By default, TCP port is 5260.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- A maximum of 8 TCP ports can be configured on a switch.
- The default port will be overwritten if the user configures any other port.
- Use the **no** form of this command to remove any TCP port configured earlier.

Examples

```
-> sip-snooping tcp-port 5260 5060
-> no sip-snooping tcp-port 5260
-> no sip-snooping tcp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPTCPPort1
aluSIPSnoopingSIPTCPPort2
aluSIPSnoopingSIPTCPPort3
aluSIPSnoopingSIPTCPPort4
aluSIPSnoopingSIPTCPPort5
aluSIPSnoopingSIPTCPPort6
aluSIPSnoopingSIPTCPPort7
aluSIPSnoopingSIPUDPPort8
```

sip-snooping threshold

Configure the various thresholds of SIP snooping.

sip-snooping threshold {audio | video | other} {jitter *jitter_ms_num* **| packet-lost** *% num* **| round-trip-delay** *round_trip_delay_ms_num* **| r-factor** *rfactor_num*| **mos** *mos_num***}**

Syntax Definitions

audio	Specify threshold for audio.
video	Specify threshold for video.
other	Specify threshold for other.
jitter_ms_num	Specify jitter in milliseconds. The valid range is 0–300.
% num	Specify packet lost in percentage. The valid range is 0–99%.
round_trip_delay_ms_num	Set round trip delay in milliseconds. The valid range is 0–500.
rfactor_num	Specify R-factor number. The valid range is 0–100.
mos_num	Specify MOS number. The valid range is 0–5.

Defaults

parameter	default
RTCP monitoring	Enable
Jitter Threshold (audio/video/other)	50/100/100 ms
Packet-lost Threshold (audio/video/other)	10 /20/20%
RTT Threshold (audio/video/other)	180 /250/250 ms
R-factor Threshold (audio/video/other)	70/80/80
MOS Threshold (audio/video/other)	3.6/3.0/3.0

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Setting a threshold value to 0 disables threshold checking for that parameter.

Examples

```
-> sip-snooping threshold audio jitter 50
-> sip-snooping threshold audio packet-lost 10
-> sip-snooping threshold video jitter 80
-> sip-snooping threshold video round-trip-delay 180
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```

   aluSIPSnoopingThresholdRoundTripDelay
   aluSIPSnoopingThresholdRFactor
   aluSIPSnoopingThresholdMOS
```

sip-snooping logging-threshold num-of-calls

Configures the threshold for the number of calls to be logged into the flash file.

sip-snooping logging-threshold num-of-calls *num*

Syntax Definitions

num	Specifies the maximum number of calls to be logged.

Defaults

By default, 200 calls can be logged.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This command is used to configure the threshold for the number of calls to be logged into the flash file.

Examples

```
-> sip-snooping logging-threshold num-of-calls 300
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration for the switch.

MIB Objects

```
aluSIPSnoopingThresholdNumberOfCalls
```

show sip-snooping call-records

Displays the SIP-snooping active/ended call records.

show sip-snooping call-records {active-calls | ended-calls} [full | threshold-violation]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This command is used to show the SIP-snooping active/ended call records.

Examples

```
-> show sip-snooping call-records ended-calls full

OmniSwitch 6860

Usage Guidelines

This command is used to show the SIP snooping status and configuration for the switch.

Examples

```
-> show sip-snooping config
Sip-snooping Status : Enable,
Sip-control DSCP : 40,
SOS-Call RTP/RTCP DSCP : 35,
SOS-Call Number : 911, 2233,
Jitter Threshold (audio/video/other) : 50ms/100ms/100ms,
Packet-Lost Threshold (audio/video/other) : 10/20/20,
Round-Trip-Delay Threshold (audio/video/other) : 180ms/250ms/250ms,
R-factor Threshold (audio/video/other) : 70/80/80,
MOS Threshold (audio/video/other) :3.6/3.0/3.0 ,
Logging Number of calls : 200,
UDP-Port(s) : 5060, 5260
TCP-Port(s) : 5260
Trusted Server IP(s) : 192.254.32.11,192.254.32.22,192.254.32.33
Reserved HW resource : 1,
CPU Rate Limiter for SIP PDUS : 1 mbps,
```

output definitions

Sip-snooping Status	Indicates whether the SIP Snooping status is Enable or Disable.
Sip-control DSCP	Displays the SIP control DSCP value
SOS-Call RTP/RTCP DSCP	Displays the SOS-Call RTP/RTCP DSCP number.
SOS-Call Number	Displays the emergency call number.
Jitter Threshold	Displays the Jitter threshold in milliseconds.
Packet-Lost Threshold	Displays the packet lost threshold in percentage.
Round-Trip-Delay Threshold	Displays the Round-Trip-Delay threshold period in milliseconds.
R-factor Threshold	Displays the R-Factor value.

output definitions (continued)

MOS Threshold	Displays the MOS for SIP Snooping.
Logging Number of calls	Displays the maximum number of calls to be logged in flash file
UDP-Ports	Displays the SIP Snooping UDP Ports.
TCP Ports	Displays the SIP Snooping TCP ports.
Trusted Server IP(s)	Displays the truster server IP addresses.

Release History

UPDATE(40) PRACK(20)
Number of SIP response packet received:
Number of discarded/malformed/unsupported SIP packets:
Number of discarded SIP packets not from/to trusted servers:
Number of dropped SIP packet due the software error:
(NI overflow, NI/CMM, CMM overflow)
Total Emergency Calls                  :
```

output definitions

Total calls processed	Total calls processed for SIP Snooping.
Total audio streams	Displays the total audio streams.
Total video streams	Displays the total video streams.

output definitions (continued)

Total other streams	Displays the total other streams.
Total audio streams that crossed threshold	Displays the total audio streams that have exceeded threshold.
Total video streams that crossed threshold	Displays the total video streams that have exceeded threshold.
Total other streams that crossed threshold	Displays the total other streams that have exceeded threshold.
Number of Active calls	Displays the number of active calls.
Number of Active audio streams	Displays the number of active audio streams.
Number of Active video streams	Displays the number of active video streams.
Number of Active other streams	Displays the number of active other streams.
Number of SIP packet received by hardware	Displays the total SIP packet received by hardware.
Number of SIP packet received by software	Displays the total SIP packet received by software.
Number of SIP packet received by per method	Displays the method by which the SIP packet is received. The various per method are Invite, Ack, Bye, Update and Prack.
Number of SIP response packet received	Displays the total number of SIP response packet received.
Number of discarded/ malformed/unsupported SIP packets	Displays the total number of discarded, malformed or unsupported SIP packets.
Number of discarded SIP packets not from/to trusted servers	Displays the total number of discarded SIP packets not from or to trusted servers
Number of dropped SIP packet due the software error	Displays the Total number of SIP packets dropped due the software error. (i.e. NI overflow, NI/CMM, CMM overflow etc.)
Total Emergency Calls	Displays the total number of Emergency Calls.

alaSIPSnoopingRegisteredClientAddr
```

18 Automatic Fabric Commands

The Dynamic Auto-Fabric feature can be used to bring up AOS compatible devices by automating some tedious and complex steps including Link Aggregate formation, and SPB neighbor adjacency formation. Dynamic recognition of the neighboring elements will allow a quick, out-of-the box configuration. The focus area for this feature is data center but the feature is applicable in campus LAN environment to reduce administrative overhead.

Upon boot-up the system will automatically attempt auto discovery of LACP, SPB, MVRP, and IP connections if configuration files are not available in the device. The feature allows to build a true fabric when a device is plugged to the network and automates edge port configuration with profiles.

MIB information for the Auto Fabric commands is as follows:

Filename: ALCATEL-IND1-AUTO-FABRIC-MIB.mib
Module: alcatelIND1AUTOFABRICMIB

A summary of available commands is listed here:

auto-fabric admin-state

Enables or disables the Automatic Fabric functionality globally for the switch.

auto-fabric admin-state {enable | disable {remove-global-config | remove-vc-reload]}

Syntax Definitions

enable	Enables Automatic Fabric functionality for the switch.
disable	Disables Automatic Fabric functionality for the switch. When disabled, the global configuration settings discovered for MVRP, SPB, and IP are removed
remove-global-config	Disables Automatic Fabric functionality for the switch. This parameter option performs the same function as the **disable** parameter.
remove-vc-reload	Reboots a switch running in the Virtual Chassis (VC) of one mode to run in the standalone mode with Automatic Fabric discovery disabled. *This parameter option is not supported on the OmniSwitch 6860 and OmniSwitch 6865.*

Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric operation is based on the administrative status setting specified with this command.
- When Automatic Fabric is globally disabled for the switch, the following configuration settings are removed unless they were previously saved to the switch configuration file:
  - Spanning Tree is set back to the default 1x1 mode. This only occurs if there are no VLAN registrations on any port or link aggregate.
  - SPB is globally disabled, which removes BVLANs 4000-4015 and administratively disables SPB. This only occurs if there are no SPB adjacencies formed on any ports or link aggregates.
  - Automatic Fabric strops trying to learn IP routing protocols and neighbors on interfaces not already configured with a routing protocol. The configuration for IP interfaces on which routing protocols were previously discovered is not removed.
  - For any other scenario, administrator intervention is needed to remove the configuration.
- The **remove-global-config** and **remove-vc-config** parameters are only used in combination with the **disable** option.
- The **remove-vc-config** parameter is only meant for use when a switch has booted up in a VC of one mode. Do not use this option if the switch boots up as part of a VC configuration, where the switch is connected to other switches in the VC.

- When this command is used with the **remove-vc-config** parameter, the following process is triggered:

  1 Any Automatic Fabric configuration is cleared.

  2 The Automatic Fabric feature is disabled.

  3 A **boot.cfg** file is created in the /flash/working directory.

  4 The switch is automatically rebooted in standalone mode with a configuration file and the automatic management features will no longer run.

Examples

```
-> auto-fabric admin-state enable
-> auto-fabric admin-state disable
-> auto-fabric admin-state disable remove-global-config
-> auto-fabric admin-state disable remove-vc-reload
```

Release History

Release 7.3.2; command introduced.
Release 7.3.4; **remove-global-config** and **remove-vc-reload** parameters added-

Related Commands

auto-fabric interface	Enables or disables Automatic Fabric discovery on one or more ports.
show auto-fabric config interface	Displays the Automatic Fabric configuration applied to switch ports.

MIB Objects

```
alaAutoFabricGlobalStatus
alaAutoFabricRemoveGlobalConfig
alaAutoFabricRemoveVCReload
```

auto-fabric interface

Enables or disables the Automatic Fabric functionality for one or more switch ports.

auto-fabric interface *chassis/slot/port***[-***port2***] admin-state {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables Automatic Fabric functionality globally or on an interface.
disable	Disables Automatic Fabric functionality on the specified interface. When disabled, the configuration settings discovered for MVRP, SPB, and IP are removed from the port.

Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric status for a port is based on the administrative status setting specified with this command.
- The Automatic Fabric status for a specific port takes precedence over the global Automatic Fabric status for the switch. For example, if Automatic Fabric is enabled for the switch but disabled on a port, then the discovery process is not run on the port.

Examples

```
-> auto-fabric interface 1/1/1 admin-state disable
-> auto-fabric interface 1/1/5-10 admin-state enable
```

Release History

Release 7.3.2; command introduced.

Related Commands

auto-fabric admin-state	Globally enables or disables Automatic Fabric for the switch.
show auto-fabric config interface	Displays the Automatic Fabric configuration applied to switch ports.

MIB Objects

```
alaAutoFabricPortConfigTable
   alaAutoFabricPortConfigStatus
```

auto-fabric discovery start

Manually starts the Automatic Fabric discovery process.

auto-fabric discovery start

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

This command can be used to manually begin the Automatic Fabric discovery process after the switch has booted and the discovery window has elapsed.

Examples

```
-> auto-fabric discovery start
```

Release History

Release 7.3.2; command introduced.

Related Commands

show auto-fabric config	Displays the global Automatic Fabric configuration.
show auto-fabric config interface	Displays Automatic Fabric configuration applied on interfaces.

MIB Objects

```
alaAutoFabricGlobalDiscovery
```

auto-fabric protocols

Enables or disables the Automatic Fabric discovery process for a particular protocol.

auto-fabric protocols {lacp | mvrp | spb | ip {ospfv2 | ospfv3 | isis | all} | loopback-detection} {interface *chassis/slot/port-port2* **| chassis} admin-state {enable | disable}**

Syntax Definitions

lacp	Selects the Link Aggregation Control Protocol.
mvrp	Selects the Multiple VLAN Registration Protocol.
spb	Selects the Shortest Path Bridging protocol. *This parameter option is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
ospfv2	Selects the Open Shortest Path First version 2 protocol. *This parameter option is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
ospfv3	Selects the Open Shortest Path First version 3 protocol. *This parameter option is not supported on the OmniSwitch 6465 or OmniSwitch 6560.*
isis	Selects the Intermediate System-Intermediate System protocol. *This parameter option is not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 9900.*
all	Selects all the supported IP routing protocols (OSPFv2, OSPFv3, and IS-IS).
loopback-detection	Selects Loopback Detection for UNP SPB access ports. Access ports are used to create SPB Service Access Points (SAP).
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	All Automatic Fabric ports on the chassis. Use this parameter to globally configure the discovery status for the selected protocol.
enable	Enables the discovery status for the selected protocol.
disable	Disables the discovery status for the selected protocol.

Defaults

- Automatic Fabric discovery is globally enabled for all the protocols when the switch boots up without a configuration file.
- Automatic Fabric discovery is globally enabled for all protocols, except MVRP, when the switch boots up with an existing configuration file. In this case, the global default setting for MVRP is disabled.
- Automatic Fabric discovery is enabled for LACP, MVRP, and SPB on all eligible interfaces by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- If no interface is specified with this command, the discovery status for the protocol is enabled or disabled globally for the switch.
- The **interface** and **chassis** parameters are only used in combination with the **lacp**, **mvrp**, and **spb** parameters.
- The interface setting for LACP, MVRP, and SPB discovery overrides the global setting. For example, if SPB discovery is globally enabled for the switch but disabled on port 2/1/1, then the port does not participate in the SPB discovery process.

Examples

```
-> auto-fabric protocols lacp admin-state disable
-> auto-fabric protocols mvrp admin-state enable
-> auto-fabric protocols spb interface 1/1/3 admin-state disable
-> auto-fabric protocols loopback-detection admin-state disable
-> auto-fabric protocols ip ospfv2 admin-state enable
-> auto-fabric protocols ip ospfv3 admin-state disable
-> auto-fabric protocols ip isis admin-state disable
```

Release History

Release 7.3.2; command introduced.
Release 7.3.4; **loopback-detection** and **ip** parameters added.
Release 8.3.1; default setting for global MVRP discovery is disabled when switch boots up with an existing configuration file.

Related Commands

auto-fabric admin-state	Enables or disables Automatic Fabric functionality.
auto-fabric discovery start	Manually starts the Automatic Fabric discovery process.
show auto-fabric config interface	Displays the Automatic Fabric configuration applied on interfaces.
show auto-fabric config	Displays the global Automatic Fabric configuration.

MIB Objects

```

   alaAutoFabricPortLACPProtocolStatus
   alaAutoFabricPortSPBProtocolStatus
   alaAutoFabricPortMVRPProtocolStatus
```

auto-fabric config-save interval

Configures the time interval for saving the automatically discovered configuration to the switch configuration file.

auto-fabric config-save interval *seconds*

Syntax Definitions

seconds	The amount of time between automatic saves of the discovered configuration. Range is 60 - 3600 seconds.

Defaults

parameter	default
seconds	300

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

The automatic save time interval specified with this command is only valid when the automatic configuration save status is enabled. This is done through the **auto-fabric config-save admin-state** command.

Examples

```
-> auto-fabric config-save interval 600
```

Release History

Release 7.3.2; command introduced.

Related Commands

auto-fabric config-save admin-state	Enables or disables automatically saving of the discovered configuration to the switch configuration file
show auto-fabric config	Displays the Automatic Fabric configuration.

MIB Objects

```
alaAutoFabricGlobalConfigSaveTimer
```

auto-fabric config-save admin-state

Enables or disables automatically saving of the discovered configuration to the switch configuration file.

auto-fabric config-save admin-state {enable | disable}

Syntax Definitions

enable	Enables automatically saving the discovered configuration to the switch configuration file.
disable	Disables automatically saving the discovered configuration to the switch configuration file.

Defaults

By default, automatically saving the discovered configuration is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

When this function is enabled, the amount of time specified through the **auto-fabric config-save interval** command is active. An automatic save is performed whenever the specified amount of time elapses.

Examples

```
-> auto-fabric config-save admin-state disable
```

Release History

Release 7.3.2; command introduced.

Related Commands

auto-fabric config-save interval	Configures the amount of time to wait between automatic saves of the discovered configuration.
show auto-fabric config	Displays the Automatic Fabric configuration.

MIB Objects

```
alaAutoFabricGlobalConfigSaveTimerStatus
```

auto-fabric discovery-interval

Configures when the switch will automatically start the Automatic Fabric discovery process.

auto-fabric discovery-interval *minutes*

Syntax Definitions

minutes	The discovery interval time. The valid range is 2–3600 minutes.

Defaults

By default, the discovery interval timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- When a switch boots up without a configuration file, discovery is automatically started for a one time, initial run even when the interval timer is disabled.
- Set the value of this timer to more than two times the value of the switch MAC address aging time. This will allow time for inactive MAC addresses to age out on Automatic Fabric ports before the next discovery interval is started.

Examples

```
-> auto-fabric discovery-interval 60
```

Release History

Release 7.3.2; command introduced.
Release 7.3.4; timer default value changed to zero (disabled).

Related Commands

show auto-fabric config	Displays the Automatic Fabric configuration.

MIB Objects

```
alaAutoFabricGlobalDiscoveryTimer
```

auto-fabric protocols spb default-profile

Configures the default Service Access Point (SAP) profile that the Universal Network Profile (UNP) feature uses to dynamically create SAPs for traffic received on UNP SPB access ports.

auto-fabric protocols spb default-profile {single-service | auto-vlan}

Syntax Definitions

single-service	Dynamically creates a SAP profile only for untagged traffic on the UNP SPB access port.
auto-vlan	Dynamically creates a SAP for each VLAN tag received on a UNP SPB access port. When this option is selected, the **single-service** option is automatically triggered for untagged traffic.

Defaults

By default, the switch is set to use the **auto-vlan** option.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID and specifies the type of customer traffic (untagged or tagged) to encapsulate and tunnel through the SPB network infrastructure.
- Once the SPB adjacencies and UNP access ports are configured through Automatic Fabric discovery, traffic received on UNP access ports triggers the switch to dynamically create a SAP for the traffic based on the SAP profile selected with this command.

Examples

```
-> auto-fabric protocols spb default-profile single-service
-> auto-fabric protocols spb default-profile auto-vlan
```

Release History

Release 7.3.4; command introduced.

Related Commands

auto-fabric protocols spb set-profile	Configures the default SAP profile for a specific port or range of ports on the switch.
show auto-fabric config	Displays the global Automatic Fabric configuration.
show auto-fabric config interface	Displays Automatic Fabric configuration applied on interfaces.

MIB Objects

```
alaAutoFabricSPBDefaultProfile
```

auto-fabric protocols spb set-profile

Configures the default SAP profile for a specific port or range of ports on the switch.

auto-fabric protocols spb set-profile {single-service | auto-vlan} interface *chassis/slot/port***[-***port2***]**

Syntax Definitions

single-service	Defines single default service SAP profile. Only untagged traffic on the UNP-SPB port is learnt in this profile.
auto-vlan	The incoming traffic is automatically learnt. The SAP bindings for the concerned VLANs are automatically created based on the traffic sensed.
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1) on which the SAP profile will be enabled. Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, the **auto-vlan** option is used for Automatic Fabric ports.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

The SAP profile configured for the specified port or range of ports overrides the default SAP profile configured for the switch.

Examples

```
-> auto-fabric protocols spb set-profile single-service interface 1/1/1
-> auto-fabric protocols spb set-profile auto-vlan interface 1/2/1-4
```

Release History

Release 7.3.4; command introduced.

Related Commands

show auto-fabric config	Displays the auto-fabric configuration.
show auto-fabric config interface	Displays auto-fabric configuration applied on interfaces.

MIB Objects

```
alaAutoFabricPortConfigTable
   alaAutoFabricPortConfigIfIndex
   alaAutoFabricPortSPBDefaultProfile
```

show auto-fabric config

Displays the Automatic Fabric configuration.

show auto-fabric config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show auto-fabric config
Auto-fabric Status          : Disable,
Config Save Timer Status    : Disabled,
Config Save Timer Interval  : 300 seconds,
Default UNP SAP Profile     : Auto-vlan,
Discovery Interval          : 1 minute(s),
Discovery Status            : Idle,
LACP Discovery Status       : Enabled,
LBD Discovery Status        : Enabled,
MVRP Discovery Status       : Disabled,
OSPFv2 Discovery Status     : Enabled,
OSPFv3 Discovery Status     : Enabled,
ISIS Discovery Status       : Enabled,
SPB Discovery Status        : Enabled
```

output definitions

Auto-Fabric Status	The global status of the Automatic Fabric functionality.
Config Save Timer Status	Displays the status of the Automatic Fabric configuration save timer.
Config Save Timer Interval	Displays how often the discovered Automatic Fabric configuration is saved to the switch configuration file.
Default UNP SAP Profile	Displays the default SAP profile for the switch.
Discovery Interval	Displays how often the Automatic Fabric discovery process will run.
Discovery Status	Displays whether the global discovery process is running or idle.
LACP Discovery Status	Displays the global status of Automatic Fabric discovery for the LACP protocol.

output definitions (continued)

LBD Discovery Status	Displays the status of the Loopback Detection on dynamically created UNP Service Access Points (SAPs).
MVRP Discovery Status	Displays the global status of Automatic Fabric discovery for the MVRP protocol.
OSPFv2 Discovery Status	Displays the global status of Automatic Fabric discovery for the OSPFv2 protocol.
OSPFv3 Discovery Status	Displays the global status of Automatic Fabric discovery for the OSPFv3 protocol.
ISIS Discovery Status	Displays the global status of Automatic Fabric discovery for the ISIS protocol.
SPB Discovery Status	Displays the global status of Automatic Fabric discovery for the SPB protocol.

Release History

Release 7.3.2; command introduced.
Release 7.3.4; **OSPFv2 Discovery Status**, **OSPFv3 Discovery status**, **ISIS Discovery Status**, **LBD Discovery Status**, and **Default UNP SAP Profile** output fields added.

Related Commands

auto-fabric admin-state	Enables or disables Automatic Fabric functionality.
auto-fabric config-save admin-state	Configures the status of the Automatic Fabric configuration save timer.
auto-fabric config-save interval	Configures how often the discovered Automatic Fabric configuration is saved to the switch configuration file.
auto-fabric protocols spb default-profile	Configures the default SAP profile for the switch.
auto-fabric discovery-interval	Configures how often the Automatic Fabric discovery process will run.
auto-fabric protocols	Enables or disables Automatic Fabric discovery for specific protocols.

MIB Objects

```

   alaAutoFabricGlobalISISProtocolStatus
   alaAutoFabricSPBDefaultProfile
   alaAutoFabricLBDProtocolStatus
```

show auto-fabric config interface

Displays the Automatic Fabric configuration applied on interfaces.

show auto-fabric config interface [*chassis/slot***[-***slot2***] | ***chassis/slot/port***[-***port2***]]**

Syntax Definitions

chassis	The chassis identifier.
*slot***[-***slot2***]**	The slot number. Use a hyphen to specify a range of slot numbers (1/1-5 displays ports on slots 1 through 5).
*slot/port***[-***port2***]**	The chassis ID, slot, and port number. Use a hyphen to specify a range of ports (1/1/2-10 displays ports 1 through 10).

Defaults

By default, the Automatic Fabric configuration for all switch ports is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

To display the global and port-level configuration for specific interfaces, specify a port number this command.

Examples

```
->show auto-fabric config interface

  Port   Admin Status   LACP      SPB-M      MVRP      SAP Profile    Oper Status
--------+------------+---------+----------+---------+---------------+--------------
 1/1/1   disabled     enabled   enabled    disabled  single-service  disabled
 1/1/2   enabled      enabled   enabled    disabled  auto-vlan       disabled
 1/1/3   enabled      enabled   enabled    enabled   auto-vlan       disabled
 1/1/4   enabled      enabled   disabled   enabled   auto-vlan       disabled
 1/1/5   enabled      enabled   enabled    enabled   auto-vlan       disabled
 1/1/6   enabled      enabled   enabled    enabled   auto-vlan       disabled
```

output definitions

Port	The chassis ID, slot, and port number.
Admin-Status	The Automatic Fabric administrative status for the port.
LACP	The LACP discovery status for the port.
SPB-M	The SPB-M discovery status for the port.
MVRP	The MVRP discovery status for the port.
SAP Profile	The default SAP profile assigned to the port.
Operational Status	The Automatic Fabric operational status for the port.

```
-> show auto-fabric config interface 1/1/1
Auto-Fabric Interface Config:
    Port 1/1/1:
      Operational Status : Disabled
        Admin-Status
          Global : Disabled,   Port : Disabled
        LACP
          Global : Enabled,    Port : Enabled
        SPB-M
          Global : Enabled,    Port : Enabled
        MVRP
          Global : Enabled,    Port : Disabled
        SAP Profile
          Global : Auto-vlan,      Port : Single-service
```

output definitions

Port	The chassis ID, slot, and port number.
Operational Status	The Automatic Fabric operational status.
Admin-Status	The global and port-level administrative status for Automatic Fabric.
LACP	The global and port-level discovery status for LACP.
SPB-M	The global and port-level discovery status for SPB-M.
MVRP	The global and port-level discovery status for MVRP.
SAP Profile	The global SAP profile and port-level SAP profile.

Release History

Release 7.3.2; command introduced.
Release 7.3.4; **SAP Profile** and **Operational status** output fields added.

Related Commands

19 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the **ping** command that is used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

Note. If all devices are on the same VLAN or if the IP interfaces are created on multiple VLANs to enable routing of packets, packets can be forwarded using IP. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: Chapter 19, “IP Commands,” Chapter 26, “OSPF Commands.” For more information on VLANs and RIP, see the applicable chapters in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the IP commands is as follows:

Filename: IP-FORWARD-MIB.mib
Module: ipForward

Filename: IP-MIB.mib
Module: ipMIB

Filename: ALCATEL-IND1-IP-MIB.mib
Module: alcatelIND1IPMIB

Filename: ALCATEL-IND1-IPRM-MIB.mib
Module: alcatelIND1IPRMMIB

A summary of the available commands is listed here:

IP	**ip interface** **ip interface rtr-port** **ip interface tunnel** **ip interface dhcp-client** **ip router primary-address** **ip router router-id** **ip static-route** **ip static-route all bfd-state** **ip static-route bfd-state** **ip route-pref** **ip default-ttl** **ping** **traceroute** **ip directed-broadcast** **ip directed-broadcast trusted-source-ip** **ip directed-broadcast clear** **show ip directed-broadcast** **ip service** **ip service port** **ip service source-ip** **show ip traffic** **show ip interface** **show ip emp-interfaces** **show ip routes** **show ip route-pref** **show ip redist** **show ip access-list** **show ip route-map** **show ip router database** **show ip emp-routes** **show ip config** **show ip protocols** **show ip router-id** **show ip service** **show ip service source-ip**

ip interface

Configures an IP interface to enable IP routing on a VLAN or allow remote access. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

ip interface {*if_name* | **emp | master emp | local chassis-id** *chassis***} [{address | vip-address}** *ip_address***] [mask** *subnet_mask***] [admin-state [enable | disable]] [vlan** *vlan_id* | **service** *service_id***] [forward | no forward] [local-proxy-arp | no local-proxy-arp] [e2 | snap] [primary | no primary]**

no ip interface *if_name*

Syntax Definitions

if_name	Text string of the interface name. Use quotes around string if description contains multiple words with spaces between them (for example, "ALE Marketing"). This value is case sensitive.
emp	Modifies the shared EMP port IP address.
master emp	Modifies the EMP port IP address of the master chassis when operating in virtual chassis mode.
local chassis-id *chassis*	Modifies the EMP port IP address of the local chassis.
address *ip_address*	An IP host address (for example, 10.0.0.1, 171.15.0.20) to specify the IP router network.
vip-address *ip_address*	An IP host address for a Virtual IP (VIP) VLAN.
subnet_mask	A valid IP address mask (for example, 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.
vlan_id	An existing VLAN ID number (1–4094).
service_id	An existing Shortest Path Bridging (SPB) or L2 GRE tunneling service ID number (1–32767). *This parameter is supported only on the OmniSwitch 9900.*
forward	Enables forwarding of IP frames to other subnets.
no forward	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
local-proxy-arp	Enables Local Proxy ARP on the specified interface.
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.
e2	Enter **e2** or **ethernet2** to specify Ethernet-II encapsulation.
snap	SNAP encapsulation.
primary	Designates the specified IP interface as the primary interface for the VLAN.
no primary	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

Defaults

parameter	default
ip_address	0.0.0.0
subnet_mask	IP address class
enable | disable	**enable**
vlan_id | *service_id*	none (unbound)
forward | no forward	**forward**
local-proxy-arp | no local-proxy-arp	**no local-proxy-arp**
e2 | snap	**e2**
primary | no primary	First interface bound to a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multinetting is supported on VLANs. As a result, it is possible to configure up to 16 IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- When local proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. The same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary. Note that this option is not supported with interfaces bound to an SPB service, as multinetting is not supported on a service. There is only one IP interface per service allowed.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it always remains operationally active.
- Specify the **service** parameter to create a service-based interface that is used to provide in-line routing for SPB and L2 GRE tunneling services. When creating an IP interface for an SPB service or an L2 GRE tunneling service, consider the following:
  - The service ID specified must already exist in the switch configuration.

  - VLAN translation is automatically enabled when a service is assigned to an IP interface regardless of whether or not VLAN translation is enabled for the service; the VLAN translation status is no longer configurable as long as the service is bound to an IP interface.
  - Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended. Make sure all switches have VLAN translation enabled, especially if an OmniSwitch 9900 with a service-based interface is added to the network.
  - The same SPB service ID can be assigned to an IPv4 and an IPv6 interface as long as both interface types are in the same VRF instance.
  - See the “IP over SPBM” section in the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information.
  - See the “Using L2 GRE Tunneling” section in the “Configuring Access Guardian” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information.

- Configure an IP interface on the Control BVLAN to support in-band management access in the SPBM domain. When creating an IP interface on a Control BVLAN, consider the following:
  - The IP interface must be configured only on the Control BVLAN. Only IPv4 interface is supported.
  - Only one Control BVLAN can be configured on a switch. This IP interface will be considered operationally active when the underlying Control BVLAN becomes operationally up and all underlying configuration is considered valid.
  - Whenever the IP interface is operationally down due to an unsupported configuration, the **show ip interface** command will display "Operational State Reason" as “invalid-config”.
  - ISIS-SPB is the only protocol supported in the IP BVLAN domain for exchanging or advertising IP routing information. No other routing protocol (including VRRP) is supported.
  - Multi-netting of IP interfaces on a BVLAN is not supported. Only one IP interface must be configured on the Control BVLAN.
  - STP is not allowed on BVLANs, and all broadcast packets will be restricted on this IP interface. Hence, explicit ARP/ND resolution is not supported. ISIS-SPB will provide the MAC-to-IP address mappings, to avoid broadcast packets in the SPBM backbone domain.
  - The ARPs learned with ISIS SPB on the Control BVLAN will be shown as static ARPs, but these ARPs will have bit "M" (Managed ARP) set in the ARP flags, and displayed as “M” in the “Flags” field of the **show arp** command display.
  - Static routing is required to route packets to destinations outside of the IP BVLAN subnet. Dynamic routing protocols are not supported on this IP interface.
  - The IP BVLAN domain will operate in IP unicast mode, hence IP Multicast is not supported.
  - SPB in-band management is supported on the OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900, and OmniSwitch 9900.
  - See the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information.

Examples

```
-> ip interface Marketing
-> vrf 100 ip interface “Payroll address” 18.12.6.3 vlan 255
-> ip interface “Human Resources” 10.200.12.101 vlan 500 no forward snap
-> ip interface Distribution 11.255.14.102 vlan 500 local-proxy-arp primary
-> no ip interface Marketing
-> vrf 100 no ip interface “Payroll address”

-> ip interface l3-vpn address 10.1.1.1/24 service 10
-> service 10 vlan-xlation disable
ERROR: Modify vlan translation currently not allowed for service (10)
-> vrf 100 ip interface l3-vpn100 address 100.1.1.1/24 service 20
```

```
-> no ip interface l3-vpn
-> vrf 100 no ip interface l3-vpn100
```

Release History

Release 7.1.1; command introduced
Release 8.4.1.R03; **service** parameter added to support binding an SPB service to an IP interface.
Release 8.5R4; **service** parameter support for binding an L2 GRE tunneling service to an IP interface added. Support for an IP interface on an SPB Control BVLAN added.

ip interface rtr-port

Configures an IP routed-port interface by associating an IP interface with a port or link aggregate and a VLAN.

ip interface *if_name* **address** *ip_address/mask* **vlan** *vlan_id* **rtr-port {port** *chassis/slot/port* **| linkagg** *agg_id***} {tagged | untagged}**

Syntax Definitions

if_name	A unique name for the IP interface. Use quotes around the string if the name contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
ip_address	IP host address to specify this IP interface.
mask	IP mask to specify this IP interface.
vlan_id	An unused VLAN ID to which this IP interface is associated.
chassis/slot/port	The chassis, slot, and port number (1/1/3) of the physical port to bind to the IP interface.
agg_id	The link aggregate ID to bind to the IP interface.
tagged	Whether the assigned port or link aggregate is tagged for the specified VLAN.
untagged	Whether the assigned port or link aggregate is untagged for the specified VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- In a single step, this command creates the specified VLAN, configures an IP interface for the VLAN, and assigns a port or link aggregate (tagged or untagged) to the VLAN.
- Configuring an IPv4 and IPv6 routed-port interface for the same VLAN ID is supported if the following conditions are met:
  - The VLAN ID, port, and the tagged/untagged port status for both interfaces is the same (for example, IPv4 and IPv6 routed interfaces are both bound to VLAN 850 with port 1/1/2 tagged).
  - Both interfaces are configured in the same VRF instance.
- Make sure the specified VLAN ID does not already exist in the switch configuration or is only used as a routed-port VLAN for an IPv4 interface. This VLAN will serve as a routing-only VLAN with a single port or link aggregate (Layer 2 functionality is not supported).
- Make sure the specified port or link aggregate is not already assigned to a VLAN that is *not* a routed-port VLAN. However, the port or link aggregate can be assigned to other routed-port VLANs.

- Attempting to add more ports or link aggregates to the routed-port VLAN or attempting to delete the VLAN is not allowed. The VLAN can only be removed by deleting the associated IPv4 and, if configured, the associated IPv6 interface.
- The same VLAN cannot be used for both a routed-port interface and a non-routed-port interface.
- Once configured, an IP routed-port interface is operationally equivalent to an IP VLAN interface. Routing protocols and other switch features that use IP are configured and operate on an IP routed-port interface in the same manner as on a regular IP interface.

Examples

```
-> ip interface “rp-vlan30” 10.0.0.1/8 vlan 30 rtr-port port 1/1/1 tagged
-> ip interface “rp-vlan40” 20.0.0.1/8 vlan 40 rtr-port port 1/1/2 untagged
-> ip interface “rp-vlan50” 30.0.0.1/8 vlan 40 rtr-port linkagg 6 tagged
-> ip interface “rp-vlan60” 40.0.0.1/8 vlan 50 rtr-port linkagg 7 untagged

-> vlan 70
-> ip interface rp-vlan70 rtr-port port 1/1/13 untagged vlan 70
ERROR: vlan 70 already present

-> ip interface rpv4-vlan rtr-port port 1/1/11 tagged vlan 300
-> ipv6 interface rpv6-vlan rtr-port port 1/1/11 tagged vlan 300

-> no ipv6 interface rpv6-vlan
-> ipv6 interface rpv6-vlan rtr-port port 1/1/13 untagged vlan 300
ERROR: Configuration conflict with IPv4 routed port interface rpv4-vlan
```

Release History

Release 7.3.4; command introduced

```

ip interface tunnel

Configures the end points for a GRE or IPIP tunnel.

ip interface *if_name* **tunnel [source** *ip_address***] [destination** *ip_address***] [protocol {ipip | gre}]**

Syntax Definitions

if_name	Text string. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
source *ip_address*	Source IP address of the tunnel.
destination *ip_address*	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip | gre	**ipip**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

You can configure an interface as either a VLAN or tunnel interface.

Examples

```
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

   alaIpInterfaceName
   alaIpInterfaceTunnelSrc
   alaIpInterfaceTunnelDst
   alaIpInterfaceDeviceType
```

ip interface dhcp-client

Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.

ip interface dhcp-client [vlan *vlan_id* **] [vsi-accept-filter** *filter-string* **| server-preference] [release | renew] [option-60** *opt60_string***] [admin {enable | disable}] [local-proxy-arp | no local-proxy-arp]]**

no ip interface dhcp-client

ip interface dhcp-client no server-preference

Syntax Definitions

dhcp-client	Reserved IP interface name indicating this interface use DHCP to obtain an IP address from a DHCP server.
vlan_id	An existing VLAN ID number (1–4094).
filter-string	String that matches with option-43 filed of the DHCPACK to prefer the desired OXO server. By default the filter-string will be empty string (“ “).
server-preference	Enables DHCP server precedence logic. The DHCP server preference logic is mutually exclusive with vsi-accept-filter.
release	Releases the DHCP server assigned IP address.
renew	Renews the DHCP server assigned IP address.
opt60_string	The option-60 field value to be included in DHCP discover/request packets.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.
local-proxy-arp	Enables Local Proxy ARP on the specified interface.
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.

Defaults

parameter	default
opt60_string	OmniSwitch-xxxx (xxxx = Platform, for example, 6900)
enable | disable	enable
filter-string	(“ “).
server-preference	disabled
local-proxy-arp | no local-proxy-arp	**no local-proxy-arp**

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the DHCP-client IP interface.
- Only one DHCP client IP interface can be assigned per switch but it can belong to any VLAN and any VRF instance.
- If the system name has not been configured, it will be updated using the option-12 field. If the option-12 string is greater than 19 characters the remaining characters will be truncated.
- The minimum lease time accepted on the DHCP-client interface is 5 minutes.
- The VSI filter-string once configured cannot be deleted. It can be overwritten or modified. It can be configured as empty string (“ “).
- The VSI accept filter is case-sensitive. The maximum length of a vsi-accept-filter can be of 64 character length.
- In order to retain the same OXO server which was configured before RCL, the VSI filter must match the hard coded string “alcatel.a4400.0”.
- DHCP client preference to obtain the lease from the highest priority server among the multiple offers received can be enabled using the **server-preference** option.
- Server preference option can also be set without specifying VLAN ID, provided the dhcp-client interface is associated with a VLAN prior to setting the server preference.
- The **server-preference** option is mutually exclusive with **vsi-accept-filter** option.
- Use the **no server-preference** option to remove the server preference.

