OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.
ipv6 bgp neighbor in-communitylist	Assigns an inbound community list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListType

ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
priority *value*

Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<i>value</i>	Priority value in the range 0 - 255.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with community string list.

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListPriority

ip bgp policy prefix-list

Creates or deletes a prefix match list.

ip bgp policy prefix-list *name ip_address ip_mask*

no ip bgp policy prefix-list *name ip_address ip_mask*

Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.

Defaults

No IP BGP policy prefix-list exists.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the [ip bgp neighbor in-prefixlist](#), [ip bgp neighbor out-prefixlist](#), [ipv6 bgp neighbor in-prefixlist](#) and [ipv6 bgp neighbor out-prefixlist](#) commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the [show ip bgp policy prefix-list](#) command.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-prefixlist	Assigns an inbound prefix filter list to a BGP peer.
ip bgp neighbor out-prefixlist	Assigns an outbound prefix filter list to a BGP peer.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.
ipv6 bgp neighbor in-prefixlist	Assigns an inbound prefix filter list to an IPv6 BGP peer.
ipv6 bgp neighbor out-prefixlist	Assigns an outbound prefix filter list to an IPv6 BGP peer.

MIB Objects

alaBgpPrefixMatchListTable
 alaBgpPrefixMatchListRowStatus

ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

ip bgp policy prefix-list *name ip_address ip_mask* **action** {**permit** | **deny**}

Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

alaBgpPrefixMatchListTable
alaBgpPrefixMatchListAction

ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask ge value*

Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
<i>value</i>	The lower limit value in the range 0 –32.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the [ip bgp policy prefix-list le](#) command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

  alaBgpPrefixMatchListGE
```

ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask le value*

Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	Prefix list IP address for the prefix list.
<i>ip_mask</i>	Prefix list mask for the prefix list.
<i>value</i>	The upper limit value in the range of 0 to 32.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

alaBgpPrefixMatchListTable
alaBgpPrefixMatchListLE

ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

```
ip bgp policy prefix6-list pxf_list_name prefix6/pfx_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{masklength}] ] [le [{masklength}] ]
```

```
no ip bgp policy prefix6-list pxf_list_name prefix6/pfx_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{mask_length}] ] [le [{mask_length}] ]
```

Syntax Definitions

<i>pxf_list_name</i>	Prefix list name.
<i>prefix6</i>	Prefix list IPv6 address for the prefix list.
<i>pfx_length</i>	Prefix length. Prefix length should be in the range of 0 to 128.
<i>value</i>	The upper limit value in the range of 0 to 32.
permit deny	Action to be taken which can be either permit or deny.
enable disable	Row Status can be either enabled or disabled.
<i>mask_length</i>	Minimum length of the prefix to be matched. The valid range is 0–32.

Defaults

NA

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- This command creates prefix6 lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefix6list**, **ip bgp neighbor out-prefix6list**, **ipv6 bgp neighbor in-prefix6list** and **ipv6 bgp neighbor out-prefix6list**.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp policy prefix6-list	Displays prefix6 list parameters.

  alaBgpPrefix6MatchListId  
  alaBgpPrefix6MatchListAddr  
  alaBgpPrefix6MatchListAddrLength  
  alaBgpPrefix6MatchListAction  
  alaBgpPrefix6MatchListRowStatus  
  alaBgpPrefix6MatchListGE  
  alaBgpPrefix6MatchListLE
```

ip bgp policy route-map

Creates or deletes a policy route map.

ip bgp policy route-map *name sequence_number*

Syntax Definitions

<i>name</i>	Route map name. Case-sensitive.
<i>sequence_number</i>	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
 1. **ip bgp policy route-map aspath-list**
 2. **ip bgp policy route-map prefix-list**
 3. **ip bgp policy route-map prefix6-list**
 4. **ip bgp policy route-map community-list**
 5. **ip bgp policy route-map match-regexp**
 6. **ip bgp policy route-map match-prefix**
 7. **ip bgp policy route-map match-mask**
 8. **ip bgp policy route-map match-prefix6**
 9. **ip bgp policy route-map match-community**
- The route maps which apply to a specific address family (IPv4 or IPv6) are only applied to routes of the same address family. In other words, the prefix-list filter and match-prefix/match-mask route-maps are only applied to IPv4 routes and are ignored for IPv6 routes. The prefix6-list filter and match-prefix6 route-maps are only applied to IPv6 routes and are ignored for IPv4 routes.

- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
 - **ip bgp policy route-map community**
 - **ip bgp policy route-map community-mode**
 - **ip bgp policy route-map lpref**
 - **ip bgp policy route-map lpref-mode**
 - **ip bgp policy route-map med**
 - **ip bgp policy route-map med-mode**
 - **ip bgp policy route-map origin**
 - **ip bgp policy route-map weight**
- Route maps can be referenced as a filtering mechanism for displaying paths using the **show ip bgp path** command. They are also referenced in filtering inbound and outbound routes for BGP peers using the **ip bgp neighbor route-map** commands.

Examples

```
-> ip bgp policy route-map routemap1 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map action Configures action to be taken for a route when a match is found.

MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapRowStatus
```

ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

```
ip bgp policy route-map name sequence_number action {permit | deny}
```

Syntax Definitions

<i>name</i>	A route map name.
<i>sequence_number</i>	A route map sequence number. The valid range is 1–255.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

Defaultst

parameter	default
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapAction
```

ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

ip bgp policy route-map *name sequence_number aspath-list as_name*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>as_name</i>	The AS path list name or “none”.

Defaults

parameter	default
<i>as_name</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The [ip bgp policy aspath-list](#) and [ip bgp policy aspath-list action](#) commands are used to create and set permit/deny actions for an AS path list.

Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1  
-> ip bgp policy route-map routemap1 1 aspath-list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapAsPathMatchListId
```

ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

ip bgp policy route-map *name* *sequence_number* **asprepend** *path*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>path</i>	The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

Defaults

parameter	default
<i>path</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapAsPrepend

ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

ip bgp policy route-map *name sequence_number* **community** [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none no-export no-advertise no-export-subconfed <i>num:num</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “**none**”.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map community-list

Assigns a community matching list to the route map.

ip bgp policy route-map *name* *sequence_number* **community-list** [*list_name* / **none**]

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>list_name</i>	The community list name.
none	No community list name is specified.

Defaults

parameter	default
<i>list_name</i> / none	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
-> ip bgp policy route-map routemap1 1 community-list none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax **none** added to **community-list** string.

Related Commands

ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

ip bgp policy route-map *name sequence_number* **community-mode** {**add** | **replace**}

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
add	Adds the community string specified in the command ip bgp policy route-map community .
replace	Replaces the community string specified in the command ip bgp policy route-map community .

Defaults

parameter	default
add replace	add

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map lpref

Configures the local preference value for the route map.

ip bgp policy route-map *name sequence_number lpref value*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The local preference value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used in conjunction with [ip bgp policy route-map lpref-mode](#). The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map	Creates or deletes a policy route map.

ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

ip bgp policy route-map *name sequence_number* **lpref-mode** {**none** | **inc** | **dec** | **rep**}

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
none	Do not set the local preference attribute.
inc	Increment the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no local preference attribute is found in the matching route.
dec	Decrement the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no local preference attribute is found in the matching route.
rep	Replace the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command even if no local preference attribute is found in the matching route.

Defaults

parameter	default
none inc dec rep	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

ip bgp policy route-map *name sequence_number match-community* [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
none	Removes the community match from the route-map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes matching the community restricting advertisement to any peer.
no-export-subconfed	Routes matching the community restricting advertisement to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none no-export no-advertise no-export-subconfed <i>num:num</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command allows a matching community string primitive to be placed directly in the route map.
- By default, no community string is specified. The default behavior can be reset by changing the value to **none**.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapTable
alaBgpRouteMapMatchCommunity

ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

ip bgp policy route-map *name* *sequence_number* **match-mask** *ip_address*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching mask or “none”.

Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-prefix](#) command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

ip bgp policy route-map *name* *sequence_number* **match-prefix** *ip_address*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching prefix.

Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-mask](#) command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map match-prefix6

Configures a matching prefix6 primitive in the route map.

```
ip bgp policy route-map name sequence_number match-prefix6 ipv6_address/mask_length
```

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ipv6_address/mask_length</i>	The 128-bit IPv6 address of the matching prefix. The length in bits of the IPv6 prefix to be matched in the Route Map.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command allows a matching prefix6 primitive to be placed directly in the route map. By default, no prefix6 primitive is assigned to the route map. The default behavior can be reset by changing the value to “none”.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix6 2001:1218:103::/64
-> ip bgp policy route-map routemap1 1 match-prefix6 none
```

Release History

Release 7.3.4; command introduced.

```

ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

```
ip bgp policy route-map name sequence_number match-regexp "regular_expression"
```

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>regular_expression</i>	Regular expression or “none”. The regular expression must be enclosed by quotation marks.

Defaults

parameter	default
<i>regular_expression</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in [ip bgp policy aspath-list](#) on page 29-102.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “**none**”.
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

ip bgp policy route-map *name sequence_number med value*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med-mode](#) command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

ip bgp policy route-map *name sequence_number med-mode* {**none** | **inc** | **dec** | **rep**}

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.
none	Do not set the MED.
inc	Increment the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route.
dec	Decrement the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route.
rep	Replace the MED in the matching route by the value specified in the ip bgp policy route-map med command even if no MED is found in the matching route.

Defaults

parameter	default
none inc dec rep	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med](#). The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

ip bgp policy route-map *name sequence_number* **origin** {**igp** | **egp** | **incomplete** | **none**}

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
igp	Sets the origin attribute to remote internal BGP (IGP).
egp	Sets the origin attribute to local external BGP (EGP).
incomplete	Sets the origin attribute to incomplete, meaning the origin is unknown.
none	Sets the origin attribute to “none”.

Defaults

parameter	default
igp egp incomplete none	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

ip bgp policy route-map *name sequence_number prefix-list prefix_name*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix list name or “none”.

Defaults

parameter	default
<i>prefix_name</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The [ip bgp policy prefix-list](#), [ip bgp policy prefix-list action](#), [ip bgp policy prefix-list ge](#), and [ip bgp policy prefix-list le](#) commands are used to create and set permit/deny actions for a prefix path list.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Assigns a prefix matching list to the route map.

ip bgp policy route-map prefix6-list

Assigns a prefix6 matching list to the route map, which identifies the matching criteria list of IPv6 prefixes.

ip bgp policy route-map *name* *sequence_number* **prefix6-list** *prefix6_name*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix6 list name or “none”.

Defaults

parameter	default
<i>prefix6_name</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix6-list policy name is created using the [ip bgp policy prefix6-list](#) command.
- By default, no prefix6 list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix6-list listB
-> ip bgp policy route-map routemap1 1 prefix6-list none
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

ip bgp policy route-map *name sequence_number weight value*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The weight value. The valid range is 0–65535.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

ip bgp policy route-map *name* *sequence_number* **community-strip** *community_list*

Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>community_list</i>	The community list name.

Defaults

No IP BGP policy route-map community list exists.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

Examples

```
-> ip bgp policy route-map routemap1 1 community_strip communitylist
```

Release History

Release 7.1.1; command was introduced.

show ip bgp

Displays the current global settings for the local BGP speaker.

show ip bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

Examples

```
-> show ip bgp
Admin Status                = disabled,
Operational Status          = up,
Autonomous system Number    = 1,
BGP Router Id                = 111.1.1.1,
Confederation Identifier     = 0,
IGP Synchronization Status  = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference    = 100,
Route Reflection             = disabled,
Cluster Id                   = 0.0.0.0,
Missing MED Status           = Best,
Aspath Comparison            = enabled,
Always Compare MED           = disabled,
Fast External Fail Over     = disabled,
Log Neighbor Changes         = disabled,
Multiple path                 = disabled,
Graceful Restart             = enabled,
Graceful Restart Status      = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast                  = enabled,
IPv6 Unicast                  = disabled,
BFD Status                    = disabled,
ASN Output Format              = asplain
```

output definitions

Admin Status	Indicates whether the BGP protocol has been enabled or disabled through the ip bgp admin-state command.
Operational Status	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.
Autonomous system Number	The AS assigned to the local BGP speaker through the ip bgp autonomous-system command.
BGP Router Id	The IP address for the local BGP speaker.
Confederation Id	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the ip bgp confederation identifier command.
IGP Synchronization Status	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). Configured through the ip bgp synchronization command.
Minimum AS origin interval	The frequency, in seconds, at which routes local to the autonomous system are advertised. Configured through the ip bgp as-origin-interval command.
Default Local Preference	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the ip bgp default local-preference command.
Route Reflection	Indicates whether the local BGP speaker is acting as a route reflector for its AS. Configured through the ip bgp client-to-client reflection command.
Cluster Id	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. Configured through the ip bgp cluster-id command.
Missing MED Status	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value ($2^{32}-1$) or the best possible value (0). This value is set using the ip bgp bestpath med missing-as-worst command. By default, missing MED values are treated as best .
Aspath Comparison	Indicates whether the AS path will be in used in determining the best route. Configured through the ip bgp bestpath as-path ignore command.
Always Compare MED	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. Configured through the ip bgp always-compare-med command.
Fast External Fail Over	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. Configured through the ip bgp fast-external-failover command.
Log Neighbor Changes	Indicates whether logging of peer state changes is enabled or disabled. Configured through the ip bgp log-neighbor-changes command.
Multi path	Indicates whether support for multiple equal cost paths is enabled or disabled. Configured through the ip bgp maximum-paths command.

output definitions (continued)

Graceful Restart	Indicates whether graceful restart is enabled or disabled.
Graceful Restart Status	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Configured Graceful Restart Interval	Indicates the timer for achieving a graceful restart.
IPv4 Unicast	Indicates whether IPv4 unicast is enabled or disabled.
IPv6 Unicast	Indicates whether IPv6 unicast is enabled or disabled.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp unicast	Enables or disables unicast IPv4 updates for the BGP routing process.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process
show ip bgp statistics	Displays BGP global statistics.

show ip bgp statistics

Displays BGP global statistics.

show ip bgp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

Examples

```
-> show ip bgp statistics
# of Active Prefixes Known           = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths                  = 0,
# of Dampened Paths                   = 0,
# of Unsynchronized Paths             = 0,
# of Policy unfeasible paths          = 0,
Total Number of Paths                 = 0
```

output definitions

# of Active Prefixes Known	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
# of EBGP Neighbors in Established State	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
# of IBGP Neighbors in Established State	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
# of Feasible Paths	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
# of Dampened Paths	The number of route paths that are not active because they have violated dampening parameters.
# of Unsynchronized Paths	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

output definitions (continued)

# of Unfeasible Paths	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
Total Number of Paths	The total number of paths known to the speaker, active or not.

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

MIB Objects

alaBgpStatsTable

show ip bgp dampening

Displays the BGP route dampening settings.

show ip bgp dampening

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

Examples

```
-> show ip bgp dampening
Admin Status           = disabled,
Half life value (seconds) = 300,
Reuse value            = 200
Suppress value         = 300,
Max suppress time (seconds) = 1800,
```

output definitions

Admin Status	Indicates whether route dampening is enabled or disabled. This value is configured through the ip bgp dampening command.
Half life value	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the ip bgp dampening command.
Reuse value	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the ip bgp dampening command.
Suppress value	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the ip bgp dampening command.
Max Suppress time	The maximum time (in seconds) that a route will be suppressed. This value is configured through the ip bgp dampening command.

Release History

Release 7.1.1; command was introduced.

  alaBgpDampeningClear
```

show ip bgp dampening-stats

Displays BGP dampening statistics.

```
show ip bgp dampening-stats [ip_address ip_mask] [peer_address]
```

Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
<i>peer_address</i>	A 32-bit IP address of peer (neighbor).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

Examples

```
-> show ip bgp dampening-stats
```

Network	Mask	From	Flaps	Duration	FOM
-----+-----+-----+-----+-----+-----					
155.132.44.73	255.255.255.255	192.40.4.121	8	00h:00m:35s	175

output definitions

Network	The IP address for the local BGP speaker that is responsible for route dampening in this router.
Mask	The mask for the local BGP speaker that is responsible for route dampening in this router.
From	The IP address for the route that is flapping.
Flaps	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.
Duration	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
FOM	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in ip bgp dampening), then this route will no longer be advertised.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp dampening](#) Enables and disables route dampening.

MIB Objects

N/A

show ip bgp path

Displays BGP paths.

show ip bgp path

```
[ip-addr ip_address ip_mask]
[aspath-list aspathlist_name]
[community-list community_list_name]
[prefix-list prefix_name]
[route-map routemap_name]
[cidr-only]
[community community_number]
[neighbor-rcv rcv_peer_address]
[neighbor-adv adv_peer_addr]
[regexp "regular_expression"]
[best]
[detail]
```

Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the path.
<i>ip_mask</i>	A 32-bit subnet mask of the path.
<i>aspathlist_name</i>	AS path on which to filter.
<i>community_list_name</i>	Community name on which to filter.
<i>prefix_name</i>	Prefix on which to filter.
<i>routemap_name</i>	Route map on which to filter.
cidr-only	Filter out everything except CIDR routes.
<i>community_number</i>	Community number on which to filter.
<i>rcv_peer_address</i>	Filter all except paths received from this path.
<i>adv_peer_addr</i>	Filter all except paths sent to this path.
<i>regular_expression</i>	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, "\$100".
best	Show only the best path.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.
- 'Detail' option displays the AS Path details for a specific route.

Examples

```
-> show ip bgp path
Legends: Sta      = Path state

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Network	The IP address for this route path. This is the destination of the route.
Mask	The mask for this route path.
Nbr address	The IP or IPv6 address of the BGP peer that is advertising this path.
Next Hop	The next hop along the route path.

output definitions (continued)

(0)	The origin attribute of this route path. A question mark (?) indicates incomplete, and i indicates IGP, and an e indicates EGP.
degPref	The local preference value assigned to this route path.

```

-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
BGP Path parameters
Path address = 192.40.6.72
Path mask = 255.255.255.248
Path protocol = ebgp
Path peer = 192.40.4.29
  Path nextHop = 192.40.4.29,
  Path origin = igp,
  Path local preference = -1,
  Path state = active,
  Path weight = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED = -1,
  Path atomic = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community = <none>,
  Path unknown attribute = <none>

```

output definitions

Path address	The IP address for route path.
Path mask	The mask for this route path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: local , static , directhost , rip , ospf , isis , ibgp , ebgp , and other .
Path peer	The IP address of the peer that is advertising this route path.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be igp , egp , incomplete , and none . The origin attribute is considered during the route decision process.
Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the -1 in the above display) indicates that the local preference value is missing for this route path.
Path state	Path state indicates the state of the path. The possible states are best , feasible , policy-wait , un-synchronized , dampened , or none . When path state is none , it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.
Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the ip bgp default local-preference).

output definitions (continued)

Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the -1 in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read yes), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <none> indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <none> indicates that this is not an aggregate route.
Path community	Indicates the community to which this route path belongs, if applicable. A value of <none> indicates that this route does not belong to a community.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'detail' keyword added.

Related Commands

[show ip bgp routes](#) Displays BGP route details.

MIB Objects

alaBgpPathTable
 alaBgpPathEntry

show ip bgp routes

Displays BGP route details.

show ip bgp routes [*ip_address ip_mask*]

Syntax Definitions

ip_address A 32-bit IP address.

ip_mask A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays all the routes in the routing table with details.

Examples

```
-> show ip bgp routes
```

Legends: ECL = EBGp change list, ICC = IBGP client change list

ICL = IBGP change list, LCL = local change list

AGG = Aggregation, AGC = Aggregation contribution

AGL = Aggregation list, GDL = Deletion list

AGW = Aggregation waiting, AGH = Aggregation hidden

DMP = Dampening, ACT = Active route

Address	Mask	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
192.40.4.0	255.255.255.0	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.0	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.8	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.72	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.80	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.104	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.112	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.144	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes

output definitions

Address	The route destination network address.
Mask	The route destination network mask.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

show ip bgp aggregate-address

Displays aggregate route status.

show ip bgp aggregate-address [*ip_address ip mask*]

Syntax Definitions

ip_address A 32-bit IP address of the aggregate address.

ip_mask A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

Examples

```
-> show ip bgp aggregate-address
Network          Mask          Summarize As-Set  Admin state Oper state
-----+-----+-----+-----+-----+-----
155.132.44.73   255.255.255.255 disabled  disabled disabled  not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled  not_active
```

```
-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address      = 192.40.6.0,
Aggregate mask         = 255.255.255.255,
Aggregate admin state  = disabled,
Aggregate oper state   = not_active,
Aggregate as-set       = disabled,
Aggregate summarize    = disabled,
Aggregate metric       = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

output definitions

Network or Aggregate address	The IP address for this aggregate route. This value is configured through the ip bgp aggregate-address command.
Mask or Aggregate mask	The mask for this aggregate route. This value is configured through the ip bgp aggregate-address command.
Summarize or Aggregate summarize	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the ip bgp aggregate-address summary-only command.

output definitions (continued)

As-Set or Aggregate as-set	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the ip bgp aggregate-address as-set command.
Admin State or Aggregate admin state	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the ip bgp aggregate-address admin-state command.
Oper State or Aggregate oper state	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
Aggregate metric	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the ip bgp aggregate-address metric command.
Aggregate local preference	The local preference value for this aggregate route. This value is configured through the ip bgp aggregate-address local-preference command.
Aggregate community string	The community string value for this aggregate route. This value is configured through the ip bgp aggregate-address community command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address Creates and deletes a BGP aggregate route.

show ip bgp network

Displays currently defined network configurations.

show ip bgp network [*ip_address ip_mask*]

Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays all the configured networks, or a single network.

Examples

```
-> show ip bgp network
Network      Mask                Admin state Oper state
-----+-----+-----+-----
155.132.1.2  255.255.255.255 disabled  not_active
155.132.1.3  255.255.255.255 disabled  not_active
```

```
-> show ip bgp network 155.132.1.2 255.255.255.255
Network address      = 155.132.1.2,
Network mask         = 255.255.255.255,
Network admin state  = disabled,
Network oper state   = not_active,
Network metric       = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

output definitions

Network or Network address	The IP address configured for this local BGP network. This value is configured through the ip bgp network command.
Mask or Network mask	The mask configured for this local BGP network. This value is configured through the ip bgp network command.
Admin state or Network admin state	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the ip bgp network admin-state command.

output definitions (continued)

Oper state or Network oper state	Indicates whether this BGP local network is operationally active or inactive.
Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the ip bgp network metric command.
Network local preference	The local preference value for this local BGP network. This value is configured through the ip bgp network local-preference command.
Network community string	The community string value for this local BGP network. This value is configured through the ip bgp network community command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network Configures a local BGP network.

MIB Objects

alabgpMIBNetworkGroup
alaBgpNetworkEntry

show ip bgp neighbors

Displays the configured IPv4 BGP peers.

show ip bgp neighbors [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

There are two output options for this command. If you specify `show ip bgp peer` without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

Examples

```
-> show ip bgp neighbors
Legends:Nbr = Neighbor
```

```
      As = Autonomous System
Nbr address      As      Admin state Oper state      BgpId              Up/Down
-----+-----+-----+-----+-----+-----
192.40.4.29      3      enabled     estab           192.40.4.29       00h:14m:48s
192.40.4.121     5      disabled    idle            0.0.0.0            00h:00m:00s
```

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the ip bgp neighbor command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command.
Admin state	Indicates whether this peer has been enabled or disabled through the ip bgp neighbor admin-state command.
Oper state	The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established .
BgpId	The unique BGP identifier of the peer. This value is configured through the ip bgp neighbor update-source command.
Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.

```

-> show ip bgp neighbors 0.0.0.1
Neighbor address                = 0.0.0.1,
Neighbor autonomous system      = 1,
Neighbor Admin state            = enabled,

BFD Status                       = disabled,
Activate IPv4 unicast           = enabled

```

output definitions

Neighbor address	The IP address for this BGP peer. Assign this address through the ip bgp neighbor command.
Neighbor autonomous system	The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command.
Neighbor Admin state	Indicates whether this peer has been enabled or disabled through the ip bgp neighbor admin-state command.
Neighbor Oper state	The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established .
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the ip bgp neighbor passive command.
Neighbor name	The name assigned to this peer through the ip bgp neighbor description command.
Neighbor local address	The interface assigned to this peer. This value is configured through the ip bgp neighbor update-source command.

output definitions (continued)

Neighbor EBGP multihop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the ip bgp neighbor ebgp-multihop command.
Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the ip bgp neighbor next-hop-self command.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
Neighbor Ipv4 multicast	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
Neighbor type	Indicates whether this peer is internal or external to the router.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the ip bgp neighbor auto-restart command.
Neighbor route-reflector-client	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the ip bgp neighbor route-reflector-client command.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation. This value is configured through the ip bgp confederation neighbor command.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the ip bgp neighbor remove-private-as command.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the ip bgp neighbor default-originate command.
Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the ip bgp neighbor maximum-prefix command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the ip bgp neighbor update-source command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key [32- 47]	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the ip bgp neighbor md5 key command.
Neighbor local port	The TCP port used for the session with this peer.

output definitions (continued)

Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Advertised Restart Interval	Indicates the restart interval in seconds.
Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates if the IPv6 unicast updates are enabled or not. Options include enabled or disabled .
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the ipv6 bgp neighbor ipv6-nexthop command.
Neighbor Ipv6 unicast	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.
BFD Status	Indicates if BFD is enabled or disabled for this peer.
Activate IPv4 unicast	Indicates if the IPv4 unicast updates are enabled or not for this peer.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; BFD Status and Activate IPv4 unicast output fields added.

show ip bgp neighbors policy

Displays BGP peer policy information.

```
show ip bgp neighbors policy [ip_address]
```

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific peer.

Examples

```
-> show ip bgp neighbors policy
Neighbor address = 0.0.0.0,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,

```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the ip bgp neighbor remote-as command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the ip bgp neighbor route-map command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the ip bgp neighbor route-map command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the ip bgp neighbor out-aspathlist command.
Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the ip bgp neighbor in-aspathlist command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the ip bgp neighbor out-prefixlist command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the ip bgp neighbor in-prefixlist command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the ip bgp neighbor out-communitylist command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the ip bgp neighbor in-communitylist command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the ip bgp neighbor soft-reconfiguration command.
Neighbor output prefix6-list name	The outbound prefix6 list policy for the peer. This can be assigned by using the ip bgp neighbor out-prefix6list command.
Neighbor input prefix6-list name	The inbound prefix6 list policy for the peer. This can be assigned by using the ip bgp neighbor in-prefix6list command.

Release History

Release 7.1.1; command was introduced.

show ip bgp neighbors timer

Displays BGP peer timer statistics.

show ip bgp neighbors timer [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

Examples

```
-> show ip bgp neighbors timer
```

```
Legends: Nbr            = Neighbor
```

```
          As            = Autonomous System
```

```
          RtAdv        = Route Advertisement
```

```
          Kalive       = Keep Alive (actual)
```

```
          Ka(C)        = Configured Keep Alive
```

Nbr	address	As	Hold	Hold(C)	RtAdv	Retry	Kalive	Ka(C)
192.40.4.29		3	90	90	30	120	30	30
192.40.4.121		5	0	90	30	120	0	30

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the ip bgp neighbor command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command.
Hold	The current count for the holdtime value.
Hold(C)	The holdtime value configured through the ip bgp neighbor timers command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the ip bgp neighbor advertisement-interval command.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the ip bgp neighbor timers command.

output definitions (continued)

Kalive	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka(C)	The keepalive interval as configured through the ip bgp neighbor timers command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp neighbors Displays BGP peer main status.

MIB Objects

N/A

show ip bgp neighbors statistics

Displays BGP peer message statistics.

show ip bgp neighbors statistics [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

Examples

```
-> show ip bgp neighbors statistics
```

```
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
         RUPDS = number of Update messages received,
         SUPDS = number of Update messages sent,
         RNOFY = number of Notify messages received,
         SNOFY = number of Notify messages sent
         RPFXS = number of prefixes received
         UPTNS = number of UP transitions
         DNTNS = number of DOWN transitions
```

Nbr	address	As	RMSGS	SMSGS	RUPDS	SUPDS	RNOFY	SNOFY	RPFXS	UPTNS	DNTNS
192.40.4.29	3	110	123	5	0	0	1	8	2	2	
192.40.4.121	5	0	0	0	0	0	0	0	0	0	

output definitions

Nbr address	The IP address for this peer. This value is configured through the ip bgp neighbor command.
As	The autonomous system to which this peer belongs. This value is configured through the ip bgp neighbor remote-as command.
RMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	The number of unique route prefixes received by this peer.
UPTNS	The number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```
-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address           = 0.0.0.1,
# of UP transitions        = 0,
Time of last UP transition = 00h:00m:00s,
# of DOWN transitions      = 0,
Time of last DOWN transition = 00h:00m:00s,
Last DOWN reason          = none,
# of msgs rcvd            = 0,
# of Update msgs rcvd     = 0,
# of prefixes rcvd        = 0,
# of Route Refresh msgs rcvd = 0,
# of Notification msgs rcvd = 0,
Last rcvd Notification reason = none [none]
Time last msg was rcvd     = 00h:00m:00s,
# of msgs sent            = 0,
# of Update msgs sent      = 0,
# of Route Refresh msgs sent = 0,
# of Notification msgs sent = 0,
Last sent Notification reason = none [none]
Time last msg was sent     = 00h:00m:00s,
```

output definitions

Neighbor address	The IP address for this peer. This value is configured through the ip bgp neighbor command.
# of UP transitions	The number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of prefixes rcvd	The number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	The number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
# of Notification msgs rcvd	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgds sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgds sent	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgds sent	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgds sent	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the Peer last received notification reason field above.
Time last msg was sent	The duration since a message was sent to this peer.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

N/A

show ip bgp policy aspath-list

Displays AS path list parameters.

```
show ip bgp policy aspath-list [name] ["regular_expression"]
```

Syntax Definitions

<i>name</i>	An AS path name.
<i>regular_expression</i>	A regular expression. The regular expression must be enclosed by quotation marks.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the [ip bgp policy aspath-list](#) command on page 29-102.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

Examples

```
-> show ip bgp policy aspath-list
Aspath List Name      Aspath regular expression
-----+-----
aspl1                  (500 | 400) ? 300$
aspl2                  (500 | 400)
```

```
-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp   = (500 | 400) ? 300$
  Admin state   = disabled,
  Priority       = 1,
  Action        = deny,
  Primary index = 0,
```

output definitions

Aspath List name	The name of the AS path list. This is defined using the ip bgp policy aspath-list command.
Aspath regular expression	The regular expression that defines the AS path list. This is defined using the ip bgp policy aspath-list command.

output definitions (continued)

Admin state	The administration state of the AS path policy. It is either enable or disable.
Priority	The AS path list priority. This is defined using the ip bgp policy aspath-list priority command.
Action	The AS path list action, either permit or deny. This is defined using the ip bgp policy aspath-list action command.
Primary index	The instance identifier for the AS path list. This value is not configurable.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list Creates or removes an AS path list.

```

show ip bgp policy community-list

Displays community list parameters.

show ip bgp policy community-list [*name*] [*string*]

Syntax Definitions

<i>name</i>	Community name.
<i>string</i>	A regular expression. The regular expression must be enclosed by quotation marks.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

Examples

```
-> show ip bgp policy community-list
Community list name      Community string
-----+-----
adfasdf                  0:0
```

```
-> show ip bgp policy community-list coml1
Community List name = coml1
Community string    = 600:1
  Admin state       = disabled,
  Match type        = exact,
  Priority           = 1,
  Action            = deny,
  Primary index     = 0
```

output definitions

Community List name	The community list name. This is defined using the ip bgp policy community-list command.
Community string	The community list definition. This is defined using the ip bgp policy community-list command.
Admin state	The administration state of the community list policy, either enabled or disabled.
Match type	The match type of the community list. This is defined using the ip bgp policy community-list match-type command.

output definitions (continued)

Priority	The community list priority. This is defined using the ip bgp policy community-list priority command.
Action	The community list action. This is defined using the ip bgp policy community-list action command.
Primary index	The instance identifier for the community list. This value is not configurable.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy community-list Creates or deletes a community list.

```

show ip bgp policy prefix-list

Displays prefix list parameters.

```
show ip bgp policy prefix-list [name] [ip_address ip_mask]
```

Syntax Definitions

<i>name</i>	A prefix list name.
<i>ip_address</i>	A prefix list IP address.
<i>ip_mask</i>	An IP address mask.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

Examples

```
-> show ip bgp policy prefix-list
Prefix List name      Prefix address  Prefix mask
-----+-----+-----
pfxl1                 155.132.33.0   255.255.255.0
pfxl2                 155.148.32.0   255.255.255.0
```

```
-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask            = 255.255.255.0
Admin state     = disabled,
Match Mask >= (GE) = 0,
Match Mask <= (LE) = 0,
Action          = deny
```

output definitions

Prefix List name	The name of the prefix list. This is defined using the ip bgp policy prefix-list command.
Address	The IP address of the prefix list. This is defined using the ip bgp policy prefix-list command.
Mask	The mask of the prefix list. This is defined using the ip bgp policy prefix-list command.
Admin state	The administrative state of the prefix list, either enabled or disabled.

output definitions (continued)

Match Mask >= (GE)	The GE match mask of the prefix list. This is defined using the ip bgp policy prefix-list ge command.
Match Mask <= (LE)	The LE match mask of the prefix list. This is defined using the ip bgp policy prefix-list le command.
Action	The action of the prefix list. This is defined using the ip bgp policy prefix-list action command.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list Creates or deletes a prefix match list.

```

show ip bgp policy prefix6-list

Displays prefix6 list parameters.

show ip bgp policy prefix6-list [*name*] [*ipv6_address/prefixLength*]

Syntax Definitions

<i>name</i>	A prefix6 list name.
<i>ip_address</i>	A prefix6 list IPv6 address.
<i>prefixLength</i>	A prefix6 list prefix length.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the list of prefix6-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address.

Examples

```
-> show ip bgp policy prefix6-list
Prefix6 List name      Prefix6 address/Prefix length
-----+-----
p62                   ::/0
p63                   4001:1::/32
```

```
-> show ip bgp policy prefix6-list p63
Prefix6 List name = p63
Prefix           = 4001:1::
Prefix Length    = 32
Admin state      = enabled,
Match MaskLength >= (GE) = 32,
Match MaskLength <= (LE) = 0,
Action           = permit
```

output definitions

Prefix6 List name	The name of the prefix6 list. This is defined using the ip bgp policy prefix6-list command.
Prefix	The IPv6 address of the prefix6 list. This is defined using the ip bgp policy prefix6-list command.
Prefix Length	The prefix length of the prefix6 list. This is defined using the ip bgp policy prefix6-list command.
Admin state	The administrative state of the prefix6 list, either enabled or disabled.

output definitions (continued)

Match MaskLength >= (GE)	The GE match masklength of the prefix6 list. This is defined using the ip bgp policy prefix6-list command.
Match MaskLength <= (LE)	The LE match masklength of the prefix6 list. This is defined using the ip bgp policy prefix6-list command
Action	The action of the prefix6 list. This is defined using the ip bgp policy prefix6-list command.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a prefix6 match list.

```

show ip bgp policy route-map

Displays policy route map parameters.

show ip bgp policy route-map [*name*] [*sequence_number*]

Syntax Definitions

name Route map name.
sequence_number A sequence number. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

Examples

```
-> show ip bgp policy route-map
RouteMap name          Instance
-----+-----
rmap1                  1
rmap1                  2
rmap2                  1

-> show ip bgp policy route-map rmap1
RouteMap name          = rmap1
RouteMap instance     = 1
  Admin state          = disabled,
  Local pref (mode/value) = <none> / 0,
  Route map action     = permit,
  Origin               = <none>,
  MED (mode/value)    = <none> / 0,
  Weight              = 0,
  Aspath-List name     = aspl1,
  Aspath prepend       = <none>,
  Aspath match primitive = 500 .* 400$,
  Prefix-List name     = <none>,
  Prefix match primitive = 0.0.0.0 0.0.0.0,
  Prefix6-List name    = <none>,
  Prefix6 match primitive = ::/0,
  Prefix6-List name    = <none>,
  Prefix6 match primitive = ::/0,
  Community-List name  = com12,
  Community match primitive = <none>,
  Community string [mode] = [Additive]
```

output definitions

RouteMap name	The name of the route map policy. This is determined using the ip bgp policy prefix6-list command.
RouteMap instance	The instance of the route map policy. This is determined using the ip bgp policy prefix6-list command.
Admin state	The administrative state of the route map policy, either enabled or disabled.
Local pref (mode/value)	The local preference of the route map policy. This is determined using the ip bgp policy route-map lpref command.
Route map action	The action of the route map policy. This is determined using the ip bgp policy route-map action command.
Origin	The origin of the route map policy. This is determined using the ip bgp policy route-map origin command.
MED (mode/value)	The MED of the route map policy. This is determined using the ip bgp policy route-map med command.
Weight	The weight of the route map policy. This is determined using the ip bgp policy route-map weight command.
Aspath-List name	The name of the AS path list attached to this route map. This is set using the show ip bgp policy aspath-list command.
Aspath prepend	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
Aspath match primitive	The regular expression used to match AS Path for this route map.
Prefix-List name	The name of the prefix list attached to this route map. This is set using the show ip bgp policy prefix-list command.
Prefix match primitive	The prefix to match for this route map.
Prefix6-List name	The name of the prefix6 list attached to this route map.
Prefix6 match primitive	The prefix6 to match for this route map.
Community-List name	The name of the community list attached to this route map. This is set using the show ip bgp policy community-list command.
Community match primitive	The community string to match for this route map.
Community string [mode]	The name of the community mode attached to this route map. This is set using the ip bgp policy route-map community-mode command.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Prefix6-List name and Prefix6 match primitive output fields added.

ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

ip bgp graceful-restart

no ip bgp graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful restart  
-> no ip bgp graceful restart
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

ip bgp graceful-restart restart-interval [*seconds*]

Syntax Definitions

seconds The hitless restart timeout interval, in seconds. The valid range is 1–3600.

Defaults

parameter	default
<i>seconds</i>	90

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful-restart restart-interval 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

MIB Objects

  alaBgpRestartInterval
```

ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

ip bgp unicast

no ip bgp unicast

Syntax Definitions

N/A

Defaults

By default, BGP IPv4 advertisements are enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

Examples

```
-> ip bgp unicast
-> no ip bgp unicast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaBgpGlobal
  alaBgpMultiProtocolIpv4
```

ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

ipv6 bgp unicast

no ipv6 bgp unicast

Syntax Definitions

N/A

Defaults

By default, IPv6 BGP advertisements are disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

Examples

```
-> ipv6 bgp unicast  
-> no ipv6 bgp unicast
```

Release History

Release 7.1.1; command was introduced.

ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **activate-ipv6**

no ip bgp neighbor *ip_address* **activate-ipv6**

Syntax Definitions

ip_address The 32-bit IPv4 address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **ipv6-nexthop** *ipv6_address*

Syntax Definitions

<i>ip_address</i>	The 32-bit IPv4 address of the neighbor.
<i>ipv6_address</i>	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

Defaults

By default, the IPv6 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

Release History

Release 7.1.1; command was introduced.

>	4001:1:0:3::/64	2101::51	140	65536, i

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Prefix	The destination address of the IPv6 route in the hexadecimal format.
Nbr Address	The IP or IPv6 address of the BGP peer that advertises this path.
(O)	The origin attribute of this route path. A question mark (?) indicates incomplete, and i indicates IGP, and an e indicates EGP.
degPref	The local preference value assigned to this route path.

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
```

```
BGP Path parameters
```

```
Path address      = 2020:100:200:1::
Path Length       = 64
Path protocol     = ibgp
Path neighbor     = peer(2001:100:3:4::1)
  Path nextHop    = 2001:100:3:4::1,
  Path origin     = igp,
  Path local preference = 100,
  Path state      = active,
  Path weight     = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED        = <none>,
  Path atomic     = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community  = <none>,
  Path Originator Id = <none>,
  Path Cluster List = <none>,
  Path unknown attribute = <none>
```

output definitions

Path address	The IPv6 address for route path.
Path Length	The prefix length of the IPv6 path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: local , static , directhost , rip , ospf , isis , ibgp , ebgp , and other .
Path neighbor	The IPv6 address of the BGP peer.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be igp , egp , incomplete , and none . The origin attribute is considered during the route decision process.

output definitions (continued)

Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the -1 in the above display) indicates that the local preference value is missing for this route path.
Path state	Indicates the state of the path. The possible states are best , feasible , policy-wait , un-synchronized , dampened , or none . When path state is none , it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.
Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the ip bgp default local-preference).
Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the -1 in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read yes), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <none> indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <none> indicates that this is not an aggregate route.
Path community	Indicates the community to which this route path belongs, if applicable. A value of <none> indicates that this route does not belong to a community.
Path Originator Id	The Router Id of the BGP4 speaker that performed route reflection
Path Cluster List	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'detail' keyword added.

2525:2525:5::/48	No	No	No	No	No	No	No	No	No	No	No	Yes

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

ipv6 bgp network *ipv6_address/prefix_length*

no ipv6 bgp network *ipv6_address/prefix_length*

Syntax Definitions

ipv6_address

The 128-bit IPv6 address.

/prefix_length

The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network admin-state Enables or disables a BGP network.

show ipv6 bgp network Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

alaBgpNetwork6Table
 alaBgpNetwork6Addr
 alaBgpNetwork6MaskLen

ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

ipv6 bgp network *ipv6_address/prefix_length* [**community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num* | *num:num*}]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128
none	Removes a prefix from a community.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num</i>	The community attribute number.
<i>num:num</i>	Community attribute in the AS:NN format. AS indicates the autonomous system and NN indicates the community number.

Defaults

By default, a route is not assigned to a community.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

Related Commands

 alaBgpNetwork6Addr

 alaBgpNetwork6MaskLen

 alaBgpNetwork6Community

ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ipv6 bgp network *ipv6_address/prefix_length* [**local-preference num**]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>num</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6LocalPref
```

ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

```
ipv6 bgp network ipv6_address/prefix_length [metric num]
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>num</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

ipv6 bgp network *ipv6_address/prefix_length* [**admin-state** {**enable** | **disable**}]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
enable	Enables the BGP network.
disable	Disables the BGP network.

Defaults

By default, the BGP network is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp network Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```

  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6RowStatus
```

show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

show ipv6 bgp network [*ipv6_address/prefix_length*]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

By default, all IPv6 BGP networks and their status will be displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *ipv6_address/prefix_length* parameter to display the status of a specific IPv6 BGP network.

Examples

```
show ipv6 bgp network
Network
-----+-----+-----
2525:500:600::/64          enabled    active
```

```
show ipv6 bgp network 2525:500:600::/64
Network address           = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

output definitions

Network or Network address	The IPv6 address configured for this local BGP network. This value is configured through the ipv6 bgp network command.
Admin state or Network admin state	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the ipv6 bgp network admin-state command.
Oper state or Network oper state	Indicates whether this BGP local network is operationally active or inactive.

output definitions (continued)

Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the ipv6 bgp network metric command.
Network local preference	The local preference value for this local BGP network. This value is configured through the ipv6 bgp network local-preference command.
Network community string	The community string value for this local BGP network. This value is configured through the ipv6 bgp network community command.

Release History

Release 7.1.1; command was introduced.

```

ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor *ipv6_address*

no ipv6 bgp neighbor *ipv6_address*

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the new BGP peer.

Defaults

By default, no BGP peers are configured in the BGP network.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

Examples

```
-> ipv6 bgp neighbor 2001::1  
-> no ipv6 bgp neighbor 2001::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor admin-state Enables or disables the BGP peer status.

ipv6 bgp neighbor remote-as Assigns an AS number to the BGP peer.

MIB Objects

ipv6 bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

ipv6 bgp neighbor *ipv6_address* [**activate-ipv4**]

no ipv6 bgp neighbor *ipv6_address* [**activate-ipv4**]

Syntax Definitions

ipv6_address

The 128-bit IPv6 address of the new BGP peer.

activate-ipv4

Enable the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv6 BGP peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 activate-ipv4
-> no ipv6 bgp neighbor 2001::1 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

ipv6 bgp neighbor *ipv6_address* [**activate-ipv6**]

no ipv6 bgp neighbor *ipv6_address* [**activate-ipv6**]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ActivateIpv6
```

ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv6-nexthop ipv6_address]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the next hop router.

Defaults

By default, the IPv6 next hop address is set to all zeros.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24  
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeerIpv6NextHop
```

ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [admin-state {enable | disable}]
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the new BGP peer.
enable	Enables the BGP peer.
disable	Disables the BGP peer.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the [ipv6 bgp neighbor](#) command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6RowStatus
```

ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer. The peer will be unavailable during this restart.

ipv6 bgp neighbor *ipv6_address* clear

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
 - **ipv6 bgp neighbor remote-as**
 - **ipv6 bgp neighbor md5 key**
 - **ipv6 bgp neighbor passive**
 - **ipv6 bgp neighbor ebgp-multihop**
 - **ipv6 bgp neighbor maximum-prefix**
 - **ipv6 bgp neighbor update-source**
 - **ipv6 bgp neighbor next-hop-self**
 - **ipv6 bgp neighbor soft-reconfiguration**
 - **ipv6 bgp neighbor route-reflector-client**
 - **ip bgp confederation neighbor6**
 - **ipv6 bgp neighbor remove-private-as**
 - **ipv6 bgp neighbor update-source-address**
- You do not need to issue the **ipv6 bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor auto-restart Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

alaBgpPeer6Table
alaBgpPeer6Restart

Related Commands

- ipv6 bgp neighbor** Creates or deletes a BGP peer relationship using IPv6 addresses.
- ipv6 bgp neighbor admin-state** Enables or disables the BGP peer status.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6AutoRestart

ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as value]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.
value Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; modified the command.

Related Commands

ip bgp autonomous-system Sets the AS for the local BGP speaker.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6Addr
 alaBgpPeer6AS

ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

```
ipv6 bgp neighbor ipv6_address [timers num num]
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>num</i>	The KEEPALIVE message interval in seconds.
<i>num</i>	The hold time interval in seconds.

Defaults

parameter	default
<i>num</i> (keepalive)	30 seconds
<i>num</i> (holdtime)	90 seconds

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 bgp neighbor conn-retry-interval](#) The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6HoldTime
  alaBgpPeer6KeepAlive
```

ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

```
ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

```
no ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.
num The number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
<i>num</i>	5000

By default, **warning-only** is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only  
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```
ipv6 bgp neighbor ipv6_address [next-hop-self]
```

```
no ipv6 bgp neighbor ipv6_address [next-hop-self]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self  
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6NextHopSelf
```

ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

ipv6 bgp neighbor *ipv6_address* [**conn-retry-interval** *num*]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP neighbor.
<i>num</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
<i>num</i>	120

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.

Defaults

This **default-originate** parameter is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate  
-> no ipv6 bgp neighbor 2001::1 default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

ipv6 bgp neighbor *ipv6_address* [**update-source** *interface_name*]

no ipv6 bgp neighbor *ipv6_address* [**update-source** *interface_name*]

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>interface_name</i>	The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.
ipv6 interface	Configures an IPv6 interface on a VLAN or IPv6 tunnel.

MIB Objects

alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6LocalIntfName
```

ipv6 bgp neighbor ipv4-nextHop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nextHop ip_address]
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>ip_address</i>	The 32-bit IP address of the next hop.

Defaults

By default, the IPv4 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 172.22.2.115  
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 0.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp neighbor advertisement-interval

Configures the time interval for updates between external IPv6 BGP peers.

```
ipv6 bgp neighbor ipv6_address advertisement-interval value
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.
value An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

parameter	default
<i>value</i>	30

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external IPv6 BGP peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 advertisement-interval 60
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6Addr
 alaBgpPeer6MinRouteAdvertisementInterval

ipv6 bgp neighbor description

Configures the IPv6 BGP Peer name.

```
ipv6 bgp neighbor ipv6_address description string
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.
string Peer name (1 - 20 characters).

Defaults

parameter	default
<i>string</i>	peer (ipv6_address)

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format "peer(ipv6-address)" where ipv6-address is the IPv6 address of the BGP peer. For example, the default name of an IPv6 BGP peer at address 2001::1 would be "peer(2001::1)".
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ipv6 bgp neighbor 2001::1 description "peer6 for building 3"
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ipv6 bgp neighbor](#) Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6Addr
 alaBgpPeer6Name

ipv6 bgp neighbor ebgp-multihop

Allows external IPv6 BGP peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the IPv6 BGP peers to speak to each other despite the non-BGP router that sits between them.

ipv6 bgp neighbor *ipv6_address* **ebgp-multihop** [*tth*]

no ipv6 bgp neighbor *ipv6_address* **ebgp-multihop**

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>tth</i>	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

parameter	default
<i>tth</i>	255

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external IPv6 BGP peer is on a directly connected subnet. This command allows you to configure an external IPv6 BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 ebgp-multihop
-> ipv6 bgp neighbor 2001::1 ebg-multihop 50
-> no ipv6 bgp neighbor 2001::1 ebgp-multihop
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

MIB Objects

alaBgpPeer6Addr

alaBgpPeer6MultiHop

ipv6 bgp neighbor update-source-address

Configures the local IPv6 address from which a BGP peer will be connected if the peer is configured with its link-local address. This local IPv6 address can be configured for internal and external BGP peers.

```
ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

```
no ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

By default, the update-source-address value is set to all zeros.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The default is restored by using the **no** form of the command or by entering an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2001::1 update-source-address 2401::1  
-> no ipv6 bgp neighbor 2001::1 update-source-address
```

Release History

Release 7.3.4; command was introduced.

Related Commands

MIB Objects

alaBgpPeer6Table
 alaBgPeer6LocalAddr

ipv6 bgp neighbor passive

Configures the local IPv6 BGP speaker to wait for this IPv6 BGP peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ipv6 bgp neighbor *ipv6_address* passive

no ipv6 bgp neighbor *ipv6_address* passive

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default, BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 passive
-> no ipv6 bgp neighbor 2001::1 passive
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr

ipv6 bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ipv6 bgp neighbor *ipv6_address* **remove-private-as**

no ipv6 bgp neighbor *ipv6_address* **remove-private-as**

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default, all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they are intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remove-private-as  
-> no ipv6 bgp neighbor 2001::1 remove-private-as
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ipv6 bgp neighbor remote-as](#) Assigns an AS number to the BGP peer.

MIB Objects

```
alaBgpPeer6Table  
    alaBgpPeer6Addr  
    alaBgpPeer6RemovePrivateAs
```

ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ipv6 bgp neighbor *ipv6_address* soft-reconfiguration

no ipv6 bgp neighbor *ipv6_address* soft-reconfiguration

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ipv6 bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 soft-reconfiguration
-> no ipv6 bgp neighbor 2001::1 soft-reconfiguration
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer.

ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

MIB Objects

alaBgpPeer6Table

 alaBgpPeer6Addr

 alaBgpPeer6SoftReconfig

ipv6 bgp neighbor stats-clear

Clears the statistics for a peer.

ipv6 bgp neighbor *ipv6_address* stats-clear

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ipv6 bgp neighbors statistics](#).

Examples

```
-> ipv6 bgp neighbor 2001::2 stats-clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors statistics](#) Displays the neighbor statistics of the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ClearCounter
```

ip bgp confederation neighbor6

Configures this IPv6 BGP peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor6 *ipv6_address*

no ip bgp confederation neighbor6 *ipv6_address*

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.

Examples

```
-> ip bgp confederation neighbor6 2001::1  
-> no ip bgp confederation neighbor6 2001::1
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp confederation identifier Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeerAddr  
  alaBgPeer6ConfedStatus
```

ipv6 bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-aspathlist {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
none	Removes this AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to an inbound policy.
- Use **none** to deassign an AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-aspathlist InBoundASpath  
-> ipv6 bgp neighbor 2001::1 in-aspathlist none
```

Release History

Release 7.3.4; command introduced.

Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6AspathListIn
```

ipv6 bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-communitylist {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input community list (0 to 70 characters). This name is case sensitive.
none	Removes this community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input community filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-communitylist InboundCommlist  
-> ipv6 bgp neighbor 2001::1 in-communitylist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6CommunityListIn
```

ipv6 bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefixlist {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input prefix filter list (0 to 70 characters). This name is case sensitive.
none	Removes the prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound IPv4 routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input prefix filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-prefixlist InboundPrefix  
-> ipv6 bgp neighbor 2001::1 in-prefixlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6PrefixListIn
```

ipv6 bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefix6list {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
none	Removes the prefix6 list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

Examples

```
-> ipv6 bgp neighbor 2001::2 in-prefix6list InboundPrefix6  
-> ipv6 bgp neighbor 2001::2 in-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeer6Table

```

ipv6 bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-aspathlist {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- Use **none** to deassign an output AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-aspathlist OutboundASpath  
-> ipv6 bgp neighbor 2001::1 out-aspathlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6AspathListOut
```

ipv6 bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-communitylist {string | none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
none	Removes the community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- Use **none** to deassign an output community filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-communitylist OutboundCommlist  
-> ipv6 bgp neighbor 2001::1 out-communitylist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6CommunityListOut
```

ipv6 bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-prefixlist {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound prefix filter list (0 - 70 characters).
none	Removes the prefix filter list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to an outbound policy.
- Use **none** to deassign an output prefix filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-prefixlist OutboundPrefix  
-> ipv6 bgp neighbor 2001::1 out-prefixlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6PrefixListOut
```

ipv6 bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-prefix6list {string / none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound prefix6 filter list (0 - 70 characters).
none	Removes the prefix6 filter list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “**none**”.

Examples

```
-> ipv6 bgp neighbor 2001::2 out-prefix6list OutboundPrefix6  
-> ipv6 bgp neighbor 2001::2 out-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Prefix6ListOut
```

ipv6 bgp neighbor route-map

Assigns a policy map to an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address route-map {string | none} {in | out}
```

```
no ipv6 bgp neighbor ipv6_address route-map {in | out}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the peer.
<i>string</i>	Policy map name (0 to 70 characters). This name is case sensitive.
none	Deletes the route map if entered rather than a text string.
in	Designates this route map policy as an inbound policy.
out	Designates this route map policy as an outbound policy.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to deassign a policy map.
- The policy route map name (**InboundRoute** and **OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any routes from the BGP peer must match this route map filter before being accepted or passed to a policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-map InboundRoute in
-> ipv6 bgp neighbor 2001::1 route-map OutboundRoute out
-> ipv6 bgp neighbor 2001::1 route-map none in
-> no ipv6 bgp neighbor 2001::1 route-map in
```

Release History

Release 7.3.4; command introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6RouteMapIn  
  alaBgpPeer6RouteMapOut
```

ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address clear soft {in | out}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
in	Applies reconfiguration to the inbound policies.
out	Applies reconfiguration to the outbound policies.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in  
-> ipv6 bgp neighbor 2001::1 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 bgp neighbor soft-reconfiguration](#) Enables or disables IPv6 BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6ReconfigureInBound  
  alaBgpPeer6ReconfigureOutBound
```

ipv6 bgp neighbor route-reflector-client

Configures this IPv6 BGP peer as one of the clients to the local route reflector.

```
ipv6 bgp neighbor ipv6_address route-reflector-client
```

```
no ipv6 bgp neighbor ipv6_address route-reflector-client
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the command is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the no form of this command to disable IPv6 BGP peer as a client to the local route reflector.
- The IPv6 BGP peers configured using this command become part of the client group. The remaining peers become the members of the non-client group for the local route reflector.
- When IPv6 BGP Peer is configured as route reflector client, all internal BGP speakers in an autonomous system need not be fully meshed. Instead, this route reflector takes the responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-reflector-client  
-> no ipv6 bgp neighbor 2001::1 route-reflector-client
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ClientStatus
```

ipv6 bgp neighbor md5 key

Configures an encrypted MD5 signature for TCP sessions with this IPv6 peer.

```
ipv6 bgp neighbor ipv6_address md5 key {string | none}
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>string</i>	The MD5 public key. The maximum character length is 80.
none	Remove the password and disable authentication.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The password you specified in this command is encrypted before it appears in a saved snapshot file. However, if you view this command in a snapshot file or **boot.cfg** file, the command is displayed in a different syntax as given below:

```
ipv6 bgp neighbor ipv6_address md5 key-encrypt encrypted_string
```

Note. This MD5 password will not work, if this syntax is used to set it.

Examples

```
-> ipv6 bgp neighbor 2001::1 md5 key openpeer2  
-> ipv6 bgp neighbor 2001::1 md5 key none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ipv6 bgp neighbor](#) Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

```
alaBgpPeer6Table

Forwarding State during restart = NotPreserved,
Activate IPv6 unicast        = enabled,
Configured IPv4 NextHop Address = 0.0.0.0,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast        = advertised,
Activate IPv4 unicast        = enabled

```

output definitions

Nbr address or Neighbor address	The IPv6 address for this BGP peer. Assign this address through the ipv6 bgp neighbor command.
As or Neighbor autonomous system	The autonomous system to which this peer belongs. A peer's AS number is assigned through the ipv6 bgp neighbor remote-as command.
Admin state or Neighbor Admin state	Indicates whether this peer has been enabled or disabled through the ipv6 bgp neighbor admin-state command.
Oper state or Neighbor Oper state	The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established .
BGP Id	The unique BGP identifier of the peer.
Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
Neighbor name	The name assigned to this peer.
Neighbor local address	The interface assigned to this peer. This value is configured through the ipv6 bgp neighbor update-source command.
Neighbor EBGp multiHop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the ipv6 bgp neighbor next-hop-self command.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multiprotocol IPv4 unicast capable.
Neighbor Ipv4 multicast	Indicates whether this peer is multiprotocol IPv4 multicast capable.
Neighbor type	Indicates whether this peer is internal or external to the AS.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled.

output definitions (continued)

Neighbor route-reflector-client	Indicates whether this peer is a client to the local route reflector, if configured.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the ipv6 bgp neighbor default-originate command.
Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the ipv6 bgp neighbor maximum-prefix command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the ipv6 bgp neighbor update-source command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
Neighbor local port	The TCP port used for the session with this peer.
Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
Advertised Restart Interval	Indicates the restart interval in seconds.
Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates whether or not IPv6 unicast advertisements are enabled. Options include enabled or disabled .
Configured IPv4 NextHop Address	Specifies the IPv4 nexthop address. This is specified using the ipv6 bgp neighbor ipv4-nexthop command.
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the ipv6 bgp neighbor ipv6-nexthop command.
Neighbor Ipv6 unicast	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include enabled or disabled .
Activate IPv4 unicast	Indicates whether or not IPv4 unicast capability is advertised between the peers. Options include enabled or disabled .

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'Activate IPv4 unicast' output field added.

show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

show ipv6 bgp neighbors statistics [*ipv6_address*]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *ipv6_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors statistics
```

```
Legends: Nbr    = Neighbor
```

```
      As        = Autonomous System
```

```
      RMSGs    = # of received messages
```

```
      SMSGS    = # of sent messages
```

```
      RUPDS    = # of Update messages received
```

```
      SUPDS    = # of Update messages sent
```

```
      RNOFY    = # of Notify messages received
```

```
      SNOFY    = # of Notify messages sent
```

```
      RPFXS    = # of prefixes received
```

```
      UPTNS    = # of UP transitions
```

```
      DNTNS    = # of DOWN transitions
```

```
Nbr address                      As        RMSGs SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1                    30       225    260    2       3       0       0       10       1       1
```

output definitions

Nbr address	The IPv6 address for this peer. This value is configured using the ipv6 bgp neighbor command.
As	The autonomous system to which this peer belongs. This value is configured using the ipv6 bgp neighbor remote-as command.
RMSGs	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGs	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	Number of unique route prefixes received by this peer.
UPTNS	Number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```

-> show ipv6 bgp neighbors statistics 2001:100:3:4::1

Time last msg was sent     = 00h:00m:18s,

```

output definitions

Neighbor address	The IPv6 address for this peer. This value is configured using the ipv6 bgp neighbor command.
# of UP transitions	Number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of prefixes rcvd	Number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	Number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
# of Notification msgs rcvd	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgsd sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgsd sent	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgsd sent	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgsd sent	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the Peer last received notification reason field above.
Time last msg was sent	The duration since a message was sent to this peer.

show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

```
show ipv6 bgp neighbors policy ipv6_address
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

Examples

```
-> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the ipv6 bgp neighbor remote-as command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the ipv6 bgp neighbor route-map command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the ipv6 bgp neighbor route-map command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-aspathlist command.

output definitions (continued)

Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-aspathlist command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-prefixlist command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-prefixlist command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-communitylist command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-communitylist command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the ipv6 bgp neighbor soft-reconfiguration command.
Neighbor output prefix6-list name	The outbound prefix6-list policy for the peer. This is configured using the ipv6 bgp neighbor out-prefix6list command.
Neighbor input prefix6-list name	The inbound prefix6-list policy for the peer. This is configured using the ipv6 bgp neighbor in-prefix6list command.

Release History

Release 7.1.1; command was introduced.

show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

show ipv6 bgp neighbors timers [*ipv6_address*]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *ipv6_address* parameter to display the timer value for a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors timers
```

```
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

Nbr	address	As	Hold	Hold(C)	RtAdv	Retry	Kalive	Ka(C)
-----	-----	-----	-----	-----	-----	-----	-----	-----
	2001:100:3:4::1	30	90	90	30	120	30	30

output definitions

Nbr address	The IPv6 address for this BGP peer. Assign this address using the ipv6 bgp neighbor command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned using the ipv6 bgp neighbor remote-as command.
Hold	The actual negotiated hold time value.
Hold (C)	The hold time value. This value is configured using the ipv6 bgp neighbor timers command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the ipv6 bgp neighbor timers command.

output definitions (continued)

Kalive	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka (C)	The KEEPALIVE interval as configured using the ipv6 bgp neighbor timers command.

Release History

Release 7.1.1; command was introduced.

30 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

Filename AlcatellIND1Slb.mib
Module: ALCATEL-IND1-SLB-MIB

A summary of available commands is listed here:

Global SLB Commands	ip slb admin-state ip slb reset statistics show ip slb
SLB Cluster Commands	ip slb cluster ip slb cluster admin-state ip slb cluster ping period ip slb cluster ping timeout ip slb cluster ping retries ip slb cluster probe show ip slb clusters show ip slb cluster
SLB Server Commands	ip slb server ip cluster ip slb server ip cluster probe show ip slb cluster server show ip slb servers
SLB Probe Commands	ip slb probe ip slb probe timeout ip slb probe period ip slb probe port ip slb probe retries ip slb probe username ip slb probe password ip slb probe url ip slb probe status ip slb probe send ip slb probe expect show ip slb probes

ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

```
ip slb admin-state {enable | disable}
```

Syntax Definitions

enable	Enables the administrative status for Server Load Balancing on a switch.
disable	Disables the administrative status for Server Load Balancing on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

Examples

```
-> ip slb admin-state enable  
-> ip slb admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb	Displays the status of Server Load Balancing on a switch.
ip slb cluster	Configures a Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbFeatureGroup  
  slbAdminStatus
```

ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

ip slb reset statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

Examples

```
-> ip slb reset statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters Displays the status and configuration of all Server Load Balancing clusters on a switch.

show ip slb cluster Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

MIB Objects

```
slbFeatureGroup  
  slbResetStatistics
```

ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *name* {**vip** *ip_address* / **condition** *string*} [**I3** | **I2**]

no ip slb cluster *name*

Syntax Definitions

<i>name</i>	The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).
<i>ip_address</i>	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
<i>string</i>	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
I3	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
I2	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the condition parameter.

Defaults

parameter	default
I3 I2	I3

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers. In addition, do not specify a VIP address that is already in use by an MCLAG VIP interface. The SLB VIP and MCLAG VIP both provide a common IP address but for different entities and should not share the same IP address.
- Specifying the **I3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

Note. It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond 12
-> ip slb cluster cluster_2 condition slb_cond 13
-> no ip slb cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterRowStatus
  slbClusterPackets
  slbClusterCondition
  slbClusterType
```

ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

```
ip slb cluster cluster_name admin-state {enable | disable}
```

Syntax Definitions

<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
enable	Administratively enables a Server Load Balancing cluster on a switch.
disable	Administratively disables a Server Load Balancing cluster on a switch.

Defaults

By default, a cluster is administratively enabled when the cluster is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster	Configures Server Load Balancing clusters.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
    slbClusterAdminStatus
```

ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping period** *seconds*

Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>seconds</i>	The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the [ip slb cluster ping timeout](#) command to modify the ping timeout value.

Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping timeout	Modifies the ping timeout value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable  
  slbClusterPingPeriod
```

ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

ip slb cluster *cluster_name* **ping timeout** *milliseconds*

Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>milliseconds</i>	The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

Defaults

parameter	default
<i>milliseconds</i>	3000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the [ip slb cluster ping period](#) command to modify the ping period value.

Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping period	Modifies the ping period value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable  
  slbClusterPingTimeout
```

ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping retries** *count*

Syntax Definitions

cluster_name The name of the Server Load Balancing cluster.
count The number of ping retries.

Defaults

parameter	default
<i>count</i>	3

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters Displays the status and configuration of all Server Load Balancing clusters on a switch.

show ip slb cluster Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

ip slb cluster ping period Modifies the ping period value.

ip slb cluster ping timeout Modifies the ping timeout value.

MIB Objects

slbClusterTable
 slbClusterPingRetries

ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
ip slb probe	Configures and deletes SLB probes.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable  
  slbClusterProbeName
```

ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

ip slb server ip *ip_address* **cluster** *cluster_name* [**admin-state** {**enable** | **disable**}] [**weight** *weight*]

no ip slb server ip *ip_address* **cluster** *cluster_name*

Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
enable	Enables a server.
disable	Disables a server.
<i>weight</i>	Specifies the weight of the server.

Defaults

parameter	default
enable disable	enable
weight	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the **weight** parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable
  slbServerRowStatus
  slbServerAdminStatus
  slbServerAdminWeight
```

ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

```
ip slb server ip ip_address cluster cluster_name probe probe_name
```

Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>probe_name</i>	The name of the Server Load Balancing probe.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable  
  slbServerProbeName
```

ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
```

```
no ip slb probe probe_name
```

Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete an SLB probe.

Examples

```
-> ip slb probe mail_server_probe smtp  
-> no ip slb probe mail_server_probe
```

Release History

Release 7.1.1; command introduced.

Configures the length of time between each SLB probe to check the health of the servers.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
period seconds
```

Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
<i>seconds</i>	Specifies the length of time for the SLB probe period.

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http period 120
```

Release History

Release 7.1.1; command introduced.

Related Commands**ip slb probe**

Configures and deletes SLB probes.

show ip slb probes

Displays the configuration of SLB probes.

 slbProbePeriod

ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
port port_number
```

Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
<i>port_number</i>	Specifies the TDP/UDP port number.

Defaults

parameter	default
<i>port_number</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip slb probe mis_server udp port 200
```

Release History

Release 7.1.1; command introduced.

Related Commands

 slbProbePort

ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

ip slb probe *probe_name* {**ftp** | **http** | **https** | **imap** | **imaps** | **nntp** | **ping** | **pop** | **pops** | **smtp** | **tcp** | **udp**}
retries *retries*

Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
<i>retries</i>	Specifies the number of retries.

Defaults

parameter	default
<i>retries</i>	3

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip slb probe mail_server smtp retries 5
```

Release History

Release 7.1.1; command introduced.

Related Commands**ip slb probe**

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip slb
```

```
Admin status           : Enabled,  
Operational status    : In Service,  
Number of clusters    = 3
```

Output fields are described here:

output definitions

Admin status	The current administrative status of Server Load Balancing (SLB) on this switch (Enabled or Disabled).
Operational status	The current operational status of Server Load Balancing (SLB) on this switch, which is either In service (at least one SLB cluster is in service) or Out of service (all SLB clusters are out of service).
Number of clusters	The total number of Server Load Balancing (SLB) clusters on this switch.

Release History

Release 7.1.1; command introduced.

Src Port 2/49

```

output definitions

Cluster Name	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
Admin Status	The administrative state of this physical server (Enabled or Disabled).
Operational Status	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> • Disabled (this server is administratively disabled). • No Answer (this server has not responded to ping requests). • Link Down (there is a bad connection to this server). • In Service (this server is used for SLB cluster client connections). • Discovery (the SLB cluster is pinging this physical server). • Retrying (the SLB cluster is making another attempt to bring up this server).
Count	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.
Dst	The destination Virtual IP address assigned to the cluster.
Src	Source IP address assigned to the cluster.
Src Port	Source slot and port number of the SLB cluster.

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb reset statistics	Resets SLB statistics for all clusters.

show ip slb cluster

Displays detailed statistics and configuration information and operational status for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

show ip slb cluster *name* [**statistics**]

Syntax Definitions

name Specifies the name of the SLB cluster.
statistics Displays SLB statistics for the specified cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

Examples

```
-> show ip slb cluster Intranet
```

```
Cluster Intranet
VIP                : 128.241.130.204,
Type               : L3
Admin status       : Enabled,
Operational status : In Service,
Ping period (seconds) = 60,
Ping timeout (milliseconds) = 3000,
Ping retries       : 3,
Probe              : None,
Number of packets  : 25346,
Number of servers  : 3
  Server 128.241.130.107
    Admin status = Enabled, Operational status = In Service,
    Weight = 4, Availability (%) = 0
  Server 128.241.130.117
    Admin status = Enabled, Operational status = Discovery,
    Weight = 6, Availability (%) = 0
  Server 128.241.130.127
    Admin status = Enabled, Operational status = Discovery,
    Weight = 1, Availability (%) = 0
```

output definitions

Cluster	The name of this Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Type	The classifier for the hypothetical packet, which can be L2 or L3 .
Admin status	The current administrative status of this Server Load Balancing (SLB) cluster (Enabled or Disabled).
Operational status	The current operational status of this Server Load Balancing (SLB) cluster, which is In Service (at least one physical server is operational in the cluster) or Out of Service .
Ping period (seconds)	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
Ping timeout (milliseconds)	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
Ping retries	The number of ping retries that this Server Load Balancing (SLB) cluster executes before switching the status to No answer .
Probe	The probe configured for this cluster.
Number of packets	The number of packets balanced for this Server Load Balancing (SLB) cluster.
Number of servers	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin Status	The administrative state of this physical server (Enabled or Disabled).
Operational Status	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> • Disabled (this server is administratively disabled). • No Answer (this server has not responded to ping requests). • Link Down (there is a bad connection to this server). • In Service (this server is used for SLB cluster client connections). • Discovery (the SLB cluster is pinging this physical server). • Retrying (the SLB cluster is making another attempt to bring up this server).
Availability (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (In Service plus Retrying) versus down time (No Answer plus Link Down). Please note that the Disabled and the initial Discovery states are not counted as down time.

```
-> show ip slb cluster Intranet statistics
```

Cluster Name	Admin Status	Operational Status	Count
Intranet	Enabled	In Service	3 Servers
Src IP 15.2.3.2/255.255.255.255			195
Src Port 1/4			

output definitions

Cluster Name	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
Admin status	The current administrative status of this physical server (Enabled or Disabled).
Oper status	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> • Disabled (this server is administratively disabled). • No Answer (this server has not responded to ping requests). • Link Down (there is a bad connection to this server). • In Service (this server is used for SLB cluster client connections). • Discovery (the SLB cluster is pinging this physical server). • Retrying (the SLB cluster is making another attempt to bring up this server).

show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

show ip slb cluster *name* **server** *ip_address*

Syntax Definitions

name Specifies the name of the SLB cluster.
ip_address Specifies the IP address for the physical server.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specifying a value for the *name* and *ip_address* parameters is required.

Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster c11
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin status           : Enabled,
    Oper status            : In Service,
    Probe                   = phttp,
    Availability time (%)  = 95,
    Ping failures           = 0,
    Last ping round trip time (milliseconds) = 20,
    Probe status           = ,
```

Output fields are described here:

output definitions

Cluster	The name of the Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin status	The current administrative status of this physical server (Enabled or Disabled).

output definitions (continued)

Oper status	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none">• Disabled (this server is administratively disabled).• No Answer (this server has not responded to ping requests).• Link Down (there is a bad connection to this server).• In Service (this server is used for SLB cluster client connections).• Discovery (the SLB cluster is pinging this physical server).• Retrying (the SLB cluster is making another attempt to bring up this server).
Probe	The name of the probe configured for this server.
Availability time (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (In Service plus Retrying) versus down time (No Answer plus Link Down). Please note that the Disabled and the initial Discovery states are not counted as down time.
Ping failures	The total number of pings that have failed on this physical server.
Last ping round trip time (milliseconds)	The total amount of time (in milliseconds) measured for the last valid ping to this physical server to make a round trip.
Probe status	The status of the probe configured for this server.

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb servers	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.

show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

show ip slb probes [*probe_name*]

Syntax Definitions

probe_name Specifies the name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

Examples

No probe name is specified:

```
-> show ip slb probes
```

Probe Name	Period	Retries	Timeout	Method
web_server	60000	3	12000	HTTP
mail_server	60000	3	3000	SMTP
mis_servers	3600000	5	24000	Ping

Output fields are described here:

output definitions

Probe Name	The user-specified name of the probe.
Period	The period (in seconds) to check the health of servers.
Retries	The number of probe retries before deciding that a server is out of service.
Timeout	The timeout (in seconds) used to wait for probe answers.
Method	The type of probe.

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server
```

```
Probe mail_server
  Type                = SMTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp
```

```
Probe phttp
  Type                = HTTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
  Username            = ,
  Password            = ,
  Expect              = ,
  Status              = 200,
  URL                 = /,
```

Output fields are described here:

output definitions

Probe	The user-specified name of the probe.
Type	The type of probe.
Period	The period (in seconds) to check the health of servers.
Timeout	The timeout (in seconds) used to wait for probe answers.
Retries	The number of probe retries before deciding that a server is out of service.
Port	The TCP/UDP port on which the probe is sent.
Username	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
Password	The configured password for the probe.
Expect	The configured ASCII string used to compare a response from a server to verify the health of the server.
Status	The expected status returned from an HTTP GET to verify the health of a server.
URL	The configured URL sent to a server for an HTTP GET to verify the health of the server.

Release History

Release 7.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
ip slb probe period	Configures the probe period to check the health of servers.
ip slb probe timeout	Configures the timeout used to wait for probe answers.
ip slb probe retries	Configures the number of probe retries before deciding that a server is out of service.
ip slb probe port	Configures the TCP/UDP port that the probe should be sent on.
ip slb probe username	Configures a user name sent to a server as credentials for an HTTP GET operation
ip slb probe password	Configures a password sent to a server as credentials for an HTTP GET to verify the health of the server
ip slb probe expect	Configures an ASCII string used to compare a response from a server to verify the health of the server.
ip slb probe status	Configures the expected status returned from an HTTP GET to verify the health of a server.
ip slb probe url	Configures a URL sent to a server for an HTTP GET to verify the health of the server.

31 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

The OmniSwitch IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

The OmniSwitch IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS and IPv6MS commands is as follows:

Filename: ALCATEL-IND1-IPMS-MIB
Module: alcatelIND1IpmsMIB

The following table summarizes the available IP and IPv6 multicast commands:

ip multicast admin-state	ipv6 multicast admin-state
ip multicast flood-unknown	ipv6 multicast flood-unknown
ip multicast version	ipv6 multicast version
ip multicast port max-group	ipv6 multicast port max-group
ip multicast max-group	ipv6 multicast max-group
ip multicast static-neighbor	ipv6 multicast static-neighbor
ip multicast static-querier	ipv6 multicast static-querier
ip multicast static-group	ipv6 multicast static-group
ip multicast query-interval	ipv6 multicast query-interval
ip multicast last-member-query-interval	ipv6 multicast last-member-query-interval
ip multicast query-response-interval	ipv6 multicast query-response-interval
ip multicast unsolicited-report-interval	ipv6 multicast unsolicited-report-interval
ip multicast router-timeout	ipv6 multicast router-timeout
ip multicast source-timeout	ipv6 multicast source-timeout
ip multicast querying	ipv6 multicast querying
ip multicast robustness	ipv6 multicast robustness
ip multicast spoofing	ipv6 multicast spoofing
ip multicast zapping	ipv6 multicast zapping
ip multicast querier-forwarding	ipv6 multicast querier-forwarding
ip multicast proxying	ipv6 multicast proxying
ip multicast helper-address	ipv6 multicast zero-based-query
ip multicast zero-based-query	ipv6 multicast forward-mode
ip multicast forward-mode	ipv6 multicast update-delay-interval
ip multicast update-delay-interval	ipv6 multicast initial-packet-buffer admin-state
ip multicast initial-packet-buffer admin-state	ipv6 multicast initial-packet-buffer max-packet
ip multicast initial-packet-buffer max-packet	ipv6 multicast initial-packet-buffer max-flow
ip multicast initial-packet-buffer max-flow	ipv6 multicast initial-packet-buffer max-flow
ip multicast initial-packet-buffer timeout	ipv6 multicast initial-packet-buffer timeout
ip multicast initial-packet-buffer min-delay	ipv6 multicast initial-packet-buffer min-delay
ip multicast inherit-default-vrf-config	ipv6 multicast inherit-default-vrf-config
show ip multicast	show ipv6 multicast
show ip multicast port	show ipv6 multicast port
show ip multicast forward	show ipv6 multicast forward
show ip multicast neighbor	show ipv6 multicast neighbor
show ip multicast querier	show ipv6 multicast querier
show ip multicast group	show ipv6 multicast querier
show ip multicast source	show ipv6 multicast group
show ip multicast tunnel	show ipv6 multicast source
show ip multicast bridge	show ipv6 multicast tunnel
show ip multicast bridge-forward	show ipv6 multicast bridge
	show ipv6 multicast bridge-forward

ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

ip multicast [*vlan* *vlan_id*] **admin-state** [**enable** | **disable**]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IP Multicast Switching and Routing.
disable	Disable IP Multicast Switching and Routing.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an IP Multicast Routing protocol is already running on the system, the **ip multicast admin-state** command will override the existing configuration and always enable IP Multicast Switching and Routing.
- If the IP Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the system if no VLAN is specified by using only **ip multicast admin-state**.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the specified VLAN by using only **ip multicast vlan** *vlan_id* **admin-state**.

Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> ip multicast admin-state
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 2 admin-state disable
-> ip multicast vlan 2 admin-state
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigStatus
```

ip multicast flood-unknown

Enables or disables the flooding of initial unknown multicast traffic for the specified VLAN or on the system if no VLAN is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ip multicast [vlan *vlan_id*] flood-unknown [enable | disable]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable flooding of unknown traffic until it is learned.
disable	Disable flooding of unknown traffic.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- If the flooding of unknown traffic is already configured on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable
-> ip multicast flood-unknown
-> ip multicast vlan 100 flood-unknown enable
-> ip multicast vlan 100 flood-unknown disable
-> ip multicast vlan 100 flood-unknown
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigFloodUnknown
```

ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **version** [*version*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
version Default IGMP protocol version to run. Valid range is 1–3.

Defaults

parameter	default
<i>version</i>	2

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs.
- If the default IGMP protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- To restore the IGMP multicast version to the default version (i.e., 2) on the system if no VLAN is specified, use **ip multicast version** followed by the value 0 (e.g., **ip multicast version 0**) or use only **ip multicast version** (e.g., **ip multicast version**).
- To restore the IGMP multicast version to the default version (i.e., 2) on the specified VLAN, use **ip multicast vlan *vlan_id* version**, followed by the value 0 (e.g., **ip multicast vlan 2 version 0**) or use only **ip multicast vlan *vlan_id* version** (e.g., **ip multicast vlan 2 version**).

Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 2 version 0
-> ip multicast vlan 2 version
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigVersion
```

ip multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

ip multicast port *chassis/slot/port* **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>num</i>	The maximum IGMP group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a port will override the VLAN or global configuration.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is dropped.

Examples

```
-> ip multicast port 1/1 max-group 10 action drop
-> ip multicast port 6/14 max-group 20 action replace
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

show ip multicast port

Displays the maximum group configuration for all port or VLAN instances of a given port or all ports.

MIB Objects

alaIpmsIntfTable

alaIpmsIntfConfigType

alaIpmsIntfAddressType

alaIpmsIntfMaxGroupLimit

alaIpmsIntfMaxGroupExceedAction

ip multicast max-group

Configures the maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified. The limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.

ip multicast [**vlan** *vlan_id*] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum IGMP group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the maximum group limit is set to zero.

parameter	defaults
action	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a VLAN is not specified, this command configures the global maximum group limit that can be learned per port/VLAN instance.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration of a maximum group limit is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a VLAN will override the global configuration.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is to drop incoming membership requests.

Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
```

```
-> ip multicast max-group
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 10 max-group
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip multicast](#)

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

[show ip multicast port](#)

Displays the maximum group configuration for all port or VLAN instances of a given port or all ports.

MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigMaxGroupLimit
  alaIpmsConfigMaxGroupExceedAction
```

ip multicast static-neighbor

Creates a static IGMP neighbor entry on a specified port on a specified VLAN.

```
ip multicast static-neighbor vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
no ip multicast static-neighbor vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static IGMP neighbor.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP neighbor.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on a specified port on a specified VLAN.
- The **ip multicast static-neighbor** command allows you to create an IGMP static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static neighbor entry on a link aggregate port by entering **ip multicast static-neighbor** vlan *vlan_id* **linkagg**, followed by the link aggregation group number (e.g., ip multicast static-neighbor vlan 2 linkagg 7).

Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/5
-> no ip multicast static-neighbor vlan 4 port 1/1/5
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **linkagg** parameter was introduced.

Related Commands

show ip multicast neighbor Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

MIB Objects

```
alaIpmsStaticNeighborTable
  alaIpmsStaticNeighborConfigType
  alaIpmsStaticNeighborAddressType
  alaIpmsStaticNeighborValue
  alaIpmsStaticNeighborIfIndex
  alaIpmsStaticNeighborSubValue

```

ip multicast static-querier

Creates a static IGMP querier entry on a specified port on a specified VLAN.

```
ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
no ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static IGMP querier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP querier.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP querier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on a specified port on a specified VLAN.
- The **ip multicast static-querier** command allows you to create an IGMP static querier entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static querier entry on a link aggregate port by entering **ip multicast static-querier** vlan *vlan_id* linkagg, followed by the link aggregation group number (e.g., ip multicast static-querier vlan 2 linkagg 7).

Examples

```
-> ip multicast static-querier vlan 4 port 1/1/2
-> no ip multicast static-querier vlan 4 port 1/1/2
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; linkagg parameter was added.

Related Commands

show ip multicast querier Displays the IGMP querier table entries of IP Multicast Switching and Routing.

MIB Objects

```
alaIpmsStaticQuerierTable  
  alaIpmsStaticQuerierConfigType  
  alaIpmsStaticQuerierAddressType  
  alaIpmsStaticQuerierValue  
  alaIpmsStaticQuerierIfIndex  
  alaIpmsStaticQuerierSubValue  
  alaIpmsStaticQuerierRowStatus
```

ip multicast static-group

Creates a static IGMP group entry on a specified port on a specified VLAN.

```
ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
no ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

Syntax Definitions

<i>ip_address</i>	The IP address of the multicast group.
<i>vlan_id</i>	VLAN to include as a static IGMP group.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP group.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP group.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on a specified port on a specified VLAN.
- The **ip multicast static-group** command allows you to create an IGMP static group entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- You can also create an IGMP static group entry on a link aggregate port by entering **ip multicast static-group** *ip_address* **vlan** *vlan_id* **linkagg**, followed by the link aggregation group number (e.g., ip multicast static-group 225.0.0.1 vlan 2 linkagg 7).

Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.

Related Commands

show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

MIB Objects

```
alaIcmpStaticMemberTable  
  alaIpmsStaticMemberConfigType  
  alaIpmsStaticMemberAddressType  
  alaIpmsStaticMemberValue  
  alaIpmsStaticMemberIfIndex  
  alaIpmsStaticMemberSubValue  
  alaIpmsStaticMemberGroupAddress  
  alaIpmsStaticMemberRowStatus
```

ip multicast query-interval

Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **query-interval** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds IGMP query interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	125

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs.
- If the IGMP query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- To restore the IGMP query interval to its default value (i.e., 125 seconds) on the system if no VLAN is specified, use **ip multicast query-interval** followed by the value 0 (e.g., ip multicast query-interval 0) or use only **ip multicast query-interval** (e.g., ip multicast query-interval).
- To restore the IGMP query interval to its default value (i.e., 125 seconds) on the specified VLAN, use **ip multicast vlan *vlan_id* query-interval**, followed by the value 0 (e.g., ip multicast vlan 2 query-interval 0) or use only **ip multicast vlan *vlan_id* query-interval** (e.g., ip multicast vlan 2 query-interval).

Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> ip multicast vlan 2 query-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigQueryInterval
```

ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **last-member-query-interval** [*tenths_of_seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.

tenths_of_seconds IGMP last member query interval in tenths of seconds. The valid range is 1–65535.

Defaults

parameter	default
<i>tenths_of_seconds</i>	10

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs.
- If the IGMP last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- To restore the IGMP last member query interval to its default value (i.e., 10 tenths-of-seconds) on the system if no VLAN is specified, use **ip multicast last-member-query-interval** followed by the value 0 (e.g., ip multicast last-member-query-interval 0) or use only **ip multicast last-member-query-interval** (e.g., ip multicast last-member-query-interval).
- To restore the IGMP last member query interval to its default value (i.e., 10 tenths-of-seconds) on the specified VLAN, use **ip multicast vlan *vlan_id* last-member-query-interval** followed by the value 0 (e.g., ip multicast vlan 2 last-member-query-interval 0) or use only **ip multicast vlan *vlan_id* last-member-query-interval** (e.g., ip multicast vlan 2 last-member-query-interval).

Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> ip multicast vlan 2 last-member-query-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip multicast](#)

  alaIpmsConfigValue
  alaIpmsConfigLastMemberQueryInterval
```

ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **query-response-interval** [*tenths_of_seconds*]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>tenths_of_seconds</i>	IGMP query response interval in tenths of seconds. The valid range is 1–65535.

Defaults

parameter	default
<i>tenths_of_seconds</i>	100

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- To restore the IGMP query response interval to its default value (i.e., 100 tenths-of-seconds) on the system if no VLAN is specified, use **ip multicast query-response-interval** followed by the value 0 (e.g., **ip multicast query-response-interval 0**) or use only **ip multicast query-response-interval** (e.g., **ip multicast query-response-interval**).
- To restore the IGMP last member query interval to its default value (i.e., 100 tenths-of-seconds) on the specified VLAN, use **ip multicast vlan *vlan_id* query-response-interval** followed by the value 0 (e.g., **ip multicast vlan 2 query-response-interval 0**) or use only **ip multicast vlan *vlan_id* query-response-interval** (e.g., **ip multicast vlan 2 query-response-interval**).

Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
-> ip multicast vlan 2 query-response-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **unsolicited-report-interval** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds IGMP unsolicited report interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- To restore the IGMP unsolicited report interval to its default value (i.e., 1 second) on the system if no VLAN is specified, use **ip multicast unsolicited-report-interval** followed by the value 0 (e.g., ip multicast unsolicited-report-interval 0) or use only **ip multicast unsolicited-report-interval** (e.g., ip multicast unsolicited-report-interval).
- To restore the IGMP unsolicited report interval to its default value (i.e., 1 second) on the specified VLAN, use **ip multicast vlan *vlan_id* unsolicited-report-interval** followed by the value 0 (e.g., ip multicast vlan 2 unsolicited-report-interval 0) or use only **ip multicast vlan *vlan_id* unsolicited-report-interval** (e.g., ip multicast vlan 2 unsolicited-report-interval).

Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
-> ip multicast vlan 2 unsolicited-report-interval
```

ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **router-timeout** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds IGMP router timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	90

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ip multicast router-timeout** followed by the value 0 (e.g., ip multicast router-timeout 0) or use only **ip multicast router-timeout** (e.g., ip multicast router-timeout).
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ip multicast vlan *vlan_id* router-timeout** followed by the value 0 (e.g., ip multicast vlan 2 router-timeout 0) or use only **ip multicast vlan *vlan_id* router-timeout** (e.g., ip multicast vlan 2 router-timeout).

Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> ip multicast vlan 2 router-timeout
```

Release History

ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **source-timeout** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds IGMP source timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ip multicast source-timeout** followed by the value 0 (e.g., ip multicast source-timeout 0) or use only **ip multicast source-timeout** (e.g., ip multicast source-timeout).
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ip multicast vlan *vlan_id* source-timeout** followed by the value 0 (e.g., ip multicast vlan 2 source-timeout 0) or use only **ip multicast vlan *vlan_id* source-timeout** (e.g., ip multicast vlan 2 source-timeout).

Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> ip multicast vlan 2 source-timeout
```

ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [**vlan** *vlan_id*] **querying** [{**enable** | **disable**}]

no ip multicast [**vlan** *vlan_id*] **querying**

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IGMP querying.
disable	Disable IGMP querying.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP querying entry on the specified VLAN or on the system and return to its default behavior.
- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast querying** (e.g., ip multicast querying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vlan_id* querying** (e.g., ip multicast vlan 2 querying).

Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 2 querying disable
-> ip multicast vlan 2 querying
-> no ip multicast vlan 2 querying
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vlan_id] robustness [robustness]
```

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
robustness IGMP robustness variable. Valid range is 1–7.

Defaults

parameter	default
<i>robustness</i>	2

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs.
- If the IGMP robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the IGMP robustness variable to its default value (i.e., 2) on the system if no VLAN is specified, use **ip multicast robustness** followed by the value 0 (e.g., ip multicast robustness **0**) or use only **ip multicast robustness** (e.g., ip multicast robustness).
- To restore the IGMP robustness variable to its default value (i.e., 2) on the specified VLAN, use **ip multicast vlan *vlan_id* robustness** followed by the value 0 (e.g., ip multicast vlan 2 robustness 0) or use only **ip multicast vlan *vlan_id* robustness** (e.g., ip multicast vlan 2 robustness).

Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> ip multicast robustness
-> ip multicast vlan 2 robustness 3
-> ip multicast vlan 2 robustness 0
-> ip multicast vlan 2 robustness
```

Release History

Release 7.1.1; command was introduced.

ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id*] spoofing [enable | disable]

no ip multicast [vlan *vlan_id*] spoofing

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IGMP spoofing.
disable	Disable IGMP spoofing.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing configuration and return the specified VLAN or system to the default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- You can also restore the IGMP spoofing to its default setting (i.e., disabled) on the system if no VLAN is specified, by using only **ip multicast spoofing** (e.g., ip multicast spoofing).
- You can also restore the IGMP spoofing to its default setting (i.e., disabled) on the specified VLAN, by using only **ip multicast vlan *vlan_id* spoofing** (e.g., ip multicast vlan 2 spoofing).

Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
-> ip multicast vlan 2 spoofing disable
-> ip multicast vlan 2 spoofing
-> no ip multicast vlan 2 spoofing
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip multicast](#)

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigSpoofing  
  alaIpmsConfigSpoofingStaticSourceAddress
```

ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vlan_id] zapping [{enable | disable}]
```

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IGMP zapping.
disable	Disable IGMP zapping.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the IGMP querying to its default setting (i.e., disabled) on the system if no VLAN is specified, by using only **ip multicast zapping** (e.g., ip multicast zapping).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN by using only **ip multicast vlan *vlan_id* zapping** (e.g., ip multicast vlan 2 zapping).

Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 2 zapping disable
-> ip multicast vlan 2 zapping
```

Release History

Release 7.1.1; command was introduced.

ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id*] querier-forwarding [enable | disable]

no ip multicast [vlan *vlan_id*] querier-forwarding

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs (5-10).
enable	Enable IGMP querier forwarding.
disable	Disable IGMP querier forwarding.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IGMP querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.

Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> ip multicast querier-forwarding
-> no ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 2 querier-forwarding disable
-> ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 2 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip multicast

  alaIpmsConfigQuerierForwarding
```

ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [*vlan* *vlan_id*] **proxying** [**enable** | **disable**]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IGMP proxying.
disable	Disable IGMP proxying.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the IGMP proxying to its default setting (disabled) on the system if no VLAN is specified, by using only **ip multicast proxying** (e.g., ip multicast proxying).
- You can also restore the IGMP proxying to its default setting (disabled) on the specified VLAN by using only **ip multicast vlan *vlan_id* proxying** (e.g., ip multicast vlan 2 proxying).

Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 2 proxying disable
-> ip multicast vlan 2 proxying
```

Release History

Release 7.1.1; command was introduced.

  alaIpmsConfigValue  
  alaIpmsConfigProxying
```

ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host reports and Leave messages are to be sent.

ip multicast helper-address [*ip_address*]

Syntax Definitions

ip_address The IP address of the relay host.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- To disable the IPMS reporting feature, 0.0.0.0 is used as the IP address. It can also be disabled by omitting the IP address from the command.

Examples

```
-> ip multicast helper-address 10.1.1.198
-> ip multicast helper-address 0.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigHelperAddress
```

ip multicast zero-based-query

Configures the use of an all-zero source IPv4 address for IGMP query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id*] zero-based-query [enable | disable]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IGMP zero-based querying.
disable	Disable IGMP zero-based querying.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The IGMP zero-based query status set for a specific VLAN overrides the zero-based query status set for the system.
- To restore the IGMP zero-based query status to the default setting (i.e., enabled) on the system, use **ip multicast zero-based query** without specifying a VLAN.
- To restore the IGMP zero-based query status to the default setting (i.e., enabled) on the specified VLAN, use **ip multicast vlan *vlan_id* zero-based query**.

Examples

```
-> ip multicast zero-based-query enable
-> ip multicast zero-based-query disable
-> ip multicast vlan 2 zero-based-query enable
-> ip multicast vlan 2 zero-based-query disable
-> ip multicast vlan 2 zero-based-query
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigZeroBasedQuery
```

ip multicast forward-mode

Configures the Layer 2 forwarding mode for IPv4 Multicast Switching (does not apply to IPv4 Multicast Routing). The forwarding mode is set for the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vlan_id] forward-mode {asm | ssm | mac | auto}
```

```
no ip multicast [vlan vlan_id] forward-mode
```

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
asm	Sets the IPMS forwarding mode to ASM (the bridge lookup is based on the packet group destination IP address).
ssm	Sets the IPMS forwarding mode to SSM (the bridge lookup is based on the packet source IP as well as the group destination IP).
mac	Sets the IPMS forwarding mode to MAC address (the bridge lookup is based on the MAC destination address). <i>This parameter option is supported only on the OmniSwitch 9900.</i>
auto	Automatically determines the IPMS forwarding mode based on the current IGMP protocol version and the existing protocol state.