Examples

```
-> ip interface dhcp-client vlan 100
-> ip interface dhcp-client admin enable
-> ip interface dhcp-client release
-> ip interface dhcp-client renew
-> ip interface dhcp-client option-60 OmniSwitch
-> no ip interface dhcp-client
-> ip interface dhcp-client vsi-accept-filter “alcatel.a4400.0”
-> ip interface dhcp-client vlan 1 server-preference
-> ip interface dhcp-client server-preference
-> ip interface dhcp-client no server-preference
```

Release History

Release 7.3.4; command introduced.
Release 8.5R1; **server-preference** parameters included.

   alaIpInterfaceDhcpServerPreference
```

ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

ip router primary-address *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The router primary address must be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis.

Examples

```
-> ip router primary-address 172.22.2.115
```

Release History

Release 7.1.1; command introduced

Related Commands

ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterPrimaryAddress
```

ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

ip router router-id *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis.
- The router ID is used by OSPF and BGP for unique identification of the router in the network.

Examples

```
-> ip router router-id 172.22.2.115
```

Release History

Release 7.1.1; command introduced

Related Commands

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterId
```

ip static-route

Creates or deletes an IP static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. By default, static routes carry a higher priority than the dynamic routes.

ip static-route *ip_address* **[mask** *mask***] {gateway {***gateway_address* **| null} [tag** *num***] [name** *string***] | interface** *interface_name* | **follows** *ip_address***} [metric** *metric***]**

no ip static-route *ip_address* **[mask** *mask***] [gateway {***gateway_address* **| null**} **| interface** *interface_name* | **follows** *ip_address***] [metric** *metric***]**

Syntax Definitions

ip_address	Destination IP address of the static route.
mask	Subnet mask corresponding to the destination IP address.
gateway *gateway_address*	IP address of the next hop used to reach the destination IP address.
gateway null	Use this option to configure an IPv4 blackhole route.
tag *num*	Tag to be used for route.
name *string*	Name to be used for route.
interface *interface _name*	Interface of the next hop used to reach the destination IP address.
follows *ip_address*	The recursive static route follows this IP address. The recursive route uses the same gateway (and interface) or nexthop that is used to reach this host address.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the **ip route-pref** command.
- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- A static route is active if the interface it is using is “UP”.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.

- If directly connected, NAT routers interface name can be used instead of gateway IP address, provided the router is enabled for proxy-ARP to handle ARP requests for the route addresses.
- Use the **null** option to configure IPv4 blackhole routes. A blackhole route is used to forward unwanted traffic to a blackhole.
  - Redistribution of blackhole routes is supported. Dynamic routing protocols may advertise these routes, but the gateway associated with the route(s) will be an address on the router advertising them.
  - Leaking of blackhole routes across SPB service backbones is supported. However, blackhole routes cannot be leaked between VRFs. Blackhole routes need to be explicitly configured using the **ip static-route** command in any/all VRFs.
  - Blackhole routes are created and installed through static route commands. Dynamic Routing protocols shall not install blackhole IP routes.
  - Blackhole routes shall never be part of ECMP.
  - Blackhole routes cannot be enabled for BFD support.
- Alternatively, the gateway address '0.0.0.0' can be used to create an IPv4 blackhole route.

Examples

```
-> ip static-route 171.11.1.0/24 gateway 171.11.2.1
-> ip static-route 171.11.1.0/24 interface Int1
-> ip static-route 12.0.0.0/8 interface Int1
-> ip static-route 171.11.1.0/24 follows 192.168.10.1
-> ip static-route 55.0.0.0/8 gateway null
-> ip static-route 55.0.0.0/8 gateway 0.0.0.0
```

Release History

Release 7.1.1; command introduced
Release 7.3.4; **interface, tag, name** parameters included
Release 8.6R1; **null** keyword added.

```

ip static-route all bfd-state

Enables BFD for all IPv4 static routes.

ip static-route all bfd-state {enable| disable}

Syntax Definitions

enable	Enables BFD for all IPv4 static routes.
disable	Disables BFD for all IPv4 static routes.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When there are static routes configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

Examples

```
-> ip static-route all bfd-state enable
-> ip static-route all bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip static-route bfd-state	Enables BFD for a specific static route.

```

ip static-route bfd-state

Enables or disables BFD for a specific IPv4 static route.

ip static-route *ipv4_prefix/pfx_length* **gateway** *ipv4_host_address* **bfd-state {enable| disable}**

Syntax Definitions

ipv4_prefix	The destination IPv4 address.
pfx_length	The prefix length for the destination IP address.
ipv4_host_address	The gateway IPv4 address.
enable	Enables BFD for the IPv4 static route.
disable	Disables BFD for the IPv4 static route.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

BFD is enabled to track the gateway of static routes.

Examples

```
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state enable
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip route-pref

Configures the route preference of a router.

[vrf *vrf_name***] ip route-pref {static | rip | ospf | isisl2 | isisl1 | ibgp | ebgp | import}** *value*

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF routes.
isisl2	Configures the route preference of ISIS L2 routes.
isisl1	Configures the route preference of ISIS L1 routes.
rip	Configures the route preference of RIP routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
import	Configures the route preference for the routes that are imported.
value	Route preference value.

Defaults

parameter	default
static *value*	2
ospf *value*	110
isisl2 *value*	118
isisl1 *value*	115
rip *value*	120
ebgp *value*	190
ibgp *value*	200
import *value*	210

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Route preference of local routes cannot be changed.

Examples

```
-> ip route-pref ebgp 20
-> ip route-pref rip 60
-> ip route-pref import 210
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** and **import** parameters added.

Related Commands

show ip route-pref	Displays the configured route-preference of a router.
ip import	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaIprmRtPrefTable
   alaIprmRtPrefEntryType
   alaIprmRtPrefEntryValue
```

ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet travels before being discarded.

ip default-ttl *hops*

Syntax Definitions

hops	TTL value, in hops. Valid range is 1–255.

Defaults

parameter	default
hops	64

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

Examples

```
-> ip default-ttl 30
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip config	Displays IP configuration parameters.

MIB Objects

```
IpDefaultTTL
```

ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the IP address or hostname of the destination. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described below.

ping {*ip_address* | *hostname***} [source-interface** *ip_interface***] [count** *count***] [size** *packet_size***] [interval** *seconds***] [timeout** *seconds***] [data-pattern** *string***] [dont-fragment] [tos** *tos_val***]**

Syntax Definitions

ip_address	IPv4 address of the system to ping.
hostname	DNS name of the system to ping.
source-interface *ip_interface*	IP address or interface name to use as the source IP for the ping packets.
count	Number of frames to be transmitted.
packet_size	Size of the data portion of the packet sent for this ping, in bytes. Valid range is 1–65507.
interval *seconds*	Polling interval. The switch polls the host at time intervals specified in seconds.
timeout *seconds*	Number of seconds the program waits for a response before timing out.
data-pattern *string*	The data pattern to be used in the data field of the ping packets.
dont-fragment	Sets the don't-fragment bit in the IP packet.
tos *tos_val*	Type of Service field in the IP header.

Defaults

parameter	default
count	6
packet_size	64
interval *seconds*	1
timeout *seconds*	5
dont-fragment	0
tos *tos_val*	0
data-pattern *string*	Repeating sequence of ASCII characters 0x4 onwards to 0xff

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you change the default values, they are only applied to the current ping. The next time you use the ping command, the default values are used unless you again enter different values.

Examples

```
-> ping 10.255.11.242

PING 10.255.11.242: 56 data bytes
64 bytes from 10.255.11.242: icmp_seq=0. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=1. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=2. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=3. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=4. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=5. time=0. ms
----10.255.11.242 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0

-> ping 10.0.0.1 source-interface mgmt
-> ping 10.0.0.1 tos 1
-> ping 10.0.0.1 timeout 10
-> ping 10.0.0.1 interval 10
-> ping 10.0.0.1 dont-fragment
-> ping 10.0.0.1 data-pattern AB
```

Release History

Release 7.1.1; command introduced

Related Commands

traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute {*ip_address* | *hostname***} [max-hop** *max_hop_count***] [min-hop** *min_hop_count***] [source-interface** *ip_interface***] [probes** *probe_count***] [timeout** *seconds***] [port** *port_number_value***]**

Syntax Definitions

ip_address	IPv4 address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
max_hop_count	Maximum hop count for the trace. The valid range is 1–255.
min_hop_count	Minimum hop count for the trace. The valid range is 1–30.
ip_interface	Source IP interface to be used in the traceroute packets.
probe_count	The number of packets (retry) sent for each hop-count. The valid range is 1–10000.
seconds	The time to wait for the response of each probe packet.
port_number_value	The destination port number to be used in the probing packets.

Defaults

parameter	default
max-hop *max_hop_count*	30
min-hop *min_hop_count*	1
source-interface *ip_interface*	Outgoing IP interface as per route lookup
probes *probe_count*	3
timeout *seconds*	5
port *port_number_value*	33334

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When using this command, you must enter the name of the destination as part of the command line (either the IP address or host name).

Examples

```
-> traceroute 128.251.17.224

traceroute to 128.251.17.224, 30 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 0 ms  16.6667 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
 4  128.251.17.224 0 ms  0 ms  0 ms

-> traceroute 128.251.17.224 max-hop 3
traceroute to 128.251.17.224, 3 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 16.6667 ms  0 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
-> traceroute 10.0.0.1 source-interface mgmt
-> traceroute 10.0.0.1 min-hop 3
-> traceroute 10.0.0.1 probes 3
-> traceroute 10.0.0.1 timeout 10
-> traceroute 10.0.0.1 port-number 1025
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip routes	Displays the IP Forwarding table.

MIB Objects

N/A

ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1s in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

[vrf *vrf_name***] ip directed-broadcast {enable | disable}**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
enable	Enables IP directed broadcasts.
disable	Disables IP directed broadcasts.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Directed broadcasts are used in denial-of-service attacks. In a DoS attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address. This results in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Directed broadcasts must not be enabled.
- When IP directed broadcast is enabled, by default, it is enabled on the 'default' VRF.

Examples

```
-> ip directed-broadcast enable
-> ip directed-broadcast disable
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip directed-broadcast	Displays the status of the directed broadcast configuration and trusted source IP address configuration.

MIB Objects

```
alaIpDirectedBroadcast
```

ip directed-broadcast trusted-source-ip

Specify the source IP address, destination IP address and destination VLAN information to broadcast the packets in controlled manner. The specified information is considered as the trusted information to broadcast the packets received from the defined parameters, and the remaining broadcast packets are dropped.

[vrf *vrf_name***] ip directed-broadcast trusted-source-ip {***ip_address/mask* **|** *ip_address* **mask** *subnet_mask***} [destination-ip {***ip_address/mask* **|** *ip_address* **destination-mask** *subnet_mask***] | destination-vlan {***vlan_id* | *vlan_id[-vlan_id***}]**

[vrf *vrf_name***] no ip directed-broadcast trusted source-ip** *ip_address* **{***ip_address/mask* **|** *ip_address* **mask** *subnet_mask***}**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
trusted-source-ip *ip_address*	Source IP address from which the broadcast packets are received.
destination-ip *ip_address*	Destination address to which the packets must be directed.
subnet_mask	The source mask from which the broadcast packets are received.
destination-mask *subnet_mask*	The destination mask to which the packets must be directed.
vlan_id	Existing VLAN ID to which the packets are to be directed.

Defaults

parameter	default
ip_address	0.0.0.0
subnet_mask	IP address class/0.0.0.0
vlan_id	None

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the **no** command to remove the trusted information configured with the source IP address for controlled IP directed broadcast.
- IP directed broadcast must be enabled for the controlled IP directed broadcast to work.
- When controlled IP directed broadcast is enabled, by default, it is enabled on the ‘default’ VRF.
- The trusted information must have the source IP with optional destination IP address or VLAN ID.
- Ensure that the configured address/mask combination (source/destination IP address) configuration is not a subset of an already existing address/mask.
- If the source IP matches, then the packets are broadcasted in the particular destination IP interface or VLAN interfaces. The remaining packets are dropped.

- When the packet received matches with the source IP and if the destination IP or destination VLAN information are not defined by the user, then the packet will be forwarded based on the routing information in the switch.
- If no source IP is provided as trusted, by default, all the packets are forwarded.
- If the destination IP or VLAN is defined by the user, then the destination address of the packet will be matched with the user defined list and routes the packets if the destination IP matches. If the VLAN information is defined, then the packets will be routed if the destination VLAN matches a VLAN in the configured allowed VLAN list. If neither the destination IP or VLAN matches the ones configured, the packet are dropped.
- If the destination IP is not reachable or if the destination subnet is not directly connected, packet will be dropped.
- If the directed broadcast is set to controlled mode and the user does not specify any trusted information, all the broadcast packets will be dropped. This case is equivalent to disabled state of directed-broadcast.
- 32 source IP addresses can be defined, and each source IP address can have 30 destination IP addresses and 30 destination VLAN IDs.
- If IP directed broadcasts is disabled using the command **ip directed-broadcast disable**, which also is the default, all packets with subnet broadcast, will be dropped.

Examples

```
-> ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0

-> vrf test123 ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0
destination-ip 10.0.0.255 destination-mask 255.255.255.255

-> ip directed-broadcast trusted-source-ip 30.0.0.0/24 destination-ip 10.0.0.255/24

-> ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0
destination-vlan 10

-> ip directed-broadcast trusted-source-ip 30.0.0.0/24 destination-vlan 10-15

-> no ip directed-broadcast trusted-source-ip 30.0.0.0/24
-> no ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0
```

Release History

Release 8.5R2; command introduced.

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip directed-broadcast clear	Clears all the trusted information configured.
show ip directed-broadcast	Displays the status of the directed broadcast configuration and trusted source IP address configuration.

MIB Objects

```
alaIpDirectedBroadcastCtrlSrcTable
   alaIpDirectedBroadcastCtrlSrcAddrType
   alaIpDirectedBroadcastCtrlSrcAddr
   alaIpDirectedBroadcastCtrlSrcMask
alaIpDirectedBroadcastCtrlDstTable
   alaIpDirectedBroadcastCtrlDstAddrType
   alaIpDirectedBroadcastCtrlDstAddrType
   alaIpDirectedBroadcastCtrlDstMask
alaIpDirectedBroadcastCtrlVlanTable
   alaIpDirectedBroadcastCtrlVlanID
```

ip directed-broadcast clear

Clears all the trusted information configured.

[vrf *vrf_name***] ip directed-broadcast clear [trusted-source-ip {***ip_address/mask* **|** *ip_address* **mask** *subnet_mask***}]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
trusted-source-ip *ip_address*	Source IP address from which the broadcast packets are received.
subnet_mask	The source mask from which the broadcast packets are received.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

If the source IP is specified, then the destination and the VLAN information for the source IP specified is cleared. If the command is specified without the source IP address, entire trusted information database is cleared.

Examples

```
-> ip directed-broadcast clear
-> ip directed-broadcast clear trusted-source-ip 20.20.20.0 mask 255.255.255.0
```

Release History

Release 8.5R2; command introduced.

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip directed-broadcast trusted-source-ip	Specify the source IP address, destination IP address and destination VLAN information to broadcast the packets in controlled manner.

MIB Objects

```
alaIpDirectedBroadcastCtrlSrcTable
   alaIpDirectedBroadcastCtrlSrcAddrType
   alaIpDirectedBroadcastCtrlSrcAddr
   alaIpDirectedBroadcastCtrlSrcMask
   alaIpDirectedBroadcastCtrlSrcClear
alaIpDirectedBroadcastCtrlGlobalConfig
   alaIpDirectedBroadcastCtrlClearAll
```

show ip directed-broadcast

Displays the status of the directed broadcast configuration and trusted source IP address configuration.

[vrf *vrf_name***] show ip directed-broadcast [trusted-source-ip {***ip_address/mask* **|** *ip_address* **mask** *subnet_mask***}] details**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
trusted-source-ip *ip_address*	Source IP address from which the broadcast packets are received.
subnet_mask	The source mask from which the broadcast packets are received.
details	Displays the destination IP address or VLAN information for the specified source IP.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use **details** keyword to view the destination IP addresses or VLANs information for the specified source IP.

Examples

```
-> show ip directed-broadcast
IP Directed Broadcast is enabled
Source-IP         MASK              Destination-IP VLAN
------------------+-----------------+--------------+-----
100.10.1.0        255.255.255.0     YES            NO
100.10.2.2        255.255.255.255   YES            NO
100.10.3.0        255.255.255.224   YES            NO
100.10.4.0        255.255.255.248   YES            NO

-> show ip directed-broadcast trusted-source-ip 10.10.10.0 mask 255.255.255.0
details
Source-IP/Mask         =    10.10.10.0/255.255.255.0
Destination-IP/Mask    =    20.20.20.0/255.255.255.0,
Vlan                   =    10
```

output definitions

Source-IP/Mask	Trusted source IP address and mask configured in a controlled manner.
Destination-IP/Mask	Trusted destination IP address and mask configured in a controlled manner.
Vlan	Trusted VLAN ID configured for directed broadcast in a controlled manner.

Release History

Release 8.5R2; command introduced.

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip directed-broadcast trusted-source-ip	Specify the source IP address, destination IP address and destination VLAN information to broadcast the packets in controlled manner.

MIB Objects

N/A

ip service

Enables (opens) or disables (closes) well-known or user-defined TCP/UDP service ports. Selectively enabling or disabling these types of ports provides an additional method for protecting against unauthorized switch access or Denial of Service (DoS) attacks.

[vrf *vrf_name***] ip service {all |** *service_name* | **port** *service_port***} admin-state {enable | disable}**

Syntax Definitions

vrf_name	The name of an existing VRF instance in which services are to be enabled or disabled.
all	Configures access to all TCP/UDP ports.
service_name	The name of the TCP/UDP service to enable or disable. (Refer to the table in the "Usage Guidelines" section for a list of supported service names.)
service_port	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the "Usage Guidelines" section for a list of well-known port numbers.) If a user-defined port number is specified, the valid range is 20000–20999.
enable	Enables access to the service.
disable	Disables access to the service.

Defaults

All TCP/UDP ports are open by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, and so on.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the "Example" section for more information.
- When specifying a service port number, the **port** keyword is required and that only one port number is allowed in a single command.

- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443
ntp	123
snmp	161

- If a VRF is specified, the service is enabled or disabled in the specified VRF. By default, the services are enabled in the 'default' VRF.

Examples

```
-> ip service all admin-state disable
-> ip service ftp admin-state enable
-> ip service port 20000 admin-state enable
-> vrf vrf1 ip service ftp admin-state enable
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

ip service port	Configures a user-defined TCP/UDP port for the specified service.
show ip service	Displays the IP service TCP/UDP port configuration and status.

MIB Objects

```
alaIpServiceTable
   alaIpServiceType
   alaIpServicePort
   alaIpServiceStatus
alaIpPortServiceTable
   alaIpPortServicePort
   alaIpPortServiceStatus
```

ip service port

Configures a user-defined TCP/UDP service port for the specified service.

ip service {*service_name***} port {default |** *service_port***}**

Syntax Definitions

service_name	The name of the TCP/UDP service to enable or disable. (Refer to the table in the "Usage Guidelines" section for a list of supported service names.)
service_port	A TCP/UDP service port number (Refer to the table in the "Usage Guidelines" section for a list of supported service names.) Valid range is the default service port number or 20000-20999.
default	Sets the port back to the well-known port for the specified service.

Defaults

By default, the service uses the well-known TCP/UDP port number for that service.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **default** parameter with this command to set the port for the specified service back to the well-known default port for that service. For example, if the FTP port was previously changed to "20000", then the **ip service ftp port default** command would set the FTP port back to "21".
- The following table lists the **ip service port** command options for specifying TCP/UDP services and also includes the default well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443

  The **ntp** and **snmp** services are not supported with the **ip service port** command.
- Use the **ip service** command to enable or disable the status for a well-known or user-defined TCP/UDP service port.

Examples

```
-> ip service ftp port 20000
-> ip service ftp port default
-> ip service telnet port 20003
```

```
-> ip service telnet port default
```

Release History

Release 7.1.1; command introduced

Related Commands

ip service	Enables or disables well-known or user-defined service ports.
show ip service	Displays the IP service TCP/UDP port configuration and status.

MIB Objects

```
alaIpServiceTable
   alaIpServiceType
   alaIpServicePort
   alaIpServiceStatus
```

ip service source-ip

Configures a user-defined source IP address as the outgoing IP interface for the IP service.

[vrf *vrf_name***] ip service source-ip {Loopback0 |** *interface_name***} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]**

[vrf *vrf_name***] no ip service source-ip {Loopback0 |** *interface_name***} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]**

Syntax Definitions

vrf_name	Name of the VRF.
Loopback0	Uses the Loopback0 interface as the source IP for the IP service.
interface_name	Specifies the name of the interface.
tftp	Configures the source IP address to be used by TFTP.
telnet	Configures the source IP address to be used by TELNET.
tacacs	Configures the source IP address to be used by TACACS.
swlog	Configures the source IP address to be used by SWLOG.
ssh	Configures the source IP address to be used by SSH.
snmp	Configures the source IP address to be used by SNMP.
sflow	Configures the source IP address to be used by sFlow.
radius	Configures the source IP address to be used by RADIUS.
ntp	Configures the source IP address to be used by NTP.
ldap	Configures the source IP address to be used by the LDAP server.
ftp	Configures the source IP address to be used by FTP.
dns	Configures the source IP address to be used by DNS.
all	Configures the source IP address to be used by all the applications.

Defaults

By default, the outgoing interface is taken as the source IP address for all the applications.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If for a particular application, specific source IP address is configured and the “all” option is also set, the configured source IP address for the application is used as the outgoing interface.
- Use the **no** form of this command to revert to the default behavior.
- This feature is supported on non-default VRF.

Examples

```
-> ip service source-ip loopback0 dns
-> ip service source-ip ipVlan100 ftp
```

Release History

Release 7.3.4; command introduced
Release 8.5R4; **ntp** option deprecated.
Release 8.6R2; **ntp** option re-introduced.

Related Commands

show ip service source-ip	Displays the IP service TCP/UDP port configuration and status.

MIB Objects

```
alaIpServiceSourceIPTable
   AlaIpServiceSourceIPAppIndex
   alaIpServiceSourceIPName
```

ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

[vrf *vrf_name***] ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map** *route_map_name***} [admin-state {enable | disable}]**

no ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} [all-routes | route-map | *route_map_name***]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
local	Redistributes local routes.
static	Redistributes static routes.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
isis	Specifies IS-IS as the source or destination (into) protocol.
bgp	Specifies BGP as the source or destination (into) protocol.
import	Redistributes imported routes to other routing protocols.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
route_map_name	Name of an existing route map that controls the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

If a VRF name is not specified with this command, routes are redistributed within the context of the active VRF instance.

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. If a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route is greater than 15 (RIP_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.

- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the "Configuring IP" chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip disable
-> ip redist import into ospf route-map R1 status enable
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** and **import** parameters added.
Release 7.3.2; **all-routes** parameter added.

Related Commands

show ip redist	Displays the route map redistribution configuration.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip import	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

ip access-list *access-list-name*

no ip access-list *access-list-name*

Syntax Definitions

access-list-name	Name of the access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ip access-list access1
-> no ip access-list access1
```

Release History

Release 7.1.1; command introduced

Related Commands

ip access-list address	Adds IPv4 addresses to the specified IPv4 access list.
show ip access-list	Displays the details of the access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

ip access-list *access-list-name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ip access-list *access-list-name* **address** *address/prefixLen*

Syntax Definitions

access-list-name	Name of the access list.
address/prefixLen	IP address/prefix length to be added to the access list.
permit	Permits the IP address.
deny	Denies the IP address.
all-subnets	Permits or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Permits or denies only those routes that exactly match the IP address and the mask length.
aggregate	Permits an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | deny	**permit**
all-subnets | no-subnets | aggregate	**all-subnets**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* must exist before you add multiple addresses to the list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
-> ip access-list access1 address 10.1.1.0/24 redist-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

Release History

Release 7.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
show ip access-list	Displays the contents of an IPv4 access list.

MIB Objects

```
alaRouteMapAccessListTable
   alaRouteMapAccessListIndex
   alaRouteMapAccessListAddress
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
   alaRouteMapAccessListRowStatus
```

ip route-map action

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

ip route-map *route_map_name* **[sequence-number** ***number*****] action {permit | deny}**

no ip route-map *route_map_name* **[sequence-number** *number***]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
permit	Selects a route.
deny	Filters a route.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route_map_name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

Examples

```
-> ip route-map route1 sequence-number 10 action permit
-> no ip route-map route1
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapSequenceTable
   alaRouteMapSequenceIndex
   alaRouteMapSequenceNumber
   alaRouteMapSequenceAction
   alaRouteMapSequenceRowStatus
```

ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

ip route-map *route_map_name* **[sequence-number** ***number*****] match ip-address {***access-list-name* **|** ***ip_address/****prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route_map_name* **[sequence-number** ***number*****] match ip-address {***access-list-name* **|** *ip_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
access-list-name	The name of an IPv4 access list that contains IPv4 addresses to match.
ip_address/prefixLen	The destination IP address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IP address.
permit	Permits a route based on the IP address or prefix constrained by redist-control.
deny	Denies a route based on the IP address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny,** then the route is not selected. If the best matching address is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access-list-name* (if used) must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ip-address list1
-> no ip route-map route1 sequence-number 10 match ip-address list1
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-address {***access-list-name* **|** *ipv6_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-address** *ipv6_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access-list-name	The name of an IPv6 access list that contains IPv6 addresses to match.
ipv6_address/prefixLen	The destination IPv6 address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IPv6 address.
permit	Permits a route based on the IPv6 address or prefix constrained by redist-control.
deny	Denies a route based on the IPv6 address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny,** then the route is not selected. If the best matching address is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ipv6-address list1
-> no ip route-map route1 sequence-number 10 match ipv6-address list1
```

ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

ip route-map *route_map_name* **[sequence-number** *number***] match ip-nexthop {***access-list-name* | *ip_address/prefixLen* **[permit | deny]}**

no ip route-map *route_map_name* **[sequence-number** *number***] match ip-nexthop {***access-list-name* | *ip_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
access-list-name	The access list that matches the route nexthop IP address.
ip_address/prefixLen	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IP nexthop.
deny	Denies a route based on the IP nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny,** then the route is not selected. If the best matching nexthop is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ip-nexthop list1
-> no ip route-map route1 sequence-number 10 match ip-nexthop list1
-> ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
```

Release History

Release 7.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-nexthop {***access-list-name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-nexthop {***access-list-name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
access-list-name	The access list that matches the route nexthop IPv6 address.
IPv6_*address/prefixLen*	The IPv6 address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IPv6 nexthop.
deny	Denies a route based on the IPv6 nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny,** then the route is not selected. If the best matching nexthop is type **permit** but the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
```

Release History

Release 7.1.1; command introduced

ip route-map match tag

Matches the tag value specified in the route map with the one on which the routing protocol learned the route.

ip route-map *route_map_name* **[sequence-number** *number***] match tag** *tag-number*

no ip route-map *route_map_name* **[sequence-number** *number***] match tag** *tag_number*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
tag_number	The tag number.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match tag 4
-> no ip route-map route1 sequence-number 10 match tag 4
```

ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv4-interface** *interface_name*

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv4-interface** *interface_name*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
interface_name	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv4-interface int4
-> no ip route-map route1 sequence-number 10 match ipv4-interface int4
```

Release History

```

ip route-map match ipv6-interface

Matches the IPv6 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-interface** *interface_name*

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-interface** *interface_name*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
interface_name	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-interface int6
-> no ip route-map route1 sequence-number 10 match ipv6-interface int6
```

```

ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

no ip route-map *route_map_name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
metric	The metric value that matches a specified metric.
deviation	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match metric 4
-> no ip route-map route1 sequence-number 10 match metric 4
```

Release History

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match route-type

Matches the specified route type with actual route type of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

no ip route-map *route_map_name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
internal	Matches OSPF/BGP internal routes.
external	Matches OSPF/BGP external routes.
type1	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 match route-type internal
-> no ip route-map 111 sequence-number 50 match route-type internal
```

Release History

Release 7.1.1; command introduced

Related Commands

   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match protocol

Matches the protocol specified in the route map with the protocol of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

no ip route-map *route_map_name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
local	Matches a local interface route.
static	Matches a static route.
rip	Matches a RIP route.
ospf	Matches an OSPF route.
isis	Matches an IS-IS route.
bgp	Matches a BGP route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match protocol** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match protocol local
-> no ip route-map route1 sequence-number 10 match protocol local
```

Release History

Release 7.3.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match name

Matches the name of a static route specified in the route map with the name of the static route.

ip route-map *route_map_name* **[sequence-number** *number***] match name** *string*

no ip route-map *route_map_name* **[sequence-number** *number***] match name** *string*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
name *string*	The name of the static route to match.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **match name** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match name Route-Bldg1
-> no ip route-map route1 sequence-number 10 match name Route-Bldg1
```

Release History

Release 7.3.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric

Configures the metric value of the route being distributed.

ip route-map *route_map_name* **[sequence-number** *number***] set metric** *metric* **[effect {add | subtract | replace | none}]**

no ip route-map *route_map_name* **[sequence-number** *number***] set metric** *metric* **[effect {add | subtract | replace | none}]**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
metric	Configures the metric value of the route. A value of 0 is not allowed.
add	Adds the configured metric value to the actual metric value.
subtract	Subtracts the configured metric value from the actual metric value.
replace	Replaces the actual metric value with the configured metric value.
none	Uses the actual metric value of the route. The configured metric value is ignored. Use any value except 0.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric 30 effect add
-> no ip route-map 111 sequence-number 50 set metric 30 effect add
```

Release History

Release 7.1.1; command introduced

Related Commands

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric-type

Configures the metric type for the redistributed route.

ip route-map *route_map_name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

no ip route-map *route_map_name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
internal	Sets the metric type to internal for routes redistributed into BGP.
external	Sets the metric type to external for routes redistributed into BGP.
type1	Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set metric-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric-type internal
-> no ip route-map 111 sequence-number 50 set metric-type internal
```

   alaRouteMapRowStatus
```

ip route-map set tag

Configures the tag value of the selected routes.

ip route-map *route_map_name* **[sequence-number** *number***] set tag** *tag_number*

no ip route-map *route_map_name* **[sequence-number** *number***] set tag** *tag_number*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
tag_number	Configures the tag number.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set tag 23
-> no ip route-map 111 sequence-number 50 set tag 23
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

```

ip route-map set community

Configures the community name of the route being redistributed into BGP.

ip route-map *route_map_name* **[sequence-number** *number***] set community** *community_string*

no ip route-map *route_map_name* **[sequence-number** *number***] set community** *community_string*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
community_string	Defines a community for an aggregate route. Community names range from 0 to 70 characters.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set community** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set community 29
-> no ip route-map 111 sequence-number 50 set community 29
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

ip route-map *route_map_name* **[sequence-number** *number***] set local-preference** *value*

no ip route-map *route_map_name* **[sequence-number** *number***] set local-preference** *value*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
value	Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

Release History

Release 7.1.1; command introduced

Related Commands

```

ip route-map set level

Configures the level of the selected ISIS route.

ip route-map *route_map_name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

no ip route-map *route_map_name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.
level1-2	Matches IS-IS Level1-2 routes**.**

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set level** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set level level1
-> no ip route-map 111 sequence-number 50 set level level1
```

```

ip route-map set ip-nexthop

Configures the IP address of the next hop in a route map.

ip route-map *route_map_name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

no ip route-map *route_map_name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
ip_address	IP address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set ip-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
-> no ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

alaIPRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set ipv6-nexthop

Configures the IPv6 address of the next hop in a route map.

ip route-map *route_map_name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

no ip route-map *route_map_name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

Syntax Definitions

route_map_name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
ipv6_address	IPv6 address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the **set ipv6-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
-> no ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
```

Release History

Release 7.1.1; command introduced

   alaRouteMapValue
   alaRouteMapRowStatus
```

vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

vrf [create] [*vrf_name* | **default] [profile {max | low}]**

no vrf *vrf_name*

Syntax Definitions

create	Creates a new VRF instance with the specified VRF name.
vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
default	Optional. Selects the default VRF instance.
max	Creates a VRF with the maximum profile capabilities.
low	Creates a VRF with the minimum (lowest) capabilities. Low profile VRFs use less system resources.

Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
vrf_name | **default**	default VRF instance
max | low	max profile

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To create a new VRF instance, use the **create** parameter with this command. For example, **vrf create IpOne** creates a new “IpOne” VRF instance. When a new instance is created, that instance automatically becomes the current CLI context.
- If the **create** keyword is not specified, then this command will select the specified VRF name as the current CLI context. If the VRF instance does not exist, an error message is displayed.
- Use the **no** form of this command to delete a VRF instance. Deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. Use the **show vrf** command to verify the VRF instance configuration before selecting, adding, or removing instances.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.

- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.
- The type of profile assigned to a VRF instance determines the routing protocols and capabilities supported within that instance. For example:
  - Low profile VRFs only support IPv4 and VRRP with routing capabilities restricted to static and imported routes. In addition, limiting low profiles to 9 routes and 3 IP interfaces is highly recommended.
  - IPv6 routing protocols (such as BGP, IS-IS, PIM, RIPng, OSPFv3, and VRRPv3) are only supported on max profile VRFs.
- Profiles are not configurable for the default VRF, which provides full routing capabilities.
- Changing the profile for an existing VRF instance is not allowed. To change the profile, first delete the VRF then create it again with a different profile.

Examples

The following command examples create new VRF instances:

```
-> vrf create IpOne
IpOne:: ->

IpOne:: -> vrf create IpTwo
IpTwo:: ->

-> vrf create IpThree profile low
IpThree::->
```

The following command examples select a VRF instance to change the CLI context:

```
-> vrf IpTwo
IpTwo:: ->

-> vrf IpFour
ERROR: VRF IpFour does not exist.
```

The following command examples return the CLI context to the default VRF instance:

```
IpTwo:: -> vrf
->

IpTwo:: -> vrf default
->
```

The following command example configures an IP interface for the “IpOne” VRF instance from within the context of the default VRF instance:

```
-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100
->
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **max** and **low** parameters added to define VRF profiles.
Release 8.4.1.R03; **create** parameter added.

Related Commands

show vrf	Displays the VRF instance configuration for the switch.
show vrf-profiles	Displays the VRF profile resources for the switch.
ip export	Exports VRF routes to the Global Routing Table (GRT).
ip import	Imports VRF routes from the GRT.

MIB Objects

```
alaVirutalRouterNameTable
   alaVirtualRouterName
   alaVirtualRouterNameIndex
   alaVirtualRouterNameRowStatus
   alaVirtualRouterProfile
```

ip export

Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes

[vrf *vrf_name***] ip export {all-routes | route-map** *route_map_name* | **to-all-vrfs {all-routes | route-map** *route_map_name***}}**

[vrf *vrf_name***] no ip export**

Syntax Definitions

vrf_name	The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.
all-routes	Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.
route_map_name	The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.
to-all-vrfs all-routes	Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.
to-all-vrfs route-map *route_map_name*	The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.
- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter exported VRF routes can contain any of the following match and set options:
  - Match options: ip-address, ip-next-hop, tag, protocol, ipv4-interface, metric, route-type, name
  - Set options: tag, metric
- A route map with redist control of aggregate is supported when exporting IP routes, but it is not supported when importing IP routes.
- Only one route map per source VRF or ISID is allowed for filtering exported routes.

- Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.
- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is supported.

Examples

The following commands export routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

```
-> ip export route-map R1
-> ip export all-routes
-> ip export to-all-vrfs all-routes
-> ip export to-all-vrfs route-map R2
-> no ip export
```

The following commands export routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

```
-> vrf vrf2 ip export route-map R1
-> vrf vrf2 ip export all-routes
-> vrf vrf2 ip export to-all-vrfs all-routes
-> vrf vrf2 ip export to-all-vrfs route-map R2
-> no vrf vrf2 ip export
```

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

```
-> vrf vrf1
vrf1::-> ip export route-map R1
vrf1::-> ip export all-routes
vrf1::-> ip export to-all-vrfs all-routes
vrf1::-> ip export to-all-vrfs route-map R2
vrf1::-> no ip export
```

Release History

Release 7.3.1; command introduced.
Release 7.3.2; **all-routes** and **to-all-vrfs** parameters added.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip export	Displays the export route configuration details.
show ip global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmExportRouteMap
alaIprmExportToAllVrfsRouteMap
```

ip import

Imports VRF or Shortest Path Bridging (SPB) service instance identifier (ISID) routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

[vrf *dest_vrf_name***] ip import {vrf {***src_vrf_name* **| default} | isid** *instance_id***} {all-routes | route-map** *route_map_name***}**

[vrf *dest_vrf_name***] no ip import {vrf {***src_vrf_name* **| default} | isid** *instance_id***}**

Syntax Definitions

dest_vrf_name	The name of the destination VRF instance into which routes are imported from the GRT.
src_vrf_name	The name of the source VRF instance from which routes were exported to the GRT. Routes from this instance are imported from the GRT into the specified destination VRF instance.
default	Default VRF. The routes are imported from the default VRF instance.
instance_id	An existing ISID number that identifies an SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.
all-routes	Imports all routes from the source VRF instance. Imported routes are not filtered.
route_map_name	The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

Defaults

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF instance or ISID.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter imported VRF or ISID routes can contain any of the following match and set parameter options:
  - Match options: ip-address, ip-next-hop, tag, metric
  - Set options: tag, metric

- A route map with redist control of aggregate is supported when exporting IP routes, but it is not supported when importing IP routes.
- Only one route map per source (imported) VRF or ISID is allowed.
- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is supported.
- Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

Examples

```
-> ip import vrf V1 route-map R2
-> ip import vrf V2 all-routes
-> ip import isid 1500 route-map R1
-> ip import isid 2000 all-routes
-> no ip import vrf V1
-> no ip import isid 1500
```

Release History

Release 7.3.1; command introduced.
Release 7.3.2; **isid** and **all-routes** parameters added.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip import	Displays the import route configuration details.
show ip global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
alaIprmImportIsidTable
   alaIprmImportIsid
   alaIprmImportIsidRouteMap
   alaIprmImportIsidRowStatus
```

show ip export

Displays the export route configuration details.

[vrf *vrf_name***] show ip export**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the export route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If a VRF is specified, the export route configuration for that VRF is displayed.

Examples

```
-> show ip export
Export Route Map: leak-out

-> vrf vrf1 show ip export
Export Route Map: none (all-routes)

vrf2::-> show ip export
Export Route Map: none (all-routes) -> To All VRFs
```

Release History

Release 7.3.1; command introduced.

Related Commands

ip export	Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances.

MIB Objects

```
alaIprmExportRouteMap
alaIprmExportToAllVrfsRouteMap
```

show ip import

Displays the import route configuration details.

[vrf *vrf_name***] show ip import**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the import route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If a VRF is specified, the import route configuration for that VRF is displayed.

Examples

```
-> show ip import
Type  Source               RouteMap
-----+--------------------+----------------------
vrf    Customer1           leak-in
vrf    Customer2           none (all-routes)
isid   1000                isid1000-filter
```

output definitions

Type	The type of imported route (**vrf** or **isid**).
Source	The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which routes are imported to the VRF.
RouteMap	The name of the route map filter or **none (all-routes)**.

Release History

Release 7.3.1; command introduced.
Release 7.3.2; **VRF Name** and **Description** fields renamed **Type** and **Source,** imported ISID route entries added to the table.

Related Commands

ip import	Imports VRF or Shortest Path Bridging ISID routes from the GRT to the destination VRF.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
alaIprmImportIsidTable
   alaIprmImportIsid
   alaIprmImportIsidRouteMap
   alaIprmImportIsidRowStatus
```

show ip global-route-table

Displays the contents of the Global Routing Table (GRT) for all the routes that are exported from VRF instances or from Shortest Path Bridging service instance identifiers (ISIDs). This command is only available within the context of the default VRF instance.

show ip global-route-table [export-vrf *vrf_name***]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

By default, exported routes are displayed for all VRF instances and ISIDs.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **export-vrf** parameter to display exported routes for a specific VRF instance.

Examples

```
-> show ip global-route-table
Type  Source               Destination        Gateway         Metric     Tag
-----+--------------------+------------------+---------------+----------+----------
 vrf   Customer1            10.0.0.0/8         12.1.1.2        1          100
 vrf   Customer2            11.0.0.0/8         12.1.1.3        2          0
isid   1000                 12.0.0.0/8         12.1.1.4        1          2
```

output definitions

Type	The type of exported route (**vrf** or **isid**).
Source	The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which routes are exported to the GRT.
Destination	The address of the route.
Gateway	The next hop for the destination address.
Metric	The metric of the exported route.
Tag	The tag of the exported route.

Release History

Release 7.3.1; command introduced.
Release 7.3.2; **VRF Name** and **Description** fields renamed **Type** and **Source,** exported ISID route entries added to the table.

Related Commands

ip export	Configures a route map to export routes from the source VRF to Global Routing Table (GRT).
show ip export	Displays the export route configuration details.

   alaGrtRouteMetric
   alaGrtRouteTag
   alaGrtRouteVrfName
   alaGrtRouteIsid
```

arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

arp *ip_address mac_address* **[alias] [arp-name** *name***] [interface** *interface_name***] [port** *chassis/slot/port***] [linkagg** *agg_id***]**

no arp *ip_address* **[alias]**

Syntax Definitions

ip_address	IP address of the device you are adding to the ARP table.
mac_address	MAC address of the device in hexadecimal format (for example, 00.00.39.59.f1.0c).
alias	Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address. *This parameter is not supported on the OmniSwitch 9900.* The proxy feature can also be enabled for an IP interface using the **ip interface** command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.
name	The name to assign to this ARP entry.
interface_name	Name of the interface to be used for ARP resolution.
chassis	The chassis identifier.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the *ip_address* parameter instead of a unicast address.
- Using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.

- As most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), it is not required to specify permanent ARP cache entries.
- Only the IP address is required when deleting an ARP entry from the table.

Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
-> arp 171.11.1.1 00:05:02:c0:7f:11 interface int1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **interface** parameter added.

Related Commands

ip distributed-arp admin-state	Deletes all dynamic entries from the ARP table.
ip interface	Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show arp	Displays the ARP table.

MIB Objects

```
ipNetToMediaTable
   ipNetToMediaIfIndex
   ipNetToMediaNetAddress
   ipNetToMediaPhyAddress
   ipNetToMediaType
alaIpNetToMediaTable
   alaIpNetToMediaPhyAddress
   alaIpNetToMediaProxy
```

ip distributed-arp admin-state

Enables or disables the distributed ARP feature.

ip distributed-arp admin-state {enable | disable}

Syntax Definitions

enable	Dynamically assigns a Network Interface (NI) as the designated-NI for all the ARP entries on an IP interface.
disable	Disables the distributed ARP feature.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use this feature to dynamically assign a Network Interface (NI) as the designated-NI for all the ARP entries. The NI with maximum number of active ports for that IP subnet is assigned.
- To reset or update the dynamically assigned NI, the feature must be disabled and then enabled.

Examples

```
-> ip distributed-arp admin-state enable
-> ip distributed-arp admin-state disable
```

Release History

Release 7.3.4; command introduced;
Release 8.6R2; command deprecated.

Related Commands

show ip arp utilization	Displays the designated NIs for the interfaces and the NI utilization.
show ip interface	Displays the configuration and status of IP interfaces.

MIB Objects

```
alaIpDistributedArp
```

clear arp-cache

Deletes all dynamic entries from the ARP table.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the **ip service** command.
- Dynamic entries remain in the ARP table until they time out. The switch uses the MAC Address table timeout value as the ARP timeout value. Use the **mac-learning aging-time** command to set the timeout value.

Examples

```
-> clear arp-cache
```

Release History

Release 7.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
show arp	Displays the ARP table.

MIB Objects

```
alaIpClearArpCache
```

ip dos arp-poison restricted-address

Adds or deletes an ARP Poison restricted address.

ip dos arp-poison restricted-address *ip_address*

no ip dos arp-poison restricted-address *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to remove an already configured ARP Poison restricted address.

Examples

```
-> ip dos arp-poison restricted-address 192.168.1.1
-> no ip dos arp-poison restricted-address 192.168.1.1
```

Release History

Release 7.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
show arp	Displays the ARP table.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDosArpPoisonRowStatus
```

arp filter

Configures an ARP filter that determines if ARP Request packets containing a specific IP address are processed by the switch or discarded.

arp filter *ip_address* **[mask** *ip_mask***] [***vlan_id***] [sender | target] [allow | block]**

no arp filter *ip_address*

Syntax Definitions

ip_address	The IP address to use for filtering ARP packet IP addresses.
ip_mask	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (for example, mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
vlan_id	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
sender	The sender IP address in the ARP packet is used for ARP filtering.
target	The target IP address in the ARP packet is used for ARP filtering.
allow	ARP packets that meet filter criteria are processed.
block	ARP packets that meet filter criteria are discarded.

Defaults

parameter	default
vlan_id	0 (no VLAN)
ip_mask	255.255.255.255
sender | target	**target**
allow | block	**block**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

Release History

Release 7.1.1; command introduced

Related Commands

clear arp filter	Clears all ARP filters from the filter database.
ip interface	Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show ip arp utilization	Displays the ARP filter configuration.

MIB Objects

```
alaIpArpFilterTable
   alaIpArpFilterIpAddr
   alaIpArpFilterIpMask
   alaIpArpFilterVlan
   alaIpArpFilterMode
   alaIpArpFilterType
```

clear arp filter

Clears the ARP filter database of all entries.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command clears all ARP filters configured on the switch. To remove an individual filter entry, use the **no** form of the **arp filter** command.

Examples

```
-> clear arp filter
```

Release History

Release 7.1.1; command introduced

Related Commands

arp filter	Configures an ARP filter to allow or block the processing of specified ARP Request packets.
show ip arp utilization	Displays the ARP filter configuration.

MIB Objects

```
alaIpClearArpFilter
```

icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp type *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap***}**

Syntax Definitions

type	The ICMP packet type. This is conjunction with the ICMP code that determines the type of ICMP message being specified.
code	The ICMP code type. This is conjunction with the ICMP type that determines the type of ICMP message being specified.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | **disable**	disabled
gap	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages, and set the minimum packet gap between messages of the specified type.
- Enabling **Host unreachable** and **Network unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- While this command can be used to enable or disable all ICMP message, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP messages have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	**icmp unreachable**
Host unreachable (type 3, code 1)	**icmp unreachable**
Protocol unreachable (type 3, code 2)	**icmp unreachable**
Port unreachable (type 3, code 3)	**icmp unreachable**
Echo reply (type 0, code 0)	**icmp echo**
Echo request (type 8, code 0)	**icmp echo**
Timestamp request (type 13, code 0)	**icmp timestamp**
Timestamp reply (type 14, code 0)	**icmp timestamp**
Address Mask request (type 17, code 0)	**icmp addr-mask**
Address Mask reply (type 18, code 0)	**icmp addr-mask**

Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

Release History

Release 7.1.1; command introduced

Related Commands

icmp messages	Enables or disables all ICMP messages.
show icmp control	Allows the viewing of the ICMP control settings.

MIB Objects

   alaIcmpCtrlType
alaIcmpCtrlTable
   alaIcmpCtrlCode
   alaIcmpCtrlStatus
   alaIcmpCtrlPktGap
```

icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp unreachable [net-unreachable | host-unreachable | protocol-unreachable | port-unreachable] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

net-unreachable	Sets the unreachable network ICMP message.
host-unreachable	Sets the unreachable host ICMP message.
protocol-unreachable	Sets the unreachable protocol ICMP message.
port-unreachable	Sets the unreachable port ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	enable
gap	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the unreachable ICMP messages.

Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
```

```
-> icmp unreachable port-unreachable min-pkt-gap 50
```

Release History

icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp echo [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies the echo request ICMP message.
reply	Specifies the echo reply ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the echo ICMP messages.

Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

Release History

Release 7.1.1; command introduced

Related Commands

```

icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp timestamp [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies timestamp request messages.
reply	Specifies timestamp reply messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the timestamp ICMP messages.

Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

Release History

Release 7.1.1; command introduced

Related Commands

show icmp control	Allows the viewing of the ICMP control settings.

MIB Objects

```

   alaIcmpCtrlPktGap
```

icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp add-mask [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies request address mask messages.
reply	Specifies reply address mask messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- A gateway receiving an address mask request must return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply enables, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the address mask ICMP messages.

Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

```

ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

ip dos scan close-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

Examples

```
-> ip dos scan close-port-penalty 25
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanClosePortPenalty
```

ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

ip dos scan tcp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguish between a legal TCP packet and a port scan packet.

Examples

```
-> ip dos scan tcp open-port-penalty 10
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanTcpOpenPortPenalty
```

ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

ip dos scan udp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguish between a legal UDP packet and a port scan packet.

Examples

```
-> ip dos scan udp open-port-penalty 15
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanUdpOpenPortPenalty
```

ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

ip dos scan threshold *threshold_value*

Syntax Definitions

threshold_value	A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

Defaults

parameter	default
threshold_value	1000

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added. The commands for setting the packet penalty value are the **ip dos scan close-port-penalty**, **ip dos scan tcp open-port-penalty**, and **ip dos scan udp open-port-penalty** commands.

Examples

```
-> ip dos scan threshold 1200
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan close-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.
ip dos scan tcp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.
ip dos scan udp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanThreshold
```

ip dos trap

Sets whether or not the switch generates SNMP DoS traps when an attack is detected.

ip dos trap {enable | disable}

Syntax Definitions

enable	Enables the generation of DoS traps.
disable	Disables the generation of DoS traps.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the **ip dos scan threshold** command.

Examples

```
-> ip dos trap enable
-> ip dos trap disable
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSTrapCnt1
```

ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

ip dos scan decay *decay_value*

Syntax Definitions

decay_value	The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

Defaults

parameter	default
decay_value	2

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

Examples

```
-> ip dos scan decay 10
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanDecay
```

ip dos type

Enables or disables detection for the specified type of DoS attack.

ip dos type {port-scan | ping-of-death | land | loopback-src | invalid-ip | invalid-multicast | unicast-ip-mcast-mac | ping-overload | arp-flood | arp-poison} admin-state {enable | disable}

Syntax Definitions

port-scan	Detects port scans by monitoring TCP or UDP packets sent to open or closed ports.
ping-of-death	Detects the number of ICMP Ping-of-Death attacks (the switch receives ping packets that exceed the largest IP datagram size of 65535 bytes).
land	Detects the number of Land attacks (the switch receives spoofed packets with the SYN flag set on any open port that is listening).
loopback-src	Detects the number of loopback source attacks (the switch receives packets with 127.0.0.0/8 as the IP source address).
invalid-ip	Detects invalid IP packets (the switch receives packets with an invalid source or destination IP address).
invalid-multicast	Detects invalid Multicast packets (the switch receives packets with an invalid multicast address).
unicast-ip-mcast-mac	Detects a unicast IP and multicast MAC mismatch (the switch receives IP packets with multicast/broadcast source mac-address, non-matching destination IP and mac-address).
ping-overload	Detects a ping overload attack (the switch is flooded with a large number of ICMP packets).
arp-flood	Detects ARP flooding (the switch is flooded with a large number of ARP requests).
arp-poison	Detects ARP poisoning (the switch receives replies to an ARP request generated by the switch for a user-specified restricted address).
enable	Enables DoS attack detection.
disable	Disables DoS attack detection.

Defaults

By default, detection is enabled for all the specified IP DoS attack types, except for ping overload.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When detection is enabled for ping overload, the attack is not detected until the number of ICMP packets received exceeds 100 packets-per-second.
- ARP flooding is rate limited to 500 packets-per-second on the switch. As a result, ARP flooding is not detected until the number of ARP requests exceeds 500 packets-per-second.

- When detection is enabled for unicast IP/multicast MAC mismatches (**unicast-ip-mcast-mac**), ping overload attacks (**ping-overload**), or ARP flooding attacks (**arp-flood**), packets are not dropped when the attack is detected.

Examples

```
-> ip dos type ping-overload admin-state enable
-> ip dos type land admin-state disable
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip dos config	Displays the DoS scan configuration for the switch.
show ip dos statistics	Displays statistics for the detected DoS attacks.

MIB Objects

```
alaDoSTable
   alaDoSType
   alaDoSStatus
```

ip tcp half-open-timeout

Configures the timeout periods for dropping half-open TCP connections.

ip tcp half-open-timeout *timeout_value*

Syntax Definitions

timeout_value	The timeout value in seconds. Current supported values are 3, 7, 15, 31 and 63.

Defaults

parameter	default
timeout_value	63 seconds

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip tcp half-open-timeout 7
```

Release History

Release 8.4.1; command introduced

Related Commands

show ip tcp half-open-timeout	Displays the timeout value configured for half-open TCP sessions.

MIB Objects

```
systemServices
   systemServicesTcpHalfOpenTimeout
```

show ip traffic

Displays IP datagram traffic and errors.

show ip traffic

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command includes statistics regarding the spoofed traffic.
- The presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

Examples

```
-> show ip traffic

IP statistics
  Datagrams received
    Total                   =   621883,
    IP header error         =        0,
    Destination IP error    =    51752,
    Unknown protocol        =        0,
    Local discards          =        0,
    Delivered to users      =   567330,
    Reassemble needed       =        0,
    Reassembled             =        0,
    Reassemble failed       =        0

  Datagrams sent
    Fowarded                =     2801,
    Generated               =   578108,
    Local discards          =        0,
    No route discards       =        9,
```

```
Fragmented              =     2801,
Fragment failed         =        0,
Fragments generated     =        0
```

output definitions

Total	Total number of input datagrams received including the datagrams received in the error.
IP header error	Number of IP datagrams discarded due to errors in the IP header (for example, bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
Destination IP error	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (for example, Class E).
Unknown protocol	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Local discards	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. This value must be zero.
Delivered to users	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
Reassemble needed	Number of IP fragments received that needed to be reassembled.
Reassembled	Number of IP datagrams received that were successfully reassembled.
Reassemble failed	Number of IP failures detected by the IP reassembly algorithm for all reasons (for example, timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
Fragmented	Number of successfully fragmented IP datagrams.
Fragment failed	Number of packets received and discarded by IP that were not fragmented. This situation can happen if a large packet has the “Don’t Fragment” flag set.
Forwarded	Number of IP datagrams forwarded by the switch.
Generated	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as “Forwarded.”
Local discards	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This number includes datagrams counted as “Forwarded” if the packets are discarded for these reasons.
No route discards	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.

output definitions (continued)

Fragments generated	The of IP datagram fragments generated as a result of fragmentation.
Routing entry discards	Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (for example, discarded because of lack of buffer space).

Release History

Release 7.1.1; command introduced

Related Commands

show icmp statistics	Displays ICMP statistics and errors.

MIB Objects

N/A

show ip interface

Displays the configuration and status of IP interfaces.

show ip interface [*if_name* **| vlan** *vlan_id* | **dhcp-client]**

Syntax Definitions

if_name	The name associated with the IP interface.
vlan_id	VLAN ID (displays a list of IP interfaces associated with a VLAN).
dhcp-client	Displays the configuration and status of a DHCP Client interface.

Defaults

By default, all IP interfaces are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Use the optional *if_name* parameter to display detailed information about an individual interface.
- Use the optional **dhcp-client** parameter to display detailed information about an interface that has been configured to obtain an IP address from a DHCP server.
- In a virtual chassis environment this command does not accurately reflect the status of the EMP IP interface on other chassis when entered on a Slave chassis.

Examples

```
-> show ip interface
Total 13 interfaces
 Flags (D=Directly-bound)

          Name         IP Address    Subnet Mask   Status Forward Device      Flags
----------------------+-------------+-------------+------+-------+-----------+-----
EMP                   172.22.16.115 255.255.255.0     UP      NO EMP
UNP-RULE              40.1.1.1      255.255.255.0   DOWN      NO vlan 40
Loopback              127.0.0.1     255.0.0.0         UP      NO Loopback
L3VPN-2000            11.1.1.1      255.255.255.0     UP     YES service 1
L3VPN-1000            47.1.1.1      255.255.255.0     UP     YES service 2
if222                 30.1.5.1      255.0.0.0         UP     YES vlan 222
ldap_client1          173.22.16.115 255.255.255.0     UP     YES vlan 173
ldap_server1          174.22.16.115 255.255.255.0     UP     YES vlan 174
radius_client3        110.1.1.101   255.255.255.0     UP     YES vlan 30
vlan-2                0.0.0.0       0.0.0.0         DOWN      NO unbound
gre-1                 24.24.24.1    255.255.255.0     UP     YES GRE tunnel
ipip-1                25.25.25.1    255.255.255.0     UP     YES IPIP tunnel
rp-vlan850            37.2.2.1      255.0.0.0       DOWN      NO vlan 850     D
vlan-23               23.23.23.1    255.255.255.0     UP     YES vlan 23
```

output definitions

Name	Interface name. This is the name configured for the interface (for example, Accounting). **EMP-CMMA-CHAS1** refers to the Ethernet Management Port. **Loopback** refers to a built-in loopback interface that provides a local host address for the switch.
IP Address	IP address of the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface IP address. Configured through the **ip interface** command.
Status	Interface status: • **UP**—Interface is ready to pass packets. • **DOWN**—Interface is down.
Forward	Indicates whether the interface is actively forwarding packets (**YES** or **NO**).
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. • **service**—The service ID that is bound to this interface. Configured through the **ip interface** command.
Flags	Indicates if a switch port or link aggregate is directly bound to the interface (**D**=Directly-bound). This flag displays for IP routed-port interfaces.

```
-> show ip interface vlan-23
Interface Name = vlan-23
  SNMP Interface Index          =   13600007,
  IP Address                    =   23.23.23.1,

  HostName                        =   OS6560,
```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface. Configured through the **ip interface** command.
Broadcast Address	Broadcast address for the interface.

output definitions (continued)

Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. • **service**—The service ID that is bound to this interface. Configured through the **ip interface** command.
Encapsulation	Displays the IP router encapsulation (**eth2** or **snap**) that the interface uses when routing packets. Configured through the **ip interface** command.
Forwarding	Indicates whether IP forwarding is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Administrative State	Administrative state of the IP interface (**enabled** or **disabled**), which is independent of the state of the underlying device. Configured through the **ip interface** command.
Operational State	Indicates whether the interface is active (**up** or **down**).
Operation State Reason	Indicates why the operational state of the interface is down: • **unbound**—No device is bound to the interface. • **device-down—**Device bound to the interface is down. • **admin-down—**The admin state of the interface is down. • **no-such-device—**Device does not exist. • **no-router-mac—**No MAC address available for the interface. • **tunnel-src-invalid—**The source IP address of the tunnel is invalid. • **tunnel-dst-unreachable—**The destination IP address of the tunnel is not reachable. The **tunnel-src-invalid** and **tunnel-dst-unreachable** Operational State reasons apply only when the type of device bound to the interface is a **GRE tunnel** or **IPIP tunnel**. **Operational State Reason** field is only included in the display output when the operational state of the interface is **down**.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the **vlan mtu-ip** command.
Router MAC	Switch MAC address assigned to the interface. Each interface assigned to the same VLAN shares the same switch MAC address.
Local Proxy ARP	Indicates whether Local Proxy ARP is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Primary (config/actual)	Indicates if the interface is the configured and/or actual primary interface for the device (VLAN, EMP, Loopback). If the actual status is set to **yes** and the config status is set to **no**, the interface is the default interface for the VLAN. Configured through the **ip interface** command.
Directly bound port	Displays the physical port or link aggregate that is directly bound to the interface. Configured through the **ip interface rtr-port** command. This field displays only when the interface is configured as an IP routed port interface.
ARP Count	Displays the number of ARP entries in the NI.
DHCP-Client Parameter Details	(The following parameters are only applicable to the 'dhcp-client' interface. Configured through the **ip interface dhcp-client** command.)

output definitions (continued)

Dhcp Prefer Server	Indicates if the DHCP server preference option is enabled or disabled.
Client Status	DHCP Client Status (**In-active**, **Active**)
Server IP	The IP address of the DHCP server.
Router Address	The IP address of the DHCP router.
Lease Time Remaining	The lease time remaining for the DHCP client IP address.
Option-60	The option-60 string that will be included in DHCP discover or request packets.
HostName	The system name of the OmniSwitch.

```
-> show ip interface ipip-1
Interface Name = ipip-1
  SNMP Interface Index           =   13600001,
  IP Address                     =   25.25.25.1,
  Subnet Mask                    =   255.255.255.0,
  Device                         =   IPIP Tunnel,
  Tunnel Source Address          =   23.23.23.1
  Tunnel Destination Address     =   23.23.23.2,
  Forwarding                     =   enabled,
  Administrative State           =   enabled,
  Operational State              =   up,
  Maximum Transfer Unit          =   1480,

-> show ip interface gre-1
Interface Name = gre-1
  SNMP Interface Index           =   13600002,
  IP Address                     =   24.24.24.1,
  Subnet Mask                    =   255.255.255.0,
  Device                         =   GRE Tunnel,
  Tunnel Source Address          =   23.23.23.1
  Tunnel Destination Address     =   23.23.23.2,
  Forwarding                     =   enabled,
  Administrative State           =   enabled,
  Operational State              =   down,
  Operational State Reason       =   unbound,
  Maximum Transfer Unit          =   1476,
```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface. Configured through the **ip interface** command.
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. • **service**—The service ID that is bound to this interface. Configured through the **ip interface** command.

output definitions (continued)

Tunnel Source Address	The source IP address for the tunnel.
Tunnel Destination Address	The destination IP address for the tunnel.
Forwarding	Indicates whether IP forwarding is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Administrative State	Administrative state of the IP interface (**enabled** or **disabled**), which is independent of the state of the underlying device. Configured through the **ip interface** command.
Operational State	Indicates whether the interface is active (**up** or **down**).
Operational State Reason	Indicates why the operational state of the interface is down: • **interface-up—**The admin state of the interface is up. • **unbound**—No device is bound to the interface. • **device-down—**Device bound to the interface is down. • **admin-down—**The administrative state of the interface is down. • **no-such-device—**Device does not exist. • **no-router-mac—**No MAC address available for the interface. • **tunnel-src-invalid—**The source IP address of the tunnel is invalid. • **tunnel-dst-unreachable—**The destination IP address of the tunnel is not reachable. **Operational State Reason** field is only included in the display output when the operational state of the interface is **down**.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the **vlan mtu-ip** command.

Release History

Release 7.1.1; command introduced
Release 7.3.4; output modified to display **Designated NI** and **ARP Count**.
Release 8.5R1; **Dhcp prefer server** field added in output.

Related Commands

ip interface	Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.
ip interface tunnel	Configures the end points for the GRE and IPIP tunnels.
show ip emp-interfaces	Displays the configuration and status of the Ethernet Management Port (EMP) interface.
show icmp statistics	Displays ICMP statistics and errors.

MIB Objects

```
alaIpInterfaceTable
   alaIpInterfaceName
   alaIpInterfaceAddress
   alaIpInterfaceMask
   alaIpInterfaceAdminState

```

show ip emp-interfaces

Displays the configuration and status of the Ethernet Management Port (EMP) interface.

show ip emp-interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **show ip emp-routes** to display IP routes associated with the EMP interface.

Examples

```
-> show ip emp-interfaces
Total 1 interfaces
 Flags (D=Directly-bound)

          Name         IP Address    Subnet Mask   Status Forward Device      Flags
----------------------+-------------+-------------+------+-------+-----------+-----
EMP-CMMA-CHAS1         3.3.3.25      255.0.0.0       DOWN      NO EMP
```

Name	Interface name. **EMP-CMMA-CHAS1** refers to the Ethernet Management Port.
IP Address	IP address of the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface IP address. Configured through the **ip interface** command.
Status	Interface status: • **UP**—Interface is ready to pass packets. • **DOWN**—Interface is down.
Forward	Indicates whether the interface is actively forwarding packets (**YES** or **NO**).
Device	**EMP**—The Ethernet Management Port is bound to the interface.
Flags	N/A for EMP interfaces.

Release History

Release 7.3.3; command introduced.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

MIB Objects

N/A

show ip routes

Displays the IP Forwarding table.

[vrf *vrf_name***] show ip routes [summary]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
summary	Displays a summary of routing protocols that appear in the IP Forwarding table.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (for example, RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.
- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip routes

+ = Equal cost multipath routes
 Total 4 routes

  Dest Address      Gateway Addr        Age       Protocol
------------------+-----------------+---------+-----------
  0.0.0.0/0          10.255.11.254     01:50:33   STATIC
  10.255.11.0/24     10.255.11.225     01:50:33   LOCAL
  127.0.0.1/32       127.0.0.1         01:51:47   LOCAL
  212.109.138.0/24   212.109.138.138   00:33:07   LOCAL
  12.0.0.0/8         12.0.0.1          00:20:00   IMPORT
  55.0.0.0/8         0.0.0.0           00:00:17   STATIC

-> show ip route summary

  Protocol        Route Count
----------------+--------------
  Local                    3
  Static                   2
  RIP                      0
  ISIS                     0
```

```
OSPF                    0
BGP                     0
Import                  1
Other                   0

TOTAL =                 6
```

output definitions

Dest Addr	Destination IP address/mask length.
Gateway Addr	IP address of the gateway from which this address was learned. Gateway address ‘0.0.0.0’ indicates an IPv4 blackhole route.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). LOCAL indicates a local interface.
Route Count	The number of routes that appear in the IP Forwarding table for each protocol type listed.

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

ping	Used to test whether an IP destination can be reached from the local switch.
traceroute	Used to find the path taken by an IP packet from the local switch to a specified destination.
show ip router database	Displays a list of all routes (static and dynamic) that exist in the IP router database.

MIB Objects

```
ipCidrRouteTable
   ipCidrRouteDest
   ipCidrRouteMask
   ipCidrRouteTos
   ipCidrRouteNextHop
   ipCidrRouteIfIndex
   ipCidrRouteType
   ipCidrRouteProto
   ipCidrRouteAge
   ipCidrRouteInfo
   ipCidrRouteNextHopAS
   ipCidrRouteMetric1
   ipCidrRouteMetric2
   ipCidrRouteMetric3
   ipCidrRouteMetric4
   ipCidrRouteMetric5
   ipCidrRouteStatus
```

show ip route-pref

Displays the IPv4 routing preferences of a router.

[vrf *vrf_name***] show ip route-pref**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

By default, ISIS Level 1 routes are preferred over ISIS Level 2 routes and EBGP routes will carry a higher precedence than IBGP routes.

Examples

```
-> show ip route-pref
  Protocol    Route Preference Value
------------+-----------------------
  Local                 1
  Static                2
  OSPF                110
  ISISL1              115
  ISISL2              118
  RIP                 120
  EBGP                190
  IBGP                200
  Import              210
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

ip route-pref	Configures the route preference of a router.

MIB Objects

```
alaIprmRtPrefTable
  alaIprmRtPrefEntryType
  alaIprmRtPrefEntryValue
```

show ip redist

Displays the IPv4 route map redistribution configuration.

[vrf *vrf_name***] show ipv6 redist [rip | ospf | isis | bgp]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
rip	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
ospf	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
isis	Displays route map redistribution configurations that specify ISIS as the destination (into) protocol.
bgp	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

Defaults

By default, all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Examples

```
-> show ip redist

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
RIP          OSPF         Enabled   ipv4rm
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

```
-> show ip redist rip

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ip redist	Controls the conditions for redistributing different IPv6 routes between protocols.

MIB Objects

```

   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ip access-list

Displays the details of the access list.

show ip access-list [*access_list_name***]**

Syntax Definitions

access_list_name	Name of the access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the *access_list_name* is not specified in this command, all the access lists are displayed.

Examples

```
-> show ip access-list
                     Address /                  Redistribution
Name                 Prefix Length      Effect  Control
--------------------+------------------+-------+-------------
al_3                 10.0.0.0/8         permit  all-subnets
al_3                 11.0.0.0/8         permit  all-subnets
al_4                 1.0.0.0/8          permit  no-subnets
al_4                 10.0.0.0/8         permit  all-subnets

-> show ip access-list al_4

                     Address /                  Redistribution
Name                 Prefix Length      Effect  Control
--------------------+------------------+-------+-------------
al_4                 1.0.0.0/8          permit  no-subnets
al_4                 10.0.0.0/8         permit  all-subnets
```

output definitions

Name	Name of the access list.
Address/Prefix Length	IP address that belongs to the access list.
Effect	Indicates whether the IP address is permitted or denied.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 7.1.1; command was introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip access-list address	Adds multiple IPv4 addresses to the access list.

MIB objects

```
alaRouteMapAccessListIndex
alaRouteMapAccessListAddressType
alaRouteMapAccessListAddress
alaRouteMapAccessListPrefixLength
alaRouteMapAccessListAction
alaRouteMapAccessListRedistControl
```

show ip route-map

Displays the IP route maps configured on the switch.

show ip route-map [*route_map_name***]**

Syntax Definitions

route_map_name	The name of the specific route map.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the *route_map_name* is not specified in this command, all the route maps are displayed.

Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redist-control all-subnets permit
  set metric 100 effect replace
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match ip address	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
ip route-map match ipv6 address	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name
ip route-map match ip-nexthop	Matches the routes that have a next-hop router address permitted by the specified access list.
ip route-map match ipv6-nexthop	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list
ip route-map match tag	Permits or denies a route based on the specified next-hop IP address.
ip route-map match tag	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match metric	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match route-type	Matches the specified route type with the one that the routing protocol learned the route on.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistRouteMapIndex
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed and where duplicate routes are compared to determine the best route for the Forwarding Routing Database. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

[vrf *vrf_name***] show ip router database [protocol** *type* | **gateway** *ip_address* | **dest {***ip_address/prefixlen* | *ip_address***}]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
type	Routing protocol type (local, static, OSPF, RIP, or BGP).
ip_address	Destination IP address.
ip_address/prefixlen	The destination IP address along with the prefix length of the routes processed for redistribution.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch does not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.
- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip router database
Legend: + indicates routes in-use
        b indicates BFD-enabled static route
        r indicates recursive static route, with following address in brackets
        i indicates static interface route

Destination         Gateway         Interface   Protocol  Metric   Tag   Misc-Info
------------------+--------------+-----------+--------+---------+------+---------

```

output definitions

Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, **/24** indicates the destination IP address has a 24-bit mask (255.255.255.0).
Gateway	IP address of the gateway from which this route was learned. Gateway address ‘0.0.0.0’ indicates an IPv4 blackhole route.
Interface	The interface associated with the gateway.
Protocol	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
Tag	The tag associated with the route.
Misc-Info	Any additional information about the route.

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

show ip routes	Displays the IP Forwarding table.

MIB Objects

```
alaIprmRouteTable
   alaIprmRouteDest
   alaIprmRouteMask
   alaIprmRouteTos
   alaIprmRouteNextHop
   alaIprmRouteProto
   alaIprmRouteMetric
   alaIprmRoutePriority
```

show ip emp-routes

Displays the IP routes associated with the Ethernet Management Port (EMP).

show ip emp-routes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.
- There is no dedicated routing table for the EMP interface. All management interfaces use the same routing table with EMP and non-EMP routes.

Examples

```
-> show ip emp-routes
Dest Address      Subnet Mask       Gateway Addr      Age       Protocol
------------------+-----------------+-----------------+---------+-----------
  127.0.0.1         255.255.255.255   127.0.0.1           2d 4h  LOCAL
  172.17.1.10       255.255.255.255   10.255.11.225       1d 5h  LOCAL
```

output definitions

Dest Addr	Destination IP address.
Subnet Mask	Destination IP address IP subnet mask.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

Release History

Release 7.1.1; command introduced

Related Commands

ping	Tests whether an IP destination can be reached from the local switch.
traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A

show ip config

Displays IP configuration parameters.

show ip config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip config
IP directed-broadcast   =   OFF,
IP default TTL          =   64
```

output definitions

IP directed-broadcast	Indicates whether the IP directed-broadcast feature is on or off.
IP default TTL	IP default TTL interval.

Release History

Release 7.1.1; command introduced

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip default-ttl	Sets TTL value for IP packets.

MIB Objects

N/A

show ip protocols

Displays switch routing protocol information and status.

show ip protocols

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip protocols
IP Protocols
RIP status                              = Not Loaded,
OSPF status                             = Loaded,
ISIS status                             = Not Loaded,
BGP status                              = Loaded,

DVMRP status                            = Not Loaded,
RIPng status                            = Not Loaded,
OSPF3 status                            = Loaded,
```

output definitions

RIP status	Whether RIP is loaded or not.
OSPF status	Whether OSPF is loaded or not.
BGP status	Whether BGP is loaded or not.
DVMRP status	Whether DVMRP is loaded or not.
PIMSM status	Whether PIMSM is loaded or not.
RIPng status	Whether RIP is loaded or not.
OSPF3 status	Whether OSPFv3 is loaded or not.

Release History

Release 7.1.1; command introduced

Related Commands

ip interface dhcp-client	Configures the router primary IP address.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaIpRouteSumTable
   alaIpRouteProtocol
```

show ip router-id

Displays the primary IP address and router ID of the switch, if configured.

show ip router-id

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip router-id
Router ID    = 1.1.1.1,
Primary addr = 31.0.0.1
```

output definitions

Router ID	The set routing ID. The router ID is how the router is identified in IP.
Primary addr	The primary interface address the route uses.

Release History

Release 7.1.1; command introduced

Related Commands

ip interface dhcp-client	Configures the router primary IP address.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaIpRouteSumTable
   alaIpRouteProtocol
```

show ip service

Displays the status of TCP/UDP service ports.

show ip service

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The display output from this command also includes the service port number.

Examples

```
-> show ip service
Name                     Port    Status
---------------------+-------+---------
ftp                        21   enabled
ssh                        22   disabled
telnet                     23   disabled
udp-relay                  67   disabled
http                       80   disabled

show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

show ip dos arp-poison

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip dos arp-poison
 IP Address                          Attacks
-------------------------------------+------------
192.168.1.1                             0
192.168.1.2                             0
192.168.1.3                             0
```

output definitions

IP Address	The configured ARP Poison restricted-addresses.
Attacks detected	The number of ARP Poison attacks detected for each address.

Release History

Release 7.1.1; command introduced

Related Commands

ip dos arp-poison restricted-address	Adds or deletes an ARP Poison restricted address.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDoSArpPoisonDetected
```

show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

show arp [*ip_address* **|** *mac_address***]**

Syntax Definitions

ip_address	IP address of the entry you want to view.
mac_address	MAC address of the entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

Examples

```
-> show arp
Total 8 arp entries
 Flags (P=Proxy, A=Authentication, V=VRRP, R=Remote, B=BFD, H=HAVLAN, I=Interface)

```

output definitions

IP Address	Device IP address.
Hardware Addr	MAC address of the device that corresponds to the IP address.
Type	Indicates whether the ARP cache entries are dynamic or static.

output definitions (continued)

Flags	Indicates the type of entry: • P = Proxy • A = Authentication (AVLAN) • V = VRRP • R = Remote • B = BFD • H = HAVLAN • I = Interface
Port	The port on the switch attached to the device identified by the IP address.
Interface	The interface to which the entry belongs (for example, VLAN, EMP).

Release History

Release 7.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
ip distributed-arp admin-state	Deletes all dynamic entries from the ARP table.

show ip arp utilization

Displays the designated NIs for the interfaces and the NI utilization.

show ip arp utilization [slot *chassis*/*slot* | **interfaces]**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number of the interface. The output is displayed specific to the slot.
interfaces	Displays the ARP utilization of the designated-NI on all the configured interfaces.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the basic command (**show ip arp utilization**) to view all of the entries in the table. Enter a specific chassis and slot number to view a specific entry.

Examples

```
-> show ip arp utilization
Distributed ARPs:  Enabled
                   ARP     HW
  NI     Max     Count   Usage    %
------+--------+-------+-------+-------
1/1      16384       8      11    0%
2/1      16384      12      15    0%

-> show ip arp utilization interfaces
Distributed ARPs:  Enabled
                   ARP     HW
  NI     Max     Count   ARPS     %      VRF       Interface

2/1      16384       5       4    0%      0    20
```

output definitions

NI	The chassis and slot number of the designated-NI.
Max	The maximum number of ARP entries supported on the NI.
ARP count	ARP count in the NI for the NI or interface.
HW Usage	The amount of table space used up in the ASIC.
HW ARPS	The number of ARPs in the ASIC.
%	The percentage of ARP utilization on that designated-NI.
VRF	The name of the VRF associated to the interface.
Interface	The interface to which the entry belongs.

Release History

Release 7.3.4; command introduced

Related Commands

ip distributed-arp admin-state Enables or disables the distributed ARP feature.

MIB Objects

```

   alaDistArpItfTable
```

show arp filter

Displays a list of ARP filters configured for the switch.

show arp filter [*ip_address***]**

Syntax Definitions

ip_address	IP address of the filter entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

Examples

```
-> show arp filter
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
171.11.1.1         255.255.255.255        0   target     block
172.0.0.0          255.0.0.0              0   target     block
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow

-> show arp filter 198.172.16.1
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow
```

output definitions

IP Addr	The ARP packet IP address to which the filter is applied.
IP Mask	The IP mask that specifies which part of the IP address to which the filter is applied.
Vlan	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
Type	Indicates which IP address in the ARP packet (**sender** or **target**) is used to identify if a filter exists for that address.
Mode	Indicates whether to **block** or **allow** a switch response to an ARP packet that matches the filter.

Release History

Release 7.1.1; command introduced

Related Commands

arp filter	Adds a permanent entry to the ARP table.
clear arp filter	Deletes all dynamic entries from the ARP table.

MIB Objects

show icmp control

Allows the viewing of the ICMP control settings.

show icmp control

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

Examples

```
-> show icmp control
  Name                                 Type   Code   Status    min-pkt-gap(us)
--------------------------------------+------+------+---------+-----------------
  echo reply                             0      0   enabled             0
  network unreachable                    3      0   enabled             0

```

```
timestamp reply                    14      0   enabled          0
information request(obsolete)      15      0   enabled          0
information reply(obsolete)        16      0   enabled          0
address mask request               17      0   enabled          0
address mask reply                 18      0   enabled          0
```

output definitions

Name	The name of the ICMP message.
Type	The ICMP message type. This along with the ICMP code specifies the ICMP message.
Code	The ICMP message code. This along with the ICMP type specifies the ICMP message.
Status	Whether this message is **Enabled** or **Disabled**.
min-pkt-gap	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

Release History

Release 7.1.1; command introduced

Related Commands

icmp type	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
icmp unreachable	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
icmp echo	Enables or disables ICMP echo messages, and sets the minimum packet gap.
icmp timestamp	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
icmp addr-mask	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
icmp messages	Enables or disables all ICMP messages.

MIB Objects

N/A

show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

show icmp [statistics]

Syntax Definitions

statistics	Optional syntax.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the ICMP Table to monitor and troubleshoot the switch.

Examples

```
-> show icmp
Messages                  Received    Sent
--------------------------+-----------+------------
  Total                         2105        2105
  Error                            0           0
  Destination unreachable          0           0
  Time exceeded                    0           0
  Parameter problem                0           0
  Source quench                    0           0
  Redirect                         0           0
  Echo request                  2105           0
  Echo reply                       0        2105
  Time stamp request               0           0
  Time stamp reply                 0           0
  Address mask request             0           0
  Address mask reply               0           0
```

output definitions

Total	Total number of ICMP messages the switch received or attempted to send. This counter also includes all the messages that were counted as errors.
Error	Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (for example, bad ICMP checksums, bad length).

output definitions (continued)

Destination unreachable	Number of “destination unreachable” messages that were sent/received by the switch.
Time exceeded	Number of “time exceeded” messages that were sent/received by the switch. These messages occur when a packet is dropped because the TTL counter reaches zero. When a large number of these messages occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
Parameter problem	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending IP software of the host or gateway.
Source quench	Number of messages sent/received that tell a host that it is sending too many packets. A host must attempt to reduce its transmissions upon receiving these messages.
Redirect	Number of ICMP redirect messages sent/received by the switch.
Echo request	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
Echo reply	Number of echo reply messages received by the switch.
Time stamp request	Number of time stamp request messages sent/received by the switch.
Time stamp reply	Number of time stamp reply messages sent/received by the switch.
Address mask request	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
Address mask reply	Number of address mask reply messages that were sent/received by the switch.

Release History

Release 7.1.1; command introduced

Related Commands

show udp statistics	Displays UDP errors and statistics.

MIB Objects

N/A

show tcp statistics

Displays TCP statistics.

show tcp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show tcp statistics
Total segments received =   235080,
Error segments received =        0,
Total segments sent     =   363218,
Segments retransmitted  =       38,
Reset segments sent     =       97,
Connections initiated   =    57185,
Connections accepted    =      412,
Connections established =        1,
Attempt fails           =    24393,
Established resets      =      221
```

output definitions

Total segments received	Total number of segments received, including the segments received in the error. This count includes segments received on currently established connections.
Error segments received	Total number of segments received in error (for example, bad TCP checksums).
Total segments sent	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Segments retransmitted	Number of TCP segments transmitted containing one or more previously transmitted octets.
Reset segments sent	Number of TCP segments containing the reset flag.
Connections initiated	Number of connections attempted.
Connections accepted	Number of connections allowed.
Connections established	Number of successful connections.

output definitions (continued)

Attempt fails	Number of times attempted TCP connections have failed.
Established resets	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the “Closed” state.