Defaults

By default, the forwarding mode is set to automatic.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the Layer 2 forwarding mode back to automatic (the default).
- The forwarding mode set for a specific VLAN overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
 - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
 - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

Examples

```
-> ip multicast forward-mode auto
-> ip multicast forward-mode asm
-> ip multicast forward-mode ssm
-> ip multicast forward-mode mac
-> no ip multicast forward-mode
-> ip multicast vlan 100 forward-mode auto
```

```
-> ip multicast vlan 100 forward-mode asm
-> ip multicast vlan 100 forward-mode ssm
-> ip multicast vlan 100 forward-mode mac
-> no ip multicast vlan 100 forward-mode
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show ip multicast](#)

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigForwardMode
```

ip multicast update-delay-interval

Sets the amount of time to delay IPv4 multicast forwarding updates on the specified VLAN or on the system if no VLAN is specified.

ip multicast [*vlan vlan_id*] **update-delay-interval** *milliseconds*

no ip multicast [*vlan vlan_id*] **update-delay-interval**

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>milliseconds</i>	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the forwarding update delay interval back to zero (the default).
- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ip multicast update-delay-interval 10
-> no ip multicast update-delay-interval
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigUpdateDelayInterval
```

ip multicast initial-packet-buffer admin-state

Enables or disables the initial packet buffering feature globally for IPv4 multicast flows on the switch.

ip multicast initial-packet-buffer admin-state {enable | disable}

Syntax Definitions

enable Enable the initial packet buffering globally on the switch.
disable Disable the initial packet buffering globally on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When enabled, the following configuration is used for initial packet buffering on new multicast flows:

- The maximum number of initial packets buffered per IPv4 multicast flow. Use the **ip multicast initial-packet-buffer max-packet** command to set this value.
- The maximum number of IPv4 multicast flows that can be buffered. Use the **ip multicast initial-packet-buffer max-flow** command to set this value.
- The maximum amount of time buffered packets are held if they are not sent out. Use the **ip multicast initial-packet-buffer timeout** command to set this value.
- The minimum amount of time packets are held before delivery begins. Use the **ip multicast initial-packet-buffer min-delay** command to set this value.

Examples

```
-> ip multicast initial-packet-buffer admin-state disable  
-> ip multicast initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip multicast

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBuffer
```

ip multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv4 multicast flow.

ip multicast initial-packet-buffer max-packet [*num*]

Syntax Definitions

num The maximum number of packets allowed to buffer per IPv4 multicast flow. Valid range is 1 to 10.

Defaults

parameter	default
<i>num</i>	4

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ip multicast initial-packet-buffer max-packet 4
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMaxPacket
```

ip multicast initial-packet-buffer max-flow

Configures the maximum number of IPv4 multicast flows that can be buffered.

ip multicast initial-packet-buffer max-flow [*num*]

Syntax Definitions

num The maximum number of IPv4 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

Defaults

parameter	default
<i>num</i>	32

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ip multicast initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsConfigTable

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMaxFlow
```

ip multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv4 initial multicast packets.

ip multicast initial-packet-buffer timeout [*seconds*]

Syntax Definitions

seconds The timeout value for the initial buffered IPv4 multicast packets in seconds. Valid range is 1 to 10.

Defaults

parameter	default
<i>seconds</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ip multicast initial-packet-buffer timeout 2
```

Release History

Release 8.2.1; command introduced.

Related Commands

```

ip multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet.

ip multicast initial-packet-buffer min-delay [*milliseconds*]

Syntax Definitions

milliseconds The minimum delay value to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Valid range is 0 to 1000.

Defaults

parameter	default
<i>milliseconds</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ip multicast initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.
show ip multicast	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

 alaIpmsConfigType

 alaIpmsConfigAddressType

 alaIpmsConfigValue

 alaIpmsConfigInitialPacketBufferMinDelay

ip multicast inherit-default-vrf-config

Configures whether or not the global IPMS configuration defined in the default VRF instance is applied to all VRF instances.

ip multicast inherit-default-vrf-config

no ip multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMS configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMS configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled, additional VRF instances will inherit the global IPMS configuration defined in the default VRF instance.
- A global IPMS configuration defined for a specific non-default VRF instance takes precedence over the global IPMS configuration defined for the default VRF.
- Note that any per-VLAN IPMS configuration defined in a non-default VRF instance will show up as part of the default VRF instance in the configuration snapshot file. However, the functionality is still applied within the context of VRF instance in which the per-VLAN configuration was originally defined.

Examples

```
-> ip multicast inherit-default-vrf-config  
-> no ip multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show ip multicast](#)

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIpmsGlobalConfigTable  
  alaIpmsGlobalConfigAddressType  
  alaIpmsGlobalConfigInheritDefaultVrfConfig
```

ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **admin-state** [**enable** | **disable**]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable IPv6 Multicast Switching and Routing.
disable	Disable IPv6 Multicast Switching and Routing.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If an IPv6 multicast routing protocol is already running on the system, this command will override this configuration and always enable IPv6 Multicast Switching and Routing.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the MLD querying to its default status (i.e., disabled) on the system if no VLAN is specified by using this command.
- You can also restore the MLD querying to its default status (i.e., disabled) on the specified VLAN by using this command.

Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 2 admin-state disable
-> ipv6 multicast vlan 2 admin-state
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigStatus
```

ipv6 multicast flood-unknown

Enables or disables the flooding of initial unknown multicast traffic on the system. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ipv6 multicast flood-unknown [enable | disable]

Syntax Definitions

enable	Enable flooding of unknown traffic until it is learned.
disable	Disable flooding of unknown traffic.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- The IPv4 multicast version of this command (**ip multicast flood-unknown**) allows configuration of this function at the VLAN level. When enabled or disabled for IPv6 multicast, however, this function is applied globally across all VLANs.

Examples

```
-> ipv6 multicast flood-unknown enable
-> ipv6 multicast flood-unknown disable
-> ipv6 multicast flood-unknown
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigFloodUnknown
```

ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [**vlan** *vlan_id*] **version** [*version*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
version Default MLD protocol version to run. Valid entries are 1 or 2.

Defaults

parameter	default
<i>version</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs.
- If the default MLD protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- To restore the MLD multicast version to the default version (i.e., 1) on the system if no VLAN is specified, use **ipv6 multicast version** followed by the value 0 (e.g., `ipv6 multicast version 0`) or use only **ipv6 multicast version** (e.g., `ipv6 multicast version`).
- To restore the MLD multicast version to the default version (i.e., 1) on the specified VLAN, use **ipv6 multicast vlan** *vlan_id* **version** followed by the value 0 (e.g., `ipv6 multicast vlan 2 version 0`) or use only **ipv6 multicast vlan** *vlan_id* **version** (e.g., `ipv6 multicast vlan 2 version`).

Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 2 version 0
-> ipv6 multicast vlan 2 version
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigVersion
```

ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

ipv6 multicast port *chassis/slot/port* **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>num</i>	The maximum MLD group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a port will override the VLAN or global configuration.
- MLD zapping must be enabled when the maximum group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast port 1/1 max-group 10 action drop
-> ipv6 multicast port 1/1 max-group action replace
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 multicast

MIB Objects

```
alaIpmsIntfTable  
  alaIpmsIntfConfigType  
  alaIpmsIntfAddressType  
  alaIpmsIntfMaxGroupLimit  
  alaIpmsIntfMaxGroupExceedAction
```

ipv6 multicast max-group

Configures the maximum group limit learned per port for the specified VLAN or per port on the system if no VLAN is specified. The limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.

ipv6 multicast [*vlan vlan_id*] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum MLD group count. Valid range is 0–4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If a VLAN is not specified, this command configures the global maximum group limit that can be learned per port/VLAN instance.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration of a maximum group limit is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a VLAN will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
```

```
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 10 max-group 20 action replace
```

Release History

Release 7.1.1; command was introduced.

ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on a specified port on a specified VLAN.

ipv6 multicast static-neighbor *vlan* *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

no ipv6 multicast static-neighbor *vlan* *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static MLD neighbor.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD neighbor.
<i>agg_id</i>	The link aggregate to configure as a static MLD neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-neighbor** command allows you to create an MLD static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static neighbor entry on a link aggregate port by entering **ipv6 multicast static-neighbor** *vlan* *vlan_id* **linkagg**, followed by the link aggregation group number (e.g., **ipv6 multicast static-neighbor** *vlan* 2 **linkagg** 7).

Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **linkagg** parameter was added.

Related Commands

  alaIpmsStaticNeighborRowStatus
```

ipv6 multicast static-querier

Creates a static MLD querier entry on a specified port on a specified VLAN.

ipv6 multicast static-querier *vlan* *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

no ipv6 multicast static-querier *vlan* *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static MLD querier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD querier.
<i>agg_id</i>	The link aggregate to configure as a static MLD querier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-querier** command allows you to create an MLD static querier entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static querier entry on a link aggregate port by entering **ipv6 multicast static-querier** *vlan* *vlan_id* **linkagg**, followed by the link aggregation group number (e.g., `ipv6 multicast static-querier vlan 2 linkagg 7`).

Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.

Related Commands

show ipv6 multicast querier Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

```

ipv6 multicast static-group

Creates a static MLD group entry on a specified port on a specified VLAN.

ipv6 multicast static-group *ip_address* **vlan** *vlan_id* **{port** *chassis/slot/port* **| linkagg** *agg_id***}**

no ipv6 multicast static-group *ip_address* **vlan** *vlan_id* **{port** *chassis/slot/port* **| linkagg** *agg_id***}**

Syntax Definitions

<i>ip_address</i>	IPv6 multicast group address.
<i>vlan_id</i>	VLAN to include as a static MLD group.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD group.
<i>agg_id</i>	The link aggregate to configure as a static MLD group.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on a specified port on the specified VLAN.
- The **ipv6 multicast static-group** command allows you to create an MLD static group entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive MLD traffic addressed to the specified IPv6 multicast group address.
- You can also create an MLD static group entry on a link aggregate port by entering **ipv6 multicast static-group** *ip_address* **vlan** *vlan_id* **linkagg**, followed by the link aggregation group number (e.g., `ipv6 multicast static-group ff05::5 vlan 2 linkagg 7`).

Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **linkagg** parameter was added.

```

ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan* *vlan_id*] **query-interval** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds MLD query interval in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	125

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs.
- If the MLD query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- To restore the MLD query interval to its default value (i.e., 125 seconds) on the system if no VLAN is specified, use **ipv6 multicast query-interval** followed by the value 0 (e.g., `ipv6 multicast query-interval 0`) or use only **ipv6 multicast query-interval** (e.g., `ipv6 multicast query-interval`).
- To restore the MLD query interval to its default value (i.e., 125 seconds) on the specified VLAN, use **ipv6 multicast vlan *vlan_id* query-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-interval 0`) or use only **ipv6 multicast vlan *vlan_id* query-interval** (e.g., `ipv6 multicast vlan 2 query-interval`).

Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> ipv6 multicast vlan 2 query-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ipv6 multicast`

```

ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **last-member-query-interval** [*milliseconds*]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>milliseconds</i>	MLD last member query interval in milliseconds. Valid range is 1–65535.

Defaults

parameter	default
<i>milliseconds</i>	1000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs.
- If the MLD last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- To restore the MLD last member query interval to its default value (i.e., 1000 milliseconds) on the system if no VLAN is specified, use **ipv6 multicast last-member-query-interval** followed by the value 0 (e.g., `ipv6 multicast last-member-query-interval 0`) or use only **ipv6 multicast last-member-query-interval** (e.g., `ipv6 multicast last-member-query-interval`).
- To restore the MLD last member query interval to its default value (i.e., 1000 milliseconds) on the specified VLAN, use **ipv6 multicast vlan *vlan_id* last-member-query-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 last-member-query-interval 0`) or use only **ipv6 multicast vlan *vlan_id* last-member-query-interval** (e.g., `ipv6 multicast vlan 2 last-member-query-interval`).

Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> ipv6 multicast last-member-query-interval
-> ipv6 multicast vlan 4 last-member-query-interval 2200
-> ipv6 multicast vlan 4 last-member-query-interval 0
-> ipv6 multicast vlan 4 last-member-query-interval
```

Release History

ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan* *vlan_id*] **query-response-interval** [*milliseconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
milliseconds MLD query response interval in milliseconds. Valid range is 1–65535.

Defaults

parameter	default
<i>milliseconds</i>	10000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs.
- If the MLD query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- To restore the MLD query response interval to its default (i.e., 10000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast query-response-interval** followed by the value 0 (e.g., `ipv6 multicast query-response-interval 0`) or use only **ipv6 multicast query-response-interval** (e.g., `ipv6 multicast query-response-interval`).
- To restore the MLD query response interval to its default value (i.e., 10000 milliseconds) on the specified VLAN, use **ipv6 multicast vlan *vlan_id* query-response-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-response-interval 0`) or use only **ipv6 multicast vlan *vlan_id* query-response-interval** (e.g., `ipv6 multicast vlan 2 query-response-interval`).

Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> ipv6 multicast query-response-interval
-> ipv6 multicast vlan 2 query-response-interval 20000
-> ipv6 multicast vlan 2 query-response-interval 0
-> ipv6 multicast vlan 2 query-response-interval
```

Release History

Release 7.1.1; command was introduced.

ipv6 multicast unsolicited-report-interval

Sets the value of the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **unsolicited-report-interval** [*seconds*]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>seconds</i>	MLD unsolicited report interval in seconds. Valid range is 1–65535, where 0 represents the default setting.

Defaults

parameter	default
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- To restore the MLD unsolicited interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ipv6 multicast unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast unsolicited-report-interval 0`) or use only **ipv6 multicast unsolicited-report-interval** (e.g., `ipv6 multicast unsolicited-report-interval`).
- To restore the MLD unsolicited report interval to its default value (i.e., 1 second) on the specified VLAN, use **ipv6 multicast vlan *vlan_id* unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval 0`) or use only **ipv6 multicast vlan *vlan_id* unsolicited-report-interval** (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval`).

Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> ipv6 multicast vlan 2 unsolicited-report-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [**vlan** *vlan_id*] **router-timeout** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds MLD router timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	90

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ipv6 multicast router-timeout** followed by the value 0 (e.g., **ipv6 multicast router-timeout 0**) or use only **ipv6 multicast router-timeout** (e.g., **ipv6 multicast router-timeout**).
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ipv6 multicast vlan *vlan_id* router-timeout** followed by the value 0 (e.g., **ipv6 multicast vlan 2 router-timeout 0**) or use only **ipv6 multicast vlan *vlan_id* router-timeout** (e.g., **ipv6 multicast vlan 2 router-timeout**).

Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> ipv6 multicast vlan 2 router-timeout
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

 alaIpmsConfigRouterTimeout

ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **source-timeout** [*seconds*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
seconds MLD source timeout in seconds. Valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ipv6 multicast source-timeout** followed by the value 0 (e.g., `ipv6 multicast source-timeout 0`) or use only **ipv6 multicast source-timeout** (e.g., `ipv6 multicast source-timeout`).
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ipv6 multicast vlan *vlan_id* source-timeout** followed by the value 0 (e.g., `ipv6 multicast vlan 2 source-timeout 0`) or use only **ipv6 multicast vlan *vlan_id* source-timeout** (e.g., `ipv6 multicast vlan 2 source-timeout`).

Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> ipv6 multicast vlan 2 source-timeout
```

ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **querying** [{*enable* | *disable*}]

no ipv6 multicast [*vlan vlan_id*] **querying**

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable MLD querying.
disable	Disable MLD querying.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD querying entry on the specified VLAN or on the system and return to its default behavior.
- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- You can also restore the MLD querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast querying** (e.g., `ipv6 multicast querying`).
- You can also restore the MLD querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vlan_id* querying** (e.g., `ipv6 multicast vlan 2 querying`).

Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 2 querying disable
-> ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 2 querying
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ipv6 multicast`

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [**vlan** *vlan_id*] **robustness** [*robustness*]

Syntax Definitions

vlan_id VLAN on which to apply the configuration.
robustness MLD robustness variable. Valid range is 1–7.

Defaults

parameter	default
<i>robustness</i>	2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs.
- If the MLD robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the MLD robustness variable to its default value (i.e., 2) on the system if no VLAN is specified, use **ipv6 multicast robustness** followed by the value 0 (e.g., `ipv6 multicast robustness 0`) or use only **ipv6 multicast robustness** (e.g., `ipv6 multicast robustness`).
- To restore the MLD robustness variable to its default value (i.e., 2) on the specified VLAN, use **ipv6 multicast vlan** *vlan_id* **robustness** followed by the value 0 (e.g., `ipv6 multicast vlan 2 robustness 0`) or use only **ipv6 multicast vlan** *vlan_id* **robustness** (e.g., `ipv6 multicast vlan 2 robustness`).

Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> ipv6 multicast vlan 2 robustness
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 multicast

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigRobustness
```

ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id*] spoofing [enable | disable]

no ipv6 multicast [vlan *vlan_id*] spoofing

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable MLD spoofing.
disable	Disable MLD spoofing.

Defaults

parameter	defaults
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated MLD group membership information.
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast spoofing** (i.e., ipv6 multicast spoofing).
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vlan_id* spoofing** (i.e., ipv6 multicast vlan 2 spoofing).

Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
-> ipv6 multicast vlan 2 spoofing disable
-> ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 2 spoofing
```

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaIpmsConfigValue  
  alaIpmsConfigSpoofing  
  alaIpmsConfigSpoofingStaticSourceAddress
```

ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **zapping** [**enable** | **disable**]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable MLD zapping.
disable	Disable MLD zapping.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast zapping** (e.g., ipv6 multicast zapping).
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the specified VLAN by using only **ipv6 multicast vlan *vlan_id* zapping** (e.g., ipv6 multicast vlan 2 zapping).

Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 2 zapping disable
-> ipv6 multicast vlan 2 zapping
```

Release History

Release 7.1.1; command was introduced.

```

ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id*] querier-forwarding [enable | disable]

no ipv6 multicast [vlan *vlan_id*] querier-forwarding

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable MLD querier forwarding.
disable	Disable MLD querier forwarding.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an MLD querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.

Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> ipv6 multicast querier-forwarding
-> no ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 2 querier-forwarding disable
-> ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 2 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaIpmsConfigValue  
  alaIpmsConfigQuerierForwarding
```

ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [*vlan vlan_id*] **proxying** [**enable** | **disable**]

Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i>]	VLAN on which to apply the configuration.
enable	Enable MLD proxying.
disable	Disable MLD proxying.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast proxying** (e.g., `ipv6 multicast proxying`).
- You can also restore the MLD proxying to its default setting (i.e., disabled) on the specified VLAN by using only **ipv6 multicast vlan *vlan_id* proxying** (e.g., `ipv6 multicast vlan 2 proxying`).

Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 2 proxying disable
-> ipv6 multicast vlan 2 proxying
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ipv6 multicast`

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigProxying
```

ipv6 multicast zero-based-query

Configures the use of an all-zero source IPv6 address for MLD query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id*] zero-based-query [enable | disable]

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
enable	Enable MLD zero-based querying.
disable	Disable MLD zero-based querying.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The IGMP zero-based query status set for a specific VLAN overrides the zero-based query status set for the system.
- To restore the IGMP zero-based query status to the default setting (i.e., disabled) on the system, use **ipv6 multicast zero-based query** without specifying a VLAN.
- To restore the IGMP zero-based query status to the default setting (i.e., disabled) on the specified VLAN, use **ipv6 multicast vlan *vlan_id* zero-based query**.

Examples

```
-> ipv6 multicast zero-based-query enable
-> ipv6 multicast zero-based-query disable
-> ipv6 multicast vlan 2 zero-based-query enable
-> ipv6 multicast vlan 2 zero-based-query disable
-> ipv6 multicast vlan 2 zero-based-query
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigZeroBasedQuery
```

ipv6 multicast forward-mode

Configures the Layer 2 forwarding mode for IPv6 Multicast Switching (does not apply to IPv6 Multicast Routing). The forwarding mode is set for the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [**vlan** *vlan_id*] **forward-mode** {**asm** | **ssm** | **mac** | **auto**}

no ipv6 multicast [**vlan** *vlan_id*] **forward-mode**

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
asm	Sets the IPMSv6 forwarding mode to ASM (the bridge lookup is based on the packet group destination IPv6 address).
ssm	Sets the IPMSv6 forwarding mode to SSM (the bridge lookup is based on the packet source IPv6 as well as the group destination IPv6).
mac	Sets the IPMSv6 forwarding mode to MAC address (the bridge lookup is based on the MAC destination address). <i>This parameter option is supported only on the OmniSwitch 9900.</i>
auto	Automatically determines the IPMSv6 forwarding mode based on the current MLD protocol version and the existing protocol state.

Defaults

By default, the forwarding mode is set to **auto**.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the Layer 2 forwarding mode back to the default value (**auto**).
- The forwarding mode set for a specific VLAN overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
 - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
 - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

Examples

```
-> ipv6 multicast forward-mode auto
-> ipv6 multicast forward-mode asm
-> ipv6 multicast forward-mode ssm
-> ipv6 multicast forward-mode mac
-> no ipv6 multicast forward-mode
-> ipv6 multicast vlan 100 forward-mode auto
```

```
-> ipv6 multicast vlan 100 forward-mode asm
-> ipv6 multicast vlan 100 forward-mode ssm
-> ipv6 multicast vlan 100 forward-mode mac
-> no ipv6 multicast vlan 100 forward-mode
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show ipv6 multicast](#)

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigForwardMode
```

ipv6 multicast update-delay-interval

Sets the amount of time to delay IPv6 multicast forwarding updates on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vlan_id*] update-delay-interval *milliseconds*

no ipv6 multicast [vlan *vlan_id*] update-delay-interval

Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>milliseconds</i>	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the forwarding update delay interval back to zero (the default).
- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ipv6 multicast update-delay-interval 10
-> no ipv6 multicast update-delay-interval
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigUpdateDelayInterval
```

ipv6 multicast initial-packet-buffer admin-state

Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

ipv6 multicast initial-packet-buffer admin-state {enable | disable}

Syntax Definitions

enable	Enable the initial packet buffering globally on the switch for IPv6 multicast flow.
disable	Disable the initial packet buffering globally on the switch for IPv6 multicast flow.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When enabled, the following configuration is used for initial packet buffering on new multicast flows:

- The maximum number of initial packets buffered per IPv6 multicast flow. Use the [ipv6 multicast initial-packet-buffer max-packet](#) command to set this value.
- The maximum number of IPv6 multicast flows that can be buffered. Use the [ipv6 multicast initial-packet-buffer max-flow](#) command to set this value.
- The maximum amount of time buffered packets are held if they are not sent out. Use the [ipv6 multicast initial-packet-buffer timeout](#) command to set this value.
- The minimum amount of time packets are held before delivery begins. Use the [ipv6 multicast initial-packet-buffer min-delay](#) command to set this value.

Examples

```
-> ipv6 multicast initial-packet-buffer admin-state disable
-> ipv6 multicast initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

`show ipv6 multicast`

Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBuffer
```

ipv6 multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv6 multicast flow.

ipv6 multicast initial-packet-buffer max-packet [*num*]

Syntax Definitions

num The maximum number of packets allowed to buffer per IPv6 multicast flow. Valid range is 1 to 10.

Defaults

parameter	default
<i>num</i>	4

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ipv6 multicast initial-packet-buffer max-packet 4
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ipv6 multicast	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

  alaIpmsConfigInitialPacketBufferMaxPacket
```

ipv6 multicast initial-packet-buffer max-flow

Configures the maximum number of IPv6 multicast flows that can be buffered.

ipv6 multicast initial-packet-buffer max-flow [*num*]

Syntax Definitions

num The maximum number of IPv6 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

Defaults

parameter	default
<i>num</i>	32

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ipv6 multicast initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
show ip multicast	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMaxFlow
```

ipv6 multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv6 initial multicast packets.

ipv6 multicast initial-packet-buffer timeout [*seconds*]

Syntax Definitions

seconds The timeout value for the initial buffered IPv6 multicast packets in seconds. Valid range is 1 to 10.

Defaults

parameter	default
<i>seconds</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ipv6 multicast initial-packet-buffer timeout 2
```

Release History

Release 8.2.1; command introduced.

Related Commands

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferTimeout
```

ipv6 multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet.

ipv6 multicast initial-packet-buffer min-delay [*milliseconds*]

Syntax Definitions

milliseconds The minimum delay value to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Valid range is 0 to 1000.

Defaults

parameter	default
<i>milliseconds</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.

Examples

```
-> ipv6 multicast initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.

Related Commands

  alaIpmsConfigInitialPacketBufferMinDelay
```

ipv6 multicast inherit-default-vrf-config

Configures whether or not the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances.

ipv6 multicast inherit-default-vrf-config

no ipv6 multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMSv6 configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled, additional VRF instances will inherit the global IPMSv6 configuration defined in the default VRF instance.
- A global IPMSv6 configuration defined for a specific non-default VRF instance takes precedence over the global IPMSv6 configuration defined for the default VRF.

Examples

```
-> ip multicast inherit-default-vrf-config  
-> no ip multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

Related Commands

```

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

show ip multicast [*vlan vlan_id*]

Syntax Definitions

vlan_id VLAN ID number (1–4094).

Defaults

By default the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ip multicast
```

```
Profile                = default,
Status                 = disabled,
Flood Unknown          = disabled,

```

output definitions

Status	Whether the IP Multicast Switching and Routing is Enabled or Disabled (the default status). Configured through the ip multicast admin-state command.
Flood Unknown	Whether the flooding of initial unknown multicast traffic is Enabled or Disabled (the default status). Configured through the ip multicast flood-unknown command.
Version	Displays the default IGMP version, which can be 1 , 2 or 3 . Configured through the ip multicast version command.
Robustness	Displays the IGMP robustness value, ranging from 1 to 7 . (The default value is 2). Configured through the ip multicast robustness command.
Querying	The current state of IGMP querying, which can be Enabled or Disabled (the default status). Configured through the ip multicast querying command.
Query Interval (seconds)	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). Configured through the ip multicast query-interval command.

output definitions

Query Response Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). Configured through the ip multicast query-response-interval command.
Last Member Query Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the ip multicast last-member-query-interval command.
Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). Configured through the ip multicast unsolicited-report-interval command.
Proxying	The current state of IGMP proxying on the system, which can be Enabled or Disabled (the default status). Configured through the ip multicast proxying command.
Spoofing	The current state of IGMP spoofing on the system, which can be Enabled or Disabled (the default status). Configured through the ip multicast spoofing command.
Zapping	The current state of IGMP zapping on the system, which can be Enabled or Disabled (the default status). Configured through the ip multicast zapping command.
Querier Forwarding	The current state of IGMP querier forwarding on the system, which can be Enabled or Disabled (the default status). Configured through the ip multicast querier-forwarding command.
Router Timeout (seconds)	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) Configured through the ip multicast router-timeout command.
Source Timeout (seconds)	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) Configured through the ip multicast source-timeout command.
Max-group	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0 which means no limit is imposed). Configured through the ip multicast max-group command.
Max-group action	Displays the action taken when the maximum group limit has been exceeded, which can be none , drop or replace . Configured through the ip multicast max-group command.
Helper-address	Displays the destination IP address of a relay host, where IGMP host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) Configured through the ip multicast helper-address command.
Static Querier Address	The Static Source IP Address to be used when querying. (The default value of 0.0.0.0 indicates that this is not configured.)
Static Spoofing Address	The Static Source IP Address to be used when spoofing. (The default value of 0.0.0.0 indicates that this is not configured.)
Zero-based Query	The current state of Zero-based Querying, which can be Disabled or Enabled (the default status). Configured through the ipv6 multicast zero-based-query command.

output definitions

Forward Mode	Displays the current IPv4 Forwarding mode, which can be asm , ssm , or auto (the default value).
Update Delay Interval (milliseconds)	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the ip multicast update-delay-interval command.
Initial Packet Buffering	The current state of Initial Packet Buffering, which can be Enabled or Disabled (the default status). Configured through the ip multicast initial-packet-buffer admin-state command.
Max Flows	The maximum number of IPv4 multicast flows buffered for initial packet. Configured through the ip multicast initial-packet-buffer max-flow command.
Max Packets Per Flow	The maximum number of initial packets buffered per IPv4 multicast flow. Configured through the ip multicast initial-packet-buffer max-packet command.
Buffer Timeout (seconds)	The timeout value for the initial buffered IPv4 multicast packets. Configured through the ip multicast initial-packet-buffer timeout command.
Min Delay (milliseconds)	The minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Configured through the ip multicast initial-packet-buffer min-delay command.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; display fields added.

Related Commands

ip multicast admin-state Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

show ip multicast port

Displays the maximum group configuration applicable for all port or VLAN instances of a given port or all ports. The current number of groups learned on a given port or VLAN instance will also be displayed.

show ip multicast port [*chassis/slot/port*]

Syntax Definitions

chassis The chassis identifier.
slot/port The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a port number to display the configuration information for a specific switch port.

Examples

```
-> show ip multicast port
```

```
Legends: Port Max-group                = Max-group limit on the port
          Port Action                   = Max-group action on the port
          Port-VLAN Max-group         = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action             = Active Max-group action on the Port-Vlan instance
```

Total 2 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/1/13	1036	0	0	none	0	none
1/1/52	1	0	0	none	0	none

```
-> show ip multicast port 1/1/52
```

```
Legends: Port Max-group                = Max-group limit on the port
          Port Action                   = Max-group action on the port
          Port-VLAN Max-group         = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action             = Active Max-group action on the Port-Vlan instance
```

Total 1 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/1/52	1	0	0	none	0	none

output definitions

Port	The slot and port number of the IP multicast port.
VLAN	The VLAN associated with the IP multicast port.
Current Groups	The current group associated with the IP Current groups.
Port Max-group	The maximum group count allowed on the port. This limit is applicable on the given port for all VLAN instances of the port.
Port Action	The action to be taken when the group membership limit is exceeded (none, drop, or replace).
Port-VLAN Max-group	The maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified. This limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.
Port-VLAN Action	The action to be taken when the group membership limit is exceeded (none, drop, or replace).

Release History

Release 7.1.1; command was introduced.

Related Commands

ip multicast port max-group	Configures the maximum group limit learned per port.
ip multicast max-group	Configures the maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified.

show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

show ip multicast forward [*ip_address*] [**all-vrf**]

Syntax Definitions

ip_address IP multicast group address.
all-vrf Display forwarding table entries for all of the VRF instances.

Defaults

By default, forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *ip_address* parameter to display forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.

Examples

```
-> show ip multicast forward
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
225.0.1.0	21.20.20.2	0.0.0.0	20	2/1	20	1/2
225.0.1.1	21.20.20.2	0.0.0.0	20	2/1	20	1/2
225.0.1.2	21.20.20.2	0.0.0.0	20	2/1	21	1/2

```
-> show ip multicast forward 225.0.1.1
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
225.0.1.1	21.20.20.2	0.0.0.0	20	2/1	20	1/2

output definitions

Group Address	IP group address of the IP multicast forward.
Host Address	IP host address of the IP multicast forward.
Tunnel Address	IP source tunnel address of the IP multicast forward.
VLAN	VLAN associated with the IP multicast forward.
Port	The slot and port number of the IP multicast forward.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Related Commands

ip multicast static-group Creates a static IGMP group entry on a specified port on a specified VLAN.

```

show ip multicast neighbor

Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

show ip multicast neighbor [all-vrf]

Syntax Definitions

all-vrf Display IGMP neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **all-vrf** parameter option to display the neighbor table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ip multicast neighbor
```

```
Total 2 Neighbors
```

Host Address	VLAN	Port	Static	Count	Life
170.0.0.2	2000	0/10	no	528	85

show ip multicast querier

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

show ip multicast querier [all-vrf]

Syntax Definitions

all-vrf Display querier table entries for all of the VRF instances.

Defaults

By default, only IGMP querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **all-vrf** parameter option to display the IGMP querier table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ip multicast querier
```

```
Total 9 Queriers
```

Host Address	VLAN	Port	Static	Count	Life
172.1.254.96	1001	0/1	no	3	213

show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast group [*ip_address*] [**all-vrf**]

Syntax Definitions

ip_address IP multicast group address.
all-vrf Display group membership entries for all of the VRF instances.

Defaults

By default, all IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *ip_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IGMP group membership table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ip multicast group
```

```
Total 6 Groups
```

Group Address	Source Address	VLAN	Port	Mode	Static	Count	Life
231.0.0.3	1.0.0.5	1	1/2/1	exclude	no	1	257
234.0.0.4	0.0.0.0	1	1/2/1	exclude	no	1	218

```
-> show ip multicast group 239.192.1.9
```

Group Address	Source Address	VLAN	Port	Mode	Static	Count	Life
239.192.1.9	0.0.0.0	1001	1/5/7	exclude	no	10	240
239.192.1.9	0.0.0.0	1001	1/5/19	exclude	no	12	233
239.192.1.9	0.0.0.0	1001	1/5/31	exclude	no	11	236

output definitions

Group Address IP address of the IP multicast group.
Source Address IP address of the IP multicast source.

output definitions

VLAN	The VLAN associated with the IP multicast group.
Port	The slot and port number of the IP multicast group.
Mode	IGMP source filter mode.
Static	Whether it is a static multicast group or not.
Count	Number of IGMP membership requests made.
Life	Life time of the IGMP group membership.

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast source [*ip_address*] [**all-vrf**]

Syntax Definitions

ip_address IP multicast group address.
all-vrf Display source table entries for all of the VRF instances.

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *ip_address* parameter to display source entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.

Examples

```
-> show ip multicast source
```

```
Total 4 Sources
```

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
225.0.1.0	21.20.20.2	0.0.0.0	21	1/10	
225.0.1.1	21.20.20.2	0.0.0.0	21

Syntax Definitions

ip_address IP multicast group address.
all-vrf Display the tunneling table entries for all of the VRF instances.

Defaults

By default, all tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IP multicast tunnel entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ip multicast tunnel
```

Total 3 Tunnels

Group Address	Host Address	Destination		Ingress	
		Tunnel Address	VLAN	Port	
225.0.1.0	21.20.20.2	10.10.10.51	20	1/2/1	
225.0.1.1	21.20.20.2	10.10.10.51	20	1/2/2	
225.0.1.2	21.20.20.2	10.10.10.51	20	1/2/3	

output definitions

Group Address	IP group address of the IP multicast tunnel.
Host Address	IP host address of the IP multicast tunnel.
Destination Tunnel Address	IP source tunnel address of the IP multicast tunnel.
Ingress VLAN	VLAN associated with the IP multicast tunnel.
Ingress Port	The slot and port number of the IP multicast tunnel.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Related Commands

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified

MIB Objects

```
alaIpmsTunnelTable  
  alaIpmsTunnelConfigType  
  alaIpmsTunnelAddressType  
  alaIpmsTunnelValue  
  alaIpmsTunnelGroupAddress  
  alaIpmsTunnelHostAddress  
  alaIpmsTunnelDestAddress  
  alaIpmsTunnelOrigAddress  
  alaIpmsTunnelType  
  alaIpmsTunnelNextDestAddress  
  alaIpmsTunnelNextType
```

show ip multicast bridge

Displays the IP multicast bridge table entries that match the specified VLAN, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ip multicast bridge [vlan vlan_id | ip_address | mac_address] [all-vrf]
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID.
<i>ip_address</i>	IP multicast group address.
<i>mac_address</i>	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *ip_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
 - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge vlan 130
```

```
Total 1 Bridge Entries
```

Interface	Type	Group Address	Host Address	UpTime	Action
vlan 130	asm	225.0.0.1		8576	forwarding

output definitions

Interface	VLAN ID associated with the IP multicast bridge entry.
Type	The bridge type for the IP multicast bridge entry (asm , ssm , mac). Configured through the ip multicast forward-mode command.
Group Address	IP group address based on the bridge type.

output definitions

Host Address	IP host address based on the bridge type.
UpTime	The amount of time that has elapsed since the bridge entry was created.
Action	The current state of the bridge entry (forwarding or filtering).

Release History

Release 8.3.1; command introduced.

Related Commands

[show ip multicast bridge-forward](#) Displays the forwarding state of the IP multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeTable
  alaIpmsBridgeConfigType
  alaIpmsBridgeAddressType
  alaIpmsBridgeValue
  alaIpmsBridgeType
  alaIpmsBridgeGroupAddress
  alaIpmsBridgeHostAddress
  alaIpmsBridgeUpTime
  alaIpmsBridgeAction
```

show ip multicast bridge-forward

Displays the forwarding state of the IP multicast bridge table entries that match the specified VLAN, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

show ip multicast bridge-forward [*vlan vlan_id* | *ip_address* | *mac_address*] [**all-vrf**]

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID.
<i>ip_address</i>	IP multicast group address.
<i>mac_address</i>	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *ip_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
 - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge-forward vlan 130
```

```
Total 1 Bridge Forwarding Entries
```

Interface	Type	Group Address	Host Address	Next Interface	UpTime
vlan 130	asm	225.0.0.1		1/3/25	8589

```
-> ip multicast vlan 130 forward-mode mac
```

```
-> show ip multicast bridge-forward vlan 130
```

```
Total 1 Bridge Forwarding Entries
```

Interface	Type	Group Address	Host Address	Next Interface	UpTime
vlan 130	asm	01-00-5e-00-00-01		1/3/25	8589

output definitions

Interface	VLAN ID associated with the IP multicast bridge entry.
Type	The bridge type for the IP multicast bridge entry (asm , ssm , mac). Configured through the ip multicast forward-mode command.
Group Address	IP group address based on the bridge type.
Host Address	IP host address based on the bridge type.
Next Interface	The next interface for the IP multicast bridge forwarding entry.
UpTime	The amount of time that has elapsed since the bridge forward entry was created.

Release History

Release 8.3.1; command introduced.

Related Commands

show ip multicast bridge Displays the IP multicast bridge table entries.

```

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast [**vlan** *vlan_id*]

Syntax Definitions

vlan_id VLAN for which to display the configuration.

Defaults

By default, the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ipv6 multicast
```

```

```

output definitions

Profile	TBD
Status	Whether the IPv6 Multicast Switching and Routing is Enabled or Disabled (the default status). Configured through the ipv6 multicast admin-state command.
Flood Unknown	Whether the flooding of initial unknown multicast traffic is Enabled or Disabled (the default status). Configured through the ipv6 multicast flood-unknown command.
Version	Displays the default MLD version, which can be 1 , 2 or 3 . Configured through the ipv6 multicast version command.
Robustness	Displays the MLD robustness value, ranging from 1 to 7 . (The default value is 2). Configured through the ipv6 multicast robustness command.
Querying	The current state of MLD querying, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast querying command.

output definitions

Query Interval (seconds)	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). Configured through the ipv6 multicast query-interval command.
Query Response Interval (tenths of seconds)	Displays the time (in milliseconds) taken to reply to an MLD query message. (The default value is 100 tenths-of-seconds). Configured through the ipv6 multicast query-response-interval command.
Last Member Query Interval (tenths of seconds)	Displays the time (in milliseconds) taken to reply to an MLD query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the ipv6 multicast last-member-query-interval command.
Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). Configured through the ipv6 multicast unsolicited-report-interval command.
Proxying	The current state of MLD proxying on the system, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast proxying command.
Spoofing	The current state of MLD spoofing on the system, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast spoofing command.
Zapping	The current state of MLD zapping on the system, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast zapping command.
Querier Forwarding	The current state of MLD querier forwarding on the system, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast querier-forwarding command.
Router Timeout (seconds)	Displays the MLD router timeout in seconds. (The default value is 90 seconds.) Configured through the ipv6 multicast router-timeout command.
Source Timeout (seconds)	Displays the MLD source timeout in seconds. (The default value is 30 seconds.) Configured through the ipv6 multicast source-timeout command.
Max-group	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0 which means no limit is imposed). Configured through the ipv6 multicast max-group command.
Max-group action	Displays the action taken when the maximum group limit has been exceeded, which can be none , drop or replace . Configured through the ipv6 multicast max-group command.
Helper-address	Displays the destination IP address of a relay host, where MLD host reports and Leave messages are to be sent. (By default, no Helper-address is configured.)
Static Querier Address	The Static Source IP Address to be used when querying. (The default value of 0.0.0.0 indicates that this is not configured.)
Static Spoofing Address	The Static Source IP Address to be used when spoofing. (The default value of 0.0.0.0 indicates that this is not configured.)

output definitions

Zero-based Query	The current state of Zero-based Querying, which can be Disabled or Enabled (the default status). Configured through the ipv6 multicast zero-based-query command.
Forward Mode	Displays the current IPv4 Forwarding mode, which can be asm , ssm , or auto (the default value).
Update Delay Interval	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the ipv6 multicast update-delay-interval command.
SSM Mapping	TBD
Fast Join	TBD
Initial Packet Buffering	The current state of Initial Packet Buffering, which can be Enabled or Disabled (the default status). Configured through the ipv6 multicast initial-packet-buffer admin-state command.
Max Flows	The maximum number of IPv6 multicast flows buffered for initial packet. Configured through the ipv6 multicast initial-packet-buffer max-flow command.
Max Packets Per Flow	The maximum number of initial packets buffered per IPv6 multicast flow. Configured through the ipv6 multicast initial-packet-buffer max-packet command.
Buffer Timeout (seconds)	The timeout value for the initial buffered IPv4 multicast packets. Configured through the ipv6 multicast initial-packet-buffer timeout command.
Min Delay (milliseconds)	The minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Configured through the ipv6 multicast initial-packet-buffer min-delay command.

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; display fields added.

Related Commands

ipv6 multicast admin-state Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast port

Display the maximum group configuration applicable for all port or VLAN instances of a given port or all ports. The current number of groups learned on a given port or VLAN instance will also be displayed in.

show ipv6 multicast port [*chassis/slot/port*]

Syntax Definitions

chassis The chassis identifier.
slot/port The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a port number to display the configuration information for a specific port.

Examples

```
-> show ipv6 multicast port
```

```
Legends: Port Max-group                = Max-group limit on the port
          Port Action                  = Max-group action on the port
          Port-VLAN Max-group         = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action            = Active Max-group action on the Port-Vlan instance
```

Total 22 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/5/43	1001	0	0	none	0	none
1/6/23	1002	0	0	none	0	none

```
-> show ipv6 multicast port 1/6/23
```

```
Legends: Port Max-group                = Max-group limit on the port
          Port Action                  = Max-group action on the port
          Port-VLAN Max-group         = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action            = Active Max-group action on the Port-Vlan instance
```

Total 22 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/6/23	1001	0	0	none	0	none

output definitions

Port	The slot and port number of the IP multicast port.
VLAN	The VLAN associated with the IP multicast port.
Current Groups	The current group associated with the IP Current groups.
Port Max-group	The maximum group count allowed on the port. This limit is applicable on the given port for all VLAN instances of the port.
Port Action	The action to be taken when the group membership limit is exceeded (none, drop, or replace).
Port-VLAN Max-group	The maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified. This limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.
Port-VLAN Action	The action to be taken when the group membership limit is exceeded (none, drop, or replace).

Release History

Release 7.1.1; command was introduced.

Related Commands

- ipv6 multicast port max-group** Configures the maximum group limit learned per port.
- ipv6 multicast max-group** Configures the maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified.

```

show ipv6 multicast forward

Display the IPv6 Multicast Switching and Routing forwarding table entries for the specified IPv6 multicast group address or all entries if no IPv6 multicast address is specified.

show ipv6 multicast forward [*ipv6_address*] [**all-vrf**]

Syntax Definitions

ipv6_address IPv6 multicast group address.
all-vrf Display forwarding table entries for all of the VRF instances.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *ipv6_address* parameter to display forwarding entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast forward
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	20	2/1	20	1/2
ff05::7	4444::2	::	20	2/1	20	1/2
ff06::1	::	::	100	2/1	21	1/2

```
-> show ipv6 multicast forward ff05::6
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	1	2/1	1	2/23

output definitions

Group Address	IPv6 group address of the IPv6 multicast forward.
Host Address	IPv6 host address of the IPv6 multicast forward.
Tunnel Address	IPv6 source tunnel address of the IPv6 multicast forward.

output definitions (continued)

VLAN	VLAN associated with the IPv6 multicast forward.
Port	The slot and port number of the IPv6 multicast forward.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

show ipv6 multicast neighbor

Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast neighbor [all-vrf]

Syntax Definitions

all-vrf Display MLD neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **all-vrf** parameter option to display the IPv6 neighbor table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast neighbor
```

```
Total 2 Neighbors
```

Host Address	VLAN	Port	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	2/1	no	1	6
::	1	2/13	yes	0	0

output definitions

Host Address	The IPv6 address of the IPv6 multicast neighbor.
VLAN	The VLAN associated with the IPv6 multicast neighbor.
Port	The slot and port number of the IPv6 multicast neighbor.
Static	Whether it is a static MLD neighbor or not.
Count	Displays the count of the IPv6 multicast neighbor.
Life	The life time of the IPv6 multicast neighbor.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

show ipv6 multicast querier

Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast querier [all-vrf]]

Syntax Definitions

all-vrf Display querier table entries for all of the VRF instances.

Defaults

By default, only MLD querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **all-vrf** parameter option to display the MLD querier table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast querier
```

```
Total 2 Queriers
```

Host Address	VLAN	Port	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	2/1	no	1	6
::	1	2/13	yes	0	0

output definitions

Host Address	The IPv6 address of the IPv6 multicast querier.
VLAN	The VLAN associated with the IPv6 multicast querier.
Port	The slot and port number of the IPv6 multicast querier.
Static	Whether it is a static MLD neighbor or not.
Count	Displays the count of the IPv6 multicast querier.
Life	The life time of the IPv6 multicast querier.

Release History

Release 7.1.1; command was introduced

show ipv6 multicast group

Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast group [*ipv6_address*] [**all-vrf**]

Syntax Definitions

ipv6_address IPv6 multicast group address.

all-vrf Display group membership entries for all of the VRF instances.

Defaults

By default, all IPv6 multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *ipv6_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD group membership table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast group
```

```
Total 3 Groups
```

Group Address	Source Address	VLAN	Port	Mode	Static	Count	Life
ff05::5	::	1	2/1	exclude	no	1	145
ff05::6	3333::1	1	2/1	exclude	no	1	242
ff05::9	::	1	2/13	exclude	yes	0	0

```
-> show ipv6 multicast group ff05::5
```

Group Address	Source Address	VLAN	Port	Mode	Static	Count	Life
ff05::5	::	1	2/1	exclude	no	1	145

output definitions

Group Address IPv6 address of the IPv6 multicast group.

Source Address IPv6 address of the IPv6 multicast source.

VLAN The VLAN associated with the IPv6 multicast group.

Port The slot and port number of the IPv6 multicast group. This field is blank if this is a static entry that was created just on the VLAN without a slot and port number.

output definitions

Mode	MLD source filter mode.
Static	Whether it is a static MLD group or not.
Count	Number of MLD membership requests made.
Life	Life time of the MLD group membership.

Release History

Release 7.1.1; command was introduced
 Release 8.3.1; **all-vrf** parameter added.

Related Commands

ipv6 multicast static-group Creates a static MLD group entry on a specified port on a specified VLAN.

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast source [*ipv6_ddress*] [**all-vrf**]

Syntax Definitions

ipv6_ddress IPv6 multicast group address.
all-vrf Displays source table entries for all of the VRF instances.

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *ipv6_ddress* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD source table entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast source
```

```
Total 4 Sources
```

Group Address	Host Address	Source	Ingress	
		Tunnel Address	VLAN	Port
ff05::5	4444::2	::	21	2/1
ff05::6	4444::2	::	21	2/1
ff06::1	::	::	20	3/1
ff06::1	::	::	20	3/1

```
-> show ipv6 multicast source ff05::6
```

```
Total 1 Sources
```

Group Address	Host Address	Source	Ingress	
		Tunnel Address	VLAN	Port
ff05::6	4444::2	::	21	2/1

output definitions

Group Address IPv6 group address of the IPv6 multicast source.
Host Address IPv6 host address of the IPv6 multicast source.

output definitions

Source Tunnel Address	IPv6 source tunnel address of the IPv6 multicast source.
Ingress VLAN	VLAN associated with the IPv6 multicast source.
Ingress Port	The slot and port number of the IPv6 multicast source.

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Related Commands

show ipv6 multicast tunnel Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

MIB Objects

```
alaIpmsSourceTable
  alaIpmsSourceConfigType
  alaIpmsSourceAddressType
  alaIpmsSourceValue
  alaIpmsSourceGroupAddress
  alaIpmsSourceHostAddress
  alaIpmsSourceDestAddress
  alaIpmsSourceOrigAddress
  alaIpmsSourceType
  alaIpmsSourceUpTime
```

show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

show ipv6 multicast tunnel [*ipv6_address*]

Syntax Definitions

ipv6_address IPv6 multicast group address.
all-vrf Display the IPv6 tunneling table entries for all of the VRF instances.

Defaults

By default, all IPv6 tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IPv6 multicast tunnel entries that exist in all of the VRF instances on the switch.

Examples

```
-> show ipv6 multicast tunnel
```

```
Total 2 Tunnels
```

Group Address	Host Address	Destination	
		Tunnel Address	Ingress
		VLAN	Port
ff05::6	4444::2	5555::3	21 1/2/1
ff05::7	4444::2	5555::3	21 1/2/2

output definitions

Group Address	IPv6 group address of the IPv6 multicast tunnel.
Host Address	IPv6 host address of the IPv6 multicast tunnel.
Destination Tunnel Address	IPv6 source tunnel address of the IPv6 multicast tunnel.
Ingress VLAN	VLAN associated with the IPv6 multicast tunnel.
Ingress Port	The slot and port number of the IPv6 multicast tunnel.

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; **all-vrf** parameter added.

Related Commands

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

MIB Objects

```
alaIpmsTunnelTable  
  alaIpmsTunnelConfigType  
  alaIpmsTunnelAddressType  
  alaIpmsTunnelValue  
  alaIpmsTunnelGroupAddress  
  alaIpmsTunnelHostAddress  
  alaIpmsTunnelDestAddress  
  alaIpmsTunnelOrigAddress  
  alaIpmsTunnelType  
  alaIpmsTunnelNextDestAddress  
  alaIpmsTunnelNextType
```

show ipv6 multicast bridge

Displays the IPv6 multicast bridge table entries that match the specified VLAN, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ipv6 multicast bridge [vlan vlan_id | ipv6_address | mac_address] [all-vrf]
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID.
<i>ipv6_address</i>	IPv6 multicast group address.
<i>mac_address</i>	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *ipv6_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
 - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge vlan 130
```

```
Total 1 Bridge Entries
```

Interface	Type	Group Address	Host Address	UpTime	Action
vlan 130	asm	ff05::6		8576	forwarding

output definitions

Interface	VLAN ID associated with the IPv6 multicast bridge entry.
Type	The bridge type for the IPv6 multicast bridge entry (asm , ssm , mac). Configured through the ipv6 multicast forward-mode command.
Group Address	IPv6 group address based on the bridge type.

output definitions

Host Address	IPv6 host address based on the bridge type.
UpTime	The amount of time that has elapsed since the bridge entry was created.
Action	The current state of the bridge entry (forwarding or filtering).

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast bridge-forward Displays the forwarding state of the IPv6 multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeTable
  alaIpmsBridgeConfigType
  alaIpmsBridgeAddressType
  alaIpmsBridgeValue
  alaIpmsBridgeType
  alaIpmsBridgeGroupAddress
  alaIpmsBridgeHostAddress
  alaIpmsBridgeUpTime
  alaIpmsBridgeAction
```

show ipv6 multicast bridge-forward

Displays the forwarding state of the IPv6 multicast bridge table entries that match the specified VLAN, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

show ipv6 multicast bridge-forward [*vlan vlan_id* | *ipv6_address* | *mac_address*] [**all-vrf**]

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID.
<i>ipv6_address</i>	IPv6 multicast group address.
<i>mac_address</i>	Group MAC address.
all-vrf	Display bridge table entries for all of the VRF instances.

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *ipv6_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
 - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge-forward vlan 130
```

```
Total 1 Bridge Forwarding Entries
```

Interface	Type	Group Address	Host Address	Next Interface	UpTime
vlan 130	asm	ff05::6		1/3/25	8589

```
-> ipv6 multicast vlan 130 forward-mode mac
```

```
-> show ipv6 multicast bridge-forward vlan 130
```

```
Total 1 Bridge Forwarding Entries
```

Interface	Type	Group Address	Host Address	Next Interface	UpTime
vlan 130	asm	01-00-5e-00-00-01		1/3/25	8589

output definitions

Interface	VLAN ID associated with the IPv6 multicast bridge entry.
Type	The bridge type for the IPv6 multicast bridge entry (asm , ssm , mac). Configured through the ipv6 multicast forward-mode command.
Group Address	IPv6 group address based on the bridge type.
Host Address	IPv6 host address based on the bridge type.
Next Interface	The next interface for the IPv6 multicast bridge forwarding entry.
UpTime	The amount of time that has elapsed since the bridge forward entry was created.

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast bridge Displays the IPv6 multicast bridge table entries.

  alaIpmsBridgeForwardNextSubValue
  alaIpmsBridgeForwardUpTime
```

32 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

Filename: AlcatelIND1Dvmrp.MIB
Module: ALCATEL-IND1-DVMRP-MIB

Filename: IETF_DVMRP_STD_DRAFT.MIB
Module: DVMRP-STD-MIB

A summary of the available commands is listed here:

ip load dvmrp
ip dvmrp admin-state
ip dvmrp flash-interval
ip dvmrp graft-timeout
ip dvmrp interface
ip dvmrp interface metric
ip dvmrp interface mbr-default-information
ip dvmrp neighbor-interval
ip dvmrp neighbor-timeout
ip dvmrp prune-lifetime
ip dvmrp prune-timeout
ip dvmrp report-interval
ip dvmrp route-holddown
ip dvmrp route-timeout
ip dvmrp subord-default
ip interface tunnel
show ip dvmrp
show ip dvmrp interface
show ip dvmrp neighbor
show ip dvmrp nexthop
show ip dvmrp prune
show ip dvmrp route
show ip dvmrp tunnel

ip load dvmrp

Dynamically loads DVMRP to memory.

ip load dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the [ip dvmrp admin-state command on page 32-3](#).

Examples

```
-> ip load dvmrp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp admin-state](#) Globally enables or disables DVMRP protocol on the switch.

MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPDvMrpStatus
```

ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

ip dvmrp admin-state {enable | disable}

Syntax Definitions

enable Administratively enables DVMRP on the switch.
disable Administratively disables DVMRP on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the [ip load dvmrp command on page 32-2](#).
- To enable or disable DVMRP for a particular interface, refer to the [ip dvmrp interface command on page 32-6](#).

Examples

```
-> ip dvmrp admin-state enable  
-> ip dvmrp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.
[ip load dvmrp](#) Dynamically loads DVMRP to memory.
[show ip dvmrp](#) Displays global DVMRP parameters, including current status.

MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpAdminStatus
```

ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

ip dvmrp flash-interval *seconds*

Syntax Definitions

seconds Specifies the interval value, in seconds (5–86400).

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

Examples

```
-> ip dvmrp flash-interval 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpFlashUpdateInterval
```

ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

ip dvmrp graft-timeout *seconds*

Syntax Definitions

seconds Specifies the graft message retransmission value, in seconds (5–86400).

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp graft-timeout 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpGraftRetransmission

ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

ip dvmrp interface {*interface_name*}

no ip dvmrp interface {*interface_name*}

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete an interface.

Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables the DVMRP protocol on the switch.
ip dvmrp interface metric	Configures the distance metric for an interface, which is used to calculate distance vectors.
show ip dvmrp interface	Displays information for all multicast-capable interfaces.

MIB Objects

dvmrpInterfaceTable
 dvmrpInterfaceLocalAddress
 dvmrpInterfaceStatus

ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

ip dvmrp interface *interface_name* **metric value**

Syntax Definitions

interface_name The name of the interface.
value Specifies the metric value (1–31).

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.
[show ip dvmrp interface](#) Displays the DVMRP interface table.

MIB Objects

dvmrpInterfaceTable
 dvmrpInterfaceLocalAddress
 dvmrpInterfaceMetric

ip dvmrp interface mbr-default-information

Configures a DVMRP interface to advertise the default route for the interface. This command only applies when the local switch is operating in the Multicast Border Router (MBR) mode.

ip dvmrp interface *interface_name* **mbr-default-information** {**enable** | **disable**}

Syntax Definitions

<i>interface_name</i>	The name of the interface.
enable	Enables advertisement of the default route on the specified interface.
disable	Disables advertisement of the default route on the specified interface.

Defaults

By default, advertising the default route is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Advertising a default route on the DVMRP interface provides a method for ensuring that sources inside the PIM domain can reach all routers inside the DVMRP domain.
- Make sure that the default route is not advertised on the MBONE.

Examples

```
-> ip dvmrp interface mbr-default-information enable
-> ip dvmrp interface mbr-default-information disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
show ip dvmrp interface	Displays the DVMRP interface table.

MIB Objects

```
alaDvmrpIfAugTable
  alaDvmrpIfMbrDefaultInfoStatus
```

ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

ip dvmrp neighbor-interval *seconds*

Syntax Definitions

seconds Specifies the probe interval time, in seconds (5–30).

Defaults

parameter	default
<i>seconds</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-timeout	Configures the neighbor timeout.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpNeighborProbeInterval

ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

ip dvmrp neighbor-timeout *seconds*

Syntax Definitions

seconds Specifies the neighbor timeout, in seconds (5–86400).

Defaults

parameter	default
<i>seconds</i>	35

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-timeout 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-interval	Configures the neighbor probe interval time.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpNeighborTimeout

ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

ip dvmrp prune-lifetime *seconds*

Syntax Definitions

seconds Specifies the prune lifetime, in seconds (180–86400).

Defaults

parameter	default
<i>seconds</i>	7200

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-lifetime 7200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|--|--|
| ip dvmrp prune-timeout | Configures the prune packet retransmission value. |
| show ip dvmrp prune | Displays DVMRP prune entries, including the router's upstream prune state. |
| show ip dvmrp | Displays the global DVMRP parameters. |

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpPruneLifetime

ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

ip dvmrp prune-timeout *seconds*

Syntax Definitions

seconds Specifies retransmission time, in seconds (30–86400).

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-timeout 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
show ip dvmrp prune	Displays DVMRP prune entries, including the router's upstream prune state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpPruneRetransmission

ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

ip dvmrp report-interval *seconds*

Syntax Definitions

seconds Specifies the report interval, in seconds (10–2000).

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp report-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp route](#) Displays the DVMRP routes that are being advertised to other routers.

[show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteReportInterval

ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

ip dvmrp route-holddown *seconds*

Syntax Definitions

seconds Specifies the holddown time, in seconds (1–86400).

Defaults

parameter	default
<i>seconds</i>	120

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-holddown 120
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp route-timeout	Configures the route expiration timeout value.
show ip dvmrp	Displays the global DVMRP parameters.
show ip dvmrp route	Displays the DVMRP routes that are being advertised to other routers.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteHoldDown

ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

ip dvmrp route-timeout *seconds*

Syntax Definitions

seconds Specifies the timeout value, in seconds (20–4000).

Defaults

parameter	default
<i>seconds</i>	140

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-timeout 140
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp route-holddown](#) Configures the time during which DVMRP routes are kept in a hold down state.

[show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteExpirationTimeout

ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

ip dvmrp subord-default {true | false}

Syntax Definitions

true	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
false	DVMRP neighbors are <i>not</i> assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

Defaults

parameter	default
true false	true

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a subordinate be changed to false.
- To view the current subordinate neighbor status, use the [show ip dvmrp](#) command. For more information, refer to [page 32-20](#).

Examples

```
-> ip dvmrp subord-default false
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ip dvmrp**

Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig

 alaDvmrpInitNbrASSubord

ip interface tunnel

Configures the end points for the GRE and IPIP tunnels.

ip interface *name* **tunnel** [**source** *ip_address*] [**destination** *ip_address*] [**protocol** {**ipip** | **gre**}]

no ip dvmrp interface *name*

Syntax Definitions

<i>name</i>	Text string up to 20 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. "Alcatel-Lucent Marketing"). Note that this value is case sensitive.
source <i>ip_address</i>	Source IP address of the tunnel.
destination <i>ip_address</i>	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip gre	ipip

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- You can configure an interface as either a vlan or tunnel interface.
- The maximum number of GRE tunnel interfaces that can be configured on a switch is 8.
- The maximum number of IPIP tunnel interfaces that can be configured on a switch is 127.
- Use the **no** form of this command to remove an IP interface.

Examples

```
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip dvmrp interface

Displays information for all multicast-capable interfaces or for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

MIB Objects

```
alaIpInterfaceTable  
  alaIpInterfaceName  
  alaIpInterfaceTunnelSrc  
  alaIpInterfaceTunnelDst  
  alaIpInterfaceDeviceType
```

show ip dvmrp

Displays the global DVMRP parameters configuration.

show ip dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip dvmrp
DVMRP Admin Status          = enabled,
Flash Interval               = 5,
Graft Timeout                = 5,
Neighbor Interval           = 10,
Neighbor Timeout             = 35,
Prune Lifetime                = 7200,
Prune Timeout                = 30,
Report Interval              = 60,
Route Holddown               = 120,
Route Timeout                = 140,
Subord Default                = true,
BFD status                   = disabled,
MBR Operational Status       = enabled,

Number of Routes              = 3,
Number of Reachable Routes    = 3
```

output definitions

DVMRP Admin Status

The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, use the **ip dvmrp admin-state** command.

Flash Interval

The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

output definitions (continued)

Graft Timeout	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Valid range from 5–86400. The default value is 5.
Neighbor Interval	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Valid range from 5–30. The default value is 10.
Neighbor Timeout	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Valid range from 5–86400. The default value is 35.
Prune Lifetime	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Valid range from 180–86400. The default value is 7200.
Prune Timeout	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Valid range from 30–86400. The default value is 30.
Report Interval	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Valid range from 10–2000. The default value is 60.
Route Holddown	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Valid range from 1–120. The default value is 120.
Route Timeout	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Valid range from 20–4000. The default value is 140.
Subord Default	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, use the ip dvmrp subord-default command. Options include true and false . The default value is true.
BFD Status	Not supported in the current release.
MBR Operational Status	Indicates whether or not DVMRP interaction with PIM is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

output definitions (continued)

Number of Routes	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
Number of Reachable Routes	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR Operational Status** field added.

Related Commands

ip dvmrp admin-state	Globally enables or disables DVMRP protocol on the switch.
ip dvmrp flash-interval	Configures the minimum flash update interval value.
ip dvmrp graft-timeout	Configures the graft message retransmission value.
ip dvmrp neighbor-timeout	Configures the neighbor timeout.
ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
ip dvmrp prune-timeout	Configures the prune packet retransmission value.
ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.
ip dvmrp subord-default	Configures the neighbor probe interval time.

show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

show ip dvmrp interface [*ip_address* | *interface_name* | **enabled** | **disabled**]

Syntax Definitions

<i>ip_address</i>	Specifies a particular interface IP address.
<i>interface_name</i>	The name of the interface.
enabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>enabled</i> .
disabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>disabled</i> .

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as **enabled** in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

Examples

```
-> show ip dvmrp interface
```

```
Total 4 Interfaces
```

Interface Name	Vlan	Metric	Admin-Status	Oper-Status	BFD-Status	MBR-Default
vlan-4	4	1	Disabled	Disabled	Disabled	Disabled
vlan-6	6	1	Enabled	Enabled	Disabled	Enabled

```
-> show ip dvmrp interface enabled
```

```
Total 1 Interfaces
```

Interface Name	Vlan	Metric	Admin-Status	Oper-Status	BFD-Status	MBR-Default
vlan-6	6	1	Enabled	Enabled	Disabled	Enabled

output definitions

Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Tunnel	Indicates whether there is a DVMRP tunnel currently configured on the interface.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Admin-Status	The current administrative status of the corresponding interface. Options include Enabled or Disabled . An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the ip dvmrp interface command.
Oper-Status	The current operational status of the corresponding multicast-capable interface. Options include Enabled or Disabled . For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the ip dvmrp admin-state command.
BFD-Status	Not supported in the current release.
MBR-Default	Whether or not the DVMRP interface will advertise a default route when the interface is configured on a Multicast Border Router. Options include Enabled or Disabled . Configured through the ip dvmrp interface mbr-default-information command.

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR-Default** field added.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.

```

show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

show ip dvmrp neighbor [*ip_address*]

Syntax Definitions

ip_address Specifies a particular IP address for a neighboring DVMRP router.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

Examples

-> show ip dvmrp neighbor

Neighbor Address	Intf Name	Uptime	Expires	GenID	Vers	State
143.209.92.214	vlan-2	00h:09m:12s	00h:00m:06s	546947509	3.255	active

output definitions

Neighbor Address	The 32-bit IP address of the DVMRP neighbor's router interface.
Intf Name	The interface name of the neighbor's router.
Uptime	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
Expires	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
GenID	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
Version	The DVMRP version number for the neighbor.
State	The current state of the DVMRP neighbor. Options include active and down .

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip dvmrp neighbor-interval** Configures the neighbor probe interval time.
ip dvmrp neighbor-timeout Configures the neighbor timeout.

MIB Objects

  dvmrpNeighborExpiryTime  
  dvmrpNeighborGenerationId  
  dvmrpNeighborMajorVersion  
  dvmrpNeighborMinorVersion  
  dvmrpNeighborState
```

show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

show ip dvmrp nexthop [*ip_address ip_mask*]

Syntax Definitions

<i>ip_address</i>	Specifies a source IP address for which DVMRP next hop entries will be displayed.
<i>ip_mask</i>	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0
```

Src Address/Mask	Interface Name	Vlan	Hop Type
172.22.2.115/24	vlan-2	2	branch

output definitions

Src Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Hop Type	The hop type of the associated entry. Options include leaf or branch . If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as branch .

Release History

Release 7.1.1; command was introduced.

show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

show ip dvmrp prune [*group_address source_address source_mask*]

Syntax Definitions

<i>group_address</i>	Specifies a pruned group address.
<i>source_address</i>	Specifies a source IP address.
<i>source_mask</i>	Specifies a source IP mask.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

Examples

```
-> show ip dvmrp prune
```

```
Group Address      Source Address/Mask  Expires
-----+-----+-----
225.0.0.4          143.209.92.14/24    00h:00m:30s
```

output definitions

Group Address	The 32-bit multicast group address.
Source Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Expires	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp prune-lifetime](#)

Indicates the length of time a prune will be in effect.

[ip dvmrp prune-timeout](#)

Configures the prune packet retransmission value.

MIB Objects

dvmrpPruneTable

 dvmrpPruneGroup

 dvmrpPruneSource

 dvmrpPruneSourceMask

 dvmrpPruneExpiryTime

show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

show ip dvmrp route [*ip_address ip_mask*]

Syntax Definitions

ip_address The 32-bit source IP address representing route(s).
ip_mask A 32-bit number that determines the subnet mask for the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid
          Address/Mask      Gateway      Metric      Age          Expires      Flags
-----+-----+-----+-----+-----+-----
          11.0.0.0/8         55.0.0.5    2           00h:13m:14s  02m:07s     R
          22.0.0.0/8         44.0.0.4    2           00h:33m:14s  02m:15s     R
          44.0.0.0/8         -           1           05h:24m:59s  -           L
          55.0.0.0/8         -           1           05h:24m:59s  -           L
          66.0.0.0/8         44.0.0.4    2           00h:03m:11s  02m:15s     R
```

output definitions

Address/Mask	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc.
Gateway	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Age	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

output definitions (continued)

Expires	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
Flags	The flag type of a particular DVMRP route. Options include L (Local), R (Remote), F (Flash), H (Holddown), and I (Invalid).

Release History

Release 7.1.1; command was introduced.

Related Commands

ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.

MIB Objects

```
dvmrpRouteTable
  dvmrpRouteSource
  dvmrpRouteSourceMask
  dvmrpRouteMetric
  dvmrpRouteExpiryTime
  dvmrpRouteUpTime
```

show ip dvmrp tunnel

Displays DVMRP tunnel entries.

show ip dvmrp tunnel [*local_address remote_address*]

Syntax Definitions

local_address

The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.

remote_mask

The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

Examples

-> show ip dvmrp tunnel

Interface Name	Local Address	Remote Address	TTL	Status
vlan-2	143.209.92.203	12.0.0.1	255	Enabled

output definitions

Interface Name	The interface name.
Local Address	The 32-bit local IP address for the DVMRP tunnel.
Remote Address	The 32-bit remote IP address for the DVMRP tunnel.
TTL	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Valid range from 0–255.
Status	The corresponding interface status. Options include Enabled or Disabled . If the interface specified by the local address has been configured and is operationally enabled, the status is Enabled . If the interface is down, the value displayed is Disabled .

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip interface tunnel](#)

Adds or deletes a DVMRP tunnel.

[show ip dvmrp](#)

Configures the TTL value for the tunnel defined for the specified local address and remote address.

33 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs).

PIM-SM builds unidirectional shared trees that are rooted at a Rendezvous Point (RP) multicast router. Bidirectional PIM (BIDIR-PIM) is a variant of PIM-SM that builds bidirectional shared trees also rooted at an RP. However, BIDIR-PIM forwards packets from the source to the RP without the overhead of encapsulation or source-specific states.

PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

Alcatel-Lucent implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

Filename: ALCATEL-IND1-PIM-MIB.mib
Module: alcatelIND1PIMMIB

Filename: PIM-BSR-MIB.mib
Module: pimBsrMIB

Filename: PIM-STD-MIB.mib
Module: pimStdMIB

ip load pim

Dynamically loads PIM to memory.

ip load pim

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip load pim
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim dense admin-state	Globally enables or disables PIM-DM protocol on the switch.
show ip pim dense	Displays the status of the various global parameters for the PIM Dense mode.
ipv6 pim sparse admin-state	Enables or disables IPv6 PIM-SM (sparse mode) globally for IPv6.
ipv6 pim bidir admin-state	Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
ipv6 pim dense admin-state	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaVrConfigTable  
  alaVrConfigPimStatus
```

ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

ip pim sparse admin-state {enable | disable}

Syntax Definitions

enable Globally enables PIM-SM on the switch.
disable Globally disables PIM-SM on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim sparse admin-state enable
-> ip pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip load pim](#) Dynamically loads PIM to memory.
[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPismGlobalConfig
alaPismAdminStatus
```

ip pim bidir admin-state

Globally enables or disables the BIDIR-PIM protocol on the switch.

```
ip pim bidir admin-state {enable | disable}
```

Syntax Definitions

enable	Globally enables BIDIR-PIM on the switch.
disable	Globally disables BIDIR-PIM on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- BIDIR-PIM is a variant of PIM-SM, which means that PIM-SM must also be globally enabled on the switch.

Examples

```
-> ip pim bidir admin-state enable
-> ip pim bidir admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.

```

ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

ip pim dense admin-state {enable | disable}

Syntax Definitions

enable Globally enables PIM-DM on the switch.
disable Globally disables PIM-DM on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim dense admin-state enable
-> ip pim dense admin-state disable
```

[show ip pim dense](#) Displays the status of the various global parameters for the PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
alaPimdmAdminStatus
```

ip pim rp-hash admin-state

Configures the version of the hashing algorithm that the Rendezvous Point (RP) hashing function will use to select an RP.

ip pim rp-hash admin-state {enable | disable}

Syntax Definitions

enable Applies the newer version of the hashing algorithm.
disable Applies the legacy version of the hashing algorithm.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The RP hashing function is applied when selecting an RP from two or more equal group-range-to-RP mappings.
- To maintain interoperability between PIM routers, make sure all routers have the same setting for the RP hash function. For example, this function is enabled for all PIM routers or this function is disabled for all PIM routers.

Examples

```
-> ip pim rp-hash admin-state enable  
-> ip pim rp-hash admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```

  alaPimsmRPHashStatus
```

ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ip pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ip pim ssm group group_address/prefix_length
```

Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

Examples

```
-> ip pim ssm group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

```

ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

ip pim dense group *group_address/prefix_length* [[**no**] **override**] [**priority** *priority*]

no ip pim dense group *group_address/prefix_length*

Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
override	Specifies that this static Dense mode mapping configuration should override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ip pim dense group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ip pim cbsr *ip_address* [**priority** *priority*] [**mask-length** *bits*]

no ip pim cbsr *ip_address*

Syntax Definitions

<i>ip_address</i>	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<i>priority</i>	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0–255.
<i>bits</i>	Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1–32.

Defaults

parameter	default
<i>priority</i>	64
<i>bits</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim cbsr](#)

Displays the Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```

ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

ip pim static-rp *group_address/prefix_length rp_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

no ip pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>rp_address</i>	Specifies a 32-bit Rendezvous Point (RP) address.
bidir	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

- To view current static RP configuration settings, use the **show ip pim static-rp** command.

Examples

```
-> ip pim static-rp 225.0.0.0/24 10.1.1.1 priority 10
-> ip pin static-rp 225.0.0.0/24 10.1.1.1 bidir override
-> no ip pin static-rp 225.0.0.0/24 10.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim static-rp	Displays the PIM static RP table for ASM mode, which includes the group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
pimStaticRPTable
  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPRPAddress
  pimStaticRPPimMode
  pimStaticRPOverrideDynamic
  pimStaticRPPrecedence
  pimStaticRPRowStatus
```

ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

ip pim candidate-rp *rp_address group-address/prefix_length* [[**no**] **bidir**] [**priority** *priority*] [**interval** *seconds*]

no ip pim candidate-rp *rp_address group-address/prefix_length*

Syntax Definitions

<i>rp_address</i>	Specifies a 32-bit address that will be advertised as a Candidate-RP.
<i>group_address</i>	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
bidir	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
[no] bidir	no bidir
<i>priority</i>	192
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple C-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the C-RP entries.

- This command is supported only in the sparse mode.

Examples

```
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 priority 100 interval 100
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 bidir priority 100 interval 100
-> no ip pim candidate-rp 50.1.1.1 225.0.0.0/24
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

show ip pim candidate-rp Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

  pimBsrCandidateRPRowStatus
```

ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

ip pim rp-threshold *bps*

Syntax Definitions

bps The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

Defaults

parameter	default
<i>bps</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the [show ip pim sparse](#) command.

Examples

```
-> ip pim rp-threshold 131072
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the global parameters for PIM sparse mode.

MIB Objects

alaPismGlobalConfig
alaPismRPThreshold

ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

ip pim keepalive-period *seconds*

Syntax Definitions

seconds Specifies the timeout value, in seconds (0-65535).

Defaults

parameter	default
<i>seconds</i>	210

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

Examples

```
-> ip pim keepalive-period 500
```

Release History

Release 7.1.1; command was introduced.

show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

pim
pimKeepalivePeriod

ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

ip pim max-rps *number*

Syntax Definitions

number The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

Defaults

parameter	default
<i>number</i>	32

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the [ip pim sparse admin-state command on page 33-5](#).

Examples

```
-> ip pim max-rps 32
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim sparse admin-state	Globally enables or disables the PIM-SM protocol on the switch.
ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

alaPimsmGlobalConfig
alaPimsmMaxRPs

ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

ip pim probe-time *seconds*

Syntax Definitions

seconds The probe time, in seconds (1–300).

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim probe-time 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmProbeTime
```

ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

ip pim register checksum {header | full}

Syntax Definitions

header	Specifies that the checksum for registers is done only on the PIM header.
full	Specifies that the checksum is done over the entire PIM register message.

Defaults

parameter	default
header full	header

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
alaPimsmOldRegisterMessageSupport
```

ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

ip pim register-suppress-timeout *seconds*

Syntax Definitions

seconds The timeout value, in seconds (0–65535).

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-suppress-timeout 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
pim  
  pimRegisterSuppressionTime
```

ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

ip pim spt admin-state {enable | disable}

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the [show ip pim sparse](#) command.

Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

ip pim state-refresh-interval *seconds*

Syntax Definitions

seconds The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-interval 80
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.

show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

pim
pimRefreshInterval

ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

ip pim state-refresh- limit *ticks*

Syntax Definitions

ticks The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

Defaults

parameter	default
<i>ticks</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

Examples

```
-> ip pim state-refresh-limit 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.

MIB Objects

```
alaPimdmGlobalConfig
  alaPimdmStateRefreshLimitInterval
```

ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

ip pim state-refresh-ttl *num*

Syntax Definitions

num The Time to Live to be used. Values may range from 0 to 255.

Defaults

parameter	default
<i>num</i>	16

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-ttl 122
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig  
  alaPimdmStateRefreshTimeToLive
```

ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

```
ip pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]
```

```
no ip pim interface if_name
```

Syntax Definitions

<i>if_name</i>	The interface name on which PIM is being enabled or disabled.
hello-interval <i>seconds</i>	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000.
triggered-hello <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60.
joinprune-interval <i>seconds</i>	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
hello-holdtime <i>seconds</i>	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
joinprune-holdtime <i>seconds</i>	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
prune-delay <i>milliseconds</i>	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
override-interval <i>milliseconds</i>	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in <i>milliseconds</i> . Values may range from 0 to 65535.
dr-priority <i>priority</i>	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.

prune-limit-interval <i>seconds</i>	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
graft-retry-interval <i>seconds</i>	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
df-election-robustness <i>messages</i>	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM (<i>which is not supported on the OmniSwitch 9900</i>).
stub	Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets.

Defaults

parameter	default
hello-interval <i>seconds</i>	30
triggered-hello <i>seconds</i>	5
joinprune-interval <i>seconds</i>	60
hello-holdtime <i>seconds</i>	105
joinprune-holdtime <i>seconds</i>	210
prune-delay <i>milliseconds</i>	500
override-interval <i>milliseconds</i>	2500
dr-priority <i>priority</i>	1
prune-limit-interval <i>seconds</i>	60
graft-retry-interval <i>seconds</i>	3
df-election-robustness <i>messages</i>	3
stub	Disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the [ip pim sparse admin-state command on page 33-5](#). To enable or disable PIM-DM on the switch, refer to the [ip pim dense admin-state command on page 33-7](#).
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.

- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/ Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.

Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval
100 hello-holdtime 350 joinprune-holdtime 400
-> no ip pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **df-election-robustness** parameter added.

Related Commands

[show ip pim interface](#)

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

  pimInterfaceGraftRetryInterval
```

ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

ip pim neighbor-loss-notification-period *seconds*

Syntax Definitions

seconds Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

Defaults

parameter	default
<i>seconds</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim neighbor-loss-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimNeighborLossNotificationPeriod

ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

ip pim invalid-register-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

Defaults

parameter	default
<i>seconds</i>	65535

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim invalid-register-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

MIB Objects

pim
pimInvalidJoinPruneNotificationPeriod

ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

ip pim rp-mapping-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

Defaults

parameter	default
<i>seconds</i>	65535

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim rp-mapping-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimRPMappingNotificationPeriod

ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

ip pim interface-election-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

Defaults

parameter	default
<i>seconds</i>	65535

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim interface-election-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimInterfaceElectionNotificationPeriod

ip pim nonbidir-hello-notification-period

Specifies the minimum time that must elapse between notifications that a Bidirectional PIM (BIDIR-PIM) router transmits whenever the router receives a PIM Hello message that *does not* contain the Bidirectional Capable option.

ip pim nonbidir-hello-notification-period *seconds*

Syntax Definitions

seconds The minimum time value that must elapse between notifications, in seconds. The valid range is 10–65535.

Defaults

parameter	default
<i>seconds</i>	65535

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The default value of 65535 represents an infinite time. This type of notification is never sent when this value is set to infinite time.
- The default minimum time is set to a non-zero value to provide resilience against the propagation of denial-of-service (DoS) attacks from the control plane to the network management plane.
- The Bidirectional Capable option indicates that a router is capable of participating as a BIDIR-PIM neighbor.
- This value is used with both IPv4 and IPv6 PIM.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim nonbidir-hello-notification-period 1000
-> ip pim nonbidir-hello-notification-period 65535
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip pim df-abort](#)

Configures whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

[show ip pim notifications](#)

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

alaPimsmGlobalConfig

alaPimsmNonBidirHelloPeriod

ip pim df-abort

Configures whether or not the Designated Forwarder (DF) election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

ip pim df-abort {enable | disable}

Syntax Definitions

enable	Administratively enables the DF abort operation (DF election is stopped).
disable	Administratively disables the DF abort operation (DF election is not stopped).

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The DF election process occurs between PIM routers that support BIDIR-PIM. When the DF abort option is disabled, this election process continues between the BIDIR-PIM routers.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim df-abort enable  
-> ip pin df-abort disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim nonbidir-hello-notification-period

Specifies the minimum time between notifications that a BIDIR-PIM router transmits when the router receives a Hello message from a neighbor that does not contain the Bidirectional Capable option.

show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

alaPimsmGlobalConfig

alaPimsmBidirDFAbort

ip pim mbr all-sources

Configures whether or not PIM notifies DVMRP about the routes to all multicast sources learned. This command applies only when the local switch is operating as a Multicast Border Router (MBR).

ip pim mbr all-sources

no ip pim mbr all-sources

Syntax Definitions

N/A

Defaults

By default, PIM only notifies DVMRP about the routes for subnets directly connected to PIM interfaces.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable notification of all route sources learned.
- This command applies to both PIM-SM and PIM-DM. Note that PIM-SSM does not support MBR functionality. In addition, PIM-SM and PIM-SSM are not supported on the OmniSwitch 9900.
- DVMRP advertises the routes received from PIM within the DVMRP domain using standard DVMRP mechanisms.

Examples

```
-> ip pim mbr all-sources  
-> no ip pim mbr all-sources
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
ip mroute mbr	Configures the switch to operate as a Multicast Border Router to provide interoperability between PIM and DVMRP.
ip dvmrp interface mbr-default-information	Configures whether or not the DVMRP interface on a Multicast Border Router advertises a default route.

MIB Objects

```
alaPimGlobalConfig  
  alaPimMbrAllSourcesStatus
```

ip pim df-periodic-interval

Sets the interval at which the Designated Forwarder (DF) for each Rendezvous Point Address (RPA) periodically announces its status in a Winner message.

ip pim df-periodic-interval *seconds*

Syntax Definitions

seconds The time interval between successive Winner messages, in seconds. The valid range is 0–2000.

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the value for this interval is set to zero, no messages are sent.
- This value is used with both IPv4 BIRDIR-PIM and IPv6 BIRDIR-PIM.
- Setting this interval value provides an additional degree of safety to ensure that two routers do not both consider themselves to be the DF for the same link.
- The periodic Winner messages will only occur for RPAs that have active groups, thus avoiding the periodic control traffic in areas of the network without senders or receivers for a particular RPA.

Examples

```
-> ip pim df-periodic-interval 80  
-> ip pin df-periodic-interval 0
```

Release History

Release 7.3.4; command was introduced.

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip pim sparse
Status                    = disabled,
Keepalive Period          = 210,
Max RPs                   = 32,
Probe Time                = 5,
Register Checksum         = header,
Register Suppress Timeout = 60,
RP Threshold              = 1,
SPT Status                = enabled,
BIDIR Status              = disabled,
BIDIR Periodic Interval  = 60,
BIDIR DF Abort Status     = disabled,
BFD Status                = disabled,
MoFRR Status              = disabled,
MoFRR All Routes Status  = disabled,
MBR All Sources Status    = disabled,
MBR Operational Status    = disabled,
RP Hash Algorithm         = disabled
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-SM. Options include enabled and disabled .
Keepalive Period	The duration of the Keepalive timer. The default value is 210.
Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.

output definitions (continued)

Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Checksum	The current application of the checksum function on register messages in the domain. Options include header and full . The default setting is header .
Register Suppress Timeout	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
RP Threshold	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
SPT Status	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include enabled (the default) and disabled .
BIDIR Status	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include enabled and disabled (the default).
BIDIR Periodic Interval	The amount of time, in seconds, between Winner messages the Designated Forwarder (DF) sends out to announce its status. The valid range is 0–2000. The default is 60 seconds.
BIDIR DF Abort Status	Indicates whether or not the DF election process is stopped when a BIDIR-PIM router receives a Hello message that does not contain the Bidirectional Capable option. When enabled DF election is stopped; when disabled (the default) DF election continues.
BFD Status	Not supported in the current release.
MoFRR Status	
MoFRR All Routes Status	
MBR All Sources Status	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include enabled (routes to all sources) or disabled (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.
RP Hash Algorithm	The status of the RP hashing algorithm. When enabled , a newer version of the algorithm is in use; when disabled (the default), a legacy version of the algorithm is in use.

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

Release 7.3.4; **BIDIR** fields added, **RP Hash Algorithm** field added.

Related Commands

ip pim sparse admin-state	Globally enables or disables PIM-SM protocol on the switch.
ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register checksum	Configures the application of the checksum function on sent and received register messages in the domain.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
ip pim rp-threshold	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
ip pim spt admin-state	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.
ip pim bidir admin-state	Globally enables or disables BIDIR-PIM protocol on the switch.
ip pim df-periodic-interval	Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
ip pim df-abort	Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
ip pim mbr all-sources	Configures PIM to notify DVMRP of all learned routes to sources. This command only applies when the switch is operating in the Multicast Border Router mode.
ip pim rp-hash admin-state	Globally enables or disables the RP hashing algorithm version for the switch.

Displays the status of the various global parameters for the PIM dense mode.

show ip pim dense

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip pim dense
Status = enabled,
Source Lifetime = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL = 16,
BFD Status = disabled,
MoFRR Status = disabled,
MBR All Sources Status = disabled,
MBR Operational Status = enabled
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-DM. Options include enabled and disabled .
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
BFD Status MoFRR Status	Not supported in the current release.

output definitions (continued)

MBR All Sources Status	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include enabled (routes to all sources) or disabled (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

Related Commands

show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

show ip pim ssm group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

Examples

```
-> show ip pim ssm group
Group Address/Prefix RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24      0.0.0.0      ssm   false   none     enabled
```

output definitions

Group Address/Prefix	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
RP Address	A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix.
Mode	The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , or dm .
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include enabled and disabled .

Release History

Release 7.1.1; command was introduced.

 alaPimdmDenseGroupPrecedence
 alaPimdmDenseGroupRowStatus

output definitions

Neighbor (IP) Address	The 32-bit IP address of the active PIM neighbor.
Interface Name	The name of the interface used to reach this PIM neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expiry time	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
Lan Prune Delay Present	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
Propagation Delay	The expected propagation delay between PIM routers on this network.
DR Priority Present	Evaluates to TRUE if the neighbor is using the DR Priority option.
DR Priority	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
TBit field	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Generation ID Present	Evaluates to TRUE if this neighbor is using the Generation ID option.
Generation ID Value	The value of the Generation ID from the last PIM Hello message received from the neighbor.
BiDir Capable	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include true or false .
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

show ip pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip pim candidate-rp
RP Address      Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
40.1.50.25     225.0.0.0/8       192      60       bidir enabled
```

output definitions

RP Address	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash character (/). This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Mode	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

Related Commands

[ip pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

MIB Objects

```
pimBsrCandidateRPTable  
  pimBsrCandidateRPAddressType  
  pimBsrCandidateRPAddress  
  pimBsrCandidateRPGroupAddress  
  pimBsrCandidateRPGroupPrefixLength  
  pimBsrCandidateRPBidir  
  pimBsrCandidateRPAdvTimer

  pimBsrCandidateRPAdvInterval  
  pimBsrCandidateRPHoldtime  
  pimBsrCandidateRPStatus  
  pimBsrCandidateRPStorageType
```

show ip pim group-map

Displays the PIM group mapping table.

show ip pim group-map [**bsr** | **static-rp** | **ssm** | **dense**]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ip pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	225.0.0.0/24	172.21.63.11	asm	192
BSR	225.0.0.0/24	214.0.0.7	asm	192
BSR	225.0.0.0/8	40.1.50.25	bidir	192
Static RP	226.0.0.0/8	10.11.203.8	bidir	none
Static RP	232.0.0.0/8		ssm	

```
-> show ip pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	225.0.0.0/24	172.21.63.11	asm	192
BSR	225.0.0.0/24	214.0.0.7	asm	192
BSR	225.0.0.0/8	40.1.50.25	bidir	192

```

-> show ip pim group-map static-rp
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----
Static RP  226.0.0.0/8                10.11.203.8  bidir none
Static RP  232.0.0.0/8                10.11.203.8  ssm

```

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
RP Address	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
Mode	The PIM mode to be used for groups in this prefix.
Mapping Precedence	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; **bidir** mode support added.

Related Commands

ip pim ssm group	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
ip pim dense group	Creates and manages the static configuration of dense mode (DM) group mappings.
ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

MIB Objects

```
pimGroupMappingTable  
  pimGroupMappingOrigin  
  pimGroupMappingAddressType  
  pimGroupMappingGrpAddress  
  pimGroupMappingGrpPrefixLength  
  pimGroupMappingRPAddressType  
  pimGroupMappingRPAddress  
  pimGroupMappingPimMode  
  pimGroupMappingPrecedence
```

show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

show ip pim interface [*if_name*]

Syntax Definitions

if_name The interface name.

Defaults

By default, displays a summary list of IP PIM interfaces.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ip pim interface
```

```
Total 1 Interfaces
```

Interface Name	IP Address	Designated Router	Hello Interval	J/P Interval	Oper Status	BFD Status
vlan-203	11.12.203.8	11.12.203.8	30	60	disabled	disabled

```
-> show ip pim interface vlan-203
```

```
Interface Name      = vlan-203,
IP Address          = 11.12.203.8,
Designated Router   = 11.12.203.8,
Hello Interval      = 30,
Triggered Hello Interval = 5,
Hello HoldTime      = 105,
Join/Prune Interval = 60,
Join/Prune HoldTime = 210,
Propagation (Prune) Delay = 500,
Override Interval   = 2500,
Generation ID       = 0x53291e4c,
DR Priority          = 1,
DR Priority Enabled  = true,
Lan Delay Enabled   = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled = true,
```

```

Stub Interface           = false,
Prune Limit Interval    = 60,
Graft Retry Interval    = 3,
State Refresh Enabled   = true,
BiDir Capable           = false,
DF Election Robustness  = 3,
Operational Status      = disabled,
BFD Status              = disabled

```

output definitions

Interface Name	The name of the interface on which PIM is enabled.
IP address	Specifies the IP address of the specified interface.
Designated Router	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
Propagation (Prune) Delay Override Interval	The expected propagation delay between PIM routers on this network. The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
Generation ID	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.

output definitions (continued)

Lan Delay Enabled	Options include true and false . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3.
State Refresh Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
BiDir Capable	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM.
DF Election Robustness	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM.
Operational Status	The current operational status of the corresponding interface. Options include enabled and disabled . This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is disabled . To globally enable or disable PIM on the switch, use the ip pim sparse admin-state and ip pim dense admin-state commands.
BFD Status	Not supported in the current release.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

Related Commands

show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

show ip pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ip pim static-rp
Group Address/Pref Length  RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24              172.21.63.11  asm   false   none     enabled
226.0.0.0/8               10.11.203.8   bidir false   none     enabled
```

output definitions

Group Address/Pref Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the ip pim static-rp command on page 33-15 .
RP Address	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the ip pim static-rp command on page 33-15 .
Mode	The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , or bidir .
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).

output definitions

Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether static RP configuration is currently enabled or disabled. Options include enabled and disabled . To change the current status, refer to the ip pim static-rp command.

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4: **bidir** mode support added.

Related Commands

[ip pim static-rp](#) Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

```
show ip pim cbsr
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip pim cbsr
CBSR Address      = 214.0.0.7,
Status           = enabled,
CBSR Priority     = 0,
Hash Mask Length = 30,
Elected BSR     = False,
Timer            = 00h:00m:00s
```

output definitions

CBSR Address	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim groute

Displays (*,G) routing table entries for IPv4 PIM.

show ip pim groute [*group_address*]

Syntax Definitions

group_address A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Defaults

By default, the entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ip pim groute
```

```
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	Upstream Neighbor	UpTime	Mode
225.0.0.0	212.61.60.8	vlan-30	212.61.30.7	00h:01m:43s	asm
225.0.0.1	212.61.60.8	vlan-30	212.61.30.7	00h:01m:43s	bidir

```
-> show ip pim groute 225.0.0.0
```

```
(* ,225.0.0.0)
```

```
UpTime           = 00h:01m:49s

```

output definitions

Group-address	The IPv4 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
UpTime	The time since this entry was created.
Mode	Whether this entry represents an asm , (Any Source Multicast) or bidir (Bidirectional PIM) group.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.

output definitions (continued)

Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
RPF Next Hop	The address of the RPF next hop towards the RP.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.
Local Membership	Whether the local router has (*,G) local membership on this interface.
Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner, or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Mode field added, **bidir** mode support added

show ip pim sgroute

Displays (S,G) routing table entries for IPv4 PIM.

show ip pim sgroute [*source_address* *group_address*]

Syntax Definitions

source_address The 32-bit IP address for a specific multicast source.
group_address A 32-bit multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ip pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
          L = Local, R = RPT, T = SPT, F = Register,
          P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

```

output definitions

Source-address	The IPv4 Source address.
Group-address	The IPv4 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

output definitions (continued)

Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.
RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.

output definitions (continued)

Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

show ip pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ip pim df-election [*rp_address* | *if_name*]

Syntax Definitions

rp_address A 32-bit RP address.
if_name The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

-> show ip pim df-election

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
10.11.203.8	vlan-13	Win	10.11.126.3	00h:06m:31s	1	1	00h:00m:24s
	vlan-200	Win	10.11.200.1	00h:06m:31s	1	1	00h:00m:24s
	vlan-204	Win	10.11.204.8	00h:06m:31s	1	1	00h:00m:24s
	vlan-210	Win	10.5.5.8	00h:06m:31s	1	1	00h:00m:24s

	vlan-204	Lose	10.11.204.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-210	Win	10.5.5.8	00h:06m:31s	110	2	00h:00m:32s

-> show ip pim df-election 40.1.50.25

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
40.1.50.25	vlan-203	Lose	10.11.203.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-13	Win	10.11.126.3	00h:06m:31s	110	2	00h:00m:32s
	vlan-200	Win	10.11.200.1	00h:06m:31s	110	2	00h:00m:32s
	vlan-204	Lose	10.11.204.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-210	Win	10.5.5.8	00h:06m:31s	110	2	00h:00m:32s

```
-> show ip pim df-election vlan-200
```

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
10.11.203.8	vlan-200	Win	10.11.200.1	00h:06m:31s	1	1	00h:00m:24s
40.1.50.25	vlan-200	Win	10.11.200.1	00h:06m:31s	110	2	00h:00m:32s

output definitions

RP Address	The IPv4 address of the Rendezvous Point (RP).
Interface Name	The name of the IPv4 interface.
DF State	The state of the DF election process (Offer , Lose , Win , or Backoff).
Winner Address	The primary IPv4 address of the winner of the DF election process.
UpTime	The amount of time since the current winner was last elected the DF for the RP.
Metric Pref	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
Metric	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
Expires	The minimum time remaining before the local router expires the current DF state.

ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

ipv6 pim sparse admin-state {enable | disable}

Syntax Definitions

enable	Enables PIM-SM globally for IPv6.
disable	Disables PIM-SM globally for IPv6.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

ipv6 pim ssm group *group_address/prefix_length* [[no] **override**] [**priority** *priority*]

no ipv6 pim ssm group *group_address/prefix_length*

Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

MIB Objects

pimStaticRPTable

pimStaticRPGrpAddress
pimStaticRPGrpPrefixLength
pimStaticRPPimMode
pimStaticRPPrecedence
pimStaticRPOverrideDynamic
pimStaticRPRowStatus

ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

```
ipv6 pim dense group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim dense group group_address/prefix_length
```

Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
override	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50  
-> no ipv6 pim dense group ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

```
ipv6 pim cbsr ipv6_address [priority priority] [mask-length bits]
```

```
no ipv6 pim cbsr ipv6_address
```

Syntax Definitions

<i>ipv6_address</i>	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address.
<i>priority</i>	The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255.
<i>bits</i>	The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.

Defaults

parameter	default
<i>priority</i>	64
<i>bits</i>	126

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4  
-> no ipv6 pim cbsr 2000::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ipv6 pim cbsr`

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

  pimBsrCandidateBSRPriority
  pimBsrCandidateBSRHashMaskLength
  pimBsrCandidateBSRRowStatus
```

ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

ipv6 pim static-rp *group_address/prefix_length rp_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

no ipv6 pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<i>rp_address</i>	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
bidir	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
override	Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined a value of 65535 can be used to unset the priority

- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> ipv6 pin static-rp ff0e::1234/128 2000::1 bidir override
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

[show ipv6 pim group-map](#)

```

ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

ipv6 pim candidate-rp *rp_address group_address/prefix_length* [[no] **bidir**] [**priority** *priority*] [**interval** *seconds*]

no ipv6 pim candidate-rp *rp_address group_address/prefix_length*

Syntax Definitions

<i>rp_address</i>	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
<i>group_address</i>	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the specified IPv6 multicast group address.
bidir	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
[no] bidir	no bidir
<i>priority</i>	192
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 bidir priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

```

ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

ipv6 pim rp-switchover {enable | disable}

Syntax Definitions

enable Enables the RP to switch to native forwarding.
disable Disables the RP from switching to native forwarding.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim rp-switchover enable  
-> ipv6 pim rp-switchover disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

```
ipv6 pim spt admin-state {enable | disable}
```

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

Examples

```
-> ipv6 pim spt admin-state enable  
-> ipv6 pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

```

ipv6 pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]

```

```
no ipv6 pim interface if_name
```

Syntax Definitions

<i>if_name</i>	The interface name on which the IPv6 PIM is being enabled or disabled.
hello-interval <i>seconds</i>	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
triggered-hello <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
joinprune-interval <i>seconds</i>	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
hello-holdtime <i>seconds</i>	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
joinprune-holdtime <i>seconds</i>	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds. Values may range from 0 to 65535.
prune-delay <i>milliseconds</i>	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
override-interval <i>milliseconds</i>	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in <i>milliseconds</i> . Values may range from 0 to 65535.

dr-priority <i>priority</i>	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
prune-limit-interval <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
graft-retry-interval <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
df-election-robustness <i>messages</i>	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM (<i>which is not supported on the OmniSwitch 9900</i>).
stub	Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets.

Defaults

parameter	default
hello-interval <i>seconds</i>	30
triggered-hello <i>seconds</i>	5
joinprune-interval <i>seconds</i>	60
hello-holdtime <i>seconds</i>	105
joinprune-holdtime <i>seconds</i>	210
prune-delay <i>milliseconds</i>	500
override-interval <i>milliseconds</i>	2500
dr-priority <i>priority</i>	1
prune-limit-interval <i>seconds</i>	60
graft-retry-interval <i>seconds</i>	3
df-election-robustness <i>messages</i>	3
stub	Disabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the [ipv6 pim sparse admin-state command on page 33-89](#). To enable or disable IPv6 PIM-DM on the switch, refer to the [ipv6 pim dense admin-state command on page 33-91](#).

- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a joinprune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.

Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-  
interval 100 hello-holdtime 350 joinprune-holdtime 400  
-> no ipv6 pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4: **df-election robustness** parameter added.

```

show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

show ipv6 pim sparse

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim sparse
Status = enabled,
Keepalive Period = 210,
Max RPs = 32,
Probe Time = 5,
Register Suppress Timeout = 60,
RP Switchover = enabled,
SPT Status = enabled,
BIDIR Status = disabled,
BIDIR Periodic Interval = 60,
BIDIR DF Abort Status = disabled
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include enabled and disabled .
Keepalive Period	The duration of the Keepalive timer. The default value is 210.
Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.
Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the RP. This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Suppress Timeout	The amount of time, in seconds, the DR will stop sending registers to the RP once a Register-Stop is received (1–300). The default value is 60.

output definitions

RP switchover	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include enabled and disabled . The default setting is enabled .
SPT Status	The current status of last hop DR switching to the SPT. Options include enabled and disabled . The default setting is enabled .
BIDIR Status	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include enabled and disabled (the default).
BIDIR Periodic Interval	The amount of time, in seconds, between Winner messages the DF sends out to announce its status. The valid range is 0–2000. The default is 60 seconds.
BIDIR DF Abort Status	Indicates whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message is received from a non-Bidirectional PIM (BIDIR-PIM) capable router. Options include enabled and disabled (the default).

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; BIDIR fields added.

Related Commands

ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
ipv6 pim rp-switchover	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
ipv6 pim spt admin-state	Enables or disables last hop DR switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
ip pim bidir admin-state	Globally enables or disables BIDIR-PIM protocol on the switch.

- ip pim df-periodic-interval** Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
- ip pim df-abort** Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
- ipv6 pim interface** Enables IPv6 PIM and configures statistics on the interface.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show IPv6 pim dense
Status = enabled,
Source Lifetime = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL = 16
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include enabled and disabled .
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim dense admin-state	Enables or disables IPv6 PIM-DM (dense mode) globally on the switch.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim state-refresh-interval	Sets the interval between successive State Refresh messages originated by a router.
ip pim state-refresh-limit	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
ip pim state-refresh-ttl	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

```
show ipv6 pim ssm group
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim ssm group
```

Group Address/Prefix	RP Address	Mode	Override	Precedence	Status
ff00::/8	::	ssm	false	none	enabled
ff34::/32	::	ssm	false	none	enabled

output definitions

Group Address/Prefix	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix
Mode	The IPv6 PIM mode that is used for the groups in this prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
Precedence	The precedence value that can be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include enabled and disabled .

DF Election Robustness  = 3,
Operational Status      = enabled

```

output definitions

Interface Name	The name of the IPv6 PIM interface.
IPv6 address	Specifies the IPv6 address of the specified interface.
Designated Router	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
Propagation Delay	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
Generation ID Option	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.

output definitions (continued)

Lan Delay Enabled	Options include true and false . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.
DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
SR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
BiDir Capable	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM.
DF Election Robustness	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM.
Operational Status	The current operational status of the corresponding interface. Options include enabled and disabled . This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is disabled . To enable or disable PIM on an interface, refer to the ipv6 pim interface command on page 33-104 . To globally enable or disable PIM on the switch, refer to the ipv6 pim sparse admin-state command on page 33-89 and ipv6 pim dense admin-state command on page 33-91 .

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

```
show ipv6 pim neighbor [ipv6_address] [if_name]
```

Syntax Definitions

ipv6_address The IPv6 address for the PIM neighbor.
if_name The name of the interface.

Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ipv6 pim neighbor
Neighbor Address                      Interface Name                      Uptime                      Expires                      DR Pri
-----+-----+-----+-----+-----
fe80::2d0:95ff:feac:a537              vlan-30                              02h:56m:51s                  00h:01m:28s                  1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
Neighbor IPv6 Address                  = fe80::2d0:95ff:feac:a537,
Uptime                                    = 02h:57m:09s,
Expires                                   = 00h:01m:40s,
Lan Prune Delay Present                  = True,
Propagation Delay                        = 500,
Override Interval                        = 2500,
TBit Field                                = True,
Gen ID Present                           = True,
Gen ID Value                             = 0x7720c123,
BiDir Capable                            = False,
DR Priority Present                       = True,
DR Priority                               = 1,
State Refresh Capable                    = True,
Secondary Addresses:
  3000::11
```

```

vlan-40
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 03h:57m:03s,
Expires                   = 00h:01m:20s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval        = 2500,
TBit Field                = True,
Gen ID Present           = True,
Gen ID Value              = 0x7720c123,
BiDir Capable            = False,

DR Priority                = 1,
State Refresh Capable    = True,
Secondary Addresses:
  4000::11

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```

-> show IPv6 pim neighbor vlan-30
vlan-30
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 02h:57m:09s,
Expires                   = 00h:01m:40s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval        = 2500,
TBit Field                = True,
Gen ID Present           = True,
Gen ID Value              = 0x7720c123,
BiDir Capable            = False,
DR Priority Present       = True,
DR Priority                = 1,
State Refresh Capable    = True,
Secondary Addresses:
  3000::11

```

output definitions

Neighbor IPv6 Address	The IPv6 address of the active PIM neighbor.
Interface Name	The name of the IPv6 PIM interface that is used to reach the neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expires	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
LAN Prune Delay present	Specifies whether this neighbor is using the LAN Prune Delay option. Options include true or false .
Propagation Delay	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

output definitions (continued)

Override Interval	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
TBit field	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Gen ID present	Specifies whether this neighbor is using Generation ID option. Options include true or false .
Gen ID Value	The value of the Generation ID in the last PIM Hello message received from this neighbor.
BiDir Capable	Specifies whether this neighbor is using the Bidirectional-PIM Capable option.
DR Priority Present	Displays whether the neighbor is using the Designated Router option. Options include true or false .
DR priority	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include true or false .
Secondary Addresses	The secondary IPv6 address of this PIM neighbor.

Release History

show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

show ipv6 pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

-> show ipv6 pim static-rp

Group Address/Pref Length	RP Address	Mode	Override	Precedence	Status
ff00::/8	3000::11	asm	false	none	enabled
ff08::/32	2100::8	bidir	false	none	enabled

output definitions

Group Address/Pref Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
Mode	The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , dm , or bidir .
Override	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s).
Precedence	The precedence value that is used for this static RP configuration.
Status	Displays whether the static RP configuration is currently enabled or disabled. Options include enabled and disabled .

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** mode support added.

Related Commands

[ipv6 pim static-rp](#)

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

MIB Objects

```
pimStaticRPTable
  pimStaticRPAddressType
  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPRPAddress
  pimStaticRPPimMode
  pimStaticRPOverrideDynamic
  pimStaticRPPrecedence
  pimStaticRPRowStatus
  pimStaticRPStorageType
```

show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

show ipv6 pim group-map [**bsr** | **static-rp** | **ssm** | **dense**]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ipv6 pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	2000::8	bidir	192
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192
SSM	ff33::/32		ssm	

```
-> show ipv6 pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	2000::8	bidir	192
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192

```
-> show ipv6 pim group-map ssm
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
SSM	ff33::/32		ssm	

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
Mode	The IPv6 PIM mode to be used for groups in this prefix.
Mapping Precedence	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; **bidir** mode support added.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
ipv6 pim ssm group	Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).
ipv6 pim dense group	Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

MIB Objects

```

show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

show ipv6 pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim candidate-rp
RP Address          Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
2000::8             ff00::/8           192      60        bidir enabled
```

output definitions

RP Address	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Mode	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

show ipv6 pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim cbsr
CBSR Address          = 3000::7,
Status                = enabled,
CBSR Priority          = 0,
Hash Mask Length      = 126,
Elected BSR          = False,
Timer                 = 00h:00m:00s
```

output definitions

CBSR Address	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group)
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 7.1.1; command was introduced.

show ipv6 pim groute

Displays (*,G) routing table entries for IPv6 PIM.

show ipv6 pim groute [*group_address*]

Syntax Definitions

group_address The IPv6 address of the Multicast Group.

Defaults

By default, entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ipv6 pim groute
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	UpTime	Mode
ff08::2	2000::8	vlan-200	00h:05m:42s	bidir
ff0e::7	5ffe::3	vlan-4	00h:01m:23s	asm

```
-> show ipv6 pim groute ff0e::7
(*,ff0e::7)
  UpTime           = 00h:01m:28s

Assert State            = No Info,
Assert Timer            = 00h:00m:00s,

```

output definitions

Group-address	The IPv6 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
UpTime	The time since this entry was created.
Mode	Whether this entry represents an asm , (Any Source Multicast) or bidir (Bidirectional PIM) group.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.
Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
RPF Next Hop	The address of the RPF next hop towards the RP.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.

output definitions (continued)

Local Membership	Whether the local router has (*,G) local membership on this interface.
Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Mode field added, **bidir** mode support added

show ipv6 pim sgroute

Displays (S,G) routing table entries for IPv6 PIM.

show ipv6 pim sgroute [*source_address* *group_address*]

Syntax Definitions

source_address The IPv6 address for a specific multicast source.
group_address A IPv6 multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ipv6 pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
           L = Local, R = RPT, T = SPT, F = Register,
           P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

Source Address	Group Address	RPF Interface	UpTime	Flags
8ffe::3	ff0e::7		00h:01m:34s	SR

```
-> show ipv6 pim sgroute 8ffe::3 ff0e::7
(8ffe::3,ff0e::7)
```

```
UpTime                                = 00h:01m:40s
PIM Mode                              = ASM,
Upstream Join State                  = Not Joined,

```

output definitions

Source-address	The IPv6 Source address.
Group-address	The IPv6 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.

output definitions (continued)

RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.
Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

show ipv6 pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ipv6 pim df-election [*rp_address* / *if_name*]

Syntax Definitions

rp_address An IPv6 RP address.
if_name The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

```
-> show ipv6 pim df-election
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                     Pref

```

output definitions

RP Address	The IPv6 address of the Rendezvous Point (RP).
Interface Name	The name of the IPv6 interface.
DF State	The state of the DF election process (Offer , Lose , Win , or Backoff).
Winner Address	The primary IPv6 address of the winner of the DF election process.
UpTime	The amount of time since the current winner was last elected the DF for the RP.
Metric Pref	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
Metric	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
Expires	The minimum time remaining before the local router expires the current DF state.

34 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for multicast routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

Filename: ALCATEL-IND1-IPMRM-MIB.mib
Module: alcatelIND1IPMRMMIB

Filename: IPMCAST-MIB.mib
Module: IpMcastMib

A summary of the available commands is listed here:

ip mroute-boundary
ip mroute-boundary extended
ip mroute interface ttl
ip mroute mbr
show ip mroute-boundary
show ip mroute
show ip mroute interface
show ip mroute-nexthop
show ip mroute mbr
ipv6 mroute interface ttl
show ipv6 mroute
show ipv6 mroute interface
show ipv6 mroute-nexthop

ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary *if_name scoped_address mask*

no ip mroute-boundary *if_name scoped_address mask*

Syntax Definitions

<i>if_name</i>	The interface name on which the boundary is being assigned.
<i>scoped_address</i>	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
<i>mask</i>	A corresponding Class A, B, or C mask address (e.g., 255.0.0.0).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute-boundary Displays scoped multicast address boundaries for the switch’s router interfaces.

MIB Objects

```
ipMcastBoundaryTable  
  ipMcastBoundaryIfIndex  
  ipMcastBoundaryAddressType  
  ipMcastBoundaryAddress  
  ipMcastBoundaryAddressPrefixLength
```

ip mroute-boundary extended

Enables or disables the multicast route boundary expansion feature. On enabling the multicast route boundary is extended to all the multicast groups (that is, the non-scoped address, 224.0.0.0 to 239.255.255.255). All multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary extended {enable | disable}

Syntax Definitions

enable	The multicast route boundary is extended to all the multicast cast address groups (224.0.0.0 through 239.255.255.255).
disable	The multicast route boundary is limited to administratively scoped multicast address (239.0.0.0 through 239.255.255.255).

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip mroute-boundary extended enable  
-> ip mroute-boundary extended disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip mroute-boundary Displays multicast address boundaries for the switch's router interfaces.

MIB Objects

alaIpirmGlobalConfig
alaIpirmExtendedBoundaryStatus

ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ip mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

<i>if_name</i>	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
<i>threshold</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip mroute interface](#) Displays IP multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

ip mroute mbr

Configures the switch to serve as a Multicast Border Router (MBR) that will provide interoperability between DVMRP and PIM domains.

ip mroute mbr admin-state {enable | disable}

Syntax Definitions

enable	Enables MBR functionality on the switch.
disable	Disables MBR functionality on the switch.

Defaults

MBR functionality is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To configure the switch to operate as an MBR, first configure the DVMRP and PIM protocols for the switch then enable MBR functionality.
- The MBR functionality is operationally enabled only when there is at least one PIM interface and one DVMRP interface enabled and both interfaces are operationally active on the switch.
- The MBR feature only supports interoperability between DVMRP and PIM (includes PIM-DM and PIM-SM) domains; no other routing protocols are supported.
- The following is *not* supported by the MBR feature in the current release:
 - PIM-SSM
 - Interoperability between multiple PIM domains
 - IPv6 (only IPv4)

Examples

```
-> ip mroute mbr admin-state enable
-> ip mroute mbr admin-state disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show ip mroute mbr Displays MBR configuration information.

MIB Objects

alaIpmrmMbrStatus

ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ipv6 mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

<i>if_name</i>	The name of the IPv6 interface.
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
<i>threshold</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaIpMcastInterfaceTtl
```

show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

show ip mroute-boundary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip mroute-boundary
Extended Boundary Address Range: enabled
```

Interface Name	Interface Address	Boundary Address
vlan-4	214.0.0.7	239.1.1.1/32
vlan-2	170.2.0.1	224.2.2.2/24

output definitions

Extended Boundary Address Range	Displays the status of extended multicast route boundary on the interface.
Interface Name	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
Interface Address	The IP address of this interface where the boundary is assigned.
Boundary Address	The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

Release History

Release 7.1.1; command was introduced.

Release 8.2.1; **Extended Boundary Address Range** output filed added.

Related Commands

ip mroute-boundary	Adds or deletes a router's scoped multicast address boundaries.
ip mroute interface ttl	Enables or disables the multicast route boundary expansion feature.
show ip mroute interface	Displays IP multicast interface information.

MIB Objects

  alaIpmmExtendedBoundaryStatus
```

show ip mroute

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

show ip mroute

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

-> show ip mroute

```
Total 2 Mroutes
Group Address      Src Address      Upstream Nbr    Route Address    Proto
-----+-----+-----+-----+-----
225.0.0.0         214.0.0.2/32    0.0.0.0         214.0.0.0/24    PIM-SM
225.0.0.1         214.0.0.2/32    0.0.0.0         214.0.0.0/24    PIM-DM
```

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address which identifies the source for this entry.
Upstream Nbr	The address of the upstream neighbor from which IP datagrams from these sources to this multicast address are received.
Route Address	The address portion of the route used to find the upstream or parent interface for this multicast forwarding entry.
Proto	The multicast routing protocol through which this multicast forwarding entry was learned (i.e., DVMRP, PIM-SM or PIM-DM).

Release History

Release 7.1.1; command was introduced.

Related Commands

ff06:7777:::2 2600::7          vlan-30 fe80::2d0:95ff:feac:a537 2600::/64 PIM-SM
```

output definitions

Group Address	The IPv6 multicast group address for this entry.
Source Address	The IPv6 multicast address, which identifies the source for this entry.
Interface	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
Upstream Neighbor	The IPv6 address of the upstream neighbor from which the datagrams from these sources to this multicast address are received.
Route Addr/Prefix len	The IPv6 address portion of the route used to find the upstream or parent interface for this IPv6 multicast forwarding entry.
Proto	The IPv6 multicast routing protocol through which this IPv6 multicast forwarding entry was learned.

Release History

Release 7.1.1; command was introduced.

Related Commands

- show ipv6 mroute interface** Displays IPv6 multicast interface information.

show ip mroute interface

Displays IP multicast interface information.

show ip mroute interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

Examples

-> show ip mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	214.0.0.7	0	PIM
vlan-26	172.21.63.7	0	PIM
vlan-11	212.61.11.7	0	PIM

output definitions

Interface Name	The name configured for the interface.
IP Address	The IP address of this interface entry.
TTL	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
Multicast Protocol	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

Release History

Release 7.1.1; command was introduced.

Related Commands

225.0.0.6	214.0.0.2/32	vlan-26	225.0.0.6	PIM-SM
225.0.0.7	214.0.0.2/32	vlan-26	225.0.0.7	PIM-SM
225.0.0.8	214.0.0.2/32	vlan-26	225.0.0.8	PIM-SM
225.0.0.9	214.0.0.2/32	vlan-26	225.0.0.9	PIM-SM

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address, which identifies the source for this entry.
Interface Name	Generally, this is the name configured for the interface.
Next Hop Address	The address of the next-hop that is specific to this entry.
Protocol	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

show ip mroute mbr

Displays the MBR status for the switch.

```
show ip mroute mbr
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The MBR feature only supports interoperability between DVMRP and PIM. Both of these multicast protocols must be configured and operationally active on the switch.

Examples

```
-> show ip mroute mbr
MBR Status                = enabled,
Protocols Registered      = DVMRP PIM
```

output definitions

MBR Status	The administrative status (enabled or disabled) of MBR functionality on the switch.
Protocols Registered	The operationally active multicast protocols (DVMRP , PIM) to which MBR functionality is applied.

Release History

Release 7.3.2; command was introduced.

Related Commands

ip mroute mbr Configures the administrative status of Multicast Border Router functionality.

MIB Objects

  alaIpMrMBrStatus
  alaIpMrMBrProtocolApps
```

35 QoS Commands

Alcatel-Lucent's QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to [Chapter 44, "QoS Policy Commands,"](#) for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB_mib
Module alaQoS MIB

Filename: ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB_mib
Module alcatelIND1VfcMIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS commands are listed here:

Global commands	qos qos trust-ports qos forward log qos log console qos log lines qos log level qos stats interval qos phones qos quarantine mac-group qos user-port qos dei qos dscp-table debug qos debug qos internal clear qos log qos apply qos revert qos flush qos reset qos stats reset show qos log show qos config show qos statistics show qos dscp-table
------------------------	---

Port and Slice commands	<code>qos port</code> <code>qos port reset</code> <code>qos port trusted</code> <code>qos port maximum egress-bandwidth</code> <code>qos port maximum ingress-bandwidth</code> <code>qos port default 802.1p</code> <code>qos port default dscp</code> <code>qos port default classification</code> <code>qos port dei</code> <code>show qos port</code>
Queue Management commands	<code>qos qsi qsp</code> <code>qos qsp system-default</code> <code>qos qsi wred</code> <code>qos qsi stats</code> <code>show qos qsi summary</code> <code>show qos qsp</code> <code>show qos wrp</code> <code>show qos qsi</code> <code>show qos qsi stats</code> <code>show qos qsi wred-stats</code> <code>show qos qsp system-default</code> <code>clear qos qsi stats</code>

qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of this option, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos {enable | disable}
    [trust-ports]
    [forward log]
    [log console]
    [log lines lines]
    [log level level]
    [stats interval seconds]
    [phones [priority priority_value | trusted]]
    [user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcpserver
    | dns-reply}]
```

Syntax Definitions

enable	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The enable setting may be used alone or in conjunction with optional command keywords.
disable	Disables QoS. Flows coming into the switch are not matched to policies. The disable setting cannot be used with any other command keyword.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

Examples

```
-> qos disable  
-> qos enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy rule	Configures a policy rule on the switch.
show policy rule	Displays information for policy rules configured on the switch.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigEnable  
  alaQoSConfigTrustedPorts  
  alaQoSConfigForwardLog  
  alaQoSConfigLogLines  
  alaQoSConfigLogLevel  
  alaQoSConfigLogConsolealaQoSConfigStatsInterval  
  alaQoSConfigAutoPhones  
  alaQoSConfigUserportFilter  
  alaQoSConfigAppliedUserportFilter  
  alaQoSConfigUserportShutdown  
  alaQoSConfigAppliedUserportShutdown
```

qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See [page 35-34](#) for more information about this command.

qos trust-ports

qos no trust-ports

Syntax Definitions

N/A

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

Examples

```
-> qos trust-ports  
-> qos no trust-ports
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port trusted	Configures whether or not a particular port is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigTrustedPorts
```

qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

qos forward log

qos no forward log

Syntax Definitions

N/A

Defaults

By default, logged events are not sent to the policy server software in the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

Examples

```
-> qos forward log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigForwardLog
```

qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

qos log console

qos no log console

Syntax Definitions

N/A

Defaults

QoS log messages are not sent to the switch logging utility by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

Examples

```
-> qos log console  
-> qos no log console
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
swlog output	Enables or disables switch logging output to the console, file, or data socket (remote session).
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigLogConsole
```

qos log lines

Configures the number of lines in the QoS log.

qos log lines *lines*

Syntax Definitions

lines The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–512.

Defaults

parameter	default
<i>lines</i>	10000

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

Examples

```
-> qos log lines 5
-> qos log lines 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos log](#) Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigLogLines
```

qos log level

Configures the level of log detail.

qos log level *level*

qos no log level

Syntax Definitions

level The level of log detail, in the range from 1 (least detail) to 8 (most detail).

Defaults

parameter	default
<i>level</i>	5

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **qos debug** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **qos debug** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- To log fatal errors only, set the log level to 0.
- Note that a high log level value will impact the performance of the switch.

Examples

```
-> qos log level 4  
-> qos log level 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos log lines**

Configures the number of lines in the QoS log.

show qos log

Displays the log of QoS events.

MIB Objects

alaQoSConfigTable

 alaQoSConfigLogLevel

qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

qos stats interval *seconds*

Syntax Definitions

seconds

The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

Defaults

parameter	default
<i>seconds</i>	60

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

Examples

```
-> qos stats interval 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

MIB Objects

alaQoSConfigTable
 alaQoSConfigStatsInterval

qos phones

Enables or disables the automatic prioritization of IP phone traffic.

qos phones [*priority* *priority_value* | **trusted**]

qos no phones

Syntax Definitions

priority_value The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

trusted Trusts IP phone traffic; priority value of the IP phone packet is used.

Defaults

parameter	default
<i>priority_value</i> trusted	trusted

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:
 00:80:9f:00:00:00 – 00:80:9f:ff:ff:ff
 00:13:fa:00:00:00 – 00:13:fa:ff:ff:ff
- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.
- On the OmniSwitch 6860, consider the following:
 - When automatic prioritization of QoS IP phone traffic is enabled, a rule is configured in the FFP (Fast Filtering Processor) with the source MAC address as 00:80:9F:00:00:00 and the mask FF:FF:FF:00:00:00 and 00-13-FA-xx-xx-xx and mask FF:FF:FF:00:00:00.
 - The QoS IP phone prioritization and SIP Snooping features are mutually exclusive. If one of these features is enabled when an attempt is made to enable the other feature, an error message is displayed. To enable QoS IP phone prioritization, first use the **sip-snooping admin-state disable** command to disable SIP Snooping. To enable the SIP Snooping feature, first use the **qos no phones** command to disable QoS IP phone prioritization.

Note. QoS IP phone prioritization is configured, by default, on initialization

Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos config](#) Displays the QoS configuration for the switch.

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigAutoPhones
```

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
show quarantine mac group	Displays information about the Quarantine MAC group.
show qmr	Displays the QMR configuration for the switch.

MIB Objects

alaQoSConfigTable
 alaQoSConfigQuarantineMacGroupName

qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

qos user-port {**filter** | **shutdown**} {**spoof** | **bgp** | **bpdu** | **rip** | **ospf** | **vrrp** | **dvmrp** | **pim** | **isis** | **dhcp-server** | **dns-reply**}

qos no user-port {**filter** | **shutdown**}

Syntax Definitions

filter	Filters the specified type of traffic when it is received on UserPort ports.
shutdown	Administratively disables UserPort ports that receive the specified type of traffic.
spoof	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
bgp	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
bpdu	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
rip	Filters RIP protocol packets.
ospf	Filters OSPF protocol packets.
vrrp	Filters VRRP protocol packets.
dvmrp	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
pim	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
isis	Filters IS-IS protocol packets.
dhcp-server	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
dns-reply	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

Defaults

parameter	default
filter	spoof
shutdown	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spoof bgp ospf**).
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spoof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.

Examples

```
-> qos user-port filter spoof bpdu
-> qos user-port shutdown spoof bgp ospf
-> qos no user-port shutdown
```

Release History

Release 7.1.1; command was introduced.

  alaQoSConfigAppliedUserportFilter
  alaQoSConfigUserportShutdown
  alaQoSConfigAppliedUserportShutdown
```

qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

qos dei {ingress | egress}

qos no dei {ingress | egress}

Syntax Definitions

ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic.
egress	Marks the DEI/CFI bit for egress packets if TCM marked the packets yellow.

Defaults

By default, no DEI/CFI bit marking or mapping is done.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
-> qos no dei egress
```

Release History

Release 7.2.1; command was introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port dei	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
policy action cir	Configures a Tri-Color Marking policy action.
show qos config	Displays global information about the QoS configuration.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDEIMapping  
  alaQoSConfigDEIMarking
```

qos dscp-table

Configures the internal priority and drop precedence for the specified Differentiated Services Code Point (DSCP) value. This value defines the six most significant bits of the DS byte in the IP header.

qos dscp-table *value*[-*value2*] **priority** *priority* **drop-precedence** {**low** | **medium** | **high**}

Syntax Definitions

<i>value</i> [- <i>value2</i>]	The DSCP value. The range is 0–63.
<i>priority</i>	The internal priority value to map to the DSCP value. The valid range is 0–7,
low	Sets the drop precedence to low for the DSCP value.
medium	Sets the drop precedence to medium for the DSCP value.
high	Sets the drop precedence to high for the DSCP value.

Defaults

By default, the drop precedence value is set to low precedence.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The priority and drop precedence settings configured with this command are global settings that are applied to all trusted ports.
- The values set in the DSCP table do not apply to untrusted ports.

Examples

```
-> qos dscp-table 63 priority 1 drop-precedence medium
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show qos dscp-table](#) Configures the priority and drop-precedence to be associated with the configured DSCP table.

MIB Objects

```
alaQoSdSCPEntryNumber  
alaQoSdSCPPriority  
alaQoSdSCPDropPrecedence
```

debug qos

Configures the type of QoS events that will be displayed in the QoS log.

```
debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

```
debug no qos
```

```
debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

Syntax Definitions

info	Logs basic information about the switch.
config	Logs information about the global configuration.
rule	Logs events for rules configured on the switch.
main	Logs information about basic program interfaces.
port	Logs events related to QoS ports.
msg	Logs QoS messages.
sl	Logs information about source learning.
mem	Logs information about memory.
mapper	Logs information about mapping queues.
slot	Logs events related to slots.
l2	Logs Layer 2 QoS events on the switch.
l3	Logs Layer 3 QoS events on the switch.
classifier	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
nat	Logs events for Network Address Translation policies.
sem	Logs information about semaphore, process locking.
pm	Logs events related to the Policy Manager.
ingress	Logs information about packets arriving on the switch.
egress	Logs information about packets leaving the switch.

Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.

- Use this command to troubleshoot QoS events on the switch.

Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos forward log	Enables the switch to send events to the PolicyView application in real time.
qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigDebug
```

debug qos internal

Displays debugging information for QoS internal to the switch.

debug qos internal [*slice slot/slice*] [**flow**] [**queue**] [**port**] [**l2tree**] [**l3tree**] [**vector**] [**pending**] [**verbose**] [**mapper**] [**pool**] [**log**] [**pingonly** | **nopingonly**]

Syntax Definitions

<i>slot/slice</i>	The slot number and slice to view debugging information. A <i>slice</i> is a logical section of hardware that corresponds to particular ports on a network interface module.
flow	Displays information about QoS flows.
queue	Displays information about QoS queues.
port	Displays information about QoS ports.
l2tree	Displays information about Layer 2 flows.
l3tree	Displays information about Layer 3 flows.
vector	Displays information about vectors.
pending	Displays information about pending QoS objects.
verbose	Sets the output to verbose mode for more detailed information.
mapper	Displays information about QoS mapping flows to queues.
pool	Displays information about the buffer pool.
log	Displays information about QoS information that is logged.
pingonly	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
nopingonly	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

Defaults

Debugging is disabled by default.

parameter	default
pingonly nopingonly	nopingonly

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **debug qos** command to set the level of log detail in the QoS log.

Examples

```
-> debug qos internal "verbose log"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[debug qos](#)

Configures the type of QoS events that will be displayed in the QoS log.

MIB Objects

N/A

clear qos log

Clears messages in the current QoS log.

```
clear qos log
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

Examples

```
-> clear qos log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
debug qos	Configures the type of QoS events that will be displayed in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigClearLog
```

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

qos apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

Examples

```
-> qos apply
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos revert	Removes any policies configured through policy rule but not applied to the current configuration through the qos apply command.
qos reset	Resets the QoS configuration to its default values.
qos flush	Deletes all pending policy information.

MIB Objects

alaQoSConfigTable
alaQoSConfigApply

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos revert

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

Examples

```
-> qos revert
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
qos apply	Applies all QoS settings configured on the switch to the current configuration.
qos reset	Resets the QoS configuration to its defaults.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigRevert
```

qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

qos flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration*.

Note. Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

base commands

policy rule	policy mac group
policy network group	policy port group
policy service	policy condition
policy service group	policy action

Examples

```
-> qos flush
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

policy server flush

Removes all cached LDAP policy data from the switch.

MIB Objects

alaQoSConfigTable

 alaQoSConfigFlush

qos reset

Resets the QoS configuration to its defaults.

```
qos reset
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

Examples

```
-> qos reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply

Applies all QoS settings configured on the switch to the current configuration.

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

MIB Objects

alaQoSConfigTable

alaQoSConfigReset

qos stats reset

Resets QoS statistic counters to zero.

qos stats reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

Examples

```
-> qos stats reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsReset
```

qos port reset

Resets all QoS port configuration to the default values.

```
qos port chassis/slot/port[-port2] reset
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The QoS port configuration parameters that are reset include:

parameter	default
default queues	8
trusted	not trusted

Examples

```
-> qos port 3/1 reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos port](#) Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortReset
```

qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos port chassis/slot/port[-port2]  
  [trusted]  
  [maximum egress-bandwidth bps]  
  [maximum ingress-bandwidth bps]  
  [maximum depth bps]  
  [default 802.1p value]  
  [default dscp value]  
  [default classification {802.1p | tos | dscp}]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

Examples

```
-> qos port 3/1 trusted  
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port trusted	Configures whether the default mode for QoS ports is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
  alaQoSPortSlot
  alaQoSPortPort
  alaQoSPortTrusted
  alaQoSPortMaximumBandwidth
  alaQoSPortMaximumBandwidthStatus
  alaQoSPortMaximumIngBandwidth
  alaQoSPortMaximumIngBandwidthStatus
  alaQoSPortMaximumDefaultDepth
  alaQoSPortMaximumDefaultDepthStatus
  alaQoSPortDefault8021p
  alaQoSPortDefaultDSCPalaQoSPortDefaultClassification
```

qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

qos port chassis/slot/port[-port2] trusted

qos port chassis/slot/port no trusted

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the [qos trust-ports](#) command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the [qos port default 802.1p](#) or [qos port default dscp](#) commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos apply**

Applies configured QoS and policy settings to the current configuration.

qos port

Configures a physical port for QoS.

qos trust-ports

Configures the global trust mode for QoS ports.

show qos port

Displays information about QoS ports.

MIB Objects

alaQoSPortTable

 alaQoSPortTrusted

qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

qos port *chassis/slot/port[-port2]* **maximum egress-bandwidth** *bps*[k | m | g | t]

qos port *chassis/slot/port[-port2]* **no maximum egress-bandwidth**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps</i> [k m g t]	The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k m g t	k

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000
-> qos port 4/1-8 maximum egress-bandwidth 10m
-> qos port 3/1 no maximum egress-bandwidth
-> qos port 4/1-8 no maximum egress-bandwidth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port maximum ingress-bandwidth	Configures the rate at which traffic is received on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
  alaQoSPortSlot
  alaQoSPortPort
  alaQoSPortMaximumBandwidth
  alaQoSPortMaximumBandwidthStatus
```

qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

qos port *chassis/slot/port[-port2]* **maximum ingress-bandwidth** *bps[k | m | g | t]*

qos port *chassis/slot/port[-port2]* **no maximum ingress-bandwidth**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps[k m g t]</i>	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k m g t	k

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000
-> qos port 4/1-8 maximum ingress-bandwidth 10m
-> qos port 3/1 no maximum ingress-bandwidth
-> qos port 4/1-8 no maximum ingress-bandwidth
```

Release History

Release 7.1.1; command introduced.

Related Commands

qos port maximum egress-bandwidth	Configures the rate at which traffic is sent on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumIngBandwidth  
  alaQoSPortMaximumIngBandwidthStatus
```

qos port maximum depth

Configures the maximum bucket size used for traffic metering. The bucket size determines how much the traffic can burst over the maximum bandwidth rate.

qos port *chassis/slot/port[-port2]* **maximum depth** *bps[k | m | g | t]*

qos port *chassis/slot/port[-port2]* **no maximum depth**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps[k m g t]</i>	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g).

Defaults

parameter	default
<i>k m g t</i>	k

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- Modifying the maximum depth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum depth 100
-> qos port 4/1-8 maximum depth 10m
-> qos port 3/1 no maximum depth
-> qos port 4/1-8 no maximum depth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumDefaultDepth
```

qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port[-port2]* **default 802.1p** *value*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>value</i>	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

Examples

```
-> qos port 3/1 default 802.1p 5
-> qos port 4/1-8 default 802.1p 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos apply**

Applies configured QoS and policy settings to the current configuration.

qos port

Configures a physical port for QoS.

show qos port

Displays information about QoS ports.

MIB Objects

alaQoSPortTable

alaQoSPortDefault8021p

qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

```
qos port chassis/slot/port[-port2] default dscp value
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>value</i>	The ToS/DSCP value. The range is 0–63.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the [qos port default 802.1p](#) command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the [qos port default dscp](#) command.

Examples

```
-> qos port 3/1 default dscp 63  
-> qos port 4/1-8 default dscp 33
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

alaQoSPortTable
alaQoSPortDefaultDSCP

qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

qos port *chassis/slot/port[-port2]* default classification {tos | 802.1p | dscp}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
tos	Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port.
802.1p	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
dscp	Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port.

Defaults

parameter	default
tos 802.1p dscp	dscp

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

Examples

```
-> qos port 8/24 default classification dscp
-> qos port 4/1-8 default classification dscp
-> qos port 7/1 default classification 802.1p
-> qos port 5/1-8 default classification 802.1p
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

alaQoSPortTable
alaQoSPortDefaultClassification

qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

```
qos port chassis/slot/port dei {ingress | egress}
```

```
qos port chassis/slot/port no dei {ingress | egress}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5).
ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress packets.
egress	Sets the DEI/CFI bit for egress packets if TCM marked the packets yellow.

Defaults

By default, no DEI/CFI bit mapping or marking is done.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

Release History

Release 7.2.1; command was introduced.

Related Commands

  alaQoSPortDEIMapping  
  alaQoSPortDEIMarking
```

qos qsi qsp

Configures the QSet profile (QSP) association for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port, link aggregate, and virtual fabric link (VFL).

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] | vf-link vfl_id} qsp {qsp_id | qsp_name}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
<i>vfl_id</i>	The VFL link ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i>
<i>qsp_id</i>	An existing QSet profile (QSP) ID number to assign to this instance. The valid range is 1–4.
<i>qsp_name</i>	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to assign to this instance.

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- There is only one QSI for each port, link aggregate, and VFL and only one QSP associated with each QSI.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.
- The QSP assignment is not configurable on the OmniSwitch 9900. Only the QSP 1 profile is applied by default to switch ports and link aggregates on an OmniSwitch 9900.
- On an OmniSwitch 6860 or OmniSwitch 6865, changing the QSP assignment for one VFL instance automatically changes the QSP assignment for all other VFL instances to the same QSP. For example, if QSP 2 is assigned to VFL 1/0, then the QSP assignment for VFL 2/0 is also changed to QSP 2. It is not necessary to configure the QSP assignment separately for each VFL on the switch.

Examples

```
-> qos qsi port 1/2 qsp 2
-> qos qsi port 2/1-10 qsp 3
-> qos qsi slot 3 qsp 4
-> qos qsi linkagg 10 qsp 2
```

The following command examples show that when the QSP assignment for VFL 1 is changed to QSP 2, the QSP for VFL 2 is automatically changed as well:

```
-> qos qsi vf-link 1/0 qsp 2
WARNING: configuration change applied to all VFLs in the system
```

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-1/0	2	qsp-2	NDCB	vfl-1/0

```
-> show qos qsi vf-link 2/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-2/0	2	qsp-2	NDCB	vfl-2/0

Release History

Release 7.2.1.R02; command introduced.

Release 8.3.1; **vf-link** parameter added.

Related Commands

qos qsi wred	Configures the WRED administrative status for a QSet instance.
qos qsi stats	Configures statistics collection for the QSet instance.
show qos qsi	Displays the QSet instance configuration.
show qos qsp	Displays the QSet profile attributes.

MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
  alaVfcQsetId
  alaVfcQsetQSPId
  alaVfcQsetQSPName
```

qos qsp system-default

Changes the default QSet profile (QSP) that is assigned to each port, link aggregate ID, and virtual fabric link (VFL).

```
qos qsp system-default {qsp_id | qsp_name}
```

Syntax Definitions

<i>qsp_id</i>	An existing QSet profile (QSP) ID number to use as the default QSP. The valid range is 1–4.
<i>qsp_name</i>	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to use as the default QSP.

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- When this command is used, the specified QSP is assigned to all ports, link aggregates, and VFLs on the switch.
- Changing the system default profile is only allowed when the switch is running in the non-Data Center Bridging (NDCB) mode. This mode is active by default when there is no OmniSwitch Data Center software license installed on the switch.
- A QSP assigned through the **qos qsi qsp** command overrides the system default QSP assignment. For example, if the system default QSP is set to 1 and the **qos qsi qsp** command is used to change the QSP to 2 on port 1/1/20, the QSP 2 settings are applied to port 1/1/20.

Examples

```
-> qos qsp system-default 2  
-> qos qsp system-default qsp-4
```

Release History

Release 8.3.1; command introduced.

Related Commands

- qos qsi qsp** Configures the QSet profile association for the QSet instance.
- show qos qsp system-default** Displays the name and ID of the default QSP for the switch.

MIB Objects

```
alcatelIND1VfcMIB  
  alaVfcSystemDefaultQsetQSPName  
  alaVfcSystemDefaultQsetQSPID
```

qos qsi wred

Configures the WRED profile (WRP) administrative status for the QSet profile associated with the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred admin-state {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the WRED profile for the instance.
disable	Disables the WRED profile for the instance.

Defaults

By default, WRED is disabled for the QSet instance.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- There is only one QSI per port or LAG ID and only one profile (WRP 1) associated with the QSI.
- Changing the WRED profile status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.
- WRP 1 is the only profile supported. Configuring additional profiles is not supported at this time.
- When enabled, WRP 1 applies the following color threshold values only to TCP traffic. The threshold values indicated are a percentage of the maximum average queue length.

Color	Min Threshold	Max Threshold	Drop Probability	Gain
Red	10	50	36	9
Yellow	50	90	30	9
Green	90	100	24	9

Examples

```
-> qos qsi port 1/2 wred admin-state enable
-> qos qsi port 2/1-10 wred admin-state disable
-> qos qsi slot 3 wred admin-state enable
```

```
-> qos qsi linkagg 10 wred admin-state enable
```

Release History

Release 7.2.1.R02; command introduced.

Related Commands

qos qsi qsp	Configures the QSet profile association for the QSet instance.

  alaVfcQsetStatsInterval
```

qos qsi stats

Configures the administrative status and interval for statistics collection for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats {admin-state {enable | disable} | interval interval_time}}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
enable	Enables statistics collection for the instance.
disable	Disables statistics collection for the instance.
<i>interval_time</i>	The time interval for statistics gathering. The valid range is 10–300 seconds.

Defaults

By default, statistics collection is disabled and the time interval is set to 10 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSet profile (QSP) or DCB profile (DCP) associated with the QSI.
- Changing the statistics collection status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.

Examples

```
-> qos qsi port 1/2 stats admin-state enable
-> qos qsi port 1/2 stats interval 30
-> qos qsi port 2/1-10 stats admin-state enable
-> qos qsi linkagg 10 stats admin-state enable interval 120
```

Release History

Release 7.2.1.R02; command introduced.

Related Commands

  alaVfcQsetStatsInterval
```

show qos port

Displays information about all QoS ports or a particular port.

show qos port [*chassis/slot/port*] [**statistics**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1).
statistics	Displays statistics for high-density gigabit modules.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

character	definition
+	Indicates that the port is manually configured as trusted through the qos port trusted command; the port setting takes precedence over the global trust setting configured through the qos trust-ports command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the qos trust-ports command. (Applies to mobile ports and ports configured for 802.1Q.)

Examples

```
-> show qos port
```

Slot/ Port	Active	Trust	Default P/DSCP	Default Classification	Bandwidth Physical	Ingress	Egress	DEI Map/Mark	Type
1/1	No	No	0/ 0	DSCP	0K	-	-	No / No	ethernet

```

output definitions

Slot/Port	The slot and physical port number.
Active	Whether or not the port is sending/receiving QoS traffic.
Trust	Whether the port is trusted or not trusted. Configured through the qos port trusted command.
Default P	The default 802.1p setting for the port. Configured through the qos port default 802.1p command.
Default DSCP	The default ToS/DSCP setting for the port. Configured through the qos port default dscp command.
Default Classification	The default classification setting for the port (802.1p , ToS , or DSCP). Configured through the qos port default classification command.
Physical Bandwidth	The amount of physical bandwidth available on the port.
Ingress Bandwidth	The amount of ingress bandwidth configured for the port. Configured through the qos port maximum ingress-bandwidth command.
Egress Bandwidth	The amount of egress bandwidth configured for the port. Configured through the qos port maximum egress-bandwidth command.
DEI Map/Mark	The Drop Eligible Indicator (DEI) bit mapping and marking setting for the port. Configured through the qos port dei command.
Type	The interface type, ethernet or wan .

Release History

Release 7.1.1; command was introduced.

```

show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

show qos slice [*slot/slice*]

Syntax Definitions

slot/slice The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.
- On the OmniSwitch 9900, use the [show tcam utilization](#) command instead of the **show qos slice** command.

Examples

-> show qos slice

Slot/ Unit	Ranges Type Total/Free	Rules CAM Total/Free	Counters Total/Free	Meters Total/Free

		2 256/256	256/256	256/256
		3 256/256	256/256	256/256

output definitions

Slot/Unit	The slot and slice number.
Type	The type of slice.
Ranges Total	The total number of TCP/UDP port ranges supported per slot/slice.
Ranges Free	The number of TCP/UDP port ranges that are still available for use.
CAM	The CAM number.
Rules Total	The total number of rules supported per CAM.
Rules Free	The number of rules that are still available for use. On startup, the switch uses 27 rules.
Counters Total	The total number of counters supported per CAM.
Counter Free	The number of counters that are still available for use.
Meters Total	The total number of meters supported per CAM.
Meters Free	The number of meters that are still available for use.

Release History

Release 7.1.1; command was introduced.

Related Commands**[policy rule](#)**

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

Match rule 2 to 2
Match rule 2 to 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[clear qos log](#)

Clears messages in the current QoS log.

[qos log lines](#)

Configures the number of lines in the QoS log.

MIB Objects

N/A

show qos config

Displays global information about the QoS configuration.

show qos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

Examples

```
-> show qos config
QoS Configuration,
  Admin                = enable,
  Trust ports          = no,
  Phones               = trusted,
  Log lines            = 10240,
  Log level            = 5,
  Log console          = no,
  Forward log          = no,
  Stats interval       = 5,
  User-port filter     = spoof,
  User-port shutdown   = none,
  Debug                = info,
  Pending changes     = port
```

output definitions

Admin	Whether or not QoS is enabled or disabled. Configured through the qos command.
Trust Ports	The default trusted mode for switch ports. Configured through the qos trust-ports command.
Phones	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the qos phones command.
Log lines	The number of lines included in the QoS log. Configured through the qos log lines command.
Log level	The level of log detail. Configured through the qos log level command.

output definitions (continued)

Log console	Whether or not log messages are sent to the console. Configured through the qos log console command.
Forward log	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the qos forward log command.
Stats interval	How often the switch polls network interfaces for statistics about QoS events. Configured through the qos stats interval command.
User-port filter	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the qos user-port command.
User-port shutdown	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the qos user-port command.
Debug	The type of information that will be displayed in the QoS log. A value of info indicates the default debugging type.
Pending changes	QoS changes not yet applied to the configuration.

Release History

Release 7.1.1; command was introduced.

Related Commands

qos	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.

output definitions

Events	The number of Layer 2 or Layer 3 flows transmitted on the switch.
Matches	The number of Layer 2 or Layer 3 flows that match policies.
Drops	The number of Layer 2 or Layer 3 flows that were dropped.
L2	The number of Layer 2 events, matches, and drops.
L3 Ingress	The number of Layer 3 ingress events, matches, and drops.
L3 Egress	The number of Layer 3 egress events, matches, and drops.
IGMP join	The number of multicast events, matches, and drops.
Fragments	The number of fragments dropped.
Bad Fragments	The number of fragments received with an offset of 1.
Unknown Fragments	The number of out-of-order fragments received.
Sent NI messages	The number of messages sent to network interfaces.
Received NI messages	The number of messages received by network interfaces.
Failed NI messages	The number of failed message attempts to network interfaces.
Load balanced flows	The number of Server Load Balance flow entries.
Reflexive flows	The number of reflexive flows.
Reflexive correction	The number of reflexive flow corrections.
Flow lookups	The number of flow table lookups.
Flow hits	The number of flow table lookup hits.
Max PTree nodes	The highest number of nodes in the classifier tree.
Max Ptree depth	The length of the longest path in the classifier tree.
Spoofed Events	The number of spoofed events.
Nonspoofed Events	The number of non-spoofed events.
DropServices	The number of TCP/UDP flows dropped.

Release History

Release 7.1.1; command was introduced.

show qos dscp-table

Displays the QoS DSCP table. This table contains the internal priority mapping and drop precedence value for each of the DSCP values.

show qos dscp-table

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The DSCP table mapping is a global configuration that applies to all trusted ports; does not apply to untrusted ports.

Examples

```
-> show qos dscp-table
DSCP-Table   Priority      Drop-Precedence
-----+-----+-----
0             0             low
1             0             low
2             0             low
3             0             low
4             0             low
5             0             low
6             0             low
7             0             low
8             1             low
9             1             low
10            1             low
```

output definitions

DSCP-Table	The DSCP number.
Priority	The priority number mapped to the DSCP value.
Drop-Precedence	The drop precedence value mapped to the DSCP value.

Release History

Release 8.1.1; command was introduced.

Related Commands**qos dscp-table**

Configures the priority and drop-precedence value associated with the DSCP number.

show qos qsi summary

Displays a list of switch ports showing the QoS or DCB profile assigned to each port.

show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} summary

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the summary of the user ports in the switch.

Examples

```
-> show qos qsi port 1/1-5 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
1/1	8	dcp-8	DCB	1/1
1/2	8	dcp-8	DCB	1/2
1/3	8	dcp-8	DCB	1/3
1/4	1	dcp-1	DCB	1/4
1/5	1	dcp-1	DCB	1/5

output definitions

Port	Configured DCB ports.
Profile #	Identifies the DCB profile assigned to the port.
Profile Name	Name of the DCB profile assigned to the port.
Mode	Indicates if the port is DCB or NDCB.
Parent	Lists the parent of the port.

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsi dcb dcbx

Displays the configured ports in the system and the related DCBX information.

qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

```
show qos qsp [qsp_id | qsp_name] [detail [port chassis/slot/port[-port2]] | linkagg agg_id[-agg_id2]]]
```

Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	A QSP profile name.
detail	Displays QSP configuration details for a specific profile, port, slot, or link aggregate.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *qsp_id* or the *qsp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates.
- Use the **port** *slot/port* and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.
- The QSP assignment is not configurable on the OmniSwitch 9900. Only the QSP 1 profile is applied by default to switch ports and link aggregates on an OmniSwitch 9900.
- Configuring a QSP assignment for a virtual fabric link (VFL) is supported only on the OmniSwitch 6860 and OmniSwitch 6865.

Examples

```

output definitions

QSP	The QSet profile (QSP) ID number and name.
#Ports	The number of ports to which this profile is attached.
#Queues	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
BW%	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.
WRP	The WRED profile (WRP) ID number associated with the QSet.
Name	The WRP name.
Scheduler	The type of scheduler, such as queue specific priority (Qspec) or strict priority.

output definitions (continued)

Type	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.
QP 1...8	The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4.

QSAP Port	QSAP Type	dQSI	ID	Name	QSAP Parent	BW (%) Admin	BW (%) Oper	T
1/1/12	Phy	Port 1/1/12	1	qsp-1	Port 1/1/12	100	100	S

output definitions

QSAP Port	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
QSAP Type	The type of QSAP port; Phy = physical (slot/port), Log = logical (linkagg ID or VFL ID).
dQSI	The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port, link aggregate, and VFL.
ID	The QSet profile (QSP) ID number.
Name	The QSP name.
QSAP Parent	The QSAP parent ID number. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or a VFL.
BW (%) Admin	The administrative bandwidth percentage for the QSet. The administrative percentage is not configurable at this time.
BW (%) Oper	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
Type	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.

Release History

Release 7.2.1; command was introduced.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.

show qos wrp

Displays the Weighted Random Early Detection (WRED) profile (WRP) configuration for the switch.

```
show qos wrp [wrp_id | wrp_name] [detail [port chassis/slot/port[-port2]] | slot slot | linkagg agg_id[-agg_id2]]
```

Syntax Definitions

<i>wrp_id</i>	A WRED profile (WRP) ID number. The valid range is 1.
<i>wrp_name</i>	A WRED profile name.
detail	Displays WRED profile configuration details for a port, slot, or link aggregate.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all non-DCB ports on the slot.
<i>agg_id[-agg_id2]</i>	The link aggregate ID for a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the *wrp_id* or the *wrp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

Examples

```
-> show qos wrp
WRP 1 (wrp-1)
  #Ports: 480, MTU: 1540
  Red
    Min-Th: 10, Max-Th: 50, Max-Pb: 36, Gain: 9
  Yellow
    Min-Th: 50, Max-Th: 90, Max-Pb: 30, Gain: 9
  Green
```

Min-Th: 90, Max-Th: 100, Max-Pb: 24, Gain: 9

output definitions

WRP	The WRED profile (WRP) ID number and name.
#Ports	The number of ports to which this profile is attached.
MTU	The MTU size.
Min-Th	The minimum queue threshold percentage for red, green, and yellow packets.
Max-Th	The maximum queue threshold percentage for red, green, and yellow packets.
Max-Pb	The maximum drop probability percentage for red, green, and yellow packets.
Gain	The gain value to smooth out the queue (1–15).

```

output definitions

Port	The physical slot and port number (or link aggregate ID for a logical port).
QSAP	The QSet attachment point (QSAP). This is a logical entity used internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
Parent	The QSAP ID for the parent QSAP, if any.
WRP Name Admin	The WRED profile (WRP) ID number, name, and administrative status.
QSI	The switch port associated with the QSet instance (QSI).
QSP Name Admin	The QSet profile (QSP) ID number, name, and administrative status.
QI 1...8	The WRP information for each of the QSet queues.

Release History

Release 7.2.1; command was introduced.

Related Commands

qos qsi wred	Configures the administrative status of the WRED profile.
qos qsi qsp	Changes the QSet profile association for a QSet instance.

show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight virtual output queues (OmniSwitch 10K) or eight egress queues (other OmniSwitch platforms) associated with each port, link aggregate (LAG) ID, and virtual fabric link (VFL).

show qos qsi [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*] | **vf-link** *vfl_id*] [**detail** | **summary**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>vfl_id</i>	The VFL ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i>
detail	Displays additional queue information for the instance.
summary	Displays summary information for the instance.

Defaults

By default, displays the entire QSI configuration for the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **port** *slot/port*, **slot** *slot*, **linkagg** *agg_id*, and **vf-link** *vfl_id* parameters to display the QSI information associated with specific ports, link aggregates, or VFLs. These parameters can also be combined with the **detail** or **summary** parameters.

```

output definitions

QSAP	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
Parent	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.
QSI	The QSet instance (QSI) ID number, internally generated by the switch.
QSP, Name	The QSet profile (QSP) ID number and name associated with the QSI.
WRP, Name, Admin, Oper	The WRED profile (WRP) ID number and name associated with the QSI. Also indicates the administrative and operational status of the WRP for the QSI. Only default WRP 1 is supported on the OS6900, and WRED is not supported on the OS10K.
Stats, Admin, Oper, Interval	The QSI administrative status, operational status, and time interval for statistics collection.
BW Admin (%)	The administrative percentage of bandwidth (currently not user-configurable).
BW Oper (%)	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
QI 1–8	The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the QSet profiles (QSP 1–4) is associated with the QSI.

```
-> show qos qsi port 1/1/20 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
1/1/20	1	qsp-1	NDCB	1/1/20

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-1/0	2	qsp-2	NDCB	vfl-1/0

output definitions

Port	The physical slot and port number (or link aggregate ID or VFL ID for a logical port).
Profile #, Name	The QSet profile (QSP) ID number and name associated with the QSI.
Mode	The QSI operating mode (NDCB or DCB). This mode determines whether Data Center Bridging (DCB) profiles or QSet profiles (non-DCB) are applied to the QSI instance. DCB and QSet profiles are mutually exclusive in that if the OmniSwitch Data Center software license is installed, only DCB profiles are applied.
Parent	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.

Release History

Release 7.1.1; command was introduced.

Release 7.2.1; output display modified for the OmniSwitch 6900.

Release 7.2.1.R02; output display modified for the OmniSwitch 10K and OmniSwitch 6900.

Release 8.3.1; **vf-link** and **summary** parameters added.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.

show qos qsi stats

Displays statistics for the QSet instance (QSI) queues that are associated with non-DCB (NDCB) ports.

```
show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats [bytes | rate [bytes]]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
bytes	Displays the total number of bytes (instead of packets) that flow through the QSI queues.
rate	Displays the number of packets-per-second that flow through the QSI queues.

Defaults

parameter	default
bytes rate	bytes

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The specified port or link aggregate must have statistics collection enabled.
- Use the **port** *slot/port* or **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- It is possible to combine the **bytes** parameter with the **rate** parameter to display the number of bytes-per-second that flow through the QSI queues. For example, **show qos qsi port 1/20 stats rate bytes**.
- Statistics are displayed on a per-queue basis for each port. There are eight queues associated with a single QSet instance. Each queue is identified with a queue ID (1–8). Each port and link aggregate is associated with one QSet instance.

Examples

```
-> show qos qsi port 1/20 stats
```

Port	Q	Total	
		Tx	Drop
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	9984	0

```
-> show qos qsi port 1/20 stats bytes
```

Port	Q	Total	
		Tx	Drop
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	987424	0

```
-> show qos qsi port 1/20 stats rate
```

Port	Q	Average	
		Tx/s	Drop/s
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	7	0

```
-> show qos qsi port 1/20 stats rate bytes
```

Port	Q	Average	
		Tx/s	Drop/s
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	694	0

output definitions

Port	The slot and port number.
Q	The QSet queue ID number (1–8) associated with the QoS (non-DCB) port.
Total Tx	Total packets or bytes transmitted.
Total Drop	Total packets or bytes dropped.

Release History

Release 7.3.1; command was introduced.

Related Commands

qos qsi stats	Enables or disables statistics collection for a DCB or non-DCB port.
clear qos qsi stats	Clears statistics collected for one or more QSet instances.

MIB Objects

show qos qsi wred-stats

Displays the Weighted Random Early Detection (WRED) statistics for the QSet instance.

```
show qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred-stats [rate | bytes]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).
rate	Displays the number of packets per second.
bytes	Displays the total number of bytes.

Defaults

By default, displays the total number of packets for all the QSI queues.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- This command displays the total number of packets or bytes.

Examples

```
-> show qos qsi port 1/2 wred-stats
* OS6900 WRED Per Q stats not supported, Tx stats not supported
Port          Green          Yellow          Red
             Q Drop          Drop          Drop
-----+-----+-----+-----+
Port 1/2     - 0              0              0

-> show qos qsi port 1/1 wred-stats rate
* OS6900 WRED Per Q stats not supported, Tx stats not supported
Port          Green          Yellow          Red
             Q Drop/s          Drop/s          Drop/s
-----+-----+-----+-----+
1/1          - 0              0              0
```

```
-> show qos qsi port 1/1 wred-stats bytes
* OS6900 WRED Per Q stats not supported, Tx stats not supported
          Green          Yellow          Red
Port      Q Drop          Drop          Drop
-----+-----+-----+-----
1/1      - 0              0              0
```

output definitions

Port	The switch port.
Q	The egress queue ID (1–8) associated with the port.
Green TX, Green Drop	The number of green packets or bytes transmitted and dropped.
Yellow TX, Yellow Drop	The number of yellow packets or bytes transmitted and dropped.
Red TX, Red Drop	The number of red packets or bytes transmitted and dropped.

Release History

Release 7.2.1.R01; WRED per Q stats not supported; Tx stats not supported.

Related Commands

qos qsi wred	Configures the administrative status of the WRED profile.
show qos wrp	Displays the WRED profile (WRP) configuration for the switch.
show qos qsi	Displays the QSet instance configuration.
clear qos qsi stats	Clears statistics collected for one or more QSet instances.

MIB Objects

```

show qos qsp system-default

Displays the name and ID of the QSet profile (QSP) that serves as the default system QSP. when the switch is running in the non-DCB (NDCB) mode.

show qos qsp system-default

Syntax Definitions

N/A

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- The switch is operating in the NDCB mode when the OmniSwitch Data Center software license is *not* installed on the switch.
- The switch is operating in the Data Center Bridging (DCB) mode when the OmniSwitch Data Center software license is installed on the switch. Configuring the system default profile is not supported in the DCB mode.

Examples

```
-> show qos qsp system-default
NDCB Default QSP profile      : 1   (qsp-1)
```

Release History

Release 8.3.1; command introduced.

Related Commands

[qos qsp system-default](#) Configures the default QSet profile for the switch.

```

clear qos qsi stats

Clears QSet instance (QSI) statistics.

```
clear qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1\5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** *slot/port* and **linkagg** *agg_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- QSI statistics can only be cleared on ports or link aggregates that have statistics collection enabled.

Examples

```
-> clear qos qsi port 1/1/2 stats
-> clear qos qsi port 1/1/10-15 stats
-> clear qos qsi linkagg 5 stats
-> clear qos qsi linkagg 10-15 stats
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos qsi stats](#) Displays QSet instance statistics.

```

qos qsp dcb import

Imports a Data Center Bridging profile (DCB) to a new or previous custom profile.

```
qos qsp dcb {dcp_id | dcp_name} import qos dcb {import_dcp_id | import_dcp_name} [802.3x-pause]
no qos qsp dcb {dcp_id | dcp_name}
```

Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB profile name.
<i>import_dcp_id</i>	The ID of the DCB profile to import. The valid profile ID range is 1–11 to specify a predefined profile and 12–128 to specify a custom profile.
<i>import_dcp_name</i>	The name of the DCB profile to import.
802.3x-pause	Makes the profile pause-ready. When enabled, the Priority based Flow Control (PFC) is lossy for all traffic classes in the profile and they cannot be changed to lossless.

Defaults

By default the **802.3x-pause** flag is disabled.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- The new DCB profile must be unique and not contain the same name and ID of an existing DCB profile.
- On an OmniSwitch 6900-Q32, only import DCB profile 8 to create a custom profile. Do not use any of the other pre-defined profiles to create a custom profile.
- Use the **no** form of the command to remove an existing custom DCB profile from the switch configuration.
- The pre-defined DCB profiles from 1 to 11 cannot be removed from the switch configuration.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.
- Use the **802.3x-pause** tag to enable pause-ready on the profile. When enabled, the PFC is lossy for all traffic classes in the profile and they cannot be changed to lossless. This type of custom profile is created to support legacy PAUSE frames on ports to which the profile is applied. However, before applying the custom profile to a port, disable PFC TLV and PFC willing on the port.

Examples

```
-> qos qsp dcb 33 import qos dcb 8
-> qos qsp dcb lossyETS import qos 10
```

```
-> qos qsp dcb 34 import qsp dcb 7 802.3x-pause  
-> no qsp dcb 33
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

qos qsp dcb tc

Modifies the Data Center Bridging (DCB) traffic class attributes of a DCB profile.

```
qos qsp dcb {dcp_id | dcp_name} tc tc_num {pfc flow-type { ll | nll} | pfc link-delay allowance | min-bw % | max-bw % | recommended bw %}
```

Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB custom profile name.
<i>tc_num</i>	The traffic class number in the DCB profile.
ll	Designates traffic class as lossless.
nll	Designates traffic class as non-lossless (lossy).
<i>allowance</i>	Link delay allowance value for PFC.
min-bw %	Sets the minimum bandwidth guaranteed for the Enhanced Transmission Selection (ETS) traffic class.
max-bw %	Sets the maximum bandwidth guaranteed for the Strict Priority (SP) traffic class.
recommended bw %	Sets the recommended minimum bandwidth for the traffic class.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- The **pfc flow-type** option is used to change a traffic class from lossless (ll) to lossy (nll) or from lossy (nll) to lossless (ll).
- The **pfc link-delay** option sets the actual headroom for the traffic class. An incorrect setting can result in traffic loss.
- The **min-bw** option sets the minimum bandwidth guaranteed for the ETS traffic class.
- The **max-bw** option sets the maximum bandwidth guaranteed for the SP traffic class.
- The **recommended bw** option sets the recommended minimum bandwidth for the traffic class.

Examples

```
-> qos qsp dcb 11 tc 0 min-bw 3
-> qos qsp dcb lossyETS tc 1 min-bw 12
-> qos qsp dcb lossyETS tc 2 pfc flow-type ll
-> qos qsp dcb 11 tc 0 recommended bw 3
```

Release History

Release 7.3.1; command was introduced.

Related Commands

  alaDcbxDCPTCMinimumBandwidth
  alaDcbxDCPTCMaximumBandwidth
  alaDcbxDCPTCRecommendedBandwidth
```

qos qsp dcb tc-numbering

Modifies the traffic class (TC) numbering for custom profiles.

```
qos qsp dcb {dcp_id | dcp_name} tc-numbering tc_num
```

Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB custom profile name.
<i>tc_num</i>	Enter the traffic class numbering sequence for the DCB profile.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- The command can be used to modify the traffic class numbering for the custom profiles.
- The numbering must be assigned in ascending order. For example, a profile with TCs numbered 0, 1, 2, can be changed to 1, 5, 7.
- The number of TCs specified must match the number of TCs in the profile.

Examples

```
-> qos qsp dcb 11 tc-numbering 1 5 7 9
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show qos qsp dcb](#) Displays the configured DCB profiles and the traffic classes associated to the DCB profile.

```

qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} qsp dcb {dcp_id | dcb_name}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>dcp_id</i>	DCB profile ID. DCB profile ID 11 through 128 refers to the custom profiles. DCB profile ID 1 through 10 refers to the predefined profiles.
<i>dcp_name</i>	DCB profile name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- When a DCB profile is assigned to a link aggregate, the profile is applied to all the ports associated with the linkagg.
- Avoid configuring different profiles for each port of the link aggregate.
- The command will not work if the link aggregate is associated with 1Gig port. Different combination of ports (10G and 40G) are allowed in a link aggregate.

Examples

```
-> qos qsi port 1/11 qsp dcb lossyETS  
-> qos qsi port 1/11 qsp dcb 7
```

Release History

Release 7.3.1; command was introduced.

Related Commands

`show qos qsp dcb`

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

MIB Objects

alaDcbxPortInstanceEntry

 alaDcbxPIAdminDCPId

 alaDcbxPIAdminDCPName

qos qsi dcb dcbx version

Selects the version of the DCB Exchange protocol (DCBX) to apply to the specified DCB port.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx version {ieee | cee | auto}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
ieee	Selects IEEE 802.1Qaz DCBX.
cee	Selects Converged Enhanced Ethernet DCBX 1.01.
auto	Automatically detects the DCBX version used by the peer switch.

Defaults

By default, the DCB port is configured to automatically use the DCBX version detected from the peer.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Initially, the IEEE version of DCBX is run on the port until the switch detects the peer is running the CEE version. At that point, the switch will stop IEEE DCBX and start to run the CEE version.

Examples

```
-> qos qsi port 1/10 dcb dcbx version ieee
-> qos qsi port 1/10 dcb dcbx version cee
-> qos qsi port 1/11 dcb dcbx version auto
```

Release History

Release 7.3.3; command was introduced.

  alaDcbxPIDCBXVersion
```

qos qsi dcb dcbx admin-state

Enables or disables DCB exchange protocol (DCBX) functionality on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx admin-state {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
enable	Enables the DCBX functionality on the port.
disable	Disables the DCBX functionality on the port.

Defaults

parameter	default
dcbx admin-state	enable

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The DCBX admin-state, enables or disables DCBX TLVs and negotiation on a port.

Examples

```
-> qos qsi port 1/10 dcb dcbx admin-state enable
-> qos qsi port 1/10 dcb dcbx admin-state disable
```

Release History

Release 7.3.1; command was introduced.

```

qos qsi dcb dcbx ets

Enables or disables config-TLV, recommended-TLV, and the willing bit for ETS on a per-port basis.

qos qsi {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **dcb dcbx ets** [config-tlv {enable | disable} | recommend-tlv {enable | disable} | willing {yes | no}]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
config-tlv enable	Enables the transmission of ETS configuration TLVs.
config-tlv disable	Disables the transmission of ETS configuration TLVs.
recommend-tlv enable	Enables the transmission of ETS recommended TLVs.
recommend-tlv disable	Disables the transmission of ETS recommended TLVs.
yes	Sets the willing bit to on in the TLVs.
no	Sets the willing bit to off in the TLVs.

Defaults

parameter	default
config-tlv {enable disable}	enable
ets recommend-tlv {enable disable}	enable
willing {yes no}	yes

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the option **ets config-tlv** to enable or disable the transmission of ETS configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets recommended-tlv** to enable or disable the transmission of ETS recommended TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to set the willing bit on the TLVs. This option is used when the DCBX is enabled on the port and the ETS configuration TLV is sent on the port.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx ets config-tlv disable
-> qos qsi port 1/11 dcb dcbx ets recommended-tlv disable
-> qos qsi linkagg 5 dcb dcbx ets willing no
```

Release History

Release 7.3.1; command was introduced.

Related Commands

qos qsi dcb dcbx version	Selects the version of DCBX to apply to the specified DCB port.
qos qsi dcb dcbx admin-state	Enables or disables DCBX functionality for the port.
qos qsi dcb dcbx pfc	Enables or disables config-TLV, defense mode, and willing bit for PFC on a per port basis.
show qos qsi dcb dcbx	Displays the configured ports in the system and the related DCBX information.
show qos qsi dcb ets	Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

qos qsi dcb dcbx pfc

Enables or disables config-TLV, defense mode, and willing for PFC on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx pfc [config-tlv {enable |
disable} | defense {enable | disable} | willing {yes | no}]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
config-tlv enable	Enables the transmission of PFC configuration TLVs.
config-tlv disable	Disables the transmission of PFC configuration TLVs.
defense enable	Enables the defense mode for the PFC.
defense disable	Disables the defense mode for the PFC.
willing yes	Allows the PFC to negotiate with the network.
willing no	Stops the PFC from negotiating with the network.

Defaults

parameter	default
pfc config-tlv	enable
pfc defense	enable
pfc willing	yes

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the option **pfc config-tlv** to enable or disable the transmission of PFC configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to allow the PFC to negotiate with the network.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx pfc config-tlv disable
-> qos qsi port 1/11 dcb dcbx pfc defense disable
-> qos qsi linkagg 5 dcb dcbx pfc willing no
```

show qos qsp dcb

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

```
show qos qsp dcb [dcp_id | dcp_name] [tc tc_num]
```

Syntax Definitions

<i>dcp_id</i>	DCB profile ID. DCB profile ID 11–128 refers to the custom profiles. DCB profile ID 1–0 refers to the predefined profiles.
<i>dcp_name</i>	DCB profile name.
<i>tc_num</i>	The traffic class associated to the DCB profile. The valid range is 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- This command displays the details of the configured DCB profile.
- Use the **tc** option to display the traffic classes associated to the DCB profile.

Examples

```
-> show qos qsp dcb
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;
begins with priority 0 on the left and displays the
traffic class it belongs to.

#	Name	Priority TC Map	PFC Cap	Max TC	ETS		802.3x Pause-Ready
					Template-DCP #	Name	
1	dcp-1	00001122	8	8	1	dcp-1	No
2	dcp-2	00112233	8	8	2	dcp-2	No
3	dcp-3	00112234	8	8	3	dcp-3	No

20	dcp-20	10234567	8	8	10	dcp-10	No

output definitions

#	Indicates a DCB profile entry.
Name	Name of the DCB profile.
Priority TC Map	Indicates the priority of the traffic class.
PFC Cap	Indicates the number of traffic classes on the local device that have simultaneously PFC enabled.
ETS Max TC	Indicates the number of traffic classes supported.
Template-DCP #	Identifies the template DCB profile.
Template-DCP Name	Name of the template DCB profile.
802.3x Pause-Ready	Indicates if pause-ready is enabled for the profile.

-> show qos qsp dcp tc

Legends: Linkdelay shown in KB.
* denotes user modified value

#	Name	TC	Priorities	ETS		ETS	ETS		PFC	PFC
				Min BW	Max BW		ETS	Reco BW

1	Dft_1	2	01	50	100	ETS	50	ETS	LL	60

output definitions

#	Indicates a DCB profile entry.
Name	Name of DCB profile.
TC	Indicates the traffic class.
Priorities	Indicates the priorities assigned to the traffic class.
ETS Min BW	Indicates the minimum bandwidth assigned to the traffic class.
ETS Max BW	Indicates the maximum bandwidth assigned to the traffic class.
ETS Sched	Indicates the traffic class scheduler assigned to the traffic class.
ETS Reco BW	Indicates the recommended minimum bandwidth assigned to the traffic class.
ETS Reco Sched	Indicates the recommended traffic class scheduler assigned to the traffic class.
PFC Mode	Indicates if PFC traffic flow is enabled on the traffic class.
PFC LinkDelay	Indicates the delay in the PFC link.

Release History

Release 7.3.1; command was introduced.

show qos qsi dcb dcbx

Displays the DCBX port configuration and status.

```
show qos qsi [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] dcb dcbx [status]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
status	Displays the DCBX operational status for the port.

Defaults

By default, the DCBX configuration is displayed for all ports.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *agg_id*, parameters to display information for a specific port or link aggregate.
- Use the **status** option to display the status information of the DCBX related to the port.

Examples

```
-> show qos qsi port 1/1-5 dcb dcbx
```

Port	DCP Name	DCBX Ver	DCBX Admin	Stats Admin	PFC Defense	ETS				
						PFC TLV	PFC Will	Cfg TLV	Reco TLV	ETS Will
1/1	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/2	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/3	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/4	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/5	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes

output definitions

Port	The DCB slot and port number or link aggregate ID.
DCP Name	The DCB profile ID assigned to the port.
DCBX Ver	The version of DCBX running on the port (CEE , IEEE , or AUTO).
DCBX Admin	Indicates the administrative status of DCBX on the port.
Stats Admin	Indicates if statistics collection is enabled or disabled on the port.

output definitions (continued)

PFC Defense	Indicates the status of PFC defense (Ena or Dis). Applies when PFC negotiation fails. If enabled then PFC becomes disabled but traffic still flows. If disabled then the PFC local configuration remains on the port.
PFC TLV	Indicates whether the IEEE 802.1 organizationally defined PFC TLV transmission is allowed on a given LLDP transmission capable port.
PFC Will	Indicates whether or not the port is willing to accept the PFC configuration from a remote peer.
Cfg TLV	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
Reco TLV	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
ETS Will	Indicates whether or not the port is willing to accept the recommended ETS configuration from a remote peer.

```

output definitions

Port	The DCB slot and port number or link aggregate ID.
DCBX Oper	Indicates the operational status of DCBX on the port.
Local Oper Changed	Identifies if the local configuration is different from the configuration imported from the DCB profile applied to the port.
Error	Indicates if there is an error condition.
Local Oper Ver	The version of DCBX running on the local port (CEE , IEEE , or AUTO).
Remote Oper Ver	The version of DCBX running on the remote port (CEE , IEEE , or AUTO).
Action	Indicates the action taken as a result of the status.

Release History

Release 7.3.1; command was introduced.

show qos qsi dcb ets

Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

show qos qsi {port *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]} **dcb ets** [*tc* [*tc_num*]]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i>]	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>tc_num</i>	Enter the traffic class for which the information needs to be displayed. The valid range is 0-7.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the *tc_num* option to display the DCBX ETS information for a specific traffic class.

Examples

```
-> show qos qsi port 1/1 dcb ets
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;
begins with priority 0 on the left and displays the
traffic class it belongs to.

show qos qsi dcbx pfc

Displays the configured ports in the system and the related DCBX PFC information.

show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb pfc

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

If there is no PFC TLV received from the remote end, then the remote information will be blank.

Examples

```
-> show qos qsi port 4/1-2 dcb pfc
```

Legends: * indicates port oper status is different than the configured status

Port	Priorities	Loc-Adm			Loc-Oper			Rem-Oper				
		MBC	Will	Cap	Priorities	MBC	Will	Cap	Priorities	MBC	Will	Cap

4/2*	23	No	No	3	-	No	No	3	-	Yes	No	3

output definitions

Port	Configured DCB ports.
Loc-Adm Priorities	Indicates the priority for which PFC is enabled or disabled.
Loc-Adm MBC	Indicates if the local system is capable of bypassing MACsec processing when MACsec is disabled.
Loc-Adm Will	Indicates if the local system is willing to accept the PFC configuration of the remote system.
Loc-Adm Cap	Indicates the number of traffic classes on the local device that have simultaneously PFC enabled.
Loc-Oper Priorities	Indicates if PFC is enabled on the corresponding priority.
Loc-Oper MBC	Indicates if the local system is capable of bypassing MACsec processing when MACsec is disabled.

output definitions (continued)

Loc-Oper Will	Indicates if the local system is willing to accept the PFC configuration of the remote system.
Loc-Oper Cap	Indicates the number of traffic classes on the local device that have simultaneously PFC enabled.
Rem-Oper Priorities	Indicates if PFC is enabled on the corresponding priority on the remote system.
Rem-Oper MBC	Indicates if the remote system is capable of bypassing MACsec processing when MACsec is disabled.
Rem-Oper Will	Indicates if the remote system is willing to accept the PFC configuration of the local system.
Rem-Oper Cap	Indicates the number of traffic classes on the remote device that have simultaneously PFC enabled.

Displays the usage of the PFC lossless traffic class on the switch.

```
show qos pfc-lossless-usage
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

This command displays the PFC lossless traffic class usage on the switch.

Examples

```
-> show qos pfc-lossless-usage
Lossless Priorities in use      : 55,
Lossless Priorities reserved   : 60,
Lossless Priorities available  : 73
```

output definitions

Lossless Priorities in use	Indicates the number of PFC lossless priorities in use in the system.
Lossless Priorities reserved	Indicates the number of PFC lossless priorities in reserve in the system.
Lossless Priorities available	Indicates the number of priorities available to be configured as PFC lossless.

show qos qsi dcb pfc stats

Displays the Priority Flow Control (PFC) statistics for the specified DCB port.

show qos qsi [port chassis/slot/port[-port2] dcb pfc stats

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Statistics are displayed on a per-traffic class (TC) basis.

Examples

```
-> show qos qsi port 1/11 dcb pfc stats
```

Legends: displays packet count

Port	Q	PFC		PFC	
		TC	TX (req)	RX (ind)	
1/11	0	0	0		0
1/11	1	0	0		0
1/11	2	0	0		0
1/11	3	0	0		0
1/11	4	1	0		0
1/11	5	1	0		0
1/11	6	2	0		0
1/11	7	2	0		0

output definitions

Port	The DCB port number.
Q	The 802.1p priority number (0–7). This number is mapped to a traffic class (TC) based on the DCB profile assigned to the port.
TC	Indicates the traffic class to which the priority belongs.
Priority	Indicates the priority of the DCB port.
PFC TX (req)	Total count of PFC packets transmitted.
PFC RX (ind)	Total count of PFC packets received.

Release History

Release 7.3.1; command was introduced.

```

clear qos qsi dcb pfc stats

Clears the DCB PFC queue statistics.

```
clear qos qsi {port chassis/slot/port[-port2]} dcb pfc stats
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the *slot/port* parameter to clear queue statistics associated with specific ports.

Examples

```
-> clear qos qsi port 2/1 dcb pfc stats
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show qos qsi stats](#) Displays the queue statistics for DCB and NDCB ports.

36 QoS Policy Commands

This chapter describes the CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

Note. Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

Refer to [Chapter 35, “QoS Commands,”](#) for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

Filename: alcatelIND1Qos.mib
Module ALCATEL-IND1-QoS-MIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS Policy commands are listed here:

Policy commands	policy rule policy validity-period policy list policy list rules policy condition policy action show policy action show policy condition show active policy rule show policy rule show policy validity period show active policy list show policy list
Group commands	policy network group policy service policy service group policy mac group policy port group policy map group show policy network group show policy mac group show policy port group show policy map group show policy service show policy service group

Condition commands

policy condition
policy condition source ip
policy condition source ipv6
policy condition destination ipv6
policy condition multicast ip
policy condition source network group
policy condition destination network group
policy condition multicast network group
policy condition source ip-port
policy condition destination ip-port
policy condition source tcp-port
policy condition destination tcp-port
policy condition source udp-port

policy condition source port group
policy condition destination port group
policy condition vrf
policy condition fragments
policy condition appfp-group

Action commands	<p> policy action policy action disposition policy action shared policy action priority policy action maximum bandwidth policy action maximum depth policy action cir policy action cpu priority policy action tos policy action 802.1p policy action dscp policy action map policy action permanent gateway-ip policy action permanent gateway-ipv6 policy action port-disable policy action redirect port policy action redirect linkagg policy action no-cache policy action mirror </p>
------------------------	---

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

Access Control Lists	<p> policy condition policy action disposition policy rule </p>
Traffic prioritization/shaping	<p> policy action shared policy action priority policy action maximum bandwidth policy rule </p>

policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

policy rule *rule_name* [**enable** | **disable**] [**precedence** *precedence*] [**condition** *condition*] [**action** *action*] [**validity-period** *name*] [**save**] [**log** [**log-interval** *seconds*]] [**count** {**packets** | **bytes**}] [**trap**] [**default-list**]

policy rule *rule_name* **no** {**validity-period** | **save** | **log** | **trap** | **default-list**}

no policy rule *rule_name*

Syntax Definitions

<i>rule_name</i>	The name of the policy rule, any alphanumeric string.
enable	Enables the policy rule.
disable	Disables the policy rule.
<i>precedence</i>	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
<i>condition</i>	The condition name that is associated with this rule. Conditions are configured through the policy condition command.
<i>action</i>	The name of the action that is associated with this rule. Actions are configured through the policy action command.
<i>name</i>	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the policy validity period command.
save	Marks the policy rule so that it may be captured as part of the switch configuration.
log	Configures the switch to log messages about specific flows coming into the switch that match this policy rule.
<i>seconds</i>	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
packets	Counts the number of packets that match the rule.
bytes	Counts the number of bytes that match the rule.
trap	Enables or disables traps for the rule.
default-list	Adds the rule to the QoS default policy list.

Defaults

parameter	default
enable disable	enable
<i>precedence</i>	0
log	no
<i>seconds</i>	60
packets bytes	packets
trap	enable
default-list	adds rule to the default list

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

from {cli | ldap | blt}

This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.

- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy validity-period	Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.
policy condition	Configures condition parameters.
policy action	Configures action parameters.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy rule	Displays information for policy rules configured on the switch.
show active policy rule	Displays only those policy rules that are currently being enforced on the switch.

- alaQoSAppliedRuleLog
- alaQoSAppliedCountType
- alaQoSAppliedPacketCount
- alaQoSAppliedByteCount
- alaQoSAppliedDefaultList

policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

policy validity-period *name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*] [**interval** *mm:dd:yyyy hh:mm to mm:dd:yyyy hh:mm*]

policy validity-period *name* **no** {**hours** / **interval**}

no policy validity-period *name*

Syntax Definitions

<i>name</i>	The name of the validity period (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., monday , tuesday , wednesday , etc.).
<i>months</i>	The month(s) in which the validity period is active. Enter the actual month (e.g., january , february , march , etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yyyy hh:mm</i>	An interval of time in which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).

Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **policy rule** command to associate a validity period with a rule.

- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

Release History

policy list

Configures a QoS policy list. There are three types of lists available: a Universal Network Profile (UNP) policy list, an Application Fingerprinting list, and the default policy list. Rules assigned to a UNP list are applied to traffic classified into a specific profile. A default policy list is available when the switch boots up; all policy rules belong to this list unless otherwise specified.

policy list *list_name* **type** {**unp** | **appfp**} [**enable** | **disable**]

no policy list *list_name*

Syntax Definitions

<i>list_name</i>	The name to assign to the policy list. Note that the list name is case sensitive.
unp	Specifies the list type as a Universal Network Profile list.
appfp	Specifies the list type as an Application Fingerprinting list.
enable	Enables the policy list.
disable	Disables the policy list.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration.
- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.
- Once a policy list is created, use the **policy list rules** command to add rules to the list.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

from {**cli** | **ldap** | **blt**}

This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy list unpl type unp
-> policy list unpl disable
-> policy list unpl enable
-> no policy list unpl
```

Release History

Release 7.2.1; command was introduced.

Related Commands

policy list rules	Assigns QoS policy rules to a QoS policy list.
policy rule	Configures a policy rule on the switch and optionally associates that rule with a validity period.
show policy rule	Displays information for policy rules configured on the switch.
show active policy list	Displays only those policy lists that are currently being enforced on the switch.
show policy list	Displays information for policy lists configured on the switch.

MIB Objects

```

policy list rules

Assigns existing QoS policy rules to the specified QoS policy list.

policy list *list_name* **rules** *rule_name* [*rule_name2*...]

policy list *list_name* **no rules** *rule_name* [*rule_name2*...]

Syntax Definitions

<i>list_name</i>	The name of an existing QoS policy list. Note that the list name is case sensitive.
<i>rule_name</i>	The name of an existing QoS policy rule to include in the policy list.
<i>rule_name2</i>	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.

Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a policy rule from an existing list.
- The QoS policy list and rule names specified with this command must already exist in the switch configuration.
- This command is only used to assign rules to a UNP policy list. Create the rules for this type of list using the **no default-list** option of the **policy rule** command to ensure these rules take precedence over other default list rules when the UNP policy list is applied to device traffic.
- A rule may belong to a UNP list and the default list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a policy rule is disabled, then the rule is disabled for all lists even if a list to which the policy rule belongs is enabled.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.

Examples

```
-> policy list unpl rules r1 r2 r3
-> policy list unpl no rules r2
```

Release History

Release 7.2.1; command was introduced.

Related Commands

policy list	Configures a QoS policy list.
policy rule	Configures a policy rule on the switch and optionally associates that rule with a validity period.
show policy rule	Displays information for policy rules configured on the switch.
show active policy list	Displays only those policy lists that are currently being enforced on the switch.
show policy list	Displays information for policy lists configured on the switch.

MIB Objects

  alaQoSAppliedRuleGroupsStatus
```

policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

policy network group *net_group ip_address [mask net_mask] [ip_address2 [mask net_mask2]...]*

no policy network group *net_group*

policy network group *net_group no ip_address [mask netmask] [ip_address2 [mask net_mask2]...]*

Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>net_mask</i>	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
<i>ip_address2</i>	Optional. Another IPv4 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
<i>net_mask2</i>	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to configure a group of IPv4 addresses to which you want to apply QoS rules. Rather than create a condition for each IPv4 address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration, or to remove an IP address from a network group.
- If the **snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

from {cli | ldap | blt}

This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Configures a policy condition. A network group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy network group	Displays information for policy network groups.

MIB Objects

```
alaQoSNetworkGroupsTable
  alaQoSNetworkGroupsName
  alaQoSNetworkGroupsSource

  alaQoSNetworkGroupIpAddr
  alaQoSNetworkGroupsIpMask
alaQoSAppliedNetworkGroupTable
  alaQoSAppliedNetworkGroupIpAddr
  alaQoSAppliedNetworkGroupsIpMask
```

policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

policy service group *service_group service_name1 [service_name2...]*

no policy service group *service_group*

policy service group *service_group no service_name1 [service_name2...]*

Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>service_group</i>	The name of the service group (up to 31 alphanumeric characters).
<i>service_name1</i>	The service name is configured through the policy service command and includes information about protocol, source port, and destination port.
<i>service_name2...</i>	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- If the **snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

from {cli | ldap | blt}

This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by

a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy service	Configures a service that may be used as part of a policy service group.
policy condition	Configures a policy condition. A network group may be configured as part of a policy condition.
show policy service group	Displays information for policy service groups.

  alaQoSServiceGroupServiceName
alaQoSAppliedServiceGroupTable
  alaQoSAppliedServiceGroupServiceName
```

policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

policy mac group *mac_group mac_address [mask mac_mask] [mac_address2 [mask mac_mask2]...]*

no policy mac group *mac_group*

policy mac group *mac_group no mac_address [mask mac_mask] [mac_address2 [mask mac_mask2]...]*

Syntax Definitions

<i>mac_group</i>	The name of the MAC group (up to 31 alphanumeric characters).
<i>mac_address</i>	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
<i>mac_address2</i>	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
<i>mac_mask2</i>	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the [qos phones](#) command for more information.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

from {cli | ldap | blt}

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Configures a policy condition. A MAC group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy mac group	Displays information about policy MAC groups.

  alaQoSACGroupMacAddr
  alaQoSACGroupMacMask
alaQoSAppliedMACGroupTable
  alaQoSAppliedMACGroupMacAddr
  alaQoSAppliedMACGroupMacMask
```

policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

policy port group *group_name* {*chassis//slot/port[-port2]* | *agg_id[-agg_id2]*} [*chassis//slot/port[-port2]* / *agg_id[-agg_id2]*]

no policy port group *group_name*

policy port group *group_name no* {*chassis//slot/port[-port2]* | *agg_id[-agg_id2]*} [*chassis//slot/port[-port2]* / *agg_id[-agg_id2]*]

Syntax Definitions

<i>group_name</i>	The name of the port group (up to 31 alphanumeric characters).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port (or port range) to be included in the group. At least one slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). Additional combinations may be included in the group; each combination should be separated by a space.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use this command to configure a group of ports or link aggregates to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Configuring ports and link aggregates in the same port group is allowed.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *slot/port-port2* (i.e., 2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- If a range of link aggregates is specified using the syntax *agg_id[-agg_id2]* (i.e., 10-15), a single aggregate within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.

- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and only applies to routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.
- If the **snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

from {cli | ldap | blt}

This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy port group port_group4 3/1-2 4/3 5/4
-> policy port group port_group4 no 3/1-2
-> policy port group UserPorts 4/1-8 5/1-8
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; *agg_id* parameter added.

Related Commands

policy condition	Configures a policy condition. A port group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy action maximum bandwidth	Configures a maximum bandwidth value for a policy action.
show policy port group	Displays information about policy port groups.

  alaQoSAppliedPortGroupsName
  alaQoSAppliedPortGroupSlot
  alaQoSAppliedPortGroupPort
  alaQoSAppliedPortGroupPortEnd
```

policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

```
policy map group map_group {value1:value2...}
```

```
no policy map group map_group
```

```
policy map group no {value1:value2...}
```

Syntax Definitions

<i>map_group</i>	The name of the map group (up to 31 alphanumeric characters).
<i>value1</i>	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, 1-2).
<i>value2...</i>	The 802.1p, ToS, or DSCP value to be used in place of <i>value1</i> . Additional mapping pairs may be included.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6
-> policy map group tosGroup no 7:6
-> no policy map group tosGroup
```

Release History

Release 7.1.1; command was introduced.