  10.255.11.223          2526   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2529   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2530   10.255.11.25              389    TIME-WAIT
```

output definitions

Local Address	Local IP address for this TCP connection. If a connection is in the LISTEN state it accepts connections for any IP interface associated with the node. The IP address 0.0.0.0 is used.
Local Port	Local port number for this TCP connection. The range is 0–65535.

output definitions (continued)

Remote Address	Remote IP address for this TCP connection.
Remote Port	Remote port number for this TCP connection. The range is 0–65535.
State	State of the TCP connection, as defined in RFC 793. A connection progresses through a series of states during its lifetime: • Listen—Waiting for a connection request from any remote TCP and port. • Syn Sent—Waiting for a matching connection request after having sent a connection request. • Syn Received—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request. • Established—Open connection. Data received can be delivered to the user. This is the normal state for the data transfer phase of the connection. • Fin Wait 1—Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent. • Fin Wait 2—Waiting for a connection termination request from the remote TCP. • Close Wait—Waiting for a connection termination request from the local user. • Closing—Waiting for a connection termination request acknowledgment from the remote TCP. • Last Ack—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request). • Time Wait—Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request. • Closed—No connection state.

Release History

Release 7.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show tcp statistics	Displays TCP statistics.

MIB Objects

N/A

show ip tcp half-open-timeout

Displays the timeout value configured for half-open TCP sessions.

show ip tcp half-open-timeout

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip tcp half-open-timeout
Tcp Half-Open Timeout(Seconds): 15.
```

Release History

Release 8.4.1; command introduced

Related Commands

ip tcp half-open-timeout	Configures the timeout periods for dropping half-open TCP connections.

MIB Objects

```
systemServicesTcpHalfOpenTimeout
```

show udp statistics

Displays UDP errors and statistics.

show udp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

Examples

```
-> show udp statistics
Total datagrams received   =   214937,
Error datagrams received   =        0,
No port datagrams received =    32891,
Total datagrams sent       =   211884
```

output definitions

Total datagrams received	Total number of UDP datagrams delivered to UDP applications.
Error datagrams received	Number of UDP datagrams that could not be delivered for any reason.
No port datagrams received	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
Total datagrams sent	Total number of UDP datagrams sent from this switch.

Release History

Release 7.1.1; command introduced

Related Commands

show udp ports	Displays the UDP Listener table.

MIB Objects

N/A

show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

show udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

Examples

```
-> show udp port
Local Address     Local Port
------------------+--------------
  0.0.0.0                  67
  0.0.0.0                 161
  0.0.0.0                 520
```

output definitions

Local Address	Local IP address for this UDP connection.
Local Port	Local port number for this UDP connection.

Release History

Release 7.1.1; command introduced

Related Commands

show udp statistics	Displays UDP errors and statistics.

MIB Objects

N/A

show ip dos config

Displays the DoS scan configuration for the switch.

show ip dos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

Examples

```
-> show ip dos config

   Dos type                                    Status
-------------------------------------------+-----------------
   port scan                                   ENABLED
   ping of death                               ENABLED
   loopback-src                                ENABLED
   invalid-ip                                  ENABLED
   invalid-multicast                           ENABLED
   unicast dest-ip/multicast-mac               ENABLED
   ping overload                               DISABLED
   arp flood                                   ENABLED
   arp poison

DoS trap generation                            =  ENABLED,
DoS port scan threshold                        =  1000,
DoS port scan decay                            =  2,
DoS port scan close port penalty               =  10,
DoS port scan TCP open port penalty            =  0,
DoS port scan UDP open port penalty            =  0,
Dos MAximum Ping Rate                          =  100
Dos Maximum ARP Request Rate                   =  500
```

output definitions

DoS Type	The type of DoS attack.
Status	Whether or not detection for this type of DoS attack is enabled. Configured through the **ip dos type** command.
DoS trap generation	Displays the status of DoS trap generation. It is either **ENABLED** or **DISABLED**. This is set using the **ip dos trap** command.
DoS port scan threshold	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the **ip dos scan threshold** command.
DoS port scan decay	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the **ip dos scan decay** command.
DoS port scan close port penalty	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the **ip dos scan close-port-penalty** command.
DoS port scan TCP open port penalty	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the **ip dos scan tcp open-port-penalty** command.
DoS port scan UDP open port penalty	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the **ip dos scan udp open-port-penalty** command.

```

show ip dos statistics

Displays the statistics for detected DoS attacks on the switch.

show ip dos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- If an attack is detected and reported, it does not necessarily mean that an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.
- Statistics for the “unicast dest-ip/multicast-mac” DoS type are not reported for the multicast MAC address attack. In this case, the packet is dropped at a lower level so IP never sees the attack. IP only collects and reports statistics for IP attacks.

Examples

```
-> show ip dos statistics

  DoS type                              Attacks detected
----------------------------------+-------------------------
  port scan                                            0
  ping of death                                        0
  land                                                 0
  loopback-src                                         0
  invalid-ip                                           0
  invalid-multicast                                    0
  unicast dest-ip/multicast-mac                       52
  ping overload                                        0
  arp flood                                            0
  arp poison                                           0
```

output definitions

DoS type	The type of DoS attack.
Attacks detected	The number of attacks detected for each DoS type.

Release History

Release 7.1.1; command introduced

Related Commands

ip dos type	Enables or disables detection for a specific type of DoS attack.
show ip dos config	Displays the DoS scan configuration for the switch.

MIB Objects

```
alaDoSTable
   alaDoSType

```

show vrf

Displays the Multiple VRF instance configuration for the switch.

show vrf [*vrf_name* | **default]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
default	Selects the default VRF instance.

Defaults

By default, a list of all VRF instances is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *vrf_name* parameter to display route-map resource information for a specific VRF instance.
- Use the **default** parameter to display route-map resource information for the default VRF instance.
- The type of profile (low or max) assigned to a VRF determines the routing capabilities and the amount of route-map resources available for that specific VRF instance.

Examples

```
-> show vrf
 Virtual Routers     Profile Protocols
--------------------+-------+------------------
default              default BGP PIM VRRP
customer1            max     RIP OSPF
customer2            max     RIP OSPF
customer3            low

Total Number of Virtual Routers: 4
```

output definitions

Virtual Routers	The name of the VRF instance.
Profile	The type of profile applied to this instance (**low** or **max**).
Protocols	The protocols loaded within the context of this instance.

```
-> show vrf customer1
Legend:          in use/max
route-maps       :    3/30,
sequences        :    5/60,
tlvs             :    8/100,
access-lists     :    0/20,
address blocks   :    0/40,
match interfaces :    3/100
```

```
-> show vrf customer3
Legend:          in use/max
route-maps       :    0/10,
sequences        :    0/20,
tlvs             :    0/20,
access-lists     :    0/10,
address blocks   :    0/10,
match interfaces :    0/10

-> show vrf default
Legend:          in use/max
route-maps       :    0/200,
sequences        :    0/400,
tlvs             :    0/1000,
access-lists     :    0/200,
address blocks   :    0/500,
match interfaces :    0/2000
```

output definitions

route-maps	The number of route maps used and the maximum allowed.
sequences	The number of route map sequences used and the maximum allowed.
tlvs	The number of TLV blocks used and the maximum allowed. The TLV blocks contain the route-map match and set clauses.
access-lists	The number of route-map access lists used and the maximum allowed.
address blocks	The number of address blocks used and the maximum allowed. The address blocks hold access list addresses.
match interfaces	The number of route-map interfaces used in match clauses and the maximum allowed.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **Profile** field added, option to display route-map resources for a specific VRF instance.

Related Commands

vrf	Configures a Multiple VRF instance for the switch.
show vrf-profiles	Displays a summary of VRF profile usage and route map resources.
show ip protocols	Displays switch routing protocol information and status.

show vrf-profiles

Displays the current VRF profile usage and the maximum route-map resources allowed for each profile type (default, low, and max).

show vrf-profiles

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command also provides an estimate of the number of low profile VRFs that can be created.

Examples

```
-> show vrf-profiles
EST: Estimated number of low profile VRFs that can be created
RM:  Maximum route-maps
SEQ: Maximum sequences
TLV: Maximum TLVs (used to hold match and set clauses)
AL:  Maximum access-lists
AB:  Maximum address blocks (used to hold addresses)
ITF: Maximum route-map interfaces used in match clauses

Profile          Inuse EST  RM   SEQ  TLV  AL   AB   ITF
---------------+-----+----+----+----+----+----+----+----
default              1    -  200  400 1000  200  500 2000
low                  2  329   10   20   20   10   10   10
max                  3    -   30   60  100   20   40  100
```

20 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch. IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

Expanded Routing and Addressing Capabilities - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

Header Format Simplification - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

Anycast Addressing - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

Improved Support for Options - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

Authentication and Privacy Capabilities - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

Filename: IPV6-MIB.mib
Module: Ipv6MIB

Filename: ALCATEL-IND1-IPV6-MIB.mib
Module: alcatelIND1IPv6MIB

Filename: ALCATEL-IND1-IPRMV6-MIB.mib
Module: alcatelIND1IPRMV6MIB

A summary of the IPv6 commands is listed here:

IPv6	**ipv6 interface** **ipv6 interface rtr-port** **ipv6 interface tunnel source destination** **ipv6 address** **ipv6 address global-id** **ipv6 address local-unicast** **ipv6 dad-check** **ipv6 hop-limit** **ipv6 pmtu-lifetime** **ipv6 neighbor stale-lifetime** **ipv6 neighbor** **ipv6 neighbor limit** **ipv6 neighbor vrf-limit** **ipv6 ra-filter** **ipv6 ra-filter trusted** **ipv6 prefix** **ipv6 static-route** **ipv6 static-route all bfd-state** **ipv6 static-route bfd-state** **ipv6 route-pref** **ipv6 virtual-source-mac** **ipv6 echo** **ipv6 icmp rate-limit** **ping6** **traceroute6** **modify boot parameters** **show ipv6 icmp statistics** **show ipv6 interface** **show ipv6 emp-interface** **show ipv6 emp-routes** **show ipv6 pmtu table** **show ipv6 ra-filter** **show ipv6 neighbors** **clear ipv6 neighbors** **show ipv6 prefixes** **show ipv6 routes** **show ipv6 route-pref** **show ipv6 router database** **show ipv6 tcp listeners** **show ipv6 tcp connections** **show ipv6 tunnel configured** **show ipv6 tunnel 6to4** **show ipv6 information**
IPv6 Route Map Redistribution	**ipv6 redist** **ipv6 access-list** **ipv6 access-list address** **show ipv6 redist** **show ipv6 access-list**
Route Leak	**ipv6 export** **ipv6 import** **show ipv6 export** **show ipv6 import** **show ipv6 global-route-table**

ipv6 interface

Configures an IPv6 VLAN, IPv6 tunnel, or Loopback0 interface.

ipv6 interface *if_name* **[vlan** *vlan_id* **| | service** *service_id* **| tunnel {***tunnel_id* **| 6to4} | loopback0] admin-state [enable | disable]**
[base-reachable-time *time***]**

[ra-managed-config-flag {true | false}]
[ra-other-config-flag {true | false}]
[ra-reachable-time *time***]**
[ra-retrans-timer *time***]**
[ra-default-lifetime *time* **| no ra-default-lifetime]**
[ra-min-interval *interval* **| no ra-min-interval]**
[ra-clock-skew *time***]**
[ra-preference {medium| low | high}]
[ra-send-mtu] {yes | no}
[mtu *size***]**
[retrans-timer *time***]**
[dad-transmits *count***]**
[ra-hop-limit *count***]**
[[no] local-proxy-nd]
[neighbor-limit *count* **| no neighbor-limit]**
[retrans-backoff *backoff***]**
[retrans-max *max***]**

no ipv6 interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.
vlan_id	VLAN ID number to identify a VLAN interface.
service_id	An existing Shortest Path Bridging (SPB) service ID number (1–32767) to identify a service interface. *This parameter is supported only on the OmniSwitch 9900.*
tunnel_id	Tunnel ID number to identify a configured tunnel interface (*not supported on the OmniSwitch 6465 or the OmniSwitch 6560*).
6to4	Identifies the 6to4 tunnel interface (*not supported on the OmniSwitch 6465 or the OmniSwitch 6560*).
loopback0	Identifies a Loopback0 interface.
enable	Administratively enable the interface.
disable	Administratively disable the interface.
base-reachable-time *time*	Base value used to compute the reachable time for neighbors reached through this interface.
ra-send {yes | no}	Specifies whether the router advertisements are sent on this interface.

ra-max-interval *interval*	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4–1,800.
ra-managed-config-flag {true | false}	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
ra-other-config-flag {true | false}	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
ra-reachable-time *time*	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0–3,600,000. The special value of zero indicates that this time is unspecified by the router.
ra-retrans-timer *time*	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.
ra-default-lifetime *time*	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of **ra-max-interval** and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The **no ra-default-lifetime** option will calculate the value using the formula (3 * ra-max-interval).
ra-min-interval *interval*	Value, in seconds, allowed between the transmission of unsolicited multicast router advertisements on this interface. The interval must be a minimum of 3 and not more than.75 times the value of ra-max-interval.The **no ra-min-interval** option will calculate the value using the formula (.33 * ra-max-interval).
ra-clock-skew *time*	Value, in seconds. The router advertisement clock skew allows the link propagation delays and poorly synchronized clocks on routers participating in router discover over this interface. The timer differences that fall within the clock skew value are treated as valid times.
ra-preference	Specify the router preference.
ra-send-mtu {yes | no}	Specifies whether the MTU option is included in the router advertisements sent on the interface.
mtu *size*	The maximum transmission unit for a tunnel interface. Use the **vlan** command's mtu-ip to set for a VLAN.
retrans-timer *time*	The amount of time, in milliseconds, between retransmission of a neighbor solicitation during neighbor discovery.
dad-transmits *count*	The number of neighbor solicitations to send during Duplicate Address Detection.
ra-hop-limit *count*	The value placed in the current hop limit field of router advertisements sent on this interface.
[no] local-proxy-nd	Enable or disable Local Proxy Neighbor Discovery (LPND) on the interface. The default value is **no**. *LPND can only be enabled on IPv6 VLAN interfaces and is not supported on the OmniSwitch 6465 or the OmniSwitch 6560.*

neighbor-limit *count*	Sets the neighbor cache limit for the interface.The range for this value is platform dependent: • 16–64 on the OmniSwitch 6465. • 16–128 on the OmniSwitch 6560. • 10–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.
no neighbor-limit	Sets the neighbor cache limit back to the default value (64 for OmniSwitch 6465, 128 for OmniSwitch 6560, and no limit is enforced for all other supported OmniSwitch platforms).
retrans-backoff *backoff*	Sets the Neighbor Unreachability Detection (NUD) exponential back-off base value. The configurable values are 1, 2 or 3. The default value is 1. This allows the exponentially increase of the interval between retransmissions of the Neighbor Solicitation (NS), providing a longer interval over which the neighbor can respond.
retrans-max *max*	Sets the maximum number of neighbor solicitations to be sent during ND and NUD. The range is from 1 to 10 with a default value of 3. This allows the number of neighbor solicitations sent for neighbor discovery to be increased.

Defaults

parameter	default
base-reachable-time	360
ra-send	yes
ra-max-interval	600

ra-min-interval	calculated
ra-clock-skew	600
ra-preference	Medium
ra-send-mtu	no
retrans-timer	1000
dad-transmits	1
ra-hop-limit	64
local-proxy-nd	no
retrans-backoff	1
retrans-max	3

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN, service, and tunnel interfaces must have a unique name.
- When creating an IPv6 interface for a VLAN, service, or a configured tunnel, specifying a VLAN ID, service ID, or a Tunnel ID is required. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- Specify the **service** parameter to create a service-based interface that is used to provide in-line routing for IPv6 over SPB. When creating an IPv6 interface for an SPB service, consider the following:
  - The SPB service ID specified must already exist in the switch configuration.
  - VLAN translation is automatically enabled when a service is assigned to an IPv6 interface regardless of whether or not VLAN translation is enabled for the service; the VLAN translation status is no longer configurable as long as the service is bound to an IPv6 interface.
  - The same SPB service ID can be assigned to an IPv4 and an IPv6 interface as long as both interface types are in the same VRF instance.
  - See the “IP over SPBM” section in the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information.
- A default 6to4 tunnel named “tunnel_6to4” is automatically created in the default VRF instance. The tunnel status and configuration can be changed, but the tunnel itself cannot be deleted.
- The 6to4 tunnel interface and the Loopback0 interface do not send router advertisements (**ra-send** is always set to **no**).
- Before a 6to4 tunnel or Loopback0 interface can be enabled, at least one address must be assigned to the interface.
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See Chapter 5, “VLAN Management Commands,” for information on creating VLANs.
- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the **ipv6 interface** command.
- Use the **no** option to disable the Local Proxy Neighbor Discovery on the interface.
- Consistency checks are performed between the configured RA parameters and those present in received RAs. In the case of a discrepancy between the value in a received RA and the value configured on the switch, an informational message will be written to the SWLog log file. The messages are not logged on the console.
- The **ra-managed-config-flag** and **ra-other-config flag** parameters specify the values to be present in RAs sent by the switch when the DHCPv6 server is disabled. If the DHCPv6 server is enabled, the M and O flags in RAs sent by the switch will always be true.

Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
-> ipv6 interface Mgmt_intf loopback0
-> ipv6 interface vpn1 service 10
-> service 10 vlan-xlation disable
```

```
ERROR: Modify vlan translation currently not allowed for service (10)
```

Release History

ipv6 interface rtr-port

Configures an IPv6 routed-port interface by associating an IPv6 interface with a port or link aggregate and a VLAN.

ipv6 interface *if_name* **rtr-port {port** *chassis/slot/port* **| linkagg** *agg_id***} {tagged | untagged} vlan** *vlan_id*

Syntax Definitions

if_name	A unique name for the IPv6 interface. Use quotes around the string if the name contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
chassis/slot/port	The chassis, slot, and port number (1/2/1) of the physical port to bind to the IPv6 interface.
agg_id	The link aggregate ID to bind to the IP Interface.
tagged	Whether the assigned port or link aggregate is tagged for the specified VLAN.
untagged	Whether the assigned port or link aggregate is untagged for the specified VLAN.
vlan_id	An unused VLAN ID to which this IPv6 interface is associated.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- In a single step, this command creates the specified VLAN, configures an IPv6 interface for the VLAN, and assigns a port or link aggregate (tagged or untagged) to the VLAN. The **ipv6 address** command is then used to assign and IPv6 address to the routed-port interface.
- Configuring an IPv4 and IPv6 routed-port interface for the same VLAN ID is supported if the following conditions are met:
  - The VLAN ID, port, and the tagged/untagged port status for both interfaces is the same (for example, IPv4 and IPv6 routed interfaces are both bound to VLAN 850 with port 1/1/2 tagged).
  - Both interfaces are configured in the same VRF instance.
- Make sure the specified VLAN ID does not already exist in the switch configuration or is only used as a routed-port VLAN for an IPv4 interface. This VLAN will serve as a routing-only VLAN with a single port or link aggregate (Layer 2 functionality is not supported).
- Make sure the specified port or link aggregate is not already assigned to a VLAN that is not a routed-port VLAN. However, the port or link aggregate can be assigned to other routed-port VLANs.

- Attempting to add more ports or link aggregates to the routed-port VLAN or attempting to delete the VLAN is not allowed. The VLAN can only be removed by deleting the associated IPv6 and, if configured, the associated IPv4 interface.
- The same VLAN cannot be used for both a routed-port interface and a non-routed port interface.
- Once configured, an IPv6 routed port interface is operationally equivalent to an IPv6 VLAN interface. Routing protocols and other switch features that use IPv6 are configured and operate on an IPv6 routed port interface in the same manner as on a regular IPv6 interface.

Examples

```
-> ipv6 interface rp-vlan30 rtr-port port 1/1/1 tagged vlan 30
-> ipv6 interface rp-vlan40 rtr-port port 1/1/2 untagged vlan 40
-> ipv6 interface rp-vlan50 rtr-port linkagg 6 tagged vlan 50
-> ipv6 interface rp-vlan60 rtr-port linkagg 7 untagged vlan 60
-> ipv6 interface rp-vlan60 rtr-port port 1/1/3 untagged vlan 60
ERROR: Routed port interface rp-vlan60 VLAN and/or port configuration cannot be
changed
-> no ipv6 interface rp-vlan60

-> vlan 70
-> ipv6 interface rp-vlan70 rtr-port port 1/1/15 untagged vlan 70
ERROR: VLAN 70 already exists

-> ip interface rpv4-port rtr-port port 1/1/2 tagged vlan 850
-> ipv6 interface rpv6-port rtr-port port 1/1/2 tagged vlan 850

-> no ipv6 interface rpv6-port
-> ipv6 interface rpv6-port rtr-port port 1/1/2 untagged vlan 850
ERROR: Configuration conflict with IPv4 routed port interface rp-port
```

Release History

ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

ipv6 interface *if_name* **tunnel {source** *ipv4_source* **destination** *ipv4_destination***}**

Syntax Definitions

if_name	Name assigned to the tunnel interface.
ipv4_source	Source IPv4 address for the configured tunnel.
ipv4_destination	Destination IPv4 address for the configured tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **ipv6 interface** command to create an IPv6 tunnel interface.
- A configured tunnel interface cannot be enabled until both its IPv4 source and destination addresses have been specified.

Examples

```
-> ipv6 interface Test tunnel 2 source 192.0.2.1 destination 198.51.100.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 tunnel configured	Displays IPv6 tunnel information.

MIB Objects

```
IPv6IfIndex
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
   alaIPv6ConfigTunnelRowStatus
```

ipv6 address

Configures an IPv6 address for an IPv6 interface. There are different formats for this command depending on the address type.

ipv6 address *ipv6_address /prefix_length* **{***if_name* | **loopback}**

no ipv6 address *ipv6_address* **{***if_name* **| loopback}**

ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

no ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

Syntax Definitions

ipv6_address	IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). (3..128).
eui-64	Append an EUI-64 identifier to the prefix.
if_name	Name assigned to the interface.
loopback	Configures an IPv6 address for the loopback interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length. However, the prefix for the loopback or the user-defined Loopback0 interface must always be /128.
- Make sure that only 6to4 addresses are assigned to a 6to4 tunnel interface.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.
- When JITC mode is enabled, Site-Local addresses of range FEC0::/10 cannot be configured. This consists of all the addresses that begin with FEC, FED, FEE, and FEF. Refer to the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information on enabling JITC mode.

Examples

```
-> ipv6 address 2001:db8:4132:86::19a/64 Test_Lab
-> ipv6 address 2002:c633:6489::35/64 Test_6to4
```

```
-> ipv6 address 2001:db8:6489::36/128 loopback
-> ipv6 interface Test_Loopback0 loopback0
-> ipv6 address 2001:db8:6489::37/128 Test_Loopback0
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1: **anycast** keyword deprecated.

```

ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

ipv6 address global-id {generate | *globalID*}

Syntax Definitions

generate	Automatically generates the global ID.
globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh

Defaults

By default, the IPv6 global ID is set to all zeros.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added through the **ipv6 address local-unicast** command or when the **ipv6 address global-id** command is executed.

Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 address local-unicast	Creates a IPv6 local unicast address using the configured global ID.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaIPv6GlobalID
```

ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***] {***if_name* **| loopback}**

no ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***]** *{if_name* **| loopback}**

Syntax Definitions

globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh.
subnetID	A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.
interfaceID	An interface identifier specified in the form hhhh:hhhh:hhhh:hhhh.
eui-64	Automatically-generated EUI-64 value to be used for interface identfier.
prefixLength	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value must rarely be overridden.
if_name	The name assigned to the interface.
loopback	The loopback for the loopback interface.

Defaults

parameter	default
prefixLength	64

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier, similar to that used for full IPv6 addresses, is allowed.

Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaIPv6LocalUnicastPrefixLength
```

ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

ipv6 dad-check *ipv6_address if_name*

Syntax Definitions

ipv6_address	IPv6 address.
if_name	Name assigned to the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The switch performs DAD check when an interface is attached and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

Examples

```
-> ipv6 dad-check 2001:db8::1/32 Test_Lab
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaIPv6InterfaceAddressTable
   alaIPv6InterfaceAddressDADStatus
```

ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

ipv6 hop-limit *value*

no ipv6 hop-limit

Syntax Definitions

value	Hop limit value. The range is 0 - 255.

Defaults

parameter	default
value	64

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

Examples

```
-> ipv6 hop-limit 64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 information	Displays IPv6 information.

MIB Objects

ipv6 pmtu-lifetime

Configures the minimum lifetime for entries in the path MTU Table.

ipv6 pmtu-lifetime *time*

Syntax Definitions

time	Minimum path MTU entry lifetime, in minutes. Valid range is 10–1440.

Defaults

parameter	default
time	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 pmtu-lifetime 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pmtu table	Displays the IPv6 path MTU Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUMinLifetime
```

ipv6 neighbor stale-lifetime

Configures the minimum lifetime for neighbors in the unconfirmed state.

ipv6 neighbor stale-lifetime *stale-lifetime*

Syntax Definitions

stale-lifetime	Minimum lifetime for neighbor entries in the stale state (5–2800).

Defaults

parameter	default
stale-lifetime	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
IPv6IfIndex
alaIPv6NeighborTable
   alaIPv6NeighborStaleLifetime
```

ipv6 neighbor

Configures a static entry in the IPv6 Neighbor Table.

ipv6 neighbor *ipv6_address hardware_address* **{***if_name***} {port** *chassis/slot/port* | **linkagg** *agg_id*}

no ipv6 neighbor *ipv6_address* **{***if_name***}**

Syntax Definitions

ipv6_address	IPv6 address that corresponds to the hardware address.
hardware_address	MAC address in hex format (e.g., 00:00:39:59:F1:0C).
if_name	Name assigned to the interface on which the neighbor resides.
chassis	The chassis identifier.
slot/port	The slot and port number of the port used to reach the neighbor.
agg_id	The link aggregate ID number of the link aggregate used to reach the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test port 1/1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

   alaIPv6NeighborStaleLifetime
```

ipv6 neighbor limit

Configures the system-wide maximum limit for the number of neighbor entries in the cache.

ipv6 neighbor limit *count*

no ipv6 neighbor limit

Syntax Definitions

count	The system-wide maximum limit for the number of neighbor entries in the cache. The valid range for this value is platform dependent: • 16–64 on the OmniSwitch 6465. • 16–128 on the OmniSwitch 6560. • 200–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.

Defaults

By default, the maximum number of neighbor entries is set to 64 on the OmniSwitch 6465 and 128 on the OmniSwitch 6560. On all other supported OmniSwitch platforms, there is no enforced limit.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to set the limit back to the default value.

Examples

```
-> ipv6 neighbor limit 16
-> ipv6 neighbor limit 200
-> no ipv6 neighbor limit
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6NeighborLimit
```

ipv6 neighbor vrf-limit

Configures the maximum limit for the number of neighbor entries in a VRF's cache.

ipv6 neighbor vrf-limit *count*

no ipv6 neighbor vrf-limit

Syntax Definitions

count	The maximum limit for the number of VRF neighbor entries in the cache. The valid range for this value is platform dependent: • 16–64 on the OmniSwitch 6465. • 16–128 on the OmniSwitch 6560. • 200–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.

Defaults

By default, the maximum number of neighbor entries is set to 64 on the OmniSwitch 6465 and 128 on the OmniSwitch 6560. On all other supported OmniSwitch platforms, there is no enforced limit.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to set the limit back to the default value.

Examples

```
-> ipv6 neighbor vrf-limit 16
-> ipv6 neighbor vrf-limit 200
-> no ipv6 neighbor vrf-limit
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6NeighborVRFLimit
```

ipv6 ra-filter

Configures the status of Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled on an interface, RAs received on any port or linkagg will be discarded. If one or more trusted ports or link aggregates are configured, RAs received on them will be accepted and sent on to any connected IPv6 nodes.

ipv6 ra-filter *if-name* **[admin-state {enable | disable}]**

no ipv6 ra-filter *if-name*

Syntax Definitions

if-name	Specify the name of the IPv6 VLAN interface.
enable	Enables RA filtering on the specified interface.
disable	Disables RA filtering on the specified interface.

Defaults

By default, the administrative status of RA filtering on an IPv6 VLAN interface is disabled.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900

Usage Guidelines

Use the **no** form of this command to return the RA filtering status to the default value (disabled).

Examples

```
-> ipv6 ra-filter vlan-23 admin-state enable
-> ipv6 ra-filter vlan-23 admin-state disable
-> no ipv6 ra-filter vlan-23
```

Release History

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.

Related Commands

ipv6 ra-filter trusted	Configures trusted ports or link aggregates on which RAs are accepted when RA filtering is enabled.
ipv6 interface	Creates an IPv6 interface.
show ipv6 interface	Displays IPv6 Interface Table.
show ipv6 ra-filter	Displays the RA filter configuration for an IPv6 interface.

MIB Objects

```
alaIPv6RAFilterInterfaceTable
   alaIPv6RAFilterInterfaceAdminStatus
   alaIPv6RAFilterInterfaceRowStatus
```

ipv6 ra-filter trusted

Configures trusted sources (ports or link aggregates) on which Router Advertisements (RAs) are accepted and sent on to any connected IPv6 nodes. When RA filtering is enabled on an IPv6 VLAN interface, RAs received on any port or linkagg will be discarded, except on trusted ports or link aggregates.

ipv6 ra-filter *if-name* **trusted {port** *chassis/slot/port* **| linkagg** *agg_num***}**

no ipv6 ra-filter *if-name* **trusted {port** *chassis/slot/port* **| linkagg** *agg_num***}**

Syntax Definitions

if-name	Specify the name of the IPv6 VLAN interface on which RA filtering is enabled or disabled.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a trusted port.
agg_num	A trusted link aggregate ID number.

Defaults

By default all ports and link aggregates are untrusted.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to return a port or linkagg to an untrusted state.
- Use the **ipv6 ra-filter** command to enable or disable the RA filtering status for an IPv6 VLAN interface.

Examples

```
-> ipv6 ra-filter vlan-23 trusted port 1/1/22
-> ipv6 ra-filter vlan-23 trusted linkagg 10
-> no ipv6 ra-filter vlan-23 trusted port 1/1/22
-> no ipv6 ra-filter vlan-23 trusted linkagg 10
```

Release History

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.

Related Commands

ipv6 ra-filter	Configures the RA filtering status for an IPv6 VLAN interface.
ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 interface	Displays IPv6 Interface Table.
show ipv6 ra-filter	Displays the RA filter configuration for an IPv6 interface.

MIB Objects

```
alaIPv6RAFilterTrustedSourceTable
   alaIPv6RAFilterTrustedSourceRowStatus
```

ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

ipv6 prefix *ipv6_address /prefix_length if_name* **[valid-lifetime** *time***] [preferred-lifetime** *time***] [on-link-flag {true | false} [autonomous-flag {true | false}]** *if_name*

no ipv6 prefix *ipv6_address /prefix_length if_name*

Syntax Definitions

ipv6_address	IPv6 address of the interface.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). (1...127).
valid-lifetime *time*	Length of time, in seconds, that this prefix will remain valid (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
preferred-lifetime *time*	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
on-link-flag {true | false}	On-link configuration flag. When “true” this prefix can be used for on-link determination.
autonomous-flag {true | false}	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
if_name	Name assigned to the interface.

Defaults

parameter	default
valid-lifetime *time*	2,592,000
preferred-lifetime *time*	604,800
on-link-flag	true
autonomous-flag	true

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete a prefix.

Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

Release History

Release 7.1.1; command was introduced.

Related Commands

   alaIP6vInterfacePrefixAutonomousFlag
   alaIP6vInterfacePrefixRowStatus
```

ipv6 static-route

Configures an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. By default, static routes carry a higher priority than dynamic routes.

ipv6 static-route *ipv6_prefix/prefix_length* **gateway {***ipv6_address* **| null} [tag** *num***] [name** *string***] [***if_name***] [emp] [metric** *metric***]**

no ipv6 static-route *ipv6_prefix/prefix_length* **gateway {***ipv6_address* **| null} [** *if_name***] [emp]**

Syntax Definitions

ipv6_prefix	IPv6 network that is the destination of this static route.
/prefix_length	The number of bits (0...128) that are significant in the iPv6 address (mask).
gateway *ipv6_address*	IPv6 address of the next hop used to reach the destination IPv6 address.
gateway null	Use this option to configure an IPv6 blackhole route.
num	Tag to be used for route.
string	Name to be used for route.
if_name	If the next hop is a link-local address, the name of the interface used to reach it.
emp	Represents the EMP interface.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static route.
- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the **ipv6 route-pref** command.
- To create an IPv6 static route with gateway pointing to an EMP interface, specify the keyword **emp** for the interface name field instead of specifying the exact interface name of the EMP interface (for example, EMP-CMMA-CHAS1).
- If IPv6 address is configured on the EMP port on a VC or chassis setup, ensure to configure the IPv6 address on all the VC elements or CMM.
- Static route with default gateway towards EMP interface is not allowed.

- Use the **null** option to configure IPv6 blackhole routes. A blackhole route is used to forward unwanted traffic to a blackhole.
  - Redistribution of blackhole routes is supported. Dynamic routing protocols may advertise these routes, but the gateway associated with the route(s) will be an address on the router advertising them.
  - Leaking of blackhole routes across SPB service backbones is supported. However, blackhole routes cannot be leaked between VRFs. Blackhole routes need to be explicitly configured using the **ip static-route** command in any/all VRFs.
  - Blackhole routes are created and installed through static route commands. Dynamic Routing protocols shall not install blackhole IPv6 routes.
  - Blackhole routes shall never be part of ECMP.
  - Blackhole routes cannot be enabled for BFD support.
- Alternatively, the gateway address '::' can be used to create an IPv6 blackhole route.

Examples

```
-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
```

Static route with gateway towards EMP interface:

```
-> ipv6 static-route 212:95:5::/64 gateway 2001::205 emp
or
-> ipv6 static-route 212:95:5::/64 gateway 2001::205 EMP-CMMA-CHAS1
```

Static route with default gateway towards EMP interface is not allowed.

```
-> ipv6 static-route ::/0 gateway 2001::205 EMP-CMMA-CHAS1
ERROR: Default routes with gateway on EMP port not allowed
```

Configuring a static blackhole route.

```
-> ipv6 static-route 212:95:5::/64 gateway null

-> ipv6 static-route 22::/64 gateway ::
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **tag** and **name** parameters included.
Release 8.4.1; **emp** parameter added.
Release 8.6R1; **null** keyword added.

Related Commands

ipv6 static-route all bfd-state

Enables BFD for all IPv6 static routes.

ipv6 static-route all bfd-state {enable| disable}

Syntax Definitions

enable	Enables BFD for all IPv6 static routes.
disable	Disables BFD for all IPv6 static routes.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When there are static routes configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

Examples

```
-> ipv6 static-route all bfd-state enable
-> ipv6 static-route all bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

ipv6 static-route bfd-state	Enables BFD for a specific static route.

MIB Objects

```
alaIprmV6Config
   alaIprmV6StaticAllBfd
```

ipv6 static-route bfd-state

Enables or disables BFD for a specific IPv6 static route.

ipv6 static-route *ipv6_prefix/pfx_length* **gateway** *ipv6_host_address* **bfd-state {enable| disable}**

Syntax Definitions

ipv6_prefix	The destination IPv6 address.
pfx_length	The prefix length for the destination IPv6 address.
ipv6_host_address	The gateway IPv6 address.
enable	Enables BFD for the IPv6 static route.
disable	Disables BFD for the IPv6 static route.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

BFD is enabled to track the gateway of static routes.

Examples

```
-> ipv6 static-route 195:35::/64 gateway fe80::2d0:95ff:fe12:f470 bfd-state enable
-> ipv6 static-route 195:35::/64 gateway fe80::2d0:95ff:fe12:f470 bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

   alaIprmV6StaticRouteBfdStatus
   alaIprmV6StaticRouteType
```

ipv6 route-pref

Configures the route preference of a router.

ipv6 route-pref {static | ospf | rip | ebgp | ibgp | isisl1 | isisl2 | import} *value*

Syntax Definitions

static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF3 routes (*OSPF3* is *not supported on the OmniSwitch 6465 or OmniSwitch 6560*).
rip	Configures the route preference of RIPng routes.
ebgp	Configures the route preference of external BGP routes (*the IPv6 version of BGP is not supported on the OmniSwitch 6465 or OmniSwitch 6560*).
ibgp	Configures the route preference of internal BGP routes (*the IPv6 version of BGP is not supported on the OmniSwitch 6465 or OmniSwitch 6560*).
isisl1	Configures the route preference of IS-IS L1 routes (*IS-IS* is *not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 9900*).
isisl2	Configures the route preference of IS-IS L2 routes (*IS-IS* is *not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 9900*).
import	Configures the route preference for the routes that are imported from another VRF instance.
value	Route preference value. The valid range is 1–255.

Defaults

parameter	default
static *value*	2
ospf *value*	110
rip *value*	120
ebgp *value*	190
ibgp *value*	200
isisl1 *value*	115
isisl1 *value*	118
import *value*	210

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Route preference of local routes cannot be changed.