```

policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

```
policy service service_name
  [protocol protocol]
  [source ip port port[-port]]
  [destination ip port port[-port]]
  [source tcp port port[-port]]
  [destination tcp port port[-port]]
  [source udp port port[-port]]
  [destination udp port port[-port]]
```

```
no policy service service_name
```

Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for source ip port or destination ip port ; it cannot be specified for source tcp port , destination tcp port , source udp port , or destination udp port .
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, 22-23).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	protocol source ip port destination ip port	<i>The protocol must be specified with at least one source or destination port.</i>
TCP ports for a service	source tcp port destination tcp port	<i>Keywords may be used in combination.</i>
UDP ports for a service	source udp port destination udp port	<i>Keywords may be used in combination.</i>

- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip port 23
-> policy service telnet3 destination tcp port 23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.

policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **protocol** *protocol* {[**source ip-port** *port*[-*port*]] [**destination ip-port** *port*[-*port*]]}

no policy service *service_name*

policy service *service_name* **no** {**source ip-port** | **destination ip-port**}

Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, 22-23).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp-port**, **policy service destination tcp-port**, **policy service source udp-port**, and **policy service destination udp-port**.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {**cli** | **ldap** | **blt**}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service telnet2 protocol 6 destination ip-port 23 source ip-port 22
-> policy service telnet2 no source ip-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

policy service source tcp-port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source tcp-port** *port[-port]*

no policy service *service_name*

policy service *service_name* **no source tcp port**

Syntax Definitions

service_name

The name of the service (up to 31 alphanumeric characters).

port

The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_5 source tcp port 21-22
-> policy service serv_5 no source tcp port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```
alaQoSServiceTable
  alaQoSServiceName
  alaQoSServiceSource
  alaQoSServiceSourceTcpPort
  alaQoSServiceSourceTcpPortEnd
alaQoSAppliedServiceTable
  alaQoSAppliedServiceName
  alaQoSAppliedServiceSource
  alaQoSAppliedSourceTcpPort
  alaQoSAppliedSourceTcpPortEnd
```

policy service destination tcp-port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination tcp-port** *port[-port]*

no policy service *service_name*

policy service *service_name* **no destination tcp-port**

Syntax Definitions

service_name

The name of the service (up to 31 alphanumeric characters).

port

The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination tcp-port 23
-> policy service service4 no destination tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

  alaQoSAppliedServiceSource
  alaQoSAppliedServiceDestinationTcpPort
  alaQoSAppliedServiceDestinationTcpPortEnd
```

policy service source udp-port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source udp-port** *port*[-*port*]

no policy service *service_name*

policy service *service_name* **no source udp-port**

Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. Specify a port range with a hyphen (for example, 22-23).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {**cli** | **ldap** | **blt**}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_a source udp-port 1000
-> no policy service serv_a source udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.

  alaQoSServiceSourceUdpPortEnd
alaQoSAppliedServiceTable
  alaQoSAppliedServiceName
  alaQoSAppliedServiceSource
  alaQoSAppliedSourceUdpPort
  alaQoSAppliedSourceUdpPortEnd
```

policy service destination udp-port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination udp-port** *port[-port]*

no policy service *service_name*

policy service *service_name* **no destination udp-port**

Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, 137-138).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination udp-port 137
-> policy service service4 no destination udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.

```

policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

policy condition *condition_name*

```
[source ip ip_address [mask netmask]]
[source ipv6 {any | ipv6_address [mask netmask]}]
[destination ip ip_address [mask netmask]]
[destination ipv6 {any | ipv6_address [mask netmask]}]
[multicast ip ip_address [mask netmask]]
[source network group network_group]
[destination network group network_group]
[multicast network group multicast_group]
[source ip port port[-port]]
[destination ip port port[-port]]
[source tcp port port[-port]]
[destination tcp port port[-port]]
[source udp port port[-port]]
[destination udp port port[-port]]
[ethertype etype]
[established]
[tcpflags {any | all} flag [mask flag]]
[service service]
[service group service_group]
[icmptype type]
[icmpcode code]
[ip protocol protocol]
[ipv6]
[nh next_header_value]
[flow-label flow_label_value]
[tos tos_value tos_mask]
[dscp {dscp_value[-value] [dscp_mask]}]
[source mac mac_address [mask mac_mask]]
[destination mac mac_address [mask mac_mask]]
[source mac group group_name]
[destination mac group mac_group]
[source vlan vlan_id]
[destination vlan vlan_id]
[802.1p 802.1p_value]
```

```
[source port chassis/slot/port[-port2]]
[source port group group_name]
[destination port chassis/slot/port[-port2]]
[destination port group group_name]
[vrf {vrf_name | default}]
[fragments]
[appfp-group group_name]
```

```
no policy condition condition_name
```

Syntax Definitions

condition_name The name of the condition. Any alphanumeric string.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule](#) command.
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

Examples

```
-> policy condition cond4 source port 3/1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Configures a policy action.
policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName
  alaQoSConditionSource
alaQoSAppliedConditionTable
  alaQoSAppliedConditionName
  alaQoSAppliedConditionSource
```

policy condition source ip

Configures a source IP address for a policy condition.

policy condition *condition_name* **source ip** *ip_address* [**mask** *netmask*]

policy condition *condition_name* **no source ip**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

Defaults

parameter	default
<i>netmask</i>	IP address class

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

policy condition source ipv6

Configures a source IPv6 address for a policy condition.

```
policy condition condition_name source ipv6 {any | ipv6_address [mask netmask]}
```

```
policy condition condition_name no source ipv6
```

Syntax Definitions

<i>condition_name</i>	The name of the condition.
any	Any source IPv6 address.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The mask for the source IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition destination ip

Configures a destination IP address for a policy condition.

policy condition *condition_name* **destination ip** *ip_address* [**mask** *netmask*]

policy condition *condition_name* **no destination ip**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

Release History

policy condition destination ipv6

Configures a destination IPv6 address for a policy condition.

```
policy condition condition_name destination ipv6 {any | ipv6_address [mask netmask]}
```

```
policy condition condition_name no destination ipv6
```

Syntax Definitions

<i>condition_name</i>	The name of the condition.
any	Any destination IPv6 address.
<i>ipv6_address</i>	A specific destination IPv6 address.
<i>netmask</i>	The mask for the destination IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a destination IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

Examples

```
-> policy condition cond3 destination ipv6 ::1234:531f:bcd2:f34a
```

Release History

Release 7.1.1; command was introduced.

policy condition multicast ip

Configures a multicast IP address for a policy condition.

policy condition *condition_name* **multicast ip** *ip_address* [**mask** *netmask*]

policy condition *condition_name* **no multicast ip**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The multicast IP address.
<i>netmask</i>	Optional. The mask for the multicast IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 multicast ip 224.1.1.1
```

Release History

policy condition source network group

Associates a source network group with a policy condition.

policy condition *condition_name* **source network group** *network_group*

policy condition *condition_name* **no source network group**

Syntax Definitions

condition_name

The name of the condition.

network_group

The name of the source network group. Network groups are configured through the **policy network group** command. See [page 44-16](#) for more information about this command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.

Examples

```
-> policy condition cond5 source network group webgroup1
```

Release History

Release 7.1.1; command was introduced.

policy condition source ip-port

Configures a source IP port number for a policy condition.

policy condition *condition_name* **source ip-port** *port[-port]*

policy condition *condition_name* **no source ip-port**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

Examples

```
-> policy condition cond1 ip protocol 6 source ip-port 137
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition destination ip-port

Configures a destination IP port number for a policy condition.

policy condition *condition_name* **destination ip-port** *port[-port]*

policy condition *condition_name* **no destination ip-port**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a destination IP port with a service or service group.

Examples

```
-> policy condition cond2 ip protocol 6 destination ip-port 137-138
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName

  alaQoSConditionDestinationIpPortEnd
alaQoSAppliedConditionTable
  alaQoSAppliedConditionName
  alaQoSAppliedConditionDestinationIpPort
  alaQoSAppliedConditionDestinationIpPortEnd
```

policy condition source tcp-port

Configures a source TCP port number for a policy condition.

```
policy condition condition_name source tcp-port port[-port]
```

```
policy condition condition_name no source tcp-port
```

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip protocol**, use **source tcp-port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond3 source tcp-port 137
-> policy condition cond4 ipv6 source tcp-port 21
-> policy condition cond3 no source tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

policy condition destination tcp-port

Configures a destination TCP port number for a policy condition.

policy condition *condition_name* **destination tcp-port** *port*[-*port*]

policy condition *condition_name* **no destination tcp-port**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a destination TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip protocol**, use **destination tcp-port**.
- The same condition cannot specify a destination TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination tcp-port 137-138
-> policy condition cond5 ipv6 destination tcp-port 140
-> policy condition cond4 no destination tcp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition source udp-port

Configures a source UDP port number for a policy condition.

policy condition *condition_name* **source udp-port** *port*[-*port*]

policy condition *condition_name* **no source udp-port**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip port** and **ip protocol**, use **source udp-port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond5 source udp-port 1200-1400
-> policy condition cond6 ipv6 source-udp port 1000
-> policy condition cond5 no source udp-port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

```

policy condition destination udp-port

Configures a destination UDP port number for a policy condition.

policy condition *condition_name* **destination udp-port** *port[-port]*

policy condition *condition_name* **no destination udp-port**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip protocol**, use **destination udp-port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination udp-port 137-138
-> policy condition cond5 ipv6 destination udp-port 140
-> policy condition cond4 no destination udp-port
```

Release History

Release 7.1.1; command was introduced.

  alaQoSAppliedConditionDestinationTcpPortEnd
```

policy condition ethertype

Configures an ethertype value to use for traffic classification.

policy condition *condition_name* **ethertype** *etype*

policy condition *condition_name* **no ethertype**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>etype</i>	The ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.

Examples

```
-> policy condition cond12 ethertype 8137
```

Release History

Release 7.1.1; command was introduced.

policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

policy condition *condition_name* **established**

policy condition *condition_name* **no established**

Syntax Definitions

condition_name The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
  alaQoSConditionTcpEstablished
alaQoSAppliedConditionTable
  alaQoSAppliedConditionTcpEstablished
```

policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

policy condition *condition_name* **tcpflags** [**any** | **all**] {**f** | **s** | **r** | **p** | **a** | **u** | **e** | **w**} **mask** {**f** | **s** | **r** | **p** | **a** | **u** | **e** | **w**}

policy condition *condition_name* **no tcpflags**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
any	Match on any of the specified TCP flags.
all	Match all specified TCP flags.
f s r p a u e w	TCP flag value to match (f =fin, s =syn, r =rst, p =psh, a =ack, u =urg, e =ecn, and w =cwr). <i>The e and w flags are currently not supported.</i>

Defaults

parameter	default
any all	all

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.

Examples

```
-> policy condition c1 tcpflags all f s mask f s a
-> policy condition c2 tcpflags any a r mask a r
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

policy condition service

Configures a service for a policy condition.

policy condition *condition_name* **service** *service_name*

policy condition *condition_name* **no service**

Syntax Definitions

condition_name The name of the condition.

service_name The service name, configured through the **policy service** command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service serv2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service	Configures a service that may be used as part of a policy service group.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy service	Displays information about all particular policy services or a particular policy service configured on the switch.

MIB Objects

    alaQoSAppliedConditionService
```

policy condition service group

Associates a policy service group with a policy condition.

policy condition *condition_name* **service group** *service_group*

policy condition *condition_name* **no service group**

Syntax Definitions

condition_name

The name of the condition.

service_group

The service group name. Service groups are configured through the [policy service group](#) command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service group servgroup2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition icmptype

Configures an ICMP type value to use for traffic classification.

policy condition *condition_name* **icmptype** *type*

policy condition *condition_name* **no icmptype**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>type</i>	The ICMP type value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmptype 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition icmpcode	Configures an ICMP code value for traffic classification.

policy condition icmpcode

Configures an ICMP code value to use for traffic classification.

policy condition *condition_name* **icmpcode** *code*

policy condition *condition_name* **no icmpcode**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>code</i>	The ICMP code value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmpcode 150
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition icmptype	Configures an ICMP type value for traffic classification.

policy condition ip-protocol

Configures an IP protocol for a policy condition.

policy condition *condition_name* **ip-protocol** *protocol*

policy condition *condition_name* **no ip-protocol**

Syntax Definitions

condition_name The name of the condition.

protocol The protocol associated with the flow. The range is 0–255.

Defaults

parameter	default
<i>protocol</i>	6

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip port** or **policy condition destination ip port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

Examples

```
-> policy condition cond4 ip protocol 6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition source ip-port Configures a source IP port number for a policy condition.

policy condition destination ip-port Configures a destination IP port number for a policy condition.

qos apply Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

show policy condition Shows information about policy conditions configured on the switch.

MIB Objects

policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

policy condition *condition_name* **ipv6**

policy condition *condition_name* **no ipv6**

Syntax Definitions

condition_name The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1
-> policy condition cond7 ipv6 source tcp port 21
-> policy condition cond8 ipv6 source tcp port 0-1024
-> policy condition cond6 no ipv6
```

Release History

Release 7.1.1; command was introduced.

policy condition nh

Configures an IPv6 next header value as a policy condition. This value is compared to the next header value in the IPv6 header.

policy condition *condition_name* **nh** *next_header_value*

policy condition *condition_name* **no nh**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>next_header_value</i>	The next header value (0–255).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove the next header value as a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 nh 100
-> policy condition cond4 no nh
```

Release History

Release 7.1.1; command was introduced.

policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

policy condition *condition_name* **flow-label** *flow_label_value*

policy condition *condition_name* **no flow-label**

Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>flow_label_value</i>	The flow-label value (0–1048575).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

```

policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

policy condition *condition_name* **tos** *tos_value* [**mask** *tos_mask*]

policy condition *condition_name* **no tos**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>tos_value</i>	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
<i>tos_mask</i>	The mask for the ToS bits, in the range 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

Examples

```
-> policy condition cond2 tos 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

policy condition *condition_name* **dscp** {*dscp_value*[-*value*]} [**mask** *dscp_mask*]

policy condition *condition_name* **no dscp**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>dscp_value</i> [- <i>value</i>]	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
<i>dscp_mask</i>	The mask for the DiffServ Code Point, in the range 0–63.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.
- When a DSCP policy condition is configured on one of these switches, QoS automatically calculates the appropriate mask value.

Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Creates a policy condition.

policy condition source mac

Configures a source MAC address for a policy condition.

policy condition *condition_name* **source mac** *mac_address* [**mask** *mac_mask*]

policy condition *condition_name* **no source mac**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

Release History

Release 7.1.1; command was introduced.

policy condition destination mac

Configures a destination MAC address for a policy condition.

Note. Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

policy condition *condition_name* **destination mac** *mac_address* [**mask** *mac_mask*]

policy condition *condition_name* **no destination mac**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition source mac group

Associates a source MAC group with a policy condition.

policy condition *condition_name* **source mac group** *group_name*

policy condition *condition_name* **no source mac group**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source MAC group, configured through the policy mac group command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond4 source mac group mac_group1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

policy condition inner source-vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

policy condition *condition_name* **inner source-vlan** *vlan_id*

policy condition *condition_name* **no inner source-vlan**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond5 inner source-vlan 3
-> policy condition cond5 no inner source-vlan
```

Release History

Release 7.1.1; command was introduced.

```

policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

policy condition *condition_name* **inner 802.1p** *802.1p_value*

policy condition *condition_name* **no inner 802.1p**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>802.1p_value</i>	The inner 802.1p value of the inner 802.1Q VLAN tag (customer VLAN) to match on double-tagged packets. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond3 inner 802.1p 7  
-> policy condition cond3 no inner 802.1p
```

Release History

Release 7.1.1; command was introduced.

policy condition source port

Configures a source port number for a policy condition. Use the **no** form of the command to remove a source port number from a condition.

```
policy condition condition_name source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
policy condition condition_name no source {port | linkagg}
```

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number on which the frame is received. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID on which the frame is received. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond2 source port 3/1
-> policy condition cond3 source port 3/2-4
-> policy condition cond3 no source port
-> policy condition cond3 source linkagg 10
-> policy condition cond3 source linkagg 15-20
-> policy condition cond3 no source linkagg
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **linkagg** parameter added.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName

```

policy condition destination port

Configures a destination port number for a policy condition.

```
policy condition condition_name destination {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
policy condition condition_name no destination {port | linkagg}
```

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number for which the frame is destined. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID for which the frame is destined. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition does not apply to routed traffic. Only bridged unicast traffic is supported (bridged multicast and broadcast traffic is not supported).

Examples

```
-> policy condition cond3 destination port 4/2
-> policy condition cond4 destination port 4/3-4
-> policy condition cond4 no destination port
-> policy condition cond4 destination linkagg 10
-> policy condition cond4 destination linkagg 15-20
-> policy condition cond4 no destination linkagg
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **linkagg** parameter added.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.

```

policy condition source port group

Associates a source port group with a policy condition. Use the **no** form of the command to remove a source port group from a condition.

policy condition *condition_name* **source port group** *group_name*

policy condition *condition_name* **no source port group**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source port group. Port groups are configured through the policy port group command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 source port group portgr4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.

policy condition destination port group

Associates a destination port group with a policy condition. Use the **no** form of the command to remove a destination port group from a condition.

policy condition *condition_name* **destination port group** *group_name*

policy condition *condition_name* **no destination port**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the destination port group. Port groups are configured through the policy port group command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove a destination port group from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 destination port group portgr4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

policy condition *condition_name* **vrf** {*vrf_name* / **default**}

policy condition *condition_name* **no vrf**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vrf_name</i>	The name of the VRF instance to which the QoS policy condition applies.
default	Specifies the default VRF instance.

Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

  alaQoSAppliedConditionVrfNameStatus
```

policy condition fragments

Associates TCP packet fragments with a policy condition.

policy condition *condition_name* **fragments**

policy condition *condition_name* **no fragments**

Syntax Definitions

condition_name The name of the condition. May be an existing condition name or a new condition.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of the command to remove TCP packet fragments from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 fragments
-> policy condition cond7 no fragments
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

  alaQoSAppliedConditionName
  alaQoSAppliedConditionFragments
```

policy condition appfp-group

Associates an Application Fingerprinting (AFP) application signature group with a policy condition.

policy condition *condition_name* **appfp-group** *group_name*

policy condition *condition_name* **no appfp-group**

Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the AFP application group to which the QoS policy condition applies.

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove an AFP group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **appfp-group** policy condition is used in rules associated with QoS policy lists that are applied to AFP ports running in either the QoS or UNP mode.

Examples

```
-> policy condition cond6 appfp-group my-p2p
-> policy condition cond6 no appfp-group
```

Release History

Release 7.3.2; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable  
  alaQoSConditionAppFpGroup  
  alaQoSConditionAppFpGroupStatus
```

policy condition vxlan

Creates a VXLAN Snooping policy condition to determine the parameters the switch uses to classify incoming encapsulated Virtual eXtensible Local Area Network (VXLAN) packets. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

```
policy condition condition_name vxlan vni vxlan_id  
    [inner source mac mac_address [mask mac_mask]]  
    [inner source mac-group mac_group]  
    [inner source ip ip_address [mask netmask]]  
    [inner source ipv6 ip6_address [mask netmask]]  
    [inner ip protocol protocol]  
    [inner l4-port {src src_port / dest dest_port}]  
    [vxlan-port udp_port]
```

```
no policy condition condition_name
```

Syntax Definitions

<i>condition_name</i>	The name of the VXLAN condition. Any alphanumeric string.
<i>vxlan_id</i>	A 24-bit numerical value that identifies traffic for a VXLAN segment. The valid range is 1– 2147483647.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule](#) command.
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from the switch configuration.
- The **vni** (VXLAN Network Identifier) parameter is required to configure a VM Snooping policy condition. The VXLAN header contains the VNI that is associated with the source MAC address of the Ethernet frame that is encapsulated in a VXLAN packet. The VNI represents the VXLAN segment ID to which the packet belongs.

- The **vxlan-port** condition parameter applies only to the outer header of an encapsulated VXLAN packet. All other **inner** condition parameters apply only to the inner header of the Ethernet frame that was encapsulated in a VXLAN packet.
- When a VXLAN Snooping policy condition is used in a policy rule, the rule is then applied only to traffic on ports that have the VM Snooping feature enabled.
- All existing policy actions are supported in combination with VXLAN Snooping policy conditions; there are no specific policy actions required for policy rules containing VXLAN Snooping policy conditions. Policy actions are applied to the outer header of an encapsulated VXLAN packet.
- See the “Configuring VXLAN Snooping” chapter in the *OmniSwitch AOS Release 8 Data Center Switching Guide* for more information about using VXLAN Snooping policy rules.

Examples

```
-> policy condition cond4 vxlan vni 23000
```

The following is an example of using VM Snooping policy conditions in a policy rule that is added to a UNP policy list:

```
-> policy condition c1 vxlan vni 1234 udp port 4789
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c1 vxlan inner source ip 10.10.10.10
-> policy action a1 disposition dscp 45
-> policy rule r1 condition c1 action a1 no default-list
-> policy list list1 type UNP
-> policy list list1 rule r1
-> qos apply
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Configures a policy action.
policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
show policy condition	Shows information about policy conditions configured on the switch.

policy condition vxlan inner source mac

Configures a source MAC address as a policy condition for a VM Snooping policy rule. This type of condition applies to the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source mac** *mac_address* [**mask** *mac_mask*]

policy condition *condition_name* **vxlan no source mac**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>mac_address</i>	The source MAC address of a VM (inner MAC address of an encapsulated VXLAN frame).
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the VM source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VM Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c2 vxlan inner source mac 00:20:da:05:f6:23 mask
ff:ff:ff:ff:ff:ff
-> policy condition c2 vxlan no source mac
```

Release History

Release 7.3.4; command was introduced.

```

policy condition vxlan inner source mac-group

Configures a source MAC address group as a policy condition for a VXLAN Snooping policy rule. This type of condition checks to see if the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet matches any of the MAC addresses specified in the MAC address group.

policy condition *condition_name* **vxlan inner source mac-group** *group_name*

policy condition *condition_name* **vxlan no source mac-group**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>group_name</i>	The name of the source MAC group, configured through the policy mac group command.

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the source MAC address group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source mac-group vm-macs  
-> policy condition c1 vxlan no source mac-group
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN policy condition.

```

policy condition vxlan inner source ip

Configures a source IPv4 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source ip** *ip_address* [**mask** *netmask*]

policy condition *condition_name* **vxlan no source ip**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>ip_address</i>	A specific source IP address.
<i>netmask</i>	The network mask for the source IP address (for example, 255.0.0.0, 255.255.0.0).

Defaults

parameter	default
<i>netmask</i>	IP address class

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the source IP address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source ip 10.1.1.2
-> policy condition c2 vxlan inner source ip 10.1.1.3 mask 255.0.0.0
-> policy condition c1 vxlan no source ip
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

```

policy condition vxlan inner source ipv6

Configures a source IPv6 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner source ipv6** *ipv6_address* [**mask** *netmask*]

policy condition *condition_name* **vxlan no source ipv6**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The network mask for the source IPv6 address.

Defaults

parameter	default
<i>netmask</i>	IPv6 address class

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner source ipv6 ::1234:531F:BCD2:F34A
-> policy condition c1 vxlan no source ipv6
```

Release History

Release 7.3.4; command was introduced.

policy condition vxlan inner ip-protocol

Configures a an IP protocol number as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the IP protocol of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* vxlan inner ip-protocol *protocol*

policy condition *condition_name* vxlan no ip-protocol

Syntax Definitions

condition_name The name of an existing policy condition.
protocol The IP protocol number. The range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the IP protocol number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner ip-protocol 6  
-> policy condition c1 vxlan no ip-protocol
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy condition vxlan inner l4-port

Configures a Layer 4 (UDP or TCP) source port and/or destination port as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the Layer 4 port of the inner Ethernet frame of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan inner l4-port** {**src** *src_port* | **dest** *dest_port*}

policy condition *condition_name* **vxlan no l4-port**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>src_port</i>	The source port number. The valid range is 0–65535
<i>dest_port</i>	The destination port number. The valid range is 0–65535

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the Layer 4 port number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan inner l4-port dest 9445
-> policy condition c1 vxlan inner l4-port src 4000
-> policy condition c2 vxlan inner l4-port dest 8100 inner l4-port src 3000
-> policy condition c1 vxlan no l4-port
```

Release History

Release 7.3.4; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition vxlan	Creates a VXLAN Snooping policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

policy condition vxlan vxlan-port

Configures a UDP destination port number as a policy condition for a VXLAN Snooping policy rule. This number is found in the outer IP header of an encapsulated VXLAN packet.

policy condition *condition_name* **vxlan vxlan-port** *udp_port*

policy condition *condition_name* **vxlan no vxlan-port**

Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>udp_port</i>	The UDP destination port number of the VXLAN packet. The valid range is 0–65535

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the VXLAN port number from a condition; however, at least one classification parameter must be associated with a condition.
- VXLAN packets use the well-known UDP destination port 4789 by default.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

Examples

```
-> policy condition c1 vxlan vxlan-port 6000
-> policy condition c1 vxlan 7000
-> policy condition c1 vxlan no vxlan-port
```

Release History

Release 7.3.4; command was introduced.

policy action

Configures or deletes a QoS action. A QoS action describes how traffic that matches a particular QoS condition should be treated. It may specify a particular set of bandwidth and queue parameters, or it may simply specify whether the flow is allowed or denied on the switch.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove the parameter from the action.

Note that some action parameters may not be supported depending on the platform you are using. Also some action parameters may not be supported with some conditions. See the condition in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

policy action *action_name*

[redirect port *chassis/slot/port***]**
[redirect linkagg *link_agg***]**
[no-cache]
[{ingress | egress | ingress egress | no} mirror *chassis/slot/port***]**

policy no action *action_name*

Syntax Definitions

action_name A name for the action, any alphanumeric string.

Defaults

By default, no drop algorithm is configured for the action, and any queues created by the action are not shared.

parameter	default
accept drop deny	accept

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

from {cli | ldap | blt}

This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

Examples

```
-> policy action action1 accept
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy condition	Configures a condition associated with the action.
qos apply	Applies configured QoS and policy settings to the current configuration.

    alaQoSAppliedActionSource
```

policy action disposition

Configures a disposition for a policy action.

policy action *action_name* **disposition** {**accept** | **drop** | **deny**}

policy action *action_name* **no disposition**

Syntax Definitions

<i>action_name</i>	The name of the action.
accept	Specifies that the switch should accept the flow.
drop	Specifies that the switch should silently drop the flow.
deny	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as drop ; that is, the flow is silently dropped.

Defaults

parameter	default
accept drop deny	accept

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove a disposition from an action.

Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

Release History

Release 7.1.1; command was introduced.

    alaQoSAppliedActionName  
    alaQoSAppliedActionDisposition
```

policy action shared

Enables bandwidth sharing among multiple QoS rules that use the same maximum bandwidth action.

policy action *action_name* **shared**

policy action *action_name* **no shared**

Syntax Definitions

action_name The name of the action.

Defaults

By default, queues created by an action are *not* shared.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the **shared** policy action is not specified, then each bandwidth rule will implement a separate instance of the specified bandwidth allocation.
- Use the **no** form of the command to disable sharing.

Example

```
-> policy action action5 maximum bandwidth 10m shared
-> policy action action6 maximum bandwidth 10m shared
-> policy action action5 no shared
```

Release History

Release 7.1.1; command was introduced.

 alaQoSAppliedActionShared

policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

policy action *action_name* **priority** *priority_value*

policy action *action_name* **no priority**

Syntax Definitions

action_name

The name of the action.

priority_value

The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest) on the OmniSwitch 6900 and 0 (lowest) to 12 (highest) on the OmniSwitch 10K.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- This priority value is independent of 802.1Q, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

Examples

```
-> policy action action1 priority 1  
-> policy action action1 no priority
```

Release History

Release 7.1.1; command was introduced.

policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

policy action *action_name* **maximum bandwidth** *bps*[**k** | **m** | **g** | **t**]

policy action *action_name* **no maximum bandwidth**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [k m g t]	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t).

Defaults

parameter	default
k m g t	k

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- If the maximum bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- Use the **shared** policy action to enabling sharing of bandwidth across policy rules that specify the same maximum bandwidth action.

Examples

```
-> policy action action3 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k shared
-> policy action action5 maximum bandwidth 10k shared
-> policy action action4 no maximum bandwidth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

```

policy action maximum depth

Configures the maximum bucket size assigned to this action. The bucket size determines how much the traffic can burst over the maximum bandwidth rate. When the bucket size is reached, the switch starts to drop packets.

policy action *action_name* **maximum depth** *bps*[**k** | **m** | **g** | **t**]

policy action *action_name* **no maximum depth**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [k m g t]	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g).

Defaults

parameter	default
k m g t	k

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- A maximum depth action is used in combination with a maximum bandwidth action.

Examples

```
-> policy action action2 maximum depth 100
-> policy action action2 no maximum depth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.

policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action includes parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), and Peak Burst Size (PBS). The TCM policier meters and marks packets red, green, or yellow based on the parameter values of this policy action.

policy action *action_name* **cir** *bps* [**cbs** *bps*] [**pir** *bps*] [**pbs** *bps*] [**color-only**]

policy action *action_name* **no cir**

policy action *action_name* **no pir**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [k m g t]	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t).
color-only	Disables TCM rate limiting based on the metering results. Packets are only marked the specific color that applies to the level of packet conformance.

Defaults

parameter	default
cbs pir pbs <i>bps</i>	0
k m g t	k

By default, this action enables rate limiting based on TCM marking and metering.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.
- If the **color-only** parameter is specified with this command, the TCM action will only mark packet color; packets are not rate limited based on the metering results. In this case, packets are then subject to any rate limiting specifications as defined in the queue management configuration for the switch. See the [qos qsi wred](#) command for more information.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.
- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action.

If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.

- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule** command. These statistics are only shown for those rules that are configured with a TCM policy action.

Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k color-only
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M color-only
-> policy action A7 no cir
```

policy action cpu priority

Configures a CPU priority policy action.

policy action *action_name* **cpu priority** *priority*

policy action *action_name* **no cpu priority**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>priority</i>	The CPU queue on which packets destined for the CPU are received. The valid range is 0–31.

Defaults

By default, the CPU priority is set to zero.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove the CPU priority parameter value.

Examples

```
-> policy action A7 cpu priority 15
-> policy action A8 cpu priority 31
-> policy action A7 no cpu priority
```

Release History

policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

policy action *action_name* **tos** *tos_value*

policy action *action_name* **no tos**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>tos_value</i>	The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action3 tos 4  
-> policy action action3 no tos
```

policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

policy action *action_name* **802.1p** *802.1p_value*

policy action *action_name* **no 802.1p**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>802.1p_value</i>	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

Release History

policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

policy action *action_name* **dscp** *dscp_value*

policy action *action_name* **no dscp**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>dscp_value</i>	The DSCP value to be set, in the range 0–63.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

Release History

Release 7.1.1; command was introduced.

policy action map

Configures a mapping group for a policy action.

policy action map {802.1p | tos | dscp} to {802.1p | tos | dscp} using *map_group*

policy action no map

Syntax Definitions

<i>action_name</i>	The name of the action.
802.1p	Indicates that an 802.1p value should be mapped.
tos	Indicates that a ToS value should be mapped.
dscp	Indicates that a DSCP value should be mapped.
<i>map_group</i>	The name of the map group, configured through the policy map group command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will determine the outgoing 802.1p and ToS based on whether or not the port is trusted or untrusted).

- Use the **no** form of the command to delete the map group from the configuration.

Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

Release History

Release 7.1.1; command was introduced.

policy action permanent gateway-ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

policy action *action_name* **permanent gateway-ip** *ip_address*

policy action *action_name* **no permanent gateway-ip**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>ip_address</i>	The destination IP address to which packets will be routed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

Examples

```
-> policy action pbr2 permanent gateway-ip 10.10.2.1  
-> policy action pbr2 no permanent gateway-ip
```

policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

policy action *action_name* **port-disable**

policy action *action_name* **no port-disable**

Syntax Definitions

action_name The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a UserPorts shutdown function.
- To enable a port disabled by this action, use the **interfaces** or **clear violation** command to administratively enable the port, or physically disconnect and reconnect the port cable.

Examples

```
-> policy action pd01 port-disable  
-> policy action pb02 no port-disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.
interfaces	Administratively enables or disables a port.
interfaces wait-to-restore	Administratively clears the violation that disabled the port or link aggregate and restores the port to enabled status.

policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

policy action *action_name* **redirect port** *chassis/slot/port*

policy action *action_name* **no redirect port**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number that will receive the redirected traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaQoSAppliedActionRedirectSlot
  alaQoSAppliedActionRedirectPort
```

policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

policy action *action_name* **redirect linkagg** *agg_id*

policy action *action_name* **no redirect linkagg**

Syntax Definitions

<i>action_name</i>	The name of the action.
<i>agg_id</i>	The link aggregate ID number (0–32) to assign to the specified VLAN. See the “Link Aggregation Commands” chapter in this guide.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
  alaQoSActionName
  alaQoSActionRedirectAgg
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionRedirectAgg
```

policy action no-cache

Disables logging of rule entries to the hardware cache.

policy action *action_name* **no-cache**

policy action *action_name* **no no-cache**

Syntax Definitions

action_name The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove **no cache** from the policy action.
- Recommended for use when applied to traffic going to the switch.

Examples

```
-> policy action nc01 no-cache  
-> policy action nc01 no no-cache
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable  
  alaQoSActionName  
  alaQoSActionNocache  
alaQoSAppliedActionTable  
  alaQoSAppliedActionName  
  alaQoSAppliedActionNocache
```

policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

policy action *action_name* [**ingress** | **egress** | **ingress egress**] **mirror** *chassis/slot/port*

policy action *action_name* **no mirror** *slot/port*

Syntax Definitions

<i>action_name</i>	The name of the action.
ingress	Mirrors ingress packets.
egress	Mirrors egress packets.
ingress egress	Mirrors ingress and egress packets.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number that will receive the mirrored traffic.

Defaults

parameter	default
ingress egress ingress egress	ingress

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) action that is used for policy based mirroring.
- Only one MTP session is supported at any given time. As a result, all mirroring policies should specify the same MTP port.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

Examples

```
-> policy action a1 mirror 1/7 (default ingress)
-> policy action a1 ingress mirror 1/7
-> policy action a1 egress mirror 1/7
-> policy action a1 ingress egress mirror 1/7
-> policy action a1 no mirror
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable  
  alaQoSActionName  
  alaQoSActionMirrorSlot  
  alaQoSActionMirrorPort  
  alaQoSActionMirrorMode  
  alaQoSActionMirrorModeStatus
```

show policy network group

Displays information about pending and applied policy network groups.

show [applied] policy network group [*network_group*]

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>network_group</i>	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information for all policy network groups displays unless *network_group* is specified.

Examples

```
-> show policy network group
Group Name           : netg1
State                = new,
Entries              = 198.206.10.1
```

```
-> show policy network group
Group Name           : group1
Entries              = 203.185.129.0 mask 255.255.255.0,
                    203.185.131.192 mask 255.255.255.192,
                    203.185.132.0 mask 255.255.252.0,
                    204.226.0.0 mask 255.255.0.0
```

output definitions

Group Name	The name of the port group, configured through the policy network group command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Entries	The IP addresses associated with the network group.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy network group](#) Configures policy network groups.

MIB Objects

```
alaQoSNetworkGroupsTable
  alaNetworkGroupsName
  alaNetworkGroupsSource
alaNetworkGroupTable
  alaNetworkGroupIpAddr

```

show policy service

Displays information about pending and applied policy services.

show [applied] policy service [*service_name*]

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>service_name</i>	The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information about all policy services is displayed unless *service_name* is specified.

Examples

```
-> show policy service
Service name           : s1
State                  = new,
Destination UDP port   = 1001-2004
```

output definitions

Service Name	The name of the port group, configured through the policy service command.
State	This field appears if the service was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
IPProto	The IP protocol associated with the service.
ScrPort	A source port associated with the service.
DstPort	A destination port associated with the service.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy service](#)

Configures a service that may be used as part of a policy service group.

MIB Objects

```
alaQoSServiceTable
  alaQoSServiceName

  alaQoSServiceIpProtocol
  alaQoSServiceSourceIpPort
  alaQoSServiceDestinationIpPort
alaQoSAppliedServiceTable
  alaQoSAppliedServiceName
  alaQoSAppliedServiceSource
  alaQoSAppliedServiceIpProtocol
  alaQoSAppliedSourceIpPort
  alaQoSAppliedServiceDestinationIpPort
```

show policy service group

Displays information about pending and applied policy service groups.

show [**applied**] **policy service group** [*service_group*]

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>service_group</i>	The name of the service group for which you want to display information; or a wildcard sequence of characters for displaying information about service groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information for all policy service groups displays unless *service_group* is specified.

Examples

```
-> show policy service group
Group Name      : mgmt
State           = new,
Entries         = ftp,
                  http,
                  https,
                  snmp,
                  ssh,
                  telnet
```

output definitions

Group Name	The name of the port group, configured through the policy service group command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Entries	The services associated with the group. Services are configured through the policy service command.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy service group

Configures a service group and its associated services. A service group may be attached to a policy condition.

MIB Objects

alaQoSAppliedServiceGroupTable
  alaQoSAppliedServiceGroupServiceName
```

show policy mac group

Displays information about pending and applied MAC groups.

show [**applied**] **policy mac group** [*mac_group*]

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>mac_group</i>	The name of the MAC group for which you want to display information; or a wildcard sequence of characters for displaying information about MAC groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information for all policy MAC groups displays unless *mac_group* is specified.

Examples

```
-> show policy mac group
Group Name           : mg1
State                = new,
Entries              = 00:02:9A:44:5E:10 mask 00:00:00:FF:FF:FF,
                    00:11:01:00:00:01 mask 00:00:00:FF:FF:FF
                    00:02:9A:44:5E:20
```

output definitions

Group Name	The name of the port group, configured through the policy mac group command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Entries	The MAC addresses associated with the group.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy mac group](#)

Configures policy MAC groups.

```

show policy port group

Displays information about pending and applied policy port groups.

show [**applied**] **policy port group** [*group_name*]

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>group_name</i>	The name of the policy port group for which you want to display information; or a wildcard sequence of characters for displaying information about port groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information for all policy port groups displays unless *group_name* is specified.

Examples

```
-> show policy port group
Group Name      : pg1
State           = new,
Entries         = 1/2,
                1/3,
                1/4,
                3/11
```

output definitions

Group Name	The name of the port group, configured through the policy port group command or built-in port groups automatically set up by the switch (Slot01 , Slot02 , Slot03 , etc.).
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Entries	The slot/port combinations associated with the port group.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy port group](#)

Configures a port group and its associated slot and port numbers.

MIB Objects

```

```

show policy map group

Displays information about pending and applied policy map groups.

show [applied] policy map group *[group_name]*

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
<i>group_name</i>	The name of the policy map group for which you want to display information; or a wildcard sequence of characters for displaying information about map groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Information for all policy map groups displays unless *group_name* is specified.

Examples

```
-> show policy map group
```

```
Group Name      : m1
State           = new,
Entries        = 0:0,
                1:9,
                2:18,
                3:27,
                4:36,
                5:45,
                6:54,
                7:63
```

output definitions

Group Name	The name of the map group, configured through the policy map group command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Entries	The slot/port combinations associated with the port group.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy map group](#)

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

MIB Objects

  alaQoSMapGroupValue
alaQoSAppliedMapGroupTable
  alaQoSAppliedMapGroupKey
  alaQoSAppliedMapGroupKeyEnd
  alaQoSAppliedMapGroupValue
```

show policy action

Displays information about pending and applied policy actions configured on the switch.

show [applied] policy action [*action_name*]

Syntax Definitions

applied	Displays only actions that have been applied to the QoS configuration for the switch.
<i>action_name</i>	The name of the action for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Information for all policy actions displays unless *action_name* is specified.
- When the optional **applied** parameter is used, pending QoS actions are not displayed.

Examples

```
-> show policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M

Action name           : a2
  State                 = new,
  Disposition           = deny

Action name           : a3
  State                 = new,
  Priority               = 7,

-> show applied policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M
```

output definitions

Action Name	The name of the action, configured through the policy action command.
State	This field appears if the action was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Policy Action Parameters	Displays the configured policy action parameters.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy action Creates a policy action. A QoS action is a particular set of bandwidth and queue parameters that may be applied to a flow matching particular QoS conditions.

MIB Objects

```

alaQoSActionTable
  alaQoSActionName
  alaQoSActionSource
  alaQoSActionDisposition
  alaQoSActionShared
  alaQoSActionMinimumBandwidth
  alaQoSActionMaximumBandwidth

  alaQoSAppliedActionDisposition
  alaQoSAppliedActionShared
  alaQoSAppliedActionMinimumBandwidth
  alaQoSAppliedActionMaximumBandwidth
  alaQoSAppliedActionMaximumDepth

```

show policy condition

Displays information about pending and applied policy conditions.

show [**applied**] **policy condition** [*condition_name*]

Syntax Definitions

applied	Displays only conditions that have been applied to the QoS configuration for the switch.
<i>condition_name</i>	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Information for all policy conditions displays unless *condition_name* is specified.
- When the optional **applied** parameter is used, pending QoS conditions are not displayed.

Examples

```
-> show policy condition
Condition name           : c1
  Source VLAN           = 1001

Condition name           : c2
  State                 = new,
  Source IP             = 10.2.2.1,
  Destination UDP port  = 17

-> show applied policy condition
Condition name           : c1
  Source VLAN           = 1001
```

output definitions

Condition Name	The name of the condition, configured through the policy condition command.
State	This field appears if the condition was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Policy Condition Parameters	Displays the configured policy condition parameters.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy condition](#)

Creates a policy condition. The condition determines what parameters the switch uses to classify incoming flows.

MIB Objects

```

show active policy rule

Displays information about pending and applied policy rules that are active (enabled) on the switch.

show active policy rule [*rule_name*]

Syntax Definitions

rule_name The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rules is displayed unless *rule_name* is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.

Examples

```
-> show active policy rule
Rule name           : r1
Condition name      = c1,
Action name         = a1,
Packets             = 4166772,
Bytes               = 266665728
```

output definitions

Rule name	The name of the policy rule, configured through the policy rule command.
Condition name	The name of the condition configured for this rule.
Action name	The name of the action configured for this rule.
Packets	The number of packets that match this rule.
Bytes	The number of bytes that match this rule.

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy rule](#)

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

```
alaQoSRuleTable
  alaQoSRuleName
  alaQoSRuleEnabled
  alaQoSRuleSource
  alaQoSRulePrecedence

  alaQoSRuleReflexive
  alaQoSRuleLog
  alaQoSRuleTrapEvents
  alaQoSRuleSave
  alaQoSRuleCondition
  alaQoSRuleAction
```

show policy rule

Displays information about pending and applied policy rules.

```
show [applied] policy rule [rule_name]
```

Syntax Definitions

applied	Indicates that only policy rules that have been applied should be displayed.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Information for all rules is displayed unless *rule_name* is specified.
- Use the [show active policy rule](#) command to display only active rules that are currently being enforced on the switch.

Examples

```
-> show policy rule
Rule name           : r1
  Condition name    = c1,
  Action name       = a1

Rule name           : r2
  State             = new,
  Condition name    = c2,
  Action name       = a1

Rule name           : r3
  State             = new,
  Condition name    = c2,
  Action name       = a2

-> show applied policy rule
Rule name           : r1
  Condition name    = c1,
  Action name       = a1
```

output definitions

Rule name	The name of the policy rule, configured through the policy rule command.
State	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the qos apply command is issued, this field no longer displays.
Condition name	The name of the condition configured for this rule.
Action name	The name of the action configured for this rule.

Release History

Release 7.1.1; command was introduced.

Related Commands

policy rule Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

  alaQoSAppliedValidityPeriodEndInterval

```

show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

show active policy list [*list_name*]

Syntax Definitions

list_name The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Information for all active rules is displayed unless a *list_name* is specified.
- Use the **show policy list** command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last qos apply .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

Examples

```
-> show active policy list
Group Name                From  Type  Enabled  Entries
-----
list1                     cli   unp   Yes      r1
                           r2
+list2                    cli   unp   Yes      r3
egress_list1             cli   egress Yes      r1
                           r2
                           r3
```

output definitions

Group Name	The name of the policy list. Configured through the policy list command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last qos apply .
From	Where the list originated.
Type	The type of rule (unp or egress). Configured through the policy list command. Note that the default policy list is not shown. Use the show policy rule command to display rules that are members of the default policy list.
Enabled	Whether or not the rule is enabled. Configured through the policy list command.
Entries	The QoS policy rules that are grouped together in this policy list. Configured through the policy list command.

Release History

Release 7.2.1; command was introduced.

Related Commands

show policy list	Displays information about pending and applied policy lists.
show policy rule	Displays information about pending and applied policy rules

show policy list

Displays information about pending and applied policy lists.

show [applied] policy list *[list_name]*

Syntax Definitions

applied	Displays only those policy lists that have been applied to the switch configuration.
<i>list_name</i>	The name of the list to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Information for all rules is displayed unless a *list_name* is specified.
- Use the [show active policy list](#) command to display only active policy lists that are currently enforced on the switch.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last qos apply .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

Examples

```
-> show policy list
Group Name          From  Type   Enabled  Entries
-----+-----+-----+-----+-----
list1               cli   unp    Yes      r1
                   cli   unp    Yes      r2
+list2              cli   unp    Yes      r3
```

```
-> show applied policy list
```

Group Name	From	Type	Enabled	Entries
list1	cli	unp	Yes	r1 r2

output definitions

Group Name	The name of the policy list. Configured through the policy list command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last qos apply .
From	Where the list originated.
Type	The type of rule (unp or egress). Configured through the policy list command. Note that the default policy list is not shown. Use the show policy rule command to display rules that are members of the default policy list.
Enabled	Whether or not the rule is enabled. Configured through the policy list command.
Entries	The QoS policy rules that are grouped together in this policy list. Configured through the policy list command.

37 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules can be created on an attached server through the PolicyView GUI application. Policy rules can also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See [Chapter 35, “QoS Commands,”](#) for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

Filename: alcatelIND1policy.mib
Module: ALCATEL-IND1-POLICY-MIB

The policy server commands are summarized here:

[policy server load](#)
[policy server flush](#)
[policy server](#)
[show policy server](#)
[show policy server long](#)
[show policy server statistics](#)
[show policy server rules](#)
[show policy server events](#)

policy server load

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

policy server load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

Examples

```
-> policy server load
```

Release History

Release 7.1.1; command introduced.

Related Commands

[policy server flush](#) Removes all cached LDAP policy data from the switch.

MIB Objects

```
serverPolicyDecision
```

policy server flush

Removes all cached LDAP policy data from the switch.

policy server flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

Examples

```
-> policy server flush
```

Release History

Release 7.1.1; command introduced.

Related Commands

[policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```
serverPolicyDecision
```

policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

policy server *ip_address* [**port** *port_number*] [**admin-state** {**enable** | **disable**}] [**preference** *preference*] [**user** *user_name* **password** *password*] [**searchbase** *search_string*] [**ssl** | **no ssl**]

no policy server *ip_address* [**port** *port_number*]

Syntax Definitions

<i>ip_address</i>	The IP address of the LDAP-enabled directory server.
<i>port_number</i>	The TCP/IP port number used by the switch to connect to the directory server.
enable	Enables the specified policy server to download rules to the switch. The policy servers are up by default.
disable	Prevents the specified policy server from downloading rules to the switch.
<i>preference</i>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<i>user_name</i>	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: (e.g. “Directory Manager”).
<i>password</i>	The password associated with the user name. The password must match the password defined on the directory server.
<i>search_string</i>	The root of the directory required for searching the policy information. Typically, the <i>search_string</i> includes o=organization and c=country . For example, o=company and c=country .
ssl	Enables a Secure Socket Layer between the switch and the policy server.
no ssl	Disables a Secure Socket Layer between the switch and the policy server.

Defaults

parameter	default
admin	up
<i>port_number</i>	389 (SSL disabled) 636 (SSL enabled)
<i>preference</i>	0
ssl no ssl	no ssl

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If you change the port number, another entry is added to the policy server table; the existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase  
ou=qos,o=company,c=country
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show policy server](#) Displays information about policies downloaded from an LDAP server.

MIB Objects

```
DIRECTORYSERVERTABLE  
  directoryServerAddress  
  directoryServerPort  
  directoryServerAdminStatus  
  directoryServerPreference  
  directoryServerUserId  
  directoryServerAuthenticationType  
  directoryServerPassword  
  directoryServerSearchbase  
  directoryServerEnableSSL
```

show policy server

Displays information about servers from which policies can be downloaded to the switch.

show policy server

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

Examples

```
-> show policy server
```

Server	IP Address	port	enabled	status	primary
1	208.19.33.112	389	Yes	Up	X
2	208.19.33.66	400	No	Down	-

output definitions

Server	The index number corresponding to the LDAP server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
enabled	Whether or not the policy server is enabled.
status	The state of the policy server, Unkn , Up or Down .
primary	Indicates whether the server is the primary server; this server can be used for the next download of policies; only one server is a primary server.

Release History

Release 7.1.1; command introduced.

Related Commands**policy server**

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

```
directoryServerTable
  directoryServerAddress
  directoryServerPort

```

show policy server long

Displays more detailed information about an LDAP policy server.

show policy server long

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

Examples

```
-> show policy server long
LDAP server 0
  IP address           : 155.132.44.98,
  TCP port             : 16652,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 99,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : ou:4.1, cn=policyRoot, o=company.fr
  Last load time       : 09/13/01 16:38:18
LDAP server 1
  IP address           : 155.132.48.27,,
  TCP port             : 21890,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 50,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : o=company.fr
  Last load time       : 00/00/00 00:00:00
```

output definitions

IP address	The IP address of the policy server.
TCP port	The TCP/IP port number used by the switch to connect to the policy server.

output definitions (continued)

Enabled	Displays whether the policy server is enabled through the PolicyView application.
Operational status	The state of the policy server, Up or Down .
Preference	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
Authentication	Displays password if a user name and password was specified for the server through the policy server command. Displays anonymous if a user name and password are not configured.
login DN	The directory user name.
searchbase	The searchbase name, which is the root of the directory that can be searched for policy download information.
Last load time	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

Release History

Release 7.1.1; command introduced.

MIB Objects

```

directoryServerTable
  directoryServerAddress
  directoryServerPort
  directoryServerPreference
  directoryServerAuthenticationType
  directoryServerSearchbase
  directoryServerUserId
  directoryServerPassword
  directoryServerCacheChange
  directoryServerLastChange
  directoryServerAdminStatus
  directoryServerOperStatus

```

show policy server statistics

Displays statistics about policy directory servers.

show policy server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

Examples

```
-> show policy server statistics
Server  IP Address      port  accesses  delta  successes  delta  errors  delta
-----+-----+-----+-----+-----+-----+-----+-----+-----
   1    155.132.44.98 16652     793     793       295     295       0       0
   2    155.132.48.27 21890       0       0         0       0       0       0
```

output definitions

Server	The index number corresponding to the server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
accesses	The number of times the server was polled by the switch to download policies.
delta	The change in the number of accesses since the last time the policy server was accessed.
successes	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
delta	The change in the number of successful policy downloads since the last time the policy server was accessed.
errors	The number of errors returned by the server.
delta	The change in the number of errors returned by the server since the last time the policy server was accessed.

Release History

Release 7.1.1; command introduced.

Related Commands

[policy server](#)

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

policyStatsTable

 policyStatsAddress

 policyStatsServerPort

 policyStatsAccessCount

 policyStatsSuccessAccessCount

 policyStatsNotFoundCount

show policy server rules

Displays the names of policies originating from a directory server, that have been downloaded to the switch.

show policy server rules

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays information about policies created on directory servers only. [Chapter 35, “QoS Commands,”](#) for information about configuring and displaying policies directly on the switch.

Examples

```
-> show policy server rules
Num      name          prio      scope      status
-----+-----+-----+-----
1         QoSRule1       0         Provisioned Active
2         QoSrule2       0         Provisioned Active
```

Fields are defined here:

output definitions

Num	An index number corresponding to the policy rule.
name	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
prio	The priority or preference of the rule. Indicates the order in which rules can be checked to match to the incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
scope	The type of rule. Provisioned is the only type valid for the current release.
status	The status of the rule: Active indicates that the rule is available in the QoS software on the switch and is available to be applied to the traffic; notInService means the rule can be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); notReady indicates that the rule can never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

Release History

Release 7.1.1; command introduced.

Related Commands

[policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```

show policy server events

Displays any events related to a directory server on which policies are stored.

show policy server events

Syntax Definitions

N/A

Defaults

The display is limited to 50 events.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The Policy Manager initialization event is always the first event logged.

Examples

```
-> show policy server events
Event Time                event description
-----+-----
09/13/01 16:38:15 Policy manager log init

38 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- **Authenticated Switch Access.** Authenticates users into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, LDAP or information may be stored locally in the switch user database.
- **Local user database.** User information may be configured for Authenticated Switch Access. For functional management access, users may be allowed to access specific command families or domains.

MIB information for the AAA commands is as follows:

Filename: alcatelIND1AAA.mib
Module: ALCATEL-IND1-AAA-MIB

A summary of the available commands is listed here:

Authentication servers	aaa radius-server aaa tacacs+-server aaa tacacs command-authorization aaa ldap-server aaa test-radius-server show aaa server
Federal Information Processing Standards (FIPS)	system fips admin-state show system fips
Authenticated Switch Access	aaa authentication aaa authentication default aaa accounting session aaa accounting command show aaa authentication show aaa accounting

Port-based Network Access Control (Access Guardian)	aaa device-authentication aaa accounting aaa accounting radius calling-station-id aaa 802.1x re-authentication aaa interim-interval aaa session-timeout aaa inactivity-logout aaa radius nas-port-id aaa radius nas-identifier aaa radius mac-format aaa profile show aaa device-authentication show aaa accounting show aaa config show aaa radius config show aaa profile
Local User Database and Partitioned Management	user password user password-size min user password-expiration show user show aaa priv hexa
Password Policy	user password-size min user password-expiration user password-policy cannot-contain-username user password-policy min-uppercase user password-policy min-lowercase user password-policy min-digit user password-policy min-nonalpha user password-history user password-size min user password-min-age user password-expiration show user show user password-policy
User Lockout Settings	user lockout-window user lockout-threshold user lockout-duration user lockout unlock show user show user lockout-setting

Authenticated Switch Access - Enhanced Mode

- aaa switch-access mode
- aaa switch-access ip-lockout-threshold
- aaa switch-access banned-ip release
- aaa switch-access priv-mask
- aaa switch-access management-stations admin-state
- aaa switch-access management-stations
- show aaa switch-access mode
- show aaa switch-access ip-lockout-threshold
- show aaa switch-access banned-ip
- show aaa switch-access priv-mask
- show aaa switch-access management-stations
- show aaa switch-access hardware-self-test
- show aaa switch-access process-self-test

Common Criteria

- aaa common-criteria admin-state
- show aaa common-criteria config
- aaa certificate update-ca-certificate
- aaa certificate update-crl
- aaa certificate generate-rsa-key key-file
- aaa certificate generate-self-signed
- aaa certificate view
- aaa certificate verify ca-certificate - TBD
- aaa certificate delete
- aaa certificate generate-csr

Kerberos Snooping

- kerberos mac-move
- kerberos inactivity-timer
- kerberos ip-address
- kerberos server-timeout
- kerberos authentication-pass policy-list-name
- kerberos authentication-pass domain
- show kerberos configuration
- show kerberos users
- show kerberos statistics
- clear kerberos statistics

aaa radius-server

Configures or modifies a RADIUS server for Authenticated Switch Access, and device authentication.

aaa radius-server *server_name* **host** {*hostname* | *ip_address*} [*hostname2* | *ip_address2*] **{key** *secret* | **prompt-key**} [**hash-key** *hash_secret*] [**retransmit** *retries*] [**timeout** *seconds*] [**auth-port** *auth_port*] [**acct-port** *acct_port*] [**vrf-name** *name*]

no aaa radius-server *server*

Syntax Definitions

<i>server_name</i>	The name of the RADIUS server.
<i>hostname</i>	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary RADIUS server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup RADIUS server.
<i>ip_address2</i>	The IP address of an optional backup RADIUS server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
prompt-key	This option allows to enter the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears prompting to enter the secret key. Secret key needs to be re-entered, and only if both the entries match, command is accepted. Key provided in this mode is not displayed on the CLI as text.
<i>hash_secret</i>	A shared secret that the switch saves with a hashing algorithm.
<i>retries</i>	The number of retries the switch makes to authenticate a user before trying the backup server (<i>hostname2</i> or <i>ip_address2</i>).
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>auth_port</i>	The UDP destination port for authentication requests.
<i>acct_port</i>	The UDP destination port for accounting requests.
<i>name</i>	The name of the VRF to be used to access the server.

Defaults

parameter	default
<i>retries</i>	3
<i>seconds</i>	2
<i>auth_port</i>	1812
<i>acct_port</i>	1813

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be RADIUS servers.
- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server can be deleted at a time.
- RADIUS server can be configured on any VRF instance or the default VRF instance. However, all the RADIUS servers must reside on the same VRF instance.

Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5
-> no aaa radius-server pubs2

-> aaa radius-server radsrv1 host rad1_ipaddr key rad1_secret vrf-name rad_vrf

-> aaa radius-server rad1 prompt-key host 10.10.2.1
Enter Key: *****
Confirm Key: *****
```

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; **prompt-key** parameter added.

Related Commands

show aaa server	Displays information about AAA servers.
aaa authentication	Specifies the AAA servers to be used for Authenticated Switch Access.
aaa device-authentication	Specifies the AAA servers to use for Access Guardian device authentication.
aaa accounting session	Specifies the accounting servers to be used for Authenticated Switch Access.

MIB Objects

  aaasRetries
  aaasTimeout
  aaasRadAuthPort
  aaasRadAcctPort
  aaasVrfName
```

aaa tacacs+-server

Configures or modifies a TACACS+ server for Authenticated Switch Access.

```
aaa tacacs+-server server_name host {hostname | ip_address} [hostname2 | ip_address2] {key secret | prompt-key} [timeout seconds] [port port] [vrf-name name]
```

```
no aaa tacacs+-server server
```

Syntax Definitions

<i>server_name</i>	The name of the TACACS+ server.
<i>hostname</i>	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup TACACS+ server.
<i>ip_address2</i>	The IP address of an optional backup TACACS+ server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
prompt-key	This option allows to enter the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears prompting to enter the secret key. Secret key needs to be re-entered, and only if both the entries match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>port</i>	The port number for the primary TACACS+ server.
<i>name</i>	The name of the VRF to be used to access the server.

Defaults

parameter	default
<i>seconds</i>	2
<i>port</i>	49

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time.
- A host name (or IP address) and a secret are required when configuring a server.

- The server and the backup server must both be TACACS+ servers.
- TACACS+ server can be configured on any VRF instance or the default VRF instance. However, all the TACACS+ servers must reside on the same VRF instance.

Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
-> aaa tacacs+-server tacsrv1 host tac1_ipaddr key tac1_secret vrf-name tac_vrf

-> aaa tacacs+-server tac1 prompt-key host 10.10.2.2
Enter Key:  *****
Confirm Key:  *****
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf-name** parameter added.
Release 8.3.1; **prompt-key** parameter added.

Related Commands

show aaa server	Displays information about AAA servers.

  aaasTimeout
  aaasTacacsPort
  aaasVrfName
```

aaa tacacs command-authorization

Configures a command based authorization in TACACS+ server for authenticated switch.

aaa tacacs command-authorization {enable | disable}

Syntax Definitions

enable	Enable command based authorization in TACACS+ server.
disable	Disable command based authorization. This enables partition-management family based authorization in TACACS+ server.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is applicable only for CLI commands.
- If this command is enabled, then in the TACACS+ server the authorization of every command executed on the switch is command based. CLI commands executed on the switch are sent for authorization to the TACACS+ server along with mode of operation (read or read-write). After authorization, the server will send the response message to the TACACS+ client.
- If the command is disabled, then in the TACACS+ server the authorization is partition-management family based.
- Use **show configuration snapshot aaa** command to view the configuration details of this command.

Examples

```
-> aaa tacacs command-authorization enable  
-> aaa tacacs command-authorization disable
```

Release History

Release 8.3.1; command was introduced.

alaAaaTacacsServerCmdAuthorization

aaa ldap-server

Configures or modifies an LDAP server for Authenticated Switch Access.

```
aaa ldap-server server_name host {hostname | ip_address} [hostname2 | ip_address2] dn dn_name
{password super_password | prompt-password} [base search_base] [retransmit retries] [timeout
seconds] [ssl | no ssl] [port port] [vrf-name name]
```

```
no aaa ldap-server server-name
```

Syntax Definitions

<i>server_name</i>	The name of the LDAP server.
<i>hostname</i>	The host name (DNS name) of the primary LDAP server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary LDAP server.
<i>hostname2</i>	The host name (DNS name) of the backup LDAP server.
<i>ip_address2</i>	The IP address of a backup host for the LDAP server.
<i>dn_name</i>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers. For example: cn=manager . Must be different from the <i>search-base</i> name and must be in a format supported by the server. Required when creating a new server.
<i>super_password</i>	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
prompt-password	This option allows to enter the super-user password in a obscured format rather than as clear text. When this option is selected, press the Enter key. A password prompt appears prompting to enter the super-user password. Password needs to be re-entered, and only if both the passwords match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>search_base</i>	The search base recognized by the LDAP-enabled directory servers. For example, o=company or c=country . Must be different from the <i>dn_name</i> . Required when creating a new server.
<i>retries</i>	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
<i>seconds</i>	The timeout in seconds for server replies to authentication requests from the switch.
ssl	Enables a secure switch layer (SSL) between the switch and the LDAP server.
no ssl	Disables a secure switch layer (SSL) between the switch and the LDAP server.
<i>port</i>	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.
<i>name</i>	The name of the VRF to be used to access the server.

Defaults

Defaults for optional parameters are as follows:

parameter	default
<i>port</i>	389 (SSL disabled) 636 (SSL enabled)
<i>retries</i>	3
<i>seconds</i>	2
ssl no ssl	no ssl

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The *dn_name* must be different from the *search_base* name.
- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time.
- The port number configured on the switch must match the port number configured for the server.
- LDAP server can be configured on any VRF instance or the default VRF instance. However, all the LDAP servers must reside on the same VRF instance.

Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> aaa ldap-server omnivista host 1.2.3.4 dn "cn=DirMgr, o=alcatel.com" password
somepass base "ou=People, o=alcatel.com" vrf-name ldap_vrf
-> no aaa ldap-server topanga5
```

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager prompt-password base c=us
retransmit 4
Enter Password: ******
Confirm Password: ******
```

Release History

```

aaa test-radius-server

RADIUS test tool allows the user to test the RADIUS server reachability from the OmniSwitch. Use this command to start the authentication or accounting test for the specified user name and password.

```
aaa test-radius-server server-name type {authentication user user-name password password [method {md5 | pap}] | accounting user user-name}
```

Syntax Definitions

<i>server_name</i>	RADIUS server name for which test has been configured.
authentication accounting	Type of test to run.
<i>user-name</i>	User name configured on the server.
<i>password</i>	Password for the given user name.
md5 pap	Authentication method for the test.

Defaults

By default, MD5 is used as the authentication method.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- RADIUS server must be configured on the switch to test the tool.
- The switch must have the following RADIUS server configuration before starting the test tool: RADIUS server name, acct-port, auth-port, secret key, retransmit count, and timeout. See the [aaa radius-server](#) command for more information on RADIUS server configuration.
- Supports multiple sessions (console, telnet, SSH) to test multiple RADIUS servers.
- The CLI of the user session (console, telnet, SSH) goes in the blocking state when the test is started. In the blocking state, no other command (CLI) is accepted. The blocking state of the CLI prompt of the switch can be terminated by pressing any key.
- Two IP addresses are configurable for a RADIUS server. When the test starts, the requests are sent to the first address. When all the requests to the first address time out, then the requests are sent to the second address.

Examples

```
-> aaa test-radius-server rad1 type authentication user admin password switch  
method MD5  
-> aaa test-radius-server rad2 type authentication user admin password switch  
method pap  
-> aaa test-radius-server rad1 type accounting user admin
```

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

N/A

system fips admin-state

Enable or disable the Federal Information Processing Standards (FIPS) mode on the switch.

system fips admin-state {enable | disable}

Syntax Definitions

enable | disable Enables or disables the FIPS mode.

Defaults

By default, the FIPS mode is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enabling or disabling FIPS mode takes effect only after a switch reboot. The FIPS mode configuration is persistent across reboots.
- When FIPS mode is disabled, all other existing cryptographic algorithms will be supported.
- A FIPS supported client is required to access the switch in FIPS enabled mode. For example, Absolute Telnet.
- Other unsecured management interfaces, such as Telnet or FTP, have to be manually disabled after FIPS mode is enabled to achieve a completely secure device.

Examples

```
-> system fips admin-state enable
WARNING: FIPS Admin State only becomes Operational after write memory and reload

-> system fips admin-state disable
WARNING: FIPS Admin State only becomes Operational after write memory and reload
```

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

systemFipsAdminState

aaa authentication

Configures the interface for Authenticated Switch Access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

aaa authentication {console | telnet | ftp | http | snmp | ssh | default} *server1* [*server2...*] [local]

no aaa authentication [console | telnet | ftp | http | snmp | ssh | default]

Syntax Definitions

console	Configures Authenticated Switch Access through the console port.
telnet	Configures Authenticated Switch Access for any port used for Telnet.
ftp	Configures Authenticated Switch Access for any port used for FTP.
http	Configures Authenticated Switch Access for any port used for Web-based management.
snmp	Configures Authenticated Switch Access for any port used for SNMP.
ssh	Configures Authenticated Switch Access for any port used for Secure Shell.
default	Configures Authenticated Switch Access for any port using any service (telnet , ftp , etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
<i>server1</i>	The name of the authentication server used for Authenticated Switch Access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the aaa radius-server , aaa tacacs+-server , and aaa ldap-server commands.
<i>server2...</i>	The names of backup servers for Authenticated Switch Access. Up to 3 backups may be specified (including local). These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
local	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify local for <i>server1</i> .

Defaults

- At switch startup, Authenticated Switch Access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- The default user on the switch is **admin**, and **switch** is the password.
- Remote authentication is not supported on secondary CMMs or Slave chassis. Use local authentication on secondary CMMs and Slave chassis.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The server type may be RADIUS, TACACS+, LDAP, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

aaa authentication default

Sets the authenticated switch access type to the default server setting.

aaa authentication {console | telnet | ftp | http | snmp | ssh} default

Syntax Definitions

console	Configures the default Authenticated Switch Access server setting for the console port.
telnet	Configures the default Authenticated Switch Access server setting for Telnet.
ftp	Configures the default Authenticated Switch Access server setting for FTP.
http	Configures the default Authenticated Switch Access server setting for Web-based management.
snmp	Configures the default Authenticated Switch Access server setting for any port used for SNMP.
ssh	Configures the default Authenticated Switch Access server setting for any port used for Secure Shell.

Defaults

By default, the default Authenticated Switch Access server setting does not include any servers.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **aaa authentication** command to set the default servers.

Examples

```
-> aaa authentication telnet default
-> aaa authentication default default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

aaa accounting session

Configures an accounting server or servers for authenticated switch sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting session *server1* [*server2...*] [**local**]

no accounting session

Syntax Definitions

<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the aaa radius-server , aaa tacacs+-server , and aaa ldap-server commands.
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified (including local); each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated Switch Access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

Examples

```
-> aaa accounting session ldap1 radius2 local  
-> no aaa accounting session
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

aaa accounting command

Enables or disables the server for command accounting. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting command *server1* [*server2...*] [**local**]

no accounting command

Syntax Definitions

<i>server1</i>	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the aaa tacacs+-server commands.
<i>server2...</i>	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers can be only TACACS+ servers.
- The switch uses *only the first available server* in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the [aaa tacacs+-server](#) command.

Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show aaa accounting](#)

```

aaa device-authentication

Configures the switch to use RADIUS servers for 802.1X, MAC, and Captive Portal device authentication.

```
aaa device-authentication {802.1x | mac | captive-portal} server1 [server2] [server3] [server4]
```

```
no device-authentication {802.1x | mac | captive-portal}
```

Syntax Definitions

802.1x	Use the specified RADIUS server to authenticate 802.1X users.
mac	Use the specified RADIUS server for MAC authentication.
captive-portal	Use the specified RADIUS server for Captive Portal authentication.
<i>server1</i>	The name of the RADIUS authentication server to use for the specified type of authentication. (<i>Note that only RADIUS servers are supported for these types of authentication.</i>) At least one server is required. RADIUS server names are configured through the aaa radius-server command.
<i>server2...server4</i>	The names of backup servers used for authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a RADIUS server assignment for a specific authentication type.
- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses **only the first available server** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.
- Configuring the RADIUS servers to use for 802.1X, MAC, and Captive Portal authentication is required to support authentication and classification of devices connected to Universal Network Profile (UNP) ports.

Examples

```
-> aaa device-authentication 802.1x rad1
-> aaa device-authentication 802.1x rad1 rad2
-> no aaa device-authentication 802.1x

-> aaa device-authentication mac rad1
-> aaa device-authentication mac rad1 rad2
-> no aaa device authentication mac

-> aaa device-authentication captive-portal rad1
-> aaa device-authentication captive-portal rad1 rad2
-> no aaa device-authentication captive-portal
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.4; **802.1x** parameter added.
Release 8.1.1; **captive-portal** parameter added.

Related Commands

  aaaDaName1
  aaaDaName2
  aaaDaName3
  aaaDaName4
```

aaa accounting

Configures RADIUS server accounting or local Switch Logging (syslog) accounting for 802.1X, MAC, and Captive Portal authenticated device sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting {802.1x | mac | captive-portal} {server1 [server2...]} | **syslog** ip_address [port udp_port]}

no accounting {802.1x | mac | captive-portal}

Syntax Definitions

802.1x	Enables the specified RADIUS or syslog server to log accounting of 802.1X authenticated sessions.
mac	Enables the specified RADIUS or syslog server to log accounting for MAC authenticated sessions.
captive-portal	Enables the specified RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.
<i>server1</i>	The name of the RADIUS server used for accounting of authenticated switch sessions. At least one server is required. RADIUS server names are configured through the aaa radius-server command.
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<i>ip_address</i>	The IP network address for syslog accounting.
<i>udp_port</i>	The UDP port number for syslog accounting.

Defaults

By default, no RADIUS server or syslog accounting is configured for the switch.

parameter	default
<i>udp_port</i>	514

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to disable accounting for device authentication sessions.
- Up to 4 RADIUS accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.

- Accounting with the local syslog facility is not allowed if RADIUS accounting is already configured. In other words, configure either RADIUS *or* syslog accounting.
- RADIUS servers may each have an additional backup specified through the [aaa radius-server](#) command.

Examples

```
-> aaa accounting 802.1x rad1
-> aaa accounting 802.1x rad1 rad2 rad3 rad4
-> aaa accounting 802.1x syslog 10.135.67.99 port 8000
-> no aaa accounting 802.1x

-> aaa accounting mac rad1
-> aaa accounting mac rad1 rad2
-> aaa accounting mac syslog 10.135.67.99 port 8000
-> no aaa accounting mac

-> aaa accounting captive-portal rad1
-> aaa accounting captive-portal rad1 rad2 rad3
-> aaa accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa accounting captive-portal
```

```

aaa accounting radius calling-station-id

Configures the RADIUS Calling-Station-Id attribute for the specified accounting session type.

```
aaa accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}
```

Syntax Definitions

802.1x	Configures the attribute for 802.1X accounting sessions.
mac	Configures the attribute for MAC accounting sessions.
captive-portal	Configures the attribute for Captive Portal accounting sessions.
mac-address	Sets the Calling Station ID to the MAC address of the user.
ip-address	Sets the Calling Station ID to the IP address of the user.

Defaults

By default, the RADIUS Calling -Station-Id attribute value is set to the MAC address of the user.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Configuring the Calling-Station-Id attribute is not allowed if the accounting server configuration is set to use local Switch Logging (syslog) for the specified accounting session type (802.1x, MAC, or Captive Portal).
- The Calling Station ID attribute is defined in a RADIUS Accounting-Request message that is sent to the RADIUS accounting server.

Examples

```
-> aaa accounting 802.1x radius calling-station-id ip-address
-> no aaa accounting 802.1x radius calling-station-id ip-address
-> aaa accounting 802.1x radius calling-station-id mac-address

-> aaa accounting mac radius calling-station-id ip-address
-> no aaa accounting mac radius calling-station-id ip-address
-> aaa accounting mac radius calling-station-id mac-address

-> aaa accounting captive-portal radius calling-station-id ip-address
-> no aaa accounting onex radius calling-station-id ip-address
-> aaa accounting captive-portal radius calling-station-id mac-address
```

aaa 802.1x re-authentication

Enables or disables the automatic re-authentication of authenticated 802.1X users.

aaa 802.1x re-authentication {enable | disable} [interval *seconds*] [trust-radius {enable | disable}]

Syntax Definitions

enable	Enables re-authentication of 802.1X users.
disable	Disables re-authentication of 802.1X users.
<i>seconds</i>	The amount of time the switch waits before triggering re-authentication of 802.1X users. The valid range is 600–7200 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute value for the re-authentication time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured re-authentication time interval value.

Defaults

By default, 802.1X re-authentication is disabled for the switch.

parameter	default
<i>seconds</i>	3600
trust-radius enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The re-authentication time interval is triggered when 802.1X re-authentication is enabled.
- When the trust RADIUS option is enabled, the Session-Timeout attribute value received from the RADIUS server overrides the locally configured value for the switch.
- When the re-authentication time interval is changed, the new value does not apply to existing authenticated 802.1X users until the user is flushed out or when the user is authenticated again. Any new 802.1X users are re-authenticated based on the current time interval setting.

Examples

```
-> aaa 802.1x re-authentication enable
-> aaa 802.1x re-authentication enable interval 7200
-> aaa 802.1x re-authentication enable trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius enable

aaa interim-interval

Configures the amount of time between each interim accounting update for any given session.

aaa {802.1x | mac | captive-portal} interim-interval *seconds* [trust-radius {enable | disable}]

Syntax Definitions

802.1x	Configures the interim interval value for 802.1X accounting sessions.
mac	Configures the interim interval value for MAC accounting sessions.
captive-portal	Configures the interim interval value for Captive Portal accounting sessions.
<i>seconds</i>	The amount of time between each interim accounting update. The valid range is 60–1200 seconds.
trust-radius enable	Directs the switch to use the Acct-Interim-Interval attribute value for the interim time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured interim time interval value.

Defaults

By default, the accounting interim interval value is set to 600 seconds.

parameter	default
trust-radius enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the trust RADIUS option is enabled, the accounting interim interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the accounting interim interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

Examples

```
-> aaa 802.1x interim-interval 1200
-> aaa 802.1x interim-interval 1200 trust-radius enable
-> aaa 802.1x interim-interval 1200 trust-radius disable

-> aaa mac interim-interval 1200
-> aaa mac interim-interval 1200 trust-radius enable
-> aaa mac interim-interval 1200 trust-radius disable

-> aaa captive-portal interim-interval 1200
```

```
-> aaa captive-portal interim-interval 1200 trust-radius enable
-> aaa captive-portal interim-interval 1200 trust-radius disable
```

Release History

aaa session-timeout

Configures whether or not an authenticated user is automatically logged out of the network based on a session timeout value.

aaa {mac | captive-portal} session-timeout {enable | disable} [interval *seconds*] [trust-radius {enable | disable}]

Syntax Definitions

mac	Configures the session timeout parameter for authenticated MAC users.
captive-portal	Configures the session timeout parameter for authenticated Captive Portal users.
session-timeout enable	Enables the session timeout timer for authenticated user sessions.
session-timeout disable	Disables the session timeout timer for authenticated user sessions.
<i>seconds</i>	The session timeout value. The valid range is 12000–86400 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured timeout interval value.

Defaults

By default, the session timer is disabled for the switch.

parameter	default
<i>seconds</i>	43200 seconds (12 hours)
trust-radius enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The session timeout parameter is configurable only for MAC and Captive Portal authentication sessions. When 802.1x re-authentication is enabled, the session timeout is set to 43200 seconds by default.
- The timeout interval is triggered when the session timeout parameter is enabled for the switch.
- When the trust RADIUS option is enabled, the timeout interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the session timeout interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- When the session timeout value is reached, the authenticated users are logged out and the MAC address for each logged out user device is flushed.

Examples

```
-> aaa mac session-timeout enable interval 13000
-> aaa mac session-timeout enable interval 14000 trust-radius enable
-> aaa mac session-timeout disable

-> aaa captive-portal session-timeout enable interval 13000
-> aaa captive-portal session-timeout enable interval 14000 trust-radius enable
-> aaa captive-portal session-timeout disable
```

aaa inactivity-logout

Configures whether or not an authenticated user is automatically logged out of the network after a specific period of inactivity.

aaa {mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds*]

Syntax Definitions

mac	Configures the inactivity logout timer for authenticated MAC users.
captive-portal	Configures the inactivity logout timer for authenticated Captive Portal users.
enable	Enables the inactivity logout timer for the specified authentication type.
disable	Disables the inactivity logout timer for the specified authentication type.
<i>seconds</i>	The inactivity logout time. The valid range is 60–1200 seconds.

Defaults

By default, the inactivity logout timer is disabled for the switch.

parameter	default
seconds	600 seconds

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The inactivity logout timer is configurable only for MAC and Captive Portal authentication sessions.
- The timer is triggered when the inactivity logout parameter is enabled for the switch.
- Make sure the configured inactivity logout time is set to a value greater than the MAC address aging time for the switch.
- If a specific time is configured for the inactivity logout timer, the user is *not* logged out of the network if the MAC address for the user device ages out before the inactivity logout timer value expires.
- When the inactivity logout time is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

Examples

```
-> aaa mac inactivity-logout enable
-> aaa mac inactivity-logout enable interval 600
-> aaa mac inactivity-logout disable

-> aaa captive-portal inactivity-logout enable
-> aaa captive-portal inactivity-logout enable interval 600
-> aaa captive-portal inactivity-logout disable
```

aaa radius nas-port-id

Configures the RADIUS client NAS-Port attribute for authentication and accounting sessions.

```
aaa radius nas-port-id {user-string string | default}
```

Syntax Definitions

<i>string</i>	A text string (up to 31 characters) used to define a NAS-Port identifier for the NAS-Port attribute.
default	Sets the NAS-Port attribute value to the chassis/slot/port of the user.

Defaults

By default, the NAS-Port attribute is set to the user port (chassis/slot/port).

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The NAS-Port attribute value specified with this command is used in Account-Request messages and in Accounting-Request messages.

Examples

```
-> aaa radius nas-port-id default
-> aaa radius nas-port-id user-string nasport
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show aaa radius config](#) Displays the global RADIUS client attribute configuration.

MIB Objects

```
alaAaaClientAttrGroup
  alaAaaRadNasPortId
```

aaa radius nas-identifier

Configures the RADIUS client NAS-Identifier attribute for authentication and accounting sessions.

aaa radius nas-identifier {**user-string** *string* | **default**}

Syntax Definitions

<i>string</i>	A text string (up to 31 characters) used to identify the switch (RADIUS client) in the NAS-Identifier attribute.
default	Sets the NAS-Identifier attribute to the system name of the switch.

Defaults

By default, the NAS-Identifier attribute is set to the system name of the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The NAS-Identifier attribute value specified with this command is used in both Account-Request and Accounting-Request messages.

Examples

```
-> aaa radius nas-identifier default
-> aaa radius nas-identifier user-string os6860
```

Release History

Release 8.1.1; command was introduced.

Related Commands

```

aaa radius mac-format

Configures the MAC address format to use in the specified RADIUS client attributes.

```
aaa radius mac-format {username | password | calling-station-id | called-station-id} delimiter {char | none} case {uppercase | lowercase}
```

Syntax Definitions

username	Configures the MAC address format for the User-Name attribute.
password	Configures the MAC address format for the User-Password attribute.
calling-station-id	Configures the MAC address format for the Calling-Station-Id attribute.
called-station-id	Configures the MAC address format for the Called-Station-Id attribute.
<i>char</i>	The delimiter character to use to separate the octets within a MAC address. The valid characters are a space (“ ”), a hyphen (“-”), or a colon (“:”). For example, “e8 e7 32 a4 63 23”, “e8-e7-32-a4-63-23”, or “e8:e7:32:a4:63:23”.
none	No delimiter is used in the MAC address format.
uppercase	Uses uppercase characters in the MAC address format.
lowercase	Uses lowercase characters in the MAC address format.

Defaults

By default, no delimiter is used and the MAC address characters are in uppercase.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The MAC address format configured for the User-Name and User-Password attributes is only applied for MAC authentication and accounting, where these attributes are set to the MAC address of the user. The configured format is not applied for 802.1X or Captive Portal authentication and accounting.
- The MAC address format configured for the Called-Station-Id and Calling-Station-Id attributes is applied for MAC, 802.1X, and Captive Portal authentication and accounting sessions when these attributes are set to a MAC address value.
- The Called-Station-Id attribute is set to the base MAC address of the switch.
- The Calling-Station-ID attribute is configurable and can be set to the MAC address or IP address of the user.

Examples

```
-> aaa radius mac-format username delimiter none case lowercase
-> aaa radius mac-format username delimiter ":" case lowercase

-> aaa radius mac-format password delimiter none case lowercase
-> aaa radius mac-format password delimiter ":" case lowercase
```

```
-> aaa radius mac-format calling-station-id delimiter none case lowercase
-> aaa radius mac-format calling-station-id delimiter ":" case lowercase

-> aaa radius mac-format called-station-id delimiter none case lowercase
-> aaa radius mac-format called-station-id delimiter ":" case lowercase
```

user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

user *username*

{**password** *password* | **password-prompt**}

[**expiration** {*day* | *date*}]

[**read-only** | **read-write** [*families...* / *domains...* / **all** | **none** | **all-except** [*families* / *domains...*]]]

[**no snmp** | **no auth** | **sha** | **md5** | **sha+des** | **md5+des** | **sha+aes** | **sha224** | **sha256**]

[**console-only** {**enable** | **disable**}]

[**priv-password** *password* | **prompt-priv-password**]

no user *username*

Syntax Definitions

<i>username</i>	The name of the user. Used for logging into the switch. Required to create a new user entry or for modifying a user. Maximum 63 characters.
<i>password</i>	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. Maximum 47 characters.
password-prompt	This option allows to enter the password in a obscured format rather than as clear text. Select this option with the 'user' command to configure the password for the user. When this option is selected, a password prompt appears and the password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>day</i>	The number of days before this user's current password expires. The range is 1 to 150 days.
<i>date</i>	The date (in the format <i>mm/dd/yyyy hh:mm</i>) that the user's current password will expire.
read-only	Specifies that the user will have read-only access to the switch.
read-write	Specifies that the user will have read-write access to the switch.
<i>families</i>	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains.
<i>domains</i>	Determines the command domains available to the user on the switch. Each domain should be separated by a space.
all	Specifies that all command families and domains are available to the user.
none	Specifies that no command families or domains are available to the user.
all-except	Specifies that functional privileges for families or domains followed by 'all-except' are disabled to the user.
no snmp	Denies the specified user SNMP access to the switch.

no auth	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
sha	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
md5	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.
sha+des	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
md5+des	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
sha+aes	Specifies that the SHA authentication algorithm and AES encryption standard is used for authenticating and encrypting SNMP PDU for the user.
sha224	Specifies that the SHA224 authentication algorithm used for storing the user passwords.
sha256	Specifies that the SHA256 authentication algorithm used for storing the user passwords.
console-only enable	Enables console only access for the user <i>admin</i> .
console-only disable	Disables console only access for the user <i>admin</i> .
priv-password	Separate password that is used for SNMPv3 encryption. (8-30 characters)
prompt-priv-password	This option allows to enter the privacy password in a obscured format rather than as clear text. When this option is selected, press the Enter key. Select this option with the 'user' command to configure the privacy password for the user. When this option is selected, a password prompt appears and the privacy password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted. Password provided in this mode is not displayed on the CLI as text.

Defaults

- By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The **default** user account may be modified.
- By default, the password will be encrypted using SHA for all non SNMP users.
- For SNMP users without authentication, password will be encrypted with SHA.
- For SNMP users with authentication, it will be encrypted with the authentication method set for the user. If user is created with MD5, then it will be still encrypted with MD5.
- Users created with SHA2 authentication algorithm cannot be used for SNMP authentication.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Note that the some characters (i.e. '!', '\$') are not valid password characters in the Bash shell. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password **123456**** is allowed; **password ******* is not allowed.
- A password expiration for the user's current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user's password expiration will be configured with the global expiration setting.
- When modifying a user's SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user's password expires, the **admin** user will have access only through the console port.)
- New users or updated user settings are saved *automatically*.
- The priv-password token is accepted only when SNMP level with encryption is configured for the user. If SNMP level with encryption is not selected and **priv-password** is configured, then CLI command is rejected with error.
- If priv-password is not configured for the user with encryption SNMP level, then the user password parameter is used for priv-password (both for authentication/encryption).
- Password policy is not applicable for the new optional parameter **priv-password**.
- For authenticating switch access through other access types such as telnet, FTP, SSH the existing user password will be used irrespective of whether **priv-password** is configured or not.
- When the SNMP level for an existing user with priv-password configured is changed from one encryption level to another encryption level, then the previously configured priv-password will not be used with the new SNMP level. Priv-password needs to be configured again when SNMP level is changed for an existing user.

Examples

```
-> user techpubs password writer_pass read-only config
-> user techpubs password-prompt
Enter Password: *****
Confirm Password: *****

-> user techpubs password writer_pass read-write all sha256
```

The following example creates a user with read-write privileges for all families except aaa.

```
-> user techpubs password writer_pass read-write all-except aaa

-> no user techpubs

-> user snmpv3user password pass1pass1 priv-password priv1priv1 read-write all
sha+aes

-> user snmpv3user password pass1pass1 prompt-priv-password
Enter Priv-Password: *****
Confirm Priv-Password: *****
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **password-prompt**, **all-except**, **priv-password**, **prompt-priv-password** parameter added, **sha224** and **sha256** algorithm support added.

Related Commands

password	Configures the current user's password.
show user	Displays information about users configured in the local database on the switch.

MIB Objects

```

  aaauPassword
  aaauReadRight
  aaauWriteRight
  aaauSnmpLevel
  aaauSnmpAuthKey
  aaauPasswordExpirationDate
```

password

Configures the current user's password.

password

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password **123456**** is allowed; **password ******* is not allowed.
- Password settings are saved *automatically*.

Examples

```
-> password
enter old password: *****
enter new password: *****
reenter new password: *****
->
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

MIB Objects

aaaUserTable

 aaauPassword

 aaauOldPassword

user password-size min

Configures the minimum number of characters required when configuring a user password.

user password-size min *size*

Syntax Definitions

size The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

Defaults

parameter	default
<i>size</i>	6

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A.

Examples

```
-> user password-size min 9
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[user](#) Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

[show user password-policy](#) Displays the global password policy configuration for the switch.

MIB Objects

aaaAsaConfig
aaaAsaPasswordSizeMin

user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

user password-expiration {*day* / **disable**}

Syntax Definitions

<i>day</i>	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
disable	Disables password expiration for users configured locally on the switch.

Defaults

parameter	default
<i>day</i> / disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

Release History

Release 7.1.1; command was introduced.

aaaAsaDefaultPasswordExpirationInDays

user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

user password-policy cannot-contain-username {enable | disable}

Syntax Definitions

enable Does not allow the password to contain the username.
disable Allows the password to contain the username.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

Examples

```
-> user password-policy cannot-contain-username enable  
-> user password-policy cannot-contain-username disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig  
  aaaAsaPasswordContainUserName
```

user password-policy min-uppercase

Configures the minimum number of uppercase English characters required for a valid password.

user password-policy min-uppercase *number*

Syntax Definitions

number The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
<i>number</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify **0** with this command to disable the minimum uppercase character requirement.
- The minimum number of uppercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-uppercase 2
-> user password-policy min-uppercase 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinUpperCase
```

user password-policy min-lowercase

Configures the minimum number of lowercase English characters required for a valid password.

user password-policy min-upperce *number*

Syntax Definitions

number The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
<i>number</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify **0** with this command to disable the minimum lowercase character requirement.
- The minimum number of lowercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-lowercase 2
-> user password-policy min-lowercase 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinLowerCase
```

user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

user password-policy min-digit *number*

Syntax Definitions

number The minimum number of uppercase characters. The valid range is 0–7.

Defaults

parameter	default
<i>number</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinDigit
```

user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

user password-policy min-nonalpha *number*

Syntax Definitions

number The minimum number of non-alphanumeric characters. The valid range is 0–7.

Defaults

parameter	default
<i>number</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-nonalpha 2
-> user password-policy min-nonalpha 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinNonAlpha
```

user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

user password-min-age *days*

Syntax Definitions

days The number of days to use as the minimum age of the password. The range is 0–150.

Defaults

parameter	default
<i>days</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinAge
```

user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

user lockout-window *minutes*

Syntax Definitions

minutes The number of minutes the observation window remains active. The range is 0–99999.

Defaults

parameter	default
<i>minutes</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*.

Examples

```
-> user lockout-window 500
-> user lockout-window 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout-duration	Configures the amount of time a user account remains locked out of the switch.
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutWindow
```

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.
user lockout-duration	Configures the length of time a user account remains locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutThreshold
```

user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

user lockout-duration *minutes*

Syntax Definitions

minutes The number of minutes the user account remains locked out. The range is 0–99999.

Defaults

parameter	default
<i>minutes</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts,
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutDuration
```

user lockout unlock

Manually locks or unlocks a user account on the switch.

```
user username {lockout | unlock}
```

Syntax Definitions

<i>username</i>	The username of the account to lock or unlock.
lockout	Locks the user account out of the switch.
unlock	Unlocks a locked user account.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*.

Examples

```
-> user j_smith lockout  
-> user j_smith unlock
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show user	Displays information about all users or a particular user configured in the local user database on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaUserTable  
    aaauPasswordLockoutEnable
```

show aaa server

Displays information about a particular AAA server or AAA servers.

show aaa server [*server_name*]

Syntax Definitions

server_name The server name, which is defined through the **aaa radius-server**, **aaa tacacs+-server**, or **aaa ldap-server** commands.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If you do not include a server name in the syntax, information for all servers is displayed.

Examples

```
-> show aaa server
Server name = ldap2
  Server type           = LDAP,
  Host name 1           = ors40535,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Port                  = 389,
  Domain name           = manager,
  Search base           = c=us,
  VRF                    = default
Server name = rad1
  Server type           = RADIUS,
  IP Address 1          = 10.10.2.1,
  IP Address 2          = 10.10.3.5,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Authentication port   = 1645,
  Accounting port       = 1646
  VRF                    = default
Server name = Tpub1
  Server type           = TACACS+,
  IP Address 1          = 10.10.5.1,
  Port                  = 3,
  Timeout (in sec)     = 2,
  Encryption enabled    = no
  VRF                    = default
```

```

-> show aaa server ldap2
Server name = ldap2
  Server type           = LDAP,
  Host name 1          = ors40535,
  Retry number         = 3,
  Timeout (in sec)     = 2,
  Port                 = 389,
  Domain name          = manager,
  Search base           = c=us,
  VRF                  = default

```

output definitions

Server name	The name of the server. A RADIUS, TACACS+ or LDAP server name is defined through the aaa radius-server , aaa tacacs+-server , and aaa ldap-server commands respectively.
Server type	The type of server (LDAP, TACACS+, or RADIUS).
Host name	The name of the primary LDAP, TACACS+, or RADIUS host.
IP address	The IP address of the server.
Retry number	The number of retries the switch makes to authenticate a user before trying the backup server.
Timeout	The timeout for server replies to authentication requests.
Port	The port number for the primary LDAP or TACACS+ server.
Encryption enabled	The status of the encryption.
Domain name	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
Search base	The search base recognized by the LDAP-enabled directory servers.
Authentication port	The UDP destination port for authentication requests.
Accounting port	The UDP destination port for accounting requests.
VRF	Name of the VRF associated with the server.

Release History

Release 7.1.1; command was introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for Authenticated Switch Access.
aaa ldap-server	Configures or modifies an LDAP server for Authenticated Switch Access.
aaa tacacs+-server	Configures or modifies an TACACS+ server for Authenticated Switch Access.

show aaa authentication

Displays information about the current authenticated switch session.

show aaa authentication

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

Examples

```
-> show aaa authentication
Service type = Default
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Console
  1st authentication server = local
Service type = Telnet
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = FTP
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Http
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Snmp
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Ssh
  Authentication = Use Default,
  1st authentication server = TacacsServer
  2nd authentication server = local
```

output definitions

Authentication	Displays denied if the management interface is disabled. Displays Use Default if the management interface is configured to use the default configuration.
1st authentication server	The first server to be polled for authentication information.
2nd authentication server	The next server to be polled for authentication information.

Release History

Release 7.1.1; command was introduced.

Related Commands

[aaa authentication](#) Configures the interface for Authenticated Switch Access and specifies the server(s) to be used.

MIB Objects

aaaAuthSatable
aaatsName1
aaatsName2
aaatsName3
aaatsName4

show aaa device-authentication

Displays a list of RADIUS servers assigned to provide 802.1X, MAC, or Captive Portal authentication.

show aaa device-authentication [**802.1x** | **mac** | **captive-portal**]

Syntax Definitions

802.1x	Displays the servers used for 802.1X authentication.
mac	Displays the servers used for MAC authentication.
captive-portal	Uses the servers used for Captive Portal authentication.

Defaults

By default, all assigned servers are displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Use the optional **802.1x**, **mac**, or **captive-portal** parameters to display the servers assigned to provide the specified type of authentication.

Examples

```
-> show aaa device-authentication
Authentication type = mac
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1
    3rd authentication server = rad2,
    4th authentication server = rad3

Authentication type = 802.1x
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1

Authentication type = captive-portal
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1
```

output definitions

Authentication type	The type of authentication the server is assigned to provide (802.1x , mac , or captive-portal)
1st authentication server	The first server to be polled for authentication information. Any backup servers are also displayed on subsequent lines.

Release History

Release 7.2.1; command was introduced.

Release 7.3.4; **802.1x** and **mac** parameters added.

Release 8.1.1; **captive-portal** parameter added.

Related Commands

aaaDaName2

aaaDaName3

aaaDaName4

show aaa accounting

Displays information about accounting servers configured for authenticated switch access and device authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

show aaa accounting [802.1x | mac | captive-portal]

Syntax Definitions

802.1x	Displays the RADIUS or syslog server used to log accounting for 802.1X authenticated sessions.
mac	Displays the RADIUS or syslog server used to log accounting for MAC authenticated sessions.
captive-portal	Displays the RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.

Defaults

By default, the accounting server configuration is displayed for TACACS+ commands and management sessions (Telnet, FTP, console port, HTTP, or SNMP).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **802.1x**, **mac**, or **captive-portal** parameters to display the accounting server configuration for a specific type of device authentication.
- If no parameters are entered with this command, the accounting server configuration for authentication sessions and TACACS+ commands is displayed.

Examples

```
-> show aaa accounting mac
Accounting type = mac
  Accounting Server:
    1st Acct Server = rad1,
    2nd Acct Server = rad2

-> show aaa accounting 802.1x
Accounting type = 802.1x
  Syslog Acct Server:
    IP Address = 135.254.163.110,
    UDP port   = 514

-> show aaa accounting captive-portal
Accounting type = captive-portal
  Syslog Acct Server:
    IP Address = 135.254.163.110,
    UDP port   = 514
```

```
-> show aaa accounting
Session (telnet, ftp, ...)
  1st accounting server = rad1
Command accounting server
  1st accounting server = server1
```

Release History

Release 7.1.1; command was introduced.

Release 8.1.1; **802.1x**, **mac**, and **captive-portal** parameters added.

Related Commands

aaa accounting session	Configures an accounting server for authenticated switch access sessions.

  aaacdRowStatus
```

show aaa config

Displays the AAA parameter configuration for 802.1X, MAC, and Captive Portal sessions.

```
show aaa {802.1x | mac | captive-portal} config
```

Syntax Definitions

802.1x	Displays the parameter configuration for 802.1X authenticated sessions.
mac	Displays the parameter configuration for MAC authenticated sessions.
captive-portal	Displays the parameter configuration for Captive Portal authenticated sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **802.1x**, **mac**, or **captive-portal** parameters to display the parameter configuration for a specific type of device authentication.

Examples

```
-> show aaa 802.1x config
Authentication type = 802.1x
  Re-Authentication Timeout:
    Status                = enable,
    Interval (sec)        = 3600,
    Trust Radius           = disable

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius           = disable

-> show aaa mac config
Authentication type = mac
  Session Timeout:
    Status                = disable,
    Interval (sec)        = 43200,
    Trust Radius           = disable

  Inactivity Timeout:
    Status                = disable,
    Interval (sec)        = 600

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius           = disable
```

```

-> show aaa captive-portal config
Authentication type = captive-portal
  Session Timeout:
    Status                = disable,
    Interval (sec)        = 43200,
    Trust Radius          = disable

  Inactivity Timeout:
    Status                = disable,
    Interval (sec)        = 600

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius          = disable

```

output definitions

Authentication type	The type of authentication (802.1x , mac , or captive-portal).
Session Timeout	The parameter values for the AAA session timeout parameter. Does not apply to 802.1X authentication. Configured through the aaa session-timeout command.
Inactivity Logout	The parameter values for the AAA inactivity logout parameter. Does not apply to 802.1X authentication. Configured through the aaa inactivity-logout command.
Accounting Interim	The parameter values for the AAA accounting interim parameter. Configured through the aaa interim-interval command.
Re-authentication Timeout	The parameter values for the AAA 802.1X re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication. Configured through the aaa 802.1x re-authentication command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa device-authentication	Displays the device authentication server configuration.
show aaa accounting	Displays the accounting server configuration.
show aaa profile	Displays the AAA parameter profile configuration.

show aaa radius config

Displays the global AAA attribute values and MAC address format.

show aaa radius config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The MAC address format determines the delimiter character used between MAC address octets and whether or not characters are in uppercase or lowercase. This format is applied only when the RADIUS attribute value is set to a MAC address.

Examples

```
-> show aaa radius config
RADIUS client attributes:
  NAS port id          = default,
  NAS identifier       = default
  MAC format delimiter:
    Username           = none, UserNameCase = uppercase,
    Password           = none, PasswordCase = uppercase,
    calling station id = none, ClgStaIdCase = uppercase,
    called station id  = none, CldStaIdCase = uppercase
```

Release History

show aaa profile

Displays the AAA profile configuration.

show aaa profile [*profile_name*]

Syntax Definitions

profile_name The name of an existing AAA profile.

Defaults

By default, all profiles are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Enter an AAA profile name with this command to display information about a specific profile.

Examples

```
-> show aaa profile ap2
```

```
AAA profile name = ap2
Authentication type = mac
  Authentication Server:
    1st Auth Server   = rad1,
    2nd Auth Server   = rad2

```

output definitions

Authentication type	The type of authentication (802.1x , mac , or captive-portal) configured through the profile.
Session Timeout	The profile values defined for the AAA session timeout parameter. Does not apply to 802.1X authentication.
Inactivity Logout	The profile values defined for the AAA inactivity logout parameter. Does not apply to 802.1X authentication.
Accounting Interim	The profile values defined for the AAA accounting interim parameter.
Re-authentication Timeout	The profile values defined for the AAA re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication.
RADIUS client attributes	The profile values defined for the NAS-Port and NAS-Port-Identifier attributes and the format to use when the specified attribute value is set to a MAC address.

```

output definitions

User name	The user name for this account.
Password expiration	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the user password-expiration command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the system date and system time commands.)
Password allow to be modified date	The earliest date and time on which the user may change the password. Configured through the user password-min-age command.
Account lockout	Indicates if the user account is locked out (Yes or No) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the admin user or a user with admin privileges must manually unlock the account. Configured through the user lockout-duration and user lockout unlock commands.
Password bad attempts	The number of failed password login attempts for this user account.
Read Only for domains	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains.
Read/Write for domains	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains.
Read Only for families	The command families available with the user's read-only access. See the table on the next page for a listing of valid families.
Read/Write for families	The command families available with the user's read-write access. See the table on the next page for a listing of valid families.
Snmp allowed	Indicates whether or not the user is authorized to use SNMP (YES or NO). SNMP is allowed for the user account when SNMP authentication is specified for the account.
Snmp authentication	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
Snmp encryption	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.

Possible values for command domains and families are listed here:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

Release History

Release 7.1.1; command was introduced.

show user password-policy

Displays the global password settings configured for the switch.

show user password-policy

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

output definitions

Contain username flag	Indicates if the username is included with the password check (Enable or Disable). Configured through the user password-policy cannot-contain-username command.
Minimum number of English uppercase characters	The minimum number of uppercase characters required in a password. Configured through the user password-policy min-uppercase command.
Minimum number of English lowercase characters	The minimum number of lowercase characters required in a password. Configured through the user password-policy min-lowercase .
Minimum number of base-10 digit	The minimum number of digits required in a password. Configured through the user password-policy min-digit command.

output definitions

Minimum number of non-alphanumeric	The minimum number of non-alphanumeric characters required in a password. Configured through the user password-policy min-nonalpha command.
Minimum size	The minimum number of characters required for the password size. Configured through the user password-size min command.
Password history	The maximum number of old passwords retained in the password history. Configured through the user password-history command.
Password minimum age	The number of days a password is protected from any modification. Configured through the user password-min-age command.
Password expiration	The default expiration date applied to all passwords. Configured through the user password-expiration command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show user password-policy Displays the expiration date for passwords configured for user accounts stored on the switch.

MIB Objects

```

show user lockout-setting

Displays the global user lockout settings for the switch.

show user lockout-setting

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

output definitions

Observation window	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the user lockout-window command.
Duration	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the user lockout-duration command.
Threshold	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the user lockout-threshold command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

show aaa priv hexa [*domain or family*]

Syntax Definitions

domain or family The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

Examples

```

-> show aaa priv hexa
file           = 0x00000001 0x00000000,
telnet         = 0x00000008 0x00000000,

Release History

Release 7.1.1; command was introduced.

Related Commands

[user](#)

Configures or modifies user entries in the local user database.

MIB Objects

N/A

show system fips

Displays the administrative and operational status of the FIPS mode on the switch.

show system fips

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The **show system fips** command is the only command that can be used to view the FIPS mode status. The FIPS status is not shown in the **show configuration snaphot** command output.

Examples

```
-> show system fips
Admin State: Enabled
Oper State: Enabled
```

Release History

Release 8.1.1; command introduced.

Related Commands

[aaa authentication](#) Enable or disable the FIPS mode on the switch.

MIB Objects

```
systemFipsAdminState
  systemFipsOperState
```

aaa switch-access mode

Globally sets the access mode as enhanced or default.

```
aaa switch-access mode {default | enhanced}
```

Syntax Definitions

default	Sets the access mode as default.
enhanced	Sets the access mode as enhanced.

Defaults

parameter	default
default enhanced	default

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

It is recommended to save configuration and reboot the switch when the ASA access mode is configured.

Example

```
-> aaa switch-access mode default
```

```
-> aaa switch-access mode enhanced
```

```
WARNING: Recommended to save configuration and reload the switch upon switch access mode change.
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show aaa switch-access mode](#) Displays the access mode configuration.

MIB Objects

```
aaaAsaConfig  
  aaaAsaAccessMode
```

aaa switch-access ip-lockout-threshold

Configures the threshold value for failed login attempts from an IP address after which the IP address will be banned from switch access.

aaa switch-access ip-lockout-threshold *number*

Syntax Definitions

number Set the threshold value for login attempts in the range 0 to 999.

Defaults

parameter	default
<i>number</i>	6

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The command is applicable only if ASA enhanced mode is enabled.
- Set the IP threshold value to '0' to disable the IP lockout thresholds.
- IP address is permanently blocked/banned if the number of authentication failures from a particular IP reaches IP lockout threshold limit within two times of the user lockout window.
- Only the switch access will be restricted from the banned IP address. Any IP packet (with monitored port number) destined to a switch IP interfaces will be discarded. IP packets normally bridged/routed by the switch will not be discarded.
- A maximum of 128 IP addresses can be added to the banned list. When the maximum limit has reached, oldest entry from the list is removed to accommodate the new entries.
- User lockout window ([user lockout-window](#)) is applicable for IP lockout threshold as well.
- IP lockout threshold shall share the same window as user lockout window, and by default, IP lockout threshold shall be two times that of user lockout window. Since user lockout is giving more priority, the IP lockout threshold must be greater than the user lockout threshold value.
- The IP address will remain blocked until it is released using the command [aaa switch-access banned-ip release](#).

Example

```
-> aaa switch-access ip-lockout-threshold 2
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode

Globally sets the access mode as enhanced or default.

show aaa switch-access ip-lockout-threshold

Displays the lockout threshold configured for the remote IP addresses.

MIB Objects

aaaAsaConfig

aaaAsaAccessIpLockoutThreshold

aaa switch-access banned-ip release

Releases the banned IP addresses that are blocked due to failed login attempts.

aaa switch-access banned-ip {all | *ip_address*} release

Syntax Definitions

all Release all banned IP addresses from the banned list.

ip_address Release a specific IP address from the banned list.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The IP addresses are banned if the failed login count reaches IP lockout threshold limit.

Example

```
-> aaa switch-access banned-ip all release
-> aaa switch-access banned-ip 100.2.45.56 release
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show aaa switch-access banned-ip](#) Displays the list of banned ip addresses.

MIB Objects

```
aaaSwitchAccessBannedIpTable
  aaaSwitchAccessBannedIpAddress
  aaaSwitchAccessBannedIpRowStatus
```

aaa switch-access priv-mask

Configure the functional privileges mask for the switch access based on the access type on top of the user privilege.

```
aaa switch-access priv-mask {console | telnet | ssh | http | https} {read-only | read-write} [families... / domains...] all | none | all-except families...
```

Syntax Definitions

read-only	Specifies that the user will have read-only access to the switch through a specific access type.
read-write	Specifies that the user will have read-write access to the switch through a specific access type.
<i>families</i>	Determines the command families available to the user on the switch for a specific access type. Each command family should be separated by a space. Command families are subsets of domains. See <i>Usage Guidelines</i> for more details.
<i>domains</i>	Determines the command domains available to the user on the switch for a specific access type. Each domain should be separated by a space. See the <i>Usage Guidelines</i> for more details.
all	Specifies that all command families and domains are available to the user for a specific access type.
none	Specifies that no command families or domains are available to the user for a specific access type.
all-except	Specifies that functional privileges for families followed by 'all-except' are disabled for a specific access type.

Defaults

By default, the access types are enabled with read-write privileges for all the families.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- The access privileges for the SSH, TELNET, Console, HTTP, HTTPS can be defined.
- Possible values for domains and families are listed in the table here:

Domain	Corresponding Families
domain-admin	file telnet debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health

domain-network	ip rip ospf bgp vrrp ip-routing ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa
domain-mpls	mpls
domain-datacenter	fips, auto-fabric
domain-afn	sip-snooping, dpi, app-mon

Example

```
-> aaa switch-access priv-mask ssh read-only webmgt vrrp vrf vlan udd
-> aaa switch-access priv-mask telnet read-write tftp-client telnet system stp ssh
-> aaa switch-access priv-mask ssh read-only all-except vlan
-> aaa switch-access priv-mask telnet read-write all-except ip
```

If privileges for specific families need to be applied, then remove the existing privilege using the **no** command, and re-apply the required family privilege.

```
-> no aaa switch-access priv-mask telnet read-write all
-> aaa switch-access priv-mask telnet read-write vlan aaa
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode Globally sets the access mode as enhanced or default.

  aaaSwitchAccessWriteRight3
  aaaSwitchAccessWriteRight4
```

aaa switch-access management-stations admin-state

Enables or disables the IP management station feature in a switch.

aaa switch-access management-stations admin-state {enable | disable}

Syntax Definitions

enable	Enables the IP management station feature in the switch.
disable	Disables the IP management station feature in the switch.

Defaults

The IP management station feature is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- When the IP management station is disabled, switch access from any IP address shall be allowed. If there is a login failure (based on the **ip-lockout threshold** value), the IP address will be banned/ blocked and added to the banned IP address list.
- When the IP management station is enabled, the switch access will be allowed only from those IPs configured in the management station list and only if those are not in banned list.
- It is recommended to enable this command from console since this may terminate the existing session, if enabled through telnet or SSH.

Example

```
-> aaa switch-access management stations admin-state enable
-> aaa switch-access management stations admin-state disable
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access mode

Globally sets the access mode as enhanced or default.

**aaa switch-access
management-stations**

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station.

**show aaa switch-access
management-stations**

Displays the list of configured management stations.

MIB Objects

aaaSwitchAccessMgmtStationTable

aaaSwitchAccessMgmtStationRowStatus

aaa switch-access management-stations

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station. The remote access is allowed only from these IP addresses if management station feature is enabled.

```
aaa switch-access management-stations [ip_address / ip_address /mask]
```

```
no aaa switch-access management-stations ip_address
```

Syntax Definitions

ip_address IP address and the mask of the management station.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The command is configurable when [aaa switch-access management-stations admin-state](#) is enabled.
- A maximum of 64 management stations can be configured.
- Removing an IP address from the management station list will not remove the IP from the banned list.
- Whenever an IP address is removed from the management station, switch will stop responding to that IP. However, the existing sessions are not terminated automatically.

Example

```
-> aaa switch-access management stations 100.15.9.8  
-> aaa switch-access management stations 100.15.9.9 255.255.255.0
```

Release History

```

show aaa switch-access ip-lockout-threshold

Displays the IP lockout threshold value.

```
show aaa switch-access ip-lockout-threshold
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Example

```
-> show aaa switch-access ip-lockout-threshold
ip Lockout Threshold = 6
```

output definitions

IP lockout threshold	The IP lockout threshold value.
-----------------------------	---------------------------------

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa switch-access ip-lockout-threshold](#) Configures the threshold for failed login attempts from an IP address after which the IP address will be banned from switch access.

MIB Objects

```
aaaAsaConfig
  aaaAsaAccessIpLockoutThreshold
```

show aaa switch-access banned-ip

Displays the list of banned IP addresses.

show aaa switch-access banned-ip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Example

```
-> show aaa switch-access banned-ip
  S. No      Banned IP address
|-----+-----|
  1          100.15.5.21
  2          100.15.5.22
```

output definitions

Banned IP address	The banned IP address blocked due to failed login attempts.
--------------------------	---

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa switch-access banned-ip release](#) Releases the banned IP addresses that are blocked due to failed login attempts.

MIB Objects

aaaSwitchAccessBannedIpTable
aaaSwitchAccessBannedIpAddress

show aaa switch-access priv-mask

Displays the privilege details for the access types.

show aaa switch-access priv-mask

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show aaa switch-access priv-mask
Interface Type = CONSOLE,
  Read Only for domains   = All ,
  Read/Write for domains  = All
Interface Type = TELNET,
  Read Only for domains   = All ,
  Read/Write for domains  = All
Interface Type = SSH,
  Read Only for domains   = All ,
  Read/Write for domains  = All
Interface Type = HTTP,
  Read Only for domains   = All ,
  Read/Write for domains  = All
Interface Type = HTTPS,
  Read Only for domains   = All ,
  Read/Write for domains  = All
```

output definitions

Interface Type	The interface type.
Read Only for domains	Read-only privileges for the domains.
Read/Write for domains	Read-write privileges for the domains.

Release History

Release 8.3.1; command introduced.

Related Commands

aaa switch-access priv-mask Configure the functional privileges for a particular access type.

MIB Objects

```
aaaSwitchAccessPrivMaskTable
  aaaSwitchAccessType
  aaaSwitchAccessReadRight1
  aaaSwitchAccessReadRight2
  aaaSwitchAccessReadRight3
  aaaSwitchAccessReadRight4
  aaaSwitchAccessWriteRight1
  aaaSwitchAccessWriteRight2
  aaaSwitchAccessWriteRight3
  aaaSwitchAccessWriteRight4
```

show aaa switch-access management-stations

Displays the list of configured management stations.

show aaa switch-access management-stations

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show aaa switch-access management-stations
AAA Switch Access:
Restricted Management station = ENABLED
  Management          Subnet
  IP Address          Prefix
-----+-----
  100.15.5.21        255.255.255.255
```

output definitions

Restricted Management station	IP management station status: Enabled or disabled.
Management IP address	IP address of the management station.
Subnet Prefix	The prefix corresponding to the IP address.

Release History

Release 8.3.1; command introduced.

Related Commands

**aaa switch-access
management-stations admin-
state**

Enables or disables the IP management station feature in a switch.

**aaa switch-access
management-stations**

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station.

MIB Objects

```
aaaSwitchAccessMgmtStationTable  
  aaaSwitchAccessMgmtStationRowStatus  
  aaaSwitchAccessMgmtStationIpAddress
```

show aaa switch-access hardware-self-test

Displays the major hardware component status.

show aaa switch-access hardware-self-test

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The command is applicable only when ASA enhanced mode is enabled.

Examples

```
-> show aaa switch-access hardware-self-test
Checking CPU status -> Ok
Checking Memory status -> Ok
Checking Flash Status -> Ok
Checking NI Module status -> Ok
Checking Power Supply status -> Ok
Checking Lanpower Status -> Ok
Checking GBIC Status -> Ok
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show aaa switch-access process-self-test](#) - Displays the major software process status.

MIB Objects

N/A

show aaa switch-access process-self-test

Displays the major software process status.

show aaa switch-access process-self-test

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The command is applicable only when ASA enhanced mode is enabled.

Examples

```
-> show aaa switch-access process-self-test
-----+-----
      Process Self Test
-----+-----
Checking Chassis Supervision Process -> Ok
Checking AAA Process -> Ok
Checking Configuration Manager Process -> Ok
Checking Network Process -> Ok
Checking QoS Process ---> Ok
Checking VLAN Manager Process -> Ok
Checking H/W Driver Process -> Ok
Checking Layer2/Switching -> Ok
Checking Layer3/Switching -> Ok
```

Release History

Release 8.3.1; command introduced

Related Commands

[show aaa switch-access hardware-self-test](#)

Displays the major hardware components status.

MIB Objects

N/A

aaa common-criteria admin-state

Enables or disables common criteria mode on the switch.

aaa common-criteria admin-state {enable | disable}

Syntax Definitions

enable | disable Enables or disables the common criteria mode.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The configuration is applied only after a reload of the switch.

Examples

```
-> aaa common-criteria admin-state enable  
WARNING: Common Criteria configuration is applied only after reload
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show aaa common-criteria config](#) Displays the common criteria status on the switch.

MIB Objects

N/A

show aaa common-criteria config

Displays the common criteria status on the switch.

show aaa common-criteria config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show aaa common-criteria config
Admin State: Enabled,
Operational State: Enabled
```

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa common-criteria admin-state](#) Enables or disables common criteria mode on the switch.

MIB Objects

N/A

aaa certificate update-ca-certificate

Updates the CA-bundle with the custom CA server certificate provided by CA.

aaa certificate update-ca-certificate *ca_file*

Syntax Definitions

ca_file The custom CA server certificate (in PEM format) provided by the CA.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The custom CA server certificate should be copied in PEM format to the **/flash/switch/** directory via SFTP.
- This command appends the existing CA bundle (**certs.pem**) and the custom CA server certificate provided as input.
- The update of custom CA server certificates needs to be done before corresponding server configurations are done on the switch. If the update is done post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate update-ca-certificate ca.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa certificate update-crl](#) Updates the CRL list with the custom CRL provided by CA.

MIB Objects

N/A

aaa certificate update-crl

Updates the CRL list with the custom CRL provided by CA.

aaa certificate update-crl *crl_file*

Syntax Definitions

crl_file The custom CRL file (in PEM format) provided by the CA.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The custom CRL file should be copied in PEM format to the **/flash/switch/** directory via SFTP.
- This command appends the existing CRL file (**crl.pem**) and the custom CRL provided as input.
- The update of the custom CRL needs to be done before corresponding server configurations are done on the switch. If the update is done post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate update-crl crl.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa certificate update-ca-certificate](#) Updates the CA-bundle with the custom CA server certificate provided by CA.

MIB Objects

N/A

aaa certificate generate-rsa-key key-file

Generates the RSA 2048 bit key with the file name provided as input.

aaa certificate generate-rsa-key key-file *key_file*

Syntax Definitions

key_file The name of the key file under which the RSA 2048 bit key is stored.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Generates RSA 2048 bit key in **/flash/switch/cert.d** directory with the file name as the input key file.

Examples

```
-> aaa certificate generate-rsa-key key-file myCliPrivate.key
```

Release History

Release 8.3.1; command introduced.

Related Commands

aaa certificate generate-self-signed	Generates the X.509 self-signed certificate for TLS client authentication.
aaa certificate view	Displays the contents of the X.509 certificate.
aaa certificate delete	Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate generate-self-signed

Generates the X.509 self-signed certificate for TLS client authentication.

```
aaa certificate generate-self-signed {cert_file} key {key_file} [days valid_period] {CN common_name}  
{ON org_name} {OU org_unit} {L locality} {ST state} {C country}
```

Syntax Definitions

<i>cert_file</i>	The name of the X.509 certificate file to be created.
<i>key_file</i>	The name of the key file under which the RSA 2048 bit key is stored.
<i>valid_period</i>	Validity period (in days) of the X.509 certificate.
<i>common_name</i>	Common Name used in X.509 certificate.
<i>org_name</i>	The Organization Name used in X.509 certificate.
<i>org_unit</i>	The Organization Unit used in X.509 certificate.
<i>locality</i>	The Locality used in X.509 certificate.
<i>state</i>	The State used in X.509 certificate.
<i>country</i>	The Country used in X.509 certificate.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command generates the file in **/flash/switch/cert.d** directory.
- Default values will be taken for all other optional parameters while generating the X.509 certificate.
- The X.509 certificate needs to be done before corresponding server configurations are done on the switch. If the certificate is created post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate generate-self-signed myCliCert.pem key clientkey.key days 3650  
cn client.ale.com on ALE ou ESD l BAN st KAR c IN
```

Release History

Release 8.3.1; command introduced.

Related Commands

Release History

Release 8.3.1; command introduced.

Related Commands**aaa certificate generate-self-signed**

Generates the X.509 self-signed certificate for TLS client authentication.

aaa certificate delete

Deletes the X.509 certificate.

MIB ObjectsN/A

aaa certificate verify ca-certificate - TBD

Verifies the contents of the X.509 certificate.

aaa certificate verify ca-certificate *cert_file* **certificate** *cert_file*

Syntax Definitions

ca_cert_file The X.509 certificate file (in PEM format) to be displayed.

cert_file The X.509 certificate file (in PEM format) to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> aaa certificate verify ca-certificate ca_cert certificate cert_file
```

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa certificate generate-self-signed](#) Generates the X.509 self-signed certificate for TLS client authentication.

[aaa certificate delete](#) Deletes the X.509 certificate.

MIB Objects

N/A

aaa certificate delete

Deletes the X.509 certificate.

aaa certificate delete *cert_file*

Syntax Definitions

cert_file The X.509 certificate file (in PEM format) to be deleted.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> aaa certificate delete clientcert.pem
```

Release History

Release 8.3.1; command introduced.

Related Commands

[aaa certificate generate-self-signed](#) Generates the X.509 self-signed certificate for TLS client authentication.

[aaa certificate view](#) Displays the contents of the X.509 certificate.

MIB Objects

N/A

aaa certificate generate-csr

Generates the CSR (Certificate Signing Request) to be sent to get a CA signed certificate for TLS client authentication.

```
aaa certificate generate-csr {csr_file} key {key_file} [dn domain_name] {CN common_name} {ON org_name} {OU org_unit} {L locality} {ST state} {C country}
```

Syntax Definitions

<i>csr_file</i>	The name of the CSR certificate file to be created.
<i>key_file</i>	The name of the key file under which the RSA 2048 bit key is stored.
<i>domain_name</i>	Domain name to be used in the CSR.
<i>common_name</i>	Common Name used in X.509 certificate.
<i>org_name</i>	The Organization Name used in X.509 certificate.
<i>org_unit</i>	The Organization Unit used in X.509 certificate.
<i>locality</i>	The Locality used in X.509 certificate.
<i>state</i>	The State used in X.509 certificate.
<i>country</i>	The Country used in X.509 certificate.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Generates <csr_file>.pem file in **/flash/switch** directory. The <csr_file>.pem file created should be sent to CA signing authority to get the CA certificate.
- Default values will be taken for all other optional parameters while generating the CSR.
- The CSR needs to be created, sent to CA authority and the corresponding CA certificate (obtained from CA authority) should be uploaded to the **/flash/switch** directory before corresponding server configurations are done on the switch. If the CA certificate is uploaded post server configuration, then a switch reboot needs to be done for the changes to take effect.

Examples

```
-> aaa certificate generate-csr myCliCert.pem key clientkey.key days 3650 cn
client.ale.com on ALE ou ESD l BAN st KAR c IN
```

Release History

Release 8.3.1; command introduced.

Related Commands

**show aaa common-criteria
config**

Displays the common criteria status on the switch.

MIB Objects

N/A

kerberos mac-move

Enable or disable MAC move globally on the switch.

kerberos mac-move {enable | disable}

Syntax Definitions

enable Enable MAC move globally on the switch.

disable Disable MAC move globally on the switch.

Defaults

By default, MAC move is enabled.

Platforms Supported

Not supported in this release.

Usage Guidelines

There is no support for multiple users on the same MAC address. For the same MAC address, a new Kerberos authentication will overwrite the existing entry in the Kerberos Database.

Examples

```
-> kerberos mac-move enable  
-> kerberos mac-move disable
```

Release History

Release 8.3.1; command introduced.

Related Commands

alaDaKerberosGlobalMacMoveStatus
```

kerberos inactivity-timer

Configures global inactivity timer on the switch for Kerberos users.

kerberos inactivity-timer *num*

Syntax Definitions

mins Time interval in minutes. The valid range is 10–600 minutes.

Defaults

By default, inactivity timer is set to 300 minutes.

Platforms Supported

Not supported in this release.

Usage Guidelines

N/A

Examples

```
-> kerberos inactivity-timer 30
```

Release History

Release 8.3.1; command introduced.

Related Commands

kerberos mac-move	Enable or disable MAC move globally on the switch.
show kerberos configuration	Displays Kerberos global configuration.

MIB Objects

```
alaDaKerberosGlobalConfig  
  alaDaKerberosGlobalInactivityTimer
```

kerberos ip-address

Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.

kerberos ip-address *ip_address* [**udp-port** *num*]

no kerberos ip-address *ip_address*

Syntax Definitions

<i>ip_address</i>	The IP address of the Kerberos server.
<i>num</i>	UDP or TCP port number of the Kerberos application running on the Kerberos server. UDP port range is 1–65535.

Defaults

Default value of UDP port is 88.

Platforms Supported

Not supported in this release.

Usage Guidelines

- At least one Kerberos server and one Kerberos enabled port must be configured on the switch for Kerberos snooping to function.
- A maximum of four Kerberos server IP addresses can be configured on a switch
- Server IP address cannot be configured as 0.0.0.0, and the octet value in the IP address cannot be greater than 255 (for example, 1.256.2.3).
- Use the 'udp-port' keyword to configure both UDP and TCP protocol port number.
- Use the **no** form of this command to delete the Kerberos server IP address. Only one server can be deleted at a time.
- If all the authentication servers are removed from the switch, then all the Kerberos users learned so far on all the ports are not removed from the database.

Examples

```
-> kerberos ip-address 172.21.160.102 udp-port 2001
-> kerberos ip-address 172.21.160.103 udp-port 2003
-> no kerberos ip-address 172.21.160.102
```

Release History

Release 8.3.1; command introduced.

Related Commands

kerberos mac-move	Enable or disable MAC move globally on the switch.
kerberos inactivity-timer	Configures global inactivity timer on the switch for Kerberos users.
kerberos server-timeout	Configures global server reply time-out timer value on the switch for Kerberos users.
show kerberos configuration	Displays Kerberos global configuration.

MIB Objects

```
alaDaKerberosServerTable  
  alaDaKerberosIpAddressType  
  alaDaKerberosIpAddress  
  alaDaKerberosUdpPort  
  alaDaKerberosRowStatus
```

kerberos server-timeout

Configures global server reply time-out timer value on the switch for Kerberos users.

kerberos kerberos server-timeout *num*

Syntax Definitions

secs Server reply time-out time interval in seconds in the range 1 second to 30 seconds.

Defaults

By default, reply-timeout is 2 seconds.

Platforms Supported

Not supported in this release.

Usage Guidelines

All the users trying to get authenticated from a specific server will have the same value for reply-timeout timer. Whenever a Kerberos request packet is sent to the server, the server reply time-out starts. If the timer expires before receiving the reply from the server, the user authentication is marked as server-time-out and a trap is generated.

Examples

```
-> kerberos server-timeout 20
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show kerberos configuration](#) Displays Kerberos global configuration.

MIB Objects

alaDaKerberosGlobalConfig
alaDaKerberosGlobalServerTimeoutTimer

Examples

```
-> kerberos authentication-pass policy-list-name p2
```

The following example shows that the **p2** is configured as the global classification QoS policy list on the switch for Kerberos users.

```
-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Active,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  Active
```

When the QoS policy list **p2** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list p2
-> qos apply

-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Inactive,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  active
```

The following command removes the global classification QoS policy list from the switch.

```
-> no kerberos authentication-pass policy-list-name
```

Release History

Release 8.3.1; command introduced.

Related Commands

[kerberos ip-address](#)

Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.

[kerberos authentication-pass domain](#)

Configures "per domain" classification policy for the Kerberos users.

[show kerberos configuration](#)

Displays Kerberos global configuration.

MIB Objects

alaDaKerberosGlobalConfig
alaDaKerberosGlobalPolicy

kerberos authentication-pass domain

Configures "per domain" classification policy for the Kerberos users.

kerberos authentication-pass domain *domain_name* **policy-list-name** *policy_list*

no kerberos authentication-pass domain *domain_name*

Syntax Definitions

domain_name Domain name on which the QoS policy is applied. Domain name length can be a maximum of 32 characters. Domain name is case sensitive.

policy_list Name of the QoS policy list already configured.

Defaults

By default, global policy list name is 'none', that is, there is no Kerberos global QoS policy list configured.

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the **no** form of this command to remove the "per domain" classification policy for Kerberos users.

Examples

```
-> kerberos authentication-pass domain EXAMPLE.COM policy-list-name p11
```

The following example shows that the **p11** is configured as the policy list associated with the domain EXAMPLE.COM

```
-> show kerberos configuration
```

```
Mac-Move           :disabled,
Inactivity Timer    :30 (mins),
Server Timeout      :20 (secs),
Global QoS Policy List :p2,
Global QoS Policy Status :Active,
```

```
Servers           :
IP-Address         UDP Port
-----+-----
1.1.1.1           88
```

```
Per Domain QoS policy List :
Domain-Name           Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM           p11                  Active
```

When the QoS policy list **p11** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list p11
-> qos apply

-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Active,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  Inactive
```

The following command removes the “per domain” classification policy for Kerberos users.

```
-> no kerberos authentication-pass domain EXAMPLE.COM
```

Release History

Release 8.3.1; command introduced.

```

show kerberos users

Displays the learnt Kerberos users information.

show kerberos users [*port slot/port* | *mac-address*]

Syntax Definitions

slot/port The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

mac-address MAC address of the Kerberos user.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- If a slot/port is specified, the Kerberos users learnt on that port are displayed.
- If MAC address is specified, then the information related to that Kerberos user is displayed.
- If none of the parameters are specified (slot/port, MAC address), then the information related to all the Kerberos users learnt on the switch is displayed.

Examples

```
-> show kerberos users
Slot/      MAC           Authentication      QOS
Port      Address        Status             Policy
-----+-----+-----+-----
 2/18 00:11:22:33:44:55 tgs-authenticated  p11
 2/19 00:01:02:03:04:05 tgs-timeOut
```

```
-> show kerberos users port 2/18
Slot/      MAC           Authentication      QOS
Port      Address        Status             Policy
-----+-----+-----+-----
 2/18 00:11:22:33:44:55 tgs-authenticated  p11
```

```
-> show kerberos users 00:11:22:33:44:55
Detail User Information:
  MAC Address       : 00:11:22:33:44:55
  Port              : 2/18
  Authentication Status : tgs-authenticated
  QoS Policy        : p11
  Domain Name       : EXAMPLE.COM
  User Name         : root\admin
```

```
User Entry State      : active
Inactivity Timer Left : -1
```

output definitions

Slot/Port	The Kerberos slot and the port number.
MAC Address	MAC address of the Kerberos user.
Authentication Status	Kerberos authentication process involve exchange of two requests (AS_REQ and AS_REP) and two response (AS_REP and TGS_REP). This field indicates up to which level the authentication has reached. On successful authentication, "tgs-authenticated" is displayed.
QoS Policy	QoS policy list configured on the switch for the Kerberos user.
Domain Name	Per domain classification policy configured for the Kerberos user.
User Name	User name of the client

Release History

Release 8.3.1; command introduced.

Related Commands

  alaDaKerberosUserState
```

show kerberos statistics

Displays global and port-level Kerberos statistics.

show kerberos statistics [**port**] *slot/port*[-*port2*]

Syntax Definitions

slot/port

The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-10).

Defaults

By default, global Kerberos statistics are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **port** parameter to display Kerberos statistics for all ports.
- Use the *slot/port* option along with the **port** parameter to display the statistics for a specific port.
- Use the *slot/port1-port2* (range of ports) option to display the statistics for a range of ports.

Examples

```
-> show kerberos statistics
Total Client Packet Rx           : 52
Total Server Packet Rx           : 13
Total KRB-AS-REQ Packet Rx       : 47
Total KRB-AS-REP Packet Rx       : 8
Total KRB-TGS-REQ Packet Rx      : 5
Total KRB-TGS-REP Packet Rx      : 5
Total KRB-ERROR Packet Rx        : 0
Total Client Packet Sw Discard   : 0
Total Server Packet Sw Discard   : 2
Total Client Packet Hw Discard   : 0
Total Server Packet Hw Discard   : 0
```

output definitions

Total Client Packet Rx	Total client request packets received.
Total Server Packet Rx	Total server response packets received.
Total KRB-AS-REQ Packet Rx	Total AS-REQ request packets received.
Total KRB-AS-REP Packet Rx	Total AS-REP response packets received.
Total KRB-TGS-REQ Packet Rx	Total TGS-REQ request packets received.
Total KRB-TGS-REP Packet Rx	Total TGS-REP response packets received.
Total KRB-ERROR Packet Rx	Total error packets received from the server.

output definitions (continued)

Total Client Packet Sw Discard	Total client's request packets discarded at software by Kerberos module.
Total Server Packet Sw Discard	Total server's response packets discarded at software by Kerberos module.
Total Client Packet Hw Discard	Total client's request packets discarded at hardware.
Total Server Packet Hw Discard	Total server's response packets discarded at hardware.

```
-> show kerberos statistics port
```

39 Access Guardian Commands

Access Guardian refers to a set of OmniSwitch security functions that work together to provide a dynamic, proactive network security solution. This chapter provides information about the commands that are used to configure the following Access Guardian features through the Command Line Interface (CLI):

- **Universal Network Profile (UNP)**—Access Guardian is configured and applied through the framework of the UNP feature. UNP is enabled on switch ports to activate Access Guardian functionality that is used to authenticate and classify users into UNP profiles. Each profile is mapped to a VLAN ID or Service Access Point (SAP) to which the user is dynamically assigned. Specific UNP port configurations help to simplify and easily replicate the same configuration across multiple ports.
- **Bring Your Own Device (BYOD) - OmniSwitch / ClearPass Integration:** The OmniSwitch leverages Access Guardian functionality along with the ClearPass Policy Manager (CPPM) to provide an overall BYOD solution.
 - Configurable UNP port and profile attributes are used to redirect traffic from the OmniSwitch to the CPPM server.
 - Configurable GRE tunnels allow the OmniSwitch to intercept and tunnel Multicast Domain Name System (mDNS) and Simple Service Discovery Protocol (SSDP) packets to or from a WLAN controller in a BYOD network.
- **Captive Portal**—Internal and external Captive Portal Web-based authentication. Internal Captive Portal authentication is provided through an internal Web server on the OmniSwitch that presents default or customized Web pages to the user. A post-authentication and/or post-classification process to validate user credentials and dynamically assign a new role (policy list) to enforce user access to the network. External, guest Captive Portal authentication is provided through the OmniSwitch Access Guardian interaction with the ClearPass Policy Manager.
- **Quarantine Manager and Remediation (QMR)**—QMR is a switch-based application that restricts the network access of known quarantined users and provides a remediation path to allow quarantined users to regain their network access.

For commands used to configure device authentication, authorization, and accounting parameters that are used to support Access Guardian functionality, see “[Chapter 38, “AAA Commands.”](#)”

For commands used to configure Learned Port Security (LPS), which is used by Access Guardian to help ensure that only certain devices are allowed to connect to the switch, see “[Chapter 47, “Learned Port Security Commands.”](#)”

MIB information for the UNP commands is as follows:

Filename: ALCATEL-IND1-DA-MIB
Module: alcatelIND1DaMIB

Filename: ALCATEL-IND1-UDP-RELAY-MIB
Module: alcatelIND1UDPRelayMIB

A summary of the available commands is listed here:

unp dynamic-vlan-configuration

Configures the UNP status for dynamic VLAN configuration. When this functionality is enabled and a VLAN mapping is configured with a VLAN ID that does not exist, the switch will dynamically create the necessary VLAN ID.

unp dynamic-vlan-configuration

no unp dynamic-vlan-configuration

Syntax Definitions

N/A

Defaults

By default, dynamic VLAN configuration is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Note. Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootstrap.

- Use the **no** form of this command to disable dynamic VLAN configuration.
- When dynamic VLAN configuration is disabled, configuring a VLAN mapping with a VLAN ID that does not exist in the switch configuration is not allowed.
- The VLAN status and other port (non-UNP port) assignments for a dynamic UNP VLAN are configurable using standard VLAN commands. In addition, the STP status is configurable and enabled by default when the dynamic VLAN is created.
- A dynamic VLAN cannot be deleted using standard VLAN commands (**no vlan *vlan_id***).
- UNP dynamic VLANs are identified as a separate type of VLAN. The **vlan show** commands will display this type with the default name of “UNP-DYN-VLAN” and the designated type as “UNP Dynamic Vlan”.

Examples

```
-> unp dynamic-vlan-configuration
-> no unp dynamic-vlan-configuration
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.1; OmniSwitch 10K support added.

Related Commands

- unp profile** Configures a UNP in the switch configuration.
- show unp global configuration** Displays the dynamic VLAN configuration status for the switch.

MIB Objects

alaDaUNPGlobalConfiguration
alaDaUNPDynamicVlanConfigFlag

unp dynamic-profile-configuration

Configures the UNP status for dynamic profile configuration. When this functionality is enabled, a UNP profile is dynamically created based on specific traffic conditions.

unp dynamic-profile-configuration

no unp dynamic-profile-configuration

Syntax Definitions

N/A

Defaults

By default, dynamic profile configuration is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable dynamic profile configuration.
- When dynamic profile configuration is enabled, a UNP profile is dynamically created when the trust VLAN tag option is enabled on the UNP port or link aggregate and one of the following conditions occurs:
 - A tagged packet received on the UNP port contains a VLAN tag that matches an existing MVRP VLAN in the switch configuration that is not assigned to a profile.
 - There is no matching VLAN in the switch configuration.
- Dynamically created profiles are saved in the **boot.cfg** file for the switch.
- By default, dynamically created profiles are automatically named **dynamic_profile_vlan_id**, where the VLAN ID is the ID of the VLAN contained in the packet tag.
- After the dynamic profile is created, changing the profile name, the associated VLAN ID, or the QoS policy list is allowed. To avoid any confusion, change the profile name if the VLAN ID associated with the profile has changed.
- If the dynamic profile configuration option is enabled along with the dynamic VLAN configuration option and a dynamically created profile refers to a VLAN that is an MVRP VLAN, then the MVRP VLAN is automatically converted to a dynamic UNP VLAN (UNP-DYN-VLAN).

Examples

```
-> unp dynamic-profile-configuration
-> no unp dynamic-profile-configuration
```

Release History

Release 7.2.1.R02; command was introduced.
Release 7.3.1; OmniSwitch 10K support added.

Related Commands

- unp profile** Configures a UNP in the switch configuration.
- unp dynamic-vlan-configuration** Configures the status of dynamic VLAN configuration. When enabled, UNP will create a VLAN at the time a VLAN mapping for a profile is created that specifies a VLAN ID that does not exist in the switch configuration.
- show unp global configuration** Displays the dynamic profile configuration status for the switch.

MIB Objects

alaDaUNPGlobalConfiguration
alaDaUNPDynamicProfileConfigFlag

unp auth-server-down

Configures a UNP profile to which a device is classified if authentication fails because the RADIUS server is unreachable.

```
unp auth-server-down {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp auth-server-down [profile1] [profile2] [profile3]
```

Syntax Definitions

profile_name The name of an existing profile to which the device is assigned when the authentication server is unreachable.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an authentication server down UNP profile.
- When a device is classified into the specified profile, a configurable authentication down timer is started for that device. When the timer runs out, the authentication process is performed again. If authentication fails again, the device is classified back into the authentication server down profile. The switch will repeat this process until the device authentication is completed.
- Configuring an authentication server down UNP is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, the traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
 - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
 - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- If the authentication server down UNP is removed, the authentication server down timer is also removed.
- Up to three different profile names are configurable as authentication server down UNP profiles. The profile applied to the traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to device traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to device traffic received on UNP access ports.
 - When multiple profiles are configured, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the device traffic.

- Configuring both a VLAN profile and a service profile ensures that an authentication server down UNP is available for device traffic received on both types of UNP ports (bridge and access).

Examples

```
-> unp auth-server-down profile1 unp1-vlan
-> no unp auth-server-down profile1
-> unp auth-server-down profile1 unp1-vlan profile2 unp2-vxlan
-> no unp auth-server-down profile1 profile2
```

Release History

Release 7.2.1; command was introduced.

Release 7.3.1; OmniSwitch 10K support added.

Release 7.3.4; command syntax changed; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters replaced with **profile1**, **profile2**, and **profile3** parameters.

Related Commands

unp auth-server-down-timeout Configures the value for the authentication server down timer.

show unp global configuration Displays the profiles designated as the authentication server down UNP for the switch.

MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPAuthServerDownUnp

unp auth-server-down-timeout

Configures the authentication server down timer value. This timer value is applied to devices that are learned in the authentication server down UNP.

unp auth-server-down-timeout *seconds*

no unp auth-server-down-timeout

Syntax Definitions

seconds The number of seconds the authentication server down timer is active. The valid range is 10 to 1000 seconds.

Defaults

By default, the timeout value is set to 60 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the timer value back to the default value (60 seconds).
- When this timer expires, devices learned in the authentication server down UNP are cleared from that UNP. The authentication and classification process is attempted again.
- When the authentication server down UNP is removed, the authentication server down timer is also cleared.

Examples

```
-> unp auth-server-down-timeout 500
-> unp auth-server-down-timeout 120
-> no unp auth-server-down-timeout
```

Release History

Release 7.2.1; command was introduced.

Release 7.3.1: OmniSwitch 10K support added.

Release 7.3.4; command syntax changed; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72)

Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters deprecated.

Related Commands

- unp auth-server-down** Configures a UNP to which a device is classified if MAC or 802.1X authentication fails because the RADIUS server is not reachable.
- show unp global configuration** Displays the authentication server down timeout value for the switch.

MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPAuthServerDownTimeout

unp policy validity-period

Configures a UNP validity period policy that specifies the days and times during which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria.

unp policy validity-period *policy_name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*] [**interval** *mm:dd:yyyy hh:mm to mm:dd:yyyy hh:mm*] [**timezone** *zones*]

no unp policy validity-period *policy_name* [**days** *days* | **months** *months* | **hours** / **interval** | **timezone**]

Syntax Definitions

<i>policy_name</i>	The name of the validity period policy (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., monday , tuesday , wednesday , etc.).
<i>months</i>	The month(s) in which the validity period is active. Enter the actual month (e.g., january , february , march , etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yyyy hh:mm</i>	An interval of time during which the validity period is active. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).
<i>zones</i>	The timezone in which the validity period is active (for example, pst , est , gmt , etc.)

Defaults

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval
<i>zones</i>	local timezone

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a UNP period policy from the configuration, or to remove parameters from a particular validity period policy.

- Any combination of the **days**, **months**, **hours**, **interval**, and **timezone** parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **unp profile period-policy** command to associate a period policy with a UNP profile.

Examples

```
-> unp policy validity-period Office-Time
-> no unp policy validity-period Office-Time

-> unp policy validity-period Office-Time days monday
-> unp policy validity-period Office-Time days monday time-zone IST
-> no unp policy validity-period Office-Time time-zone
-> no unp policy validity-period Office-Time days monday

-> unp policy validity-period Office-Time days all
-> unp policy validity-period Office-Time days all time-zone PST
-> no unp policy validity-period Office-Time days saturday sunday

-> unp policy validity-period Office-Time hours 9:00 to 17:00
-> unp policy validity-period Office-Time hours 9:00 to 17:00 time-zone IST
-> no unp policy validity-period Office-Time hours

-> unp policy validity-period Holiday months december january
-> no unp policy validity-period Holiday months january

-> unp policy validity-period Holiday months december time-zone IST
-> no unp policy validity-period Holiday time-zone
-> no unp policy validity-period Holiday months december

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
-> no unp policy validity-period Seminar interval

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
time-zone PST
-> no unp policy validity-period Seminar time-zone
-> no unp policy validity-period Seminar interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

- unp profile period-policy** Assigns a UNP period policy to a profile.
- show unp policy validity-period** Displays information about the UNP period policy configuration.

MIB Objects

  alaDaUNPValidityPeriodTimezone
  alaDaUNPValidityPeriodTimezoneStatus
  alaDaUNPValidityPeriodActiveStatus
```

unp policy validity-location

Configures a UNP validity location policy that defines a specific location from which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria defined.

unp policy validity-location *policy_name* [**port** *chassis/slot/port[-port2]* | **linkagg** *agg_id[-agg_id2]*]
[**system-name** *system_name*] [**system-location** *system_location*]

no unp policy validity-location *policy_name* [**port** | **linkagg** | **system-name** | **system-location**]

Syntax Definitions

<i>policy_name</i>	The name of the validity location policy (up to 31 alphanumeric characters).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a UNP port. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number of a UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>system_name</i>	The configured system name for the switch from which the device can access the network.
<i>system_location</i>	The configured system location for the switch from which the device can access the network.

Defaults

parameter	default
<i>chassis/slot/port[-port2]</i>	no restriction
<i>agg_id[-agg_id2]</i>	no restriction
<i>system_name</i>	no restriction
<i>system_location</i>	no restriction

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove a UNP location policy from the configuration, or to remove parameters from a particular location policy.
- Any combination of the **port**, **linkagg**, **system-name**, and **system-location** parameters is allowed. The location policy is only in effect when all specified parameters are true.
- Use the [unp profile location-policy](#) command to associate a location policy with a UNP profile.

Examples

```
-> unp policy validity-location ALU-NA
-> no unp policy validity-location ALU-NA

-> unp policy validity-location ALU-NA port 1/1/10
-> unp policy validity-location ALU-NA port 1/1/1-5
-> no unp policy validity-location ALU-NA port

-> unp policy validity-location ALU-NA linkagg 10
-> unp policy validity-location ALU-NA linkagg 1-5
-> no unp policy validity-location ALU-NA linkagg

-> unp policy validity-location ALU-NA system-name OS6860
-> no unp policy validity-location ALU-NA system-name OS6860

-> unp policy validity-location ALU-NA system-location US-West
-> no unp policy validity-location ALU-NA system-location
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

unp domain description

Configures a customer domain ID to which UNP ports and classification rules are assigned.

unp domain *domain_id* [**description** *domain_description*]

no unp domain *domain_id* **description** *domain_description*

Syntax Definitions

domain_id A numerical customer domain ID.
domain_description An alphanumeric string (1–128 characters).

Defaults

By default, customer domain ID zero (0) is assigned to all UNP ports.

parameter	default
<i>domain_description</i>	Domain ID

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the customer domain ID from the switch configuration. When a domain ID is removed, the following actions are triggered:
 - All UNP ports assigned to that domain are moved to the default domain ID 0.
 - Any classification rules assigned to that domain are removed.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain (see the [unp domain](#) command page), classification rules associated with the same customer domain ID are applied only to UNP ports associated with the same domain ID.

Examples

```
-> unp domain 1  
-> unp domain 2 description CustomerA
```

Release History

Release 8.3.1; command was introduced.

Related Commands

- unp domain** Assigns a UNP port or link aggregate to the specified customer domain (UNP group) ID.
- show unp domain** Displays the customer domain ID configuration for the switch.

MIB Objects

```
alaDaUnpCustomerDomainTable  
  alaDaUnpCustomerDomainId  
  alaDaUnpCustomerDomainDesc
```

unp redirect pause-timer

Configures the global pause timer value for the switch. Use this command to configure the amount of time the switch filters traffic from a non-suppliant (non-802.1X device) on a UNP port. This is done to allow enough time for the switch to clear the authentication state of the non-suppliant, at which time the device is re-authenticated.

unp redirect pause-timer *seconds*

no redirect pause-timer

Syntax Definitions

seconds The pause timer value. The valid range is 60–65535

Defaults

By default, the pause timer is set to zero.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to reset the pause time back to the default (timer no set).
- The pause timer is triggered when a Change of Authorization (COA) request is received that requires a VLAN change for a non-suppliant (non-802.1X device) *and* the port bounce action is not triggered for the device.
- During the pause time period, it is expected that the DHCP lease of the client IP in the old VLAN will expire and the client device will re-initiate DHCP resulting in new authentication and a UNP VLAN assignment.
- This command is used when configuring the switch to interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect pause-timer 180  
-> no unp redirect pause-timer
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp redirect port-bounce** Configures the port bounce action for a port or globally for the switch.
- unp redirect proxy-server-port** Configures the HTTP proxy port number to use for redirection.
- unp redirect allowed-name** Configures a list of additional IP addresses to which a host can access.
- unp redirect-server** Configures an IP network address to allow HTTP traffic redirection.
- show unp global configuration** Displays the global UNP parameter settings for the switch.

MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPRedirectPauseTimer

unp redirect proxy-server-port

Configures the HTTP proxy port number to use for redirection to the ClearPass Policy Manager (CPPM) server.

unp redirect proxy-server-port *proxy_port*

no unp redirect proxy-server-port

Syntax Definitions

proxy_port The HTTP proxy port number. The valid range is 1024–49151.

Defaults

By default, the redirect proxy port number is set to 8080 (traps HTTP 80, 8080, and 443).

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- Configuring the switch to interact with the CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect proxy-server-port 8887  
-> no unp redirect proxy-server-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP parameter settings for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration  
alaDaUNPRedirectServerIP
```

unp redirect-server

Configures an IP network address to allow redirection of HTTP traffic to a ClearPass Policy Manager (CPPM) server. Specify the address that is associated with the dynamic URL returned from the CPPM server.

unp redirect-server ip-address *ip_address*

no unp redirect-server ip-address

Syntax Definitions

ip_address IPv4 network address (e.g., 171.15.0.0).

Defaults

By default, no redirect server IP address is specified.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the redirect server IP from the switch configuration.
- If the redirect server IP address does not match the CPPM server configuration, then redirection to the URL will not work. This provides additional security.
- Configuring the switch to interact with the CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect-server ip-address 10.0.0.20  
-> no unp redirect-server ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp redirect allowed-name** Configures a list of additional IP addresses to which a host can access.
- show unp global configuration** Displays the global UNP configuration for the switch.

MIB Objects

alaDaUNPGlobalConfiguration
alaDaUNPRedirectServerIP

unp redirect allowed-name

Configures a list of additional IP addresses to which a host can access. This allows traffic to reach additional subnets other than that of the ClearPass Policy Manager (CPPM) server.

unp redirect allowed-name *name* **ip-address** *ip_address* **ip-mask** *ip_mask*

no unp redirect allowed-name *name*

Syntax Definitions

<i>name</i>	Specify a name to assign to the allowed IP network address.
<i>ip_address</i>	An IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>ip_mask</i>	The IP subnet mask for the allowed IP network address.

Defaults

By default, no allowed IP addresses are configured.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- Explicitly configure and append the allowed IP list to the built-in "restrictedPolicylist" policy list.

Examples

```
-> unp redirect allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0  
-> no unp redirect allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp redirect port-bounce** Configures the port bounce action for a port or globally for the switch.
- unp redirect pause-timer** Configures the global pause timer value for the switch
- unp redirect proxy-server-port** Configures the HTTP proxy port number to use for redirection.
- unp redirect-server** Configures an IP network address to allow HTTP traffic redirection.

  alaDaUNPRedirectAllowedServerName  
  alaDaUNPRedirectAllowedServerIP  
  alaDaUNPRedirectAllowedMaskIP
```

unp user flush

Performs a MAC address flush of Access Guardian users (devices learned on UNP ports) based on the specified port, link aggregate, authentication type, or MAC address.

unp user flush [**port** *chassis/slot/port1[-port2]* | **linkagg** *agg_id[-agg_id2]*] [**sap-id** [**linkagg**] *sap_id*] [**service-id** *service_id*] [**authentication-type** {**mac** | **802.1x** | **none**}] [**profile** *profile_name*] [**mac-address** *mac_address*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
[linkagg] <i>sap_id</i>	A Service Access Point (SAP) ID. Use the optional linkagg parameter if the SAP ID is for a link aggregate.
<i>service_id</i>	A service ID.
mac	Clears only the MAC authenticated users.
802.1x	Clears only the 802.1X authenticated users.
none	Clears only the users that have not been authenticated.
<i>mac_address</i>	A MAC address (e.g., 00:00:39:59:f1:0c).
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, all MAC addresses learned on all UNP ports are flushed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** or **linkagg** parameter to flush users on a specific port or link aggregate.
- Use the **sap-id** parameter to flush users learned on a specific SAP. A SAP ID is comprised of a device-facing port or link aggregate (referred to as a service access port) and an encapsulation value that is used to identify the type of device traffic to map to the associated service.
- Use the **service-id** parameter to flush users learned on a specific service.
- Use the **authentication-type** parameter with the **mac**, **802.1x**, or **none** options to flush users that were authenticated (MAC or 802.1X) or users that were not authenticated.
- Use the **mac-address** parameter to flush a specific device.

- Use the **profile** parameter to flush all users associated with the specified profile name. Combine this parameter with the **mac-address** parameter to flush a specific user associated with the specified profile name.
- Combine the **sap-id** or **service-id** parameter with the **profile** parameter option to flush only users on the SAP or service that are classified into the specified profile.
- Combine the **sap-id** or **service-id** parameter with the **type** parameter option to flush only users on the SAP or service that were authenticated with the specified authentication type.

Examples

```
-> unp user flush
-> unp user flush port 1/1/6
-> unp user flush linkagg 10
-> unp user flush sap-id 1/1/2:50
-> unp user flush service-id 10
-> unp user flush authentication-type mac
-> unp user flush mac-address 00:11:22:33:44:55
-> unp user flush profile un1-vlan
-> unp user flush profile un1-vlan mac-address 00:da:95:11:22:01
```

Release History

Release 8.3.1; command was introduced.

```

unp force-l3-learning

Configures the status of UNP Layer 3 learning. When this functionality is enabled and IP-based classification rules are configured, only Layer 3 packets are used to learn devices connected to UNP ports. Layer 2 packets are not used for learning devices.

unp force-l3-learning

no unp force-l3-learning

Syntax Definitions

N/A

Defaults

By default, UNP Layer 3 learning is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable Layer 3 learning.
- When UNP Layer 3 learning is enabled and there is at least one IP-based classification rule configured, the first packet of the following types of packets is used to learn the device:
 - An IP packet with a non-zero source IP address.
 - A valid ARP/GARP request/reply.
 - DHCP packets, even if the source IP address is 0.0.0.0.

However, the first packet of the following types of packets is *dropped* and not used to learn the device:

- Layer 2 frames.
- Invalid ARP/GARP request/reply (one with sender IP address 0.0.0.0 or 169.254.0.0/16).
- IP packet with a source IP address of 0.0.0.0, except for DHCP packets where the source IP address is 0.0.0.0.

Examples

```
-> unp force-l3-learning  
-> no unp force-l3-learning
```

Release History

Release 8.3.1; command was introduced.

Related Commands

show unp global configuration Displays the dynamic VLAN configuration status for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration  
  alaDaUNPForceL3Learning
```

unp profile

Configures a classification profile that is used to provide role-based access to the switch. This type of profile determines the VLAN or service a device can join and applies any additional profile-defined attributes to the device.

When a profile is created with this command, the base command (**unp profile** *profile_name*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
unp profile profile_name
  [qos-policy-list list_name]
  [location-policy policy_name]
  [period-policy policy_name]
  [captive-portal-authentication]
  [captive-portal-profile profile_name]
  [authentication-flag]
  [mobile-tag]
  [redirect]
  [maximum ingress-bandwidth bps[k | m]]
  [maximum egress-bandwidth bps[k | m]]
  [maximum ingress-depth bps]
  [maximum egress-depth bps]
  [inactivity-interval seconds]
  [saa-profile profile_name]
```

```
no unp profile profile_name
```

Syntax Definitions

profile_name The name to assign to the UNP classification profile.

Defaults

When a profile is created without specifying any parameter values, the profile parameters are set to the following default values:

parameter	default
qos-policy-list <i>list_name</i>	No list assigned
location-policy	No policy assigned
period-policy	No policy assigned
captive-portal-authentication	disabled
captive-portal-profile	No profile assigned
authentication-flag	disabled
mobile-tag	disabled

parameter	default
redirect	disabled
maximum ingress-bandwidth <i>bps[k m]</i>	None
maximum egress-bandwidth <i>bps[k m]</i>	None
maximum ingress-depth <i>bps</i>	None
maximum egress-depth <i>bps</i>	None
inactivity-interval <i>seconds</i>	10
saa-profile <i>profile_name</i>	No profile assigned

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a profile from the switch configuration.
- Profiles are applied only to traffic received on UNP bridge and access ports or link aggregates.
- After a profile is created, use the **unp profile map** command to map the profile to a VLAN or service.
 - If the profile is mapped to a VLAN, the profile is used to classify traffic received on UNP bridge ports.
 - If the profile is mapped to a service (SPB, VXLAN, or static), the profile is used to classify traffic received on UNP access ports.
- Any configuration change to a profile will flush all MAC addresses learned on that profile.

Examples

```
-> unp profile unp-profl
-> no unp profile unp-profl
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile qos-policy-list	Assigns a QoS policy list to an existing profile.
unp profile location-policy	Assigns a UNP location policy to the specified profile.
unp profile period-policy	Assigns a UNP time-based policy to the specified profile.
unp profile captive-portal-authentication	Configures the status of Captive Portal authentication for the specified profile.
unp profile captive-portal-profile	Assigns a Captive Portal configuration to the specified profile.
unp profile authentication-flag	Configures whether the specified profile only allows authenticated devices into the profile.
unp profile mobile-tag	Configures whether a tagged VLAN-port association is created for a device port that is classified into the specified profile.
unp profile redirect	Configures whether or not profile traffic is redirected to the ClearPass Policy Manager (CPPM) for authentication.
unp profile maximum-ingress-bandwidth	Configures a maximum ingress bandwidth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-egress-bandwidth	Configures a maximum egress bandwidth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-ingress-depth	Configures a maximum ingress depth value that is applied to UNP ports associated with the specified profile.
unp profile maximum-egress-depth	Configures a maximum egress depth value that is applied to UNP ports associated with the specified profile.
unp profile inactivity-interval	Configures the inactivity interval timer for the specified profile.
unp profile saa-profile	Assigns an existing Service Assurance Agent (SAA) profile to the specified profile.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName
```

unp profile qos-policy-list

Configures the QoS policy list attribute for the specified profile. Use this command to assign the name of an existing QoS policy list to the profile. A policy list contains QoS policy rules/ACLs that are applied to devices classified with the associated profile.

```
unp profile profile_name qos-policy-list list_name
```

```
no unp profile profile_name qos-policy-list
```

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>list_name</i>	The name of a QoS policy list to associate with the specified UNP.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the QoS list name from the profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.
- The QoS policy list is used to define the initial role for any UNP user learned in the profile.

Examples

```
-> unp profile unp-prof1 qos-policy-list unp-list1  
-> no unp profile unp-prof1 qos-policy-list unp-list2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP classification profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
policy list	Configures a QoS policy list.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileQoSPolicy
```

unp profile location-policy

Configures the location policy attribute for the specified profile. Use this command to assign the name of an existing UNP location policy to a profile. This type of policy defines criteria (such as the slot/port, system name and location) to determine if a device is accessing the network from a valid location.

unp profile *profile_name* **location-policy** *policy_name*

no unp profile *profile_name* **location-policy**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>policy_name</i>	The name of an existing UNP location policy.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the location policy name from the profile configuration.
- The location policy name specified with this command must already exist in the switch configuration.
- If a UNP device does not meet the criteria applied through the location policy, the device role is changed to unauthorized.

Examples

```
-> unp profile unp-profl location-policy alu-na  
-> no unp profile unp-profl location-policy
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp policy validity-location	Configures a UNP location policy.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileLocationPolicy
```

unp profile period-policy

Configures the period policy attribute for the specified profile. Use this command to assign the name of an existing UNP period policy to a profile. This type of policy specifies the days and times during which a device can access the network.

unp profile *profile_name* **period-policy** *policy_name*

no unp profile *profile_name* **period-policy**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>policy_name</i>	The name of an existing UNP period policy.

Defaults

By default, no profile attributes are enabled or defined when the profile is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the period policy name from the profile configuration.
- The period policy name specified with this command must already exist in the switch configuration.
- If a UNP device does not meet the criteria applied through the period policy, the device role is changed to unauthorized.

Examples

```
-> unp profile unp-profl period-policy office-time  
-> no unp profile unp-profl period-policy
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp policy validity-period	Configures a UNP period policy.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfilePeriodPolicy
```

unp profile captive-portal-authentication

Configures the status of Captive Portal (CP) authentication for the specified UNP profile. When enabled, the Captive Portal authentication process is triggered for devices classified into the profile.

unp profile *profile_name* captive-portal-authentication

no unp profile *profile_name* captive-portal-authentication

Syntax Definitions

profile_name The name of a UNP profile.

Defaults

By default, Captive Portal authentication is disabled for the profile.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable Captive Portal authentication for the profile configuration.
- When CP authentication is enabled, the UNP user is assigned an implicit CP pre-login role to facilitate the CP authentication process with the configured CP RADIUS server.
- The CP profile associated with the UNP profile defines the CP RADIUS server to use for the CP authentication process. If a CP profile is not associated with the UNP profile, then the server defined in the global CP configuration for the switch is used instead.
- If CP authentication for the device is successful, the user role is automatically changed according to the CP pass policy list returned from the RADIUS server, if it is the highest precedence role known for the user.
- If CP authentication for the device fails, the user role will be changed to the last known highest precedence role for the user.

Examples

```
-> unp profile unp-profl captive-portal-authentication
-> no unp profile unp-profl captive-portal-authentication
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile

Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

show unp profile

Displays the profile configuration for the switch.

MIB Objects

alaDaUNPProfileTable

alaDaUNPProfileName

alaDaUNPProfileCPortalAuthentication

unp profile captive-portal-profile

Configures the Captive Portal (CP) profile attribute for the specified profile. Use this command to assign the name of an existing CP profile to a profile. This type of profile defines a CP configuration that is applied to devices when CP authentication is enabled for the profile.

unp profile *profile_name* **captive-portal-profile** *cp_profile_name*

no unp profile *profile_name* **captive-portal-profile**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>cp_profile_name</i>	The name of an existing UNP Captive Portal profile.

Defaults

By default, no CP profile is assigned to a profile.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the CP profile name from the profile configuration.
- The CP profile name specified with this command must already exist in the switch configuration.
- The configuration defined in the CP profile overrides the global CP configuration for the switch.

Examples

```
-> unp profile unp-prof1 captive-portal-profile cp-prof  
-> no unp profile unp-prof1 captive-portal-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
captive-portal-profile	Configures a Captive Portal profile.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileCPortalProfile
```

unp profile authentication-flag

Configures the authentication flag status for the specified UNP profile. When enabled, only devices successfully authenticated are classified into the profile.

unp profile *profile_name* authentication-flag

no unp profile *profile_name* authentication-flag

Syntax Definitions

profile_name The name of a UNP profile.

Defaults

By default, the authentication flag is disabled for the profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the authentication flag for the profile configuration.
- When the authentication flag is enabled for a profile, devices that did not pass L2 authentication (802.1X or MAC) are not allowed into the profile. However, other configured classification options are applied to such devices to determine the appropriate network access control for that device.

Examples

```
-> unp profile unp-profl authentication-flag  
-> no unp profile unp-profl authentication-flag
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

show unp profile Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
    alaDaUNPProfileName  
    alaDaUNPProfileAuthenticationFlag
```

unp profile mobile-tag

Configures the mobile tag status for the specified UNP profile. When enabled, the first user that is learned on a UNP port and classified into the specified UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created.

unp profile *profile_name* **mobile-tag**

no unp profile *profile_name* **mobile-tag**

Syntax Definitions

profile_name The name of a UNP profile.

Defaults

By default, the mobile tag status is disabled for the profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the mobile tag status for the profile configuration.
- When the mobile tag status is disabled for a profile, any user device classified into the profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association would be determined based on the user traffic which was learned as tagged or untagged, respectively.
- If the device port is already an untagged member of the VLAN associated with the profile, then a tagged association is not created.

Examples

```
-> unp profile unp-profl mobile-tag  
-> no unp profile unp-profl mobile-tag
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile

Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

show unp profile

Displays the UNP profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMobileTag
```

unp profile redirect

Configures the redirect status for the specified UNP profile. When enabled, the profile will interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

unp profile *profile_name* redirect

no unp profile *profile_name* redirect

Syntax Definitions

profile_name The name of a UNP profile.

Defaults

By default, the redirect status is disabled for the profile.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the redirect status for the profile configuration.
- The name of the OmniSwitch profile that has the redirect option enabled must also exist in the CPPM configuration.
- Enabling the redirect option applies only to UNP profiles that are mapped to VLANs.
- To ensure proper redirection for devices classified into the profile, configure the redirection server as the preferred server through authentication, authorization, and accounting (AAA) commands for MAC and 802.1X authentication.

Examples

```
-> unp profile unp-prof1 redirect
-> no unp profile unp-prof1 redirect
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
show unp profile	Displays the profile configuration for the switch.
show unp profile map	Displays the mapping configuration for UNP profiles.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileRedirect
```

unp profile maximum-ingress-bandwidth

Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified profile.

unp profile *profile_name* **maximum-ingress-bandwidth** *bps*[**k** | **m**]

no unp profile *profile_name* **maximum-ingress-bandwidth**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i> [k m]	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m).

Defaults

By default, the maximum ingress bandwidth value is not defined for the profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the maximum ingress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum ingress bandwidth value is set to zero, then all ingress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp profile unp-profl maximum-ingress-bandwidth 100
-> unp profile unp-profl maximum-ingress-bandwidth 10m
-> no unp profile unp-profl maximum-ingress-bandwidth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-ingress-depth	Configures how much the traffic can burst over the maximum ingress bandwidth rate.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxIngressBandwidth
```

unp profile maximum-egress-bandwidth

Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified profile.

unp profile *profile_name* **maximum-egress-bandwidth** *bps*[k | m]

no unp profile *profile_name* **maximum-egress-bandwidth**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i> [k m]	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m).

Defaults

By default, the maximum egress bandwidth value is not defined for the profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the maximum egress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum egress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp profile unp-profl maximum-egress-bandwidth 100
-> unp profile unp-profl maximum-egress-bandwidth 10m
-> no unp profile unp-profl maximum-egress-bandwidth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp profile maximum-egress-depth	Configures how much the traffic can burst over the maximum egress bandwidth rate.
show unp profile	Displays the profile configuration for the switch.
show unp port bandwidth	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxEgressBandwidth
```

unp profile maximum-ingress-depth

Configures the maximum ingress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP profile. This value determines how much the traffic can burst over the maximum ingress bandwidth rate.

unp profile *profile_name* **maximum-ingress-depth** *bps*

no unp profile *profile_name* **maximum-ingress-depth**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i>	The maximum ingress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum ingress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress depth value from the profile.
- The maximum ingress depth value is configured in conjunction with the maximum ingress bandwidth parameter. When the ingress depth value is reached, the switch starts to drop packets.
- Configure the maximum ingress bandwidth rate (**unp profile maximum-ingress-bandwidth**) before attempting to set the maximum ingress depth value.
- The maximum ingress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp profile unp-profl maximum-ingress-bandwidth 10
-> unp profile unp-profl maximum-ingress-depth 5
-> no unp profile unp-profl maximum-ingress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxIngressDepth
```

unp profile maximum-egress-depth

Configures the maximum egress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP profile. This value determines how much the traffic can burst over the maximum egress bandwidth rate.

unp profile *profile_name* **maximum-egress-depth** *bps*

no unp profile *profile_name* **maximum-egress-depth**

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i>	The maximum egress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum egress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the maximum egress depth value from the profile.
- The maximum egress depth value is configured in conjunction with the maximum egress bandwidth parameter. When the egress depth value is reached, the switch starts to drop packets.
- Configure the maximum egress bandwidth rate (**unp profile maximum-egress-bandwidth**) before attempting to set the maximum egress depth value.
- The maximum egress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp profile unp-profl maximum-egress-bandwidth 10
-> unp profile unp-profl maximum-egress-depth 5
-> no unp profile unp-profl maximum-egress-depth
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxEgressDepth
```

unp profile inactivity-interval

Configures whether or not an authenticated device is automatically logged out of the network after a specific period of inactivity (MAC address for the device has aged out). This timer value applies only to devices learned in the specified profile.

unp profile *profile_name* inactivity-interval *seconds*

Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>minutes</i>	The inactivity timer value. The valid range is 10 to 600 seconds.

Defaults

By default, the inactivity interval value is set to 10 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Make sure the configured inactivity interval time is set to a value greater than the MAC address aging time for the switch.
- When a specific time is configured for the inactivity interval timer, the device is not logged out of the network if the MAC address aging time expires before the configured timer value.
- When the inactivity interval time is changed for the profile, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- An inactivity logout timer value is also configurable through authentication, authorization, and accounting (AAA) commands. The value set through the AAA commands takes precedence over the inactivity interval value set for the UNP.

Examples

```
-> unp profile unp-profl inactivity-interval 500
-> unp profile unp-profl inactivity-interval 10
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile

Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

show unp profile

Displays the profile configuration for the switch.

MIB Objects

alaDaUNPProfileTable

alaDaUNPProfileName

alaDaUNPProfileInactivityInterval

unp profile saa-profile

Assigns a Service Assurance Agent (SAA) profile to the specified UNP profile. Although an SAA profile can be assigned to a UNP profile with this command, an SAA profile is mainly used by the OmniVista network management application to monitor connections between virtual machines (VMs) in a data center network.

unp profile *profile_name* **saa-profile** *profile_name*

no unp profile *profile_name* **saa-profile**

Syntax Definitions

profile *profile_name* The name of a UNP profile.

saa-profile *profile_name* The name of the SAA profile to assign to the UNP profile.

Defaults

By default, no SAA profile is assigned to a UNP profile.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an SAA profile assignment from a UNP profile configuration.
- The SAA profile specified with this command must already exist in the switch configuration.

Examples

```
-> unp profile unp-profl saa-profile saal  
-> no unp profile unp-profl saa-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
unp saa-profile	Configures an SAA profile.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileSaaProfile
```

unp profile map vlan

Configures the mapping of a standard VLAN to a UNP profile. When a device is assigned to a profile through authentication or classification, the device and the port on which the device was learned are dynamically assigned to the VLAN that is mapped to the profile.

```
unp profile profile_name map vlan vlan_id
```

Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
<i>vlan_id</i>	The VLAN ID number to associate with the specified profile name. Devices assigned to the profile are assigned to the associated VLAN.

Defaults

By default, no mapping configuration is applied to a profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Removing a VLAN mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile *profile_name***).
- The VLAN associated with a profile must already exist in the switch configuration, unless the dynamic VLAN configuration functionality is enabled.
- Configuring a new VLAN mapping for a profile will overwrite the existing VLAN mapping for that profile. Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.

Examples

```
-> unp profile unp1-vlan map vlan 10  
-> no unp profile unp1-vlan
```

Release History

Release 8.3.1; command was introduced.

Related Commands

    alaDaUNPProfileName  
alaDaUNPProfileMapVlanTable  
    alaDaUNPProfileMapVlanVlanID
```

unp profile map service-type spb

Configures the mapping of Shortest Path Bridging (SPB) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, an SPB service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

unp profile *profile_name* **map service-type spb tag-value** {0 | *qtag* | *outer_qtag:inner_qtag*} **isid** *instance_id* **bvlan** *bvlan_id* [**multicast-mode** {**headend** | **tandem**}] [**vlan-xlation**]

no unp profile *profile_name* **map service-type spb** [**vlan-xlation**]

Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>instance_id</i>	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
<i>bvlan_id</i>	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
headend	Specifies the head-end replication mode for the service associated with this UNP.
tandem	Specifies the tandem replication mode for the service associated with this UNP.
vlan-translation	Configures egress VLAN translation for the service associated with this UNP.

Defaults

By default, no mapping configuration is applied to a profile. When the SPB mapping is configured, the following default values are applied for the optional parameters:

parameter	default
multicast-mode { headend tandem }	headend
vlan-xlation	disabled

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable VLAN translation for the profile. To remove any other SPB mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile *profile_name***).
- Configuring a new SPB mapping for a profile will overwrite the existing SPB mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the SPB service that is dynamically created based on the specified I-SID and BVLAN values.
- Consider the following when configuring the profile tag value:
 - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
 - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
 - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and I-SID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- If the I-SID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- The BVLAN ID specified with this command must already exist in the switch configuration.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- When an SPB service is configured to use the head-end multicast mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem multicast mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.

Examples

```
-> unp profile unp1-spb map service-type spb tag-value 10 isid 1510 bvlan 4001
-> unp profile unp2-spb map service-type spb tag-value 20 isid 1520 bvlan 4002
multicast-mode tandem vlan-xlation
-> no unp profile unp2-spb map service-type spb vlan-xlation
-> no unp profile unp1-spb
```

Release History

Release 8.3.1; command was introduced.

  alaDaUNPProfileMapSpbVlanXlation
```

unp profile map service-type vxlan

Configures the mapping of Virtual eXtensible LAN (VXLAN) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, a VXLAN service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

```
unp profile profile_name map service-type vxlan tag-value {0 | qtag | outer_qtag:inner_qtag} vnid
vxlan_id {far-end-ip-list ip_list_name [multicast-group mc_group_address] | multicast-group
mc_group_address [far-end-ip-list ip_list_name]} [multicast-mode [tandem | headend | hybrid] [vlan-
xlation]
```

```
no unp profile profile_name map service-type vxlan [far-end-ip-list | multicast-group | vlan-xlation]
```

Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>vxlan_id</i>	The VXLAN network identifier that identifies the VLAN segment form where the frames originate. This value is used to create the VXLAN service that is required to dynamically create the SAP.
<i>ip_list_name</i>	The name of an existing list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The valid range is 1–32 characters. The IP addresses in this list are used to dynamically create service distribution points (SDPs) for the VXLAN service.
<i>mc_group_address</i>	The multicast IP address of the group to which this service will join.
tandem	Specifies the tandem replication mode for the service associated with this UNP. This mode uses PIM routing and sends traffic through multicast SDPs.
headend	Specifies the head-end replication mode for the service associated with this UNP. This mode sends traffic through unicast SDPs.
hybrid	Specifies the hybrid replication mode for the service associated with this UNP. This mode uses both the head-end and tandem methods.
vlan-translation	Configures egress VLAN translation for the VXLAN service associated with this UNP.

Defaults

By default, no mapping configuration is applied to a profile. When the VXLAN mapping is configured, the following default values are applied for the optional parameters:

parameter	default
multicast-mode { headend tandem }	tandem
vlan-xlation { enable disable }	disabled

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **no** form of this command to disable VLAN translation, remove a far-end IP list, or remove a multicast group IP address for the profile. To remove any other VXLAN mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- Configuring a new VXLAN mapping for a profile will overwrite the existing VXLAN mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the VXLAN service that is dynamically created based on the specified VXLAN ID value.
- Consider the following when configuring the profile tag value:
 - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
 - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP on which the traffic is forwarded.
 - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is forwarded on the SAP. If the traffic tags do not match, traffic is not forwarded on the SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags). If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one based on the profile attributes for the profile traffic.
- If the VXLAN ID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.

- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- Configuring both a far-end IP list and a multicast group IP address is allowed for the same profile.
- The following multicast modes are supported for a VXLAN service:
 - **Tandem:** In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This also requires the manual configuration of a multicast SDP object to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
 - **Headend:** In this mode, unicast SDP objects are manually configured to tunnel traffic to the far-end nodes. In this case, PIM multicast routing is not required. Any BUM traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
 - **Hybrid:** In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.

Examples

```
-> unp profile unp1-vxlan map service-type vxlan tag-value 10:12 vnid 100
multicast-group 225.1.1.1
-> unp profile unp2-vxlan map service-type vxlan tag-value 15 vnid 200 far-end-ip-
list vtep-list1 vlan-xlation
-> unp profile unp3-vxlan map service-type vxlan tag-value 0 vnid 200 far-end-ip-
list vtep-list2 multicast-group 225.1.1.2
-> no unp profile unp3-vxlan map service-type vxlan vlan-xlation far-end-ip-list
-> no unp profile unp2-vxlan
```

Release History

Release 8.3.1; command was introduced.

 alaDaUNPProfileMapVxlanVlanXlation

 alaDaUNPProfileMapVxlanMulticastMode

unp vxlan far-end-ip-list

Configures a list of IP addresses, each of which is assigned to the Loopback0 interface of a far-end VXLAN node. The list name is assigned to a profile through the mapping of VXLAN service parameters to the profile. This allows multiple far-end nodes to be associated with the service created for the VXLAN Network ID (VNID) specified in the VXLAN profile.

```
unp vxlan far-end-ip-list ip_list_name ip_address [ip_address]
```

```
no unp vxlan far-end-ip-list ip_list_name [ip_address [ip_address]]
```

Syntax Definitions

<i>ip_list_name</i>	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEP). The valid range is 1–32 characters.
<i>ip_address</i>	The IP address of the loopback0 interface for the far-end VTEP node. The loopback0 address is required on every VXLAN node that serves as a VTEP. Use a space to specify a list of IP addresses to assign to the list name.

Defaults

N/A

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **no** form of this command to remove the far-end list from the switch configuration or to remove an individual IP address from the list.
- The reachability of a far-end IP address is not tested. Make sure the addresses are valid before adding them to the list.
- There is no limit to the number of IP addresses that can be assigned to a single list.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- The far-end IP list is used to build service distribution points (SDPs) for VXLAN services.
- When there is any change to the VXLAN profile, all users associated with that profile are flushed.

Examples

```
-> unp vxlan far-end-ip-list vtep-list1 10.1.1.1 11.1.1.1 12.1.1.1 13.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1 10.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1
```

Release History

Release 7.3.4; command was introduced.

  alaDaUNPVxlanFarEndIPListName
  alaDaUNPVxlanFarEndIPListIPAddressCount
  alaDaUNPVxlanFarEndIPListRemove
```

unp profile map service-type static

Configures the mapping of an existing Shortest Path Bridging (SPB) or Virtual eXtensible LAN (VXLAN) service ID to the specified UNP profile. This type of profile mapping is only valid if the specified SPB or VXLAN service is already configured; the switch does not dynamically create the service. The specified service ID is then used to dynamically create a service access point (SAP) based on the specified tag value.

```
unp profile profile_name map service-type static tag-value {0 | qtag | outer_qtag:inner_qtag} service-id service_id
```

Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>service_id</i>	An existing (statically configured) numerical value that identifies a specific SPB or VXLAN service. The valid service ID range is 1–32767.

Defaults

By default, no mapping configuration is applied to a profile.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Removing a static service mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile** *profile_name*).
- Configuring a new static service mapping for a profile will overwrite the existing static service mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.

- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the service ID value specified with this command.
- Consider the following when configuring the profile tag value:
 - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
 - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
 - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and service ID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- When there is a MAC flush for all UNP users learned and forwarded on the static service ID:
 - UNP triggers the removal of all dynamic SAPs associated with the service ID.
 - The service ID is not removed because the service was statically created; not dynamically generated through UNP.
- A static service ID cannot be removed until all the UNP users learned and forwarded on that service and associated SAPs are deleted.

Examples

```
-> unp profile unp1-static map service-type static tag-value 10 service-id 1
-> unp profile unp2-static map service-type static tag-value 20 service-id 2
-> no unp profile unp1-static
```

Release History

Release 8.3.1; command was introduced.

```

unp saa-profile

Configures a Service Assurance Agent (SAA) performance monitoring profile. This type of profile is assigned to UNP profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP profile.

unp saa-profile *profile_name* [**jitter-threshold** *jitter_thresh*] [**latency-threshold** *latency_thresh*]

no unp saa-profile *profile_name*

Syntax Definitions

<i>profile_name</i>	The name to assign to the SAA profile.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>latency_thresh</i>	The latency threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

Defaults

parameter	default
<i>jitter_thresh</i>	0 (disabled)
<i>latency_thresh</i>	0 (disabled)

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the SAA profile from the switch configuration.
- Although SAA profiles can be configured and assigned to a UNP through the CLI, these profiles are mainly used by the OmniVista network management application to trigger SAA sessions that monitor connections between virtual machines (VMs) in a data center network.
- Assigning SAA profiles is supported only with UNP profiles that are assigned to UNP bridge ports. UNP access ports do not support this functionality.

Examples

```
-> unp saa-profile unp_saa1 jitter-threshold 100 latency-threshold 500
-> unp saa-profile unp_saa2 jitter-threshold 150
-> unp saa-profile unp_saa3 latency-threshold 250
```

Release History

Release 7.3.2; command was introduced.

Related Commands

unp profile	Configures a UNP profile.
show unp saa-profile	Displays the SAA profile configuration for the switch.
show unp profile	Displays the profile configuration for the switch.

MIB Objects

```
alaDaSaaProfileTable  
  alaDaSaaProfileName  
  alaDaSaaProfileLatencyThreshold  
  alaDaSaaProfileJitterThreshold
```

unp port-type

Configures UNP functionality for the specified port or link aggregate. This includes configuring the UNP port type (bridge or access). Traffic received on a UNP bridge port is classified using VLAN profiles and port attributes. Traffic received on a UNP access port is classified using service profiles and port attributes.

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id1*[-*agg_id2*]} port-type {access | bridge}

no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id1*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id1</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
access	Configures the specified port or link aggregate as a service access port. This port type is used for classifying traffic into service-based profiles.
bridge	Configures the specified port or link aggregate as a standard bridge port. This port type is used for classifying traffic into VLAN-based profiles.

Defaults

By default, UNP is disabled on all ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the UNP configuration from a port or link aggregate.
- Any configuration change to a UNP-enabled port will flush all MAC addresses learned on that port. This applies only to CLI commands used to configure UNP port parameters.
- Only one UNP port type is configurable for a specific port or link aggregate. To change the port type of an existing UNP port, remove the current UNP configuration first using the **no unp port** or **no unp linkagg** command then use the **unp port-type** command to set the new port type.
- There is no limit to the number of switch ports that can have UNP enabled.
- Enabling UNP is *not* supported on the following switch ports:
 - 802.1q-tagged ports.
 - MVRP ports.
 - Port Mirroring destination ports (MTP).
 - Port Mapping network ports.
 - STP and ERP ports.

- Ports on which a static MAC address is configured.
 - Ports on which dynamic Source Learning is disabled.
 - VLAN Stacking (Ethernet Services NNI or UNI) ports.
 - Service Manager access and network ports.
 - Ethernet OAM ports.
 - Edge Virtual Bridging (EVB) ports.
- UNP and Learned Port Security (LPS) are supported on the same port with the following conditions:
 - LPS is not supported on link aggregates.
 - The LPS learning window is set globally but not on a per-port basis. So the window applies to all UNP ports.
 - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
 - Configuring a static MAC address is not allowed on a UNP port unless LPS is also enabled on the same port.
 - When both LPS and UNP are enabled on the same port, UNP first authenticates and classifies any MAC addresses received, then LPS rules are applied. If a MAC address violates any of the LPS rules for the port, the address may get filtered or the port violated even if UNP initially determined the address was valid. In other words, LPS rules take precedence over UNP to determine if a MAC address is bridged or filtered on the port.
 - If UNP classifies a MAC address as learning but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
 - When a MAC address is filtered by LPS, the **show unp user** command will display “LPS-Blocked” as the classification source for that MAC address.
 - UNP ports support both tagged and untagged packets. If the VLAN ID of a tagged packet matches the VLAN associated with a UNP into which the packet was classified, the packet is learned as forwarding and a tagged VLAN-port association is created. However, if the VLAN ID tag does not match the VLAN ID associated with the profile, the packet is filtered.
 - UNP bridge and access ports support single-tagged and double-tagged packets with the following conditions:
 - Double-tagged packets are treated the same as single-tagged packets in that UNP will only use the outer VLAN tag to determine how the packet is processed on the UNP bridge port.
 - UNP access ports use the inner VLAN tag of double-tagged packets received on the port to determine the service access port (SAP) to use or create for forwarding the traffic on the network backbone.

Examples

```
-> unp port 1/1 port-type access
-> unp port 1/1-3 port-type bridge
-> unp port 1/10 port-type access
-> no unp port 1/10

-> unp linkagg 5 port-type access
-> unp linkagg 8 port-type bridge
-> unp linkagg 2 port-type access
-> no unp linkagg 2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp admin-state	Configures the administrative status of the UNP configuration for the specified port or link aggregate.
unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable  
  alaDaUNPPortIfIndex  
  alaDaUNPPortType
```

unp redirect port-bounce

Enables or disables the port bounce action on the specified UNP bridge port or globally on all UNP bridge ports. When enabled, a port bounce is triggered upon receipt of a RADIUS Change of Authorization (COA) or a Disconnect request (DM) message from a redirection server to enforce a user role or terminate a user session.

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} redirect port-bounce

no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} redirect port-bounce

unp redirect port-bounce {enable | disable}

Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
enable	Globally enables the port bounce function for all UNP bridge ports.
disable	Globally disables the port bounce function for all UNP bridge ports.

Defaults

By default, port bounce is disabled on all UNP bridge ports.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **port** or **linkagg** parameter to enable port bounce for a specific UNP bridge port or link aggregate. Use the **no** form of this command to disable port bounce for a specific UNP bridge port or link aggregate. Note that port bounce is not supported on UNP access ports.
- Use the **enable** or **disable** parameters to globally enable or disable the port bounce status for all UNP bridge ports or link aggregates on the entire switch.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- The port bounce action only applies to a MAC authenticated non-suppliant (non-802.1X device). If the device is a suppliant (802.1X device), then an EAP-Fail frame is sent instead. In both cases, re-authentication is triggered for both types of devices.
- The port-level setting of the port bounce action overrides the global setting for the switch. The following table indicates when a port is toggled based on the status of port bounce at the global and port level:

Global Port Bounce	Per-Port Bounce	Action
Enabled	Disabled	Port is not toggled
Enabled	Enabled	Port is toggled
Disabled	Enabled	Port is toggled
Disabled	Disabled	Port is not toggled

- This command is used when configuring the switch to interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

Port-level configuration example:

```
-> unp port 1/1/6 redirect port-bounce
-> no unp port 1/1/6 redirect port-bounce
```

Global configuration example:

```
-> unp redirect port-bounce enable
-> unp redirect port-bounce disable
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **no** form of this command added for specific port or link aggregate configuration.

Related Commands

show unp global configuration Displays the profile designated as the authentication server down UNP for the switch.

  alaDaUNPRedirectPortBounce
```

unp 802.1x-authentication

Configures the status of 802.1X authentication for the specified UNP port. Enable this functionality to invoke 802.1X-based authentication for devices connected to the UNP port.

unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication

no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

By default, 802.1X authentication is enabled on UNP ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable 802.1X authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- An option exists to classify a device into an alternate UNP in the event successful 802.1X authentication does not return a UNP name. See the [unp 802.1x-authentication pass-alternate](#) command.
- If UNP MAC authentication, 802.1X authentication, and classification (see [unp classification](#) and [unp mac-authentication](#)) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured.
- Configuring an authentication server down UNP (see [unp auth-server-down](#)) is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
 - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
 - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

- The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

Examples

```
-> unp port 1/1/5 802.1x-authentication
-> no unp port 1/1/5 802.1x-authentication

-> unp port 1/1/10-15 802.1x-authentication
-> no unp port 1/1/10-15 802.1x-authentication

-> unp linkagg 10 802.1x-authentication
-> no unp linkagg 20 802.1x-authentication

-> unp linkagg 10-50 802.1x-authentication
-> no unp linkagg 10-50 802.1x-authentication
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication pass-alternate	Assigns the device to another profile when successful 802.1X authentication does not return a UNP name.
unp mac-authentication	Configures the MAC authentication status for the UNP port.
unp classification	Configures the classification status for the UNP port.
unp auth-server-down	Configures an authentication server down UNP for the switch.

  alaDaUNPPortIfIndex
  alaDaUNPPort8021XAuthStatus
```

unp 802.1x-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate profile. A device is assigned to the alternate profile when successful 802.1X authentication does not return the name of a profile.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication pass-alternate profile_name
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id} 802.1X-authentication pass-alternate
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>profile_name</i>	The name of an existing VLAN, SPB, or VXLAN profile.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1/1 802.1x-authentication pass-alternate Finance
-> unp port 1/1/1-3 802.1x-authentication pass-alternate CustomerA
-> no unp port 1/1/1-3 802.1x-authentication pass-alternate

-> unp linkagg 5 802.1x-authentication pass-alternate AltUNP
-> unp linkagg 10-15 802.1x-authentication pass-alternate CustomerB
-> no linkagg 5 mac-authentication pass-alternate
```

Release History

Release 7.3.4; command was introduced.

Release 8.3.1; **vlan-profile**, **spb-profile**, and **vxlan-profile** parameters deprecated.

Related Commands

unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP port parameter configuration.

  alaDaUNPPortIfIndex  
  alaDaUNPPort8021XPassAltProfileName
```

unp 802.1x-authentication tx-period

Configures the 802.1X authentication re-transmission time interval for the specified UNP port.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication tx-period  
seconds
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication tx-period
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>seconds</i>	The amount of time before an EAP Request Identity is retransmitted. The valid range is 1–60 seconds.