Examples

```
-> ipv6 route-pref ospf 20
-> ipv6 route-pref rip 60
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; **import** parameter added.

Related Commands

show ipv6 route-pref	Displays the configured route preference of a router.

MIB Objects

```
alaIprmV6RtPrefTable
   alaIprmV6RtPrefEntryType
   alaIprmV6RtPrefEntryValue
```

ipv6 virtual-source-mac

Configures the source MAC to be used for packets being sent from a VRRP instance.

ipv6 virtual-source-mac {on | off}

Syntax Definitions

on	The switch will use the VRRP virtual MAC address for all packets.
off	The switch will use the physical MAC address for all packets except VRRP advertisements.

Defaults

parameter	default
virtual-source-mac	off

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to change which MAC address the switch will use as the source MAC when sending packets from a VRRP instance.
- This command has no affect on VRRP advertisements, the VRRP virtual MAC will always be used.

Examples

```
-> ipv6 virtual-source-mac on
-> ipv6 virtual-source-mac off
```

Release History

Release 7.2.1; command was introduced.

Related Commands

show ipv6 route-pref	Displays the configured route preference of a router.

MIB Objects

N/A

ipv6 echo

Configures the switch to reply or ignore echo requests in response to an echo request sent to a multicast or anycast IPv6 address. Use **no** option to ignore reply to anycast or multicast echo requests.

ipv6 echo {anycast | multicast}

no ipv6 echo {anycast | multicast}

Syntax Definitions

anycast	Ignore (when **no** option is used) or reply to anycast echo requests.
multicast	Ignore (when **no** option is used) or reply to multicast echo requests.

Defaults

By default, the switch will reply to multicast or anycast echo requests.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The switch will not ignore echo requests that it originates that are destined to one of its own anycast or multicast addresses.

Examples

```
-> ipv6 echo multicast
-> no ipv6 echo anycast
```

Release History

Release 8.4.1; command introduced.

Related Commands

show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6IgnoreAnycastEchos
alaIPv6IgnoreMcastEchos
```

ipv6 icmp rate-limit

Configures the rate-limiting of ICMPv6 error messages.

ipv6 icmp rate-limit [interval *number***] [burst** *number***]**

no ipv6 icmp rate-limit

Syntax Definitions

interval *number*	The minimum interval between the ICMPv6 error messages.Valid range is 0 to 10000 in milliseconds.
burst *number*	The maximum number of ICMPv6 error messages that may be sent in a single burst regardless of the interval. Valid range is 1 to 50.

Defaults

parameter	default
interval *number*	10ms
burst *number*	10

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use **no** option to disable the ICMPv6 error message rate limiting.

Examples

```
-> ipv6 icmp rate-limit interval 100
-> ipv6 icmp rate-limit burst 20
-> no ipv6 icmp rate-limit
```

Release History

Release 8.4.1; command introduced.

Related Commands

show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6IcmpRateLimitInterval
alaIPv6IcmpRateLimitBurst
```

ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

ping6 {*ipv6_address* | *hostname***}** [*if_name*] **[count** *count***] [size** *data_size***] [interval** *seconds***]**

Syntax Definitions

ipv6_address	The IP address of the system to ping.
hostname	DNS name of the system to ping.
if_name	If the target is a link-local address, the name of the interface used to reach it.
count	Number of packets to be transmitted.
size	Size of the data portion of the packet sent for this ping, in bytes.
seconds	Interval, in seconds, at which ping packets are transmitted.

Defaults

parameter	default
count	6
size	8
interval *seconds*	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

Examples

```
-> ping6 2001:db8:302::44
-> ping6 fe80::2d0:95ff:fe6a:f458 vlanif-23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

traceroute6	Finds the path taken by an IPv6 packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute6 {*ipv6_address* | *hostname*} [*if_name*] **[max-hop** *hop_count***] [dest-port** *port_number***] [probe-count** *probe***] [size** *size***] [host-names** {**yes** | **no**}**]**

Syntax Definitions

ipv6_address	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
if_name	If the target is a link-local address, the name of the interface used to reach it.
hop_count	Maximum hop count for the trace.
port_number	Specific UDP port destination. By default, the destination port is chosen by traceroute6.
probe	Number of probes to be sent to a single hop.
size	The initial size for the probe packets. During the trace the packet size will be adjusted downward as path MTU information is received. The default and maximum value is 24,000 bytes with a minimum of 1,280 bytes.
host-names {**yes** | **no**}	Specify whether each hop must be shown as an IPv6 address or the host name corresponding to the address.

Defaults

parameter	default
hop_count	32
probe	3
host-names	no

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

Examples

```
-> traceroute6 41EA:103::65C3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ping6	Tests whether an IPv6 destination can be reached from the local switch.

MIB Objects

N/A

modify boot parameters

This command is used to configure IPv6 EMP interface.

modify boot parameters

Syntax Definitions

N/A

Defaults

By default, the EMP interface will have the following configuration.

parameter	default
baudrate	9600
parity	none
wordsize	8
stopbits	1
mode	modemControlOff

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must be on the system console to modify the system boot parameters. Enter **modify boot parameters** command. This enters the **boot** mode. IPv6 EMP interface parameters like the unique IP address and mask, baudrate, priority, and so on can be configured after entering the boot mode.
- Only one IPv6 EMP interface is allowed per physical EMP port in the default VRF.
- It is required to configure an unique IPv6 Address that does not conflict with any other IPv6 interface configured in the system.
- It is required to reload the switch for the modified interface configuration to come into effect.

Examples

```
-> modify boot parameters
Please wait...
Type '?' for help, 'exit' to exit the boot param parser.
Boot > ?
boot empipaddr         <ip address>
boot empmasklength     <number of bits in mask>
boot serialbaudrate    <1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200>
boot serialparity      <none, even, odd>
boot serialwordsize    <7, 8>
boot serialstopbits    <1, 2>
boot serialmode        <modemControlOn, modemControlOff>
boot empipv6addr       <ipv6 address>
boot empipv6masklength <number of bits in mask>
```

```
'show'           - Display the edit buffer
'commit boot'    - Commit the changes to non volatile memory for future boots
'commit system'  - Commit the changes to running system ONLY
                   Note: EMP changes will only take effect on a future boot
'exit'           - Exit (quit)
```

show command displays the existing configuration of EMP interface.

```
Boot > show
EMP IP Address            : 10.200.105.21/24
Serial (console) baud     : 9600
Serial (console) parity   : none
Serial (console) wordsize : 8
Serial (console) stopbits : 1
Serial (console) mode     : modemControlOff
EMP IPV6 Address          : /
```

To Configure IPv6 EMP interface, configure the IP address and mask:

```
Boot > boot empipv6masklength 64
Boot > show
EMP IP Address            : 10.200.105.21/24
Serial (console) baud     : 9600
Serial (console) parity   : none
Serial (console) wordsize : 8
Serial (console) stopbits : 1
Serial (console) mode     : modemControlOff
EMP IPV6 Address          : /64

Boot > boot empipv6addr  2001::205
Boot > show
EMP IP Address            : 10.200.105.21/24
Serial (console) baud     : 9600
Serial (console) parity   : none
Serial (console) wordsize : 8
Serial (console) stopbits : 1
Serial (console) mode     : modemControlOff
EMP IPV6 Address          : 2001::205/64
Boot >
```

Release History

Release 8.4.1; command introduced.

Related Commands

show ipv6 interface	Displays IPv6 interface configuration.
show ipv6 emp-interface	Displays the IPv6 EMP interface configuration.
show ipv6 emp-routes	Displays the IPv6 routes targeted to EMP port/IPv6 EMP interface configuration.

MIB Objects

N/A

show ipv6 icmp statistics

Displays IPv6 ICMP statistics.

show ipv6 icmp statistics [*if_name*]

Syntax Definitions

if_name	Display statistics only for this interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the ICMP table to monitor and troubleshoot the switch.

Examples

```
-> show ipv6 icmp statistics
Message                          Current    Previous   Change
-------------------------------+----------+----------+----------

Neighbor Solicitations              4          0          4
Neighbor Advertisements             0          0          0
Redirects                           0          0          0
Administratively Prohibited         0          0          0
```

output definitions

Total	Total number of ICMPv6 messages the switch received or attempted to send.
Errors	Number of ICMPv6 messages the switch sent or received but was unable to process because of ICMPv6-specific errors (bad checksums, bad length, etc.).
Destination Unreachable	Number of Destination Unreachable messages that were sent or received by the switch.
Packet Too Big	Number of Packet Too Big messages sent or received by the switch.
Administratively Prohibited	Number of Destination Unreachable/Communication Administratively Prohibited messages sent or received by the switch.
Time Exceeded	Number of Time Exceeded messages sent or received by the switch.
Parameter Problems	Number of Parameter Problem messages sent or received by the switch.
Echo Requests	Number of Echo Request messages sent or received by the switch.
Echo Replies	Number of Echo Reply messages sent or received by the switch.
Group Membership Queries	Number of Group Membership Queries sent or received by the switch.
Group Membership Responses	Number of Group Membership Responses sent or received by the switch.
Group Membership Reductions	Number of Group Membership Reductions sent or received by the switch.
Router Solicitations	Number of Router Solicitations sent or received by the switch.
Router Advertisements	Number of Router Advertisements sent or received by the switch.
Neighbor Solicitations	Number of Neighbor Solicitations sent or received by the switch.
Neighbor Advertisements	Number of Neighbor Advertisements sent or received by the switch.
Redirects	Number of Redirect messages sent or received by the switch.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 interface

Displays the configuration and status of IPv6 interfaces.

show ipv6 interface [*if_name* | **loopback**]

Syntax Definitions

if_name	Interface name. Limits the display to a specific interface.
loopback	Limits display to loopback interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an interface name is not specified, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

Examples

```
-> show ipv6 interface
Name                 IPv6 Address/Prefix Length               Status    Device
-----------------+---------------------------------------+---------+-----------
smbif-5            fe80::2d0:95ff:fe12:f470/64             Active    VLAN 955
                   212:95:5::35/64

rp_11              fe80::2b0:d0ff:fe86:880e/64             Active    VLAN 11 agg 7
```

output definitions

Name	The name assigned to the IPv6 interface.
IPv6 Address/Prefix Length	IPv6 address and prefix length assigned to the interface. If an interface has more than one IPv6 address assigned to it, each address is shown on a separate line.

output definitions

Status	Interface status (Active/Inactive/Disabled).
Device	The device on which the interface is configured (for example, VLAN 955). This field will also display the port or link aggregate assignment for IPv6 routed-port interfaces (for example, “VLAN 10 1/1/2”)

output definitions

IPv6 interface index	IPv6IfIndex value that must be used in SNMP requests pertaining to this interface.
Administrative status	Administrative status of this interface (Enabled/Disabled).

output definitions (continued)

Operational status	Indicates whether the physical interface is connected to a device (Active/Inactive).
Hardware address	The hardware address.
Device	The device on which the interface is configured (for example, VLAN 955). This field will also display the port or link aggregate assignment for IPv6 routed-port interfaces (for example, "VLAN 10 1/1/2")
Routed Port	This field appears only for routed port interfaces and displays the tag status (tagged or untagged) of the port or link aggregate that is associated with the routed port interface.
Link-local address	Link-local address assigned to the interface.
Global unicast address(es)	Global unicast address(es) assigned to the interface.
Anycast address(es)	The anycast address(es) assigned to this interface.
VRRP address(es)	Addresses assigned to the interface because a VRRP virtual router is active. If (accept) is present, the switch will accept packets destined to the address. If not present, any such packets will be discarded.
Joined group address(es)	Addresses of the multicast groups that this interface has joined.
Maximum Transfer Unit	Interface MTU value.
Neighbor reachable time (sec)	The amount of time that a neighbor reached through this interface will remain in the reachable state.
Base reachable time (sec)	The base reachable time used to calculate the current neighbor reachable time.
Retransmit timer (ms)	The interval at which neighbour solicitations will be retransmitted during the neighbor discovery process.
Retransmit backoff	The NUD exponential backoff base value.
Retransmit max	The maximum number of neighbor solicitations to be sent during ND/ NUD.
DAD transmits	The number of neighbour solicitations that will be sent as part of the Duplicate Address Detection process.
Send Router Advertisements	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
Maximum RA interval (sec)	Maximum time between the transmission of unsolicited router advertisements over the interface.
Minimum RA interval (sec)	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).
RA managed config flag	True/False value in the managed address configuration flag field in router advertisements.
RA other config flag	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
RA reachable time (ms)	Value placed in the reachable time field in the router advertisements sent over this interface.
RA retransmit timer (ms)	Value placed in the retransmit timer field in router advertisements sent over this interface.
RA default lifetime (sec)	The value placed in the router lifetime field in the router advertisements sent over this interface.
RA hop limit	The value placed in the current hop limit field in the router advertisements sent over this interface.

output definitions (continued)

RA Send MTU option	Specifies whether the MTU option is included in the router advertisements sent over this interface.
RA clock skew (sec)	The clock skew allowed for router advertisements on this interface.
RA filtering	Specifies if RA filtering is enabled or disabled on the interface.
Neighbor cache limit	The interface's neighbor cache limit. “none” if value not set.
RA router preference	Specifies the router preference - medium, high, low.
Local Proxy ND	Specifies if Local Proxy Neighbor Discovery is enabled or disabled on the interface.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1: EMP interface information added.
Release 8.5R4; service-based interface information added.
Release 8.6R2; “Device” and “Routed Port” fields added.

Related Commands

ipv6 address	Configures an IPv6 address for an IPv6 interface.
ipv6 interface	Configures an IPv6 interface.
ipv6 interface rtr-port	Configures an IPv6 routed-port interface.
modify boot parameters	Configures the IPv6 EMP interface.

show ipv6 emp-routes

Displays the IPv6 routes targeted to EMP port/IPv6 EMP interface configuration.

show ipv6 emp-routes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 emp-routes
Legend: Flags: U=Up, G=Gateway, H=Host, S=Static, C=Cloneable, B=Discard, E=ECMP

Total 2 routes

Destination/Prefix  Gateway Address    Interface      Age    Protocol   Flags
------------------+---------------+--------------+-------+----------+------
2001::/64             ::            EMP-CMMA-CHAS1  1d 1h    LOCAL      UC
4001::/64             2001::9       EMP-CMMA-CHAS1  1d 1h    STATIC     UGS
```

output definitions

Destination/Prefix	The destination IPv6 address of the IPv6 EMP route.
Gateway Address	The next hop IPv6 address to reach the destination.
Interface	The interface through which the destination IPv6 address is reachable.
Age	Time since this route was last updated or otherwise determined to be correct.
Protocol	The routing mechanism through which this route was learned. For EMP routes, this can be only local or static. Routing protocol are not supported on EMP interface.
Flags	Route flags that describes the route details.

Release History

Release 8.4.1; command introduced.

Related Commands

ipv6 static-route	Configures an IPv6 static route.

```

show ipv6 pmtu table

Displays the IPv6 Path MTU Table.

show ipv6 pmtu table

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pmtu table

1-PMTU Entry
PMTU entry minimum lifetime = 10m
Destination Address                                      MTU      Expires
---------------------------------------------------------+--------+-------
fe80::02d0:c0ff:fe86:1207                                1280     1h 0m
```

output definitions

Destination Address	IPv6 address of the path's destination.
MTU	Path’s MTU.
Expires	Minimum remaining lifetime for the entry.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUDest
   alaIPv6PMTUexpire
```

show ipv6 ra-filter

Displays the RA filter configuration for an IPv6 interface.

show ipv6 ra-filter [*if-name***]**

Syntax Definitions

if_name	IPV6 interface name.

Defaults

By default, the RA filter configuration is displayed for all IPv6 VLAN interfaces.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900

Usage Guidelines

Use the *if-name* parameter to display information for a specific IPv6 interface.

Examples

```
-> show ipv6 ra-filter
Interface                       Status   Trusted Ports
--------------------------------+--------+--------------------------------------
vlan-23                         Enabled  1/1/22, agg 7
vlan-24                         Enabled  none
```

output definitions

Interface	Displays the IPv6 VLAN interface on which RA filtering is configured.
Status	Displays the status of RA filtering on the interface. The interfaces on which the RA filtering is disabled are displayed only if one or more trusted ports are configured for the interface.
Trusted Ports	Displays the RA filtering trusted sources for the interface. A '+' will appear at the end of the list to indicate that there are more trusted sources configured which cannot be displayed in a single line. To view the full list of configured trusted sources, specify the interface name in the **show** command as recommended.

```
-> show ipv6 ra-filter vlan-23
RA Filtering: Enabled
Trusted ports:
  1/1/22
  linkagg 7
```

output definitions

RA Filtering	Indicates if RA filtering is enabled or disabled on the IPv6 VLAN interface.
Trusted ports	Shows the RA filtering trusted ports (chassis/slot/port) or link aggregates (linkagg ID) for the interface. Displays **none** if there are no trusted ports.

Release History

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.

Related Commands

ipv6 ra-filter	Enables or disables the status of RA filtering on IPv6 VLAN interfaces. When enabled, any RAs received on associated ports and link aggregates are discarded.
ipv6 ra-filter trusted	Configures the RA filtering trust status for ports and link aggregates associated with the IPv6 VLAN interface. When a port or link aggregate is trusted, it can accept RAs received when the RA filtering status is enabled.

MIB Objects

```
IPv6IfIndex
   alaIPv6RAFilterTrustedChassis
   alaIPv6RAFilterTrustedSlot
   alaIPv6RAFilterTrustedPort
```

show ipv6 neighbors

Displays IPv6 Neighbor Table.

show ipv6 neighbors [*ipv6_prefix/prefix_length* | *if_name* | **hw** *hardware_address* | **static]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
if_name	Interface name. Restricts the display to those neighbors reached through the specified interface.
hardware_address	MAC address. Restricts the display to the specified MAC address.
static	Restricts display to statically configured neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you do not specify an option (e.g., if_name), all IPv6 neighbors are displayed.

Examples

```
-> show ipv6 neighbors

Total 4 neighbors

IPv6 Address            Hardware Address  Reachability Lifetime Port           Interface
------------------------+-----------------+------------+--------+--------------+---------
2001:db8:9::88          00:d0:95:01:0a:ec Confirmed       5m 5s 1/3/7          vlan_7
fe80::2d0:95ff:fe01:aec 00:d0:95:01:0a:ec Confirmed       5m 6s 1/3/7          vlan_7
2001:db8:1000::100      00:d0:95:a8:08:11 Confirmed      2m 20s sap:1/3/9:1000 vpn1
2001:db8:1000::101      00:d0:95:c3:19:aa Confirmed      1m 23s sdp:32768:1000 vpn1
```

output definitions

IPv6 Address	The neighbor's IPv6 address.
Hardware Address	The MAC address corresponding to the IPv6 address.
Reachability	The neighbor's reachability: • Incomplete • Confirmed • Unconfirmed
Lifetime	The time the entry will remain in its current state.
Port	The port used to reach the neighbor.
Interface	The neighbor's interface name (e.g., vlan_1).

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; neighbor information for service-based interfaces added.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.

MIB Objects

```

   alaIPv6NeighborType
   alaIPv6NeighborPortIfIndex
   alaIPv6NeighborPortType
   alaIPv6NeighborPortSubId
```

clear ipv6 neighbors

Removes all entries, except static entries, from IPv6 Neighbor Table.

clear ipv6 neighbors

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command only clears dynamic entries. If static entries have been added to the table, they must be removed using the **no** form of the **ipv6 neighbor** command.

Examples

```
-> clear ipv6 neighbors
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 neighbor	Configures a static entry in IPv6 Neighbor Table.
show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

```

   alaIPv6ClearNeighbors
```

show ipv6 prefixes

Displays IPv6 prefixes used in router advertisements.

show ipv6 prefixes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

                                          Valid     Preferred
Name           IPv6 Address/Prefix Length   Lifetime   Lifetime   Flags   Source
---------------+----------------------------+----------+----------+-------+---------
vlan 955       212:95:5::/64                 2592000    604800     LA     dynamic
vlan 1002      195:35::/64                   2592000    604800     LA     dynamic
6to4tunnel     2002:d423:2323::/64           2592000    604800     LA     dynamic
tunnel 2       137:35:35::/64                2592000    604800     LA     dynamic
```

output definitions

Name	The interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
Valid Lifetime	Length of time, in seconds, that this prefix will remain valid (i.e., time until deprecation). A value of 4,294,967,295 represents infinity.
Preferred Lifetime	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
Flags	**L** - Prefix can be used for onlink determination. **A** - Prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
Source	**config** - Prefix has been configured by management. **dynamic** - Router Advertisements are using interface prefixes.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 prefix	Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

MIB Objects

```

```

show ipv6 routes

Displays IPv6 Forwarding Table.

show ipv6 routes [*ipv6_prefix/prefix_length* **| summary | protocol [bgp| import | isis | local | ospf | rip static]]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those routes starting with the specified prefix.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

show ipv6 routes does not include the EMP interface included in the total routes count.

Examples

```
-> show ipv6 routes
Legend: Flags: U=Up, G=Gateway, H=Host, S=Static, C=Cloneable, B=Discard, E=ECMP

Total 5 routes

Destination Prefix  Gateway Address           Interface         Age          Protocol  Flags
--------------------+---------------+--------+-----------------+------------+---------+-----
::/0                2002:d468:8a89::137       v6if-6to4-137     18h 47m 26s  Static    UGS
137:35:35::/64      fe80::2d0:95ff:fe12:f470  v6if-tunnel-137   18h 51m 55s  Local     UC

212:95:5::/64       fe80::2d0:95ff:fe12:f470  smbif-5           18h 51m 55s  Local     UC
55::/64             ::                        loopback          00:00:13     STATIC    UBS
```

output definitions

Destination Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network. Gateway address '::' indicates an IPv6 blackhole route.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Age	Age of the entry. Entries less than 1 day old are displayed in hh:mm:ss format. Entries more than 1 day old are displayed in dd:hh format.
Protocol	Protocol by which the route was learned.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 static-route	Configures a static entry in the IPv6 route.

MIB Objects

```
IPv6RouteTable
   IPv6Routes
   IPv6RoutesPrefix
   IPV6RoutesStatic

  IBGP                  200
  Import                210
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 route-pref	Configures the IPv6 route preference of a router.

MIB Objects

N/A

show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

show ipv6 router database [protocol *type* | **gateway** *ipv6_address* | **dest** *ipv6_prefix/prefix_length***]**

Syntax Definitions

type	Routing protocol type (local, static, OSPF, RIP, BGP, IS-IS, or IMPORT).
ipv6_address	IPv6 address of the next hop used to reach the destination IPv6 address.
ipv6_prefix	IPv6 network that is the destination of this static route.
/prefix_length	The number of bits that are significant in the iPv6 address (mask). (0...128).

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

Examples

```
-> show ipv6 router database
Legend: + indicates routes in use
        b indicates BFD-enabled static route

Total IPRM IPv6 routes: 4

Destination/Prefix    Gateway Address             Interface   Protocol    Metric    Tag
------------------+--------------------------+-----------+-----------+---------+--------
+  2001::/64          fe80::2efa:a2ff:fe23:24ca   VL-2059      OSPF         1        0
+  2001::/64          fe80::de08:56ff:fe10:b41    VL-2060      OSPF         1        0
+  2001:0:1::/64      fe80::2efa:a2ff:fe23:24ca   VL-2059      OSPF         2        0
+  55::/6             ::                          loopback     STATIC       10       0

Inactive Static Routes:
Vlan  Destination/Prefix       Gateway Address               Metric       Tag
-----+---------------------+----------------------------+------------+--------
1510  212:95:5::/64            fe80::2d0:95ff:fe6a:f458        1           0
```

output definitions

Destination/Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network. Gateway address '::' indicates an IPv6 blackhole route.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Protocol	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
VLAN	The VLAN on which the route was *learned*, not forwarded. Note that **N/A** appears in this field for static routes as they are not learned on a VLAN.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 routes	Displays the IPv6 Forwarding Table.

  Fragmentation failed          0          0          0
  Fragments generated           0          0          0
  Multicast packets            34          0         34
```

output definitions

Total	Total number of input packets received, including those received in error.
Header errors	Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
Too big	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
No route	Number of input packets discarded because no route could be found to transmit them to their destination.
Address errors	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).
Unknown protocol	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
Truncated packets	Number of input packets discarded because the packet frame did not carry enough data.
Local discards	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
Delivered to users	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
Reassembly needed	Number of IPv6 fragments received that needed to be reassembled.
Reassembly failed	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).
Multicast packets	Number of multicast packets received.
Forwarded	Number of output packets that this entity received and forwarded to their final destinations.
Generated	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
Local discards	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
Fragmented	Number of IPv6 packets successfully fragmented.
Fragmentation failed	Number of IPv6 packets discarded because they needed to be fragmented but could not be.
Fragments generated	Number of output packet fragments generated as a result of fragmentation.
Multicast packets	Number of multicast packets transmitted.

Release History

Tunnel              IPv6 Address/Prefix Length    Source IPv4     Destination IPv4
--------------------+-----------------------------+---------------+-----------------
1                   2001:0000:0200::101/48        192.16.10.101   192.28.5.254
23                  2001:0000:0200::102/48        192.15.10.102   10.27.105.25
v6if-tunnel-137     fe80::2d0:95ff:fe12:f470/64   212.35.35.35    212.104.138.137
```

output definitions

IPv6 6to4 tunnel	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
Tunnel	Tunnel ID.
IPv6 Address/Prefix Length	IPv6 address associated with the tunnel.
Source IPv4	Source IPv4 address for the tunnel.
Destination IPv4	Destination IPv4 address for the tunnel.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 interface	Configures an IPv6 interface on a VLAN or IPv6 tunnel.

MIB Objects

```
alaIPv6ConfigTunnelTable
   alaIPv6Tunnel6to4
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
```

show ipv6 tunnel 6to4

Displays IPv6 tunnel information and whether the 6to4 tunnel is enabled.

show ipv6 tunnel 6to4

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 tunnel 6to4
tunnel_6to4
  Status = Disabled
  IPv6 Address(es):
  Local IPv4 Address(es):
```

output definitions

Name	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
Status	Tunnel ID.
IPv6 Address(es)	IPv6 address associated with the tunnel.
Local IPv4 Addresses(es)	Source IPv4 address for the tunnel.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 interface	Configures an IPv6 interface on a VLAN or IPv6 tunnel.

MIB Objects

```
alaIPv6ConfigTunnelTable
   alaIPv6Tunnel6to4
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
```

show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

show ipv6 udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

Examples

```
-> show ipv6 udp ports

Local Address                                Port  Interface
---------------------------------------------+-----+-------------------
::                                            521
```

output definitions

Local Address	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
Port	Local Port number for the UDP connection.
Interface	Name of the interface the listener is using or “unknown.”

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 routes	Displays TCP Over IPv6 Connection Table.

MIB Objects

```
IPv6UdpTable
   IPv6UdpEntry
   IPv6UdpLocalAddress
   IPv6UdpLocalPort
   IPv6UdpIfIndex
```

show ipv6 information

Displays IPv6 information.

show ipv6 information

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 information
Default hop limit                     = 64
Path MTU entry minimum lifetime (min) = 10
Neighbor stale lifetime (min)         = 10
Local Unicast Global ID               = none
Use VRRP virtual source MAC           = Off
Neighbor cache limit                  = None
VRF neighbor cache limit              = None
Ignore anycast echo requests          = No
Ignore multicast echo requests        = No
ICMPv6 error rate limit interval (ms) = 10
ICMPv6 error rate limit burst         = 10
```

output definitions

Default hop limit	The value placed in the hop limit field in router advertisements
Path MTU entry minimum lifetime	Minimum lifetime for entries in the path MTU.
Neighbor stale lifetime	Minimum lifetime for neighbor entries in the stale state.
Local Unicast Global ID	The default global ID value used in unique local unicast addresses. "none" if a global ID has not been configured.
Use VRRP virtual source MAC	If On, when a packet's source address is a VRRP virtual IPv6 address, the corresponding VRRP virtual MAC will be used as the source MAC address. If Off, the interface's real MAC will be used as the source MAC address.
Neighbor cache limit	The system-wide neighbor cache limit. If this value is not set: • “64” is displayed on the OmniSwitch 6465. • “128” is displayed on the OmniSwitch 6560. • “none” is displayed on all other supported OmniSwitch platforms.

output definitions

VRF neighbor cache limit	The neighbor cache limit in use for the VRF in which the command was executed. If this value is not set: • "64" is displayed on the OmniSwitch 6465. • "128" is displayed on the OmniSwitch 6560. • "none" is displayed on all other supported OmniSwitch platforms.
Ignore anycast echo requests	States whether the echo reply to anycast echo request is set to Yes or No. If set to Yes, echo replies will not be sent in response to an echo request sent to an anycast address. If set to No, the switch will reply to all anycast echo requests.
Ignore multicast echo requests	States whether the echo reply to multicast echo request is set to Yes or No. If set to Yes, echo replies will not be sent in response to an echo request sent to an multicast address. If set to No, the switch will reply to multicast echo requests.
ICMPv6 error rate limit interval	The rate limit interval in milliseconds.
ICMPv6 error rate limit burst	The maximum ICMPv6 error message burst size.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **ignore anycast echo requests**, **ignore multicast echo requests**, **ICMPv6 error rate limit interval**, **ICMPv6 error rate limit burst** fields added.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.
ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.
ipv6 hop-limit	Configures the value placed in the hop limit field in the header of all IPv6 packet.
ipv6 address global-id	Configures the default global ID for unique local unicast addresses
ipv6 echo	Configures the switch to reply or ignore echo requests in response to an echo request sent to a multicast or anycast IPv6 address.

MIB Objects

```
ipv6MibObjects
   Ipv6DefaultHopLimit
alaIPv6ConfigTable
   alaIPv6PMTUMinLifetime
alaIPv6NeighborTable
   alaIPv6NeighborStaleLifetime
```

ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

ipv6 redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map *route_map_name***} [admin-state {enable | disable}]**

no ipv6 redist {local | static | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} [all-routes | route-map *route_map_name***]**

Syntax Definitions

local	Redistributes local IPv6 routes.
static	Redistributes static IPv6 routes.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol (*OSPF* is *not supported on the OmniSwitch 6465 or OmniSwitch 6560*).
isis	Specifies IS-IS as the source or destination (into) protocol (*IS-IS* is *not supported on the OmniSwitch 6465, OmniSwitch 6560, or* OmniSwitch 9900).
bgp	Specifies BGP as the source or destination (into) protocol (*BGP* is *not supported on the OmniSwitch 6465 or OmniSwitch 6560*).
import	Redistributes imported routes to other routing protocols.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
route_map_name	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported in the current release.

- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **all-routes** parameter added.
Release 8.5R1; **import** parameter added.

Related Commands

show ipv6 redist	Displays the route map redistribution configuration.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

ipv6 access-list *access_list_name*

no ipv6 access-list *access_list_name*

Syntax Definitions

access_list_name	Name of the IPv6 access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ipv6 access-list access1
-> no ipv6 access-list access1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 access-list address	Adds IPv6 addresses to an existing IPv6 access list.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

ipv6 access-list *access_list_name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ipv6 access-list *access_list_name* **address** *address/prefixLen*

Syntax Definitions

access_list_name	Name of the IPv6 access list (up to 20 characters).
address/prefixLen	IPv6 address along with the prefix length to be added to the access list.
permit	Permits the IPv6 address for redistribution.
deny	Denies the IPv6 address for redistribution.
all-subnets	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Redistributes or denies only those routes that exactly match the IP address and the mask length.
aggregate	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | deny	**permit**
all-subnets | no-subnets | aggregate	**all-subnets**

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access_list_name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 access-list	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListTable
   alaRouteMapAccessListIndex
   alaRouteMapAccessListAddress
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
   alaRouteMapAccessListRowStatus
```

show ipv6 redist

Displays the IPv6 route map redistribution configuration.

show ipv6 redist [rip | ospf | bgp]

Syntax Definitions

rip	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
ospf	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
bgp	This parameter is not supported.

Defaults

By default all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported in the current release.

Release History

Release 7.1.1; command was introduced.

Examples

```
-> show ipv6 redist

Source       Destination
Protocol     Protocol     Status    Route Map
------------+------------+---------+--------------------
localIPv6    RIPng        Enabled   ipv6rm
RIPng        OSPFv3       Enabled   ipv6rm

-> show ipv6 redist ospf

Source       Destination
Protocol     Protocol     Status    Route Map
------------+------------+---------+--------------------
RIPng        OSPFv3       Enabled   ipv6rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ipv6 redist	Controls the conditions for redistributing IPv6 routes between different protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ipv6 access-list

Displays the contents of the specified IPv6 access list.

show ipv6 access-list [*access_list_name***]**

Syntax Definitions

access_list_name	Name of the IPv6 access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the *access_list_name* is not specified in this command, all the access lists will be displayed.

Examples

```
-> show ipv6 access-list
                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+-------------
al_3                128::/64           permit   all-subnets
al_4                124::/64           permit   no-subnets

-> show ipv6 access-list 4

                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+-------------
al_4                124::/64           permit   no-subnets
```

output definitions

Name	Name of the IPv6 access list.
Address/Prefix Length	IPv6 address that belongs to the access list.
Effect	Indicates whether the IPv6 address is permitted or denied for redistribution.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 7.1.1; command was introduced

Related Commands

ipv6 access-list	Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.
ipv6 access-list address	Adds multiple IPv6 addresses to the IPv6 access list.

MIB objects

```
alaRouteMapAccessListIndex
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListAddress
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
```

ipv6 export

Exports IPv6 routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes

[vrf *vrf_name***] ipv6 export {all-routes | route-map** *route_map_name* | **to-all-vrfs {all-routes | route-map** *route_map_name***}}**

[vrf *vrf_name***] no ipv6 export**

Syntax Definitions

vrf_name	The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.
all-routes	Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.
route_map_name	The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.
to-all-vrfs all-routes	Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.
to-all-vrfs route-map *route_map_name*	The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.
- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.
- To leak IPv6 routes between VRF instances, IPv6 must be available in both instances. It is important to note that IPv6 route leaking is supported only in max profile VRFs.
- IPv6 route leaking supports configured tunnel routes, but 6to4 tunnel and loopback routes are not supported.
- Routes that were leaked into a VRF instance cannot be exported from that instance to another VRF.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in the “IP Commands” chapter of this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

- A route map created to filter exported VRF IPv6 routes can contain any of the following match and set options:
  - Match options: ipv6-address, ipv6-next-hop, tag, protocol, ipv6-interface, metric, route-type, name
  - Set options: tag, metric
- A route map with redist control of aggregate is supported when exporting IPv6 routes, but it is not supported when importing IPv6 routes.
- Only one route map per source VRF is allowed for filtering exported routes.
- Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.
- Modifying a route map that is assigned to a VRF through the **ipv6 import** or **ipv6 export** command is supported.

Examples

The following commands export IPv6 routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

```
-> ipv6 export route-map R1
-> ipv6 export all-routes
-> ipv6 export to-all-vrfs all-routes
-> ipv6 export to-all-vrfs route-map R2
-> no ipv6 export
```

The following commands export IPv6 routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

```
-> vrf vrf2 ipv6 export route-map R1
-> vrf vrf2 ipv6 export all-routes
-> vrf vrf2 ipv6 export to-all-vrfs all-routes
-> vrf vrf2 ipv6 export to-all-vrfs route-map R2
-> no vrf vrf2 ipv6 export
```

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

```
-> vrf vrf1
vrf1::-> ipv6 export route-map R1
vrf1::-> ipv6 export all-routes
vrf1::-> ipv6 export to-all-vrfs all-routes
vrf1::-> ipv6 export to-all-vrfs route-map R2
vrf1::-> no ipv6 export
```

Release History

Release 8.5R1; command introduced.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ipv6 export	Displays the export route configuration details.
show ipv6 global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmV6ExportRouteMap
alaIprmV6ExportToAllVrfsRouteMap
```

ipv6 import

Imports VRF IPv6 routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

[vrf *dest_vrf_name***] ipv6 import {vrf {***src_vrf_name* **| default} | isid** *instance_id***} {all-routes | route-map** *route_map_name***}**

[vrf *dest_vrf_name***] no ipv6 import vrf {***src_vrf_name* **| default}**

Syntax Definitions

dest_vrf_name	The name of the destination VRF instance into which routes are imported from the GRT.
src_vrf_name	The name of the source VRF instance from which routes were exported to the GRT. Routes from this instance are imported from the GRT into the specified destination VRF instance.
default	Default VRF. The routes are imported from the default VRF instance.
instance_id	An existing ISID number that identifies an SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.
all-routes	Imports all routes from the source VRF instance. Imported routes are not filtered.
route_map_name	The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

Defaults

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF or ISID instance.
- To leak IPv6 routes between VRF instances, IPv6 must be available in both instances. It is important to note that IPv6 route leaking is supported only in max profile VRFs.
- IPv6 route leaking supports configured tunnel routes, but 6to4 tunnel and loopback routes are not supported.
- Routes that were leaked into a VRF instance cannot be exported from that instance to another VRF.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in the “IP Commands” chapter of this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about

how to create a route map.

- A route map created to filter imported VRF or ISID IPv6 routes can contain any of the following match and set parameter options:
  - Match options: ipv6-address (no aggregates), ipv6-next-hop, tag, metric
  - Set options: tag, metric
- A route map with redist control of aggregate is supported when exporting IPv6 routes, but it is not supported when importing IPv6 routes.
- Only one route map per source (imported) VRF or ISID is allowed.
- Modifying a route map that is assigned to a VRF or ISID through the **ipv6 import** or **ipv6 export** command is supported.
- Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

Examples

```
-> ipv6 import vrf V1 route-map R2
-> ipv6 import vrf V2 all-routes
-> no ipv6 import vrf V1

-> vrf V3 ipv6 import vrf V2 route-map import-map
-> vrf V3 no ipv6 import vrf V2

-> ipv6 import isid 1500 route-map R1
-> ipv6 import isid 2000 all-routes
-> no ipv6 import isid 1500

-> vrf V4 ipv6 import isid 2500 route-map import-map
-> vrf V4 no ipv6 import isid 2500
```

Release History

Release 8.5R1; command introduced.
Release 8.5R2; **isid** parameter added.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ipv6 import	Displays the import route configuration details.
show ipv6 global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmV6ImportVrfTable
   alaIprmV6ImportVrfName
   alaIprmV6ImportVrfRouteMap
   alaIprmV6ImportIsid
   alaIprmV6ImportVrfRowStatus
```

show ipv6 export

Displays the export route configuration details.

[vrf *vrf_name***] show ipv6 export**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the export route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If a VRF is specified, the export route configuration for that VRF is displayed.

Examples

```
-> show ipv6 export
Export Route Map: leak-out

-> vrf vrf1 show ipv6 export
Export Route Map: none (all-routes)

vrf2::-> show ipv6 export
Export Route Map: none (all-routes) -> To All VRFs
```

Release History

Release 8.5R1; command introduced.

Related Commands

ipv6 export	Exports IPv6 routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances.

MIB Objects

```
alaIprmV6ExportRouteMap
alaIprmV6ExportToAllVrfsRouteMap
```

show ipv6 import

Displays the import route configuration details.

[vrf *vrf_name***] show ipv6 import**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the import route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If a VRF is specified, the import route configuration for that VRF is displayed.

Examples

```
-> show ipv6 import
Type  Source               RouteMap
-----+--------------------+----------------------
vrf    Customer1           leak-in
vrf    Customer2           none (all-routes)
isid   1000                isid1000-filter
```

output definitions

Type	The type of imported route (**vrf** or **isid**).
Source	The name of the VRF instance from which IPv6 routes are imported to the VRF.
RouteMap	The name of the route map filter or **none (all-routes)**.

Release History

Release 8.5R1; command introduced.
Release 8.5R2; imported ISID route entries added to the table.

Related Commands

ipv6 import	Imports VRF IPv6 routes from the GRT to the destination VRF.