Defaults

By default, the retransmission period is set to 30 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the re-transmission time interval back to the default value of 30 seconds.
- The re-transmission time period only applies to UNP ports on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication tx-period 60  
-> unp port 1/1/6-10 802.1x-authentication tx-period 20  
-> no unp port 1/1/5 802.1x-authentication tx-period  
  
-> unp linkagg 10 802.1x-authentication tx-period 60  
-> unp linkagg 20-25 802.1x-authentication tx-period 20  
-> no unp linkagg 10 802.1x-authentication tx-period
```

Release History

Release 7.3.4; command was introduced.

Related Commands**unp port-type**

Configures UNP functionality on a port or link aggregate.

Configures the 802.1X authentication status for the UNP port.

show unp port

Displays the UNP configuration for the port.

MIB Objects

alaDaUNPPortTable

 alaDaUNPPort8021XTxPeriod

unp 802.1x-authentication supp-timeout

Configures the 802.1X authentication supplicant timeout for the specified UNP port. This value is the amount of time the switch will wait before timing out an 802.1X user that is attempting to authenticate.

unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **802.1x-authentication supp-timeout** *seconds*

no unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **802.1x-authentication supp-timeout**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15)
<i>seconds</i>	The timeout value. The valid range is 1–120 seconds.

Defaults

By default, the supplicant timeout value is set to 30 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the supplicant timeout back to the default value of 30 seconds.
- Increase the supplicant timeout value if the authentication process requires additional steps by the user (for example, entering a challenge).
- The supplicant timeout is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication supp-timeout 10
-> unp port 1/1/10-15 802.1x-authentication supp-timeout 60
-> no unp port 1/1/5 802.1x-authentication supp-timeout

-> unp linkagg 10 802.1x-authentication supp-timeout 40
-> unp linkagg 2-5 802.1x-authentication supp-timeout 40
-> no unp linkagg 10 802.1x-authentication supp-timeout
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.

MIB Objects

```
alaDaUNPPortTable  
  alaDaUNPPort8021XSuppTimeOut
```

unp 802.1x-authentication max-req

Configures the maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge) to an 802.1X user on the specified UNP port.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication max-req  
max_req
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication max-req
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>max_req</i>	The maximum number of times information requests are retransmitted. The valid range is 1–3.

Defaults

By default, the maximum number of requests is set to two.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the maximum number of times information requests are retransmitted back to the default value of two.
- The 802.1X requests are transmitted, up to the maximum number allowed, until the authentication session is shut down based on the supplicant timeout value configured for the 802.1X port.
- The maximum number of requests is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication max-req 10  
-> unp port 1/1/10-15 802.1x-authentication max-req 5  
-> no unp port 1/1/5 802.1x-authentication max-req  
  
-> unp linkagg 10 802.1x-authentication max-req 10  
-> unp linkagg 2-5 802.1x-authentication max-req 5  
-> no unp linkagg 10 802.1x-authentication max-req
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp 802.1x-authentication bypass-8021x

Configures whether the 802.1X authentication process is bypassed on the specified UNP port. When enabled, the 802.1X device authentication process is skipped; only MAC authentication or rule-based classification is applied to device traffic on the UNP port.

unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication bypass-8021x

no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication bypass-8021x

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

By default, 801.1X authentication bypass is disabled on the UNP port; 802.1X authentication is attempted first.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- Enabling 802.1X authentication bypass is not allowed on UNP ports that are configured with an 802.1X authentication failure policy.

Examples

```
-> unp port 1/1/5 802.1x-authentication bypass-8021x
-> no unp port 1/1/5 802.1x-authentication bypass-8021x
-> unp port 1/1/10-15 802.1x-authentication bypass-8021x
-> no unp port 1/1/10-15 802.1x-authentication bypass-8021x

-> unp linkagg 10 802.1x-authentication bypass-8021x
-> no unp linkagg 10 802.1x-authentication bypass-8021x
-> unp linkagg 2-5 802.1x-authentication bypass-8021x
-> no unp linkagg 2-5 802.1x-authentication bypass-8021x
```

Release History

Release 7.3.4; command was introduced.

Related Commands

MIB Objects

alaDaUNPPortTable
alaDaUNPPort8021XBypassStatus

unp 802.1x-authentication failure-policy

Configures whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails.

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **802.1x-authentication failure-policy** {**mac**}

no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **802.1x-authentication failure-policy**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
mac	Perform MAC authentication if 802.1X authentication fails.

Defaults

By default, device classification is performed after the initial 802.1X authentication process fails.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuring the 802.1X authentication failure policy is not allowed on UNP ports on which 802.1X authentication bypass is enabled.
- Device classification (the default) is performed based on the classification options configured for the UNP port.

Examples

```
-> unp port 1/1/5 802.1x-authentication failure-policy mac
-> no unp port 1/1/10-15 802.1x-authentication failure-policy

-> unp linkagg 10 802.1x-authentication failure-policy mac
-> no unp linkagg 2-5 802.1x-authentication failure-policy
```

Release History

Release 7.3.4; command was introduced.

unp mac-authentication

Configures the status of MAC authentication for the specified UNP port. Enable this functionality to invoke MAC-based authentication for devices connected to the UNP port.

unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication

no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, MAC authentication is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable MAC authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports (both bridge and access port types).
- MAC-based authentication is supported only through a RADIUS server.
- An option exists to classify a device into an alternate UNP in the event successful MAC authentication does not return a UNP name.
- If MAC authentication fails, any classification rules configured for the UNP port are applied.
- If UNP MAC authentication, 802.1X authentication, and classification (see [unp classification](#) and [unp 802.1x-authentication](#)) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured and/or trust VLAN tag is enabled for the port.
- Configuring an authentication server down UNP (see [unp auth-server-down](#)) is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
 - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.

- If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

Examples

```
-> unp port 1/1 mac-authentication
-> no unp port 1/1 mac-authentication
-> unp linkagg 2 mac-authentication
-> no unp linkagg 2 mac-authentication
```

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **linkagg** parameter added.
Release 7.3.1; OmniSwitch 10K support added.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp mac-authentication pass-alternate	Assigns the device to another VLAN-based or service-based UNP when successful MAC authentication does not return a UNP name.
unp classification	Configures the classification status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortMacAuthFlag
```

unp mac-authentication pass-alternate

Configures the name of an existing VLAN-based or service-based UNP to use as an alternate profile. A device is assigned to the alternate profile when successful MAC authentication does not return a UNP name.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication pass-alternate profile_name
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication pass-alternate
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>profile_name</i>	The name of an existing VLAN, SPB, or VXLAN profile.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- Service-based profiles classify traffic received on UNP access ports; VLAN-based profiles classify traffic received on UNP bridge ports. Make sure the specified port is of the correct type for the specified profile.
- The UNP name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1 mac-authentication pass-alternate Finance
-> unp port 1/1-3 mac-authentication pass-alternate CustomerA
-> unp port 1/4-10 mac-authentication pass-alternate CustomerC
-> no unp port 1/1-3 mac-authentication pass-alternate

-> unp linkagg 5 mac-authentication pass-alternate AltUNP
-> unp linkagg 1-5 mac-authentication pass-alternate CustomerB
-> unp linkagg 10-12 mac-authentication pass-alternate CustomerD
-> no linkagg 5 mac-authentication pass-alternate
```

Release History

Release 7.2.1; command was introduced.

Release 7.2.1.R02; **linkagg** parameter added.

Release 7.3.1; OmniSwitch 10k support added, **spb-profile** parameter added, **unp-name** parameter changed to **vlan-profile**.

Release 7.3.4; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Release 8.3.1; **vlan-profile**, **spb-profile**, and **vxlan-profile** parameters deprecated.

Related Commands

unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
unp port-type	Configures UNP functionality on a port or link aggregate.
unp mac-authentication	Configures the MAC authentication status for the UNP port.
show unp port	Displays the UNP port parameter configuration.

MIB Objects

```
alaDaUNPPortTable  
  alaDaUNPPortIfIndex  
  alaDaUNPPortPassAltProfileName
```

unp mac-authentication allow-eap

Configures whether the switch attempts subsequent 802.1X authentication for a device connected to a UNP port on which 802.1X authentication bypass is enabled. When 802.1X bypass is enabled on the port, MAC authentication is performed first on any device connected to that port. This command specifies the conditions under which 802.1X authentication is performed or bypassed after the initial MAC authentication process.

unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **mac-authentication allow-eap** {pass | fail | noauth}

no unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **mac-authentication allow-eap**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
pass	Perform 802.1X (EAP frame) authentication if the device passes MAC authentication.
fail	Perform 802.1X (EAP frame) authentication if the device fails MAC authentication.
noauth	Perform 802.1X (EAP frame) authentication if MAC authentication is not configured on the UNP port.

Defaults

By default, the allow 802.1X authentication option is not set.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the allow 802.1X authentication option back to the default value of none (option is not set).
- The port specified with this command must also have 802.1X bypass enabled (see the [unp 802.1x-authentication bypass-8021x](#) command). If bypass is not enabled, the option configured with this command does not apply.
- This command is only allowed on UNP-enabled ports and link aggregates.

Examples

```
-> unp port 1/1/5 mac-authentication allow-eap pass
-> unp port 1/1/10-15 mac-authentication allow-eap fail
-> no unp port 1/1/5 mac-authentication allow-eap
```

```
-> unp linkagg 10 mac-authentication allow-eap noauth
-> unp linkagg 2-5 mac-authentication allow-eap none
-> no unp linkagg 10 mac-authentication allow-eap
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication bypass-8021x	Configures the 802.1X bypass operation status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortMacAllowEap
```

unp classification

Configures the classification status for the specified UNP port. When classification is enabled but authentication is disabled or fails, UNP classification rules (such as MAC address, MAC address range, IP network address, or VLAN tag) are applied to the traffic received on the UNP port.

unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} classification

no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} classification

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

Defaults

By default, classification is enabled on the UNP port.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the classification status for a UNP port or link aggregate.
- This command is allowed only on UNP-enabled ports (both bridge and access ports).
- UNP classification rules are applied if authentication is disabled on the port, is enabled on the port but the RADIUS server is not configured, or the authentication method fails.
- If untagged device traffic does not match any of the classification rules, the device is assigned to the default UNP configured for the port.
- If tagged device traffic does not match any of the classification rules and the trust VLAN tag option (see [unp trust-tag](#)) is enabled for the port, the device is classified based on the VLAN tag of the traffic if a VLAN matching the tag exists in the switch configuration.
- If all of the UNP authentication methods *and* UNP classification are disabled for the UNP port, then all MAC addresses received on that port are blocked unless a default VLAN is specified and/or trust VLAN tag is enabled for the port.

- When classification is enabled for the port, UNP classification rules are applied in the following order of precedence:
 - MAC address + VLAN tag
 - MAC address
 - MAC address range + VLAN tag
 - MAC address range
 - IP address + VLAN tag
 - IP address
 - VLAN tag

Examples

```
-> unp port 1/1 classification
-> no unp port 1/1 classification
-> unp port 1/1-4 classification
ERROR: Port 1/3 is not a unp-port
-> unp linkagg 5 classification
-> no unp linkagg 5 classification
```

Release History

Release 7.2.1; command was introduced.
Release 7.2.1.R02; **linkagg** parameter added.
Release 7.3.1; OmniSwitch 10K support added.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortClassificationFlag
```

unp trust-tag

Configures the option of whether or not to trust the VLAN ID of a tagged packet to determine how the packet is classified.

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} trust-tag

no {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} trust-tag

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

Defaults

By default, the VLAN tag is not trusted.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the trust tag status for a UNP port or link aggregate.
- When this option is enabled, the device is classified into a VLAN or service access point (SAP) when one of the following conditions occur:
 - MAC or 802.1X authentication passes, but the RADIUS server returns a UNP that does not exist in the switch configuration.
 - MAC or 802.1X authentication passes, but the RADIUS server does not return a UNP and the alternate UNP option is disabled for the port.
 - Device traffic does not match any of the classification rules configured for the UNP port.
 - The UNP VLAN obtained from a matching classification rule does not exist in the switch configuration.
 - Auth-Server-Down UNP option is used, but the VLAN associated with that UNP does not exist in the switch configuration.
- When the trust tag option is triggered on a UNP bridge port and a VLAN exists in the switch configuration that matches the VLAN tag, a VLAN-port-association (VPA) is created between the UNP port and the matching VLAN even if the matching VLAN is *not* associated with a UNP.
- When the trust tag option is triggered on a UNP access port, the VLAN tag information is used to create a dynamic SAP (virtual port) to which the access port is associated.
- Enabling the trust VLAN ID tag option provides an implicit method of VLAN tag classification that will accept tagged traffic matching any of the existing UNPs without the need to create specific classification rules for those profiles.

Examples

```
-> unp port 1/1 trust-tag
-> unp port 1/1-4 trust-tag
-> no unp port 1/1 trust-tag

-> unp linkagg 5 trust-tag
-> unp linkagg 6-10 trust-tag
-> no unp linkagg 5 trust-tag
```

Release History

Release 7.2.1; command was introduced.
Release 7.3.1; OmniSwitch 10K support added.

Related Commands

show unp port	Displays the UNP configuration for the port.
show unp user	Displays information about the devices learned on a UNP port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortTrustTagStatus
```

unp default-profile

Configures the name of an existing UNP classification profile to serve as the default UNP for the specified UNP port or link aggregate.

unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **default-profile** *profile_name*

no unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id*} **default-profile**

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a UNP-enabled port. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>profile_name</i>	The name of an existing UNP classification profile.

Defaults

By default, there is no default profile configured for UNP ports or link aggregates.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the default UNP from the port configuration.
- This command is allowed only on UNP-enabled ports.
- The UNP classification profile specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
 - UNP authentication and classification are not enabled on the port.
 - MAC authentication fails.
 - Device traffic does not match any UNP classification rules.
 - The UNP trust VLAN tag option (see [unp trust-tag](#)) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist in the switch configuration.
 - Untagged device traffic is not classified.

Examples

```
-> unp port 1/1 default-profile Sales
-> no unp port 1/1 default-profile
-> unp port 1/1-4 default-profile Sales
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
```

```
-> unp port 1/1 default-profile BAD-UNP
ERROR: UNP doesn't exist
-> no unp port 1/1-4 default-profile
-> unp linkagg 5 default-profile VM1-Server1
-> no unp linkagg 5 default-profile
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp profile	Configures a UNP profile that is used to classify traffic received on UNP ports.
unp port-type	Configures the status of UNP functionality on the port.
unp trust-tag	Configures whether or not a device is classified into an existing VLAN that matches the VLAN ID tag of the packets received from the device.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortDefaultProfileName
```

unp domain

Assigns a UNP port or link aggregate to a customer domain (UNP group).

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **domain** *domain_id*

no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **domain** *domain_id*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>domain_id</i>	The numerical domain ID to which the specified port or link aggregate is assigned.

Defaults

By default, all UNP ports are assigned to customer domain zero (0).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The domain ID specified with this command must already exist in the switch configuration.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain, only classification rules associated with the same customer domain ID are applied to that port.

Examples

```
-> unp port 1/1 domain 1
-> unp port 1/1-3 domain 2
-> no unp port 1/1 domain 1
-> unp linkagg 5 domain 5
-> unp linkagg 8-10 domain 6
-> no unp linkagg 5 domain 5
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type

Configures the status of UNP for the specified port or link aggregate.

unp domain description

Creates a customer domain ID.

show unp domain

Displays the available customer domain IDs.

show unp port

Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortDomainId
```

unp aaa-profile

Assigns the name of an existing authentication, authorization, and accounting (AAA) profile to the specified UNP port or link aggregate. This type of profile defines AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are applied to device traffic received on the UNP port to which the profile is assigned.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} aaa-profile profile_name
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} aaa-profile
```

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>profile_name</i>	The name of an existing AAA profile.

Defaults

By default, there is no AAA profile assigned to UNP ports or link aggregates. The global AAA configuration for the switch is applied.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the AAA profile from the port configuration.
- The AAA profile specified with this command must already exist in the switch configuration.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> unp port 1/1/5 aaa-profile A1
-> no unp port 1/1/5 aaa-profile

-> unp port 1/1/1-5 aaa-profile A2
-> no unp port 1/1/1-5 aaa-profile

-> unp linkagg 10 aaa-profile A3
-> no unp linkagg 10 aaa-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port-type

Configures UNP functionality for the specified port or link aggregate.

aaa profile

Configures an AAA configuration profile.

show unp port

Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortAaaProfile
```

unp port port-template

Assigns the name of an existing port template to the specified UNP port or link aggregate. A port template defines UNP port configuration options (such as the type of authentication, classification status, a default profile) that are applied to the UNP port to which the template is assigned.

unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **port-template** *template_name*

no unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **port-template**

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>template_name</i>	The name of an existing port template.

Defaults

By default, the “bridgeDefaultPortTemplate” port template is assigned to UNP bridge ports, and the “accessDefaultPortTemplate” port template is assigned to UNP access ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the port template from the port configuration.
- The port template specified with this command must already exist in the switch configuration.
- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.

Examples

```
-> unp port 1/1/5 port-template up1
-> unp port 1/1/1-5 port-template up2
-> no unp port 1/1/5 port-template
-> no unp port 1/1/1-5 port-template

-> unp linkagg 10 port-template up3
-> unp linkagg 10-50 port-template up4
-> no unp linkagg 10 port-template
-> no unp linkagg 10-50 port-template

-> unp port 1/10 802.1x-authentication
ERROR: Port Template already enforced on port, please remove it for manual config
on Port
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type	Configures the UNP status and port type for the specified port or link aggregate.
unp port-template	Configures a port template.
show unp port config	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortPortTemplate
```

unp direction

Configures whether network access control is applied to both incoming and outgoing traffic or only applied to incoming traffic on the specified UNP bridge port or link aggregate.

unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **direction** {**both** | **in**}

no unp {port *chassis/slot/port1[-port2]* | linkagg *agg_id[-agg_id2]*} **direction**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
both	Enables bidirectional network access control on the specified port or link aggregate.
in	Enables network access control for incoming traffic only on the specified port or link aggregate.

Defaults

By default, bidirectional network access control is enabled on the port.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the network access control direction to the default (**both**).
- When the port control direction is set to **both**, egress broadcast, unknown unicast, and multicast traffic is blocked on the UNP port.
- When the port control direction is set to **in**, egress broadcast, unknown unicast, and multicast traffic is allowed on the UNP port.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.

Examples

```
-> unp port 1/1/5 direction in
-> unp port 1/1/10-15 direction both
-> no unp port 1/1/10-15 direction

-> unp linkagg 10 direction in
-> unp linkagg 2-5 direction both
-> no unp linkagg 2-5 direction
```

Release History

Release 7.3.4; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

alaDaUNPPortTable
alaDaUNPPortAdminControlledDirections

unp admin-state

Enables or disables the UNP configuration for a port or link aggregate.

```
unp {port {chassis/slot/port1[-port2] | linkagg agg_id1[-agg_id2]} admin-state {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id1[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
enable	Activates the UNP configuration for the UNP port or link aggregate. UNP functionality is applied to traffic received on the UNP port or link aggregate.
disable	Disables the UNP configuration for the UNP port or link aggregate. UNP functionality is not applied to traffic received on the UNP port or link aggregate.

Defaults

By default, UNP is administratively enabled at the time UNP functionality is configured for the port or link aggregate.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When UNP functionality is disabled, the UNP configuration for the port or link aggregate is retained but is not applied to traffic received on the port or link aggregate.

Examples

```
-> unp port 1/1 admin-state disable
-> unp port 1/2-5 admin-state disable
-> unp port 1/1 admin-state enable
-> unp linkagg 5 admin-state disable
-> unp linkagg 8-10 admin-state disable
-> unp linkagg t admin-state enable
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type

Configures UNP functionality for the specified port or link aggregate.

show unp port

Displays the UNP configuration for the port.

MIB Objects

alaDaUNPPortTable

alaDaUNPPortIfIndex

alaDaUNPPortAdminState

unp dynamic-service

Configures whether the System Default service profile dynamically creates an SPB Service Access Point (SAP) or a VXLAN SAP based on the traffic received on the UNP access port.

unp {port [*chassis_id*]/slot/port1[-port2] | linkagg *agg_id*[-*agg_id2*]} **dynamic-service** {spb | vxlan}

no unp {port [*chassis_id*]/slot/port1[-port2] | linkagg *agg_id*[-*agg_id2*]} **dynamic-service**

Syntax Definitions

<i>chassis_id</i>	The chassis identifier when running in virtual chassis mode.
slot/port[-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
spb	Dynamically creates an SPB SAP.
vxlan	Dynamically creates a VXLAN SAP (supported only on OmniSwitch 6900-Q32 and OmniSwitch 6900-X72).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the System Default profile capability.
- This command applies only to ports and link aggregates configured as UNP access ports; this command does not apply to UNP bridge ports.
- Traffic received on UNP access ports that are not assigned to a user-defined service profile is assigned to the System Default service profile. The System Default profile attributes used to dynamically create a SAP for such traffic are derived based on the setting for this UNP port parameter.
 - If the dynamic service port parameter is set to SPB, then the SPB control BVLAN, a calculated default I-SID number, and an incremental reserved service ID number are used to dynamically create a SAP for SPB service traffic received on the UNP access port.
 - If the dynamic service port parameter is set to VXLAN, then a calculated VNI number, a default multicast group IP address, and an incremental reserved service ID number are used to dynamically create a SAP for VXLAN service traffic received on the UNP access port.

Examples

```
-> unp port 1/1/5 dynamic-service vxlan
-> unp port 1/1/10-15 dynamic-service spb
-> no unp port 1/1/10-15 dynamic-service
```

```
-> unp linkagg 10 dynamic-service vxlan
-> unp linkagg 2-5 dynamic-service spb
-> no unp linkagg 2-5 dynamic-service
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp port-type	Configures UNP functionality on a port or link aggregate.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortDynamicService
```

unp vlan

Configures an untagged VLAN-port association between the specified UNP bridge port and VLAN ID.

unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **vlan** *vlan_id* [-*vlan_id2*]

no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **vlan** *vlan_id* [-*vlan_id2*]

Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>vlan_id</i> [- <i>vlan_id2</i>]	The VLAN ID to assign to the UNP port. Use a hyphen to specify a range of VLAN IDs.

Defaults

By default, no VLAN associations are configured for UNP and bridge ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a VLAN association from the UNP port configuration.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- When this command is used to assign a VLAN to a UNP bridge port, the port goes into a forwarding state for egress traffic associated with the VLANs assigned to the port. This automatically occurs even when there is no MAC address learned on the UNP port in the assigned VLANs and regardless of the direction value (in or both) set for the port.

Examples

```
-> unp port 1/1/5 vlan 500
-> unp port 1/1/10 vlan 100-105
-> no unp port 1/1/5 vlan 500
-> no unp port 1/1/10 vlan 100-105

-> unp linkagg 10 vlan 500
-> unp linkagg 20 vlan 100-105
-> no unp linkagg 10 vlan 500
-> no unp linkagg 20 vlan 100-105
```

MIB Objects

alaDaUNPPortVlanTable

alaDaUNPPortVlanVID

unp port-template

Configures a UNP port template that is used to apply a pre-defined port configuration to a UNP port or link aggregate. Using a port template to configure UNP functionality on a port or link aggregate avoids having to configure each parameter with a separate CLI command. Applying an template configures all port-based parameters with a single CLI command.

This section describes the base command (**unp port-template**) along with optional command keywords that are used to configure port parameter values that are applied when the template is assigned to a UNP port or link aggregate. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the template.

There are two default port templates: “bridgeDefaultPortTemplate” (applied to UNP bridge ports) and “accessDefaultPortTemplate” (applied to UNP access ports). These templates define a default set of port parameter values that are applied at the time a port or link aggregate is configured as a UNP bridge or access port. The default templates cannot be deleted, but the template parameter values are configurable through this command.

unp port-template {*template_name* | **bridgeDefaultPortTemplate** | **accessDefaultPortTemplate**}

[**802.1x-authentication**]

[**802.1x-authentication pass-alternate** *profile_name*]

[**mac-authentication**]

[**mac-authentication pass-alternate** *profile_name*]

[**classification**]

[**trust-tag**]

[**default-profile** *profile_name*]

[**domain** *domain_id*]

[**aaa-profile** *profile_name*]

[**redirect port-bounce**]

[**direction** {**in** | **both**}]

[**802.1x-authentication tx-period** *seconds*]

[**802.1x-authentication supp-timeout** *seconds*]

[**802.1x-authentication max-req** *max_req*]

[**802.1x-authentication bypass**]

[**802.1x-authentication failure-policy** {**mac**}]

[**mac-authentication allow-eap** {**pass** | **fail** | **noauth**}]

[**admin-state** {**enable** | **disable**}]

[**dynamic-service** {**spb** | **vlan**}]

[**vlan** *vlan_id* [-*vlan_id2*]

no unp port-template *template_name* [**802.1x-authentication** | **802.1x authentication pass-alternate** | **mac-authentication** | **mac-authentication pass-alternate** | ...]

Syntax Definitions

template_name

The name to associate with the UNP port template.

bridgeDefaultPortTemplate

The name of the default port template applied to UNP bridge ports.

accessDefaultPortTemplate

The name of the default port template applied to UNP access ports.

Defaults

The following table contains the default values that are set when a new port template is created and the default values for the “accessDefaultPortTemplate” and “bridgeDefaultPortTemplate” system-defined port templates:

parameter	new port template default values	system-defined port template values
802.1x-authentication	disabled	enabled
802.1x-authentication pass-alternate <i>profile_name</i>	none	none
mac-authentication	disabled	enabled
mac-authentication pass-alternate <i>profile_name</i>	none	none
classification	enabled	enabled
trust-tag	enabled	enabled
default-profile <i>profile_name</i>	none	none
domain <i>domain_id</i>	0	0
aaa-profile <i>profile_name</i>	none	none
redirect port-bounce	disabled	disabled
direction {in both}	both	both
802.1x-authentication tx-period <i>seconds</i>	0	30
802.1x-authentication supp-timeout <i>seconds</i>	0	30
802.1x-authentication max-req <i>max_req</i>	2	2
802.1x-authentication bypass	disabled	disabled
802.1x-authentication failure-policy {mac}	default	default
mac-authentication allow-eap {pass fail noauth}	none	none
admin state {enable disable}	enabled	enabled
dynamic-service {vxlan spb}	none	none
vlan <i>vlan_id</i> [- <i>vlan_id2</i>]	none	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the port template from the switch configuration. Specify an optional keyword parameter with the **no** form of this command to change the value for a specific parameter.
- If the name of the template does not exist when this command is used to modify a port parameter, the switch will automatically create a new template using the name specified. For example, the **unp port-**

template port-1 mac-authentication command will create the “port-1” template if it does not already exist in the switch configuration.

- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.
- For more information about specific port parameter values, refer to the following explicit UNP port configuration commands for each template parameter:

Port Template Parameter	Explicit Port Configuration Command
[802.1x-authentication]	unp 802.1x-authentication
[802.1x-authentication pass-alternate <i>profile_name</i>]	unp 802.1x-authentication pass-alternate
[mac-authentication]	unp mac-authentication
[mac-authentication pass-alternate <i>profile_name</i>]	unp mac-authentication pass-alternate
[classification]	unp classification
[default-profile <i>profile_name</i>]	unp default-profile
[domain <i>domain_id</i>]	unp domain
[aaa-profile <i>profile_name</i>]	unp aaa-profile
[redirect port-bounce]	unp redirect port-bounce
[direction {in both}]	unp direction
[802.1x-authentication tx-period <i>seconds</i>]	unp 802.1x-authentication tx-period
[802.1x-authentication supp-timeout <i>seconds</i>]	unp 802.1x-authentication supp-timeout
[802.1x-authentication max-req <i>max_req</i>]	unp 802.1x-authentication max-req
[802.1x-authentication bypass]	unp 802.1x-authentication bypass-8021x
[802.1x-authentication failure-policy {mac}]	unp 802.1x-authentication failure-policy
[mac-authentication allow-eap {pass fail noauth}]	unp mac-authentication allow-eap
[trust-tag]	unp trust-tag
[admin-state {enable disable}]	unp admin-state
[dynamic-service {spb vlan}]	unp dynamic-service
[vlan <i>vlan_id</i> [- <i>vlan_id2</i>]]	unp vlan

Examples

```
-> unp port-template port-1
-> unp port-template port-1 mac-authentication
-> unp port-template port-1 mac-authentication pass-alternate unp1
-> unp port-template port-1 classification
-> no unp port-template port-1 mac-authentication
-> no unp port-template port-1
```

```
-> unp port-template port-2 802.1x-authentication
-> unp port-template port-2 classification
-> unp port-template port-2 domain 10
-> no unp port-template port-2 classification
-> no unp port-template port-2
```

unp classification port

Defines a Port classification rule for the specified UNP profile. If the UNP port or link aggregate on which the device traffic is received matches the port or link aggregate defined for the rule, the specified profile is applied to the device.

unp classification {port *chassis/slot/port1[-port2]* | linkagg [*agg_id[-agg_id2]*] } [vlan-tag *vlan_id* | *outer_vlan_id:inner_vlan_id*] {profile1 *profile_name* [profile2 *profile_name*] [profile3 *profile_name*] }

no unp classification {port *chassis/slot/port1[-port2]* | linkagg *agg_id*} [profile1] [profile2] [profile3]

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
[<i>agg_id[-agg_id2]</i>]	The link aggregate ID for a specific UNP link aggregate. Use a hyphen to specify a range of IDs (5-10).
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the Port rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- The Port rule configured for the specified profile is applied only to traffic learned on the specified UNP port or link aggregate.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.
- When configuring a Port classification rule, specify an optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is applied only to tagged packets that are received on the specified UNP port *and* that contain the VLAN ID tag.
- Untagged packets are only classified using the specified UNP port; the VLAN ID tag is ignored if it is specified with this rule.
- A Port classification rule can be combined with a MAC address rule and IP address rule to configure a port-based binding rule. The following binding rule combinations are supported:
 - Port + MAC address + IP address
 - Port + MAC address
 - Port + IP address

Examples

```
-> unp classification port 1/1/5 vlan-tag 100 profile1 un1-vxlan profile2 un2-spb
-> unp classification port 1/1/10-15 profile1 un1-vlan profile2 un2-spb
-> no unp classification port 1/1/5 profile2
-> no unp classification port 1/1/5
```

```
-> unp classification linkagg 5 profile1 un1-vlan profile2 un2-vxlan profile3
unp3-spb
-> unp classification linkagg 6-10 vlan-tag 10:20 profile1 un1-vlan
-> no unp classification linkagg 5 profile3
-> no unp classification linkagg 5
```

Port + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15
```

Port + MAC address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 port 1/1/5 profile1 Pr1
-> no unp classification mac-address 00:11:22:33:44:55 port 1/1/5
```

Port + IP address binding rule example:

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 profile1
Pr2
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.

```

unp classification domain

Defines a Domain ID classification rule for the specified UNP profile. If the port or link aggregate on which the device traffic is received belongs to a Domain ID that matches the Domain ID defined for the rule, the specified profile is applied to the device.

unp classification domain *domain_id* [**vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id*] {**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]}

no unp classification domain *domain_id* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>domain_id</i>	A domain ID number.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the domain ID rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a Port classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets received on a UNP port associated with the Domain ID *and* tagged with the specified VLAN ID.
- Untagged packets are only classified using the specified domain ID; the VLAN ID tag is ignored if it is specified with this rule.
- A domain ID classification rule can be combined with a MAC address rule and an IP address rule to configure a domain-based binding rule.

Examples

```
-> unp classification domain 10 profile1 unp1-vlan
-> unp classification domain 20 vlan-tag 100 profile1 unp1-vxlan profile2 unp2-spb
profile3 unp3-vlan
-> no unp classification domain 20 profile3
-> no unp classification domain 20
```

Domain ID + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10
```

```

unp classification mac-address

Defines a MAC address classification rule for the specified UNP. If the source MAC address of the device traffic matches the MAC address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

unp classification mac-address *mac_address* [**domain** *domain_id*] [**vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id*] {**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]}

no unp classification mac-address *mac_address* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MAC address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address classification rule, specify an optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is configured for this rule.

Examples

```
-> unp classification mac-address 00:11:22:33:44:55 profile1 CustA
-> unp classification mac-address 00:2a:95:00:00:01 vlan-tag 200 profile1 VNP1
profile2 vxlp-1
-> unp classification mac-address 00:2b:96:11:22:03 profile1 CustA profile2 VNP1
profile3 vxlp-1
-> unp classification mac-address 00:11:22:33:44:56 domain 2 vlan-tag 100:200
profile1 CustB
-> unp classification mac-address 00:2a:95:00:00:02 domain 1 profile1 unp1-vlan
profile2 unp2-spb
-> no unp classification mac-address 00:2b:96:11:22:03 profile3
-> no unp classification mac-address 00:2a:95:00:00:02
```

```

unp classification mac-oui

Defines a MAC address Organizationally Unique Identifier (OUI) classification rule for the specified UNP profile. If the OUI of the source MAC address of the device traffic matches the OUI defined for the rule, the specified profile is applied to the device.

unp classification mac-oui *mac_oui* [**vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id*] {**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]}

no unp classification mac-oui *mac_oui* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>mac_oui</i>	The first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MAC OUI rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address OUI classification rule, specify an optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address OUI *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address OUI; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```
-> unp classification mac-oui 00:11:22 profile1 unp1-vlan
-> unp classification mac-oui 00:11:33 vlan-tag 10 profile1 unp1-vlan profile2
unp2-spb profile3 unp3-vxlan
-> no classification mac-oui 00:11:33 profile3
-> no unp classification mac-oui 00:11:22
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp profile	Configures a UNP profile.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPMacOuiRuleTable
  alaDaUNPMacOuiRuleAddr
  alaDaUNPMacOuiRuleVlanTag
  alaDaUNPMacOuiRuleProfile1
  alaDaUNPMacOuiRuleProfile2
  alaDaUNPMacOuiRuleProfile3
```

unp classification mac-range

Defines a MAC address range classification rule for the specified UNP. If the source MAC address of the device traffic matches any address within the range of MAC addresses, the specified UNP is applied to the device. An optional VLAN ID tag parameter is also available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

```
unp classification mac-range low_mac_address high_mac_address [domain domain_id] [vlan-tag
vlan_id | outer_vlan_id:inner_vlan_id] {profile1 profile_name [profile2 profile_name] [profile3
profile_name]}
```

```
no unp classification mac-range low_mac_address high_mac_address [profile1] [profile2] [profile3]
```

Syntax Definitions

<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MAC address range rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address range classification rule, specify and optional VLAN tag and/or an optional domain ID before specifying the UNP for which the rule will classify traffic.

- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing a source MAC address within the specified range *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address range; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```

unp classification ip-address

Defines an IP network address classification rule for the specified UNP. If the source IP address of the device traffic matches the IP address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source IP address.

unp classification ip-address *ip_address* **mask** *subnet_mask* [**domain** *domain_id*] [**vlan-tag** *vlan_id* | *outer_vlan_id:inner_vlan_id*] {**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]}

no unp classification ip-address *ip_address* **mask** *subnet_mask* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>ip_address</i>	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>subnet_mask</i>	An IP address mask to identify the IP subnet for the interface (supports class-less masking).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IP network address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring an IP network address classification rule, specify and optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.

- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source IP address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified IP address; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```
-> unp classification ip-address 10.1.1.1 mask 255.255.255.0 profile1 CustA
-> unp classification ip-address 20.1.1.1 mask 255.255.0.0 profile1 vNP1 profile2
vNP2

```

unp classification vlan-tag

Defines a VLAN tag classification rule for the specified UNP. If the VLAN ID tag of the device traffic matches the VLAN ID defined for the rule, the specified UNP is applied to the device.

unp classification vlan-tag {*vlan_id* | *outer_vlan_id:inner_vlan_id*} [**domain** *domain_id*] {**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]}

no unp classification vlan-tag *vlan_id* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>domain_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a VLAN tag rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a VLAN tag classification rule, specify an optional customer domain ID before specifying the name of the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Untagged packets are not classified with this rule.

Examples

```
-> unp classification vlan-tag 400 profile1 CustA
-> unp classification vlan-tag 10:20 domain 3 profile1 unp1 profile2 spb1
-> no unp classification vlan-tag 10:20 profile1
-> no unp classification vlan-tag 400
```

Release History

Release 8.3.1; command was introduced.

Related Commands

  alaDaUNPCustDomainVlanTagRuleProfile2
  alaDaUNPCustDomainVlanTagRuleProfile3
```

unp classification lldp med-endpoint ip-phone

Defines a Link Layer Discovery Protocol (LLDP) classification rule for the specified UNP profile. This rule is specifically for IP phones. When the LLDP TLVs from an IP phone are detected, the specified profile is applied to the IP phone.

```
unp classification lldp med-endpoint ip-phone {profile1 profile_name [profile2 profile_name]
[profile3 profile_name]}
```

```
no unp classification lldp med-endpoint ip-phone [profile1] [profile2] [profile3]
```

Syntax Definitions

profile_name The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

Examples

```
-> unp classification lldp med-endpoint ip-phone profile1 unp1-vlan profile2 unp2-
vlan
-> no unp classification lldp med-endpoint ip-phone profile2
-> no unp classification lldp med-endpoint ip-phone
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp profile	Configures a UNP profile.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPEndPoinRuleTable  
alaDaUNPEndPoinRuleId  
alaDaUNPEndPoinProfile1  
alaDaUNPEndPoinProfile2  
alaDaUNPEndPoinProfile3
```

unp classification authentication-type

Defines an Authentication Type classification rule for the specified UNP profile. If the type of authentication applied to the device traffic matches the authentication type defined for the rule, the specified profile is applied to the device.

```
unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [vlan-tag vlan_id |
outer_vlan_id:inner_vlan_id] {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [profile1] [profile2]
[profile3]
```

Syntax Definitions

none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, no classification rules are defined for a UNP profile.

parameter	default
<i>vlan_id</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.

- When configuring this type of classification rule, specify an optional VLAN tag before specifying the UNP profile name for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
 - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
 - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
 - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified authentication type *and* the VLAN ID tag.
- Untagged packets are only classified using the specified authentication type; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```
-> unp classification authentication-type 802.1X profile1 un1-vlan profile2 un2-
vlan profile3 un3-vlan
-> no unp classification authentication-type 802.1X profile2
-> no unp classification authentication-type 802.1X

-> unp classification authentication-type 802.1X fail profile1 un1-vlan profile2
un2-vlan profile3 un3-vlan
-> no unp classification authentication-type 802.1X fail profile3
-> no unp classification authentication-type 802.1X fail

-> unp classification authentication-type MAC profile1 un1-vlan profile2 un2-vlan
profile3 un3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC

-> unp classification authentication-type MAC fail profile1 un1-vlan profile2
un2-vlan profile3 un3-vlan
-> no unp classification authentication-type MAC fail profile3
-> no unp classification authentication-type MAC fail

-> unp classification authentication-type MAC vlan-tag 10 profile1 un1-vlan
profile2 un2-vlan profile3 un3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC
```

Release History

Release 8.3.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp profile	Configures a UNP profile.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPAuthRuleTable  
  alaDaUNPAuthRuleType  
  alaDaUNPAuthRuleVlanTag  
  alaDaUNPAuthRuleProfile1  
  alaDaUNPAuthRuleProfile2  
  alaDaUNPAuthRuleProfile3
```

unp classification-rule

Configures an extended classification rule name and assigns a precedence value to the specified name. This type of rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name.

unp classification-rule *rule_name* [**precedence** *precedence_value*] [**profile1** *profile_name* [**profile2** *profile_name*] [**profile3** *profile_name*]]

no unp classification-rule *rule_name* [**profile1**] [**profile2**] [**profile3**]

Syntax Definitions

<i>rule_name</i>	The name to associate with the extended classification rule.
<i>precedence_value</i>	The precedence level to assign to the extended rule. The valid range is 1–255 (1 = lowest, 255 = highest).
<i>profile_name</i>	The name of an existing UNP profile to assign to the extended rule.

Defaults

parameter	default
<i>precedence_value</i>	1
<i>profile_name</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the extended rule from the switch configuration or to remove a UNP profile name assigned to the rule.
- The precedence value specified with this command is used to determine precedence among extended classification rules.
- Extended rules take precedence over all other UNP classification rules (individual rules and binding rule combinations).
- Although some individual classification rules can be combined to form a binding rule, a binding rule is not assigned a rule name and does not have a configurable precedence value. In addition, extended classification rules offer more rule combinations than binding rules.

Examples

```
-> unp classification-rule ext-r1
-> unp classification-rule ext-r1 profile1 UNP1
-> no unp classification-rule ext-r1 profile1 UNP1
-> no unp classification-rule ext-r1
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **edge-profile** parameter deprecated; **profile1**, **profile2**, and **profile3** parameters added.

Related Commands

  alaDaUNPClassifRuleProfile1  
  alaDaUNPClassifRuleProfile2  
  alaDaUNPClassifRuleProfile3
```

unp classification-rule port

Defines a Port rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name {port chassis/slot/port1[-port2] | linkagg agg_id}
```

```
no unp classification-rule rule_name {port | linkagg}
```

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>chassis/slot/port1[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i>	Link aggregate ID.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the Port rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 port 1/1/10
-> no unp classification-rule ext-r1 port

-> unp classification-rule ext-r2 port 1/1/1-5
-> no unp classification-rule ext-r2 port

-> unp classification-rule ext-r3 linkagg 10
-> unp classification-rule ext-r3 linkagg
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRulePort
```

unp classification-rule domain

Defines a domain ID rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **domain** *domain_id*

no unp classification-rule *rule_name* **domain**

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>domain_id</i>	Domain ID number.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the Domain ID rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 domain-id GRP1  
-> no unp classification-rule ext-r1 domain-id
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **group-id** parameter changed to **domain**.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

```

unp classification-rule mac-address

Defines a MAC address, rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-address** *mac_address*

no unp classification-rule *rule_name* **mac-address**

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-address 00:11:22:33:44:55  
-> no unp classification-rule ext-r1 mac-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

  alaDaUNPClassifRuleMacAddr
```

unp classification-rule mac-oui

Defines a MAC OUI rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name mac-oui mac_oui
```

```
no unp classification-rule rule_name mac-oui
```

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>mac_oui</i>	The Organizationally Unique Identifier (OUI) of the MAC address. The OUI is the first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-oui 00:11:22  
-> no unp classification-rule ext-r1 mac-oui
```

Release History

Release 8.1.1; command was introduced.

Related Commands

```

unp classification-rule mac-range

Defines a MAC address range rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name mac-range low_mac_address high_mac_address
```

```
no unp classification-rule rule_name mac-range
```

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>low_mac_address</i>	MAC address that defines the low end of the range (for example, 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (for example, 00:00:39:59:f1:90).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-range 00:11:22:33:44:55 00:11:22:33:44:66  
-> no unp classification-rule ext-r1 mac-range
```

Release History

Release 8.1.1; command was introduced.

unp classification-rule ip-address

Defines an IP network address rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name ip-address ip_address mask subnet_mask
```

```
no unp classification-rule rule_name ip-address
```

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the IP address rule condition is assigned.
<i>ip_address</i>	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>subnet_mask</i>	An IP address mask to identify the IP subnet for the interface (supports class-less masking).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 ip-address 10.0.0.20 mask 255.0.0.0  
-> no unp classification-rule ext-r1 ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

  alaDaUNPClassifRuleIpMaskType  
  alaDaUNPClassifRuleIpMask
```

unp classification-rule vlan-tag

Defines a VLAN tag rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **vlan-tag** [*vlan_id* | *outer_vlan_id:inner_vlan_id*]

no unp classification-rule vlan-tag

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the VLAN tag rule condition is assigned.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 vlan-tag 200
-> unp classification-rule ext-r2 vlan-tag 10:20
-> no unp classification-rule ext-r1 vlan-tag
```

Release History

Release 8.2.1; command was introduced.

Related Commands

alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleVlanTag
```

unp classification-rule lldp med-endpoint ip-phone

Defines an LLDP rule condition for the specified extended classification rule name. This rule condition is specifically to detect IP phone TLVs.

unp classification-rule *rule_name* lldp med-endpoint ip-phone

no unp classification-rule *rule_name* lldp med-endpoint ip-phone

Syntax Definitions

rule_name The name of an extended classification rule to which the port condition is assigned.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 lldp med-endpoint ip-phone
-> no unp classification-rule ext-r1 lldp med-endpoint ip-phone
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleEndPoin
```

unp classification-rule authentication-type

Defines an authentication type rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **authentication-type** {**none** | **mac** [**fail**] | **802.1x** [**fail**]}

no unp classification-rule *rule_name* **authentication-type**

Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.

Examples

```
-> unp classification-rule ext-r1 authentication-type 8021x
-> unp classification-rule ext-r1 authentication-type 8021X fail
-> unp classification-rule ext-r1 authentication-type mac
-> unp classification-rule ext-r1 authentication-type mac fail
-> no unp classification-rule ext-r1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleAuthType
```

unp user-role

Configures a user-defined role name and assigns a precedence value to the specified name. This type of role is used to define a list of conditions and a QoS policy list name. If the current context of a device matches all of the role conditions, then the policy list is applied to that device.

unp user-role *role_name* [**precedence** *precedence_value*]

no unp user-role *role_name*

Syntax Definitions

<i>role_name</i>	The name to associate with the user-defined role.
<i>precedence_value</i>	The precedence level to assign to the user-defined role. The valid range is 1–255 (1 = lowest, 255 = highest).

Defaults

parameter	default
<i>precedence_value</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the user-defined role from the switch configuration.
- The precedence value specified with this command is used to determine precedence among other user-defined roles.
- Every time the user context changes for a device, all the user-defined roles are checked to see if there is a role that matches the current user context.
- Only one user-defined role per user is allowed because only one QoS policy list per user is allowed.

Examples

```
-> unp user-role role1
-> unp user-role role2 precedence 255
-> no unp user-role role2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role profile	Configures a UNP profile condition for a user-defined role name.
unp user-role authentication-type	Defines an authentication type condition for a user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable  
  alaDaUNPUserRoleName  
  alaDaUNPUserRolePrecedenceNum
```

unp user-role policy-list

Assigns a QoS policy list to the specified user-defined role name. When the context of a user device matches all the user-defined role conditions, the policy list associated with the role is applied to the device.

unp user-role *role_name* **policy-list** *list_name*

no unp user-role *role_name* **policy-list**

Syntax Definitions

<i>role_name</i>	The name of a user-defined role to which the QoS policy list is assigned.
<i>list_name</i>	The name of an existing QoS policy list.

Defaults

By default, no QoS policy list is assigned to a user-defined role.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a QoS policy list from the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the QoS policy list with that name.
- The QoS policy list name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 policy-list role1-list
-> unp user-role role2 policy-list role2-list
-> no unp user-role role2 policy-list
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
policy list	Configures a QoS policy list.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable  
  alaDaUNPUserRoleName  
  alaDaUNPUserRolePolicyList
```

unp user-role profile

Defines a UNP profile condition for the specified user-defined role name.

```
unp user-role role_name {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp user-role role_name [profile1] [profile2] [profile3]
```

Syntax Definitions

<i>role_name</i>	The name of a user-defined role.
<i>profile_name</i>	The name of an existing UNP profile.

Defaults

By default, the profile condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the profile name as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 profile1 unp1
-> unp user-role role2 profile1 unp1 profile2 unp2
-> unp user-role role3 profile1 unp1 profile2 unp2 profile3 unp3
-> no unp user-role role1 profile1
-> no unp user-role role2 profile1 profile2
-> no unp user-role role3 profile3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role

Configures the name and precedence for a user-defined role.

unp user-role policy-list

Assigns a QoS policy list to a user-defined role.

show unp user-role

Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable  
  alaDaUNPUserRoleName  
  alaDaUNPUserRoleProfile1  
  alaDaUNPUserRoleProfile2  
  alaDaUNPUserRoleProfile3
```

unp user-role authentication-type

Defines an authentication type condition for the specified user-defined role name.

```
unp user-role role_name authentication-type {none | mac [fail] | 802.1x [fail]}
```

```
no unp user-role role_name authentication-type
```

Syntax Definitions

<i>role_name</i>	The name of a user-defined role.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1X authentication.

Defaults

By default, the authentication type condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the authentication type as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.

Examples

```
-> unp user-role role1 authentication-type 8021x
-> unp user-role role1 authentication-type 8021X fail
-> unp user-role role1 authentication-type mac
-> unp user-role role1 authentication-type mac fail
-> no unp user-role role1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role

Configures the name and precedence for a user-defined role.

unp user-role policy-list

Assigns a QoS policy list to a user-defined role.

show unp user-role

Displays the user-defined role configuration for the switch.

MIB Objects

alaDaUNPUserRoleTable

alaDaUNPUserRoleName

alaDaUNPUserRoleAuthType

unp restricted-role policy-list

Assigns an explicit QoS policy list to an implicit restricted role. When the switch assigns a user device to one of the restricted role states (unauthorized, Quarantine Manager, or Captive Portal pre-login), the explicit QoS policy list is applied instead of the built-in policy list associated with the restricted role.

unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list *list_name*

no unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list

Syntax Definitions

<i>list_name</i>	The name of an existing QoS policy list.
unauthorized	Applies the explicit policy list to unauthorized devices.
qmr	Applies the explicit policy list to quarantined devices.
cp-prelogin	Applies the explicit policy list to devices in a Captive Portal pre-login state.

Defaults

By default, the built-in policy list associated with the restricted role state.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the explicit QoS policy list assignment.
- An explicit QoS policy list overrides the built-in policy list associated with the restricted role state.
- When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> unp restricted-role unauthorized policy-list unauth1
-> unp restricted-role qmr policy-list quarantined1
-> unp restricted-role cp-prelogin policy-list cplogin1
-> no unp restricted-role unauthorized
-> no unp restricted-role qmr
-> no unp restricted-role cp-prelogin
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[policy list](#)

Configures a QoS policy list.

MIB Objects

alaDaUNPRstrctedRoleTable

alaDaUNPRstrctedRoleType

alaDaUNPRstrctedRolePolicyList

captive-portal name

Configures the name of the redirect URL to use for Captive Portal.

captive-portal name *cp_url_name*

no captive-portal name *cp_url_name*

Syntax Definitions

cp_url_name The Captive Portal redirect URL.

Defaults

By default, the Captive Portal redirect name is set to “captive-portal.com”.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to revert the URL name back to the default “captive-portal.com”.
- Use this command to change the Captive Portal redirect URL name to match the common name (cn) used by the public certificate on the switch. Matching these two names prevents a certificate warning message caused when these names do not match.
- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login state. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login Web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal name cert-name  
-> no captive-portal name
```

Release History

Release 8.1.1; command was introduced.

Related Commands**captive-portal ip-address**

Configures the internal Captive Portal IP address for the switch.

**show captive-portal
configuration**

Displays the global Captive Portal configuration for the switch.

MIB Objects

alaDaCPortalGlobalConfig

alaDaCPortalRedirectUrlName

captive-portal ip-address

Configures the internal Captive Portal IP address for the switch.

captive-portal ip-address *ip_address*

Syntax Definitions

ip_address IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).

Defaults

By default, the internal Captive Portal IP address is set to 10.123.0.1.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- If the default 10.123.0.0 subnet is already in use, then use this command to change the Captive Portal IP address to another 10.x.0.0 subnet (only the second octet of the Captive Portal IP address can be changed).
- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login role. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect URL name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal ip-address 10.255.0.20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

captive-portal name

Configures the name of the redirect URL that is used for accessing a public certificate.

show captive-portal configuration

Displays the global Captive Portal configuration for the switch.

MIB Objects

alaDaCPortalGlobalConfig

alaDaCPortalIpAddress

captive-portal success-redirect-url

Configures the URL of a specific site to which a user is redirected after a successful Captive Portal authentication.

captive-portal success-redirect-url *redirect_url*

no captive-portal success-redirect-url

Syntax Definitions

redirect_url The redirect URL (up to 63 characters).

Defaults

By default, no success redirect URL is configured.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove the success redirect URL from the Captive Portal global configuration.

Examples

```
-> captive-portal success-redirect-url http://server-1.com/pass.html
-> no captive-portal success-redirect-url
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show captive-portal configuration](#) Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
  alaDaCPortalSuccRedirectUrl
```

captive-portal authentication-pass

Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process. Each policy can specify a QoS policy list and UNP profile name to assign to the authenticated devices.

```
captive-portal authentication-pass {policy-list list_name | profile profile_name | profile-change {enable | disable}}
```

```
no captive-portal authentication-pass {policy-list | profile}
```

Syntax Definitions

<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

By default, no policy list name or UNP profile name is specified for the global Captive Portal configuration.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal authentication pass policy from the global Captive Portal configuration.
- When the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal users is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new UNP profile assigned also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.
- When the **profile-change** parameter is disabled, the QoS policy list name returned from the RADIUS server or the list name specified with this command is applied instead.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
 - The policy list name returned from the RADIUS server.

- The policy list name specified with this command for the global Captive Portal configuration.
- The policy list name associated with the UNP profile returned from the RADIUS server.
- The policy list name associated with the UNP profile specified with this command for the global Captive Portal configuration.
- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

Examples

```
-> captive-portal authentication-pass policy-list list1
-> captive-portal authentication-pass profile unpl-vlan profile-change enable
-> captive-portal authentication-pass profile-change disable
-> no captive-portal authentication-pass policy-list
-> no captive-portal authentication-pass profile
```

Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

Related Commands

captive-portal authentication-pass domain Configures a domain specific authentication pass policy to determine the QoS policy list or UNP profile name to apply to authenticated devices. This type of policy overrides the global Captive Portal configuration.

show captive-portal configuration Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
  alaDaCPortalPolicyListName
  alaDaCPortalUNPProfile
  alaDaCPortalUNPProfileChange
```

captive-portal authentication-pass domain

Configures a domain specific authentication pass policy. This type of policy is applied to all devices within the specified domain that were successfully authenticated through the Captive Portal process.

captive-portal authentication-pass realm {prefix | suffix} domain *domain_name* {policy-list *list_name* | profile *profile_name* | profile-change {enable | disable}}

no captive-portal authentication-pass [realm {prefix | suffix} domain *domain_name*]

Syntax Definitions

prefix	Specifies a prefix domain name (for example, <i>domain_name</i> /user).
suffix	Specifies a suffix domain name (for example, user@ <i>domain_name</i>).
<i>domain_name</i>	The domain name for the user device.
<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

By default, no domain specific authentication pass policy is configured for the Captive Portal process.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the domain specific authentication pass policy from the Captive Portal configuration.
- Use the **realm prefix domain** or **realm suffix domain** parameter to apply the authentication policy list or UNP profile based on the domain name of the Captive Portal authenticated user device.
- If the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal user is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is then applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new profile assigned to the user also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.

- If the **profile-change** parameter is disabled, then the QoS policy list name returned from the RADIUS server or the list name specified through the global (non-domain specific) Captive Portal configuration is applied.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
 - The policy list name returned from the RADIUS server.
 - The policy list name specified with this command or through the global Captive Portal configuration.
 - The policy list name associated with the UNP profile returned from the RADIUS server.
 - The policy list name associated with the UNP profile specified with this command or through the global Captive Portal configuration.
- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

Examples

```
-> captive-portal authentication-pass realm prefix domain asia-pacific policy-list
list2
-> captive-portal authentication-pass realm suffix domain north-america profile
unp2 profile-change enable
-> no captive-portal authentication-pass realm suffix domain north-america
```

Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

Related Commands

captive-portal authentication-pass Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process.

show captive-portal configuration Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalAuthPassTable
  alaDaCPortalAuthDomainName
  alaDaCPortalAuthRealm
  alaDaCPortalAuthPolicyListName
  alaDaCPortalAuthRowStatus
  alaDaCPortalAuthUNPProfile
  alaDaCPortalAuthUNPProfileChange
```

captive-portal-profile

Configures a Captive Portal profile that is assigned to a UNP profile. This type of profile defines Captive Portal configuration options that are applied to devices classified into the assigned UNP profile. This command page describes the base command (**captive-portal-profile** *profile_name*) along with the other command keywords that are used to configure profile attributes.

```
captive-portal-profile profile_name
  [aaa-profile aaa_profile_name]
  [success-redirect-url redirect_url]
  [retry-count retries]
  [authentication-pass [realm {prefix | suffix} domain domain_name] {policy-list list_name | profile
profile_name | profile-change {enable | disable}}
```

```
no captive-portal-profile profile_name
```

Syntax Definitions

<i>profile_name</i>	The name to assign to the Captive Portal profile (up to 32 characters).
<i>aaa_profile_name</i>	The name of an authentication, authorization, and accounting (AAA) profile to associate with the Captive Portal profile.
<i>redirect_url</i>	A URL (up to 63 characters) to which user devices are redirected after successful Captive Portal authentication.
<i>retries</i>	The number of login attempts allowed. The range is 1–99.
realm prefix	Specifies a prefix domain name (for example, <i>domain_name</i> /user).
realm suffix	Specifies a suffix domain name (for example, user@ <i>domain_name</i>).
<i>domain_name</i>	The domain name for the user device.
<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
enable	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
disable	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

Defaults

parameter	default
<i>aaa_profile_name</i>	none
<i>redirect_url</i>	none
<i>retries</i>	3
realm prefix suffix	none
<i>domain_name</i>	none
<i>list_name</i>	none
<i>profile_name</i>	none
enable disable	disabled

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal profile from the switch configuration.
- Creating a Captive Portal profile name with the base command (**captive-portal-profile** *profile_name*) is not required to configure a profile attribute value. If the profile name does not exist, the switch will automatically create the name specified when the attribute is configured. For example, the **unp captive-portal-profile cp-prof1 retry-count 5** command will create the “cp-prof1” profile if it does not already exist in the switch configuration.
- When a Captive Portal profile is applied to a UNP profile, the parameter values defined in the profile override the global Captive Portal parameter values configured for the switch.
- A Captive Portal profile is applied only when Captive Portal authentication is enabled for the UNP profile. If there is no Captive Portal profile associated with a UNP profile, then the global Captive Portal configuration is applied.
- Assigning an AAA profile to a Captive Portal profile defines specific AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are used for Captive Portal authentication. If there is no AAA profile assigned, then the global AAA configuration is used.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> captive-portal-profile cp-p1
-> captive-portal-profile cp-p1 aaa-profile aaa_p1
-> captive-portal-profile cp-p1 authentication-pass realm prefix domain asia-
pacific policy-list list1
-> no captive-portal-profile cp-p1 aaa-profile aaa_p1
-> no captive-portal-profile cp-p1

-> captive-portal-profile cp-p2 retry-count 5
-> captive-portal-profile cp-p2 authentication-pass profile ep-1
-> captive-portal-profile cp-p2 authentication-pass profile-change enable
```

```
-> captive-portal-profile cp-p2 success-redirect-url http://server-1.com/pass.html
-> captive-portal-profile cp-p2 authentication-pass profile-change disable
-> no captive-portal-profile cp-p2 authentication-pass profile
-> no captive-portal-profile cp-p2
```

Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

Related Commands

show captive-portal configuration

Displays the global Captive Portal parameter settings configured for the switch.

show captive-portal configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Currently only the internal (Web server on the switch) Captive Portal mode is configurable for the switch. An external Captive Portal operation is provided through interaction with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.
- The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration. A Captive Portal profile is associated with a UNP profile and is applied to devices classified into that profile.

Examples

```
-> show captive-portal configuration
```

```
Captive Portal Global Configuration:
```

```

Captive Portal Mode           = Internal
Captive Portal IP address     = 10.123.0.1
Captive Portal Redirect String = captive-portal.com
Captive Portal Success Redirect URL =
Captive Portal Proxy Server Port = 8080
Captive Portal Retry Count    = 3
Captive Portal Global Auth Policy List =
Captive Portal Page Customization = Disable
Captive Portal Profile Name    =
Captive Portal Profile Change  = Disable
Domain Specific Policy Lists:

```

Domain	Realm	Policy List	Profile Name	Profile Change
na01	Suffix	qos-bw1	unp1-vlan	Enable
na02	Prefix	qos-bw2	unp2-vlan	Enable

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only the internal mode (Web server on the OmniSwitch) is supported at this time.
Captive Portal IP address	The internal Captive Portal IP address for the switch. Configured through the captive-portal ip-address command.
Captive Portal Redirect String	The name of the redirect URL that is used for accessing a public certificate. Configured through the captive-portal name command.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication. Configured through the captive-portal success-redirect-url command.
Captive Portal Proxy Server Port	The proxy server port to use for Captive Portal. Configured through the captive-portal proxy-server-port command.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed. Configured through the captive-portal retry-count command.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication. Configured through the captive-portal authentication-pass command.
Captive Portal Profile Name	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled. Configured through the captive-portal authentication-pass command.
Captive Portal Profile Change	The status of profile change (Enable or Disable). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option. Configured through the captive-portal authentication-pass command.
Domain Specific Policy Lists:	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
Domain	The domain name associated with a domain specific policy. Configured through the captive-portal authentication-pass domain command.
Realm	The realm of the domain name (prefix or suffix) associated with a domain specific policy. The realm identifies the domain name as a prefix (<i>domain-name/user</i>) or as a suffix (<i>user@domain-name</i>). Configured through the captive-portal authentication-pass domain command.
Policy List	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name. Configured through the captive-portal authentication-pass domain command.

output definitions

Profile Name	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name. Configured through the captive-portal authentication-pass domain command.
Profile Change	The status of profile change (Enable or Disable) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name. Configured through the captive-portal authentication-pass domain command.

  Captive Portal Mode           = Internal
  Captive Portal AAA Profile Name =
  Captive Portal Success Redirect URL =
  Captive Portal Retry Count    = 3
  Captive Portal Global Auth Policy List =
  Captive Portal Profile Name   =
  Captive Portal Profile Change = Disable
Domain Specific Policy Lists:
  Domain      | Realm | Policy List | Profile Name | Profile Change
-----|-----|-----|-----|-----
na01          | Suffix | qos-bw1    | unp1-vlan   | Enable
na02          | Prefix | qos-bw2    | unp2-vlan   | Enable

```

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only internal mode (Web server on the OmniSwitch) is supported at this time.
Captive Portal AAA Profile Name	The name of an authentication, authorization, and accounting (AAA) profile associated with the Captive Portal profile.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication.
Captive Portal Profile Name	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled.
Captive Portal Profile Change	The status of profile change (Enable or Disable). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option.
Domain Specific Policy Lists:	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
Domain	The domain name associated with a domain specific policy.
Realm	The realm of the domain name (prefix or suffix) associated with a domain specific policy. The realm identifies the domain name as a prefix (<i>domain-name/user</i>) or as a suffix (<i>user@domain-name</i>).
Policy List	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name.
Profile Name	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name.
Profile Change	The status of profile change (Enable or Disable) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name.

show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

alaDaQMRGlobalConfig

alaDaQMRPath

qmr quarantine page

Configures the QMR application to send a “Quarantined” page to a client if a remediation server is not configured. This page is used to notify the client that QMR has quarantined the client.

qmr qos quarantine page {enable | disable}

Syntax Definitions

enable	Enables the sending of a “Quarantined” page to the client.
disable	Disables the sending of a “Quarantined” page to the client.

Defaults

By default, no “Quarantined” page is sent to the client.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

A “Quarantined” page is only sent if a remediation server path was not configured for QMR. Note that even if the remediation server is not active, QMR will not send the page as long as there is a value set for the remediation server path.

Examples

```
-> qmr quarantine page enable  
-> qmr quarantine page disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qmr quarantine custom-proxy-port	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.

qmr quarantine allowed-name

Configures a list of IP addresses that a restricted quarantined user is allowed to access.

qmr quarantine allowed-name *name* **ip-address** *ip_address* [**ip-mask** *ip_mask*]

no qmr quarantine allowed-name *name*

Syntax Definitions

<i>name</i>	Specify a name to assign to the allowed IP network address.
<i>ip_address</i>	An IPv4 network address (for example, 10.0.0.0, 171.15.0.0, or 196.190.254.0).
<i>ip_mask</i>	A valid IP address mask for the allowed IP network address (for example, 255.0.0.0 or 255.255.0.0)

Defaults

By default, no IP addresses are configured as QMR allowed addresses.

parameter	default
<i>ip_mask</i>	IP address class

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- A maximum of three allowed IP addresses is supported.
- Make sure the IP address of the QMR remediation server is configured as an allowed IP address. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

Examples

```
-> qmr quarantine allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no qmr quarantine allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

MIB Objects

alaDaQMRGlobalConfig
alaDaQMRCustomHttpProxyPort

show qmr

Displays the Quarantine Manager and Remediation (QMR) configuration for the switch.

```
show qmr
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

QMR is an OmniSwitch application that interacts with the OmniVista Quarantine Manager (OVQM) application to restrict the network access of quarantined clients and provide a remediation path for such clients to regain their network access. This command displays the OmniSwitch QMR configuration.

Examples

```
-> show qmr
```

```
Quarantine Mac Group Name      : Quarantine,
Allowed IP Subnets            : IT-HD 135.254.1.10 /255.255.255.248,
                                oss-lan 10.1.1.0 /255.255.255.0,
                                rem-ser 135.254.200.0 /255.255.255.0,
Custom Proxy port              : 8888,
Quarantine Path                : www.remediation-server.alu.com,
Quarantine Page                : enabled,
```

output definitions

Quarantine MAC Group Name	The name of the QoS Quarantine MAC address group. Configured through the qos quarantine mac-group command.
Allowed IP Subnets	A list of IP network addresses that devices can still access while in a quarantined state. Configured through the qmr quarantine allowed-name command.
Custom Proxy port	The HTTP proxy port number used for redirection of HTTP traffic from quarantined devices. Configured through the qmr quarantine custom-proxy-port command.

output definitions

Quarantine Path	The URL of a remediation server to which a device is redirected when the device is quarantined. Configured through the qmr quarantine path command.
Quarantine Page	Whether or not QMR sends a “Quarantined” page notification to a quarantined user when there is no remediation server configuration. Configured through the qmr quarantine page command.

Release History

show quarantine mac group

Displays the contents of the QoS Quarantine MAC address group.

show quarantine mace group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

The QoS MAC address group contains the MAC addresses of clients that the OmniVista Quarantine Manager (OVQM) application has quarantined. This command displays the quarantined MAC addresses that belong to this group.

Examples

```
-> show quarantine mac group
```

```
Group Name      : Quarantine,  
Number of MACs quarantined : 11,  
00:00:00:11:11:1b,  
00:00:00:11:11:1a,  
00:00:00:11:11:19,  
00:00:00:11:11:18,  
00:00:00:11:11:17,  
00:00:00:11:11:16,  
00:00:00:11:11:15,  
00:00:00:11:11:14,  
00:00:00:11:11:13,  
00:00:00:11:11:12,  
00:00:00:11:11:11,
```

mdns-relay

Enables or disables the Multicast Domain Name System (mDNS) relay on the switch.

mdns-relay {enable | disable}

Syntax Definitions

enable	Enables mDNS relay.
disable	Disables mDNS relay.

Defaults

The MDNS relay feature is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- A GRE tunnel interface must be associated with the mDNS tunnel relay before mDNS can be enabled.
- When MDNS relay is disabled on the switch, mDNS packets are handled in the same manner as conventional packets.

Example

```
-> mdns-relay enable
ERROR: Please associate the GRE tunnel before MDNS enable.
-> mdns-relay tunnel byod_dev
-> mdns-relay enable
-> mdns-relay disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

mdns-relay tunnel	Associates a GRE tunnel interface with the mDNS relay feature.
show mdns-relay config	Displays the mDNS relay configuration.

MIB Objects

```
alcatelIND1UDPRelayMIB
  alaMdnsAdminStatus
```

mdns-relay tunnel

Associates a GRE tunneling interface for the Multicast DNS (mDNS) relay feature.

mdns-relay tunnel *ip_interface_name*

no mdns-relay tunnel *ip_interface_name*

Syntax Definitions

ip_interface_name

The name of an existing IP GRE tunnel interface to associate with the mDNS tunnel relay.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the associated GRE tunnel interface.
- Configure the GRE tunnel interface before attempting to associate the interface with the mDNS tunnel relay. An IP address is required to bring the interface up; if necessary, specify a dummy IP address when configuring the interface.
- Only a Layer 2 GRE Tunnel interface is supported.
- GRE Tunneling is supported only for IPv4 frames.
- To change the GRE tunnel interface, execute the command with the new existing IP interface name.

Example

```
-> mdns-relay tunnel byod_dev  
-> no mdns-relay tunnel byod_dev
```

Release History

Release 8.1.1; command introduced.

Related Commands**ip interface tunnel**

Configures a GRE tunnel interface.

mdns-relay

Enables or disables mDNS tunnel relay for the switch.

show mdns-relay config

Displays the mDNS relay configuration.

MIB Objects

alcatelIND1UDPRelayMIB

alaMdnsGreTunnelName

show mdns-relay config

Displays the mDNS relay configuration.

```
show mdns-relay config
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

N/A

Example

```
-> show mdns-relay config
mdns-relay admin status      : disabled
mdns-relay tunnel interface  : byod_dev
mdns-relay operational status : down
```

output definitions

mdns-relay admin status	The mDNS relay administrative status (enabled or disabled).
mdns-relay tunnel interface	The GRE tunnel interface name for the mDNS relay feature.
mdns-relay operational status	The mDNS relay operational status (up or down).

Release History

Release 8.1.1; command introduced.

Related Commands

mdns-relay	Enables or disables mDNS tunnel relay for the switch.
mdns-relay tunnel	Associates a GRE tunnel interface with the mDNS relay feature.

MIB Objects

```
alcatelIND1UDPRelayMIB
  alaMdnsAdminStatus
  alaMdnsGreTunnelName
```

ssdp-relay

Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch. SSDP relay enables the OmniSwitch to allow non-Apple devices to discover services with minimal configuration by the administrator.

```
ssdp-relay {enable | disable}
```

Syntax Definitions

enable	Enables SSDP relay.
disable	Disables SSDP relay.

Defaults

The SSDP relay feature is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- A GRE tunnel interface must be configured specifically for the SSDP feature before SSDP relay can be enabled.
- The Digital Living Network Alliance (DLNA) uses Universal Plug and Play (UPnP) for media management, discovery, and control. DLNA/UPnP uses SSDP to discover services, similar to how Bonjour uses mDNS for the same. All the SSDP packets coming in on an OmniSwitch are intercepted and tunneled through the GRE tunnel to the WLAN controller (acting as a gateway).
- When SSDP relay is disabled on the switch, SSDP packets are handled in the same manner as conventional packets.

Example

```
-> ssdp-relay enable
ERROR: Please associate the GRE tunnel before SSDP enable.
-> ssdp-relay tunnel byod_dev
-> ssdp-relay enable
-> ssdp-relay disable
```

Release History

Release 8.2.1; command introduced.

Related Commands[ssdp-relay tunnel](#)

Associates a GRE tunnel interface with the SSDP relay feature.

[show ssdp-relay config](#)

Displays the SSDP relay configuration.

MIB Objects

alcatelIND1UDPRelayMIB

alaSsdpAdminStatus

ssdp-relay tunnel

Assigns a GRE tunneling interface for the Simple Service Discovery Protocol (SSDP) relay feature. The GRE tunnel is setup between the switch and a WLAN controller to tunnel SSDP frames.

ssdp-relay tunnel *ip_interface_name*

no ssdp-relay tunnel *ip_interface_name*

Syntax Definitions

ip_interface_name

The name of an existing IP GRE tunnel interface to associate with the SSDP tunnel relay.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the associated GRE tunnel interface.
- Configure the GRE tunnel interface before attempting to associate the interface with the SSDP tunnel relay. An IP address is required to bring the interface up; use the IP address of the wireless controller as the destination IP address for the GRE tunnel.
- Only a Layer 2 GRE Tunnel interface is supported.
- GRE Tunneling is supported only for IPv4 frames.
- To change the GRE tunnel interface, use this command again with a new existing IP interface name.

Example

```
-> ssdp-relay tunnel byod_dev  
-> no ssdp-relay tunnel byod_dev
```

Release History

Release 8.2.1; command introduced.

show unip profile

Displays the UNP profile configuration for the switch.

show unip profile [*profile_name*]

Syntax Definitions

profile_name The name of the UNP to display.

Defaults

By default, the configuration for all profiles is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a UNP profile name with this command to display information for a specific profile.
- Use the [show unip profile map](#) command to display the VLAN or service type (SPB, VXLAN, or static) that is mapped to the UNP profile.

Examples

```
-> show unip profile
Profile Name: unip2-spb
  Qos Policy      = qrules1,
  Location Policy = -,
  Period Policy   = -,
  CP Profile      = -,
  Redirect State  = Dis,
  CP State        = Dis,
  Authen Flag     = Dis,
  Mobile Tag      = Dis,
  SAA Profile     = -,
  Ingress BW      = -,
  Egress BW       = -,
  Ingress Depth   = -,
  Egress Depth    = -,
  Inact Interval  = 10

Profile Name: unip1-vlan
  Qos Policy      = -,
  Location Policy = loclist1,
  Period Policy   = timelist1,
  CP Profile      = guest-profile,
  Redirect State  = Dis,
  CP State        = Dis,
  Authen Flag     = Dis,
  Mobile Tag      = Dis,
  SAA Profile     = -,
  Ingress BW      = -,
```

```

Egress BW      = -,
Ingress Depth  = -,
Egress Depth   = -,
Inact Interval = 10

```

Total Profile Count: 2

```

-> show unip profile unip1-vlan
Profile Name: unip1-vlan
  Qos Policy      = -,
  Location Policy = loclist1,
  Period Policy   = timelist1,
  CP Profile      = guest-profile,
  Redirect State  = Dis,
  CP State        = Dis,
  Authen Flag     = Dis,
  Mobile Tag      = Dis,
  SAA Profile     = -,
  Ingress BW      = -,
  Egress BW       = -,
  Ingress Depth   = -,
  Egress Depth    = -,
  Inact Interval  = 10

```

output definitions

Profile Name	The name of the UNP profile. Configured through the unip profile command.
QoS Policy	The name of the QoS policy list associated with the profile. Configured through the unip profile qos-policy-list command.
Location Policy	The name of the location policy assigned to the UNP profile. Configured through the unip profile location-policy command.
Period Policy	The name of the period policy assigned to the UNP profile. Configured through the unip profile period-policy command.
CP Profile	The name of the Captive Portal (CP) profile assigned to the UNP profile. A CP profile defines a CP configuration that is applied to devices when CP authentication is enabled for the UNP profile. Configured through the unip profile captive-portal-profile command.
Redirect State	The redirection status (Ena or Dis) for the UNP profile. Indicates whether the profile is one that is returned through interaction with the ClearPass Policy Manager (CPPM). Configured through the unip profile redirect command.
CP State	The CP authentication status (Ena or Dis) for the UNP profile. Indicates whether CP authentication is triggered for devices classified into the profile. Configured through the unip profile captive-portal-authentication command.
Authen Flag	The authentication flag status (Ena or Dis) for the UNP profile. Indicates whether only authenticated devices are allowed into the profile. Configured through the unip profile authentication-flag command.

output definitions

Mobile Tag	The mobile tag status (Ena or Dis) for the UNP profile. When enabled, the first user that is learned on a UNP port and is classified into a UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created. Configured through the unip profile mobile-tag command.
SAA Profile	The name of a Service Assurance Agent (SAA) profile that is associated with the UNP profile. Configured through the unip profile saa-profile command.
Ingress BW	The maximum ingress bandwidth setting that is applied to ports associated with the profile. Configured through the unip profile maximum-ingress-bandwidth command.
Egress BW	The maximum egress bandwidth setting that is applied to ports associated with the profile. Configured through the unip profile maximum-egress-bandwidth command.
Ingress Depth	The maximum ingress depth setting that is applied to ports associated with the profile. Configured through the unip profile maximum-ingress-depth command.
Egress Depth	The maximum egress depth setting that is applied to ports associated with the profile. Configured through the unip profile maximum-egress-depth command.
Inact Interval	The amount of time, in seconds, that a device can remain inactive after the MAC address for the device has aged out. When the timer reaches this value, inactive devices are automatically logged out of the network. Configured through the unip profile inactivity-interval command.

Release History

Release 8.3.1; command was introduced.

Related Commands

show unip classification	Displays the UNP classification rule configuration for the switch.
show unip global configuration	Displays the UNP global parameter values configured for the switch.
show unip port	Displays the UNP configuration for the port.
show unip user	Displays information about the devices learned on a UNP port.

show unprofile map

Displays the VLAN or service mapping configuration assigned to a UNP profile.

```
show unprofile [profile_name] map {vlan | service-type {spb | vxlan | static}}
```

Syntax Definitions

<i>profile_name</i>	The name of the UNP to display.
vlan	Displays the VLAN mapping configuration for a UNP profile.
spb	Displays the Shortest Path Bridging (SPB) service mapping configuration for a UNP profile.
vxlan	Displays the Virtual eXtensible Local Area Network (VXLAN) service mapping configuration for a UNP profile.
static	Displays the existing SPB or VXLAN service IDs that are statically assigned to a UNP profile. This type of mapping is used to map the profile to a known service ID.

Defaults

By default, the VLAN, or service mapping configuration for all profiles is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a UNP profile name with this command to display the mapping information for a specific profile.
- Only one VLAN or service is mapped to a profile at any given time.
- SPB services are not supported on the OmniSwitch 9900.
- VXLAN services are supported only on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Examples

```
-> show unprofile map vlan
Profile Name                Vlan-Id
-----+-----
unp1-vlan                   300
unp2-vlan                   301
unp3-vlan                   500
unp4-vlan                   501

Total Profile Vlan-Map Count: 4
```

```
-> show unprofile map unprofile2-vlan map vlan
Profile Name          Vlan-Id
-----+-----
unprofile2-vlan      301
```

output definitions

Profile Name	The name of the UNP profile that is mapped to the VLAN ID.
Vlan-Id	The VLAN ID associated with the profile.

```
-> show unprofile map service-type spb
Profile Name          Isid      Tag Value   BVlan   Vlan Xlation   Mcast Mode
-----+-----+-----+-----+-----+-----
unprofile1-spb       1500      10         400     Ena      Tandem
unprofile2-spb       1600      20:30      401     Ena      Headend
```

Total Profile Spb-Map Count: 2

output definitions

Profile Name	The name of the UNP profile that is mapped to the SPB service.
Isid	The SPB service instance identifier (I-SID) that will be used to dynamically create the SPB service access point (SAP) for the profile.
Tag Value	The VLAN ID tags of the traffic that the dynamically created SPB SAP will carry for the profile.
BVlan	The SPB BVLAN ID that will be associated with the I-SID for the dynamically created SPB SAP.
Vlan Xlation	The status of egress VLAN translation (Ena or Dis) for the dynamically created SPB SAP.
Mcast Mode	The multicast mode (Headend or Tandem) for the dynamically created SPB SAP.

```
-> show unprofile map service-type vxlan
Profile Name          Vnid      Tag Value   Far-End-List Vlan Xlation   Mcast Mode   Mcast Group
-----+-----+-----+-----+-----+-----+-----
unprofile1-vxlan     2300      20         vtep-ip1     Ena      Tandem      225.1.1.2
unprofile2-vxlan     2301      40:50      vtep-ip2     Ena      Headend     -
```

Total Profile Vxlan-Map Count: 2

output definitions

Profile Name	The name of the UNP profile that is mapped to the VXLAN service.
Vnid	The VXLAN network identifier for the VXLAN segment that will be used to dynamically create the VXLAN service access point (SAP) for the profile.
Tag Value	The VLAN ID tags of the traffic that the dynamically created VXLAN SAP will carry for the profile.
Far-End-List	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The VTEPs are used to create service distribution points (SDPs) for the dynamically created VXLAN SAP.

output definitions

Vlan Xlation	The status of egress VLAN translation (Ena or Dis) for the dynamically created VXLAN SAP.
Mcast Mode	The multicast mode (Headend or Tandem) for the dynamically created VXLAN SAP.
Mcast Group	The multicast group IP address that the dynamically created VXLAN SAP will use to forward traffic to participating VTEPs.

```
-> show unprofile map service-type static
Profile                               Tag
Name                                  SvcId  Value
-----+-----+-----
unpl-staticSPB                        10     20
unp2-staticVXLAN                       20    40:50
```

Total Profile Static-Service-Map Count: 2

output definitions

Profile Name	The name of the UNP profile that is mapped to the static service.
SvcId	The service ID for the existing SPB or VXLAN service.
Tag Value	The VLAN ID tags of the traffic that the SAP associated with the service ID will carry.

Release History

Release 8.3.1; command was introduced.

Related Commands

unprofile map vlan	.Configures the mapping of a standard VLAN to a UNP profile.
unprofile map service-type spb	Configures the mapping of SPB parameters that are used to dynamically create an SPB SAP to carry profile traffic.
unprofile map service-type vxlan	Configures the mapping of VXLAN parameters that are used to dynamically create a VXLAN SAP to carry profile traffic.
unprofile map service-type static	Configures the mapping of an existing SPB or VXLAN service to the profile.
show unprofile	Displays the UNP profile configuration for the switch.
show unprofile vxlan far-end-ip-list	Displays the contents of a far-end IP address list that is used to map VXLAN service parameters to a profile.

show unip vxlan far-end-ip-list

Displays the contents of an IP address list. Each address represents a VXLAN Tunnel End Point (VTEP). A far-end IP list is associated with a VXLAN service to identify all the VTEPs that will participate in that service.

```
show unip vxlan far-end-ip-list [ip_list_name]
```

Syntax Definitions

ip_list_name The name of a list that contains the IP addresses for the far-end VTEPs.

Defaults

By default, the contents of all the VXLAN far-end IP address lists is displayed.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

Enter a list name with this command to display information for a specific list.

Examples

```
-> show unip vxlan far-end-ip-list
Far-End-IP-List Name: toDataCenter1, IP-Count: 3,
  IP-Addresses:
    101.1.1.1
    102.1.1.1
    103.1.1.1
Far-End-IP-List Name: toDataCenter2, IP-Count: 3,
  IP-Addresses:
    201.1.1.1
    202.1.1.1
    203.1.1.1
```

```
-> show unip vxlan far-end-ip-list toDataCenter2
Far-End-IP-List Name: toDataCenter2, IP-Count: 3,
  IP-Addresses:
    201.1.1.1
    202.1.1.1
    203.1.1.1
```

output definitions

Far-End-IP-List Name	The name of the far-end IP address list.
IP-Count	The number of IP addresses in the list.
IP-Addresses	The IP addresses that are members of the specified list name.

Release History

Release 7.3.4; command was introduced.

Related Commands

show unp saa-profile

Displays the Service Assurance Agent (SAA) performance monitoring profile configuration for the switch. SAA profiles are assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

show unp saa-profile [*profile_name*]

Syntax Definitions

profile_name The name of an existing SAA profile to display.

Defaults

By default, all SAA profiles are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enter an SAA profile name with this command to display information for a specific profile.
- This command does not provide the UNP assignment for each SAA profile. Use the [show unp profile](#) command to display the assignment information.

Examples

```
-> show unp saa-profile
```

Profile Name	Latency Threshold	Jitter Threshold	MC Conf Status
unp_saa1	500	100	Local
unp_saa2	0	150	Local
unp_saa3	250	0	Local

output definitions

Profile Name	The name of the SAA profile.
Latency Threshold	The latency threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
Jitter Threshold	The jitter threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
MC Conf Status	The MCLAG consistency check status of the UNP configuration (Sync , Out-Of-Sync , or Local). <i>Note that MCLAG is not supported in this release.</i>

Release History

Release 7.3.2; command was introduced.

show unip global configuration

Displays the switch configuration for the global Universal Network Profile (UNP) parameter settings.

show unip global configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- UNP global parameter settings determine specific actions related to the following:
 - Dynamically creating VLANs and/or profiles.
 - Whether or not devices attempting to authenticate are assigned to a temporary profile if the authentication server is unreachable.
 - Interaction with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.
- A hyphen, “-”, indicates that a value has not been configured for the global UNP parameter.

Examples

```
-> show unip global configuration
Dynamic Vlan Configuration      = Disabled,
Dynamic Profile Configuration   = Disabled,
Auth Server Down Profile1      = -,
Auth Server Down Profile2      = -,
Auth Server Down Profile3      = -,
Auth Server Down Timeout       = 60,
Redirect Port Bounce           = Enabled,
Redirect Pause Timer           = -
Redirect http proxy-port       = 8080
Redirect Server IP             = 10.1.1.1
Allowed IP                     = -
Force L3-Learning              = Disabled
```

output definitions

Dynamic Vlan Configuration	The status (Enabled or Disabled) of dynamic VLAN configuration. Configured through the unip dynamic-vlan-configuration command.
Dynamic Profile Configuration	The status (Enabled or Disabled) of dynamic profile configuration. Configured through the unip dynamic-profile-configuration command.

output definitions

Auth Server Down Profile1 Auth Server Down Profile2 Auth Server Down Profile3	The name of a UNP that a device is assigned to in the event the RADIUS server is unreachable. Up to three different profile names are configurable as authentication server down UNP profiles. Configured through the unip auth-server-down command.
Auth Server Down Timeout	The amount of time, in seconds, that devices remain assigned to the authentication server down UNP. Configured through the unip auth-server-down-timeout command.
Redirect Port Bounce	The status (Enabled or Disabled) of the port bounce operation for non-suppliant devices. Configured through the unip redirect port-bounce command.
Redirect Pause Timer	The amount of time, in seconds, the switch pauses to clear all device authentication states and trigger re-authentication. Configured through the unip redirect pause-timer command.
Redirect http proxy-port	The HTTP proxy port number to use for redirection to a server. Configured through the unip redirect proxy-server-port command.
Redirect Server IP	The IP network address of a redirection server. Configured through the unip redirect-server command.
Allowed IP	A list of IP addresses to which a host can access additional servers. Configured through the unip redirect allowed-name command.
Force L3-Learning	The status (Enabled or Disabled) of UNP Layer 3 learning. Configured through the unip force-l3-learning command.

Release History

Release 7.2.1; command was introduced.

Release 7.2.1.R02; **Dynamic Profile Configuration** and **MC Conf Status** fields added.

Release 7.3.1; OmniSwitch 10K supported.

Release 7.3.4; VXLAN fields added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72); **MC Conf Status** fields deprecated.

Release 8.3.1; **Auth Server Down UNP** field replaced with **Auth Server Down UNP Profile1**, **Auth Server Down UNP Profile2**, and **Auth Server Down UNP Profile3** fields; **Force L3-Learning** field added.

Related Commands

show unip profile	Displays the UNP configuration for the switch.
show unip port	Displays the UNP configuration for the port.
show unip user	Displays information about the devices learned on a UNP port.

Displays the UNP domain configuration for the switch.

show unnp domain

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific domain, classification rules associated with the same domain ID are applied only to UNP ports associated with that same domain ID.

Examples

```
-> show unnp domain
```

```
Domain  Description
-----+-----
0       Default-Domain
1       UNP Domain 1
2       UNP Domain 2
```

Release History

Release 8.3.1; command was introduced.

Related Commands

- | | |
|---|--|
| unnp domain description | Configures a domain ID to which UNP ports and classification rules are assigned. |
| unnp domain | Assigns a UNP port to a customer domain ID. |
| show unnp port | Displays the UNP configuration for the port. |

  alaDaUnnpCustomerDomainId
  alaDaUnnpCustomerDomainDesc
```

show unip classification

Displays the UNP classification rule configuration for the switch.

show unip classification *rule_type*

Syntax Definitions

rule_type The rule type to display (refer to the table in the “Usage Guidelines” section of this command page for a list of rule type parameters).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specifying one of the following classification rule type parameters is required with this command:

Standard Rule Parameters	Binding Rule Parameters
mac-rule	mac-port-rule
mac-oui-rule	mac-ip-port-rule
mac-range-rule	mac-domain-rule
ip-rule	mac-ip-domain-rule
vlan-tag-rule	mac-range-domain-rule
port-rule	ip-port-rule
domain	ip-domain-rule
authentication-type-rule	vlan-domain-rule
lldp-rule	

- Standard classification rule parameters are combined at the time a rule is created to define a binding classification rule. The parameter combinations provided with this command reflect the allowed binding rule parameter combinations.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration (see the **show unip classification-rule** command).

Examples

```
-> show unip classification mac-rule
MAC Address          VLAN Tag Profile1 Name      Profile2 Name      Profile3 Name
-----+-----+-----+-----+-----+-----
00:2a:da:11:22:01    -          unip1-vlan         unip2-vxlan        unip3-vlan
00:0f:b5:46:d7:56    20         unip4-spb          -                  -
00:2a:95:57:e1:67    -          unip2-vxlan        -                  -

Total Mac Rule Count: 3
```

```
-> show unp classification mac-range-rule
```

```

VLAN Tag	Profile1 Name	Profile2 Name	Profile3 Name	Tag Position
10	unp3-vlan	-	-	Inner

output definitions

Domain	The customer domain ID assigned to the classification rule for the specified profiles. The rule is applied to traffic received on UNP ports that are assigned to the same domain ID. Configured through the unp domain command.
MAC Address	The MAC address value to match for this profile rule. Configured through the unp classification mac-address command.
Low MAC Address High MAC Address	The lowest and highest MAC address values used to specify a range of addresses to match for this rule. Configured through the unp classification mac-range command.
IP Address IP Mask	The IP network address and mask values to match for this rule. Configured through the unp classification ip-address command.

output definitions

Profile1, Profile2, Profile3	The name of the UNP profile to which the rule is applied. Configured through the unip profile command.
VLAN Tag	The VLAN ID value to match for this profile rule. This rule is also supported in combination with each of the other classification rules. Configured through the unip classification vlan-tag or as a parameter with the other classification rule commands.

Release History

Release 8.3.1; command was introduced.

Related Commands

show unip classification-rule	Displays the extended classification rule configuration for the switch.
show unip profile	Displays the UNP configuration for the switch.
show unip port	Displays the UNP configuration for the port.
show unip user	Displays information about the devices learned on a UNP port.

MIB Objects

N/A

```

-> show unp classification-rule ext_rule2
Rule Name: "ext_rule2"
  Precedence           = 1,
  Profile1             = unp1-vlan,

output definitions

Role Name	The name of the user-defined role. Configured through the unip user-role command.
Qos Policy List	The name of the QoS policy list associated with the role name. The specified list defines the user role for the device. Configured through the unip user-role policy-list command.
Priority	The role precedence, which assigns a priority value to the user-defined role. This value determines which role to apply if a device matches the conditions of more than one user-defined role. Configured through the unip user-role command.
Profile1, Profile2, Profile3	The name of a UNP profile. The user-defined role is only applied to devices classified into the specified profile name. Configured through the unip user-role profile command.
Authentication-Type	The type of authentication applied to a device (none , mac , or 802.1x). The user-defined role is only applied to devices authenticated with the specified type. Configured through the unip user-role authentication-type command.
CP Status	The Captive Portal post login status. If enabled, the role is only applied to devices in this state. Configured through the unip user-role cp-status-post-login command.

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **Edge-Profile** field replaced with **Profile1**, **Profile2**, and **Profile3** fields.

Related Commands

unip user-role	Configures a user-defined role.
show unip user	Displays information about devices learned on UNP ports.

MIB Objects

  alaDaUNPUserRolePolicyList
  alaDaUNPUserRoleProfile1
  alaDaUNPUserRoleProfile2
  alaDaUNPUserRoleProfile3
  alaDaUNPUserRoleAuthType
  alaDaUNPUserRolePostLoginStatus

```

show unpr restricted-role

Displays the names of the explicit QoS policy lists assigned to the built-in restricted role states (Captive Portal pre-login, Unauthorized, and QMR) used by the switch.

show unpr restricted-role

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> show unpr restricted-role
Role name      Qos Policy List Name
-----+-----
UNAUTHORIZED  qlist-bad
QMR           qlist-qmr
CP PRE-LOGIN  qlist-cp
```

Total Restricted Role Count: 3

output definitions

Role Name	The restricted role name.
Qos Policy List	The name of the QoS policy list associated with the restricted role name.

Release History

Release 8.1.1; command was introduced.

Related Commands

- unpr restricted-role policy-list** Configures a user-defined role.
show unpr user Displays information about devices learned on UNP ports.