MIB Objects

```
alaIprmV6ImportVrfTable
   alaIprmV6ImportVrfName
   alaIprmV6ImportIsid
   alaIprmV6ImportVrfRouteMap
   alaIprmV6ImportIsidRouteMap
   alaIprmV6ImportVrfRowStatus
```

show ipv6 global-route-table

Displays the contents of the Global Routing Table (GRT) for all the IPv6 routes that are exported from VRF or from Shortest Path Bridging service instance identifiers (ISIDs). This command is only available within the context of the default VRF instance.

show ipv6 global-route-table [export-vrf *vrf_name***]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

By default, exported routes are displayed for all VRF instances and ISIDs.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **export-vrf** parameter to display exported routes for a specific VRF instance.

Examples

```
-> show ipv6 global-route-table
Type   Source          Destination            Gateway               Metric  Tag
-----+--------------+---------------------+---------------------+-------+-------
 vrf  Customer2       1601::/16             1701:ffff:0001::1       1       100
 vrf  Customer2       1111::/16             1111::1                 2         5
 vrf  Customer3       2808:3456::/32        3939::2                 1         0
 isid 1000            1801::/16             2222::2                 1         2
```

output definitions

Type	The type of exported route (**vrf** or **isid**).
Source	The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which IPv6 routes are exported to the GRT.
Destination	The address of the route.
Gateway	The next hop for the destination address.
Metric	The metric of the exported route.
Tag	The tag of the exported route.

Release History

Release 8.5R1; command introduced.
Release 8.5R2; exported ISID route entries added to the table.

Related Commands

ipv6 export	Configures a route map to export routes from the source VRF to Global Routing Table (GRT).
show ipv6 export	Displays the export route configuration details.

   alaGrt6GrtVrfName
   alaGrt6RouteIsid
```

21 IPsec Commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as Encrypting traffic, Integrity validation, Authenticating the peers, and Anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

There are two modes of IPsec operation: transport mode and tunnel mode. In transport mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two intermediate systems are processed with IPsec. In tunnel mode, the entire IPv6 packet with both the data and the message headers is encrypted and/or authenticated. In tunnel mode, all the IPv6 packets that passess through the endpoints are processed by IPsec. The current implementation of IPsec supports only the transport mode.

Note. The current implementation of IPsec supports only IPv6.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations can be manually configured or negotiated through IKE. The current implementation of IPsec does not support the negotiation of SA through IKE and SAs need to be configured manually.

Filename: ALCATEL-IND1-IPSEC-MIB.mib
Module: alcatelIND1IPsecMIB

A summary of the available commands is listed here:

ipsec key

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

ipsec key *name* **{sa-authentication | sa-encryption} [encrypted]** *key*

no ipsec key *name* **{sa-authentication | sa-encryption}**

Syntax Definitions

name	The name of this key (maximum 20 characters).
sa-authentication	Indicates that the key value is used for Authentication Header.
sa-encryption	Indicates that the key value is used for Encapsulated Security Payload.
encrypted	Not user configured, used only by switch in config file.
key	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The *name* parameter must be same as the name of the manually configured SA that uses this SA authentication and encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that uses the key. The required key length for the supported algorithm are as follows:

algorithm	key length
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128

- The combination of the key's name and type must be unique.
- The **encrypted** option is used when the key commands are written to the boot.cfg or other snapshot file. This option can not be specified by the user when entering CLI commands.

Examples

```
-> ipsec key sa_md5_in sa-authentication takd03c9@skL68L%
```

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec sa	Adds, modifies, or deletes a manually configured IPsec Security Association (SA).
show ipsec key	Displays the keys for the manually configured IPsec SA.

MIB Objects

```
AlaIPsecKeyTable
   alaIPsecKeyName
   alaIPsecKeyType
   alaIPsecKeyEncrypted
   alaIPsecKey
```

ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys.

ipsec security-key [*old_key***]** *new_key*

Syntax Definitions

old_key	The current master security key. The key can be specified either in the hexadecimal format or as a string.
new_key	The new key value. The key can be specified either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The *old_key* parameter must always be specified when you modify an existing key. Setting the key for first time does not require the *old_key*.
- If the value of the *old_key* is incorrect, the attempt to set a new key fails.
- While the SA keys can be configured without a master security key; the configured SA keys are written to the configuration file unencrypted, and a warning is logged.
- The security key must be 16 characters or 16 bytes if in hex form (32 hex digits).
- If the master security key is reset using **debug clear ipsec security-key** command, the currently configured SA keys are deleted.

Examples

```
-> ipsec security-key “old key value ab” 0xa38d901bde77af091a2485ce0a14a8cc
```

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec key	Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecSecurityKeyTable
   alaIPsecSecurityKeyCurrent
   alaIPsecSecurityKeyNew
```

ipsec policy

Adds, modifies, or removes a security policy.

ipsec policy *name* **[priority** *priority***] [source {***ipv6_address***[***/prefix_length***]} [port** *port***]] [destination {***ipv6_address***[***/prefix_length***]} [port** *port***]] [protocol {any | icmp6 [type** *type***]| tcp | udp | ospf | vrrp | number** *protocol***}] [in | out] [discard | ipsec | none] [description** *description***] [admin-state {enable | disable}]**

no ipsec policy *name*

Syntax Definitions

name	The name for the policy.
priority	The priority for the policy. Values may range from 1 to 1000. The lower the value, the higher the priority.
source *ipv6_address*	Specifies the source address of the IPv6 traffic that is covered by the policy.
source */prefix_length*	Specifies the prefix length of the source address of the IPv6 traffic that is covered by the policy.
source port	Specifies the source port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets originated from any port.
destination *ipv6_address*	Specifies the destination address of the IPv6 traffic that is covered by the policy.
destination */prefix-length*	Specifies the prefix length of the destination address of the IPv6 traffic that is covered by the policy.
destination *port*	Specifies the destination port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets destined to any port.
protocol	Specifies that the particular protocol specific traffic to be covered by the policy (Refer to the table in the “Usage Guidelines“ section below for various protocol options).
in	Specifies that the policy is applied to the inbound IPv6 traffic.
out	Specifies that the policy is applied to the outbound IPv6 traffic.
discard	Specifies the policy to discard the IPv6 packet, if it matches the criteria.
ipsec	Specifies the policy to send the IPv6 packet for IPsec processing, if it matches the criteria.
none	Specifies IPsec should not process the packet.
description	The detailed description of the policy.
enable	Administratively enables the policy.
disable	Administratively disables the policy.

Defaults

parameter	default
priority	100
port	0
any | icmp6 | tcp | udp | ospf | vrrp | number	**any**
icmp6 *type*	not present
discard | ipsec | none	**ipsec**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- If two policies can cover the same traffic, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options in this command:

protocol
any
icmp6[type *type***]**
tcp
udp
ospf
vrrp
number *protocol*

The **any** option must be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.

- If the **ipsec** option is specified this policy cannot be enabled until at least one rule has been defined. The policy rules specify that IPsec algorithms be applied to the traffic that matches the policy.

Examples

```
-> ipsec policy tcp_out source 2001:db8:3::12 destination 201:db8:4::a3e protocol
tcp out ipsec description “Outbound TCP traffic” admin-state disable
-> no ipsec policy tcp_out
```

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec policy rule	Adds, modifies, or removes an IPsec rule for a security policy.
show ipsec policy	Displays information about the security policies.

MIB Objects

```

ipsec policy rule

Adds, modifies, or removes an IPsec rule for a security policy.

ipsec policy *name* **rule** *index* **[ah | esp]**

no ipsec policy *name*

Syntax Definitions

name	The name of the security policy created by using the **ipsec policy** command.
index	The index of this rule. Values may range from 1 to 10.
ah	Specifies that the rule requires the presence of an Authentication Header (AH).
esp	Specifies that the rule requires the presence of an Encrypted Security Payload header (ESP).

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *index* parameter to specify the order in which the multiple rules for the same security policy are applied to the original payload.

Examples

```
-> ipsec policy alucent rule 1 ah
-> no ipsec policy alucent
```

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec policy	Adds, modifies, or removes a security policy.

MIB Objects

```
AlaIPsecSecurityPolicyRuleTable
   alaIPsecSecurityPolicyName
   alaIPsecSecurityPolicyRuleIndex
   alaIPsecSecurityPolicyRuleProtocol
```

ipsec sa

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

ipsec sa *name* **{esp | ah} [source** *ipv6_address* **] [destination** *ipv6_address***] [spi** *spi***] [encryption {null | 3des-cbc | aes-cbc [key-size** *key_length***]}] [authentication {none | hmac-md5 | hmac-sha1 | aes-xcbc-mac}] [description** *description***] [admin-state {enable | disable}]**

no ipsec sa *name*

Syntax Definitions

name	The name assigned to this IPsec SA.
esp	Specifies the type of security association as ESP.
ah	Specifies the type of security association as AH.
source *ipv6_address*	Specifies the source address of the IPv6 traffic that is covered by the SA.
destination *ipv6_address*	Specifies the destination address of the IPv6 traffic that is covered by the SA.
spi	The Security Parameters Index (SPI) for the SA.
encryption	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter must be used only when the SA type is ESP.
key_length	Key length for the specified encryption algorithm.
authentication	Specifies the authentication algorithm to be used for traffic covered by the SA.
description	The detailed description of the SA.
enable	Administratively enables the SA.
disable	Administratively disables the SA.

Defaults

parameter	Defaults
encryption	**none**
authentication	**none**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The **encryption** parameter must be specified with the **none** option, if **ESP** is being used to verify integrity only.

- If **null** is specified as the option for **encryption**, an integrity algorithm must be specified using the **authentication** parameter.
- To override a default key length in an **encryption** algorithm, the key length must be specified after the protocol name.The key length supported for various algorithm are as follows:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256

- For AH SAs, one of the authentication algorithms such as aes-xcbc-mac, hmac-md5 or hmac-sha1 must be specified.

Examples

```
-> ipsec sa esp_in_1 esp source 2001:db8:3::13d destination 2001:db8:1::24 spi
10392 encryption aes-cbc authentication hmac-sha1
-> no ipsec sa esp_in_1
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ipsec sa	Displays information about manually configured IPsec Security Associations.

MIB Objects

```
AlaIPsecSAConfigTable
   alaIPsecSAConfigName
   alaIPsecSAConfigType
   alaIPsecSAConfigSource
   alaIPsecSAConfigSourceType
   alaIPsecSAConfigDestination
   alaIPsecSAConfigDestinationType
   alaIPsecSAConfigSPI
   alaIPsecSAConfigEncryptionAlgorithm
   alaIPsecSAConfigEncryptionKeyLength
   alaIPsecSAConfigAuthenticationAlgorithm
   alaIPsecSAConfigDescription
   alaIPsecSAConfigAdminState
```

ipsec default-discard

Enable or disable the default discard policy.

ipsec default-discard admin-state {enable | disable}

Syntax Definitions

enable	Enables the default discard policy.
disable	Disables the default discard policy

Defaults

parameter	default
admin-state	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- The default discard policy drops all the inbound traffic that does not match an IPsec policy.
- When incoming traffic is dropped due to the default discard policy, an SWLog informational message is logged.
- The default discard policy on its own drops all the incoming traffic destined for the switch. It is required to add appropriate higher priority policies to allow the desired traffic to be received. At a minimum, policies must be added to allow neighbor discovery traffic to be accepted.
  For example:
  -> ipsec policy ns-in priority 100 source ::/0 destination ::/0 protocol ICMP6 type 135 in none
  -> ipsec policy na-in priority 100 source ::/0 destination ::/0 protocol ICMP6 type 136 in none
- The default discard policy will be given the name **default-discard** when it is enabled. In case, the name conflicts with an existing user-defined policy, a numeric value will be appended to make the policy name unique (**default-discard-1**).
- If there is an existing user-defined policy that matches the default discard policy selectors (like source, destination, protocol, direction), then the default-discard policy cannot be enabled.
- The default discard policy is not applied to the forwarded traffic.

Examples

```
-> ipsec policy default-discard admin-state enable
-> ipsec policy default-discard admin-state disable
```

Release History

Release 8.4.1; command introduced.

Related Commands

show ipsec policy	Displays information about the security policies.

MIB Objects

```
alaIPsecDefaultDiscardPolicy
```

show ipsec policy

Displays information about the security policies.

show ipsec policy [*name***]**

Syntax Definitions

name	The policy name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

Use the *name* parameter to display information about a specific security policy.

Examples

```
-> show ipsec policy
Default discard policy = Enabled

Name            Priority  Source->Destination           Protocol   Direction   Action     State
--------------+--------+-----------------------------+----------+-----------+----------+--------
default-discard  1000    ::/0 -> ::/0                    any        in        discard    active
ftp-in-drop      100     ::/0->2001:db8:3::13d           TCP        in        discard    active
telnet-in-1      100     2001:db8::/48->2001:db8:1::24   TCP        in        ipsec      active
telnet-out-1     100     2001:db8:1::24->2001:db8::/48   TCP        out       ipsec       active
```

output definitions

Default discard policy	Indicates whether the default discard policy is enabled or disabled.
Name	The name of the security policy.
Priority	The priority set for the policy.
Source -> Destination	Indicates the source and destination of traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.

```
-> show ipsec policy icmp_in
Policy
  Name        = icmp_in,
  Priority    = 100,
  Source      = 100::1/0,
```

```
  Destination = 100::2/0,
  Protocol    = ICMP6,
  Direction   = in,
  Action      = none,
  State       = active
```

output definitions

Name	The name of the security policy.
Priority	The priority set for the policy.
Source	Indicates the source of the traffic covered by this policy.
Destination	Indicates the destination of the traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.

Release History

Release 7.1.1; command introduced.
Release 8.4.1; **default discard policy** field added.

Related Commands

ipsec policy	Adds, modifies, or removes a security policy.
ipsec default-discard	Enable or disable the default discard policy.

MIB Objects

```

show ipsec sa

Displays information about manually configured IPsec Security Associations.

show ipsec sa [*name* **| esp | ah]**

Syntax Definitions

name	The name of the Security Association.
esp	Restricts the display to ESP type SAs.
ah	Restricts the display to AH type SAs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

- Use the *name* parameter to display the information about a specific SA.
- Use esp or ah option to display the information about their respective type SAs.

Examples

```
-> show ipsec sa
Name           Type  Source-> Destination[SPI]           State   Encryption
Authentication
--------------+----+-----------------------------------+--------+----------------
telnet-in-esp  ESP  2001:db8::/49->2001:db8:1::24        active   aes-cbc(128)
hmac-sha1
telnet-out-esp ESP 2001:db8:1::24->2001:db8::/48         active   aes-cbc(128)
hmac-sha1
```

output definitions

Name	The SA name.
Type	The SA type: AH or ESP.
Source -> Destination [SPI]	The traffic source, traffic destination, and SPI for this SA.
State	The operational state of this SA.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm in use for this SA.

```
-> show ipsec sa telnet-in-esp

Name           = telnet-in-esp
Type           = ESP
Source         = 2001:db8::/48
Destination    = 2001:db8:1::24
SPI            = 8920
Encryption     = aes-cbc(128)
Authentication = hmac-sha1

State          = active
Description:
  Security association for traffic from 2001:db8::/48 to
  2001:db8:1::24.
```

output definitions

Name	The SA name.
Type	The SA type: AH or ESP.
Source	The traffic source for this SA.
Destination	The traffic destination for this SA.
SPI	The SA's SPI.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm used for this SA.
State	The operational state of this SA.
Description	The SA's description.

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec sa	Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

```

show ipsec key

Displays the keys for the manually configured IPsec SA.

show ipsec key [sa-encryption | sa-authentication]

Syntax Definitions

sa-encryption	Displays the encryption keys.
sa-authentication	Displays the authentication keys.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

The key values are not be displayed due to security reasons.

Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                 Length (bits)
--------------------+-------------
sa_1                            192
sa_2                            160
sa_3                             64

-> show ipsec key sa-authentication
Authentication Keys
Name                 Length (bits)
--------------------+-------------
sa_1                            128
sa_5                            160
```

output definitions

Name	The name of the SA for which the key is used.
Length	The length of the key in bits.

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec key	Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecKeyTable
   alaIPsecKeyName
   alaIPsecKey
```

show ipsec ipv6 statistics

Displays IPsec statistics.

show ipsec ipv6 statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show ipsec ipv6 statistics

Inbound:
  Discarded                  = 2787
  Policy violation          = 0
  Authentication Failure     = 0
  No SA found                = 0
Outbound:
  Discarded                  = 5135
  No SA found                = 19
```

output definitions

Discarded	The number of incoming packets discarded because they matched a discard policy.
Policy violation	The number of incoming packets that don’t have the IPsec protection required by a security policy.
Authentication Failure	Authentication of a packet failed.
No SA found	No SA found matching the information present in a packet.

Release History

Release 7.1.1; command introduced.

Related Commands

show ipsec policy	Displays information about the security policies.
show ipsec sa	Displays information about manually configured IPsec Security Associations.

MIB Objects

```
AlaIPsecStatisticsTable
   alaIPsecStatisticsInDiscarded
   alaIPsecStatisticsInPolicyViolation
   alaIPsecStatisticsInAHAuthenticationFail
   alaIPsecStatisticsInNoSA
   alaIPsecStatisticsOutDiscarded
   alaIPsecStatisticsOutPolicyViolation
   alaIPsecStatisticsOutNoSA
```

22 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIP next generation (RIPng). It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, RFC1724, and RFC2080.

MIB information for the RIP commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: RIPv2-MIB.mib
Module: rip2

Filename: ALCATEL-IND1-RIP-MIB.mib
Module: alcatelIND1RIPMIB

Filename: ALCATEL-IND1-RIPNG-MIB.mib
Module: alcatelIND1RipngMIB

A summary of the available commands is listed here:

ip load rip	**ipv6 load rip**
ip rip admin-state	**ipv6 rip admin-state**
ip rip interface	**ipv6 rip invalid-timer**
ip rip interface admin-state	**ipv6 rip garbage-timer**
ip rip interface metric	**ipv6 rip holddown-timer**
ip rip interface send-version	**ipv6 rip jitter**
ip rip interface recv-version	**ipv6 rip route-tag**
ip rip interface ingress-filter	**ipv6 rip update-interval**
ip rip interface egress-filter	**ipv6 rip triggered-sends**
ip rip force-holddowntimer	**ipv6 rip interface**
ip rip host-route	**ipv6 rip interface metric**
ip rip route-tag	**ipv6 rip interface recv-status**
ip rip interface auth-type	**ipv6 rip interface send-status**
ip rip interface auth-key	**ipv6 rip interface horizon**
ip rip update-interval	**show ipv6 rip**
ip rip invalid-timer	**show ipv6 rip interface**
ip rip garbage-timer	**show ipv6 rip peer**
ip rip holddown-timer	**show ipv6 rip routes**
show ip rip	
show ip rip routes	
show ip rip interface	
show ip rip peer	

ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

ip load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **boot.cfg** file. The **boot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the **ip rip admin-state** command to enable RIP on the switch.

Examples

```
-> ip load rip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaVrConfigTable
   alaVrConfigRipStatus
```

ip rip admin-state

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

ip rip admin-state {enable | disable}

Syntax Definitions

enable	Enables RIP routing on the switch.
disable	Disables RIP routing on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- RIP must be loaded on the switch (**ip load rip**) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

Examples

```
-> ip rip admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip load rip	Loads RIP into the switch memory.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
```

ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

ip rip interface {*interface_name***}**

no ip rip interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the **ip rip interface admin-state** command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 5, "VLAN Management Commands".

Examples

```
-> ip rip interface rip-1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface admin-state	Enables/disables a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface admin-state

Enables and disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

ip rip interface {*interface_name***} admin-state {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Administratively enables RIP on the interface.
disable	Administratively disables RIP on the interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must first create a RIP interface by using the **ip rip interface** command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 5, “VLAN Management Commands”.

Examples

```
-> ip rip interface rip-1 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface	Creates/deletes a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

ip rip interface {*interface_name***} metric** *value*

Syntax Definitions

interface_name	The name of the interface.
value	Metric value. Valid range is 1–15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ip rip interface rip-1 metric 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface	Enables/disables RIP on a specific interface.
show ip rip peer	Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfDefaultMetric
```

ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

ip rip interface {*interface_name***} send-version {none | v1 | v1compatible | v2}**

Syntax Definitions

interface_name	The name of the interface.
none	RIP packets will not be sent by the interface.
v1	Only RIPv1 packets will be sent by the interface.
v1compatible	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
v2	Only RIPv2 packets will be sent by the interface.

Defaults

parameter	default
none | v1 | v2 | v1compatible	**v2**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 send-version v1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface recv-version	Configures the receive option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfSend
```

ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

ip rip interface {*interface_name***} recv-version {v1 | v2 | both | none}**

Syntax Definitions

interface_name	The name of the interface.
v1	Only RIPv1 packets will be received by the interface.
v2	Only RIPv2 packets will be received by the interface.
both	Both RIPv1 and RIPv2 packets will be received by the interface.
none	Interface ignores any RIP packets received.

Defaults

parameter	default
v1 | v2 | both | none	**both**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 recv-version both
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface send-version	Configures the send option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfReceive
```

ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

ip rip interface {*interface_name***} ingress-filter {***filter_name***}**

Syntax Definitions

interface_name	The name of an existing RIP interface.
filter_name	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 Ingress-filter RipFilter1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface egress-filter	Assigns an egress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip interface egress-filter

Assigns an egress route map filter to the specified RIP interface. Outbound route advertisements are compared against egress filters. When a prefix matches the corresponding filter, that prefix is sent on the interface. When a prefix does not match the filter, the prefix is dropped as if it did not exist in the RIP RIB.

ip rip interface {*interface_name***} egress-filter {***filter_name***}**

Syntax Definitions

interface_name	The name of an existing RIP interface.
filter_name	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 egress-filter RipFilter1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

iip rip interface egress-filter	Assigns an ingress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

ip rip force-holddowntimer *seconds*

Syntax Definitions

seconds	The forced hold-down time interval. The valid range is 0–120 seconds.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept *better* routes from other gateways.
- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.
- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value.

Examples

```
-> ip rip force-holddowntimer 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (for example, forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipForceHolddownTimer
```

ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

ip rip host-route

no ip rip host-route

Syntax Definitions

N/A

Defaults

The default is to enable a default host route.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

Examples

```
-> ip rip host-route
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip routes	Displays the RIP Routing Database.

MIB Objects

```
alaProtocolRip
   alaRipHostRouteSupport
```

ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ip rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0–2147483647.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Only RIPv2 supports route tags.

Examples

```
-> ip rip route-tag 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaRipRedistRouteTag
```

ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

ip rip interface {*interface_name***} auth-type {none | simple | md5}**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication will be used.
simple	Simple authentication will be used.
md5	MD5 authentication will be used.

Defaults

parameter	default
none | simple | md5	**none**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-type none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface auth-key	Configures the text string that will be used as the password for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthType
```

ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

ip rip interface {*interface_name***} auth-key** *string*

Syntax Definitions

interface_name	The name of the interface.
string	16-byte text string.

Defaults

The default authentication string is a null string.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-key nms
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface auth-type	Configures the type of authentication that will be used for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthKey
```

ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

ip rip update-interval *seconds*

Syntax Definitions

seconds	The RIP routing update interval, in seconds. The valid range is 1–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

Examples

```
-> ip rip update-interval 45
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipUpdateInterval
```

ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

ip rip invalid-timer *seconds*

Syntax Definition

seconds	The RIP invalid timer value, in seconds. The valid range is 3–360.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The invalid time interval value must be three times the update interval value.

Examples

```
-> ip rip invalid-timer 270
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipInvalidTimer
```

ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

ip rip garbage-timer *seconds*

Syntax Definition

seconds	The RIP garbage timer value, in seconds. The valid range is 0–180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

Examples

```
-> ip rip garbage-timer 180
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipGarbageTimer
```

ip rip holddown-timer

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

ip rip holddown-timer *seconds*

Syntax Definition

seconds	The hold-down time interval, in seconds. The valid range is 0–120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

Examples

```
-> ip rip holddown-timer 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipHolddownTimer
```

show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

show ip rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip rip

Status                    = Enabled
Number of routes          = 9
Host Route Support        = Enabled
Route Tag                 = 42
Update interval           = 30
Invalid interval          = 180
Garbage interval          = 120
Holddown interval         = 0
Forced Hold-Down Timer    = 0
```

output definitions

Status	RIP status (**Enabled** or **Disabled**).
Number of routes	Number of network routes in the RIP routing table.
Host Route Support	Host route status (**Enabled** or **Disabled**). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
Route Tag	Route tag value for RIP routes generated by the switch. Valid values are 0–2147483647.
Update interval	The RIP routing update interval, in seconds.
Invalid interval	The RIP invalid timer value, in seconds.
Garbage interval	The RIP garbage timer value, in seconds.
Holddown interval	The hold-down time interval, in seconds.
Forced Hold-Down Timer	The forced hold-down time interval, in seconds.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip force-holddowntimer	Configures the interval during which a RIP route remains in the forced hold-down state.
ip rip update-interval	Configures the time interval during which RIP routing updates are sent out.
ip rip invalid-timer	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
ip rip garbage-timer	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.
ip rip holddown-timer	Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold down state.

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
   alaRipRouteNumber
   alaRipHostRouteSupport
   alaRipRedistRouteTag
   alaRipUpdateInterval
   alaRipInvalidTimer
   alaRipGarbageTimer
   alaRipHolddownTimer
   alaRipForceHolddownTimer
```

show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

show ip rip routes [*ip_address ip_mask***]**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	The mask corresponding to the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

Examples

```
-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination        Gateway          State Metric Proto

                    5.0.0.14          A    3      Rip
```

output definitions

Destination	Destination network IP address.
Gateway	The Gateway IP address (switch from which the destination address was learned).
State	The associated state of the route, which can be **A** (**Active**), **H** (**Holddown**), or **G** (**Garbage**).
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Proto	The type of route (**Local**, **Rip**, or **Redist**).

```
-> show ip rip routes 2.0.0.0 255.0.0.0

Destination             = 2.0.0.0,
Mask length             = 8,
Gateway(1)              = 5.0.0.14,
  Protocol              = Rip,
  Out Interface         = intf5,
  Metric                = 2,
  Status                = Installed,
  State                 = Active,
  Age                   = 19s,
  Tag                   = 0,
Gateway(2)              = 4.0.0.7,
  Protocol              = Rip,
  Out Interface         = intf4,
  Metric                = 3,
  Status                = Not Installed,
  State                 = Active,
  Age                   = 12s,
  Tag                   = 0,
```

output definitions

Destination	Destination network IP address.
Mask length	Length of the destination network IP subnet mask.
Gateway	The Gateway IP address (switch from which the destination address was learned).
Protocol	The type of the route (**Local**, **Rip**, or **Redist**).
Out Interface	The RIP interface through which the next hop is reached.
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Status	The RIP interface status (Installed or Not Installed).
State	The associated state of the route (**Active**, **Holddown**, or **Garbage**).
Age	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
Tag	The associated route tag.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip host-route	Enables/disables a host route to an individual host on a network.

show ip rip interface

Displays RIP interface status and configuration.

show ip rip interface [*interface_name***]**

Syntax Definitions

interface_name	The interface name.

Defaults

By default, the status and configuration for all RIP interfaces is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter an interface name to view detailed information for a specific interface.

Examples

```
-> show ip rip interface
       Interface      Domain   Domain    Intf Admin   IP Intf      Updates

```

output definitions

Interface IP Name	The IP Interface name.
Interface IP Address	Interface IP address.
Domain Name	The domain on which the IP interface was configured (**VLAN**, **Service**, or **Tunnel**).
Domain ID	The VLAN ID or service ID on which the IP interface was configured. This field displays “NA” for IP tunnels.
Interface Admin Status	The RIP administrative status (enabled/disabled).
IP Interface Status	Interface status (enabled /disabled).
Interface Config Ingress Route Map Name	The name of the route map applied to filter RIP routing updates received on the interface.
Interface Config Egress Route Map Name	The name of the route map applied to filter RIP routing updates sent on the interface.
Interface Config AuthType	The type of authentication that will be used for the RIP interface (None or Simple).
Interface Config AuthKey Length	The authentication key length used for the RIP interface.

output definitions (continued)

Interface Config Send-Version	Interface send option (none, v1, v2, and v1 compatible).
Interface Config Receive-Version	Interface receive option (none, v1, v2, and both).
Interface Config Default Metric	Default redistribution metric.
Received Packets	Number of packets received on the interface.
Received Bad Packets	Number of bad packets received and discarded. Normally this value is zero (0).
Received Bad Routes	Number of bad routes received and discarded. Normally this value is zero (0).
Sent Updates	Number of RIP routing table updates sent.

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; “Domain Name” and “Domain ID” fields added.

Related Commands

ip rip interface	Enables/disables RIP for a specific interface.

MIB Objects

```

```

show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

show ip rip peer [*ip_address*]

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip rip peer

                Total   Bad     Bad             Secs since
    IP Address   Recvd  Packets Routes Version  last update
----------------+------+-------+------+-------+-----------
  100.10.10.1      1      0       0      2       3
```

output definitions

IP Address	Peer IP address.
Total recvd	Total number of RIP packets received from the peer.
Bad Packets	Number of bad packets received from peer.
Bad Routes	Number of bad routes received from peer.
Version	Peer's RIP version as seen on the last packet received.
Secs since last update	Number of seconds since the last packet was received from the peer.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip interface	Displays the RIP interface status and configuration.

MIB Objects

```

   rip2PeerAddress
   rip2PeerDomain
   rip2PeerLastUpdate
   rip2PeerVersion
   rip2PeerRcvBadPackets
   rip2PeerRcvBadRoutes
```

ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the **ipv6 rip admin-state** command to enable RIPng on the switch.

Examples

```
-> ipv6 load rip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip admin-state	Enables/disables RIPng routing on the switch.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPRipngStatus
```

ipv6 rip admin-state

Enables or disables RIPng on the switch.

ipv6 rip admin-state {enable | disable}

Syntax Definitions

enable	Enables RIPng.
disable	Disables RIPng.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded on the switch (**ip load rip**) to enable RIP on the switch.

Examples

```
-> ipv6 rip admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip load rip	Loads RIPng into memory.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaProtocolripng
   alaRipngProtoStatus
```

ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

ipv6 rip invalid-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in an “Active” state. Valid range is 1 - 300.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This timer is reset each time a routing update is received.

Examples

```
-> ipv6 rip invalid-timer 300
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip garbage-timer	Configures the RIPng garbage timer value.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngInvalidTimer
```

ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **ipv6 rip invalid-timer** command to set the Invalid Timer Value.

Examples

```
-> ipv6 rip garbage-timer 180
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngGarbageTimer
```

ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

ipv6 rip holddown-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

Examples

```
-> ipv6 rip holddown-timer 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip garbage-timer	Configures the RIPng garbage timer value.

MIB Objects

```
alaProtocolripng
   alaRipngHolddownTimer
```

ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

ipv6 rip jitter *value*

Syntax Definitions

value	Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

Defaults

parameter	default
value	5

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

Examples

```
-> ipv6 rip jitter 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip update-interval	Configures the RIPng update interval.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngJitter
```

ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ipv6 rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0 – 65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

Examples

```
-> ipv6 rip route-tag 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngRouteTag
```

ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

ipv6 rip update-interval *seconds*

Syntax Definitions

seconds	Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command, along with the **ipv6 rip jitter** command to configure RIPng updates.

Examples

```
-> ipv6 rip update-interval 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip jitter	Configures an offset value for RIPng updates.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaRipng
   alaRipngUpdateInterval
```

ipv6 rip triggered-sends

Configures the behavior of triggered updates.

ipv6 rip triggered-sends {all | updated-only | none}

Syntax Definitions

all	All RIPng routes are added to any triggered updates.
updated-only	Only route changes that are causing the triggered update are included in the update packets.
none	RIPng routes are not added to triggered updates.

Defaults

parameter	default
all | updated-only | none	**updated-only**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

Examples

```
-> ipv6 rip triggered-sends none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngTriggeredSends
```

ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface *if_name*

no ipv6 rip interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see Chapter 5, "VLAN Management Commands".
- RIPng will support a maximum of 20 interfaces.

Examples

```
-> ipv6 rip interface Test_Lab
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables or disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
```

ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

ipv6 rip interface *if_name* **metric** *value*

Syntax Definitions

if_name	IPv6 interface name.
value	Metric value. Valid range is 1 - 15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ipv6 rip Test_Lab metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip interface	Creates or deletes a RIPng interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceMetric
```

ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

ipv6 rip interface *if_name* **recv-status {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable	Enables the “Receive” status for the specified interface.
disable	Disables the “Receive” status for the specified interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded (**ip load rip**) and enabled (**ipv6 rip admin-state**) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab recv-status disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceRecvStatus
```

ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is enabled, packets can be sent from this interface. When it is disabled, packets will not be sent from this interface.

ipv6 rip interface *if_name* **send-status {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable	Enables the “Send” status for the specified interface.
disable	Disables the “Send” status for the specified interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded (**ip load rip**) and enabled (**ipv6 rip admin-state**)on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceSendStatus
```

ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

ipv6 rip interface *if_name* **horizon {none | split-only | poison}**

Syntax Definitions

if_name	IPv6 interface name.
none	Disables loop prevention mechanisms.
split-only	Enables split-horizon, without poison-reverse.
poison	Enables split-horizon with poison-reverse.

Defaults

parameter	default
none | split-only | poison	**poison**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

Examples

```
-> ipv6 rip interface Test_Lab none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip interface	Displays information for all or specified RIPng interfaces.
show ipv6 rip routes	Displays all or a specific set of routes in the RIPng Routing Table.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceHorizon
```

show ipv6 rip

Displays the RIPng status and general configuration parameters.

show ipv6 rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 rip

Status              = Enabled,
Number of routes    = 10,
Route tag           = 0,
Update interval     = 30,
Invalid interval    = 180,
Garbage interval    = 120,
Holddown interval   = 0,
Jitter interval     = 5,
Triggered Updates   = All Routes,
```

output definitions

Status	RIPng protocol status (enabled or disabled).
Number of routes	Number of RIPng routes in Forwarding Information Base (FIB).
Route tag	Route tag value for RIP routes generated by the switch. Default is 0.
Invalid interval	Invalid Timer setting, in seconds.
Garbage interval	Garbage Timer setting, in seconds.
Holddown interval	Holddown Timer setting, in seconds.
Jitter interval	Jitter setting.
Triggered updates	Triggered Updates setting (All Routes, Updated Routes, and None).

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip route-tag	Configures the route tag value for RIP routes generated by the switch.
ipv6 rip update-interval	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
ipv6 rip invalid-timer	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.
ipv6 rip jitter	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
ipv6 rip triggered-sends	Configures the behavior of triggered updates.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
   alaRipngRouteTag
   laRipngInvalidTimer
   alaRipngGarbageTimer
   alaRipngHolddownTimer
   alaRipngJitter
   alaRipngTriggeredSends
```

show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

show ipv6 rip interface [*if_name*]

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If an interface name is not specified, all IPv6 RIP interfaces are displayed.

Examples

```
-> show ipv6 rip interface

    Interface                        Packets
       Name           Status     Recvd   Sent     Metric
--------------------+----------+---------+--------+---------
Test_Lab             Active     12986     12544    1
Test_Lab_2           Active     12556     12552    1

-> show ipv6 rip interface if3

Name                           = Test_Lab,
IPv6 interface index           = 3,
Interface status               = Active,
Next Update                    = 27 secs,
Horizon Mode                   = Split and Poison-reverse,
MTU size                       = 1500,
Metric                         = 1,
Send status                    = Enabled,
Receive status                 = Enabled,
Packets received               = 12986,
Packets sent                   = 12544,
```

output definitions

Interface name	Interface name.
IPv6 interface index	IPv6 index of this interface.
Status	Interface status (Active/Inactive).
Packets Recvd	Number of packets received by the interface.

output definitions (continued)

Packets Sent	Number of packets sent by the interface.
Metric	RIPng metric (cost) configured for the interface.
IPv6 interface index	IPv6 interface index number.
Interface status	Interface status (Active/Inactive).
Next update	Seconds remaining until the next update on this interface.
Horizon mode	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
MTU size	Maximum transmission size for RIPng packets on the interface.
Send status	Interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
Receive status	Interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
Packets received	Number of packets received by the interface.
Packets sent	Number of packets sent by the interface.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip interface	IPv6 interface name.
ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip interface recv-status	Configures the interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
ipv6 rip interface send-status	Configures the interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
ipv6 rip interface metric	Configures the RIPng metric (cost) for the interface.
ipv6 rip interface horizon	Configures the interface Horizon Mode (routing loop prevention mechanisms).
show ipv6 rip	Displays RIPng status and general configuration parameters (e.g., force holddown timer).

MIB Objects

```

   alaRipngInterfaceRecvStatus
```

show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

show ipv6 rip peer [*ipv6_addresss*]

Syntax Definitions

ipv6_addresss	IPv6 address of the peer.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

Examples

```
-> show ipv6 peer
                              Seen on       Packets   Last
Address                       Interface     Recv      Update
------------------------------+-------------+--------+----------
fe80::200:39ff:fe1f:710c      vlan172       23       20
fe80::2d0:95ff:fe12:da40      bkbone20      33       2
fe80::2d0:95ff:fe12:da40      vlan150       26       25
fe80::2d0:95ff:fe6a:5d41      nssa23        20       25

-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40

Peer#1 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = bkbone20,
Last Update             = 8 secs,
Received packets        = 33,
Received bad packets    = 0
Received routes         = 5,
Received bad routes     = 0

Peer#2 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = vlan150,
Last Update             = 1 secs,
Received packets        = 27,
Received bad packets    = 0
Received routes         = 2,
Received bad routes     = 0
```

output definitions

Address	IPv6 address of the peer.
Seen on Interface	Interface used to reach the peer.
Packets Recvd	Number of packets received from the peer.
Last Update	Number of seconds since the last update was received from the peer.
Peer address	Peer IPv6 address.
Received packets	Number of packets received from the peer.
Received bad packets	Number of bad packets received from the peer.
Received routes	Number of RIPng routes received from the peer.
Received bad routes	Number of bad RIPng routes received from the peer.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip interface	Displays all or specified RIPng interface status.
show ipv6 rip routes	Displays all or a specific set of routes in RIPng Routing Table.

MIB Objects

```

   alaRipngPeerIndex
   alaRipngPeerLastUpdate
   alaRipngPeerNumUpdates
   alaRipngPeerBadPackets
   alaRipngPeerNumRoutes
   alaRipngPeerBadRoutes
```

show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

show ipv6 rip routes [dest *ipv6_prefix/prefix_length* **| gateway** *ipv6_addr* **| detail** *ipv6 prefix/ prefix_length***]**

Syntax Definitions

dest	Displays all routes whose destination matches the IPv6 prefix/prefix length.
gateway	Displays all routes whose gateway matches the specified IPv6 address.
detail	Displays detailed information about a single route matching the specified destination.
ipv6_prefix/prefix length	IPv6 address and prefix/prefix length.
ipv6_addr	IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If none of the optional parameters are entered with this command, all IPv6 RIP routes are displayed.

Examples

```
-> show ipv6 rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination     Gateway                      State    Metric Proto
---------------+----------------------------+-------+------+------
100::1/128      +fe80::200:39ff:fe1f:710c     A       2      Rip
100::100:1/128  +fe80::200:39ff:fe1f:710c     A       2      Rip

State           = Active,
Age             = 15s,
Tag             = 0,
```

output definitions

Destination	IPv6 address/address length of the destination.
Gateway	IPv6 gateway used to reach the destination.
State	Route status (Active/Inactive).
Metric	Routing metric for this route.
Protocol	Protocol used to learn the route.
Mask Length	Prefix Length.
Out Interface	The interface used to reach the destination.
Status	Route status (Active/Inactive).
Age	The number of seconds since the route was last updated.
Tag	The route tag value for the route.

Release History

Release 7.1.1; command was introduced.

Related Commands

23 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, IS-IS, OSPF, PIM, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

This implementation of BFD supports an Asynchronous control packet mode or an Asynchronous Echo function. Demand mode is not supported.

- When the Asynchronous control packet mode is activated, BFD neighbors periodically send BFD control packets to each other. A time interval for transmitting and receiving such packets is negotiated between the two BFD systems. If a neighboring system fails to receive a number of control packets continuously over a specific period of time, the session is considered down and BFD informs the appropriate routing protocol.
- The Asynchronous Echo function is used to verify the forwarding path between neighboring BFD systems. When active, a BFD system transmits Echo packets only (no control packets are sent) to a BFD neighbor, which then sends the packets back to the originating system along the forwarding path. If no Echo packets are received back from the BFD neighbor within a configured Echo time interval, the session is considered down.

MIB information for the BFD commands is as follows:

Filename: ALCATEL-IND1-BFD-MIB.mib
Module: alcatelIND1BfdMIB

A summary of the available commands is listed here:

Global BFD commands	**ip bfd admin-state** **ip bfd transmit** **ip bfd receive** **ip bfd multiplier** **ip bfd echo-interval** **show ip bfd** **show ip|ipv6 bfd sessions** **show ip|ipv6 bfd sessions statistics**
BFD Interface commands	**ip|ipv6 bfd interface** **ip|ipv6 bfd interface admin-state** **ip|ipv6 bfd interface transmit** **ip|ipv6 bfd interface receive** **ip|ipv6 bfd interface multiplier** **ip|ipv6 bfd interface echo-interval** **show ip|ipv6 bfd interfaces**

ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

ip bfd admin-state {enable | disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

```
-> ip bfd admin-state enable
-> ip bfd admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalAdminStatus
```

ip bfd transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

ip bfd transmit *transmit_interval*

Syntax Definitions

transmit_interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
transmit_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd transmit** command does not override the value set for the interface using the **ip bfd interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd transmit 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip|ipv6 bfd interface transmit	Configures the transmit time interval for a specific BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalTxInterval
```

ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

ip bfd receive *receive_interval*

Syntax Definitions

receive_interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
receive_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd receive** command does not override the value set for the interface using the **ip bfd interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd receive 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip|ipv6 bfd interface receive	Configures the receive time interval for a specific BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalRxInterval
```

ip bfd multiplier

Configures the global BFD detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. The detection time value that is specified determines how long to wait before declaring that the BFD session is down.

ip bfd multiplier *num*

Syntax Definitions

num	The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global detection time multiplier is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd multiplier** command does not override the value set for the interface using the **ip bfd interface multiplier** command.
- The global detection time multiplier serves as the default multiplier value for a BFD interface. The default multiplier value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd multiplier 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip|ipv6 bfd interface multiplier	Configures the detection time multiplier for a BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalDetectMult
```

ip bfd echo-interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd echo-interval *echo_interval*

Syntax Definitions

echo_interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
echo_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd echo-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip|ipv6 bfd interface echo-interval	Configures the echo packet time interval for a BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalEchoRxInterval
```

ip|ipv6 bfd interface

Configures an IPv4 or IPv6 BFD interface.

{ip | ipv6} bfd interface *if_name*

no {ip | ipv6} bfd interface *if_name*

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IPv4 or IPv6 interface name that is configured with an IPv4or IPv6 address.

Examples

```
-> ip bfd interface bfd-vlan-101
-> no ip bfd interface bfd-vlan-101

-> ipv6 bfd interface bfd-vlan-201
-> no ipv6 bfd interface bfd-vlan-201
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface admin-state	Configures the administrative status of an IPv4 or IPv6 BFD interface.
show ip|ipv6 bfd interfaces	Displays the status and statistics of a BFD interface.
show ip|ipv6 bfd sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfIndex
   alaBfdIntfRowStatus
```

ip|ipv6 bfd interface admin-state

Enables or disables the administrative status of an IPv4 or IPv6 BFD interface.

{ip | ipv6} bfd interface *if_name* **admin-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 BFD interface.
enable	Enables the BFD interface.
disable	Disables the BFD interface.

Defaults

By default, a BFD interface is disabled when it is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

Examples

```
-> ip bfd interface bfd-vlan-101 admin-state enable
-> ip bfd interface bfd-vlan-101 admin-state disable

-> ipv6 bfd interface bfd-vlan-201 admin-state enable
-> ipv6 bfd interface bfd-vlan-201 admin-state disable
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface	Creates an IPv4 or IPv6 BFD interface.
show ip|ipv6 bfd interfaces	Displays the status and statistics of a BFD interface.
show ip|ipv6 bfd sessions	Displays the status and statistics of BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfAdminStatus
```

ip|ipv6 bfd interface transmit

Configures the transmit time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

{ip | ipv6} bfd interface *if_name* **transmit** *transmit_interval*

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 BFD interface.
transmit_interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
transmit_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface transmit** or **ipv6 bfd interface transmit** command does not change the global value configured with the **ip bfd transmit** command.

Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500

-> ipv6 bfd interface bfd-vlan-201 transmit 500
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface	Creates an IPv4 or IPv6 BFD interface.
ip bfd transmit	Configures a global BFD transmit time interval.
show ip|ipv6 bfd interfaces	Displays the status and statistics of a BFD interface.
show ip|ipv6 bfd sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDesiredMinTxInterval
```

ip|ipv6 bfd interface receive

Configures the receive time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

{ip | ipv6} bfd interface *if_name* **receive** *receive_interval*

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 BFD interface.
receive_interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
receive_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface receive** or **ipv6 bfd interface receive** command does not change the global value configured with the **ip bfd receive** command.

Examples

```
-> ip bfd interface bfd-vlan-101 receive 500

-> ipv6 bfd interface bfd-vlan-201 receive 500
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface	Creates an IPv4 or IPv6 BFD interface.
ip bfd receive	Configures a global BFD receive time interval.
show ip|ipv6 bfd interfaces	Displays the BFD interface configuration table.
show ip|ipv6 bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdReqMinRxInterval
```

ip|ipv6 bfd interface multiplier

Configures the detection time multiplier for an IPv4 or IPv6 BFD interface. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

{ip | ipv6} bfd interface *if_name* **multiplier** *num*

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 BFD interface.
num	The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

Examples

```
-> ip bfd interface bfd-vlan-101 multiplier 5

-> ipv6 bfd interface bfd-vlan-201 multiplier 5
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface	Creates an IPv4 or IPv6 BFD interface.
show ip|ipv6 bfd interfaces	Displays the BFD interface configuration table.
show ip|ipv6 bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDetectMult
```

ip|ipv6 bfd interface echo-interval

Configures the echo time interval for an IPv4 or IPv6 BFD interface. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

{ip | ipv6} bfd interface *if_name* **echo-interval** *echo_interval*

Syntax Definitions

if_name	The name of an existing IPv4 or IPv6 BFD interface.
echo_interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
echo_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd interface echo-interval** or **ipv6 bfd interface echo-interval** command does not change the global value configured with the **ip bfd echo-interval** command.

Examples

```
-> ip bfd interface bfd-vlan-101 echo-interval 500

-> ip bfd interface bfd-vlan-201 echo-interval 500
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip|ipv6 bfd interface	Creates an IPv4 or IPv6 BFD interface.
ip bfd echo-interval	Configures a global BFD echo time interval.
show ip|ipv6 bfd interfaces	Displays the BFD interface configuration table.
show ip|ipv6 bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfReqMinEchoRxInterval
```

show ip bfd

Displays the global BFD configuration table.

show ip bfd

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip bfd
BFD Version Number              = 1,
Admin Status                    = Enabled,
Desired Tranmit Interval        = 300,
Minimum Receive Interval        = 300,
Detection Time Multiplier       = 3,
Minimum Echo Receive Interval   = 300,
Applications Registered         = STATIC-ROUTING OSPF
```

output definitions

BFD Version Number	Refers to BFD version.
Admin Status	Refers to BFD global admin status.
Desired Transmit Interval	Refers to BFD global Tx interval.
Minimum Receive Interval	Refers to BFD global Rx interval.
Detection Time Multiplier	Refers to the BFD Detection Time multiplier number.
Minimum Echo Receive Interval	Refers to BFD echo Rx interval.
Applications Registered	Refers to applications registered to BFD.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd admin-state	Configures BFD at global level.
ip|ipv6 bfd interface	Configures BFD at interface level.

MIB Objects

```
alaBfdIntfTable
   alaBfdGlobalVersionNumber
   alaBfdGlobalAdminStatus
   alaBfdGlobalTxInterval
   alaBfdGlobalRxInterval
   alaBfdGlobalDetectMult
   alaBfdGlobalEchoRxInterval
   alaBfdGlobalProtocolApps
```

show ip|ipv6 bfd interfaces

Displays the BFD interface configuration table.

show {ip | ipv6} bfd interfaces [*if_name***]**

Syntax Definitions

if_name	The name of the IPv4 or IPv6 BFD interface.

Defaults

By default, the configuration for all IPv4 or IPv6 BFD interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Enter an interface name to display information for a specific BFD interface.

Examples

```
-> show ip bfd interfaces
Interface  Admin    Tx        Min Rx   Min EchoRx Detect     OperStatus
Name       Status   Interval  Interval Interval   Multiplier
---------+--------+---------+---------+----------+----------+----------
bfd-intf1  enabled   300      300       300         3         UP
bfd-intf2  enabled   300      300       300         3         UP

-> show ip bfd interfaces bfd-intf1
Interface Name                   = bfd-intf1,
Interface IP Address             = 100.1.1.1,
Admin Status                     = Enabled,
Desired Transmit Interval        = 300,
Minimum Receive Interval         = 300,
Detection Time Multiplier        = 3,
Minimum Echo Receive Interval    = 300,
Authentication Present           = No,
Oper Status                      = UP

-> show ipv6 bfd interfaces
    Interface          Admin         Tx      Min Rx    Min EchoRx Detect  Oper
      Name             Status     Interval  Interval   Interval    Mult  Status
--------------------+----------+----------+----------+----------+------+------
bfd-intf3            disabled    300        300        300        3      DOWN

-> show ipv6 bfd interfaces bfd-intf3
Interface Name                   = bfd-intf3
Interface IP Address             = fe80::2efa:a2ff:fe13:e402,
Admin Status                     = Disabled,
Desired Transmit Interval        = 300,
Minimum Receive Interval         = 300,
Detection Time Multiplier        = 3,
```

```
Minimum Echo Receive Interval    = 300,
Authentication Present           = No,
Oper Status                      = DOWN
```

output definitions

Interface Name	Refers to BFD Interface name.
Interface IP Address	Refers to the IPv4 or IPv6 network address assigned to the BFD interface.
Admin status	Refers to BFD interface admin status.
Desired Transmit Interval	Refers to BFD interface Tx interval.
Minimum Receive Interval	Refers to BFD interface Rx interval.
Detection Time Multiplier	Refers to BFD interface Detection Time Multiplier.
Minimum Echo Receive Interval	Refers to BFD interface echo Rx interval.
Authentication Present	Refers to availability of BFD message authentication on the BFD interface.
Oper Status	Refers to BFD interface operational status.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

show ip|ipv6 bfd sessions

Displays the IPv4 or IPv6 BFD sessions for the switch.

show {ip | ipv6} bfd sessions [*session_num*] **[slot** *chassis/slot***]**

Syntax Definitions

session_num	The BFD session number. Valid range is 1–1024.
chassis	The chassis identifier.
slot	The current slot position used by the switch.

Defaults

By default, all IPv4 or IPv6 BFD sessions are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Specify a session number to display information for an individual BFD session.

Examples

```
-> show ip bfd sessions
Legends: Neg.     = Negotiated
         Discr    = Discriminator
         Intvl    = Interval (in milliseconds)
 Local Interface    Neighbor               State   Remote  Neg. Rx Neg. Tx EchoRx

Multiplier                      = 3,
Applications Registered:        = STATIC-ROUTING
```

output definitions

Local discriminator	The local discriminator.
Neighbor IP address	The IPv4 or IPv6 address of the BFD neighbor.
Requested Session Type	The bit map of the session type that is requested.
Interface IP address	The IPv4 or IPv6 address of the outgoing BFD interface for this session.
Source UDP Port	The unique source UDP port used to send BFD packets for this session.
State	The state of the BFD session.
Session Operating Mode	The current operating mode of the BFD session.
Remote discriminator	The remote discriminator.
Negotiated Tx interval	The negotiated transmit interval.
Negotiated Rx interval	The negotiated receive interval.
Echo Rx interval	The Echo packet receive interval.
Detection Time Multiplier	The BFD Detection Time multiplier number.
Applications Registered	The bit map object of applications that are registered with this BFD session.

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

show ip|ipv6 bfd sessions statistics

Displays the statistics for IPv4 or IPv6 BFD sessions.

show {ip | ipv6} bfd sessions statistics [*session_num***]**

Syntax Definitions

session_num	The BFD session number. Valid range is 1–1024.

Defaults

By default, statistics for all IPv4 or IPv6 sessions are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Specify a BFD session number to display statistics for an individual session.

Examples

```
-> show ip bfd sessions statistics
Legends:

24 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

Filename: ALCATEL-IND1-UDP-RELAY-MIB.mib
Module: alcatelIND1UDPRelayMIB

A summary of the available commands is listed here.

IP DHCP Relay	**ip dhcp relay admin-state** **ip dhcp relay destination** **ip dhcp relay per-interface-mode** **ip dhcp relay interface destination** **ip dhcp relay interface admin-state** **ip dhcp relay forward-delay** **ip dhcp relay maximum-hops** **ip dhcp relay insert-agent-information** **ip dhcp relay insert-agent-information policy** **ip dhcp relay insert-agent-information format** **ip dhcp relay pxe-support** **show ip dhcp relay interface** **show ip dhcp relay statistics** **ip dhcp relay clear statistics** **show ip dhcp relay insert-agent-information error-count** **ip dhcp relay clear insert-agent-information error-count** **show ip dhcp relay counters**
Generic IP UDP Relay	**ip udp relay port** **ip udp relay service** **ip udp relay vlan** **ip udp relay svc** **ip udp relay address** **show ip udp relay** **show ip udp relay statistics** **ipv6 udp relay clear statistics**

Generic IPv6 UDP Relay	**ipv6 udp relay port** **ipv6 udp relay service** **ipv6 udp relay vlan** **ipv6 udp relay svc** **ipv6 udp relay address** **show ipv6 udp relay** **show ipv6 udp relay statistics** **ipv6 udp relay clear statistics**
IPv6 DHCP Relay	**ipv6 dhcp relay admin-state** **ipv6 dhcp relay interface admin-state** **ipv6 dhcp relay destination** **ipv6 dhcp relay maximum-hops** **show ipv6 dhcp relay**
DHCP Server Commands	**dhcp-server** **dhcp-server restart** **show dhcp-server leases** **show dhcp-server statistics** **clear dhcp-server statistics** **dhcpv6-server** **dhcpv6-server restart** **show dhcpv6-server leases** **clear dhcpv6-server statistics** **show dhcpv6-server statistics** **dhcp-message-service** **dhcp-message-service restart** **show message-service status** **active-lease-service** **active-lease-service restart** **show active-lease-service status**

ip dhcp relay admin-state

Enables or disables DHCP Relay for the switch for both the VLAN and Shortest Path Bridging (SPB) service domains. When enabled, DHCP packets can be relayed between a client and a server across VLANs or an SPB service domain.

ip dhcp relay admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Relay for the VLAN and service domain.
disable	Disables DHCP Relay for the VLAN and service domain.

Defaults

By default, DHCP Relay is disabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Disabling this feature does not remove the DHCP relay agent configuration from the switch. However, the configuration is not active unless the feature is enabled using this command.
- When this feature is enabled, DHCP packets are relayed on a global basis or on a per-interface basis.
  - Global DHCP Relay requires a global destination IP address (configured through the **ip dhcp relay destination** command). All DHCP packets are forwarded by a global relay agent.
  - Per-interface DHCP Relay is disabled by default. To enable this mode and define a per-interface relay agent, use the **ip dhcp relay per-interface-mode** and **ip dhcp relay interface destination** commands. Only DHCP packets originating from the VLAN or SPB service that is associated with the specified IP interface are forwarded by the interface relay agent.
  - The global and per-interface modes are mutually exclusive.
  - The global or per-interface mode configuration is not active unless the DHCP Relay feature is enabled for the switch.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- Configuring a DHCP relay agent for an IP interface that is bound to an SPB service (a service-based IP interface) is supported only on the OmniSwitch 9900.

Examples

```
-> ip dhcp relay admin-state enable
-> ip dhcp relay admin-state disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay destination	Configures a global destination IP address.
ip dhcp relay per-interface-mode	Enables or disables the per-interface DHCP relay mode, which is used to process DHCP packets on a per-interface basis.
show ip dhcp relay interface	Displays the DHCP Relay configuration.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayAdminStatus
```

ip dhcp relay destination

Configures a global destination IP address. When the global DHCP Relay mode is active, all DHCP client requests are forwarded to the specified destination IP address.

ip dhcp relay destination *ip_address*

no ip dhcp relay destination *ip_address*

Syntax Definitions

ip_address	The Pv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the configured DHCP relay destination.
- Configuring a global destination IP address is required when the global DHCP Relay mode is enabled for the switch.

Examples

```
-> ip dhcp relay destination 3.3.0.2
-> ip dhcp relay destination 4.4.0.2
-> no ip dhcp relay destination 3.3.0.2
```

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay admin-state	Configures the status of the DHCP Relay feature.
show ip dhcp relay interface	Displays the DHCP Relay configuration.

MIB Objects

```
alaDhcpRelayServerDestinationTable
   alaDhcpRelayServerDestinationAddressType,
   alaDhcpRelayServerDestinationAddress,
   alaDhcpRelayServerDestinationRowStatus
```

ip dhcp relay per-interface-mode

Enables or disables the DHCP Relay per-interface mode. When this mode is enabled, a relay agent can be configured for a specific IP interface.

ip dhcp relay per-interface-mode

no ip dhcp relay per-interface-mode

Syntax Definitions

N/A

Defaults

By default, the global DHCP Relay mode is active when the DHCP Relay feature is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the per-interface DHCP relay mode is enabled with this command, the global DHCP relay mode is not available. These two types of relay agents are mutually exclusive.
- Use the **no** form of this command to change the DHCP Relay mode back to global (the default).
- When the per-interface mode is active, use the **ip dhcp relay interface destination** command to configure a destination IP address for each IP interface that will serve as a DHCP relay agent.
- The global or per-interface mode configuration is not active unless the DHCP Relay feature is enabled for the switch.

Examples

```
-> ip dhcp relay per-interface-mode
-> no ip dhcp relay per-interface-mode
```

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay interface destination	Configures the DHCP relay destination address for the specified IP interface.
ip dhcp relay interface admin-state	Enables or disables the per-interface DHCP relay agent.
ip dhcp relay admin-state	Enables or disables the DHCP relay feature.
show ip dhcp relay interface	Displays the DHCP Relay configuration.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayPerInterfaceMode
```

ip dhcp relay interface destination

Configures a DHCP relay destination IP address for the specified interface. The specified IP interface is bound to a VLAN or an SPB service; packets destined for the specified IP address are relayed over the VLAN or SPB service domain.

ip dhcp relay interface *if_name* **destination** *ip_address*

no ip dhcp relay interface *if_name* **destination** *ip_address*

Syntax Definitions

if_name	The name of an IPv4 interface on which a destination IP address is configured. Specify the primary IP interface for the VLAN or service.
ip_address	The Pv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the configured DHCP relay destination for the specified interface.
- This command works only if the per-interface DHCP mode is active. Use the **ip dhcp relay per-interface-mode** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for a VLAN or an SPB service before using this command. Packets destined for the specified IP address are relayed over the VLAN or SPB service domain.
- Configuring a DHCP relay agent for an IP interface that is bound to an SPB service (a service-based IP interface) is supported only on the OmniSwitch 9900.

Examples

```
-> ip dhcp relay interface client_traffic destination 75.0.0.10
-> ip dhcp relay interface client_traffic destination 31.0.0.20
-> no ip dhcp relay interface client_traffic destination 31.0.0.20
```

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay per-interface-mode	Enables or disables the DHCP Relay per-interface mode.
ip dhcp relay interface admin-state	Enables or disables DHCP relay on an IP interface.
show ip dhcp relay interface	Displays the DHCP Relay configuration.

MIB Objects

```
dhcpRelayInterfaceTable
   dhcpRelayInterfaceName
   dhcpRelayInterfacIpAddressType
   dhcpRelayInterfacIpAddress
   dhcpRelayInterfacStatus
```

ip dhcp relay interface admin-state

Enables or disables the relay of DHCP packets received on the specified interface.

ip dhcp relay interface *if_name* **admin-state {enable | disable}**

Syntax Definitions

if_name	The name of an IPv4 interface.
enable	Enables the relay of DHCP packets on the interface.
disable	Disables the relay of DHCP packets on the interface.

Defaults

By default, DHCP relay is enabled for the interface when a relay destination IP address is configured for the interface.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

At least one relay destination must be configured before the DHCP relay is enabled for an interface.

Examples

```
-> ip dhcp relay interface client_traffic admin-state enable
-> ip dhcp relay interface client-traffic admin-state disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay per-interface-mode	Enables or disables the DHCP Relay per-interface mode.
ip dhcp relay interface destination	Configures the DHCP relay destination address for the specified IP interface.
show ip dhcp relay interface	Displays the DHCP Relay configuration.

MIB Objects

```
alaDhcpRelayInterfaceAdminStateTable
   alaDhcpRelayInterfaceAdminStatus
```

ip dhcp relay forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

ip dhcp relay forward-delay *seconds*

Syntax Definitions

seconds	Forward delay time value in seconds.

Defaults

By default, the forward delay time is set to 0 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The time specified applies to all defined DHCP Relay agent IP addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

Examples

```
-> ip dhcp relay forward-delay 300
-> ip dhcp relay forward-delay 120
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **ip helper forward-delay** changed to **ip dhcp relay forward-delay**.

Related Commands

ip dhcp relay admin-state	Enables or disables the DHCP Relay feature for the switch.
ip dhcp relay maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip dhcp relay interface	Displays current DHCP Relay configuration information.
show ip dhcp relay statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayForwardDelay
```

ip dhcp relay maximum-hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

ip dhcp relay maximum-hops *hops*

Syntax Definitions

hops	The maximum number of relays.

Defaults

By default, the maximum hops value is set to 16 hops.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

Examples

```
-> ip dhcp relay maximum-hops 1
-> ip dhcp relay maximum-hops 10
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **ip helper maximum-hops** changed to **ip dhcp relay maximum-hops**

Related Commands

ip dhcp relay admin-state	Enables or disables the DHCP Relay feature for the switch.
ip dhcp relay forward-delay	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
show ip dhcp relay interface	Displays current DHCP Relay configuration information.
show ip dhcp relay statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayMaximumHops
```

ip dhcp relay insert-agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

ip dhcp relay insert-agent-information

no ip dhcp relay insert-agent-information

Syntax Definitions

N/A

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the DHCP Option-82 feature.
- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-interface basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the **ip dhcp relay insert-agent-information policy** command.
- The DHCP Relay agent information option and DHCP Snooping are mutually exclusive. If the DHCP Relay Option-82 feature is enabled for the switch, then DHCP Snooping is not available. The reverse is also true; if DHCP Snooping is enabled, then DHCP Relay Option-82 is not available

Examples

```
-> ip dhcp relay insert-agent-information
-> no ip dhcp relay insert-agent-information
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **ip helper agent-information** changed to **ip dhcp relay insert-agent-information**.

Related Commands

ip dhcp relay insert-agent-information policy	Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
ip dhcp relay insert-agent-information format	Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.
show ip dhcp relay interface	Displays current DHCP Relay configuration information.
show ip dhcp relay statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayInsertAgentInformation
```

ip dhcp relay insert-agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

ip dhcp relay insert-agent-information policy {drop | keep | replace}

Syntax Definitions

drop	Drop DHCP packets that already contain an Option-82 field.
keep	Keep the existing Option-82 field information and continue to relay the DHCP packet.
replace	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

```
-> ip dhcp relay insert-agent-information policy drop
-> ip dhcp relay insert-agent-information policy keep
-> ip dhcp relay insert-agent-information policy replace
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **ip helper agent-information policy** changed to **ip dhcp relay insert-agent-information policy**.

Related Commands

ip dhcp relay insert-agent-information	Enables the insertion of relay agent information Option-82 into DHCP packets.
show ip dhcp relay interface	Displays current DHCP Relay configuration information.
show ip dhcp relay statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayInsertAgentInformationPolicy
```

ip dhcp relay insert-agent-information format

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

ip dhcp relay insert-agent-information format {base-mac | system-name | user-string *string* | **interface-alias | auto-interface-alias | ascii {{circuit-id | remoted-id} {base-mac | cvlan | interface | interface-alias | system-name | user-string** *string* | **vlan}} {delimiter** *string***}]}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
string	A user defined text string. Supports up to 64 characters.
interface-alias	The alias configured for the interface.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: *SystemName_slot_port*.
ascii	ASCII format. **base-mac**: The base MAC address of the switch. **cvlan**: The Customer VLAN ID. **interface**: The interface name. **interface-alias**: The alias configured for the interface. **system-name**: The system name of the switch. **user-string**: A user defined text string. **vlan**: The VLAN ID of which the client is a member. string: A user-defined text string. **delimiter**: The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are | (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

Defaults

parameter	default
base-mac | system-name | user-string *string* **| interface-alias | auto-interface-alias | ascii**	**base-mac**
ascii	**base-mac**

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** parameters, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified is applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.
  - Configuring the Circuit ID or Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
  - Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
  - To ensure that the “\” (backward slash) delimiter is parsed correctly, enter two backward slashes in quotes (for example, “\\”).

Examples

```
-> ip dhcp relay insert-agent-information format user-string “Building B Server”
-> ip dhcp relay insert-agent-information format system-name
-> ip dhcp relay insert-agent-information format base-mac
-> ip dhcp relay insert-agent-information format interface-alias
-> ip dhcp relay insert-agent-information format auto-interface-alias
-> ip dhcp relay insert-agent-information format ascii circuit-id user-string “Bldg
A Server”
-> ip dhcp relay insert-agent-information format ascii remote-id vlan system-name
delimiter |
-> ip dhcp relay insert-agent-information ascii interface system-name delimiter
“\\”
```

Release History

Release 8.1.1; command introduced.
Release 8.6R1; **ip helper option-82 format** changed to **ip dhcp relay insert-agent-information format**, **circuit-id** and **remote-id** parameter options added.

Related Commands

show ip dhcp relay interface	Displays the current DHCP configuration for the switch.

```

ip dhcp relay pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

ip dhcp relay pxe-support

no dhcp relay pxe-support

Syntax Definitions

N/A

Defaults

By default, PXE support is disabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to disable PXE support.

Examples

```
-> ip dhcp relay pxe-support
-> no ip dhcp relay pxe-support
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; **ip helper pxe-support** changed to **ip dhcp relay pxe-support**.

Related Commands

show ip dhcp relay interface	Displays current DHCP Relay configuration information.

MIB Objects

```
alaDhcpRelayGlobalConfig
  alaDhcpRelayPxeSupport
```

show ip dhcp relay interface

Display the DHCP Relay and Relay Agent information.

show ip dhcp relay interface

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- DHCP packets are relayed on a global basis or on a per-interface basis.
- When the global DHCP Relay mode is active (the default), a global destination IP address is required. Global destination IP addresses are displayed in the **Relay Destination list** field.
- When the per-interface DHCP Relay mode is enabled, destination IP addresses are configured for specific interfaces. The **Relay Destination list** displays these IP addresses along with the name of the IP interface associated with each address.

Examples

```
-> show ip dhcp relay interface
IP DHCP Relay :
  DHCP Relay Admin Status        = Disable,
  Forward Delay(seconds)         = 0,
  Max number of hops             = 16,
  Relay Agent Information        = Disabled,
  Relay Agent Information Policy = Drop,
  DHCP Relay Opt82 Format        = Base MAC,
  DHCP Relay Opt82 String        = 00:e0:b1:e7:09:a3,
  PXE support                    = Disabled,
  Relay Mode                     = Global,
  Bootup Option                  = Disable,
  Relay Destination list (Global Mode):
    From Interface Any to Server 128.100.16.1

-> show ip dhcp relay interface
IP DHCP Relay :
  DHCP Relay Admin Status        = Enable,
  Forward Delay(seconds)         = 0,
  Max number of hops             = 16,
  Relay Agent Information        = Disabled,
  Relay Agent Information Policy = Drop,
  DHCP Relay Opt82 Format        = Base MAC,
  DHCP Relay Opt82 String        = 2c:fa:a2:13:e4:02,
```

```
PXE support                    = Disabled,
Relay Mode                     = Per Interface,
Bootup Option                  = Disable,
Relay Destination list (Per Interface Mode):
  From Interface ipvpn1 to Server 50.3.3.1
```

output definitions

DHCP Relay Admin Status	The status (**Enable** or **Disable**) of DHCP Relay. Configured through the **ip dhcp relay admin-state** command.
Forward Delay (seconds)	The current forward delay time. Use the **ip dhcp relay forward-delay** command to change this value.
Max number of hops	The current maximum number of hops allowed. Use the **ip dhcp relay maximum-hops** command to change this value.
Relay Agent Information	Indicates whether the DHCP relay agent information option (Option-82) is **Enabled** or **Disabled**. Configured through the **ip dhcp relay insert-agent-information** command.
Relay Agent Information Policy	The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the **ip dhcp relay insert-agent-information policy** command.
DHCP Relay Opt82 Format	The type of Option-82 information inserted. Configured through the **ip dhcp relay insert-agent-information format** command.
DHCP Relay Opt82 String	The Option-82 string based on the specified Option-82 format.
PXE support	Specifies the status (**Enabled** or **Disabled**) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the **ip dhcp relay pxe-support** command.
Relay Mode	Whether DHCP Relay is set to operate in the global mode or the per-interface mode. Configured through the **ip dhcp relay per-interface-mode** command.
Bootup Option	Indicates whether or not automatic IP address configuration for a specific VLAN is done when the switch boots up (**Enabled** or **Disabled**). Configured through the **ip interface dhcp-client** command.
Relay Destination list	IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip dhcp relay destination** command (global mode) or **ip dhcp relay interface destination** (per-interface mode) to add or remove DHCP server IP addresses from the DHCP Relay configuration.

Release History

Release 8.5R3; command introduced.
Release 8.6R1; “Relay Agent Information” field added.

Related Commands

show ip dhcp relay statistics	Displays the collected DHCP Relay statistics.

MIB Objects

N/A

show ip dhcp relay statistics

Displays all DHCP Relay statistics collected.

show ip dhcp relay statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The following DHCP Relay statistics are collected:
  - The number of packets DHCP Relay has received.
  - The number of packets dropped due to forward delay, maximum hops, relay agent, and gateway IP violations.
  - Statistics that apply to a specific DHCP server (such as the number of packets transmitted to the server and the number of invalid Option-82 DHCP server packets dropped by the relay agent).
  - The number of packets processed since the last time these statistics were displayed.
- Use the **ip dhcp relay clear statistics** command to clear all DHCP Relay statistics.

Examples

```
-> show ip dhcp relay statistics
Global Statistics :
    Reception From Client :
      Total Count =          12, Delta =        12
    Forw Delay Violation :
      Total Count =          3, Delta =          3
    Max Hops Violation :
      Total Count =          0, Delta =          0
    Agent Info Violation :
      Total Count =          0, Delta =          0
    Invalid Gateway IP :
      Total Count =          0, Delta =          0
Server Specific Statistics :
    From Interface ipv4-v200 to Server 75.0.0.1
        Tx Server :
          Total Count =          9, Delta =          9
        InvAgentInfoFromServer:
          Total Count =          0, Delta =          0
```

output definitions

Reception From Client	Number of packets DHCP Relay has received from the DHCP client.
Forw Delay Violation	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.
Max Hops Violation	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to **Drop** or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
Delta	Total number of packets processed since the last time the DHCP Relay statistics were checked during any user session.
Server	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service.
Tx Server	Number of packets DHCP Relay has transmitted to the DHCP server.
InvAgentInfoFromServer	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
Delta	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

Release History

Release 8.5R3; command introduced.

Related Commands

ip dhcp relay admin-state	Enables or disables the DHCP relay feature.
ip dhcp relay clear statistics	Resets the DHCP Relay statistic counters to zero.
show ip dhcp relay insert-agent-information error-count	Displays the Option-82 related error statistics.

MIB Objects

N/A

ip dhcp relay clear statistics

Clears DHCP relay statistics collected.

ip dhcp relay clear statistics [global-only | destination *ip_address* **| interface** *if_name* **destination** *ip_address***]**

Syntax Definitions

global-only	Clears statistics collected for global DHCP Relay.
ip_address	The IPv4 destination address for which statistics are cleared.
if_name	The IPv4 interface name for which statistics are cleared.

Defaults

By default, all DHCP Relay statistics are cleared.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When this command is used, all DHCP Relay statistics are reset to zero.
- Use the **show ip dhcp relay statistics** command to display DHCP Relay statistics.

Examples

```
-> ip dhcp relay clear statistics
-> ip dhcp relay clear statistics global-only
-> ip dhcp relay clear statistics destination 75.0.0.2
-> ip dhcp relay clear statistics interface ipv4-200 destination 75.0.0.2
```

Release History

Release 8.5R3; command introduced.
Release 8.6R1; **clear ip dhcp relay statistics** changed to **ip dhcp relay clear statistics** and **global-only**, **destination**, **interface** parameters added.

Related Commands

ip dhcp relay admin-state	Enables or disables the DHCP Relay feature.
show ip dhcp relay statistics	Displays DHCP Relay statistics.

MIB Objects

```
alaDhcpRelayGlobalConfig
   alaDhcpRelayStatisticsClear
alaDhcpRelayClearStatisticsTable
   alaDhcpRelayClearStatisticsAction
```

show ip dhcp relay insert-agent-information error-count

Displays the Option-82 related error statistics on a per-port and per-interface basis.

show ip dhcp relay insert-agent-informaton error-count [interface *if_name* **| port** *chassis/slot/port* **[interface** *if_name***]]**

Syntax Definitions

if_name	The name of the IPv4 interface for which the Option-82 error count statistics are displayed.
chassis/slot/port	The chassis, slot, and port number of the port for which the Option-82 error count statistics are displayed.

Defaults

By default, all Option-82 error count statistics are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To display the statistics for a specific port, use the **port** *chassis/slot/port* parameter option.
- To display the statistics for a specific IPv4 interface, use the **interface** *if_name* parameter option.
- Use the **ip dhcp relay clear insert-agent-information error-count** command to clear Option-82 error statistics.

Examples

```
-> show ip dhcp relay insert-agent-information error-count port 1/1/3
 Slot/Port | Interface | Agent Info Violation | Invalid Gateway IP
-----------+-----------+----------------------+----------------------
     1/1/3    ipv4-v100                 500                     0
     1/1/3    ipv4-v200                   0                    10
     1/1/3   ipv4-v1100                 500                     0
     1/1/3   ipv4-v3100                 500                     0

-> show ip dhcp relay insert-agent-information error-count interface ipv4-v100
 Slot/Port | Interface | Agent Info Violation | Invalid Gateway IP
-----------+-----------+----------------------+----------------------
     1/1/1    ipv4-v100                   400                     0
     2/1/3    ipv4-v100                   500                     0

-> show ip dhcp relay insert-agent-information error-count port 1/1/3 interface
ipv4-v100
 Slot/Port | Interface | Agent Info Violation | Invalid Gateway IP
-----------+-----------+----------------------+----------------------
     1/1/3    ipv4-v100                 500                     0
```

output definitions

Slot/port	The chassis, slot, and port number for which the error count statistics is displayed.
Interface	The name of the IPv4 interface associated with the port.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to **Drop** or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.

Release History

Release 8.1.1; command introduced.
Release 8.6.R1; **show ip helper option-82 error-count** changed to **show ip dhcp relay insert-agent-information error-count** and **vlan** changed to **interface**.

Related Commands

ip dhcp relay insert-agent-information format	Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.
show ip dhcp relay interface	Displays current DHCP Relay configuration information.

MIB Objects

```
alaDhcpRelayOpt82ErrStatsTable
   alaDhcpRelayOpt82ErrStatsIfIndex
   alaDhcpRelayOpt82ErrStatsIfName
   alaDhcpRelayOpt82ErrStatsAgentInfoViolation
   alaDhcpRelayOpt82ErrStatsInvalidGatewayIPAddr
```

ip dhcp relay clear insert-agent-information error-count

Clears the Option-82 related error statistics on a per-port and per-interface basis.

ip dhcp relay clear insert-agent-informaton error-count [interface *if_name* **| port** *chassis/slot/port*

Syntax Definitions

if_name	The name of the IPv4 interface for which the Option-82 error count statistics are cleared.
chassis/slot/port	The chassis, slot, and port number of the port for which the Option-82 error count statistics are cleared.

Defaults

By default, all Option-82 error count statistics are cleared.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To clear the statistics for a specific IPv4 interface, use the **interface** *if_name* parameter option.
- To clear the statistics for a specific port, use the **port** *chassis/slot/port* parameter option.
- When this command is used, all Option-82 error statistics are reset to zero.
- Use the **show ip dhcp relay insert-agent-information error-count** command to display Option-82 statistics collected.

Examples

```
-> ip dhcp relay clear insert-agent-information error-count
-> ip dhcp relay clear insert-agent-information error-count interface ipv4-v100
-> ip dhcp relay clear insert-agent-information error-count port 1/1/3
```

Release History

Release 8.6R1; command introduced.

Related Commands

ip dhcp relay insert-agent-information format	Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.
show ip helper	Displays current DHCP Relay configuration information.

MIB Objects

```
alaDhcpRelayOpt82ErrStatsTable
   alaDhcpRelayOpt82ErrStatsReset
```

show ip dhcp relay counters

Displays DHCP Relay packet statistics.

show ip dhcp relay counters

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display statistics for the various types of DHCP packets that were relayed or passed through by the switch.

Examples

```
-> show ip dhcp relay counters
DHCP Packets:
DHCP Discover Packets                          : 0,
DHCP Offer Packets                             : 0,
DHCP Request Packets                           : 0,
DHCP ACK Packets                               : 0,
DHCP NACK Packets                              : 0,
DHCP Release Packets                           : 0,
DHCP Decline Packets                           : 0,
DHCP Inform Packets                            : 0,
DHCP Renew Packets                             : 0,
```

Release History

Release 8.6R1; command introduced.

Related Commands

ip dhcp relay admin-state	Enables or disables the DHCP relay feature.
show ip dhcp relay statistics	Displays DHCP Relay error statistics.
show ip dhcp relay insert-agent-information error-count	Displays the Option-82 related error statistics.

MIB Objects

N/A

ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

ip helper address *ip_address*

no ip helper address [*ip_address***]**

Syntax Definitions

ip_address	DHCP server IP address (for example 21.0.0.10).

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

Examples

```
-> ip helper address 75.0.0.10
-> no ip helper address 31.0.0.20
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **ip dhcp relay destination**).