MIB Objects

```
alaDaUNPRstrctedRoleTable  
  alaDaUNPRstrctedRoleType  
  alaDaUNPRstrctedRolePolicyList
```

show unp port

Displays the UNP configuration for the port. Includes only ports and link aggregates on which UNP is enabled.

```
show unp {port [chassis/slot/port1[-port2]] | linkagg [agg_id[-agg_id2]]} [type {bridge | access}]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
bridge	Displays only UNP bridge ports.
access	Displays only UNP access ports.

Defaults

By default, configuration information for all UNP ports or link aggregates is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a port or link aggregate ID number to display information specific to the port or link aggregate.
- Specify a UNP port type (**bridge** or **access**) to display information only for that type of UNP port.

Examples

```
-> show unp port
Port  Port  Type  802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain Auth   Auth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----

1/17   0 Bridge Disabled Disabled Disabled unp-1001 -        -        Disabled
1/18   0 Access Disabled Enabled  Enabled spb1001 -        -        Enabled
1/35   0 Access Disabled Enabled  Disabled -        -        Disabled
1/36   5 Bridge Enabled  Enabled Disabled DefUnp  1XProf1 MacPAS  Enabled
1/37   5 Access Enabled  Disabled Enabled  -        1XProf2 -        Enabled

-> show unp port 1/17
Port  Port  Type  802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain Auth   Auth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/17   0 Bridge Disabled Disabled Disabled unp-1001 -        -        Disabled
```

```

-> show unip linkagg type bridge
LagID Port      Type      802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain      Auth      Auth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
10          1 Bridge Disabled Disabled Enabled  unip-1001  -        -        Disabled
15          0 Bridge Disabled Disabled Disabled unip-1001  -        -        Disabled

```

output definitions

Port/LagID	The port or link aggregate on which UNP is enabled. Configured through the unip port-type command.
Port Domain	The customer domain ID assigned to the UNP port. Traffic received on the port is classified with UNP profile rules that are assigned to the same domain ID. Configured through the unip domain command.
Type	The type of UNP port (Bridge or Access). UNP bridge ports classify traffic into VLAN profiles; UNP access ports classify traffic into service profiles. Configured through the unip port-type command.
802.1x Auth	The status of 802.1X authentication (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip 802.1x-authentication command.
Mac Auth	The status of MAC authentication (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip mac-authentication command.
Class.	The status of classification (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip classification command.
Default	The name of the default UNP assigned to the port or link aggregate. Configured through the unip default-profile command.
802.1X Pass-Alt	The name of the 802.1X authentication pass alternate UNP assigned to the port or link aggregate. Configured through the unip 802.1x-authentication pass-alternate command.
MAC Pass-Alt	The name of the MAC authentication pass alternate UNP assigned to the port or link aggregate. Configured through the unip mac-authentication pass-alternate command.
Trust-Tag	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the unip trust-tag command.

Release History

Release 8.3.1; command was introduced.

Related Commands

show unp profile	Displays the UNP configuration for the switch.

show unnp port config

Displays detailed configuration information for UNP ports and link aggregates.

show unnp {port [*chassis/slot/port1*[-*port2*]] | linkagg [*agg_id*[-*agg_id2*]]} config

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

Defaults

By default, configuration information for all ports or link aggregates is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.

Examples

```
-> show unnp port 1/1/10 config
Port 1/1/10
  Port-Type                = BRIDGE,
  Redirect Port Bounce     = Disabled,

  Dynamic Service = -,
  802.1x Parameters:
    Tx-Period = 30,
    Supp-Timeout = 30,
    Max-reqmeout = 2

```

output definitions

Port or Linkagg ID	The port or link aggregate on which UNP is enabled. Configured through the unnp port-type command. A “0” indicates the port is a link aggregate (for example, 0/12 is link aggregate ID 12).
Port Type	The type of UNP port (Bridge or Access).

output definitions

Redirect Port Bounce	The status of the port bounce operation (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip redirect port-bounce command. This field applies only to UNP bridge ports and link aggregates.
802.1x Authentication	The 802.1X authentication status (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip 802.1x-authentication command.
802.1x Pass Alternate Profile	The name of the 802.1X authentication pass alternate profile assigned to the port or link aggregate. Configured through the unip 802.1x-authentication pass-alternate command
802.1x Bypass	The status of 802.1X bypass (Enabled or Disabled).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (default = no MAC authentication or mac-authentication).
Mac-auth allow-eap	Indicates the conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process (pass = MAC authentication passes, fail = if MAC authentication fails, noauth = no MAC authentication, or none = do not attempt 802.1X authentication). This parameter option only applies to a UNP port or link aggregate on which 802.1X authentication bypass is enabled. Configured through the unip mac-authentication allow-eap command.
Mac Authentication	The MAC authentication status (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip mac-authentication command.
Mac Pass Alternate Profile	The name of the MAC authentication pass alternate profile assigned to the port or link aggregate. Configured through the unip mac-authentication pass-alternate command.
Classification	The classification status (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unip classification command.
Trust-Tag	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the unip trust-tag command.
Default Profile	The name of the default UNP profile assigned to the UNP port or link aggregate. Configured through the unip default-profile command.
Port Domain Name	The Group ID number assigned to the UNP port or link aggregate. Configured through the unip domain command.
AAA Profile	The name of an AAA profile assigned to the UNP port or link aggregate. Configured through the unip aaa-profile command.
Port Template	The name of a port template assigned to the UNP port or link aggregate. A port template defines and saves UNP port configuration options (such as the type of authentication, classification status, a default profile). Configured through the unip port port-template command.
Port Control Direction	Whether 802.1X access control is applied to ingress and egress traffic (both) or just ingress traffic (in). Configured through the unip direction command. This field applies only to UNP bridge ports and link aggregates.

output definitions

Egress Flooding	Indicates whether egress broadcast, unknown unicast, and multicast traffic is blocked (Not Allowed) or unblocked (Allowed) on the UNP port. The value displayed in this field is based on the port control direction setting for the port (both = Not Allowed; in = Allowed). This field is displayed only for UNP bridge ports and link aggregates.
Admin State	The administrative status (Enabled or Disabled) for the UNP port or link aggregate. Configured through the unnp admin-state command.
Dynamic Service	The type of dynamic service (vlan or spb) to generate on the UNP port or link aggregate. Configured through the unnp dynamic-service command. This field applies only to UNP access ports and link aggregates.
PVLAN Port Type	The Private VLAN (PVLAN) port type for the UNP port or link aggregate (promiscuous , isl , community , or isolated). This field is displayed only for UNP access ports, not link aggregates.
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted. Configured through the unnp 802.1x-authentication tx-period command.
802.1x Supp-Timeout	The amount of time, in seconds, the switch waits before timing out an 802.1X user (supplicant) that is attempting to authenticate. Configured through the unnp 802.1x-authentication supp-timeout command.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information. Configured through the unnp 802.1x-authentication max-req command.

Release History

Release 8.3.1; command was introduced.

Related Commands

show unnp port	Displays the UNP port configuration for the switch.
show unnp profile	Displays the UNP configuration for the switch.
show unnp user	Displays information about the devices learned on a UNP port.

show unip port bandwidth

Displays the bandwidth parameter values applied to a UNP port or link aggregate. These values are optionally assigned through the UNP profile to which a UNP port is associated.

show unip {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} bandwidth

Syntax Definitions

chassis/slot/port[-*port2*] The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

agg_id[-*agg_id2*] Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.
- The optional bandwidth parameter values are applied when a UNP port is classified into a UNP profile. The profile name is obtained through local classification or returned from the RADIUS server.
- The source from which the bandwidth parameter values was last updated is also included in the display information. The source updates are based on the following conditions:
 - The UNP profile applies the bandwidth values at the time the UNP port is classified into the profile. This overrides any existing QoS bandwidth policies configured on the physical port.
 - QoS bandwidth policies defined in a QoS policy list associated with the profile are applied after the port is classified into the profile. This overrides the profile bandwidth values initially applied.
 - User-configured QoS bandwidth policies are applied after the port is classified into the profile.

Examples

The following example shows the default display of UNP rate limit parameters when no users are learned on the UNP port:

```
-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress  Ingress BW  Ingr BW  Max Egress  Egress BW  Egress BW  Max Ingress  Max Egress
Domain  Bandwidth  Source  profile  Bandwidth  Source  profile  Bandwidth  Source  profile  Depth  Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge  0          0          -        0          -        0          0          0          0
```

The following example shows the UNP rate limit parameters that are applied when user devices are assigned to a UNP profile that specifies bandwidth parameter values:

```
-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
      Domain Bandwidth Source  profile Bandwidth Source  profile Depth  Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge 50.0M      UNP      Ingress50 30.0M      UNP      Egress30 0      0
```

The following example shows the rate limit parameter values that are applied when QoS policies override the bandwidth parameter values that were applied through UNP profile settings:

```
-> qos port 1/1/11 maximum ingress-bandwidth 60M maximum egress-bandwidth 60M
```

```
-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
      Domain Bandwidth Source  profile Bandwidth Source  profile Depth  Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge 60.0M      QoS      -          60.0M      QoS      -          0      0
```

output definitions

Port	The port or link aggregate on which UNP is enabled. A “0” indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11). Configured through the unip port-type command.
Port Domain	The domain ID assigned to the UNP port or link aggregate. Configured through the unip domain command.
Type	The type of UNP port (Bridge or Access). Configured through the unip port-type command.
Max Ingress Bandwidth	The maximum ingress bandwidth value applied to the UNP port. Configured through the unip profile maximum-ingress-bandwidth command.
Ingress BW Source	The source from which the maximum ingress bandwidth value was updated on the port (UNP or QoS).
Ingr BW Profile	The name of the UNP profile responsible for setting the maximum ingress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Egress Bandwidth	The maximum egress bandwidth value applied to the UNP port. Configured through the unip profile maximum-egress-bandwidth command.
Egress BW Source	The source from which the maximum egress bandwidth value was updated on the port (UNP or QoS).
Egress BW Profile	The name of the UNP profile responsible for setting the maximum egress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Ingress Depth	The maximum ingress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum ingress bandwidth rate. Configured through the unip profile maximum-ingress-depth command.
Max Egress Depth	The maximum egress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum egress bandwidth rate. Configured through the unip profile maximum-egress-depth command.

Release History

Release 8.2.1; command was introduced.

show unip port 802.1x statistics

Displays 802.1X statistics for a UNP port or link aggregate on which 802.1X authentication is enabled.

show unip {port *chassis/slot/port1*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} 802.1x statistics

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific UNP port or link aggregate ID.

Examples

```
-> show unip port 1/1/13 802.1x statistics
Port 1/1
  Mac-address=00:00:00:00:00:01,
  Vlan=0,
  Rx EAP Frames=0,
  Tx EAP Frames=0,
  Rx EAP Logoff Frames=0,
  Tx EAP Request Frames=0,
  Tx EAP Request ID Frames=0,
  Rx EAP Response Frames=0,
  Rx EAP Response ID Frames=0,
  Rx EAP Start Frames=0,
  Rx Invalid EAP Frames=0,
  Rx Length Error EAP Frames=0,
  Last EAP Frame Version=0,
  Last EAP Frame Version=0,
  Last EAP Source=00:00:00:00:00:00
```

```
-> show unip linkagg 20 802.1x statistics
Linkagg ID 0/10
  Mac-address=00:00:00:00:00:01,
  Vlan=0,
  Rx EAP Frames=0,
  Tx EAP Frames=0,
  Rx EAP Logoff Frames=0,
  Tx EAP Request Frames=0,
  Tx EAP Request ID Frames=0,
  Rx EAP Response Frames=0,
  Rx EAP Response ID Frames=0,
  Rx EAP Start Frames=0,
  Rx Invalid EAP Frames=0,
  Rx Length Error EAP Frames=0,
  Last EAP Frame Version=0,
  Last EAP Frame Version=0,
  Last EAP Source=00:00:00:00:00:00
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show unip port](#)

Displays the UNP port configuration for the switch.

[show unip user](#)

Displays information about the devices learned on a UNP port.

MIB Objects

N/A

show unp port configured-vlans

Displays the VLANs assigned to UNP bridge ports or link aggregates.

show unp [port [*chassis/slot/port1*[-*port2*]] | linkagg [*agg_id*[-*agg_id2*]] configured-vlans

Syntax Definitions

chassis/slot/port[-*port2*] The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).

agg_id[-*agg_id2*] Link aggregate ID for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific UNP bridge port or link aggregate ID.
- If the **port** or **linkagg** parameter is used without specifying an individual port, a range of ports, or link aggregate ID, then the configured VLAN information for all UNP ports and link aggregates is displayed.

Examples

```
-> show unp port configured-vlans
Port      Configured Vlans
-----+-----
0/10      500
0/10      501
1/1/10    500
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp port 1/1/11 configured-vlans
Port      Configured Vlans
-----+-----
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp linkagg 10 configured-vlans
LagID     Configured Vlans
-----+-----
0/10      500
0/10      501
```

Release History

Release 8.2.1; command was introduced.

Related Commands

[unp vlan](#)

Configures VLAN assignments for UNP bridge ports.

[show unp port](#)

Displays the UNP port and link aggregate configuration for the switch.

MIB Objects

alaDaUNPPortVlanTable

alaDaUNPPortVlanVID

show unip port-template

Displays the port template configuration for the switch.

show unip port-template [*template_name*] [**config** | **configured-vlans**]

Syntax Definitions

<i>template_name</i>	The name of the UNP port template to display.
config	Displays additional details about the parameter configuration for the template.
configured-vlans	Displays the VLAN IDs that the specified template assigns to a UNP port.

Defaults

By default, displays a summary of the configuration information for all port templates.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a template name with this command to display information for a specific port template.
- Use the **config** option with this command to display the full configuration for each template.
- Use the **configured-vlans** option with this command to display the VLAN IDs that a port template will statically assign to a UNP bridge port when the template is applied on the port. Configuring a static VLAN-port association (VPA) applies only to UNP bridge ports.

Examples

```
-> show unip port-template
      802.1x

```

output definitions

Port Template	The name of the port template. By default, the “accessDefaultPortTemplate” is assigned to UNP access ports and the “bridgeDefaultPortTemplate” is assigned to UNP bridge ports.
802.1x Authentication	The 802.1X authentication status (Enabled or Disabled).
802.1x Pass Alternate Profile	The name of an alternate profile for devices that pass 802.1X authentication.
Mac Authentication	The MAC authentication status (Enabled or Disabled).
Mac-Auth Pass Alternate Profile	The name of an alternate profile for devices that pass MAC authentication.
Classification	The classification status (Enabled or Disabled).
Trust-Tag	The trust VLAN ID tag status (Enabled or Disabled).
Default Profile	The name of a default profile for devices that are not classified by any other classification methods.
Port Domain Num	The domain ID number assignment for the UNP port.
Redirect Port Bounce	The status of port bounce (Enabled or Disabled) for BYOD registration and authorization. This parameter is only configurable on UNP bridge ports.

output definitions

AAA Profile	The name of an AAA profile to apply to the port.
Port Control Direction	Whether 802.1X access control is applied to ingress and egress traffic (both) or just ingress traffic (in). This parameter is only configurable on UNP bridge ports.
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted.
802.1x Supp-Timeout	The amount of time, in seconds, the switch will wait before timing out an 802.1X user that is attempting to authenticate.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information.
802.1x Bypass	The status of 802.1X bypass (Enabled or Disabled).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (default = no MAC authentication is attempted or mac-authentication).
Mac-auth allow-eap	The conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process (pass = if MAC authentication passes, fail = if MAC authentication fails, or noauth = if MAC authentication is not configured). This parameter option only applies to UNP ports on which 802.1X authentication bypass is enabled.
Admin State	The administrative status of the UNP port configuration (Enabled or Disabled).
Dynamic Service	Whether the UNP port generates dynamic SPB or VXLAN services. This parameter is only configurable on UNP access ports.

```
-> show unip port-template unip-port1 configured-vlans
Template Name          Configured Vlans
-----+-----
unip-port1            503
```

output definitions

Template Name	The name of a UNP port template.
Configured VLANs	The VLAN IDs that are assigned to a UNP bridge port when the template is applied to the port.

Release History

Release 8.3.1; command was introduced.

Related Commands

unnp port-template	Configures UNP port parameter values for a port template.
unnp port port-template	Assigns a port configuration template to a UNP port.
show unnp port config	Displays the full UNP configuration for a port, including the name of a port template that is associated with the port.

show unp user

Displays information about the MAC addresses learned on a UNP port or link aggregate.

show unp user [**port** *chassis/slot/port[-port2]*] [**linkagg** *agg_id[-agg_id2]*] [**sap-id** *sap_id*] [**service-id** *service_id*] [**profile** *profile_name*] [**authentication-type** {**none** | **mac** | **802.1x**}] [**mac-address** *mac_address*] [**count**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
none	Displays all UNP users that did not undergo the authentication process.
mac	Displays all UNP users that were authenticated through the MAC authentication process.
802.1x	Displays all UNP users that were authenticated through the 802.1X authentication process.
<i>mac_address</i>	A source MAC address. This parameter displays the UNP user device with the specified source MAC address.
count	Displays the number of UNP users learned on the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
 - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
 - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “Username” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

Examples

```
-> show unp user count
Total users: 6
```

```
-> show unp user
```

Port	Username	Mac address	User IP	Vlan	Profile	Type	Status
1/1/1	00:00:00:00:00:01	00:00:00:00:00:01	1.1.1.1	10	unp-1	Access	Active

```
Total users : 6
```

output definitions

Port	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
Username	Displays either a source MAC address or a Captive Portal user name for the learned user device.
MAC address	The MAC address of the user device. This field and the Username field may contain the same MAC address, depending on how the user device was authenticated.
User IP	The IP network address of the user device.
Vlan	The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
Profile	The name of the UNP profile to which the user device was assigned.
Type	The type of UNP port on which the device was learned (Bridge or Access).
Status	The status of the device (Active or Blocked)

```
-> show unp user port 1/1/3
```

Port	Username	Mac address	User IP	Vlan	Profile	Auth	Role
1/1/3	guest_user	00:00:00:00:00:04	1.1.1.4	20	unp-guest	8021X	Guest

```
Total users : 1
```

```
-> show unp user linkagg 10
```

```

```
-> show unp user authentication-type mac
```

Port	Username	Mac address	User		Profile	Auth	Role
			IP	Vlan			
1/1/7	00:00:00:00:00:07	00:00:00:00:00:07	1.1.1.7	11	unp-emp	MAC	Employee
0/12	00:00:00:00:00:14	00:00:00:00:00:14	1.1.2.4	20	unp-7	MAC	Employee

```
Total users : 2
```

output definitions

Port	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
Username	Displays either a source MAC address or a Captive Portal user name for the learned user device.
MAC address	The MAC address of the user device. This field and the Username field may contain the same MAC address, depending on how the user device was authenticated.
User IP	The IP network address of the user device.
Vlan	The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
Profile	The name of the UNP profile to which the user device was assigned.
Auth	The type of authentication applied to the user (none , mac , or 802.1X).
Role	The user role (QoS policy list) applied to the user device.

Release History

Release 8.1.1; command was introduced.

Related Commands

show unp user status	Displays information about the authentication and validation status of users learned on UNP ports.
show unp user details	Displays detailed information about user devices learned on UNP ports.
unp user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
show unp profile	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB ObjectsN/A

show unip user status

Displays the status of the authentication and validation process for MAC addresses learned on a UNP port or link aggregate.

```
show unip user status [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] [sap-id sap_id]
[service-id service_id] [profile profile_name] [authentication-type {none | mac | 802.1x}] [mac-address
mac_address]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile.
none	Displays users that did not undergo the authentication process.
mac	Displays users that were authenticated through MAC authentication.
802.1x	Displays users that were authenticated through 802.1X authentication.
<i>mac_address</i>	The user device MAC address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:

- Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
- Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

Examples

```
-> show unip user status port 1/1/1
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/1 00:00:00:00:00:05 Prf1 Radius 8021x Passed emp1 Profile Y - -
```

Total users : 1

```
-> show unip user status linkagg 100
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
0/100 00:00:00:00:00:06 Prf3 Radius 8021x Passed emp1 Profile Y - -
```

Total users : 1

```
-> show unip user status authentication type MAC
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/2 00:00:00:00:00:15 Prf2 Alt MAC Passed emp2 Profile Y - -
```

Total users : 1

output definitions

Port	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
MAC address	The MAC address of the user device.
Profile Name	The name of the UNP to which the user device was assigned.
Profile Source	The source of the profile assignment (e.g., Radius, Alt).
Authentication Type	The type of authentication applied to the user (none , mac , or 802.1X).
Authentication Status	The authentication status for the device.
Role Name	The name of the user role applied to the user device.
Role Source	The source of the user role applied to the user device.
CP	Indicates if the device was authenticated through Captive Portal.
Redirect	The redirection status.
Restricted Access	Whether or not access is restricted for the user.

Release History

Release 8.1.1; command was introduced.

Related Commands**show unip user**

Displays information about users learned on a UNP ports.

show unip user details

Displays detailed information about users learned on a UNP ports.

show unip profile

Displays the UNP configuration for the switch.

show unip port

Displays the UNP configuration for the port.

MIB ObjectsN/A

show unip user details

Displays additional details about the MAC addresses learned on a UNP port or link aggregate.

show unip user details [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]] [**sap-id** *sap_id*] [**service-id** *service_id*] [**profile** *profile_name*] [**authentication-type** {**none** | **mac** | **802.1x**}] [**mac-address** *mac_address*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
<i>agg_id</i> [- <i>agg_id2</i>]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
none	Displays all UNP users that did not undergo the authentication process.
mac	Displays all UNP users that were authenticated through the MAC authentication process.
802.1x	Displays all UNP users that were authenticated through the 802.1X authentication process.
<i>mac_address</i>	A source MAC address. This parameter displays the UNP user device with the specified source MAC address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
 - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
 - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “User Name” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

output definitions

Port	The UNP port or link aggregate on which the device was learned.
Mac-address	The MAC address of the device.
SAP	The port or link aggregate and encapsulation value for an SPB or VXLAN Service Access Point (SAP).
Service ID	The SPB or VXLAN service ID number.
VNID	The VXLAN Network Identifier. This value is associated with a VXLAN service ID.
ISID	The SPB service instance identifier. This value is associated with an SPB service ID.
Access Timestamp	The date and time the device was learned.
User Name	The MAC address of the user.
IP-Address	The IP network address of the device.
Vlan	The VLAN ID number for the VLAN in which the device was learned.
Authentication Type	The type of authentication used (Mac-Authentication or 802.1x-Authentication).
Authentication Status	The status of the authentication process (blank “-” , Authenticated , Failed , or In Progress).
Authentication Failure Reason	The reason authentication failed.
Authentication Retry Count	The number of times authentication has been attempted.
Authentication Server IP Used	The IP address of the authentication server.
Authentication Server Used	The name of the authentication server used.
Server Reply-Message	Reply message from the authentication server.
Profile	The name of the VLAN profile to which the user was assigned.
Profile Source	The source of the profile (returned from the server or assigned through the UNP process on the switch).
Profile From Auth Server	The name of the UNP profile returned from the authentication server.
Classification profile rule	The rule that resulted in the device classification into the profile VLAN.
QMR Status	The Quarantine Manager Remediation status for the device.
Redirect Url	The URL to which the device is redirected upon classification.
SIP Call Type	The Session Initiation Protocol (SIP) call type status for a non-suppliant (non-802.1X) device.
SIP Media Type	The SIP media type status for a non-suppliant device.
Applications	The applications a non-suppliant device is running.

Release History

Release 8.1.1; command was introduced.

Related Commands

show unip user status	Displays information about the authentication and validation status of users learned on UNP ports.
unip user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
show unip profile	Displays the UNP configuration for the switch.
show unip port	Displays the UNP configuration for the port.

MIB ObjectsN/A

show unnp policy validity-period

Displays the UNP period policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unnp policy validity-period [*policy_name*]

Syntax Definitions

policy_name The name of an existing UNP period policy.

Defaults

By default, all UNP period policies are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Enter a UNP period policy name to display information about a specific policy.

Examples

```
-> show unnp policy validity-period
Policy Days      Months      Hours      Interval      TZ Active
-----+-----+-----+-----+-----+-----+-----
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00      - - -      - NO
tp2   ----- -----          - - -      01/01/13 00:00 - 01/02/13 00:00 CST NO

Total Period Policy Count: 2
```

```
-> show unnp policy validity-period tp1
Policy Days      Months      Hours      Interval      TZ Active
-----+-----+-----+-----+-----+-----+-----
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00      - - -      - NO
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

show unip policy validity-location

Displays the UNP location policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unip policy validity-location [*policy_name*]

Syntax Definitions

policy_name The name of an existing UNP location policy.

Defaults

By default, all UNP location policies are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Enter a location policy name to display information about a specific policy.

Examples

```
-> show unip policy validity location
Policy: 11
  Port           = 1/1
  System Name    = shasta
  System Location = Bangalore
```

```
Total Location Policy Count: 1
```

40 Application Monitoring and Enforcement Commands

Application usage patterns in the enterprise network is changing with the increase in use of the social networking, browser based file sharing, and peer to peer applications. The use of these applications result in the new traffic patterns in the network that are not straightforward to distinguish. There is also an increase in consumerization of IT with multiplication of thin clients, HTTP based, and virtual desktop clients.

OmniSwitch Application Monitoring and Enforcement (AppMon) feature addresses the key challenges of real time classification of flows at application level by providing differential QoS treatment in the form of higher priority marking and security policies at application level. AppMon feature improves the quality of user experience through application aware network optimization and control.

Note. AppMon is supported in a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.

MIB information for the AppMon commands is as follows:

Filename: ALCATEL-IND1-APP-MON-MIB.mib
Module: alaAppMonMIB

A summary of the available commands is listed here:

app-mon admin-state
app-mon port admin-state
app-mon auto-group create
app-mon app-group
app-mon app-list
app-mon apply
app-mon l3-mode
app-mon l4-mode
app-mon l4port-exclude
app-mon flow-table flush
app-mon flow-table enforcement stats
app-mon aging enforcement
app-mon logging-threshold
app-mon flow-sync enforcement interval
app-mon force-flow-sync
show app-mon config
show app-mon port
show app-mon app-pool
show app-mon app-list
show app-mon app-group
show app-mon app-record
show app-mon ipv4-flow-table
show app-mon ipv6-flow-table
show app-mon l4port-exclude
show app-mon stats
show app-mon aging enforcement
show app-mon vc-topology
clear app-mon app-list

app-mon admin-state

Enable or disable the Application Monitoring and Enforcement (AppMon) feature.

app-mon admin-state {enable | disable}

Syntax Definitions

enable	Enables AppMon support on the switch.
disable	Disables AppMon support on the switch.

Defaults

By default, AppMon is disabled on the switch.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- AppMon cannot be enabled globally when,
 - all the mirroring sessions are used by port mirroring or monitoring features.
 - mirroring session is used by policy manager.
- When AppMon is enabled globally, it reserves a mirroring session in the system.
- If AppMon functionality is enabled at a port level, disabling AppMon globally overrides the functionality of all AppMon ports; however, configuration on the ports remain the same.

Examples

```
-> app-mon admin-state enable  
-> app-mon admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon port admin-state	Enable or disable AppMon on one or more switch ports.
show app-mon config	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

alaAppMonAdminStatus

app-mon port admin-state

Enable or disable AppMon Monitoring and Enforcement on one or more switch ports.

app-mon {port *chassis/slot/port*[-*port2*] | slot *chassis/slot* [-*slot*]} admin-state {enable | disable}

Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>chassis/slot</i>	The chassis ID and slot number (3/1) for a specific slot.
enable	Enables AppMon on the port.
disable	Disables AppMon on the port.

Defaults

By default, AppMon is disabled on all ports.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- It is mandatory to enable AppMon globally for the port level AppMon to function.
- When slot option is used, then AppMon configuration is applied on all the physical ports of that particular slot.
- AppMon configuration is not allowed on Virtual Fabric Link ports.
- AppMon cannot be configured on a port that is part of a link aggregate or a port mirroring port.
- AppMon must not be configured on user ports and uplink ports at the same time.

Examples

```
-> app-mon slot 1/1 admin-state enable
-> app-mon port 1/1/2-5 admin-state enable
-> app-mon slot 1/1 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon admin-state

Enable or disable the Application Monitoring feature.

show app-mon port

Displays AppMon status per physical port or per slot for the switch.

MIB Objects

alaAppMonPortConfigTable

alaAppMonPortConfigSlotPortIndex

alaAppMonPortConfigPortStatus

app-mon auto-group create

Creates application groups automatically on the switch. The application groups are automatically created based on the 'category' field of each application present in the application pool.

app-mon auto-group create

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Modifications are allowed in auto application groups with addition or deletion of applications using the **app-mon app-group** command.
- Enter **app-mon apply** and **write memory** to save the auto group configuration or modification on the switch.
- The **show app-mon app-pool** command displays the application categories in the signature file. The application group names are derived from the category name.

Examples

```
-> app-mon auto-group create
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

alaAppMonAutoGroupCreation

app-mon app-group

Creates an application group. Applications can be added or removed from the application group.

app-mon app-group *app_group_name* {**add** | **remove**} {**app-name** *app_name* | **from** *app_name* **to** *app_name*}

no app-mon app-group *app_group_name*

Syntax Definitions

<i>app_group_name</i>	Name of the application group. The group name can be a maximum of 32 alphanumeric characters.
<i>app_name</i>	The name of the application to be added to the application group. The application name can be a maximum of 32 alphanumeric characters.
from <i>app_name</i>	The first application name when adding a range of applications to an application group.
to <i>app_name</i>	The last application name when adding a range of applications to an application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **no** form of this command to remove an application group.
- This command can be used to add or delete applications for the auto application groups as well.
- One application can belong to more than one application group.
- Only those applications that are part of an application pool are allowed to be added to an application group.
- To add a range of applications or multiple applications to an application group, use the **from** and **to** options. Range is expanded based on the list of applications in the app-pool list (application pool). Use the **show app-mon app-pool** command to view the application names.
- If an application is removed from an application group which has only one application, then the complete application group is removed.
- If any application is added to a user group (group name same name as category name), and signature toolkit update operation or 'app-mon auto-group create' is done, then added group is not deleted. Only update happens.
- If an application group contains a single application and the group is part of an application list, then this single application cannot be removed from the application group.
- An application group cannot be deleted when it is part of an application list.

- When the last application from the application group is removed, the application group is automatically deleted.
- The list of applications (added or deleted) to an application group is displayed in **show configuration snapshot** command after **app-mon apply** command is entered. A list of applications (added or deleted) are displayed with the **show app-mon app-group** command even without using the **app-mon apply** command.

Examples

```
-> app-mon app-group apg2 add app-name whatsapp
-> app-mon app-group apg2 remove app-name whatsapp
-> no app-mon app-group apg2
```

To add a range of applications or multiple applications to an application group, use the **show app-mon app-pool** command to view the application names. For example:

```
-> show app-mon app-pool
Legend: Application-name: *= Not present in recently updated kit,
AppId      Application-name      Revision      Category
-----+-----+-----+-----
968        amazon                1.0.0        Web
244        facebook              1.0.0        Web
182        sip                   1.0.0        Audio/Video
183        skype                 1.1.0        Instant Messaging
211        tftp                  1.0.0        File Server
503        twitter              1.0.0        Web
597        viber                 1.0.0        Audio/Video
890        webex                 1.0.0        Audio/Video
1093       whatsapp              1.0.0        Instant Messaging
240        youtube               1.0.0        Web
-----
Number of Applications: 10
```

Select any two applications for the range option using the **app-mon app-group** command.

```
-> app-mon app-group apg1 add from sip to viber
```

This command adds the applications from sip to viber to the application group (sip, skype, tftp, twitter, and viber).

If an application is removed from an application group which has only one application, then the complete application group is removed. For example:

```
-> show app-mon app-group group1
AppGrp-Id  App-group              App-name
-----+-----+-----
1093      whatsapp              Instant Messaging
```

Now, remove the application name 'whatsapp' from the application group. The complete application group gets removed as shown below.

```
-> app-mon app-group group1 remove app-name whatsapp
-> show app-mon app-group group1
AppGrp-Id  App-group              App-name
-----+-----+-----
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-list	Displays a list of applications and application groups added to an application list.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

```
alaAppMonAppGroupTable  
  alaAppMonAppGroupName  
  alaAppMonAppGroupMember  
  alaAppMonAppGroupStatus  
  alaAppMonAppGrpFromAppName  
  alaAppMonAppGrpToAppName  
  alaAppMonAddAppGrpName  
  alaAppMonAppGroupBuiltIn  
  alaAppMonAppGroupCategoryName  
  alaAppMonAppGrpId  
  alaAppMonAppGroupAppStatus
```

app-mon app-list

Add or remove applications or application groups to an application list for enforcement or monitoring.

```
app-mon app-list {enforcement | monitor} {add | remove} {app-name app_name | app-group
app_group_name}
```

Syntax Definitions

add	Adds the specified application or application group to an application list.
remove	Removes the specified application or application group from an application list.
<i>app_name</i>	Name of the application to be added to the application list. This adds the specified application to the application list.
<i>app_group_name</i>	Name of the application group to be added to the application list. This enables the addition of multiple applications in the application group to the application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- The application group can be user created or generated automatically (see [app-mon app-group](#) and [app-mon auto-group create](#) command).
- Separate application list is maintained for enforcement and monitoring.
- The [show configuration snapshot](#) command displays the applications added or removed from the application list only after the [app-mon apply](#) command is used. The [app-mon apply](#) command saves the list of applications added or removed to the application list. The saved list of applications are displayed with the [show app-mon app-list active](#) command.
- QoS policy rules can be configured for a given application as well as an application group where the same application also exists. QoS matches policies based on the application-name or application-group name configured in an application list. For more information on configuring enforcement for QoS policy rules, see the “[QoS Policy Commands](#)” chapter.

Examples

```
-> app-mon app-list enforcement add app-name whatsapp
-> app-mon app-list enforcement add app-group apg1
-> app-mon app-list monitor add app-group apg2
-> app-mon app-list enforcement remove app-name whatsapp
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon auto-group create	Enables or disables Auto-Group functionality on the switch.
app-mon app-group	Creates an application group. Applications can be added or removed from the application group.
show app-mon app-list	Displays list of applications and application groups added to an application list.
clear app-mon app-list	Removes all applications signatures from the application list.

MIB Objects

```
alaAppMonAppListTable  
  alaAppMonAppListMemberName  
  alaAppMonAppListMemberType  
  alaAppMonAppListMemberStatus  
  alaAppMonAppListAppId  
  alaAppMonAppListAppStatus
```

app-mon apply

This activates both enforcement and monitoring application lists for flow classification.

app-mon apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The following operations are performed with the **app-mon apply** command:

- Saves the current application-list, application-group, and auto-groups to flash when 'write memory' command is used.
- The application list is checked for any application configured more than once in an application list (individually or as a part of application group).
 - The **app-mon apply** command will not be successful until the conflict is resolved.
 - The **show app-mon app-list** command with the **monitor conflict** or the **enforcement conflict** parameter displays the available conflicts in an application list.
 - The duplicate application names must be removed for a successful **app-mon apply** operation.
- QoS is applied to the flows learned for the activated applications based on the configured QoS policies for Enforcement application list.

Examples

```
-> app-mon apply
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config

Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

show app-mon port

Displays AppMon status per physical port or per slot for the switch.

show app-mon app-list

Displays a list of applications and application groups added to an application list.

MIB Objects

alaAppMonUpdateAppList

app-mon l3-mode

Enables or disables monitoring and enforcement for IPv4 flows, IPv6 flows, or both.

```
app-mon l3-mode {ipv4 | ipv6} admin-state {enable | disable}
```

Syntax Definitions

IPv4	Applies monitoring and enforcement to IPv4 flows.
IPv6	Applies monitoring and enforcement to IPv6 flows.
enable	Enables the specified L3 mode on the switch.
disable	Disables the specified L3 mode on the switch.

Defaults

By default, monitoring and enforcement is enabled for both IPv4 and IPv6 flows.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

N/A

Examples

```
-> app-mon l3-mode ipv4 admin-state disable
-> app-mon l3-mode ipv4 admin-state enable
-> app-mon l3-mode ipv6 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonEnforcementIpv4
alaAppMonEnforcementIpv6
```

app-mon l4-mode

Enables or disables monitoring and enforcement for TCP or UDP flows.

app-mon {port *chassis/slot/port[-port2]* | slot *chassis/slot*} **l4-mode** {tcp | udp} **admin-state** {enable | disable}

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>chassis/slot</i>	The chassis ID and slot number (3/1) for a specific slot.
tcp	Applies monitoring and enforcement to TCP flows.
udp	Applies monitoring and enforcement to UDP flows.
enable	Enables the specified L4 mode on the switch.
disable	Disables the specified L4 mode on the switch.

Defaults

By default, both TCP and UDP flows are processed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

N/A

Examples

```
-> app-mon port 1/1/2 l4-mode udp admin-state disable
-> app-mon slot 1/1 l4-mode tcp admin-state enable
-> app-mon port 1/1/2 l4-mode udp admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

- app-mon l4port-exclude** Configures the L4 port range to exclude from the AppMon operation.
- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonPortConfigTable  
  alaAppMonPortConfigSlotPortIndex  
  alaAppMonEnforcementPortConfigTcpStatus  
  alaAppMonEnforcementPortConfigUdpStatus
```

app-mon l4port-exclude

Configures the L4 port range to exclude from the AppMon operation.

```
app-mon l4port-exclude range-id number {tcp-service-port | udp-port} start number end number
```

```
no app-mon l4port-exclude range-id
```

Syntax Definitions

range-id <i>number</i>	The range ID number. The valid range is 1–8.
tcp-service-port	Specifies TCP service ports.
udp-port	Specifies UDP ports.
start <i>number</i>	The first port associated with the range ID number. The valid port range is 1–65535.
end <i>number</i>	The last port associated with the range ID number. The valid port range is 1–65535.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **no** form of this command to remove an L4 exclude range ID from the switch configuration.
- For the **udp-port** option, the AppMon operation is not performed on the flows with a source or destination port that is in the excluded port range.
- For the **tcp-service-port** option, the AppMon operation is not performed on the flows with a destination TCP port of TCP-SYN packet or a source TCP port of TCP-SYN-ACK packet that is in the excluded port range.
- This configuration applies to both enforcement and monitor features.

Examples

```
-> app-mon l4port-exclude range-id 5 tcp-service-port start 20 end 30
-> app-mon l4port-exclude range-id 6 udp-port start 90 end 100
-> no app-mon l4port-exclude range-id 6
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon l4port-exclude Displays the port range excluded from AppMon operation.

MIB Objects

```
alaAppMonEnforcementL4PortRangeTable  
  alaAppMonEnforcementL4PortRangeStart  
  alaAppMonEnforcementL4PortRangeEnd  
  alaAppMonEnforcementL4PortType  
  alaAppMonEnforcementL4PortStatus
```

app-mon flow-table flush

Clears all the learned flow-table entries for both IPv4 and IPv6 flow tables.

app-mon flow-table {enforcement | monitor} flush

Syntax Definitions

enforcement	Flushes all the learned flow-table entries from the enforcement application.
monitor	Flushes all the learned flow-table entries from the monitor application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- When the **enforcement** option is used, all the active flows information are cleared; no QoS treatment is provided (if configured). The data (active, gross counters, statistics, and flow information) in the following commands are cleared: **show app-mon app-list enforcement active**, **show app-mon app-list enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon ipv6-flow-table enforcement**, **show app-mon stats**.
- When the **monitor** option is used, all the learned flows information will be cleared. The data (gross counters and flow information) in the following commands are cleared: **show app-mon app-list monitor active**, **show app-mon ipv4-flow-table monitor**, **show app-mon ipv6-flow-table monitor**.
- When this command is used, application-record information is not cleared.

Examples

```
-> app-mon flow-table enforcement flush  
-> app-mon flow-table monitor flush
```

Release History

Release 8.2.1; command introduced.

Related Commands

- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
- show app-mon app-list** Displays a list of applications and application groups added to an application list. 'stats' option in this command displays active or gross packets/byte counters on per application basis.
- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

MIB Objects

alaAppMonFlowTableFlush

app-mon flow-table enforcement stats

Enable or disable flow table statistics update for enforcement applications.

app-mon flow-table enforcement stats admin-state {enable | disable}

Syntax Definitions

enable	Enable flow-table statistics update.
disable	Disable flow-table statistics update.

Defaults

By default, statistics admin status is disabled.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command is applicable only for enforcement applications.
- The statistics collection capability is shared with Service Manager, which means that either the Service Manager feature or AppMon can use this capability at any given time. Hence, disabling the counter usage in Service Manager using the **service stats disable** command is required to view the flow table statistics update for enforcement applications. For more information about this command, see the “Service Manager Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- When update statistics is enabled, the updated statistics is displayed in the **show app-mon ipv4-flow-table enforcement verbose**, **show app-mon ipv6-flow-table enforcement verbose**, and **show app-mon app-list enforcement active stats** commands. Statistics are refreshed every 160 seconds from data path, and based on the flow sync interval between the data path and the control path.

Examples

```
-> app-mon flow-table enforcement stats admin-state enable
-> app-mon flow-table enforcement stats admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

alaAppMonEnforcementFlowTableStatsAdminStatus

app-mon aging enforcement

Configures aging time for dynamically learned TCP/UDP flows for each application for Enforcement applications.

app-mon aging enforcement app-name *app_name* [tcp | udp] interval {120m | 60m | 30m | 10m | 5m | 3m | default}

Syntax Definitions

<i>app_name</i>	Name of the application to configure its aging interval. The application must be part of the application pool.
interval	The aging time interval for dynamically learned flows in the flow table, in minutes.
default	Configures the default aging interval.

Defaults

By default, aging interval is set per application and TCP or UDP flow type basis.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- User can set separate TCP or UDP flows aging interval for an given application.
- When TCP option is used to configure aging interval for an application, TCP flows generated by a given application age out with configured value.
- When UDP option is used to configure aging interval for an application, UDP flows generated by a given application age out with configured value.
- Flow aging is supported for the applications that are part of the enforcement application list. Flows related with enforcement application list are made active for QoS treatment as well statistics collection.
- Flow aging is not supported for applications that are part of Monitor application list. Monitor flow tables log these flows when they are detected until logging threshold is reached.

Examples

```
-> app-mon aging enforcement app-name sip tcp interval 60m
-> app-mon aging enforcement app-name tftp udp interval 120m
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config

Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

show app-mon aging enforcement

Displays the aging interval for each application for enforcement feature.

MIB Objects

alaAppMonEnforcementAgingTimerTable

alaAppMonEnforcementAgingTimerValue

app-mon logging-threshold

Configures the threshold for the number of matched flows for enforcement and monitor applications.

app-mon logging-threshold {enforcement | monitor} num-of-flows {number | default}

Syntax Definitions

<i>number</i>	Threshold value for the number of matched flows. The valid range is 1000–60000.
default	Sets the threshold back to the default value of 20K.

Defaults

By default, 20000 flows are logged.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- When the logging threshold value is set to '0', flows are not logged to the log file.
- When used with enforcement option, it configures the threshold for the number of matched flows to be saved on to the log file for enforcement applications.
- When used with monitor option, it configures the threshold for the number of matched flows to be displayed in the monitor flow table commands.

Examples

```
-> app-mon logging-threshold monitor num-of-flows 10000
-> app-mon logging-threshold monitor num-of-flows default
-> app-mon logging-threshold enforcement num-of-flows 10000
```

Release History

Release 8.2.1; command introduced.

Related Commands

[show app-mon config](#) Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

alaAppMonThresholdNumberOfFlows

app-mon flow-sync enforcement interval

Configures the interval at which the enforcement flows information is refreshed.

app-mon flow-sync enforcement interval {*number* | **default**}

Syntax Definitions

<i>number</i>	Flow sync interval at which the enforcement flows information is refreshed. The valid range is 10–3600 seconds. The interval can be configured only for the enforcement feature.
default	Configures the default flow-sync interval.

Defaults

Default flow-sync interval is 60 seconds for enforcement.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The refreshed information is shown in the following show commands: **show app-mon applist enforcement active**, **show app-mon applist enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon stats**.

Examples

```
-> app-mon flow-sync enforcement interval 10
-> app-mon flow-sync enforcement interval default
```

Release History

Release 8.2.1; command introduced.

Related Commands

[show app-mon ipv4-flow-table](#) Displays the flow table for IPv4 flows entries.

[show app-mon ipv6-flow-table](#) Displays the flow table for IPv6 flows entries.

MIB Objects

alaAppMonFlowSyncEnforcementInterval

app-mon force-flow-sync

Synchronizes flows learned in the data path.

app-mon force-flow-sync {enforcement | monitor}

Syntax Definitions

enforcement	Synchronizes flows learned in the data path for the enforcement feature from the hardware.
monitor	Synchronizes flows learned in the data path for the monitor feature from the hardware.

Defaults

By default, flow synchronization occurs every 5 minutes for monitor flows and 60 seconds for enforcement flows.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Use this command to force a flow synchronization with the control path database in real time.

Examples

```
-> app-mon force-flow-sync enforcement
-> app-mon force-flow-sync monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

[show app-mon ipv4-flow-table](#) Displays the flow table for IPv4 flows entries.

[show app-mon ipv6-flow-table](#) Displays the flow table for IPv6 flows entries.

MIB Objects

alaAppMonForceFlowSyncStatus

show app-mon config

Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

show app-mon config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The operational state is enabled if there is at least one OmniSwitch 6860E chassis in the virtual chassis (VC). If there is no OmniSwitch 6860E in the VC, the operational-state is disabled.

Examples

```
-> show app-mon config
Admin State                : Enable,
Operational State          : Enable,
L3-IPv4                    : Enable,
L3-IPv6                    : Enable,
Enforcement Flow-Table Stats : Enable,
Enforcement Flow-Sync Interval : 10 seconds,
Monitor Logging Threshold   : 20000,
Enforcement Logging Threshold : 20000,
App-Pool Applications       : 10,
Monitor Applied Applications : 10,
Enforcement Applied Applications : 10,
Upgraded Signature File Type : Factory,
AOS Compatible Signature Kit Version : 1,
Signature Kit version       : 1.1.1
```

output definitions

Admin-state	The AppMon administrative status (Enabled or Disabled). Configured through the app-mon admin-state command.
Operational State	The operational status (Enabled or Disabled).
L3-IPv4	Status of IPv4 I3 mode on the switch (Enable or Disable)
L3-IPv6	Status of IPv6 I3 mode on the switch (Enable or Disable)
Enforcement Flow-Table Stats	Status of the enforcement flow table statistics update.
Enforcement Flow Sync interval	Enforcement flow sync interval at which the switch polls for flow information.

output definitions (continued)

Monitor Logging-Threshold	Monitor threshold value for the flows to be saved in the IPv4 or IPv6 flow table.
Enforcement Logging-Threshold	Enforcement threshold value for the flows to be saved on to the log file.
App-Pool Applications	The number of application signatures in the application pool.
Monitor Applied Applications	The number of active applications in the Monitor application list.
Enforcement Applied Applications	The number of active applications in the enforcement application list.
Upgraded Signature File Type	The signature file type: Factory or Production
AOS Compatible Signature Kit Version	Determines the compatibility between AOS software and the signature file.
Signature Kit version	The signature file version that contains the application signatures.

Release History

show app-mon app-list

Displays a list of applications and application groups added to an application list.

show app-mon app-list {**monitor** | **enforcement**} [**active** [**stats**]] [**conflict**]

Syntax Definitions

monitor	Displays information for applications added for monitoring.
enforcement	Displays information for applications added for enforcement.
active [stats]	Displays the list of activated applications in an application list. Use the stats option together with the enforcement option.
conflict	Displays the list of applications that are present more than once in an application list.

Defaults

By default, all applications and application groups that belong to an application list are displayed.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Use the **conflict** option to identify applications that are present more than once in an application list. This needs to be checked and resolved for **app-mon apply** to be successful.
- The **active** option displays active and gross number of flows detected on per application basis.
- For monitor feature, **active** option displays only the gross counters.
- The **stats** option is used only for the **enforcement** option. This displays active or gross packets/byte counters per application basis.

Examples

```
-> show app-mon app-list monitor
App-Id/      Application-List
AppGrp-Id   Member Name      Application-List
Member Type
-----+-----+-----
244         facebook        APP
182         sip             APP-GRP
```

output definitions

App-Id/AppGrp-Id	Identity of the application or application group.
Application-List Member Name	Name of the application group or application.
Application-List Member Type	Specifies the application type: individual application or whether the application belongs to any application group.

```
-> show app-mon app-list enforcement active
Legend: Application-name: *= Not present in recently updated kit,
App-Id  Application          App-Grp      Matched      Matched
        Name                Name         Flow Count   Gross Count
-----+-----+-----+-----+-----+-----+-----+-----+-----+

show app-mon app-group

Displays the details of all the applications in an application group.

show app-mon app-group [**group-name** *group_name*]

Syntax Definitions

group_name The name of an application group. This is a case sensitive string.

Defaults

By default, information is displayed for all application groups.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- This command displays both user created and automatically created application groups and the applications added to the respective group.
- Application names which are added to group and not yet activated are also displayed.
- This also display the auto application groups.

Examples

```
-> show app-mon app-group
Legend: Application-name: *= Not present in recently updated kit,
```

AppGrp-Id	App-group	App-name
AG-1	Web	amazon facebook twitter youtube
AG-2	Instant Messaging	whatsapp skype
AG-3	Audio/Video	sip viber webex
AG-4	File Server	tftp

output definitions

AppGrp-Id	Identity of the application group.
App-group	Name of the application group whose details are viewed.
App-name	Name of the applications attached to the application group.

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon app-record

Displays current-hour application-record information as well the historic application-records on the hourly or 24-hours basis for monitored applications.

show app-mon app-record [hourly | twenty-four-hours | current-hour] [verbose]

Syntax Definitions

hourly	Displays flows detected for an applications in an hour. An Hour is defined with fixed boundary (for example, 1:30 p.m to 2:30 p.m).
twenty-four-hours	Displays aggregate of available 'hourly' records for each application, flows detected in last 24-hours since last hour boundary. 'current-hour' data will not be part of this. This information is updated every one hour when 'hourly' record is updated.
current-hour	Displays new flow detected for an application in the current hour which is not part of 'hourly' historic data. When current-hour reaches an hour boundary, this data is moved to 'hourly' records. For example, if current time is 2.40 p.m, then information between 2.30 p.m to 2.40 p.m is displayed. On 3.30 p.m, current-hour information is moved to the latest hourly record.
verbose	Select this option to view detail information for each option. Detail information include minimum, maximum and average flows detected for each application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This is supported for monitoring.

show app-mon ipv4-flow-table

Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

```
show app-mon ipv4-flow-table {monitor | enforcement [verbose]} [{src-ipv4 | dest-ipv4} ip_address]
[app-name app_name | app-group grp_name]
```

Syntax Definitions

verbose	Displays detailed information of the flows.
src-ipv4 <i>ip_address</i>	Filter flow table based on the specified source IPv4 address.
dest-ipv4 <i>ip_address</i>	Filter flow table based on the specified destination IPv4 address.
<i>app_name</i>	Filter flow table based on application name.
<i>grp_name</i>	Filter flow table based on application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

Examples

```
-> show app-mon ipv4-flow-table monitor

show app-mon l4port-exclude

Displays the port range excluded from AppMon operation.

show app-mon l4port-exclude range-id [*number*]

Syntax Definitions

number A range ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all range ID numbers.

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Enter a range ID number with this command to display information for a specific range.

Examples

```
-> show app-mon l4port-exclude range-id
Range-Id   Start-port   End-port     Port-type
-----+-----+-----+-----
1           100          200         UDP-Port
2           20           25          TCP-Service-Port
```

```
-> show app-mon l4port-exclude range-id 1
Range-Id   Start-port   End-port     Port-type
-----+-----+-----+-----
1           100          200         UDP-Port
```

output definitions

Range-Id	The service port range ID.
Start-port	The start port associated with the range ID.
End-port	The end port associated with the range ID.
Port-type	Indicates the port type (TCP or UDP)

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon l4port-exclude Configures the L4 port range to exclude from the AppMon operation.

MIB Objects

  alaAppMonEnforcementL4PortStatus
```

show app-mon stats

Displays the number of flow statistics.

show app-mon stats

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Use the **app-mon flow-table enforcement flush** command to clear the counters.

Examples

```
-> show app-mon stats
Chassis/  Total Enforcement  Total          Total TCP      Total UDP
Slot      Matched Flows      Used Flows      Overflow Flows  Overflow Packets
-----+-----+-----+-----+-----
1/1        8192                8192            1422           0
2/1         0                   3               0              0
3/1         0                   0               0              0
4/1         0                   0               0              0
Total      8192                8195            1422           0
```

output definitions

Chassis/Slot	The chassis ID and slot number.
Total Enforcement Matched Flows	Total number of active flows that matched to any active application signature for enforcement feature.
Total Used Flows	Total number of active flows (including unmatched and enforcement matched) on a given chassis/slot. Each IPv4 flow takes one entry count, while each IPv6 flow takes two entries for Total Used Flows count.
Total TCP Overflow Flows	Total number of TCP flows missed to create flow entry in flow table due to hash collision.
Total UDP Overflow Packets	Cumulative number of UDP packets missed to create flow entry in flow table due to hash collision.

Release History

Release 8.2.1; command introduced.

Related Commands

```

show app-mon vc-topology

Displays the AppMon virtual chassis topology.

show app-mon vc-topology

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

Displays the topology of the available OmniSwitch 6860 and OmniSwitch 6860E chassis. This also displays the connectivity between the chassis for flow classification.

Examples

```
-> show app-mon vc-topology
```

Chassis/ Slot	Node Type	Designated Chassis/Slot
1/1	OS6860	2/1
2/1	OS6860E	2/1
3/1	OS6860E	3/1

output definitions

Chassis/Slot	The chassis ID and slot number.
Node Type	Indicates the switch type.
Designated Chassis/Slot	The chassis and slot of the switch.

clear app-mon app-list

Removes all applications from the enforcement or monitor application list.

```
clear app-mon app-list {monitor| enforcement}
```

Syntax Definitions

monitor	Removes all applications from the monitor application list.
enforcement	Removes all applications from the enforcement application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This command does not clear the active application list until the **app-mon apply** command is used.

Examples

```
-> clear app-mon app-list enforcement  
-> clear app-mon app-list monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

```

41 Application Fingerprinting Commands

The OmniSwitch Application Fingerprinting feature attempts to detect and identify remote applications by scanning IP packets and comparing them to pre-defined bit patterns (application signatures). Once an application is identified, Application Fingerprinting collects and stores information about the application flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and generating SNMP traps when a signature match occurs.

Using this implementation of Application Fingerprinting, an administrator can obtain more detailed information about protocols running on a specific device or make sure that certain QoS actions are automatically applied wherever an application might be running.

MIB information for the Application Fingerprinting commands is as follows:

Filename: ALCATEL-IND1-APP-FINGERPRINT-MIB.mib
Module: alcatelIND1AppFPMIB

A summary of the available commands is listed here:

app-fingerprint admin-state
app-fingerprint port
app-fingerprint signature-file
app-fingerprint reload-signature-file
app-fingerprint trap
show app-fingerprint configuration
show app-fingerprint port
show app-fingerprint app-name
show app-fingerprint app-group
show app-fingerprint database
show app-fingerprint statistics

app-fingerprint admin-state

Enables or disables the Application Fingerprinting process on all Application Fingerprinting ports.

app-fingerprint admin-state {enable | disable}

Syntax Definitions

enable	Enables Application Fingerprinting.
disable	Disables Application Fingerprinting.

Defaults

By default, Application Fingerprinting is enabled for the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When Application Fingerprinting is enabled for the switch, traffic flows on Application Fingerprinting ports are sampled and compared to REGEX application signatures defined in the “app-regex.txt” file located in the **/flash/app-signature** directory on the local switch. This is done to identify the presence of remote applications on a flow-by-flow basis.
- Disabling the administrative status of the Application Fingerprinting feature does not remove the Application Fingerprinting configuration from the switch.

Examples

```
-> app-fingerprint admin-state disable
-> app-fingerprint admin-state enable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint configuration Displays the Application Fingerprinting configuration for the switch.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
alaAppFPGlobalAdminState
```

app-fingerprint port

Configures a port or link aggregate as an Application Fingerprinting interface. Once the interface is configured and Application Fingerprinting is enabled for the switch, IP packets received on the interface are sampled to determine if they match pre-defined patterns in application signature files that reside on the local switch. When a match occurs, the flow is monitored and/or subject to QoS policy rules.

```
app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]} {monitor-app-group
group_name | policy-list-name policy_list | unp-profile}
```

```
no app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports.
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
<i>group_name</i>	The name of an existing signature application group.
<i>policy_list</i>	The name of an existing QoS policy list.
unp-profile	Apply QoS policy list from UNP to which matching traffic is classified.

Defaults

By default, Application Fingerprinting is disabled on all switch ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the Application Fingerprinting service on the specified port or link aggregate.
- Use the **monitor-app-group** parameter to specify a group (profile) that represents a set of application signature files. All of the signature files in the group are checked against the IP packets received on the port. When a packet match is detected, the flow is identified and monitored. No other action is taken.
- Use the **policy-list-name** parameter to associate a QoS policy list with the Application Fingerprinting port. When a packet match is detected, the policy rules in the specified policy list are applied to the matching traffic flow.
- Use the **unp-profile** parameter to specify that if traffic received on an Application Fingerprinting interface is classified into a Universal Network Profile (UNP), then the QoS policy list rules associated with that profile are applied to the traffic.
- The QoS policy list specified with the **policy-list-name** parameter or assigned to a UNP for Application Fingerprinting traffic, must contain policy rules with the **appfp-group** condition.
- The QoS policy list specified with the **policy-list-name** parameter must be configured as an **appfp** list. However, the UNP policy list must be configured as a UNP list.

- Application Fingerprinting uses the sFlow mechanism to sample packets. Do not run Application Fingerprinting and other sFlow services on the same port or link aggregate.

Examples

```
-> app-fingerprint port 2/1-5 monitor-app-group my-p2p
-> app-fingerprint linkagg 10 policy-list-name list1
-> app-fingerprint port 1/11 unp
-> no app-fingerprint port 2/1-5
-> no app-fingerprint linkagg 10
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port Displays the Application Fingerprinting port configuration.

MIB Objects

```
alaAppFPPortTable
  alaAppFPPort
  alaAppFPGroupNameOrPolicyList
  alaAppFPPortOperationMode
  alaAppFPPortStatus
  alaAppFPPortRowStatus
```

app-fingerprint reload-signature-file

Reloads the contents of the active application signature file into the switch memory. Use this command after making any changes to the current signature file.

app-fingerprint reload-signature-file

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command reloads the application signature file that was previously applied to the switch. This may be the default “app-regex.txt” file or another signature file that was applied through the **app-fingerprint signature-file** command.
- A switch reboot is *not* required after the signature file is reloaded.

Examples

```
-> app-fingerprint reload-signature-file
```

Release History

Release 7.3.2; command was introduced.

Related Commands

app-fingerprint signature-file Specifies a different signature file to use for Application Fingerprinting.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects  
alaAppFPGlobalReloadSignatureFile
```

app-fingerprint trap

Enables or disables trap generation for the Application Fingerprinting feature.

app-fingerprint trap {enable | disable}

Syntax Definitions

enable	Enables Application Fingerprinting traps.
disable	Disables Application Fingerprinting traps.

Defaults

By default, traps are disabled for this feature.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

A trap is generated when a traffic flow matches an application signature.

Examples

```
-> app-fingerprint trap enable  
-> app-fingerprint trap disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration for the switch.
--	--

MIB Objects

```
alaAppFPGlobalMIBConfigObjects  
alaAppFPGlobalTrapConfig
```

show app-fingerprint configuration

Displays the Application Fingerprinting status and configuration information for the switch.

show app-fingerprint configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show app-fingerprint configuration
```

```
Admin-state:          Enabled,  
SNMP Trap:           Disabled,  
Signature File:      app-regex.txt
```

output definitions

Admin-state	The administrative status of Application Fingerprinting for the switch (Enabled or Disabled). Configured through the app-fingerprint admin-state command.
SNMP Trap	The status of SNMP trap generation for the switch (Enabled or Disabled). Configured through the app-fingerprint trap command.
Signature File	The name of the text file that contains the REGEX application signatures used to identify traffic flows. This file resides in the /flash/app-signature directory on the switch. Configured through the app-fingerprint signature-file and app-fingerprint reload-signature-file commands.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port Displays the Application Fingerprinting port configuration.

MIB Objects

```
alaAppFPGlobalMIBConfigObjects
  alaAppFPGlobalAdminState
  alaAppFPGlobalSignatureFile
  alaAppFPGlobalReloadSignatureFile
  alaAppFPGlobalTrapConfig
```

show app-fingerprint port

Displays the Application Fingerprinting port configuration for the switch.

show app-fingerprint [**port** *chassis/slot/port* | **linkagg** *agg_id*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, the configuration for all Application Fingerprinting ports is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

Examples

```
-> show app-fingerprint port
Legend: * = Port or App-Group is invalid
```

Port	Operation Mode	App-group/Policy-list
1/2/1	Monitoring	Testing13
1/2/1	QoS	list1
1/2/1	QoS	list2

```
-> show app-fingerprint linkagg
Legend: * = Port or App-Group is invalid
```

Port	Operation Mode	App-group/Policy-list
0/100	Monitoring	Testing16
0/100	QoS	list3
0/100	QoS	list4

output definitions

Port	The slot/port or link aggregate ID of the Application Fingerprinting interface. A “0” slot number indicates that the interface is a link aggregate.
Operation Mode	The Application Fingerprinting mode (Monitoring, QoS, or UNP) in which the port is operating.
App-group/Policy-list	The name of the group of application signatures or the QoS policy list that is applied to the traffic flows on the port.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port	Displays the Application Fingerprinting interface configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration for the switch.

MIB Objects

```
alaAppFPPortTable
  alaAppFPPort
  alaAppFPGroupNameOrPolicyList
  alaAppFPPortOperationMode
  alaAppFPPortStatus
  alaAppFPPortRowStatus
```

show app-fingerprint app-name

Displays the REGEX application signature configuration for the switch. When the switch samples Application Fingerprinting ports, the traffic flow patterns on these ports are compared against the REGEX signatures specified in the “app-regex.txt” file. When a match occurs, the traffic flow is classified and monitored. In addition, QoS policies can be applied to these flows based on a specific match to an application signature group.

show app-fingerprint app-name [*app_name*]

Syntax Definitions

app_name The name of an existing application signature.

Defaults

By default, all application signatures are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Application signatures are defined in the “app-regex.txt” file that resides in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Application signatures can also be combined into an application group. This type of group is then assigned to one or more Application Fingerprinting ports. All the application signatures that are members of the assigned group are then applied to traffic flows on that same port.
- Use the *app_name* parameter to display information for a specific application signature.

Examples

```
-> show app-fingerprint app-name
App Name: ciscovpn
  Description: VPN client software to a Cisco VPN server
  REGEX Signature: \x01\xf4\x01\xf4

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58

App Name: dhcp
  Description: Dynamic Host Configuration Protocol
  REGEX Signature: [\x01\x02][\x01- ]\x06.*c\x82sc

-> show app-fingerprint app-name citrix

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58
```

output definitions

App-name	The name of the application for which this signature applies.
Description	A description of the application.
REGEX signature	The regular expression (REGEX) that identifies this application.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-group	Displays the application group configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration.

MIB Objects

alaAppFPAppGrpNameTable
alaAppFPGrpAppName

show app-fingerprint app-group

Displays the Application Fingerprinting application group configuration for the switch. An application group contains a user-configured list of REGEX application signatures that are represented by the group name. The group name is then assigned to Application Fingerprinting ports or link aggregates.

show app-fingerprint app-group [*group_name*]

Syntax Definitions

group_name The name of an existing application group.

Defaults

By default, all application groups are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Application groups are defined in the “app-regex.txt” file that is located in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Use the *group_name* parameter to display information for a specific application group.

Examples

```
-> show app-fingerprint app-group

App Group: chatting
  App names: jabber

App Group: mail
  App names: smtp

App Group: network
  App names: bgp dhcp rtsp smb

App Group: p2p
  App names: hotline

App Group: remote_access
  App names: ciscovpn citrix rdp ssh vnc

App Group: voip
  App names: h323 sip

-> show app-fingerprint app-group network

App Group: network
  App names: bgp dhcp rtsp smb
```

output definitions

App-Group	The name of the application group file.
App names	The names of the application signature files that belong to this group.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-name Displays the contents of the REGEX application signatures that are stored in the “app-regex.txt” file on the switch.

show app-fingerprint configuration Displays the Application Fingerprinting status and configuration.

MIB Objects

alaAppFPAppGrpNameTable
 alaAppFPAppGroupName
 alaAppFPGrpAppName

show app-fingerprint database

Displays Application Fingerprinting database entries. When a match occurs between an IP traffic flow and a REGEX application signature, a multi-tuple classifier and the name of the matching application group and signature are stored in a local switch database to identify and track the application associated with the flow.

show app-fingerprint database [*port chassis/slot/port* | *linkagg agg_id*] [*detail*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and the port number (3/1).
<i>agg_id</i>	The link aggregate ID number.
<i>detail</i>	Displays additional information about the classified traffic flow.

Defaults

By default, all application flow database entries are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The following multi-tuple classifier is used to identify an application traffic flow:
 - Ingress Port
 - Dest MAC
 - Src MAC
 - VLAN
 - Dest IP
 - Src IP
 - Dest Port
 - Src Port
- Each database entry is subject to a 15 minute aging period. If the database fills up, older entries are aged out before the 15 minute limit (fast aging). However, fast aging is not applied to database entries associated with QoS. In this case, the QoS is removed after the regular 15 minute aging time period expires.
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

Examples

```
-> show app-fingerprint database
```

Port	App-Group/Name	SRC MAC	VLAN	SRC IP/Port
0/1/2	P2P/aim	00:00:22:33:44:55	20	2.3.4.4/200
0/1/2	P2P/ares	00:00:22:33:44:55	20	2.3.4.4/200
0/1/2	Mail/sntp	00:00:22:33:44:55	20	2.3.4.4/100

output definitions

Port	The slot/port or link aggregate ID of the AFP interface on which the flow was classified. A "0" slot number indicates a link aggregate.
App-Group/Name	The name of the application group and signature that matched the flow.
SRC MAC	The source MAC address of the flow.
VLAN	The VLAN on which the flow is learned and forwarded.
SRC IP/Port	The source IP network address and port.

```
-> show app-fingerprint database detail
```

```
Port 1/2/1:
```

```
App-Group/Name: Testing2/App_4
SRC-DST MAC:    00:00:00:00:04:01 - 00:e0:b1:e6:f9:b5,
VLAN:          20,

SRC IP/PORT:    10.10.10.11/113,
DST IP/PORT:    20.20.20.21/135
```

output definitions

Port	The slot and port number on which the flow was classified.
App-Group/Name	The name of the application group and signature that matched the flow.
SRC-DST MAC	The source and destination MAC addresses of the flow.
VLAN	The VLAN on which the flow is learned and forwarded.
SRC IP/Port	The source IP network address and port.
DST IP/Port	The destination IP network address and port.

Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint app-group	Displays the application group configuration.
show app-fingerprint configuration	Displays the Application Fingerprinting status and configuration.

```

show app-fingerprint statistics

Displays statistics for each application flow on an Application Fingerprinting ingress port.

show app-fingerprint statistics [**port** *chassis/slot/port* | **linkagg** *agg_id*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and the port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, statistics are displayed for all application flows.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Statistics displayed with this command include total number of packets matched, the number of unmatched packets, and the packets matched for each application signature.

Examples

```
-> show app-fingerprint statistics
  Port      Group/App name                               Last 1 hour   Last 1 day
-----+-----+-----+-----

42 Edge Virtual Bridging Commands

The OmniSwitch implementation of Edge Virtual Bridging (EVB) is based on the the 802.1Qbg IEEE Standard. EVB is activated only on the backbone edge switches in a Data Center network. EVB is used to automate the discovery of Virtual Machines and connect them to the correct network domains, either the backbone bridge service network, or the VLAN bridged network.

The Edge Virtual Bridging commands allow you to configure and view Virtual Bridge settings required to be setup on an Edge OmniSwitch.

MIB information for the Edge Virtual Bridging commands is as follows:

Filename: IEEE8021-EVBB-MIB.mib
Module: IEEE8021-EVBB-MIB

Filename: ALCATEL-IND1-EVB-MIB.mib
Module: ALCATEL-IND1-EVB-MIB

A summary of available commands is listed here:

Management Commands	evb port auto enable type evb port auto disable evb port type evb evb-ldp manual evb ecp default-ack-timer evb vdp default-keep-alive-timeout
Monitoring Commands	show evb show evb config show evb vsi-db-table show evb vsi-manager show evb sbp-config show evb cdcp-status show evb s-channel show evb ecp-status

evb port auto enable type

Enables the EVB automatic mode for the switch. This mode allows ports to automatically become EVB ports when the port receives S-Channel Discovery and Configuration Protocol (CDCP) or EVB TLV (type, length, value) control packets. When EVB is automatically enabled, this command also specifies whether the port operates as a VLAN bridging port or a service access port.

evb port auto enable type {vlan-bridging | service-access}

Syntax Definitions

vlan-bridging	Enables the port to operate as a VLAN bridging port.
service-access	Enables the port to operate as a service access port.

Defaults

By default, the EVB automatic mode is disabled.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

VLAN bridging cannot be enabled on ports that are associated with a GroupID or S-Channel.

Examples

```
-> evb port auto enable type service-access
-> evb port auto enable type vlan-bridging
```

Release History

Release 7.3.1; command introduced.

Related Commands

evb port auto disable	Disables EVB port auto mode.
show evb config	Displays the current EVB configuration on the chassis.

MIB Objects

```
evbMIBScalarObjects
  evbPortAutoMode
  evbDefaultType
```

evb port auto disable

Disables the EVB automatic mode for the switch. The port becomes an EVB port only when the port is configured through the CLI command.

evb port auto disable

Syntax Definitions

N/A

Defaults

By default, the EVB automatic mode is disabled.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

All EVB control packets are ignored when the EVB automatic mode is disabled.

Examples

```
-> evb port auto disable
```

Release History

Release 7.3.1; command introduced.

Related Commands

evb port auto enable type	Enables the EVB port to VLAN bridging mode or service access mode.
show evb config	Displays the current EVB configuration on the chassis.

MIB Objects

```
evbMIBScalarObjects  
  evbPortAutoMode
```

evb port type

Enables or disables the EVB VLAN bridging functionality on a switch port or link aggregate.

evb port {*chassis/slot/port* | **linkagg** *agg_id*} **type** {**vlan-bridging** | **service-access**}

no evb port {*chassis/slot/port* | **linkagg** *agg_id*}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.
vlan-bridging	Specifies the EVB VLAN bridging port type.
service-access	Specifies the EVB service-access port type.

Defaults

By default, EVB is not enabled on switch ports.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- If the EVB port auto mode is enabled, this command can be used to overwrite the default EVB port type.
- Use the **no** form of this command to disable the EVB configuration on the specified port.
- This command designates the specified port or link aggregate as a EVB Station-facing Bridge Port (SBP) that will connect to an EVB server.

Examples

```
-> evb port 1/1 type vlan-bridging
-> evb port 1/2 type service-access
-> evb port linkagg 2 type vlan-bridging
-> evb port linkagg 3 type service-access
```

Release History

Release 7.3.1; command introduced.

Related Commands

[show evb config](#)

Displays the current EVB configuration on the switch.

MIB Objects

evbPortModeTable

 evbPortId

 evbPortMode

evb evb-lldp manual

Enables or disables manual operating configuration for OmniSwitch after obtaining the EVB TLV setting.

evb evb-lldp manual {enable | disable}

Syntax Definitions

enable	Enables local EVB TLV manual setting.
disable	Disables local EVB TLV manual setting.

Defaults

By default, the EVB LLDP manual setting is disabled.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- When EVB LLDP manual is enabled, the operating configuration of the OmniSwitch is determined only by the local EVB TLV settings.
- When EVB LLDP manual is disabled, the operating configuration is automatically determined by comparing the local and remote EVB TLV settings.

Examples

```
-> evb evb-lldp manual enable
-> evb evb-lldp manual disable
```

Release History

Release 7.3.1; command introduced.

Related Commands

show evb config	Displays the current EVB configuration on the chassis.
show evb sbp-config	Displays the Virtual Station Interface (VSI) to Station-facing Bridge Port (SPB) mapping information.

MIB Objects

```
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbSysEvbLldpManual
```

evb ecp default-ack-timer

Configures the default amount of time to wait to receive an acknowledgment (ACK) Edge Control Protocol (ECP) data packet.

evb ecp default-ack-timer *ack_timer*

Syntax Definitions

ack_timer The default wait timer value to receive an acknowledgment (ACK) Edge Control Protocol (ECP) data packet.

Defaults

By default, the default ACK timer value is set to 14 (approximately 163.84 milliseconds).

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- The ECP operates between the EVB server and EVB OmniSwitch and provides reliable delivery of VSI Discovery and Configuration Protocol (VDP) PDUs.
- Use the following formula to get the real timer value from the ACK timer:

Timer (in milliseconds) = $10 \times 2^{\text{<ack_timer>}}$

Examples

```
-> evb ecp default-ack-timer 20
-> evb ecp default-ack-timer 14
```

Release History

Release 7.3.1; command introduced.

Related Commands

show evb config	Displays the current EVB configuration on the chassis.
show evb vsi-db-table	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

MIB Objects

```
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbECPAckTimer
```

evb vdp default-keep-alive-timeout

Configures the value to initialize the timer by the station VDP to determine when to transmit keep-alive messages.

evb vdp default-keep-alive-timeout *ka_timeout*

Syntax Definitions

ka_timeout The keep-alive value for the timer.

Defaults

By default, the default keep-alive timeout value is set to 20 (approximately 0.48576 seconds).

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the following formula to get the real timer value from the default-keep-alive timeout:

Timer (in micro second) = 10×2^{ka_timeout}

Examples

```
-> evb vdp default-keep-alive-timeout 25
```

Release History

Release 7.3.1; command introduced.

Related Commands

show evb config	Displays the current EVB configuration on the chassis.
show evb vsi-db-table	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

MIB Objects

```
ieee8021BridgeEvbConfig  
  ieee8021BridgeEvbSysVdpDfltReinitKeepAlive
```

show evb

Displays the EVB port and the port bridging type.

show evb [**port** *chassis/slot/port* | **linkagg** *agg_id*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the EVB port.
<i>agg_id</i>	Link aggregate ID of the EVB port.

Defaults

By default, the EVB port type is displayed for all ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the **port** or **linkagg** parameters with this command to display information for a specific port or link aggregate.

Examples

```
-> show evb port linkagg
Port      Bridging Type
-----+-----
0/1       VLAN
0/2       VLAN

-> show evb port
Port      Bridging Type
-----+-----
1/1       VLAN
1/2       VLAN

-> show evb port 1/2
Port      Bridging Type
-----+-----
1/2       VLAN
```

output definitions

Port	The slot/port number or link aggregate ID of the EVB port.
Bridging Type	Specifies the EVB port bridging type.

Related Commands**evb port type**

Configures the EVB port type.

show evb config

Displays the current EVB configuration on the switch.

show evb config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

NA

Examples

-> show evb config

```
Auto Port Mode:                Enabled
Auto Default Port Type:       Vlan-Bridging
No. of external ports:        102
EVB-LLDP TX:                  -
EVB-LLDP manual:              Disabled
EVB-LLDP GroupID-capable:     -
ECP default-ack-timer (msec):  14 (163.84)
ECP default-max-retry:        3
VDP resource-wait-delay (sec): 20 (10.48)
VDP keep-alive-timeout (sec):  20 (10.48)
```

output definitions

Auto Port Mode	The EVB auto mode status (Enabled or Disabled). <i>Not supported in the current release; the EVB port type is manually configured.</i>
Auto Default Port Type	The default port type setting in auto mode - Vlan-Bridging or Service-Access . <i>Not supported in the current release..</i>
No. of external ports	The number of external ports on the EVB.
EVB-LLDP TX	The EVB-LLDP transmission status (Enabled or Disabled). <i>Not supported in the current release.</i>
EVB-LLDP manual	The EVB-LLDP manual setting (Enabled or Disabled).
EVB-LLDP GroupID	The EVB-LLDP groupID capability status (Enabled or Disabled). <i>Not supported in the current release.</i>
ECP ack-timer (msec)	The EVB acknowledgement timer value in milli seconds.

output definitions (continued)

ECP max-retry	The value for the maximum number of times that the ECP is retransmitted if no acknowledgment (ACK) packet is received.
VDP resource-wait-delay (sec)	The VDP resource wait delay value in seconds.
VDP keep-alive-timeout (sec)	The VDP keep-alive timeout value in seconds.

Release History

Release 7.3.1; command introduced.

Related Commands

evb ecp default-ack-timer	Configures the default wait timer value to receive an acknowledgment (ACK) data packet.
evb ecp default-max-retry	Configures the maximum number of times that the ECP must be retransmitted if no acknowledgment (ACK) packet is received.
evb vdp default-resource-wait-delay	Configures the delay value to initialize the timer for VDP on the edge OmniSwitch when a resource is waiting for a response.
evb vdp default-keep-alive-timeout	Configures the value to initialize the timer by the station VDP to determine when to transmit keep-alive messages.

MIB Objects

```

show evb vsi-db-table

Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

```
show evb vsi-db-table chassis/slot/port | linkagg agg_id] [sbp sbp | vsi-id vsi_id | mac mac_address]
[vlan vlan_id | group-id group_id] [detail]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the Station-facing Bridge Port (SBP).
<i>agg_id</i>	Link aggregate ID of the of the group of Station-facing Bridge Ports (SBP).
<i>sbp</i>	Specifies a Station-facing Bridge Port ID.
<i>vsi_id</i>	The VSI ID that uniquely identifies the VSI in the Data Centre Network (DCN) in 32 digit format.
<i>mac_address</i>	The MAC address of the VLANs for the VSI.
<i>vlan_id</i>	The VLAN ID of the VLANs for the VSI.
<i>group_id</i>	The group ID of the VLANs for the VSI. <i>This parameter is not supported in the current release.</i>
detail	Displays additional detail about the VSI information.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- This show command has three layers of options that can be entered to narrow the scope of display. The first layer consists of the following options:
 - *slot/port*: to get information related to a specific port.
 - *sbp* or *vsi_id* or *mac_address*: to get information related to a specific SBP ID, VSI ID, or MAC address
 - no option: to get information related to all ports.
- For the second layer of information detail, some specific filter option can be entered after the first layer option such as *vlan*.
- For the third layer of information detail, the **detail** keyword can be specified for a more detailed display. When detail option is specified, extensive information of VSI is displayed in paragraph format. A proper filter option must be used to get exact data.

Examples

```
-> show evb vsi-db-table
```

Port	SBP	Vsi Id	GID	MAC	VID	TLV Type

No. of Filter Info Entries: 2
```

output definitions

port	Specifies chassis and port number in chassis/slot/port [-port1] format.
sbp port	The assigned SBP port number
VSI Mgr ID	Specifies the VSI Manager ID with the specific VSI type and instance.
VSI Type	Specifies the VSI Type ID, an integer value that identifies the pre-configured set of controls and attributes that are associated with a group of VSIs.
VSI Type Version	VSI Type Version is a specific version number of the VSI Type. Specifies the VSI Type Version in the VSI Manager Database to denote and store multiple versions of a given VSI Type.
VSI ID Type	Specifies the VSI ID Type for the VSI ID in the Data Centre Network (DCN).
VSI ID	The VSI ID that uniquely identifies the VSI in the DCN is of 16 octet string length.
Time Since Create (sec)	Specifies the time since creation of EVB VSI association in seconds.
VDP Operation Command	Specifies the type of VDP TLV. Valid options are - Pre-Associate , Pre-Associate-With-Resource-Reservation , Associate , or De-Associate .

output definitions (continued)

Most recent KEEP indicator	The most recent value of the KEEP indicator obtained from VDP protocol exchange.
Most recent HARD indicator	The most recent value of the HARD indicator obtained from VDP protocol exchange.
Operation Reason	Indicates the outcome of a request - Success, Invalid Format, Insufficient Resources, Failure.
Time Since Create (sec)	Specifies the time since creation of the
MAC/VLAN Format	The most recent KEEP indicator from the VDP exchange.
ECP max-retry	The most recent HARD indicator from the VDP exchange.
VDP resource-wait-delay (sec)	Specifies the value set for the VDP resource-wait-delay timer at the EVB Bridge.
VDP keep-alive-timeout (sec)	Specifies how long an EVB station waits for a response from the EVB Bridge. Indicates a time that EVB station waits for the Keep Alive VDP packet from the EVB Station. If the timer expires, the corresponding VSI entry is treated as De-Association.
No. of VDP Command Succeeded	Number of successful VDP commands since creation.
No. of VDP Command Failed	Number of failed VDP commands since creation.
No. of VDP Command Reverted	Number of reverted VDP commands since creation.
Counter Discontinuity (sec)	Time since the last counter discontinuity.
No. of Filter Info Entries	Number of filter information entries in the VDP TLV.

Release History

Release 7.3.1; command introduced.

Related Commands

show evb vsi-manager

Displays the slot, port, Station-facing Bridge Port and VSI ID based on the VSI database filtering option.

show evb vsi-manager [*manager_id* | **vsi-type** *vsi_type*]

Syntax Definitions

manager_id Specifies the VSI manager ID to get the configuration information.
vsi_type Specifies the VSI type assigned to the VSI manager.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Examples

-> show evb vsi-manager

VSI Manager	Type	Ver	VSI ID	port	SBP
xxxx	xx	xx	xxxx	1/1	10
xxxx	xx	xx	xxxx	1/5	20

output definitions

VSI Manager	VSI Manager ID.
Type	VSI Type ID.
Ver	VSI Type Version.
VSI ID	The VSI ID stored in the table VSI DB table that contains database of the active Virtual Station Interfaces.
port	Specifies the slot and port number.
SBP	Specifies the SBP or Virtual Port Number information.

Release History

Release 7.3.1; command introduced.

Related Commands

[show evb](#)

Displays the EVB port and its port bridging type.

[show evb vsi-db-table](#)

Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

MIB Objects

```
ieee8021BridgeEvbVSIDBTable
  ieee8021BridgeEvbVSIID
  ieee8021BridgeEvbVSIMgrID
  ieee8021BridgeEvbVSIType
  ieee8021BridgeEvbVSITypeVersion
  ieee8021BridgeEvbVSIID
  ieee8021BridgeEvbVSIPortNumber
```

show evb sbp-config

Displays the Virtual Station Interface (VSI) to Station-facing Bridge Port (SBP) mapping information.

show evb sbp-config *chassis/slot/port* | **linkagg** *agg_id*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the EVB port.
<i>agg_id</i>	Link aggregate ID of the of the group of the EVB port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The *slot/port* and *agg_id* parameter values specify the port number or link aggregate ID number to display the EVB CDCP status. If no port number is specified, then the mapping for all ports is displayed.

Examples

```
-> show evb sbp-config
```

port	sbp	manual mode	resource wait delay	reinit keep alive	tout keep alive
1/1	10	enabled	10.48	10.48	11.6
1/1	20	enabled	10.48	10.48	11.6
1/2	33	enabled	10.48	10.48	11.6
1/3	40	enabled	10.48	10.48	11.6

```
-> show evb sbp-config port linkagg 1
```

port	SBP	manual mode	resource wait delay (usec)	reinit keep alive (usec)	tout keep alive (usec)
0/1	61472	disabled	10485760	10485760	17448960
0/1	61473	disabled	10485760	10485760	17448960

output definitions

port	Specifies the slot and port number of the EVB port.
sbp	Specifies the SBP ID.
manual mode	Specifies whether manual mode is enabled or disabled .
resource wait delay	Specifies the configured resource wait delay value in seconds.

output definitions

reinit keep alive	Specifies the configured reinit keep alive value in seconds.
tout keep alive	Specifies the configured keep alive timeout value in seconds.

Release History

Release 7.3.1; command introduced.

Related Commands

evb evb-lldp manual	Enables or disables manual operating configuration for OmniSwitch after obtaining the EVB TLV setting.
show evb config	Displays the current EVB configuration on the chassis.

MIB Objects

```
ieee8021BridgeEvbSbpTable  
  ieee8021BridgeEvbSbpComponentID  
  ieee8021BridgeEvbSbpPortNumber  
  ieee8021BridgeEvbSbpLldpManual

```

show evb cdcp-status

Displays the S-channel discovery and configuration protocol (CDCP) status of Uplink Access Ports (UAP).

show evb cdcp-status *chassis/slot/port*

Syntax Definitions

chassis The chassis identifier.
slot/port Slot and port number of the Uplink Access Ports.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The *slot/port* parameter specifies the port number to display the EVB CDCP status. If no port number is specified, then the EVB CDCP status is displayed for all the related ports.

Examples

-> show evb cdcp-status

Admin	CDCP State		No. of S-channel		S-VLAN allocated		
Port	state	local	remote	Max No.	operational	lowest	highest
1/1	enable	running	enabled	55	20	1001	1020
1/2	enable	down	disabled	55	10	1001	1010

output definitions

Admin Port	Slot and port number of UAP.
Admin port state	Administrative status of CDCP of UAP - enable or disable .
CDCP State - local	Local running state of CDCP - running or down .
CDCP State - remote	Remote state for S-channel - enabled or disabled .
No. of S-channel - Max No.	Number of S-channels supported by the bridge.
No. of S-channel - operational	Number of S-channels that can be used.
S-VLAN allocated - lowest	The lowest S-VLAN available for assignment by CDCP.
S-VLAN allocated - highest	The highest S-VLAN available for assignment by CDCP.

Release History

Release 7.3.1; command introduced.

Related Commands

  ieee8021BridgeEvbUAPSchAdminCDCPSVIDPoolHigh
```

show evb s-channel

Displays the S-Channel information.

show evb s-channel *chassis/slot/port*]

Syntax Definitions

chassis The chassis identifier.
slot/port Slot and port number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The *slot/port* parameter specifies the port number to display the S-channel configuration. If no port number is specified, then the S-channel configuration is displayed for all the related ports.

Examples

```
> show evb s-channel
```

Port	S-Ch Id	S-VLAN	SBP
1/1	1	1	20
1/1	2	1002	21
1/2	1	1	200

output definitions

Port	Specifies the slot and port number.
S-Ch ID	Specifies the S-Channel ID.
S-VLAN	Specifies the S-VLAN ID.
SBP	Specifies the Station-facing Bridge Port (SBP) number.

Release History

Release 7.3.1; command introduced.

Related Commands

[show evb cdcg-status](#)

Displays the S-channel Discovery and Configuration Protocol (CDCP) status of Uplink Access Ports (UAP).

MIB Objects

```
ieee8021BridgeEvbCAPConfigTable  
  Ieee8021BridgePhyPort  
  ieee8021BridgeEvbSchID  
  ieee8021BridgeEvbCAPSChannelID

```

show evb ecp-status

Displays the Edge Control Protocol (ECP) status.

show evb ecp-status *chassis/slot/port*]

Syntax Definitions

chassis The chassis identifier.
slot/port Slot and port number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The *slot/port* parameter specifies the port number to display the ECP status. If no port number is specified, then the ECP status is displayed for all the related ports.

Examples

-> show evb ecp-status

Port	SBP	ACK Timer (msec)	MAX Retry	TX Pkt Counter	TX Retry Counter	TX Fail Counter	Rx Pkt Counter
1/1	10	163.84	3	4	0	0	4
1/1	20	163.84	3	4	0	0	4
1/2	300	163.84	3	5	0	0	5

-> show evb ecp-status 1/2

Port	SBP	ACK Timer (msec)	MAX Retry	TX Pkt Counter	TX Retry Counter	TX Fail Counter	RX Pkt Counter
0/1/2	300	163.84	3	5	0	0	5

output definitions

Port	Slot and port number of the EVB port.
SBP	ECP port number which is same as SBP number.
ACK Timer	Operational ECP ACK timer in milliseconds.
MAX Retry	Maximum number of retries to receive ACK messages.
TX Pkt Counter	Number of ECP frames transmitted since ECP was instantiated.
TX Retry Counter	Number of times ECP re-tried transmission since ECP was instantiated.

output definitions

TX Fail Counter	Number of times ECP failed to successfully deliver a frame since ECP was instantiated.
RX Pkt Counter	Number of ECP frames received since ECP was instantiated.

Release History

Release 7.3.1; command introduced.

Related Commands

show evb config	Displays the current EVB configuration on the chassis.
evb ecp default-ack-timer	Specifies default wait timer value to receive an acknowledgment (ACK) Edge Control Protocol (ECP) data packet.
evb ecp default-max-retry	Specifies the maximum number of times the ECP must be retransmitted if no ACK - acknowledgment packet is received.

```

43 FIP Snooping Commands

The OmniSwitch implementation of Fibre Channel over Ethernet (FCoE) Initiation Protocol (FIP) snooping supports the FCoE technology used to tunnel Fibre Channel (FC) frames within Ethernet MAC frames. When the FCoE and FIP snooping functionality is enabled, the OmniSwitch serves as an FCoE transit switch. In this role, the OmniSwitch implementation of Data Center Bridging (DCB) is also used to provide the lossless Ethernet network required to support FCoE.

This implementation of FIP snooping ensures the security of the FCoE network and maintains a virtual point-to-point network connection between FCoE Nodes (ENodes) and FCoE Forwarder (FCF) devices. In addition, FIP snooping is also required to support OmniSwitch FCoE/FC gateway functionality that allows the switch to provide FCoE forwarding services between an FCoE network and a native FC storage area network (SAN).

- An OmniSwitch FCoE transit switch is placed between ENodes (servers or other bridges) and an FCF or an OmniSwitch FCoE/FC gateway to extend the reach of the FCoE network without extending the physical FC connections.
- An OmniSwitch FCoE/FC gateway runs FIP snooping on the 10G Ethernet FCoE ports that connect to an FCoE network. On the same switch, FC ports connect to native FC switches or nodes. Traffic is transmitted between the FCoE network and the FC SAN through the gateway switch.

This chapter provides information about configuring FCoE and FIP global and port parameters through the Command Line Interface (CLI). See [Chapter 44, “FCoE/FC Gateway Commands,”](#) for more information about configuring OmniSwitch FCoE/FC gateway functionality.

MIB information for the FCoE and FIP snooping commands is as follows:

Filename: ALCATEL-IND1-FIPS-MIB_mib
Module: alcatelIND1FipsMIB

The FCoE and FIP Snooping commands are listed here:

Global commands	fcoe fip-snooping fcoe address-mode fcoe priority fcoe priority-protection fcoe priority-protection action fcoe filtering-resource trap-threshold fcoe house-keeping-time-period
VLAN and Port commands	fcoe vlan fcoe fcf mac fcoe fc-map fcoe discovery-advertisement fcoe role

Show commands	<code>show fcoe</code> <code>show fcoe ports</code> <code>show fcoe sessions</code> <code>show fcoe enode</code> <code>show fcoe fc</code> <code>show fcoe fc-map</code> <code>show fcoe discovery-advertisement</code>
----------------------	---

Statistics commands	<code>show fcoe statistics</code> <code>clear fcoe statistics</code>
----------------------------	---

fcoe fip-snooping

Enables or disables Fibre Channel Initiation Protocol (FIP) snooping on the switch. FIP Snooping is enabled to allow the OmniSwitch to serve as an FCoE transit switch.

fcoe fip-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables FIP Snooping.
disable	Disables FIP Snooping.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

When FIP Snooping is enabled, traffic with an Ethertype of FCoE is dropped on all switch VLANs and ports that are not configured as FCoE VLANs and ports.

Examples

```
-> fcoe fip-snooping admin-state enable
-> fcoe fip-snooping admin-state disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show fcoe Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig
  alaFipsConfigFIPSAdmin
```

fcoe address-mode

Configures the FCoE addressing mode. This mode determines whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities.

```
fcoe address-mode {spma | fpma}
```

Syntax Definitions

spma Selects the SPMA address mode.
fpma Selects the FPMA address mode.

Defaults

parameter	default
spma fpma	FPMA

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- The FCoE Node (ENode) and the FCoE Forwarder (FCF) must use the same addressing mode to establish virtual links between the ENode and FCF. Configure the global OmniSwitch addressing mode to match the mode used by the ENode and FCF.
- When the FPMA mode is active, a MAC address is assigned by an FCF to a single ENode MAC. This MAC address is not assigned to any other ENode MAC in the same VLAN.
- When the SPMA mode is active, MAC addresses are assigned by the ENode server.
- To change the addressing mode selection, disable FIP Snooping for the switch then make the change and enable FIP Snooping again.

Examples

```
-> fcoe address-mode spma  
-> fcoe address-mode fpma
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe fip-snooping

Enables or disables FIP Snooping on the switch

show fcoe

Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

alaFipsConfig

 alaFipsConfigAddressMode

Related Commands

fcoe priority-protection	Configures the status of priority protection for the switch.
fcoe priority-protection action	Configures the action taken when traffic is not FCoE or FIP.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig  
  alaFipsConfigPriorityOne  
  alaFipsConfigPriorityTwo
```

fcoe priority-protection

Enables or disables priority protection.

```
fcoe priority-protection {enable | disable}
```

Syntax Definitions

enable	Enables priority protection for the switch.
disable	Disables priority protection for the switch.

Defaults

By default, priority protection is disabled for the switch.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- When priority protection is enabled, only FCoE and FIP traffic that matches the FCoE lossless priority values is allowed. All other traffic is either marked or dropped, based on the priority protection action configured for the switch.
- This command applies only to the priority value that is specified using the [fcoe priority](#) command.
- The FCoE priority value is advertised to FCoE-enabled hosts using the Data Center Bridging Exchange (DCBx) protocol.

Examples

```
-> fcoe priority-protection enable  
-> fcoe priority-protection disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe priority	Configures the lossless priority values for the switch.
fcoe priority-protection action	Determines whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show fcoe	Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

```
alaFipsConfig  
  alaFipsConfigPrioProtection
```

fcoe priority-protection action

Specifies whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value. This action is only valid when FCoE priority protection is enabled for the switch.

fcoe priority-protection action {**drop** | **remark** *priority*}

Syntax Definitions

drop	All non-FCoE and non-FIP traffic is dropped.
<i>priority</i>	Specifies the priority value to use for remarking non-FCoE and non-FIP traffic.

Defaults

By default, non-FCoE and non-FIP traffic is dropped when priority protection is enabled for the switch.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- When priority protection is enabled, only FCoE traffic that matches the protected priority values is allowed in the priority queues. All other traffic is either re-marked or dropped, based on the priority protection action configured for the switch.
- If the re-mark action is configured, traffic is marked with the specified priority value and forwarded on the switch.

Examples

```
-> fcoe priority-protection action drop
-> fcoe priority-protection action remark 0
```

Release History

Release 7.3.2; command was introduced.

Related Commands

fcoe priority

Configures the lossless priority values for the switch.

fcoe priority-protection

Configures the status of priority protection for the switch

fcoe fip-snooping

Enables or disables FIP Snooping on the switch

show fcoe

Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

alaFipsConfig

alaFipsConfigPriorityProtectionAction

fcoe vlan

Configures an FCoE VLAN. This type of VLAN is used to deploy the OmniSwitch implementation of FIP snooping.

fcoe vlan *vlan_id* [**admin-state** {**enable** | **disable**}] [**name** *description*]

no fcoe vlan *vlan_id*

Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies an individual FCoE VLAN. The valid ID range is 2–4094.
enable	Enables the FCoE VLAN administrative status.
disable	Disables the FCoE VLAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VLAN ID. Enclose the description in double quotes if it contains more than one word with a space in between.

Defaults

parameter	default
enable disable	enable
<i>description</i>	VLAN ID

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove a FCoE VLAN from the switch configuration. All VLAN ports are detached before the VLAN is removed.
- Specify a VLAN ID that does not exist in the switch configuration, or the ID of a dynamically created MVRP VLAN.
- Only 802.1q-tagged FCoE ports and link aggregates can be members of FCoE VLANs.
- Configuring a FCoE VLAN as a default VLAN for a port or link aggregate is not allowed. All port associations are created by tagging FCoE ports with the FCoE VLAN ID.
- Configuring default VLAN 1 as an FCoE VLAN is not allowed.

- The following features are not supported on FCoE VLANs:
 - IGMP Snooping
 - IP interface
 - HA VLANs
 - SVLAN and CVLAN
 - Shortest Path Bridging (SPB)
 - MCLAG
 - UDP Relay, DHCP Snooping
 - Universal Network Profile (UNP)
- An OmniSwitch FCoE transit switch operates between an FCoE Node (ENode) and a FCoE Forwarder (FCF). Manual configuration of the FCoE VLAN is required along the transit switch path. However, the ENode and FCF may invoke FIP VLAN discovery to discover the FCoE VLANs within the transit path. If not, manual configuration of the FCoE VLANs may also be required on the appropriate ENodes and FCFs.