Related Commands

ip helper vlan address	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
ip dhcp relay forward-delay	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
ip dhcp relay maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperForwAddr
```

ip helper vlan address

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

ip helper vlan *vlan_id***[-***vlan_id2***] address** *ip_address*

no ip helper vlan *vlan_id***[-***vlan_id2***] address** *ip_address*

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	VLAN ID number of the DHCP server VLAN. Use a hyphen to specify a range of VLAN IDs (3-5).
ip_address	IP address (for example 21.0.0.10) of the DHCP server VLAN.

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

Platforms Supported

Not supported in this release.

Usage Guidelines

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The **ip helper vlan address** command works only if the **per-vlan-only** forwarding option is active. Use the **ip helper per-vlan-only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.

Examples

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **ip dhcp relay interface destination**).

Related Commands

ip helper per-vlan-only	Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperVlan
```

ip helper standard

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

ip helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

Platforms Supported

Not supported in this release.

Usage Guidelines

To process DHCP packets on a per VLAN basis or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.

Examples

```
-> ip helper standard
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use the **no** form of the **ip dhcp relay per-interface-mode**).

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

ip helper per-vlan-only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

Not supported in this release.

Usage Guidelines

- When the forwarding option is set to **per-vlan-only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.
- Using the **per-vlan-only** forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The **ip helper vlan address** command performs this function and at the same time enables relay for the specified VLAN.

Examples

```
-> ip helper per-vlan-only
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **ip dhcp relay per-interface-mode**).

Related Commands

ip helper vlan address	Configures a DHCP Relay service for the specified VLAN.
ip helper standard	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

show ip helper

Displays the current DHCP Relay and Relay Agent Information.

show ip helper

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

Displays information for all IP addresses configured.

Examples

```
-> show ip helper
Ip helper :
  Forward Delay(seconds)         = 300,
  Max number of hops             = 5,
  Relay Agent Information        = Enabled,
  Relay Agent Information Policy = Keep,
  DHCP Opt82 Format              = Base MAC,
  DHCP Opt82 String              = 2c:fa:a2:13:e4:02,
  PXE support                    = Enabled,
  Forward option                 = standard mode,
  Bootup Option                  = Disable,
  Bootup Packet Option           = DHCP
        Forwarding address list (Standard mode):
          128.100.16.1
```

output definitions

Forward Delay	The current forward delay time (default is three seconds). Use the **ip dhcp relay forward-delay** command to change this value.
Max number of hops	The current maximum number of hops allowed (default is four hops). Use the **ip dhcp relay maximum-hops** command to change this value.
Relay Agent Information	Indicates the status (**Enabled** or **Disabled**) of the DHCP relay agent information option feature. Configured through the **ip dhcp relay insert-agent-information** command.
Relay Agent Information Policy	The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the **ip dhcp relay insert-agent-information policy** command.

output definitions

DHCP Opt82 Format	The type of option-82 information inserted. Configured through the **ip dhcp relay insert-agent-information format** command.
DHCP Opt82 String	The option-82 string based on the specified Option-82 format.
PXE support	Specifies the status (**Enabled** or **Disabled**) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the **ip dhcp relay pxe-support** command.
Forward option	The current forwarding option setting: **standard mode**.
Bootup Option	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (**Enabled** or **Disabled**). Configured through the **ip interface dhcp-client** command.
Bootup Packet Option	Indicates if the Bootup Option broadcasts a **DHCP** or **BOOTP** packet to obtain an IP address for default VLAN 1.
Forwarding Addresses	IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **show ip dhcp relay interface**)

Related Commands

show ip dhcp relay statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperForwAddr
   iphelperForwDelay
   iphelperMaxHops
iphelperAgentInformation
iphelperAgentInformationPolicy
iphelperStatTable
   iphelperBootupOption
   iphelperBootupPacketOption
```

show ip helper statistics

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

show ip helper statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the **no ip helper statistics** command to clear DHCP Relay statistics.

Examples

```
-> show ip helper statistics

 Global Statistics :
    Reception From Client :
      Total Count =         12, Delta =         12,
    Forw Delay Violation :
      Total Count =          3, Delta =          3,
    Max Hops Violation :
      Total Count =          0, Delta =          0,
    Agent Info Violation :
      Total Count =          0, Delta =          0,
    Invalid Gateway IP :
      Total Count =          0, Delta =          0,
 Server Specific Statistics :
    From any Vlan to Server 5.5.5.5
        Tx Server :
          Total Count =          9, Delta =          9
        InvAgentInfoFromServer:
          Total Count =          0, Delta =          0
```

output definitions

Reception From Client	Number of packets DHCP Relay has received from the DHCP client.
Forw Delay Violation	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.

output definitions (continued)

Max Hops Violation	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to **Drop** or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
Server	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from DHCP Relay configuration.
Tx Server	Number of packets DHCP Relay has transmitted to the DHCP server.
Delta	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.
Invalid Agent Info From Server	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
Delta	Total number of packets processed since the last time the **ip helper statistics** were checked during any user session.

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **show ip dhcp relay statistics**)

Related Commands

show ip dhcp relay interface	Displays current DHCP Relay configuration information.
no ip helper statistics	Resets IP helper statistics.

MIB Objects

```
iphelperStatTable
   iphelperServerAddress
   iphelperRxFromClient
   iphelperTxToServer
   iphelperMaxHopsViolation
   iphelperForwDelayViolation
   iphelperResetAll
```

no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

no ip helper statistics [global-only | server-only | address *ip_address* | **vlan** *vlan_id* **{address** *ip_address***}]**

Syntax Definitions

global-only	Specifies that only the global IP helper statistics must be reset.
server-only	Specifies that only the IP helper statistics related to the server must be reset.
ip_address	Specifies the IP address for the flat mode instance.
vlan_id	Specifies the VLAN ID for the per-VLAN mode instance.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the **address** keyword
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the **vlan** keyword and the related IP address with the **address** keyword.

Examples

```
-> no ip helper statistics
-> no ip helper statistics global-only
-> no ip helper statistics server-only
-> no ip helper statistics address 172.6.5.1
-> no ip helper statistics vlan 20 address 172.6.5.1
```

Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use **ip dhcp relay clear statistics**)

Related Commands

show ip helper statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
iphelperStatsTable
   iphelperResetAllStats
   iphelperResetSrvStats
```

ip udp relay port

Enables or disables generic UDP relay for the specified UDP service port. A user-defined or well-known UDP port number is specified with this command.

ip udp relay port *port_num* **[description** *description***]**

ip udp relay no port *port_num*

Syntax Definitions

port_num	A UDP service port number (for example, 53, 69, 301).
description	An optional description for the specified UDP service port.

Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
description	UDP port #

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable generic UDP relay for the specified port.
- Use the **ip dhcp relay** commands to configure functionality for BOOTP/DHCP well-known ports (67/68).

Examples

```
-> ip udp relay port 54
-> ip udp relay port 54 description “Generic UDP Service”
-> ip udp relay no port 54

-> ip udp relay port 69 description “TFTP relay”
-> ip udp relay no port 69
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip udp relay vlan	Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.
ip udp relay svc	Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded
ip udp relay address	Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.
show ip udp relay	Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

```
genericUdpServiceTable
   genericUdpServiceUdpPort
   genericUdpServiceDescription
   genericUdpServiceRowStatus
```

ip udp relay service

Enables or disables generic UDP relay for the specified UDP service name (NBNS, NBDD, or other well-known UDP ports).

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} [description *description***]**

ip udp relay no service {tftp | tacacs | ntp | nbns | nbdd | dns}

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
description	An optional description for the specified UDP well-known service port.

Defaults

parameter	default
description	service name and port #

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is used with any of the **service** keywords and provides a user-defined description to identify the port service.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ip udp relay service dns
-> ip udp relay service dns description dns_1
-> ip udp relay no service dns
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip udp relay vlan	Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.
ip udp relay svc	Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded
ip udp relay address	Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.
show ip udp relay	Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

```
genericUdpServiceTable
   genericUdpServiceUdpPort
   genericUdpServiceDescription
   genericUdpServiceRowStatus
```

ip udp relay vlan

Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.

ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num* **[description** *description***]} vlan** *vlan_id***[-***vlan_id2***]**

ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num***} no vlan** *vlan_id***[-***vlan_id2***]}**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined port number.
description	A description of the UDP service.
*vlan_id***[-***vlan_id2***]**	VLAN ID number. Use a hyphen to specify a range of VLAN IDs (3-5).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

Examples

```
-> ip udp relay service DNS vlan 10
-> ip udp relay service DNS vlan 500-550
-> ip udp relay service DNS no vlan 10
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20
```

```

ip udp relay svc

Specifies a Shortest Path Bridging (SPB) service on which traffic destined for a UDP port is forwarded.

ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num* **[description** *description***]} svc** *service_id***[-***service_id2***]**

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num***} no svc** *service_id***[-***service_id2***]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined port number.
description	A description of the UDP service.
*service_id***[-***service_id2***]**	SPB service ID number. Use a hyphen to specify a range of service IDs (3-5).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the SPB service association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

Examples

```
-> ip udp relay service dns svc 10
-> ip udp relay service dns svc 50-55
-> ip udp relay service dns no svc 10
-> ip udp relay port 3047 svc 20
-> ip udp relay port 3047 no svc 20
```

Release History

Release 8.5R4; command introduced.

Related Commands

ip udp relay port	Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.
ip udp relay service	Enables or disables generic UDP relay for well-known UDP service names.
ip udp relay vlan	Specifies the VLAN on which traffic destined for the specified UDP port is forwarded.
ip udp relay address	Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.
show ip udp relay	Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

```
alaGenericUdpServiceSvcTable
    alaGenericUdpServiceSvcPort
    alaGenericUdpServiceDstSvc
    alaGenericUdpServiceSvcRowStatus
```

ip udp relay address

Specifies the UDP server IP address to which traffic destined for a UDP port is forwarded as unicast packets.

ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num* **[description** *description***]} address** *ip_address*

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num***} no address** *ip_address*

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined port number.
description	A description of the UDP service.
ip_address	The IPv4 address of a UDP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IP address association with the UDP service port.
- The UDP port must be created before using this command.
- Only one IP address can be configured for a UDP port (multiple IP addresses for the same UDP port is not supported).
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.
- When the specified UDP port is associated with an IP address, the relay is operating at the Layer 3 level; any attempt to then assign a VLAN or SPB service to that UDP port is blocked. UDP ports associated with a VLAN or SPB service are operating at the Layer 2 level.

Examples

```
-> ip udp relay service dns address 10.2.2.1
-> ip udp relay service tftp address 20.2.2.1
-> ip udp relay service dns no address 10.2.2.1
```

```
-> ip udp relay port 3047 address 10.2.2.1
-> ip udp relay port 3047 address 10.2.2.1

-> ip udp relay port 54 address 30.2.2.1
-> ip udp relay port 54 vlan 200
ERROR: UDP port configured in L3 mode

-> ip udp relay port 64 vlan 200
-> ip udp relay port 64 address 40.2.2.1
ERROR: UDP port configured in L2 mode
```

Release History

Release 8.3.1; command introduced.

Related Commands

ip udp relay port	Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.

   alaGenericUdpServiceDstIpType
   alaGenericUdpServiceDstIpAddress
   alaGenericUdpServiceDstIpRowStatus
```

show ip udp relay

Displays the generic UDP relay service configuration.

show ip udp relay [service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num***]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined or well-known port number.

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-defined or well-known port.

Examples

```
-> show ip udp relay
 Service Name         Port   IP Address       Vlans      Services
---------------------+------+----------------+---------+--------------------
DNS port              53     40.2.2.1
UDP port 54           54     20.2.2.1
UDP port 55           55                      200
UDP port 56           56                                 10
TFTP port             69                      200        20

-> show ip udp relay port 54
 Service Name         Port   IP Address       Vlans      Services
---------------------+------+----------------+---------+--------------------
UDP port 54           54     20.2.2.1
-> show ip udp relay service tftp
 Service Name         Port   IP Address       Vlans      Services
---------------------+------+----------------+---------+--------------------
TFTP port             69                      200        20
```

output definitions

Service Name	The active UDP service name.
Port	The UDP service port number.
IP Address	The destination IP address assigned to the UDP service port. Configured through the **ip udp relay address** command.
Vlans	The destination VLANs assigned to the UDP service port. Configured through the **ip udp relay vlan** command.
Services	The destination Shortest Path Bridging (SPB) service assigned to the UDP service port. Configured through the **ip udp relay svc** command.

Release History

Release 7.1.1; command introduced.
Release 8.5R4; **IP Address** and **Services** field added.

Related Commands

show ip udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

N/A

show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLANs, Shortest Path Bridging (SPB) services, or an IP address configured for that service, and the number of packets the service has sent and received.

show ip udp relay statistics [service {tftp | tacacs | ntp | nbns | nbdd | dns}] [port [*port_num***]]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined or well-known UDP service port number.

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-define or well-known port.
- Use the **ip udp relay no statistics** command to reset statistics counters.

Examples

```
-> show ip udp relay statistics
Port   Service        Pkts Recvd      Pkts Sent   Dst Vlan/IP Address    Svc

   69 TFTP port               0          0             1
                              0          0             300
                              0          0             200
   69 TFTP port               0          0                            20

-> show ip udp relay statistics port 53
Port   Service        Pkts Recvd      Pkts Sent   Dst Vlan/IP Address    Svc
-----+-------------+--------------+-----------+----------------------+-----------
   53 DNS port                0          0             10.1.1.2
```

output definitions

Port	The active UDP port number.
Service	The active UDP service name.
Pkts Recvd	The number of packets received by this service port from a client.
Pkts Sent	The number of packets sent from this service port to the server.
Dst Vlan/Ip Address	The VLAN or IP address assigned to the UDP service port that forwards traffic destined for the port. Configured through the **ip udp relay vlan** or **ip udp relay address** command.
Svc	The SPB service assigned to the UDP service port that forwards traffic destined for the port. Configured through the **ip udp relay svc** command.

Release History

Release 7.1.1; command introduced.
Release 8.5R4; **Dst Vlan/IP Address** and **Svc** fields added.

Related Commands

show ip udp relay	Displays current configuration for UDP services by service name or by service port number.
ipv6 udp relay clear statistics	Resets all the generic UDP Relay service statistics.

MIB Objects

N/A

ip udp relay no statistics

Resets all the generic UDP Relay service statistics.

ip udp relay no statistics

Syntax Definitions

N/A

Defaults

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When this command is applied, the UDP relay statistics are cleared and the **show ip udp relay statistics** command displays no information.

Examples

```
-> ip udp relay no statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
genericUdpServiceTable
   genericUdpServiceStatReset
```

ipv6 udp relay port

Enables or disables generic IPv6 UDP relay for the specified UDP service port. A user-defined or well-known UDP port number is specified with this command.

ipv6 udp relay port *port_num* **[description** *description***]**

ipv6 udp relay no port *port_num*

Syntax Definitions

port_num	A UDP service port number (for example, 53, 69, 301).
description	An optional description for the specified UDP service port.

Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
description	UDP port #

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable generic UDP relay for the specified port.
- Use the **ipv6 dhcp relay** commands to configure functionality for BOOTP/DHCP well-known ports (67/68).

Examples

```
-> ipv6 udp relay port 54
-> ipv6 udp relay port 54 description “Generic UDP Service”
-> ipv6 udp relay no port 54

-> ipv6 udp relay port 69 description “TFTP relay”
-> ipv6 udp relay no port 69
```

Release History

Release 8.6R1; command introduced.

Related Commands

ipv6 udp relay vlan	Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.
ipv6 udp relay svc	Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded
ipv6 udp relay address	Specifies the UDP server IPv6 address to which traffic destined for the specified UDP port is forwarded as unicast packets.
show ipv6 udp relay	Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

```
alaGenericUdpv6ServiceTable
   alaGenericUdpv6ServiceUdpPort
   alaGenericUdpv6ServiceDescription
   alaGenericUdpv6ServiceRowStatus
```

ipv6 udp relay service

Enables or disables generic IPv6 UDP relay for the specified UDP service name (DNS, NTP, or other well-known UDP ports).

ipv6 udp relay service {tftp | tacacs | ntp | dns} [description *description***]**

ipv6 udp relay no service {tftp | tacacs | ntp | dns}

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
dns	DNS well-known port 53.
description	An optional description for the specified UDP well-known service port.

Defaults

parameter	default
description	service name and port #

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is used with any of the **service** keywords and provides a user-defined description to identify the port service.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ipv6 udp relay service dns
-> ipv6 udp relay service dns description dns_1
-> ipv6 udp relay no service dns
```

Release History

Release 8.6R1; command introduced.

Related Commands

```

ipv6 udp relay address

Specifies the UDP server IPv6 address to which traffic destined for a UDP port is forwarded as unicast packets.

ipv6 udp relay {service {tftp | tacacs | ntp | dns} | port *port_num* **[description** *description***]} address** *ipv6_address***]**

ipv6 udp relay service {tftp | tacacs | ntp | dns} | port *port_num* **no address** *ip6_address*

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
dns	DNS well-known port 53.
port_num	A user-defined port number.
description	A description of the UDP service.
ipv6_address	The IPv6 address of a UDP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IPv6 address association with the UDP service port.
- The UDP port must be created before using this command.
- Only one IPv6 address can be configured for a UDP port (multiple IPv6 addresses for the same UDP port is not supported).
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.
- When the specified UDP port is associated with an IPv6 address, the relay is operating at the Layer 3 level; any attempt to then assign a VLAN or SPB service to that UDP port is blocked. UDP ports associated with a VLAN or SPB service are operating at the Layer 2 level.

Examples

```
-> ipv6 udp relay service dns address 2001:DB8:3001::3
-> ipv6 udp relay service tftp address 2001:DB8:3001::3
-> ipv6 udp relay service dns no address 2001:DB8:3001::3
-> ipv6 udp relay port 3047 address 2001:DB8:3001::3
-> ipv6 udp relay port 3047 no address 2001:DB8:3001::3
```

```
-> ipv6 udp relay port 54 address 30.2.2.1
-> ipv6 udp relay port 54 vlan 200
ERROR: UDP port configured in L3 mode

-> ipv6 udp relay port 64 vlan 200
-> ipv6 udp relay port 64 address 40.2.2.1
ERROR: UDP port configured in L2 mode
```

Release History

Release 8.6R1; command introduced.

Related Commands

ipv6 udp relay port	Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.
ipv6 udp relay service	Enables or disables generic UDP relay for well-known UDP service names.
ipv6 udp relay vlan	Specifies the VLAN on which traffic destined for the specified UDP port is forwarded.
ipv6 udp relay svc	Specifies the Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded.
show ipv6 udp relay	Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

```
alaGenericUdpv6ServiceDstIpTable
   alaGenericUdpv6ServiceDstUdpPort
   alaGenericUdpv6ServiceDstIpType

   alaGenericUdpv6ServiceDstIpRowStatus
```

show ipv6 udp relay

Displays the generic UDP relay service configuration.

show ipv6 udp relay [service {tftp | tacacs | ntp | dns} | port *port_num***]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
dns	DNS well-known port 53.
port_num	A user-defined or well-known port number.

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-defined or well-known port.

Examples

```
-> show ipv6 udp relay
Service Name          Port    IPv6 Address                       Vlans/Services
----------------------+------+----------------------------------+------------------
DNS port              53     3001::3
UDP port 137          137                                       200

-> show ipv6 udp relay port 137
Service Name          Port    IPv6 Address                       Vlans/Services
----------------------+------+----------------------------------+------------------
UDP port 137          137                                       200

-> show ipv6 udp relay service dns
Service Name          Port    IPv6 Address                       Vlans/Services
----------------------+------+----------------------------------+------------------
DNS port              53     3001::3
```

output definitions

Service Name	The active UDP service name.
Port	The UDP service port number.

output definitions (continued)

IPv6 Address	The destination IPv6 address assigned to the UDP service port. Configured through the **ipv6 udp relay address** command.
Vlans	The destination VLANs assigned to the UDP service port. Configured through the **ipv6 udp relay vlan** command.
Services	The destination Shortest Path Bridging (SPB) service assigned to the UDP service port. Configured through the **ipv6 udp relay svc** command.

Release History

Release 8.6R1; command introduced.

Related Commands

show ipv6 udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

N/A

show ipv6 udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLANs, Shortest Path Bridging (SPB) services, or an IPv6 address configured for that service, and the number of packets the service has sent and received.

show ipv6 udp relay statistics [service {tftp | tacacs | ntp | dns}] [port [*port_num***]]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
dns	DNS well-known port 53.
port_num	A user-defined or well-known UDP service port number.

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-define or well-known port.
- Use the **ipv6 udp relay clear statistics** command to reset statistics counters.

Examples

```
-> show ipv6 udp relay statistics
Port  Service        Pkts Recvd Pkts Sent  Dst Vlan/Svc/IPv6 Address
-----+--------------+----------+----------+----------------------------------------
   53 DNS port                0          0 3001::2
   54 UDP port 54             0          0 10
   55 UDP port 55             0          0 200
   56 UDP port 56             0          0 200
   56 UDP port 56             0          0 20
   69 TFTP port               0          0 1
                              0          0 300
                              0          0 200
   69 TFTP port               0          0 20
  123 NTP port                0          0 2001::2
```

```
-> show ipv6 udp relay statistics service tftp
Port  Service        Pkts Recvd Pkts Sent  Dst Vlan/Svc/IPv6 Address
-----+-------------+----------+----------+---------------------------------------
   69 TFTP port               0          0 1
                              0          0 300
                              0          0 200
   69 TFTP port               0          0 20

-> show ipv6 udp relay statistics port 53
Port  Service        Pkts Recvd Pkts Sent  Dst Vlan/Svc/IPv6 Address
-----+-------------+----------+----------+---------------------------------------
   53 DNS port                0          0 3001::2
```

output definitions

Port	The active UDP port number.
Service	The active UDP service name.
Pkts Recvd	The number of packets received by this service port from a client.
Pkts Sent	The number of packets sent from this service port to the server.
Dst Vlan/Ip Address	The VLAN or IPv6 address assigned to the UDP service port that forwards traffic destined for the port. Configured through the **ipv6 udp relay vlan** or **ipv6 udp relay address** command.
Svc	The SPB service assigned to the UDP service port that forwards traffic destined for the port. Configured through the **ipv6 udp relay svc** command.

Release History

Release 8.6R1; command introduced.

Related Commands

show ipv6 udp relay	Displays current configuration for UDP services by service name or by service port number.
ipv6 udp relay clear statistics	Resets all the generic UDP Relay service statistics.

MIB Objects

N/A

ipv6 udp relay clear statistics

Resets all the generic UDP Relay service statistics.

ipv6 udp relay clear statistics

Syntax Definitions

N/A

Defaults

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When this command is applied, all UDP relay statistics are reset to zero.
- Use the **show ipv6 udp relay statistics** command to display UDP relay statistics.

Examples

```
-> ipv6 udp relay clear statistics
```

Release History

Release 8.6R1; command introduced.

Related Commands

show ipv6 udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
alaGenericUdpv6ServiceGlobal
   alaGenericUdpv6ServiceStatReset
```

ipv6 dhcp relay admin-state

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.

ipv6 dhcp relay admin-state {enable | disable}

Syntax Definitions

enable	Enables the DHCPv6 Relay feature.
disable	Disables the DHCPv6 Relay feature.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DHCPv6 Relay must be explicitly enabled on the interfaces from which received DHCP client messages are to be relayed.

Examples

```
-> ipv6 dhcp relay admin-state enable
-> ipv6 dhcp relay admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

ipv6 dhcp relay interface admin-state	Enables or disables the relay of DHCPv6 client messages received on an interface.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6Config
   alaDHCPv6RelayAdminStatus
```

ipv6 dhcp relay interface admin-state

Enables or disables the relay of DHCPv6 client messages received on an interface.

ipv6 dhcp relay *if_name* **admin-state {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable	Enables the relay of DHCPv6 client messages on an interface.
disable	Disables the relay of DHCPv6 client messages on an interface.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

At least one relay destination must be configured before enabling the DHCPv6 relay on an interface.

Examples

```
-> ipv6 dhcp relay int1 admin-state enable
-> ipv6 dhcp relay int1 admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

ipv6 dhcp relay destination	Configures the DHCPv6 relay destination.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayInterfaceTable
   alaDHCPv6RelayInterfaceAdminStatus
```

ipv6 dhcp relay destination

Configures the DHCPv6 Relay destination.

ipv6 dhcp relay *if_name* **destination** *ip6_address scope_if_name*

no ipv6 dhcp relay *if_name* **destination** *ip6_address scope_if_name*

Syntax Definitions

if_name	IPv6 interface name.
ip6_address	The IPv6 address of the relay destination.
scope_if_name	Name of the interface for the local-link. This must be specified if the relay destination is a link-local. Not required if the destination address is not a link-local address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Maximum of five relay destinations can be configured for an interface.
- If the relay destination is a link-local address, the name of the interface used to reach the destination must be specified.
- Use the **no** form of the command to remove the configured DHCPv6 Relay destination for an interface.
- The IPv6 interface must be defined for a VLAN or a Shortest Path Bridging (SPB) service before using this command. Packets destined for the specified IPv6 address are relayed over the VLAN or SPB service domain.
- Configuring a DHCPv6 Relay agent for an IPv6 interface that is bound to an SPB service (a service-based IPv6 interface) is supported only on the OmniSwitch 9900.

Examples

```
-> ipv6 dhcp relay int1 destination 2001:DB8:3001::3
-> ipv6 dhcp relay int1 destination fe80::64 int1
-> no ipv6 dhcp relay int1 destination 2001:DB8:3001::3
```

Release History

Release 7.3.4; command introduced.

Related Commands

show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayDestinationTable
   alaDHCPv6RelayDestinationAddressType
   alaDHCPv6RelayDestinationAddress
   alaDHCPv6RelayDestinationRowStatus
```

ipv6 dhcp relay maximum-hops

Sets the maximum number of hops value for the DHCPv6 Relay configuration. This value specifies the maximum number of relays a DHCPv6 packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

ip dhcp relay maximum-hops *hops*

Syntax Definitions

hops	The maximum number of relays. The valid range is 1–32.

Defaults

By default, the maximum hops value is set to 32 hops.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCPv6 Relay discards the packet.
- The maximum hops value only applies to DHCPv6 Relay and is ignored by other services.

Examples

```
-> ipv6 dhcp relay maximum-hops 1
-> ipv6 dhcp relay maximum-hops 10
```

Release History

Release 8.6R1; command introduced.

Related Commands

ipv6 dhcp relay admin-state	Enables or disables the DHCP Relay feature for the switch.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayConfig
   alaDHCPv6RelayMaximumHops
```

show ipv6 dhcp relay

Displays all the interfaces on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

show ipv6 dhcp relay

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Interfaces on which DHCPv6 relay is disabled and which have no relay destinations configured will not be shown in the output.

Examples

```
-> show ipv6 dhcp relay
DHCPv6 Relay: Enabled
Maximum Hops: 32

Interface                  Relay Destination(s)                     Status
---------------------------+----------------------------------------+--------
vlan-41                    ff02::1:2                                Enabled
vlan-103                   2001:dbc8:8003::17                       Disabled
                           2001:dbc8:8004::99
vlan-200                   fe80::cd0:deff:fe28:1ca5 vlan-201        Enabled
tunnel-2                   2001:dbc8:a23::ea77                      Enabled
```

output definitions

DHCPv6 Relay	Specifies if the DHCPv6 Relay feature is enabled in the current VRF.
Maximum Hops	The maximum number of relays the BOOTP/DHCP packet can go through until it reaches its server destination.
Interface	Displays the interface on which DHCPv6 Relay is enabled.
Relay Destination(s)	Displays the configured DHCPv6 Relay destination(s) for the interface.
Status	Displays the status of DHCPv6 Relay on the interface.

Release History

Release 7.3.4; command introduced.
Release 8.6R1; “Maximum Hops” field added.

Related Commands

ipv6 dhcp relay admin-state	Enables or disables the DHCPv6 Relay feature on a per-VRF basis.
ipv6 dhcp relay interface admin-state	Enables or disables the relay of DHCPv6 client messages received on an interface.
ipv6 dhcp relay destination	Configures the DHCPv6 relay destination address.
ipv6 dhcp relay maximum-hops	Configures the maximum number of hops value.

MIB Objects

```
alaDHCPv6RelayConfig
   alaDHCPv6RelayMaximumHops
   alaDHCPv6RelayAdminStatus
alaDHCPv6RelayInterfaceTable
   alaDHCPv6RelayInterfaceEntry
   alaDHCPv6RelayInterfaceAdminStatus
alaDHCPv6RelayDestinationTable
   alaDHCPv6RelayDestinationAddress
```

dhcp-server

Enables or disables the DHCP server operation.

dhcp-server {enable | disable}

Syntax Definitions

enable	Enables the DHCP server.
disable	Disables the DHCP server.

DefaultsDefaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When DHCP server is enabled on the switch, DHCP relay and DHCP snooping will not be supported on the default VRF of the switch.
- DHCP server must be restarted when changes are made to the dhcpd.conf or dhcpd.pcy file. Use the **dhcp-server restart** command to restart the DHCP server.

Examples

```
-> dhcp-server enable
-> dhcp-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcp-server leases	Displays the leases offered by the DHCP server.
dhcp-server restart	Allows to restart the DHCP server when the **dhcpd.conf** or **dhcpd.pcy** file is modified.
clear dhcp-server statistics	Clears the statistics of the DHCP server.

MIB Objects

```
alaDhcpSrvGlobalConfigStatus
```

dhcp-server restart

Allows to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

dhcp-server restart

Syntax Definitions

restart	Restarts the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The command can be used to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

Examples

```
-> dhcp-server restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

dhcp-server	Enables or disables the DHCP server operation

MIB Objects

```
alaDhcpSrvGlobalRestart
```

show dhcp-server leases

Displays the leases offered by the DHCP server.

show dhcp-server leases [ip- address *ip_address* **| mac-address** *mac_address***] [type {static | dynamic}] [count]**

Syntax Definitions

ip_address	Specifies IP address of the interface configured with DHCP server.
mac_address	Specifies MAC address of the interface configured with DHCP server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCP messages recorded.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

```
-> show dhcp-server leases

Total leases: 8

```

show dhcp-server statistics

Displays the statistics of the DHCP server.

show dhcp-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCP server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

```
-> show dhcp-server statistics
General:
  DHCP Server Name: mample.vitalqip.com,
   DHCP Server Status         : Enabled,

output definitions

General stats	Denotes general DHCP Server statistics.
Name	Specifies the name assigned to the DHCP server.
Status	Specifies up or down status of the DHCP server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCP server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCP Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCP server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.

output definitions (continued)

Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCP request grants provided by the server to the clients.
Total DHCP Request Renews	Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.
Total DHCP Declines	Specifies the total number of DHCP requests declined by the DHCP server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.
Total DHCP Nacks	Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCP server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.
Leases stats	Denotes statistical information about leases provided by the DHCP server.
Hosts Managed	Specifies the total number of clients managed by the DHCP server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCP server.
Hosts unused	Specifies the total number of clients managed by the DHCP server which are not being used.
Hosts Pending	Specifies the total number of DHCP IP address requests which are pending by the DHCP server.
Hosts unavailable	Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.
Static DHCP	Denotes statistical information about the hosts configured with Static DHCP.
Automatic DHCP	Denotes statistical information about the hosts configured with Automatic DHCP.

output definitions (continued)

Static BootP	Denotes statistical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCP server is enabled on the switch.
Automatic BootP	Denotes statistical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCP related statistical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.
Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 7.3.4; command introduced.

Related Commands

clear dhcp-server statistics	Clears the DHCP Server lease statistics.

MIB Objects

N/A

clear dhcp-server statistics

Clears the packet counters of DHCP server statistics.

clear dhcp-server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to clear the packet counters of DHCP server statistics.

Examples

```
-> clear dhcp-server statistics
```

Release History

Release 7.3.4; command introduced.

Related Commands

show dhcp-server statistics	Displays the DHCP Server lease statistics.

MIB Objects

N/A

dhcpv6-server

Enables or disables the DHCPv6 server operation.

dhcpv6-server {enable | disable}

Syntax Definitions

enable	Enables the DHCPv6 server.
disable	Disables the DHCPv6 server.

DefaultsDefaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

- The dhcpdv6.conf and dhcpdv6.pcy files will be parsed when the DHCPv6 status is enabled for the first time.
- There will be one instance of DHCPv6 for the default VRF.

Examples

```
-> dhcpv6-server enable
-> dhcpv6-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcpv6-server leases	Displays the leases offered by the DHCPv6 server.
dhcpv6-server restart	Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.
clear dhcpv6-server statistics	Displays the statistics of the DHCPv6 server.

MIB Objects

```
alaDhcpv6SrvGlobalConfigStatus
```

dhcpv6-server restart

Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.

dhcpv6-server restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> dhcpv6-server restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

dhcpv6-server	Enables or disables the DHCPv6 server operation.

MIB Objects

```
alaDhcpv6SrvGlobalRestart
```

show dhcpv6-server leases

Displays the leases offered by the DHCPv6 server.

show dhcpv6-server leases [ip- address *ipv6_address* **| type {static | dynamic}] [count]**

Syntax Definitions

ipv6_address	Specifies IPv6 address of the interface configured with DHCPv6 server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCPv6 messages recorded.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-server leases

Total leases: 8

IP Address          Lease Granted        Pref Lease Expiry     Valid Lease Expiry   Type
------------------+--------------------+--------------------+-----------
2001:100::2        DEC 15 14:10:59 2009  DEC 19 01:30:59 2009  DEC 19 05:30:59 2009 STATIC

------------------+--------------------+--------------------+--------------------+-----
2001:100::3         DEC 15 14:11:05 2009  DEC 19 01:31:05 2009  DEC 19 05:31:05 2009 DYNAMIC

-> show dhcpv6-server leases type static

Total leases: 1
IP Address       Lease Granted       Pref Lease Expiry      Valid Lease Expiry   Type
----------------+------------------+--------------------+--------------------+-------
2001:100::2      DEC 15 14:10:59 2009  DEC 19 01:30:59 2009  DEC 19 05:30:59 2009 STATIC
```

output definitions

IP address	The IP address allocated to the client.
Lease Granted	The date and time at which lease is granted.

output definitions (continued)

Pref Lease Expiry	The date and time at which lease expires.
Type	The type of lease offered.

Release History

Release 7.3.4; command introduced.

Related Commands

clear dhcpv6-server statistics	Clears the DHCPv6 server lease statistics.

MIB Objects

show dhcpv6-server statistics

Displays the statistics of the DHCPv6 server.

show dhcpv6-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCPv6 server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCPv6 server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

DHCPv6 server should be enabled before using this command.

```

output definitions

General	Denotes general DHCPv6 Server statistics.
DHCPv6 Server Name	Specifies the name assigned to the DHCPv6 server.
DHCPv6 Server Status	Specifies up or down status of the DHCPv6 server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCPv6 server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCPv6 Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCPv6 server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.
Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCPv6 server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCPv6 request grants provided by the server to the clients.

output definitions (continued)

Total DHCP Request Renews	Specifies the total number of DHCPv6 lease renew requests sent by the clients to the DHCPv6 server.
Total DHCP Declines	Specifies the total number of DHCPv6 requests declined by the DHCPv6 server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCPv6 server to the clients.
Total DHCP Nacks	Specifies the total number of DHCPv6 Negative acknowledgements sent from the DHCPv6 server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCPv6 server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCPv6 options from the DHCPv6 server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCPv6 server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCPv6 server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCPv6 packets received by the DHCPv6 server.
Leases stats	Denotes statistical information about leases provided by the DHCPv6 server.
Hosts Managed	Specifies the total number of clients managed by the DHCPv6 server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCPv6 server.
Hosts unused	Specifies the total number of clients managed by the DHCPv6 server which are not being used.
Hosts Pending	Specifies the total number of DHCPv6 IP address requests which are pending by the DHCPv6 server.
Hosts unavailable	Specifies the total number of DHCPv6 hosts which are unavailable (for example, hosts whose lease period has expired).
Static DHCP	Denotes statistical information about the hosts configured with Static DHCPv6.
Automatic DHCP	Denotes statistical information about the hosts configured with Automatic DHCPv6.
Static BootP	Denotes statistical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCPv6 server is enabled on the switch.
Automatic BootP	Denotes statistical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCPv6 related statistical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.

output definitions (continued)

Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 7.3.4; command introduced.

Related Commands

clear dhcpv6-server statistics	Clears the DHCPv6 Server lease statistics.

MIB Objects

N/A

clear dhcpv6-server statistics

Clears the packet counters of DHCPv6 server statistics.

clear dhcpv6-server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-V72, 6900-C32

Usage Guidelines

Use this command to clear the packet counters of DHCPv6 server statistics.

Examples

```
-> clear dhcpv6-server statistics
```

Release History

Release 7.3.4; command introduced.

Related Commands

show dhcpv6-server statistics	Displays the DHCPv6 Server lease statistics.

MIB Objects

N/A

dhcp-message-service

Enable or disable the message service operation.

dhcp-message-service {enable | disable}

Syntax Definitions

enable	Enables the operational status of the message service.
disable	Disables the operational status of the message service.

Defaults

By default, the operational status of the message service is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **conf** and **pcy** files are parsed when message service is enabled.
- There is one instance of the message service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> dhcp-message-service enable
-> dhcp-message-service disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-message-service restart	Restarts the message service after the msgd.conf file is modified.

MIB Objects

```
alaMsgSrvGlobalConfigStatus
```

dhcp-message-service restart

Restarts the message service after the **msgd.conf** file or **dhcpd.pcy** is modified.

dhcp-message-service restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Before using this command, enable the message service status using the **dhcp-message-service** command.

Examples

```
-> message-service restart
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-message-service	Enable or disable the message service operation.

MIB Objects

```
alaMsgSrvGlobalRestart
```

show message-service status

Displays the status and statistical information related to the message service running on the switch.

show message-service status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show message-service status
Message Service is enabled
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-message-service	Enable or disable the message service operation.
dhcp-message-service restart	Restarts the message service, after the msgd.conf file is modified.

MIB Objects

N/A

active-lease-service

Enable or disable the Active Lease Service operation.

active-lease-service {enable | disable}

Syntax Definitions

enable	Enables the operational status of the Active Lease Service.
disable	Disables the operational status of the Active Lease Service.

Defaults

By default, the operational status of Active Lease Service is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

There is one instance of Active Lease Service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> active-lease-service enable
-> active-lease-service disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service restart	Restarts the Active Lease Service after the netd.pcy file is modified.
show active-lease-service status	Displays the status and statistical information related to Active Lease Service running on the switch.

MIB Objects

```
alaActiveLeaseSrvGlobalConfigStatus
```

active-lease-service restart

Restarts the Active Lease Service after the netd.pcy file is modified.

active-lease-service restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Before using this command, enable the Active Lease Service using the **active-lease-service** command.

Examples

```
-> active-lease-service restart
```

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service	Enable or disable the Active Lease Service operation.
show active-lease-service status	Displays the status and statistical information related to Active Lease Service running on the switch.

MIB Objects

```
alaActiveLeaseSrvGlobalRestart
```

show active-lease-service status

Displays the status and statistical information related to the Active Lease Service running on the switch.

show active-lease-service status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show active-lease-service status
Active Lease Service is enabled
```

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service	Enable or disable the Active Lease Service operation.

MIB Objects

N/A

dhcp-snooping admin-state

Enables or disables DHCP Snooping for the switch.

dhcp-snooping admin-state {enable | disable}

no dhcp-snooping

Syntax Definitions

enable	Enables DHCP Snooping for the switch.
disable	Disables DHCP Snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When DHCP Snooping is administratively disabled for the switch, the DHCP Snooping configuration remains and dynamic binding table entries are cleared.