Examples

```
-> fcoe vlan 100
-> no fcoe vlan 100
-> fcoe vlan 100 admin-state enable name fcoe-vlan1
-> fcoe vlan 100 admin-state enable
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe fcf mac	Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable
  alaFipsVlanId
  alaFipsVlanFCMap
  alaFipsVlanRowStatus
```

fcoe fcf mac

Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN. Virtual Fibre Channel (FC) links that traverse the lossless Ethernet network send FCoE frames to and from the FCF MAC address.

```
fcoe fcf mac mac_address vlan vlan_id
```

```
no fcoe fcf mac mac_address vlan vlan_id
```

Syntax Definitions

<i>mac_address</i>	Enter the FCF MAC Address (for example, 00:00:39:59:f1:0c).
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove the FCF MAC address from the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.

Examples

```
-> fcoe fcf mac 30:10:94:01:00:00 vlan 100  
-> no fcoe fcf 30:10:94:01:00:00
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN for the switch.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable  
  alaFipsVlanId  
  alaFipsVlanFCMap
```

fcoe fc-map

Configures a static Fibre Channel Mapped Address Prefix (FC-MAP) for the specified FCoE VLAN. The FC-MAP is a 24-bit value used by the Fibre Channel Forwarder (FCF) to identify an individual fabric.

fcoe fc-map *prefix* **vlan** *vlan_id*

no fcoe fc-map *prefix* **vlan** *vlan_id*

Syntax Definitions

<i>prefix</i>	Enter the FC-MAP prefix value. The valid range is 0EFC00–0EFCFF.
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.

Defaults

By default, the FC-MAP is set to 0E:FC:00.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- On an OmniSwitch 6900, use the **no** form of this command to set the FC-MAP back to the default value (0E:FC:00) for the specified FCoE VLAN.
- On an OmniSwitch 10K, use the **no** form of this command to remove the FC-MAP from the FCoE VLAN. There is no default FC-MAP setting for FCoE VLANs configured on the OmniSwitch 10K.
- The FCoE VLAN ID must already exist in the switch configuration.
- The configured FC-MAP value assigned to an FCoE VLAN must match the FC-MAP value used by the FCF device. FCF advertisement packets that contain a different FC-MAP are not processed by the switch.
- When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FCF uses the FC-MAP value (upper 24 bits) combined with an FCID value (lower 24 bits) to generate a unique MAC address to identify an ENode VN_Port for FCoE transactions.

Examples

```
-> fcoe fc-map 0E:FC:04 vlan 30
-> no fcoe fc-map 0E:FC:04 vlan 30
```

Release History

Release 7.3.2; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN for the switch.
fcoe fip-snooping	Enables or disables FIP Snooping on the switch
show vlan	Displays the VLAN configuration for the switch.

MIB Objects

```
alaFipsVlanTable  
  alaFipsVlanId  
  alaFipsVlanFCMap
```

fcoe discovery-advertisement

Configures FIP discovery advertisement message parameters for the specified FCoE VLAN. These parameter values are advertised in both unicast and multicast advertisements.

fcoe discovery-advertisement *vlan* *vlan_id*[-*vlan_id2*] [**a-bit** {**enable** | **disable**}] [**fka-adv-period** *adv_seconds*] [**priority** *priority*] [**uds-retries** *retries*]

Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i>]	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
enable	Enables the available-for-login bit (A-bit) in the discovery advertisement message to indicate that the switch can accept fabric logins from ENodes.
disable	Disables the A-bit in the discovery advertisement message to indicate that the switch cannot accept fabric logins from ENodes.
<i>adv_seconds</i>	The discovery advertisement transmission interval and the number of FIP ENode keep alive packets expected. The valid range is 1–90 seconds.
<i>priority</i>	The priority value assigned to the switch, indicated in the priority descriptor of the discovery advertisement message. The valid range is 0–255 (0 = highest priority, 255 = lowest priority).
<i>retries</i>	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down. The valid range is 0–10.

Defaults

parameter	default
a-bit <i>enable</i> <i>disable</i>	enable
fka-adv-period <i>adv_seconds</i>	8
priority <i>priority</i>	128
uds-retries <i>retries</i>	0

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- When the A-bit parameter is disabled, the switch will not process any new logins for the FCoE VLAN. However, there is no impact on existing VN_Port sessions, which are allowed to continue.
- Transmitting unicast discovery solicitations helps to find out if the same FCF is reachable on some other port of the same FCoE VLAN.

Examples

```
-> fcoe discovery-advertisement vlan 100 priority 10
-> fcoe discovery-advertisement uds-retries 3
-> no fcoe discovery-advertisement vlan 100
```

Release History

Release 7.3.3; command introduced.

Related Commands

[show fcoe discovery-advertisement](#)

Displays the discovery advertisement parameter values for the specified VLANs.

MIB Objects

```
alaFipsDiscAdvtTable
  alaFipsDiscAdvtVlanId
  alaFipsDiscAdvtAbit,
  alaFipsDiscAdvtFkaAdvPeriod,
  alaFipsDiscAdvtPriority,
  alaFipsDiscAdvtUdsRetries,
  alaFipsDiscAdvtRowStatus
```

fcoe role

Configures the specified port or link aggregate as an FCoE interface and defines the role of the interface in the FCoE network.

fcoe {port *chassis/slot/port*[-*port2*] / linkagg *agg_id*[-*agg_id2*]} **role** {**edge** | **enode-only** | **fcf-only** | **mixed** | **trusted** | **ve**}

no fcoe {port *chassis/slot/port*[-*port2*] / linkagg *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). FCoE is only supported on 10G or faster ports.
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
edge	Port connects directly to an ENode for transmission of FCoE and FIP frames from the ENode to the FCF.
enode-only	Link between FCoE switches that carries traffic from ENode to FCF.
fcf-only	Link between FCoE switches that carries traffic from FCF to ENode.
mixed	Link between FCoE switches that carries traffic in both directions (from FCF to ENode or from ENode to FCF).
trusted	Trust the FCoE Edge port; traffic on this port is not filtered by FIP ACLs. This port role type is typically assigned to the switch FCoE port that connects to an Ethernet port on the FCF.
ve	Configures port as a virtual expansion port (VE_Port) that is associated with an E2E-tunnel session. A VE_Port emulates an E_Port in an FCoE network, providing connectivity between FC switches. VE_Ports discover FCFs.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to revert the FCoE port back to a regular switch port. Before doing so, however, delete any associations the port may have with an FCoE VLAN.
- To change the role of an FCoE port, first remove the FCoE configuration from the port, then configure FCoE and the new role again for that same port.
- FCoE is only supported on 10G or faster ports that are associated with an FCoE lossless DCB profile. In addition, DCBX must be enabled on the port with both PFC and ETS in an active state (either forced

or negotiated via DCBX). The DCB configuration is done separately using QoS port and profile commands.

- The maximum frame size for an FCoE port must be at least 2500 bytes to accommodate FCoE encapsulated frames, which are larger than the standard Ethernet frame size. In addition, make sure the FCoE port frame size is configured the same end-to-end.
- When configuring a link aggregate as an FCoE port, make sure the link aggregate ID number already exists in the switch configuration. Ports already configured as FCoE ports cannot be added to a link aggregate.
- FCoE ports must be manually assigned to a default VLAN and then tagged with the FCoE VLAN that will carry the FCoE and FIP frames on that port.
- The following features are not supported on FCoE ports:
 - Edge Virtual Bridging (EVB)
 - Learned Port Security (LPS)
 - Port Mirroring and Remote Port Mirroring
 - Shortest Path Bridging (SPB)
- Enabling FCoE on a Universal Network Profile (UNP) port is only supported to allow UNP dynamic assignment of a default VLAN for an FCoE port. Manual tagging of the FCoE UNP port with FCoE VLAN IDs is still required.
- FCoE VLANs may be dynamically learned through the transmission of MVRP join PDU, but any port associations with that VLAN must be manually configured.
- Assigning FCoE interfaces to different FCoE VLANs provides a method for configuring multiple FC fabrics through the same FCoE switch.

Examples

```
-> fcoe port 1/1 role edge
-> fcoe port 1/1/1 role edge
-> fcoe port 2/1 role fcf-only
-> no fcoe port 2/1
```

Release History

Release 7.3.2; command introduced.

FCoE Global Configurations:

```
-----
FIP Snooping           : Disable,
Address-Mode           : FPMA,
Priority 1              : 3,
Priority 2              : -,
Priority Protection     : Enable,
Priority Protection Action: Drop,
Re-Mark Priority        : -,
Total Filter Resources : 256,
Used Filter Resources  : 0,
Trap threshold (%)     : 80,
House Keeping Time Period : 300
```

output definitions

FIP Snooping	The administrative status of FIP snooping for the switch (Enable or Disable). Configured through the fcoe fip-snooping command.
Address-mode	Indicates whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities. Configured through the fcoe address-mode command.
Priority 1	One of two global lossless priority values for FCoE traffic. Configured through fcoe priority command.
Priority 2	Two of two global lossless priority values for FCoE traffic. Configured through fcoe priority command.

output definitions (continued)

Priority Protection	The status of priority protection for the switch (Enable or Disable). Configured through the fcoe priority-protection command.
Priority Protection Action	The action applied to traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value (Drop or Remark). Configured through the fcoe priority-protection action command.
Re-mark Priority	The priority value to use for marking traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value. This value is only applied when the priority protection action is set to Remark . Configured through the fcoe priority-protection action command.
Total Filtering Resources	The number of ACL entries available for filtering of FCoE traffic.
Used Filtering Resources	The number of ACL entries currently in use for filtering FCoE traffic.
Trap threshold (%)	The percentage of filtering resources used for FIP. When this percentage is reached, a trap is sent indicating the available and maximum percentage of filtering resources. Configured through the fcoe filtering-resource trap-threshold command.
House Keeping Time Period	The amount of time the FCoE switch will wait to receive keep alive messages from the ENode and FCF. When this amount of time expires, information for the specific FCoE session is removed. Configured through the fcoe house-keeping-time-period command

Release History

Release 7.3.2; command was introduced.

show fcoe ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

This command also shows the FCoE role assigned to the interface.

Examples

```
-> show fcoe ports
  Ports      FCoE Role      Status
-----+-----+-----
  1/3        Edge Port      DISABLE
  1/4        Edge Port      DISABLE
  1/5        Edge Port      DISABLE
  1/6        Edge Port      DISABLE
  1/7        Edge Port      DISABLE
  1/11       Edge Port      DISABLE
  1/13       Edge Port      ENABLED
  1/14       Edge Port      ENABLED
  1/15       Edge Port      DISABLE
  1/19       FCF Port       DISABLE
  2/1        Edge Port      DISABLE
  2/8        Edge Port      DISABLE
  0/1        Mixed Port     DISABLE
  0/12       Mixed Port     ENABLED
  0/40       Mixed Port     DISABLE
  0/50       Mixed Port     ENABLED
```

output definitions

Ports	The slot/port or link aggregate ID of the FCoE interface. A “0” slot number indicates that the FCoE interface is a link aggregate.
FCoE Role	The designated role of the FCoE interface (Edge Port , ENode Port , FCF Port , Mixed Port , or Trusted Port).
Status	The operational status of the FCoE interface (ENABLE or DISABLE).

Release History

Release 7.3.2; command was introduced.

Related Commands

[fcoe role](#)

Configures a port or link aggregate as an FCoE interface.

[show fcoe](#)

Displays the FCoE and FIP status and configuration for the switch.

MIB Objects

AlaFipsIntfTable

```
alaFipsIntfIfIndex  
alaFipsIntfOperStatus  
alaFipsIntfPortRole  
alaFipsIntfRowStatus
```

show fcoe sessions

Displays the FIP snooping session status and configuration for the switch.

```
show fcoe sessions [[fips | npiv-proxy | r-npiv] [port chassis/slot/port] / vlan vlan_id | linkagg agg_id] |
[e-tunnel [tunnel_id]]
```

Syntax Definitions

fips	Displays FIP snooping sessions on FCoE ports.
npiv-proxy	Displays N_Port proxy (NPIV) sessions between ENode and FC switch.
r-npiv	Displays F_Port proxy (R- NPIV) sessions between the HBA and the gateway switch.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.
<i>agg_id</i>	The link aggregate ID number.
<i>tunnel_id</i>	Displays E2E tunnel sessions between two E_Ports on different FC switches. Optionally enter a tunnel ID to display information for a specific tunnel.

Defaults

By default, all FCoE sessions are displayed.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **port** or **linkagg** parameter to display sessions for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to display the sessions for a specific FCoE VLAN ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), F_Port proxy (reverse-NPIV), and E2E tunnel sessions. However, the N_Port proxy, F_Port proxy, and E2E tunnel sessions are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see [Chapter 44, “FCoE/FC Gateway Commands”](#) for more information).

output definitions

PORT	The FCoE port or link aggregate ID for a FIP snooping session. A "0" slot number indicates that the FCoE interface is a link aggregate. Configured through the fcoe role command.
ENODE MAC	The MAC address of the ENode for this session.
VN_PORT MAC	The MAC address of the virtual node (VN) port for this session.
FCF MAC	The MAC address of the FCoE Forwarder (FCF) for this session.

output definitions

VLAN	The FCoE VLAN used for this session. Configured through the fcoe vlan command.
STATUS	The operational status of this session.
IN-PORT	The FCoE port or link aggregate ID for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the fcoe role command.
OUT-PORT	The FC port for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the fibre-channel port mode command.
VSAN	The VSAN ID mapped to the FCoE VLAN ID for an F_Port proxy (R-NPIV) session. Configured through the fibre-channel vsan command.
FCID	The FC port ID (also referred to as N_Port ID) received after successful login for an F_Port proxy (R-NPIV) session.
TUNNEL-ID	The E2E tunnel ID associated with the session. Configured through the fcoe e-tunnel command.
PORT1, PORT2	The FCoE port (in VE_Port role) and/or FC port (in TE_Port mode) for this session. The FCoE port rule is configured through the fcoe role command. The FC port mode is configured through the fibre-channel port mode command.
PAIR MODE	The type of E2E tunnel (TE to VE or TE to TE).

Release History

Release 7.3.2; command introduced.

Release 7.3.3; fields added to display NPIV, reverse-NPIV, and E2E tunnel sessions.

Related Commands

show fcoe	Displays the global FCoE and FIP snooping configuration for the switch.
show fcoe ports	Displays the FCoE port configuration for the switch.
show fibre-channel port	Displays the FC port configuration for the switch.

show fcoe enode

Displays FCoE Node (ENode) information for FIP Snooping sessions associated with the switch.

show fcoe enode [*mac_address*]

Syntax Definitions

mac_address Enter an ENode MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all ENodes associated with the switch.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Specify an ENode MAC address to display more detailed information about a specific ENode.

Examples

```
-> show fcoe enode
Port   Enode MAC           VLAN   Sessions
-----+-----+-----+-----
1/1    00:10:00:00:00:02   100    2

```

output definitions

Port	The slot/port or link aggregate ID of the FCoE interface that is connected to the FCoE Node (ENode). A "0" slot number indicates that the FCoE interface is a link aggregate.
Enode MAC	The MAC address of the ENode connected to the FCoE interface.
VLAN	The FCoE VLAN ID.
Sessions	The number of sessions associated with the ENode MAC.
VN-Port-MAC	The MAC address of the virtual node port (VN_port) for this session.
FCF-MAC	The MAC address of the FCoE Forwarder (FCF).
Login time	The date and time the ENode logged into the FCoE fabric.

Release History

Release 7.3.2; command introduced.

Related Commands

46      0E:FC:00:01:00:80
46      0E:FC:00:01:00:82
46      0E:FC:00:01:00:81
```

output definitions

FCF-MAC	The MAC address of the FCoE Forwarder (FCF).
VLAN	The FCoE VLAN ID.
Config	Whether the FCF MAC address was user-configured or learned through the FIP Snooping session for the given FCoE VLAN.
Sessions	The number of sessions associated with the FCF MAC for the given FCoE VLAN.
A-bit	Whether or not the available-for-login bit is set for this FCF.

output definitions

MaxFrmVer	Whether or not the maximum frame size was verified for this FCF.
VN-Port-MAC	The MAC address of the virtual node port (VN_Port) for this session. This address is comprised of the FCID that the FCF assigned to the port combined with the FC-MAP.

Release History

Release 7.3.2; command introduced.
 Release 7.3.3; **A-bit** and **MaxFrmVer** fields added.

Related Commands

show fcoe sessions	Displays FCoE FIP snooping session status and configuration for the switch.
show fcoe enode	Displays FCoE Node (ENode) information for the switch.

MIB Objects

```

alaFipsFcfTable
  alaFipsFcfSessions

  alaFipsSessionVlanId
  alaFipsFcfConfigType
  alaFipsFcfAvailForLogin
  alaFipsFcfMaxFcoeFrmSizeVerified
  
```

show fcoe fc-map

Displays the Fibre Channel Mapped Address Prefix (FC-MAP) for each FCoE VLAN.

show fcoe fc-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FC-MAP value is the required upper 24 bits of a MAC address that is assigned to a Virtual N_Port (VN_Port).

Examples

```
-> show fcoe fc-map
  VLAN      FC-MAP
-----+-----
    10      0E:FC:00
   100      0E:FC:22

MIB Objects

```
alaFipsVlanTable
  alaFipsVlanId
  alaFipsVlanFCMap
```

show fcoe discovery-advertisement

Displays the FIP discovery advertisement message parameter values for the specified FCoE VLAN.

show fcoe discovery-advertisement [**vlan** *vlan_id*[-*vlan_id2*]]

Syntax Definitions

vlan_id[-*vlan_id2*] An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).

Defaults

By default, the discovery advertisement parameters are displayed for all FCoE VLANs.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Use the *vlan_id*[-*vlan_id2*] parameter to display information for a specific FCoE VLAN or for a range of FCoE VLANs.

Examples

```
-> show fcoe discovery-advertisement
VLAN  A-Bit   FKA Pd Priority  UDS-Retries
-----+-----+-----+-----+-----
46     ENABLE  8       128      3
56     ENABLE  8       128      3
76     ENABLE  8       128      3
3000  ENABLE  8       128      3
4000  ENABLE  8       128      3
```

```
VC_of_3-> show fcoe discovery-advertisement vlan 3000
  VLAN      A-Bit      FKA Period  Priority      UDS-Retries
-----+-----+-----+-----+-----
   3000    ENABLE          8           128           3
```

output definitions

VLAN	The FCoE VLAN ID. Configured through the fcoe vlan command.
A-Bit	The status of the available-for-login bit (Enabled or Disabled). When enabled, indicates the switch can accept fabric logins from ENodes.
FKA-PD	The discovery advertisement transmission interval, in seconds.
Priority	The priority value assigned to the switch (0 = highest priority, 255 = lowest priority).
UDS-Retries	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down.

Release History

Release 7.3.3; command introduced.

show fcoe statistics

Displays both ENode and FCF generated statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics [enode | fcf] {interface | vlan [vlan_id[vlan_id2] | port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

Syntax Definitions

enode	Display statistics only for ENode traffic.
fcf	Display statistics only for FCF traffic.
interface	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [- <i>vlan_id2</i>]	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, FCF and ENode statistics are displayed for all FCoE interfaces and VLANs.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), and F_Port proxy (reverse-NPIV) statistics. However, the N_Port proxy and F_Port proxy statistics are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see [Chapter 44, “FCoE/FC Gateway Commands”](#) for more information).

clear fcoe statistics

Clears ENode and FCF generated statistics on FCoE interfaces or specific VLANs.

clear fcoe statistics [**enode** | **fcf**] [**interface** | **vlan** [*vlan_id*[*vlan_id2*] | **port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]]

Syntax Definitions

enode	Clears statistics only for ENode traffic.
fcf	Clears statistics only for FCF traffic.
interface	Clears statistics on all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [<i>vlan_id2</i>]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared for all FCoE interfaces and VLANs.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **port** or **linkagg** parameters to clear the statistics for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to clear the statistics for a specific FCoE VLAN ID.

Examples

```
->clear fcoe statistics
->clear fcoe statistics interface
->clear fcoe statistics vlan

44 FCoE/FC Gateway Commands

The OmniSwitch implementation of FCoE/FC gateway functionality allows the switch to transparently connect FCoE and FC nodes with an FC SAN across an FCoE (lossless Ethernet) network. To provide this type of connectivity, an OmniSwitch FCoE/FC gateway supports the following three modes of operation that are used to converge FC over Ethernet and FC-to-FC over Ethernet:

- **N_Port Proxy mode**—allows ENodes in an FCoE network and FC switches in an FC SAN to communicate with each other. To an ENode the OmniSwitch gateway emulates an FCoE forwarder; to an FC switch the OmniSwitch gateway emulates an N_Port ID Virtualization (NPIV) host.
- **F_Port Proxy mode**—allows FC nodes to connect with FC switches and FCFs across an FCoE network. The OmniSwitch gateway forwards login requests from an FC node (N_Port on a server or storage with an HBA) across Ethernet via an FCoE VLAN to an NPIV node or FCF. This mode is sometimes referred to as reverse-NPIV proxy (R-NPIV).
- **E_Port Proxy mode**—allows FC switches to set up inter-switch link trunking between FC fabrics over an FCoE network. The OmniSwitch gateway provides an E_Port to E_Port (E2E) tunneling function that emulates a point-to-point FC link between E_Ports on native FC switches.

The OmniSwitch FCoE/FC gateway sits at the entry point of an FC fabric, which is required to handle the login process for ENodes and FC nodes accessing the fabric through the gateway switch.

OmniSwitch FCoE/FC gateway operations are not automatically activated for the switch; there is no single command to enable or disable gateway functionality. Instead, the configuration of the following software components enables one or more of the supported gateway operations:

- **FIP snooping**—FCoE/FC gateway functionality requires an active FIP snooping configuration. FIP Snooping ensures the security of an FCoE network.
- **Virtual Storage Area Network (VSAN)**—an FC port is assigned to a VSAN to create an NP_Port or F_Port connection to an FC switch or node in that VSAN. Not required for E2E Tunnel configuration.
- **VSAN-to-FCoE VLAN mapping**—identifies the FCoE/FC gateway fabric for the ENode or FC node login process via the FCoE VLAN. Not required for E_Port proxy (E2E Tunnel) configuration.
- **FC port mode**—the operational mode of the FC port determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.
- **FCoE port role**—an FCoE port serves as an E2E tunnel endpoint in an FCoE network only when the port is configured as a virtual E_Port (VE_Port). The role of other FCoE ports is configured based on the FIP snooping configuration for the gateway switch.

This chapter and the [Chapter 43, “FIP Snooping Commands,”](#) describe the command line interface (CLI) commands used to configure these components.

MIB information for the FCoE/FC gateway commands is as follows:

Filename: ALCATEL-IND1-FIPS-MIB_mib
Module: alcatelIND1FipsMIB

The acronyms used in this chapter are defined here:

CNA	Converged Network Adapter
CVL	Clear Virtual Link
E2E	E_Port-to-E_Port Tunnel
ELP	Exchange Link Parameters
ENode	FCoE Node
E_Port	Expansion Port
F_Port	Fabric Port
FC	Fibre Channel
FCF	FCoE Forwarder
FDISC	Fabric Discovery
FCID	Fabric Port ID (same as N_Port ID).
FCoE	Fibre Channel over Ethernet
FIP	FCoE Initialization Protocol
FLOGI	Fabric Login
FLOGO	Fabric Logout
HBA	Host Bus Adapter
ISL	Inter-switch Link
NPIV	N_Port ID Virtualization
N_Port	Node Port
NP_Port	Proxy Node Port
TE_Port	Tunnel Expansion Port
VE_Port	Virtual E_Port
VF_Port	Virtual F_Port
VN_Port	Virtual N_Port
VSAN	Virtual Storage Area Network
WWNN	World Wide Node Name
WWPN	World Wide Port Name

The FCoE/FC gateway commands are listed here:

Configuration commands	fibre-channel vsan fibre-channel port mode fibre-channel vsan members fcoe vsan-map fibre-channel npiv-proxy load-balance fibre-channel npiv-proxy load-balance static fcoe e-tunnel
Show commands	show fibre-channel vsan show fibre-channel vsan members show fibre-channel port show fcoe vsan-map show fibre-channel sessions show fibre-channel node show fcoe e-tunnel show fibre-channel show fibre-channel npiv-proxy load-balance
Statistics commands	show fibre-channel statistics show fcoe statistics npiv-proxy show fcoe statistics r-npiv show fcoe statistics e-tunnel
Clear commands	clear fibre-channel statistics clear fibre-channel sessions clear fcoe statistics npiv clear fcoe statistics r-npiv clear fcoe statistics e-tunnel clear fcoe sessions

fibre-channel vsan

Configures an OmniSwitch VSAN with the specified VSAN ID and an optional description. This type of VSAN is used to segment OmniSwitch Fibre Channel ports into a virtual FCoE/FC gateway fabric.

Note. The VSAN created with this command only applies to the local switch configuration. There is no correlation between an OmniSwitch VSAN and a VSAN created within a native FC SAN.

fibre-channel vsan {*vsan_id*[-*vsan_id2*]} [**admin-state** {**enable** | **disable**}] [**name** *description*]

no fibre-channel vsan {*vsan_id*[-*vsan_id2*]}

Syntax Definitions

<i>vsan_id</i> [- <i>vsan_id2</i>]	A numeric value that will uniquely identify the VSAN. Use a hyphen to specify a range of VSAN IDs (for example, 100-105). The valid range is 2–4094).
enable	Enable the VSAN administrative status.
disable	Disable the VSAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VSAN ID.

Defaults

By default, VSAN 1 is created on the switch and all unassigned FC ports are assigned to VSAN 1.

parameter	default
enable disable	enable
name <i>description</i>	VSAN ID

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to delete a VSAN from the configuration.
- When a VSAN is administratively disabled, all sessions established over that VSAN are cleared and the switch stops sending periodic FIP multicast discovery advertisement messages for the corresponding FCoE VLAN.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.
- Only FC switch ports can be assigned to a VSAN.
- Assigning multiple FC ports to the same VSAN is allowed, but an FC port can only belong to one VSAN.

- Configuring N_Port and F_Port proxy functionality requires mapping a VSAN to an FCoE VLAN. Note that only one VSAN is mapped to one FCoE VLAN (one-to-one) at any given time. This mapping defines a single traffic path through the gateway switch.
- If an FCoE VLAN is not mapped to a VSAN, then the FCoE VLAN participates only in the FIP snooping process.

Examples

```
-> fibre-channel vsan 200 name "Fabric A"  
-> fibre-channel vsan 100-105 admin-state disable  
-> no fibre-channel vsan 200
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan members	Assigns FC switch ports to a VSAN.
fcoe vsan-map	Maps a VSAN to an FCoE VLAN.
show fibre-channel vsan	Displays the VSAN configuration for the switch.
show fcoe vsan-map	Displays the VSAN-VLAN mapping configuration for the switch.
show fibre-channel vsan members	Displays FC port assignments for each VSAN.

MIB Objects

```
alaFcVsanTable  
  alaFcVsanNumber  
  alaFcVsanDescription,  
  alaFcVsanAdmStatus  
  alaFcVsanOperStatus
```

fibre-channel port mode

Configures the port type and operational mode for an eligible FC port. The port type is only set to Fibre Channel and the specified operational mode determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.

fibre-channel port *chassis/slot/port[-port2]* **mode** {np | f | te} [**bb-sc-n** *buffer_num*]

no fibre-channel port *chassis/slot/port[-port2]*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). Only ports on an OmniSwitch 6900 OS-XNI-U12E module with an SFP-FC-SR transceiver are eligible for this command.
np	Activates N_Port proxy functionality on the port. In this mode the port serves as a proxy node port (NP_Port) that aggregates N_Port transactions between FCoE devices and FC switches.
f	Activates F_Port proxy functionality on the port. In this mode the port operates as a fabric port (F_Port), which connects to an N_Port in a point-to-point link between FC devices.
te	Activates E_Port functionality on the port. In this mode, the port operates as a tunnel expansion port (TE_Port) that connects to an E_Port on an FC switch. TE_Ports allow E_Ports to connect across an FCoE network as part of an inter-switch link (ISL) tunnel that is used to expand the native FC fabric over Ethernet.
<i>buffer_num</i>	The buffer-to-buffer state change (BB_SC) number. FC ports exchange BB_SC primitives after 2 ^{BB_SC_N} frames. These primitives are used to recalculate buffer credits as part of a buffer-to-buffer flow control function between FC switch connections. The valid range is 0–15.

Defaults

By default, no operational mode is configured for the FC ports and the port type is set to Ethernet.

parameter	default
bb-sc-n <i>buffer_num</i>	0

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the operational mode configuration from the FC port. The port type reverts back to Ethernet.
- To change the FC mode for the port, use the **no** form of this command to remove the current mode configuration then configure the FC mode again for the same port.

- Changing the **bb-sc-n** parameter value can be changed at any time (removing the FC mode configuration is not required to change this parameter value).
- Make sure the **bb-sc-n** parameter value is the same on both ends of the connection between the OmniSwitch FCoE/FC gateway and an FC switch. If the value is different on each end of the connection then the greater value is used. However, if this value is set to zero for one of the ports on the connection, then the buffer-to-buffer state change function is disabled.
- FC ports do not participate in Ethernet features, such as a link aggregates, a virtual fabric links (VFLs) in virtual chassis (VC) configurations, standard VLANs, or FCoE VLANs.
- To ensure end-to-end lossless connectivity through the gateway switch, assign a PAUSE-enabled DCB profile to each FC port. For more information, see Chapter 5, “Configuring an FCoE Gateway”, in the *OmniSwitch AOS Release 8 Data Center Switching Guide*.

Examples

```
-> fibre-channel port 2/1 mode np
-> fibre-channel port 2/3 mode f
-> fibre-channel port 2/5 mode te
-> no fibre-channel port 2/5
```

To change the FC port mode:

```
-> no fibre-channel port 2/1
-> fibre-channel port 2/1 f
```

To change the **bb-sc-n** parameter value:

```
-> fibre-channel port 2/1 bb-sc-n 3
```

Release History

Release 7.3.3; command introduced.

```

fibre-channel vsan members

Configures the VSAN assignment for the specified FC port.

fibre-channel vsan *vsan_id* **members port** *chassis/slot/port[-port2]*

no fibre-channel vsan *vsan_id* **members port** *chassis/slot/port[-port2]*

Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all FC ports are assigned to VSAN 1.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the association between the specified FC port and VSAN.
- When an NP_Port is removed from a VSAN, a FIP CVL is generated for all the VN_Ports that are logged in through that NP_Port and an FC LOGO is sent on the FC port. An FC LOGO is also sent for any R-NPIV sessions that exist when the CVL is generated.
- When an F_Port (used for R-NPIV) is removed from a VSAN, then FC LOGO is sent to the host and also to the FCF.
- When an FC port is moved from VSAN 1 to another VSAN, traffic loss will occur for all existing sessions. Moving FC ports between other VSANs (for example, between VSAN 2 and 3) is not allowed.
- Multiple FC ports can belong to the same VSAN, but an FC port can belong to only one VSAN. In other words, it is not possible to tag FC ports with multiple VSANs.
- When a VSAN is mapped to an FCoE VLAN and an active FC port is assigned to that VSAN, the FC mode configured for that port determines the FCoE/FC gateway functionality provided. For example, if the FC port mode is set to operate as:
 - an NP_Port, then NPIV proxy functionality is automatically enabled.
 - an F_Port, then the R-NPIV functionality is automatically enabled.
 - a TE_Port and an FCoE port is set to operate as a virtual E_Port (VE_Port), then E2E tunneling functionality is automatically enabled.

- When more than one NP_Port is associated with the same VSAN, the OmniSwitch will load balance ENode FLOGI requests across the NP_Ports for that VSAN. By default, the NP_Port with the lowest number of logins provided is selected. If all the NP_Ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Examples

```
-> fibre-channel vsan 10 members port 2/1
-> fibre-channel vsan 10 members port 2/1-3
-> no fibre-channel vsan 10 members port 2/1-3
```

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan	Creates an FC VSAN.
fibre-channel port mode	Configures the operational mode for the FC port.
fibre-channel npiv-proxy load-balance	Configures the load balancing method applied when more than one FC port is assigned to the same VSAN.
show fibre-channel vsan	Displays the VSAN configuration for the switch.
show fibre-channel vsan members	Displays the VSAN port assignments.

```

fcoe vsan-map

Maps an FC VSAN to an FCoE VLAN. This mapping is required to activate the processing of specific FCoE ENode traffic traveling to and from the designated virtual FC fabric through the FCoE/FC gateway OmniSwitch.

```
fcoe vsan-map vsan vsan_id vlan vlan_id
```

```
no fcoe vsan-map vsan vsan_id vlan vlan_id
```

Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>vlan_id</i>	An existing FCoE VLAN ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the VSAN-to-FCoE VLAN mapping.
- When a mapping is removed, all sessions associated with the FCoE VLAN are cleared.
- Only one VSAN is mapped to one FCoE VLAN.
- The FCoE/FC gateway does not participate in FCoE discovery mechanisms for FCoE VLANs not mapped to a VSAN.
- If an FCoE VLAN is not mapped to a VSAN, then only FIP snooping functionality is applied to that VLAN.

Examples

```
-> fcoe vsan-map vsan 10 vlan 100  
-> no fcoe vsan-map vsan 10 vlan 100
```

Release History

Release 7.3.3; command introduced.

```

fibre-channel npiv-proxy load-balance

Configures the dynamic load balancing method that is applied to ENode FLOGI requests when more than one FC port is associated with the same VSAN. Load balancing is not applied to FDISC requests.

fibre-channel npiv-proxy load-balance static {default | dynamic-reorder | enode-based}

Syntax Definitions

default	Selects the default load balancing method.
dynamic-reorder	Ensures that all sessions are load balanced evenly at any given time.
enode-based	Selects the FC for the new session based on the ENode MAC address.

Defaults

By default, the FC port with the lowest number of logins provided is selected for new FLOGI requests. If all the ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- The load balancing method is globally applied to the switch, and only one method is applied at a time.
- Using the dynamic reorder load balancing method may trigger the tearing down of some sessions, so that upon re-login the ENode FLOGI is processed on a different NP_Port in the same VSAN. For example, when a new FC NP_Port is added to the VSAN, some of the sessions are torn down and logged in again on the newly added port to distribute sessions across all ports in the VSAN.
- When the ENode-based load balancing method is used, each NP_Port in the VSAN will send a multicast discovery advertisement to all ENodes in the mapped FCoE VLAN. The FCF MAC address in the discovery advertisement is the MAC address of the FC port. The ENode then decides which FCF (NP_Port) to use for the login.
- The default and ENode-based load balancing methods do not disturb existing sessions.
- The load balancing method is *not* applied to statically mapped FCoE and FC ports.

Examples

```
-> fibre-channel npiv-proxy load-balance dynamic-reorder
-> fibre-channel npiv-proxy load-balance enode-based
-> fibre-channel npiv-proxy load-balance default
```

Release History

Release 7.3.3; command introduced.

Related Commands

- fibre-channel npiv-proxy load-balance static** Configures a static mapping between an FCoE port and an FC NP_Port. Load balancing does not apply to statically mapped ports.
- show fibre-channel** Displays the global load balancing method applied to NP_Ports.

MIB Objects

alaFcInfo
 alaFcConfigNpivLoadBalance

fibre-channel npiv-proxy load-balance static

Configures a static port association between an FCoE port and an FC NP_Port to ensure that FC sessions on the specified FCoE port are mapped to the specified NP_Port.

fibre-channel npiv-proxy load-balance static {**port** *chassis/slot/port* / **linkagg** *agg_id*} **fc-port** *chassis/slot/port*

no fibre-channel npiv-proxy load-balance static {**port** *chassis/slot/port* / **linkagg** *agg_id*} **fc-port** *chassis/slot/port*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
port <i>slot/port</i>	The slot and port number (3/1) of an FCoE port.
<i>agg_id</i>	The link aggregate ID number.
fc-port <i>slot/port</i>	The slot and port number (3/1) of an FC port.

Defaults

By default, there are no static FCoE-to-FC port associations. The dynamic load balancing method is applied to the FC NP_ports.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the static association between the FCoE port and the FC port. When this association is removed, the dynamic load balancing method is applied.
- Use caution when configuring static FCoE-to-FC port assignments. Static assignments exempt both the FCoE port and the FC NP_Port from dynamic load balancing of sessions when multiple FC ports belong to the same VSAN.

Examples

```
-> fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1

-> fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel npiv-proxy load-balance Displays the static FCoE port/FC NP_Port mapping and FC port session counts.

MIB Objects

```

```

fcoe e-tunnel

Configures an E2E tunnel identifier and associates the identifier with tunnel endpoints and an FCoE VLAN. An E2E tunnel allows FC switches to set up ISLs between fabrics over an FCoE network.

fcoe e-tunnel *tunnel_id* {**fc-port1** *chassis/slot/port*} {**fc-port2** *chassis/slot/port* | **vlan** *vlan_id*}

no fcoe e-tunnel *tunnel_id*

Syntax Definitions

<i>tunnel_id</i>	A unique ID number to assign to this tunnel session.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1) of an FC tunnel edge (TE) port.
<i>vlan_id</i>	An existing FCoE VLAN ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **no** form of this command to remove the tunnel configuration.
- An OmniSwitch FC port is configured as a tunnel E_Port (TE_Port) and connects to an E_Port on an FC switch. TE_Ports can carry traffic from multiple VSANs. This command is used to associate the TE port with an FCoE VLAN or with another TE port on the same switch.
- An OmniSwitch FCoE port is configured as a virtual expansion port (VE_Port) on the FCoE network side. The VE port is associated with an FCoE VLAN by tagging the VE port with the FCoE VLAN ID.
- This command does not establish a connection. Once the required tunnel components are configured, successful exchange of exchange link parameters (ELP) between a TE_Port and a VE_Port or between two TE_Ports will establish the tunnel session.
- To create a tunnel connection between two FC switches across the FCoE network requires the following steps:
 - Configure the FCoE port that will connect to the FCoE network as a virtual expansion port (VE_Port).
 - Tag the VE_Port to the FCoE VLAN that will carry traffic through the tunnel.
 - Configure the FC port that will connect to an E_Port on an FC as a TE_Port.
 - Use this command (**fcoe e-tunnel**) with the **fc-port1** and **vlan** parameters to associate the TE_Port with the FCoE VLAN to which the VE_Port is tagged.
- To create a tunnel between two FC TE_Ports on the same switch or in a virtual chassis configuration, use the **fc-port1** and **fc-port2** parameters to specify the slot and port number of the two TE ports.

Examples

```
-> fcoe e-tunnel 1 fc-port1 2/1 fc-port2 2/2
-> fcoe e-tunnel 10 fc-port1 2/3 vlan 200
-> fcoe e-tunnel 11 fc-port1 2/4 vlan 200
-> no fcoe e-tunnel 10
```

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe vlan	Configures an FCoE VLAN.
fcoe role	Configures an FCoE port as a VE_Port.
fibre-channel port mode	Configures an FC port as a TE_Port
show fcoe e-tunnel	Displays the E2E tunnel configuration.

show fibre-channel vsan

Displays the VSAN configuration for the switch.

show fibre-channel vsan [*vsan_id*]-*vsan_id2*]

Syntax Definitions

vsan_id[-*vsan_id2*] An existing VSAN ID. Use a hyphen to specify a range of VSAN IDs (10-25).

Defaults

By default, a list of all VSANs is displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Specify a VSAN ID with this command to display information about a specific VSAN.

Examples

```
-> show fibre-channel vsan
```

```
vsan  oper admin  name
-----+-----+-----
      1  Ena   Dis   test1
     1000 Dis   Dis   test2
     2000 Ena   Dis   test3
```

```
-> show fibre-channel vsan 101
```

```
vsan  oper admin  name
-----+-----+-----
     1000 Dis   Dis   test2
```

output definitions

vsan	The numerical VSAN ID.
oper	The operational status of the VSAN: Ena (enabled) or Dis (disabled). The operational status remains disabled until an active FC port is assigned to the VSAN. A VSAN must have an enabled administrative status before it can become operationally enabled.
admin	The administrative status of the VSAN: Ena specifies that VSAN functions are enabled; Dis specifies that VLAN functions are disabled.
name	The user-defined text description for the VSAN. By default, the VSAN ID is displayed if the VLAN description is not specified.

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel vsan	Configures a VSAN for the switch.
show fibre-channel vsan members	Displays VSAN port assignments.

MIB Objects

  alaFcVsanAdmStatus  
  alaFcVsanOperStatus  
  alaFcVsanRowStatus
```

show fibre-channel vsan members

Displays the VSAN port assignments.

show fibre-channel vsan [*vsan_id* [-*vsan_id2*]] **members** [**port** *chassis/slot/port*[-*port2*]]

Syntax Definitions

<i>vsan_id</i> [- <i>vsan_id2</i>]	An existing VSAN ID number. Use a hyphen to specify a range of VSAN IDs (10-25).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all VSAN port assignments are displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- If the *vsan_id* is specified without a *slot/port*, then all port assignments for that VSAN are displayed.
- If both the *vsan_id* and *slot/port* are specified, then information only for that VSAN and slot/port is displayed.
- Only OmniSwitch FC ports can be assigned to a VSAN.

Examples

```
-> show fibre-channel vsan members
vsan  port  status
-----+-----
      1  2/2/1  Enabled
    1003 2/2/12 Enabled
    1005 3/2/5  Disbled

-> show fibre-channel vsan 1003 members
  port  status
-----+-----
  2/2/12 Enabled

-> show fibre-channel vsan 1005 members port 3/2/5
vsan   : 1005,
port   : 3/2/5,
status : disabled
```

output definitions

vsan	The numerical VSAN ID. Configured through the fibre-channel vsan command.
port	The FC port number associated with the VSAN ID. Configured through the fibre-channel vsan members command.
status	The operational status of the port (enabled or disabled).

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel vsan Displays the VSAN configuration for the switch.

show fibre-channel port

Displays the FC port configuration for the switch.

show fibre-channel port [[info](#)]

Syntax Definitions

info Displays session details for each FC port.

Defaults

By default, the parameters for each FC port are displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- When the **info** parameter is used with this command, the **fcid** field shows an FC port ID for NP_Ports. For all other port modes, this field is blank. Only NP_Ports perform fabric login (FLOGI) and obtain a port ID from an FC switch.
- If an FC port is configured to operate in the fabric or tunnel E_Port mode, there is no fabric login process performed. Ports running in these modes will come up immediately.
- FLOGI is triggered only after an NP_Port is assigned to a VSAN.

Examples

```
-> show fibre-channel port
```

Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port

```
ports   oper-status mode  BB-SC-N  service class
-----+-----+-----+-----+-----
  2/1      Up      NP      3          3
  2/2      Up      F        0          3
  2/3      Up      TE      3          3/F
  2/4      Down    NP      0          3
```

output definitions

ports	The slot and port number of the FC port.
oper-status	The operational status of the FC port.
mode	The operational mode for the FC port.
BB-SC-N	The buffer-to-buffer state change number configured for the FC port.
service class	The service class for the FC port session (2 , 3 , F , or 3/F). This value indicates the level of delivery integrity required for an application.

```
-> show fibre-channel port info
Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port
```

```
ports mode fcid wwpn state
-----+-----+-----+-----+-----+
 2/1 NP 010010c 10:00:01:00:00:0a:22:11 Up
 2/2 F - 10:00:01:00:00:0b:22:1a Up
 2/3 TE - 10:00:01:00:00:0b:23:22 Up
 2/4 NP - 10:00:01:00:00:0b:23:23 FLOGI_Sent
 2/5 NP - 10:00:01:00:00:0b:23:24 Not_Init
```

output definitions

ports	The slot and port number of the FC port.
mode	The operational mode for the FC port (NP = proxy N_Port, F = fabric port, TE = tunnel E_Port). Configured through the fibre-channel port mode command.
fcid	The FC port_ID obtained after successful fabric login. This field applies only to NP_Ports.
wwpn	The world-wide port name assigned to the OmniSwitch FC port.
state	The operational state of the fabric login process (Up , Down , FLOGI_Sent , Not_Init , ELP_Sent , Sess_Clear).

Release History

Release 7.3.3; command introduced.

show fcoe vsan-map

Displays the VSAN-to-FCoE VLAN mapping configuration.

show fcoe vsan-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Mapping a VSAN to an FCoE VLAN is required to activate the processing of specific ENode traffic traveling to and from the designated virtual FC fabric through the NPIV OmniSwitch.

Examples

```
-> show fcoe vsan-map
vsan  vlan
-----+-----
    10   10
   2000 2000
   3000 3000
```

output definitions

vsan	The VSAN ID. Configured through the fibre-channel vsan command.
vlan	The FCoE VLAN ID. Configured through the fcoe vlan command.

Release History

Release 7.3.3; command introduced.

Related Commands

fcoe vsan-map	Configures a one-to-one mapping between a VSAN and FCoE VLAN.
show vlan	Displays the FCoE VLAN configuration.

MIB Objects

```

show fibre-channel sessions

Displays the sessions established on the OmniSwitch FC ports.

show fibre-channel sessions [**vsan** *vsan_id* | **e-tunnel** *tunnel_id*] [**port** *chassis/slot/port*] [**summary**]

Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>tunnel_id</i>	An existing E-Tunnel (E2E Tunnel) ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).

Defaults

By default, all FC sessions are displayed for all FC ports.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

The **port** parameter can be combined with the **vsan** or **e-tunnel** parameters to display sessions for a specific FC port within a VSAN or E2E tunnel.

Examples

```
-> show fibre-channel sessions summary
Total FIBRE-CHANNEL Sessions      : 7
Total NPIV Sessions                : 4
Total R-NPIV Sessions              : 1
Total E-TUNNEL Sessions            : 2
```

```
-> show fibre-channel sessions
Total FIBRE-CHANNEL Sessions      : 4
Total NPIV Sessions                : 2
Total R-NPIV Sessions              : 1
Total E-TUNNEL Sessions            : 1
```

show fibre-channel node

Displays a list of FC nodes connected to OmniSwitch FC ports.

show fibre-channel node [**vsan** *vsan_id* | **port** *chassis/slot/port*]

Syntax Definitions

vsan_id An existing VSAN ID number.
chassis The chassis identifier.
slot/port The slot and port number (3/1).

Defaults

By default, a list of all FC nodes is displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Specify a VSAN ID to display nodes associated with a specific VSAN.
- Specify an FC port number to display nodes connected on a specific FC port.

Examples

```
-> show fibre-channel node
```

VSAN	VLAN	WWNN	WWPN	Port	FC-ID
1	200	20:00:00:24:FF:37:DD:BB	21:00:00:24:FF:37:DD:BB	2/7	02:09:02
10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	2/1	00:0A:01

```
-> show fibre-channel node vsan 10
```

VSAN	VLAN	WWNN	WWPN	Port	FC-ID
10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	2/1	00:0A:01
10	-	11:00:00:17:A4:B1:71:24	11:00:00:17:A4:B1:71:24	2/2	00:0B:02

```
-> show fibre-channel node port 2/1
```

Port	VSAN	VLAN	WWNN	WWPN	FC-ID
2/1	10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	00:0A:01

output definitions

Port	The slot/port of the FC interface that is connected to the FC node.
VSAN	The VSAN ID associated with the FC node. Configured through the fibre-channel vsan command.
VLAN	The FCoE VLAN ID on which FC nodes are provided. Configured through the fcoe vlan command.
WWNN	The world-wide node name assigned to an FC node.
WWPN	The world-wide port name assigned to the FC port.
FC-ID	The FC port ID assigned to an N_Port (or VN_Port, or NP_Port) after successful fabric login.

Release History

show fibre-channel

Displays global Fibre Channel parameter values.

```
show fibre-channel
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

This command currently displays the following:

- The load-balancing method that is applied to FLOGI requests when there is more than one NPIV proxy port assigned to the same VSAN. This mode does not apply to FC ports configured to operate in the F_Port proxy mode (R-NPIV) or as E2E tunnel ports.
- The World Wide Node Name (WWNN) for the switch. The WWNN is comprised of “10:00” combined with the next available increment of the switch based MAC address.

Examples

```
-> show fibre-channel
Fibre Channel Global Configurations      :
-----
NPIV Proxy Global Load Balance Method    : Default
Local WWNN                               : 10:00:00:E0:B1:E7:09:A4
```

Release History

Release 7.3.3; command introduced.

show fibre-channel statistics

Displays FC port statistics.

show fibre-channel statistics [**npiv** | **r-npiv**] [**vsan** *vsan_id*[*vsan_id2*] [**port** *chassis/slot/port*[-*port2*] [**e-tunnel** *port* *chassis/slot/port*[-*port2*]]

Syntax Definitions

npiv	Displays statistics for N_Port proxy sessions.
r-npiv	Displays statistics for F_Port proxy sessions.
e-tunnel [<i>tunnel_id</i>]	Displays E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
<i>vsan_id</i> [<i>vsan_id2</i>]	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all statistics are displayed

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vsan** parameter to display statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to display statistics for a specific FC port.

Examples

```
-> show fibre-channel statistics vsan 46
```

```

show fcoe statistics npiv-proxy

Displays ENode fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics npiv-proxy {enode-login | enode-discovery} {interface | vlan [vlan_id[vlan_id2] |
port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

Syntax Definitions

enode-login	Displays ENode login statistics.
enode-discovery	Displays ENode discovery statistics.
interface	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id[vlan_id2]</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

show fcoe statistics r-npiv

Displays FCF discovery fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

show fcoe statistics r-npiv {**node-login** | **fcf-discovery**} {**interface** | **vlan** [*vlan_id*[*vlan_id2*] | **port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

node-login	Displays FC node login statistics.
fcf-discovery	Displays FCF discovery statistics.
interface	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [<i>vlan_id2</i>]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

Examples

show fcoe statistics e-tunnel

Displays E2E tunnel statistics.

show fcoe statistics e-tunnel [**ve** | **te**] [*tunnel_id*[-*tunnel_id*]]

Syntax Definitions

ve	Displays VE_Port statistics.
te	Displays TE_Port statistics.
<i>tunnel_id</i> [- <i>tunnel_id</i>]	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

Examples

```
-> show fcoe statistics e-tunnel

show fibre-channel npiv-proxy load-balance

Displays the NPIV proxy load balancing static mapping and session count.

show fibre-channel npiv-proxy load balance {static | session-count}

Syntax Definitions

static Displays the static FCoE port/FC NP_Port mapping.
session-count Displays the number of sessions on each FC port.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- This command displays information only for FC ports operating in the NP_Port mode.
- Use the **static** parameter to display only the static mapping of FCoE ports to FC NP_Ports.
- When the **sessions-count** parameter is used, the “FC Port” field includes all NP_Ports.

Examples

```
-> show fibre-channel npiv-proxy load-balance static
```

```
FCoE Port   FC port
-----+-----
 1/1         2/1
 1/2         2/1
```

```
-> show fibre-channel npiv-proxy load-balance sessions-count
```

```
FC Port   session_count
-----+-----
 2/1             2
 2/2             0
 2/3             5
```

output definitions

FCoE Port	The slot/port of the FCoE port that is mapped to the FC port.
FC Port	The slot/port of the FC NP_Port.
Session Count	The number of sessions per FC port.

Release History

Release 7.3.3; command introduced.

Related Commands

fibre-channel npiv-proxy load-balance static Configures a static mapping between an FCoE port and an FC NP_Port.

fibre-channel npiv-proxy load-balance Configures the NPIV proxy load-balancing method applied to all FC NP_Ports on the switch.

MIB Objects

clear fibre-channel statistics

Clears FC port statistics.

clear fibre-channel statistics [**npiv** | **r-npiv**] [**port** *chassis/slot/port[-port2]*] [**e-tunnel port** *chassis/slot/port[-port2]*]

Syntax Definitions

npiv	Clears statistics for N_Port proxy sessions.
r-npiv	Clears statistics for F_Port proxy sessions.
e-tunnel [<i>tunnel_id</i>]	Clears E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
<i>vsan_id</i> [<i>vsan_id2</i>]	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, all statistics are cleared.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vsan** parameter to clear statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to clear statistics for a specific FC port.

Examples

```
-> clear fibre-channel statistics
-> clear fibre-channel statistics port 2/2/5
-> clear fibre-channel statistics npiv
-> clear fibre-channel statistics r-npiv
-> clear fibre-channel statistics e-tunnel
-> clear fibre-channel statistics npiv port 2/2/1
-> clear fibre-channel statistics r-npiv port 2/2/3
-> clear fibre-channel statistics e-tunnel port 2/2/4
```

Release History

```

clear fibre-channel sessions

Clears the specified sessions on all FC ports.

```
clear fibre-channel sessions {npiv-proxy | r-proxy | e-tunnel | all}
```

Syntax Definitions

npiv-proxy	Clears NP_Port proxy sessions.
r-proxy	Clears reverse NP_Port proxy sessions.
e-tunnel	Clears E-Tunnel (E2E Tunnel) sessions.
all	Clears all NP_Port proxy, reverse proxy, and E-Tunnel sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Only the sessions associated with the specified parameter are cleared. For example, if the **npiv-proxy** parameter is used, only NPIV proxy sessions are cleared. All other session types remain active.
- When sessions are cleared on FC ports, the corresponding sessions on the FCoE ports are also cleared.

Examples

```
-> clear fibre-channel sessions npiv-proxy
-> clear fibre-channel sessions r-npiv
-> clear fibre-channel sessions e-tunnel
-> clear fibre-channel sessions all
```

Release History

Release 7.3.3; command introduced.

Related Commands

clear fcoe statistics r-npiv {**interface** | **vlan** [*vlan_id*[*vlan_id2*] | **port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

interface	Clears statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [<i>vlan_id2</i>]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **vlan** parameter to clear statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to clear statistics for a specific FCoE port or link aggregate ID.

Examples

```
-> clear fcoe statistics r-npiv interface
-> clear fcoe statistics r-npiv vlan 100
-> clear fcoe statistics r-npiv vlan 200-205
-> clear fcoe statistics r-npiv port 1/1
-> clear fcoe statistics r-npiv port 1/5-10
-> clear fcoe statistics r-npiv port 1/1/1
-> clear fcoe statistics r-npiv linkagg 10
```

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe statistics r-npiv Displays F_Port proxy statistics.

MIB Objects

```
alaFipsVlanTable
  alaFipsVlanStatsFnreClear
alaFipsIntfTable
  alaFipsIntfStatsFnreClear
```

clear fcoe statistics e-tunnel

Clears E_Port proxy (E2E tunnel) statistics.

```
clear fcoe statistics e-tunnel [ve | te] {tunnel_id[-tunnel_id]}
```

Syntax Definitions

ve	Clears VE_Port statistics.
te	Clears TE_Port statistics.
<i>tunnel_id</i> [- <i>tunnel_id</i>]	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use the **ve** parameter to clear only VE_Port statistics for the specified tunnel ID.
- Use the **te** parameter to clear only TE_Port statistics for the specified tunnel ID.

Examples

```
-> clear fcoe statistics e-tunnel 1
-> clear fcoe statistics e-tunnel ve 2
-> clear fcoe statistics e-tunnel te 2
```

Release History

Release 7.3.3; command introduced.

Related Commands

[show fcoe statistics e-tunnel](#) Displays E_Port proxy (E2E tunnel) statistics.

alaFipsEtunnelTePortStatsTable
  alaFipsEtunnelTePortStatsTunnelId
  alaFipsEtunnelTePortStatsClear
```

clear fcoe sessions

Clears the specified sessions on all FCoE ports.

clear fcoe sessions [**fips** | **npiv-proxy** | **r-proxy** | **e-tunnel** | **all**]

Syntax Definitions

fips	Clears FIP snooping sessions.
npiv-proxy	Clears NP_Port proxy sessions.
r-proxy	Clears reverse NP_Port proxy sessions.
e-tunnel	Clears E-Tunnel (E2E Tunnel) sessions.
all	Clears all FCoE, NP_Port proxy, reverse proxy, and E-Tunnel sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- When FIP snooping sessions are cleared, a clear virtual link (CVL) request is sent for all logged ENodes.
- When R-NPIV sessions are cleared, FIP FLOGO is sent to the FCF and FC FLOGO is sent to the HBA for each R-NPIV session created.
- Once sessions are cleared, NP_Ports will trigger a fabric login to the connected fabric.

Examples

```
-> clear fcoe sessions fips
-> clear fcoe sessions npiv-proxy
-> clear fcoe sessions r-mpiv
-> clear fcoe sessions e-tunnel
-> clear fcoe sessions all
```

Release History

Release 7.3.3; command introduced.

45 VXLAN Snooping Commands

The OmniSwitch Virtual eXtensible LAN (VXLAN) Snooping feature attempts to detect and identify VXLAN traffic by sampling packets to determine if they are VXLAN encapsulated packets. Once this type of traffic is identified, VXLAN Snooping collects and stores information about the flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and SNMP trap generation.

A VXLAN segment is a Layer 2 overlay network through which devices can communicate. Traffic from such devices is encapsulated into VXLAN frames and then tunneled through the VXLAN segment. Using this implementation of VXLAN Snooping, an administrator can obtain more detailed information about the traffic flow through the overlay network.

Note. Throughout this chapter, the terms “VXLAN Snooping” and “VM Snooping” are interchangeable.

MIB information for the VXLAN Snooping commands is as follows:

Filename: ALCATEL-IND1-VM-SNOOPING-MIB.mib
Module: alaVMSnoopingMIB

A summary of the available commands is listed here:

vm-snooping admin-state
vm-snooping policy-mode
vm-snooping trap
vm-snooping filtering-resource trap threshold
vm-snooping sampling-rate
vm-snooping aging-timer
vm-snooping vxlan udp-port
vm-snooping static-policy rule
vm-snooping logging-threshold
vm-snooping port
show vm-snooping config
show vm-snooping port
show vm-snooping database
show vm-snooping virtual-machines
show vm-snooping filtering-resource
show vm-snooping statistics
show vm-snooping static-policy
clear vm-snooping database
clear vm-snooping statistics

vm-snooping admin-state

Configures the global status of the VXLAN Snooping process for the switch.

vm-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables VXLAN Snooping for the switch.
disable	Disables VXLAN Snooping for the switch.

Defaults

By default, VXLAN Snooping is disabled for the switch.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Enable VXLAN Snooping first before attempting any other VXLAN Snooping command. When enabled, the switch allocates resources for this feature. When disabled, switch resources are released for other purposes.
- This command enables or disables this feature on all VXLAN Snooping ports.

Examples

```
-> vm-snooping admin-state enable
-> vm-snooping admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config Displays the VXLAN Snooping configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingAdminStatus
```

vm-snooping policy-mode

Configures the allocation of hardware resources for VXLAN Snooping. Use this command to change the policy lookup mode to basic or advanced and specify the number of policies reserved for VXLAN Snooping. In addition, an optional inner header parameter is available to specify if the header of the inner Ethernet frame is tagged or untagged.

vm-snooping policy-mode {basic | advance} [policy-resource {extended | default}] [inner-header {tagged | untagged | default}]

Syntax Definitions

basic	Reserves resources for VNI, VXLAN UDP port, inner source MAC address, and inner IPv4 source address policy conditions.
advance	For IPv4 packets, reserves resources for VNI, VXLAN UDP port, inner source MAC address, inner IPv4 source address, IP protocol, and Layer 4 source and destination port policy conditions. For IPv6 packets, reserves resources for VNI, VXLAN UDP port, inner source IPv6 address, Layer 4 source and destination port for policy conditions.
policy-resource extended	Doubles the amount of resources for VXLAN Snooping policies.
policy-resource default	Reserves the minimum amount of resources for VXLAN Snooping policies.
inner-header tagged	The header of the inner frame is tagged.
inner-header untagged	The header of the inner frame is untagged.
inner-header default	The header of the inner frame is either tagged or untagged (basic mode) or just tagged (advance mode).

Defaults

parameter	default
[basic advance]	basic
[extended default]	default

By default, the inner header option is set to the following values based on the current policy lookup mode:

- Basic mode—untagged and tagged header for the inner frame.
- Advanced mode—tagged header for the inner frame.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- To change the policy mode, globally disable VXLAN Snooping then make the changes and enable VXLAN Snooping again to apply the changes to the switch. This command is also allowed when the VXLAN Snooping feature is globally disabled.
- When the VXLAN Snooping policy mode is changed, all database and QoS entries are flushed.
- When the VXLAN policy mode is set to **basic**, any QoS policy rules with advanced mode policy conditions will not work. When the mode is set to **advance**, QoS policy rules with basic *and* advance policy conditions will work.
- When configuring the **inner-header** parameter for **basic** mode, specifying only tagged or only untagged may increase the number of policies allowed. In other words, specifying both tagged and untagged (the default) may reduce the number of policies allowed.
- When configuring the **inner-header** parameter for **advance** mode, specifying both tagged and untagged is not allowed. In this case, the **default** option sets the parameter to tagged.
- Other applications, such as QoS user policies, VLAN Stacking, Application Fingerprinting, DHCP Snooping, Open Flow, IP multicast, and FIP Snooping also use up system resources. Depending on which application comes first, other applications may not be able to get the required hardware resources.
- If the resources are increased by two times (**policy-resource extended**), then none of the above-mentioned applications can work simultaneously.
- Only one set of hardware resources are reserved for the VXLAN Snooping application when VXLAN Snooping is globally enabled.

Examples

```
-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic policy-resource extended inner-header tagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode advance policy-resource extended inner-header untagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic inner-header default
-> vm-snooping policy-mode advance inner-header default
-> vm-snooping admin-state enable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config Displays the VXLAN Snooping configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig  
  alaVMSnoopingPolicyMode  
  alaVMSnoopingPolicyResource  
  alaVMSnoopingVMTrafficTagged
```

vm-snooping trap

Enables or disables trap generation for the VXLAN Snooping feature.

```
vm-snooping trap {enable | disable}
```

Syntax Definitions

enable	Enables VXLAN Snooping trap generation.
disable	Disables VXLAN Snooping trap generation.

Defaults

By default, trap generation for this feature is disabled.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

A trap is generated when one of the following occurs:

- A new VXLAN database entry is learned or ages out.
- The usage of system resources allocated for VXLAN Snooping exceeds a configurable threshold value.

Examples

```
-> vm-snooping trap enable  
-> vm-snooping trap disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping filtering-resource trap threshold	Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.
show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig  
alaVMSnoopingTrapStatus
```

vm-snooping filtering-resource trap threshold

Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.

vm-snooping filtering-resource trap threshold {*percentage* | **default**}

Syntax Definitions

<i>percentage</i>	The percentage of system resources used by VXLAN Snooping.
default	Sets the trap threshold value back to 80 percent (the default).

Defaults

By default, the filtering resource threshold is set to 80 percent.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

A trap is generated when the system resources used by VXLAN Snooping reach the specified threshold value.

Examples

```
-> vm-snooping filtering-resource trap threshold 50
-> vm-snooping filtering-resource trap threshold default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config	Displays the VXLAN Snooping status and configuration for the switch.
show vm-snooping filtering-resource	Displays the system resources used by VXLAN Snooping on a per-port basis.

MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingFilteringResourceTrapThreshold
```

vm-snooping sampling-rate

Configures the packets-per-second (pps) sampling rate for the VXLAN Snooping feature.

vm-snooping sampling-rate *pps*

Syntax Definitions

pps The number of packets-per-second to sample on all VXLAN Snooping ports. The valid range is 1–1000.

Defaults

By default, the sampling rate is set to 1000 pps.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The sampling rate value specified with this command is applied to every VXLAN Snooping port on the switch.

Examples

```
-> vm-snooping sampling-rate 500
-> vm-snooping sampling-rate 1000
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show vm-snooping config](#) Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingSamplingRate
```

vm-snooping aging-timer

Configures the aging time value for VXLAN packet flows learned in the VXLAN Snooping database on the local switch.

vm-snooping aging-timer *seconds*

Syntax Definitions

seconds The number of seconds to wait before aging out a learned VM. The valid range is 60–86400 seconds.

Defaults

By default, the aging timer is set to 300 seconds.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Set this timer to zero to prevent the learned VMs from aging out.
- Note that an inactive VXLAN packet flow (no packets received for the flow) can take up to twice as long as the aging time value specified to be removed from the VXLAN Snooping database. For example, if an aging time of 300 seconds is specified, the database entry for the flow ages out any time between 300 and 600 seconds of inactivity.

Examples

```
-> vm-snooping aging-timer 100
-> vm-snooping aging-timer 300
-> vm-snooping aging-timer 0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingAgingTimer
```

vm-snooping vxlan udp-port

Configures additional UDP destination port numbers to look for when the switch inspects packets received on VXLAN Snooping ports. This value is used to identify encapsulated VXLAN packets.

```
vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
```

```
no vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
```

Syntax Definitions

udp_port_num[-udp_port_num2] The UDP destination port number. Use a hyphen to specify a range of port numbers. Do not specify a range that configures more than seven UDP ports.

Defaults

By default, the well-known UDP port number 4789 is used.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove a UDP destination port number. Note that the default UDP port number of 4789 is not configurable, so it can not be removed with this command. Only port numbers that were added through this command can be removed.
- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Including the default UDP port number (4789), up to eight UDP ports are allowed. However, configuring multiple UDP ports may slow down the VXLAN Snooping process.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.

Examples

```
-> vm-snooping vxlan udp-port 8472  
-> no vm-snooping vxlan udp-port 8472
```

Release History

Release 7.3.4; command was introduced.

Related Commands

`show vm-snooping config`

Displays the destination UDP port value that is used to identify VXLAN traffic.

MIB Objects

```
alaVMSnoopingUDPPortTable  
    alaVMSnoopingUDPPortIndex  
        alaVMSnoopingUDPRowStatus
```

vm-snooping static-policy rule

Configures a static QoS policy rule. When configured, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.

vm-snooping static-policy rule *rule_name* [**list** *list_name*]

no vm-snooping static-policy rule *rule_name* [**list** *list_name*]

Syntax Definitions

rule_name The name of the policy rule (alphanumeric string up to 32 characters).

list_name The name of the policy list (alphanumeric string up to 32 characters).

Defaults

parameter	default
<i>list_name</i>	“Default”

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove a static VXLAN Snooping policy rule. If the rule is associated with a user-configured policy list (not the default list), then the list name must be specified as well to remove the static policy rule. If the rule is associated with the default list, then specifying a list name is not required to remove the static policy rule.
- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.

Examples

```
-> vm-snooping static-policy rule r1
-> vm-snooping static-policy rule r2 list l2
-> no vm-snooping static-policy rule r1
-> no vm-snooping static-policy rule r2 list l2
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping static-policy Displays the static policy configuration.

MIB Objects

```
alaVMSnoopingStaticPolicyTable  
  alaVMSnoopingStaticPolicyRuleName  
  alaVMSnoopingStaticPolicyListName  
  alaVMSnoopingStaticPolicyRowStatus
```

vm-snooping logging-threshold

Configures the threshold value that determines how many entries for VXLAN packet flows and statistics are logged into a .csv file on the local switch.

vm-snooping logging-threshold number-of-flows *{flow_num | default}*

Syntax Definitions

<i>flow_num</i>	The number of VXLAN packet flows to log. The range is 1000–6000.
default	Sets the logging threshold value back to 5000 (the default).

Defaults

By default, the logging threshold value is set to 5000 packet flows.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Set the logging threshold value to zero to turn off the logging function.
- When the logging function is on, setting the VXLAN Snooping aging timer to 300 seconds is recommended. If the aging timer is set to zero, no logging occurs regardless of this threshold setting.
- The packet flows and hardware statistics are logged to the **vm_snoop_db_flow_rec.csv** file and the **vm_snoop_hw_stats_rec.csv** file in the **/flash/switch/bridge/vm_snoop/** directory on the local switch to maintain a packet flow history.
- When the number of records logged to the .csv files exceeds the logging threshold value, the corresponding files are renamed to **/flash/switch/bridge/vm_snoop/vm_snoop_db_flow_old_rec.csv** and to **/flash/switch/bridge/vm_snoop_hw_stats_old_rec.csv**.
- These files are accessed and used by Alcatel-Lucent network management tools to provide management and visibility of the overlay network traffic.

Examples

```
-> vm-snooping logging-threshold number-of-flows 1000
-> vm-snooping logging-threshold number-of-flows 0
-> vm-snooping logging-threshold number-of-flows default
```

Release History

Release 7.3.4; command was introduced.

Related Commands**show vm-snooping config**

Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

alaVMSnoopingConfig
alaVMSnoopingLoggingThresholdFlows

vm-snooping port

Configures a switch port or link aggregate as a VXLAN Snooping interface. Once the interface is configured and enabled and VXLAN Snooping is enabled for the switch, IP packets received on the interface are sampled to determine if they contain the designated UDP destination port.

vm-snooping {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} [admin-state {enable | disable}]

no vm-snooping {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the VXLAN Snooping administrative status on the port or link aggregate ID.
disable	Disables the VXLAN Snooping administrative status on the port or link aggregate ID

Defaults

By default, VXLAN Snooping is disabled on all switch ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to revert the VXLAN Snooping interface back to a regular switch port or link aggregate. This will clear the VXLAN Snooping configuration from the interface.
- Disabling the administrative status of a VXLAN Snooping interface does not remove the VXLAN Snooping configuration from the interface.
- Make sure the VXLAN Snooping feature is globally enabled for the switch to ensure that VXLAN Snooping ports will process VXLAN packets.
- VXLAN Snooping uses the sFlow mechanism to sample packets.

Examples

```
-> vm-snooping port 1/1/1
-> vm-snooping port 1/1/5-10
-> no vm-snooping port 1/1/1
-> no vm-snooping port 1/1/5-10
-> vm-snooping port 1/1/1 admin-state enable
-> vm-snooping port 1/1/5-10 admin-state enable
```

```
-> vm-snooping port 1/1/1 admin-state disable
-> vm-snooping port 1/1/5-10 admin-state disable

-> vm-snooping linkagg 1
-> vm-snooping linkagg 5-10
-> no vm-snooping linkagg 1
-> no vm-snooping linkagg 5-10
-> vm-snooping linkagg 1 admin-state enable
-> vm-snooping linkagg 5-10 admin-state enable
-> vm-snooping linkagg 1 admin-state disable
-> vm-snooping linkagg 5-10 admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping admin-state	Configures the global VXLAN Snooping status for the switch.
show vm-snooping port	Displays the VXLAN Snooping port configuration.

MIB Objects

alaVMSnoopingPortTable
  alaVMSnoopingPortIndex
  alaVMSnoopingPortAdminStatus
  alaVMSnoopingPortIsVNP
  alaVMSnoopingPortRowStatus
```

show vm-snooping config

Displays the global VXLAN Snooping status and configuration information for the switch.

show vm-snooping config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

N/A

Examples

```
-> show vm-snooping config
VM-Snooping Status           : Enable,
Trap                          : Disable,
Trap-Threshold                : 80,
Policy-Mode                   : Basic
Policy-Resource               : Default
VM Inner Header               : Tagged and Untagged,
Aging-Timer                   : 300 seconds,
UDP-Port(s)                   : 4789,
Sampling-Rate                  : 1000
Logging-Threshold              : 5000
Qos Allocation Status          : Success
```

output definitions

VM-Snooping Status	The global administrative status of VXLAN Snooping for the switch (Enabled or Disabled). Configured through the vm-snooping admin-state command.
Trap	The status of SNMP trap generation for the switch (Enabled or Disabled). Configured through the vm-snooping trap command.
Trap-Threshold	The percentage of switch resources used that will trigger the switch to generate a trap. Configured through the vm-snooping filtering-resource trap threshold command.
Policy-Mode	The policy mode setting that designates switch resources for VXLAN Snooping. Configured through the vm-snooping policy-mode command.

output definitions (continued)

Policy Resource	Indicates the number of VXLAN Snooping policies allowed (Default or Extended). Configured through the vm-snooping policy-mode command.
VM Inner Header	Whether to check tagged and/or untagged VM traffic. Configured through the vm-snooping policy-mode command.
Aging-Timer	The number of seconds before a learned VM is aged out. Configured through the vm-snooping aging-timer command.
UDP-Port(s)	The UDP port numbers to snoop for VXLAN packets. Configured through the vm-snooping vxlan udp-port command.
Sampling-Rate	The number of packets-per-second (pps) to sample. Configured through the vm-snooping sampling-rate command.
Logging-Threshold	The number of VXLAN packet flow entries and statistics logged to a .csv file on the local switch.
Qos Allocation Status	The status of QoS resource allocation (Success , inProgress , or Failed). This field is blank when VXLAN Snooping is disabled.

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping port Displays the VXLAN Snooping port configuration.

show vm-snooping port

Displays the VXLAN Snooping port configuration for the switch.

show vm-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The display output also indicates whether or not the VXLAN Snooping port is a virtual machine network profile (vNP) port.

Examples

```
-> show vm-snooping port
Port      VM-Snooping  vNP
-----+-----+-----
1/2/1     Enable       Yes
1/2/2     Enable       No
1/2/2     Enable       Yes
1/2/2     Enable       Yes
0/12      Disable      No
```

output definitions

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates that the interface is a link aggregate.
VM-Snooping	The administrative status (Enable or Disable) of VXLAN Snooping on the port or link aggregate. Configured through the vm-snooping port command.
vNP	Whether the port is also a vNP port (Yes or No).

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

  alaVMSnoopingPortRowStatus
```

show vm-snooping database

Displays VXLAN Snooping database entries. When a VXLAN packet is detected and the packet contains the designated UDP destination port, VXLAN Snooping creates an entry in the local switch database to identify and track the VXLAN packet flow.

show vm-snooping database [**vxlan udp-port** *udp_port_num* | **vtep-ip** *ip_address* | **vni** *vxlan_id* | **vm-src-mac** *mac_address* | **vm-ip** *ip_address*] [**detail**] [**port** *chassis/slot/port[-port2]* | **linkagg** *agg_id[-agg_id2]*] [**detail**]

Syntax Definitions

<i>udp_port_num</i>	The UDP destination port number used to identify VXLAN traffic.
vtep-ip <i>ip_address</i>	The IP address of the VXLAN Tunnel End Point (VTEP). This is the Loopback0 interface address on the OmniSwitch.
<i>vxlan_id</i>	The VXLAN Network Identifier (VNI) for the VXLAN segment on which the VM was learned.
<i>mac_address</i>	The source MAC address of a VM.
vm-ip <i>ip_address</i>	The source IP address of a VM.
detail	Displays additional information about the classified traffic flow.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, all database entries are displayed.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Each database entry is subject to a VXLAN Snooping aging period. If the database fills up, older entries are aged out before the limit (fast aging).
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

Examples

```
-> show vm-snooping database
Total number of VM Flows: 15
```

Port	VXLAN PORT	VNI	VM SRC MAC	VM VLAN	VM SRC IP
1/1/3	4789	2000	00:12:01:00:00:01	-	200.200.200.1
1/1/3	4789	2001	00:12:01:00:00:02	-	200.200.201.1
1/1/3	4789	2002	00:12:01:00:00:03	-	200.200.202.1
1/1/3	4789	2003	00:12:01:00:00:04	-	200.200.203.1
1/1/3	4789	2004	00:12:01:00:00:05	-	200.200.204.1
1/1/3	4789	1234	00:00:04:00:00:00	-	2.0.0.0
1/1/3	4789	1234	00:00:04:00:00:01	-	2.0.0.1
1/1/3	4789	1234	00:00:04:00:00:02	-	2.0.0.2
1/1/3	4789	1234	00:00:04:00:00:03	-	2.0.0.3
1/1/3	4789	1234	00:00:04:00:00:04	-	2.0.0.4
1/2/2	4789	43	00:00:00:88:00:01	8	88.0.0.1
1/2/2	4789	43	00:00:00:88:00:02	8	88.0.0.2
1/2/2	4789	43	00:00:00:88:00:03	8	88.0.0.3
1/2/2	4789	43	00:00:00:88:00:04	8	88.0.0.4
1/2/2	4789	43	00:00:00:88:00:05	8	88.0.0.5

```
-> show vm-snooping database port 1/2/2
Total number of VM Flows: 5
```

Port	VXLAN PORT	VNI	VM SRC MAC	VM VLAN	VM SRC IP
1/2/2	4789	43	00:00:00:88:00:01	8	88.0.0.1
1/2/2	4789	43	00:00:00:88:00:02	8	88.0.0.2
1/2/2	4789	43	00:00:00:88:00:03	8	88.0.0.3
1/2/2	4789	43	00:00:00:88:00:04	8	88.0.0.4
1/2/2	4789	43	00:00:00:88:00:05	8	88.0.0.5

```
-> show vm-snooping database vni 1234
Total number of VM Flows: 5
```

Port	VXLAN PORT	VNI	VM SRC MAC	VM VLAN	VM SRC IP
1/1/3	4789	1234	00:00:04:00:00:00	-	2.0.0.0
1/1/3	4789	1234	00:00:04:00:00:01	-	2.0.0.1
1/1/3	4789	1234	00:00:04:00:00:02	-	2.0.0.2
1/1/3	4789	1234	00:00:04:00:00:03	-	2.0.0.3
1/1/3	4789	1234	00:00:04:00:00:04	-	2.0.0.4

output definitions

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A "0" slot number indicates a link aggregate.
VXLAN Port	The UDP port for the VXLAN segment.
VNI	The VXLAN Network ID (VNI) for the VXLAN segment on which the VM was learned.
VM SRC MAC	The source MAC address of the VM.

output definitions (continued)

VM VLAN	The VLAN ID tag for the VM packet.
VM SRC IP	The source IP address of the VM.

```

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A "0" slot number indicates a link aggregate.
VTEP SRC IP	The source IP network address for the VTEP.
VTEP DST IP	The destination IP network address for the VTEP.
VTEP VLAN	The VLAN ID associated with the VTEP.
VXLAN VNI	The VNI for the VXLAN segment on which the VM was learned.
VXLAN Port	The UDP port for the VXLAN segment.
VM SRC MAC	The source MAC address for the VM.
VM DEST MAC	The destination MAC address for the VM.
VM VLAN	The VLAN on which the VM is learned and forwarded.

VM SRC IP/PORT	The source IP address of the VM.
VM DEST IP/PORT	The destination IP address of the VM.
VM IP PROTO	The IP protocol version for the VM.
POLICY RULE	The name of the QoS policy rule applied to the VM flow.
POLICY LIST	The name of the QoS policy list applied to the VM flow.
SAMPLED PKTS	The number of packets sampled for this flow.
LEARNED TIME	The date and time the flow entry was learned.

Release History

Release 7.3.4; command was introduced.

Related Commands

clear vm-snooping database	Clears the local database entries for each virtual machine (VM) flow.
show vm-snooping config	Displays the VXLAN Snooping configuration for the switch.
show vm-snooping port	Displays the VXLAN Snooping port configuration.

```

clear vm-snooping database

Clears the local database entries for each virtual machine (VM) flow.

```
clear vm-snooping database [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, all database entries are cleared for all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the **port** and **linkagg** parameters to clear database entries for a specific port or link aggregate.

Examples

```
-> clear vm-snooping database
-> clear vm-snooping database port 3/1/1
-> clear vm-snooping database linkagg 10
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show vm-snooping database](#) Displays the contents of the VXLAN Snooping database.

MIB Objects

```

show vm-snooping virtual-machines

Displays the port, source MAC address, and VLAN associated with Virtual Machines (VMs) discovered through the VXLAN Snooping process.

show vm-snooping virtual-machines

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

The output display of this command shows the port, source MAC address, and VLAN associated with each VM learned through the VXLAN Snooping process.

Examples

```
-> show vm-snooping virtual-machines
Port          SRC MAC          VLAN
-----+-----+-----
1/1/2  00:00:00:88:00:01  -
1/1/2  00:00:00:88:00:02  -
1/1/2  00:00:00:88:00:03  -
1/1/2  00:00:00:88:00:04  -
1/1/2  00:00:00:88:00:05  -
```

output definitions

Port	The slot/port or link aggregate ID of the VXLAN Snooping interface. A "0" slot number indicates a link aggregate.
SRC MAC	The source MAC address of the VM.
VLAN	The VLAN on which the VM is learned and forwarded.

Release History

Release 7.3.4; command was introduced.

Related Commands

- show vm-snooping config** Displays the VXLAN Snooping configuration for the switch.
- show vm-snooping database** Displays the contents of the local VXLAN Snooping database.

MIB Objects

```
alaVMSnoopingLearntVMTable  
  alaVMSnoopingLearntVMIfIndex,  
  alaVMSnoopingLearntVMSrcMac,  
  alaVMSnoopingLearntVMVlanId
```

show vm-snooping filtering-resource

Displays the amount of switch resources available for and used by QoS policies that contain VXLAN conditions.

show vm-snooping filtering-resource

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- VXLAN Snooping uses the amount of resources used to calculate the percentage of switch resources used and then determine if that percentage exceeds the value set for the filtering trap threshold. An SNMP trap is generated when the percentage used meets or exceeds the trap threshold value.
- The output display of this command shows the percentage of switch resources used by VXLAN policies on a per-slot basis.

Examples

```
-> show vm-snooping filtering-resource
Total Filtering Resources      :256,
Chassis/Slot      Filtering Resources Used
-----+-----
 1/SLOT-1          0
 2/SLOT-1          0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping filtering-resource trap threshold Configures the trap threshold value for system resources used by VXLAN Snooping.

show vm-snooping config Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

```
alaVMSnoopingFilterResourceTable  
  alaVMSnoopingFilterResourceChassisId  
  alaVMSnoopingFilterResourceSlotNum  
  alaVMSnoopingFilterResourceMax  
  alaVMSnoopingFilterResourceUsed
```

show vm-snooping statistics

Displays statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

show vm-snooping statistics [**hardware** | **sampling**] [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]]

Syntax Definitions

hardware	Displays the VXLAN policy rule and list and the number of packets and bytes on which the policy rule was applied.
sampling	Displays the number of VXLAN packets that were sampled for a specific flow.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are displayed for all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

Examples

```
-> show vm-snooping statistics
Total number of Hardware Statistics: 0
```

Policy Rule	Policy List	Number of pkts	Number of Bytes
-----+-----+-----+-----+			
Total number of Sampling Statistics: 1			

Port	VXLAN UDP PORT	VXLAN VNI	VM SRC MAC	VM SRC IP	Pkts
-----+-----+-----+-----+-----+					
2/1/2	4789	43	00:00:00:88:00:01	88.0.0.1	15

```
-> show vm-snooping statistics sampling
Total number of Sampling Statistics: 1
```

Port	VXLAN UDP PORT	VXLAN VNI	VM SRC MAC	VM SRC IP	Pkts
-----+-----+-----+-----+-----+					
1/1/2	4789	43	00:00:00:99:00:01	99.0.0.1	10

```
-> show vm-snooping statistics hardware
Total number of Hardware Statistics: 1
```

Policy Rule	Policy List	Number of pkts	Number of Bytes
-----+-----+-----+-----			
r1	Default	497	45724

Release History

Release 7.3.4; command introduced.

Related Commands

[clear vm-snooping statistics](#) Clears VXLAN Snooping statistics.

MIB Objects

  alaVMSnoopingHardwareStatsNumOfBytes
```

show vm-snooping static-policy

Displays the static QoS policy rule configuration for VXLAN Snooping.

show vm-snooping static-policy

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- When a static policy rule is configured for VXLAN Snooping, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.
- If the static policy rule was created with a user-configured policy list (not the default list), then the list name appears in the “Policy List” field. However, if the static policy rule was created without specifying a policy list name, then the “Default” list name appears in the “Policy List” field.

Examples

```
-> show vm-snooping static-policy
Total number of Static-Policy: 5
```

Policy Rule	Policy List
r0	Default
r1	Default
r2	L1
r2	L3
r2	Default

output definitions

Policy Rule	The name of the QoS policy rule that was specified when the static policy rule was created.
Policy List	The name of the QoS policy list associated with the static policy rule.

Release History

Release 7.3.4; command was introduced.

Related Commands

vm-snooping static-policy rule Configures a VXLAN Snooping static policy rule.

clear vm-snooping statistics

Clears the collected statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

```
clear vm-snooping statistics [sampling [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]]
[hardware]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared on all VXLAN Snooping ports and link aggregates.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

Use the **port** and **linkagg** parameters to clear statistics for a specific port or link aggregate.

Examples

```
-> clear vm-snooping statistics
-> clear vm-snooping statistics sampling port 3/1/1
-> clear vm-snooping statistics sampling linkagg 10
-> clear vm-snooping statistics hardware
```

Release History

Release 7.3.4; command introduced.

46 Port Mapping Commands

Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

Filename: AlcatelIND1PortMapping.mib
Module: ALCATEL-IND1-PORT-MAPPING

A summary of the available commands is listed here:

port-mapping user-port network-port
port-mapping (configures port mapping status and direction)
port-mapping unidirectional bidirectional
port-mapping unknown-unicast-flooding
show port-mapping status
show port-mapping

port-mapping user-port network-port

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

port-mapping *session_id* [**user-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg_id*]
[**network-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg_id*]

no port-mapping *session_id* [**user-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg_id*]
[**network-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg_id*]

Syntax Definitions

<i>session_id</i>	The port mapping session ID.
user-port	Specifies a user port of the mapping session.
network-port	Specifies a network port of the mapping session.
<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number to be assigned to the mapping session.
<i>slot/port[-port2]</i>	The slot and port number to assign to the mapping session. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i>	The link aggregate ID number to assign to the mapping session.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.

Examples

```
-> port-mapping 3 user-port 2/3 network-port 6/4
-> port-mapping 4 user-port 2/5-8
-> port-mapping 5 user-port 2/3 network-port slot 3
-> no port-mapping 5 user-port 2/3
-> no port-mapping 6 network-port linkagg 7
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping	Enables, disables, or deletes a port mapping session.
port-mapping unidirectional bidirectional	Configures the direction of a port mapping session.
port-mapping unknown- unicast-flooding	Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
  pmapSessionNumber
portMappingTable
  pmapPortIfindex
  pmapPortType
```

port-mapping

Enables, disables, or deletes a port mapping session.

port-mapping *session_id* {**enable** | **disable**}

no port-mapping *session_id*

Syntax Definitions

<i>session_id</i>	The port mapping session ID.
enable	Enables a port mapping session.
disable	Disables a port mapping session.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To be enabled, a session should have a minimum of two ports.

Examples

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.
port-mapping unidirectional bidirectional	Configures the direction of a port mapping session.
show port-mapping status	Displays the status of one or more port mapping sessions.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

PortMappingSessionTable
 pmapSessionNumber
 pmapSessionStatus

port-mapping unidirectional bidirectional

Configures the direction of a port mapping session.

port-mapping *session_id* [**unidirectional** | **bidirectional**]

Syntax Definitions

<i>session_id</i>	The port mapping session ID.
unidirectional	Specifies unidirectional port mapping.
bidirectional	Specifies bidirectional port mapping.

Defaults

parameter	default
enable disable	enable
unidirectional bidirectional	bidirectional

Platform Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.
- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

Examples

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```

Release History

Release 7.1.1; command introduced.

Related Commands

**port-mapping user-port
network-port**

Creates a port mapping session with or without the user ports, network ports or both.

port-mapping

Enables, disables, or deletes a port mapping session.

show port-mapping

Displays the configuration of one or more port mapping sessions.

MIB Objects

PortMappingSessionTable

 PmapSessionNumber

 PmapSessionDirection

port-mapping unknown-unicast-flooding

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

port-mapping *session_id* unknown-unicast-flooding {enable | disable}

Syntax Definitions

<i>session_id</i>	The port mapping session ID.
enable	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
disable	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

Defaults

parameter	default
enable disable	enable

Platform Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

Examples

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

47 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

Filename: ALCATEL-IND1-LPS-MIB
Module: alcatelIND1LearnedPortSecurityMIB

A summary of the available commands is listed here:

port-security
port-security learning-window
port-security convert-to-static
port-security maximum
port-security port max-filtering
port-security mac-range
port-security port violation
port-security learn-trap-threshold
show port-security
show port-security brief
show port-security learning-window

port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

port-security {**port** *chassis/slot/port[-port2]* | **chassis**} [**admin-state** {**enable** | **disable** | **locked**}]

no port-security port *chassis/slot/port[-port2]*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	Specifies all LPS ports.
enable	Administratively enables LPS on the specified port(s).
disable	Administratively disables LPS on the specified port(s). All bridged and filtered MAC addresses are cleared, but the static MAC address and LPS configuration for the port is retained. Learning is unrestricted.
locked	Administratively disables all learning on the port. Existing MAC addresses are retained but no additional learning of addresses, except for static MAC addresses, is allowed.

Defaults

By default, LPS functionality is disabled on all ports.

The following default value applies if the **admin-state** parameter is *not* specified with this command:

parameter	default
admin-state	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the LPS configuration from the specified port *and* clear all MAC addresses learned on the port. Note that the **chassis** parameter is not supported when using the **no** form of this command.
- The **admin-state disable** option disables LPS on the port but does not clear the LPS configuration.
- Use the **chassis** parameter to administratively disable or enable all active LPS ports with one command. This option does not apply to ports on which LPS was not previously enabled.
- LPS is supported on Ethernet fixed and 802.1Q-tagged ports. However, LPS is *not* supported on ports that are configured as service access ports.

- LPS is not supported on link aggregates, 802.1Q tagged (trunked) link aggregates, or link aggregate member ports.
- Note that when LPS is enabled on an active port, all MAC addresses previously learned on that port are cleared from the source learning MAC address table.
- LPS is also supported on ports that have Universal Network Profile (UNP) functionality enabled, with the following conditions:
 - When LPS is enabled or disabled on a UNP edge or bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
 - UNP authentication and classification is applied first, then LPS rules.
 - If UNP classifies a MAC address as forwarding but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
 - When a MAC address is filtered by LPS, the `show unp user status` command will display “LPS-B” as the profile classification source for that MAC address.
- LPS allows for the configuration of the following source MAC address learning restrictions:
 - A source learning time limit window to specify the length of time learning is allowed on a port.
 - A maximum number of bridged and filtered MAC addresses allowed on a specific port
 - A list of MAC addresses (individual or range of addresses) allowed on a port.
 - How a port handles traffic that is unauthorized.

Examples

```
-> port-security port 4/8 admin-state enable
-> port-security port 2/1-10 admin-state enable
-> port-security chassis admin-state disable
-> no port-security port 1/1-12
```

Release History

Release 7.1.1; command introduced.

Related Commands

<code>port-security mac-range</code>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<code>port-security maximum</code>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<code>port-security learning-window</code>	Configures the amount of time, in minutes, to allow source learning on all LPS ports.
<code>port-security port violation</code>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

MIB Objects

```
learnedPortSecurityTable
  lpsAdminStatus
```

port-security learning-window

Configures the amount of time, in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

port-security learning-window *minutes* [**convert-to-static** {**enable** | **disable**}] [**no-aging** {**enable** | **disable**}] [**learn-as-static** {**enable** | **disable**}] [**mac-move** {**enable** | **disable**}] [**boot-up** {**enable** | **disable**}]

no port-security learning-window

Syntax Definitions

<i>minutes</i>	The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window. The valid range is 0–2880. When this value is set to zero, the learning window time is set to infinity (no source learning time restriction on LPS ports).
convert-to-static enable	Enables the convert-to-static option for the learning window. Dynamically learned bridged (not filtered) MAC addresses are automatically converted to static addresses when the learning window closes. This option is automatically disabled when the LPS learning window is set to infinity (zero).
convert-to-static disable	Disables the convert-to-static option for the learning window. Dynamically learned MAC addresses are not converted to static addresses and will start to age out when the learning window closes.
no-aging enable	Enables the no-aging option for the learning window. Dynamic bridged MAC addresses are learned as <i>pseudo-static</i> MACs, which do not age out but are not saved in the switch configuration.
no-aging disable	Disables the no-aging option for the learning window. MAC addresses are learned as dynamic addresses that will age out.
learn-as-static enable	Enables the learn-as-static option for the learning window. Bridged MAC addresses are learned as static MAC addresses during the learning window time and regardless of whether or not the convert-to-static option is enabled.
learn-as-static disable	Disables the learn-as-static option for the learning window. Learned bridged MAC addresses are not converted to static until the window is closed <i>and</i> the convert-to-static option is enabled.
mac-move enable	Enables the mac-move option. Allows a pseudo-static MAC address to move to a different port in the same VLAN without getting dropped. Enabling the no-aging option is required to support the mac-move option.
mac-move disable	Disables the mac-move option. Frames from a duplicate pseudo-static MAC address are dropped.

boot-up enable	Enables the automatic start of the LPS learning window timer when the switch restarts.
boot-up disable	Disables the automatic start of the LPS learning window timer when the switch restarts.

Defaults

By default, the LPS source learning time limit is not set for the switch; the learning window defaults to infinity (source learning is not limited to a specific time frame).

parameter	default
convert-to-static	disable
no-aging	disable
learn-as-static	disable
mac-move	disable
boot-up	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to clear the learning window time (no learning window time limit is applied to the port).
- The LPS source learning time window is started and/or reset each time the **port-security learning-window** command is issued or when the **port-security learning-window boot-up** option is enabled and the switch restarts.
- Setting the LPS learning window time to 0 (zero) configures an infinite source learning time period for all LPS ports. The learning of MAC addresses on LPS ports never times out.
- When the LPS learning window time is set to zero, all options except the **convert-to-static** option are still valid. For example, the **no-aging** option setting still applies.
- After the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.
- If the **no-aging** option is enabled, then all new bridged MAC addresses are learned as pseudo-static MAC addresses during the learning window time period. Pseudo-static addresses do not age out but are not saved to the switch configuration.
- When the **no-aging** option is enabled and the learning window starts, any MAC addresses that were learned prior to the learning window time period are retained as dynamic addresses; they are not converted to pseudo-static MAC addresses.
- Enabling the **mac-move** option is not allowed unless the **no-aging** option is also enabled. When the **mac-move** option is enabled, disabling the **no-aging** option is *not* allowed.

- If the **convert-to-static** option is enabled, then all dynamic bridged and pseudo-static MAC addresses are converted to static MAC addresses when the learning window closes. Static MAC addresses do not age out and are saved to the switch configuration.

Note. When UNP is enabled on any one LPS port, the **convert-to-static**, **no-aging**, and **boot-up** parameter options are not supported on *all* LPS-enabled ports. This is because the learning window configuration is global and applies to all LPS ports.

Examples

```
-> port-security learning-window 25
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 60 no-aging enable mac-move enable
-> port-security learning-window 0 learn-as-static enable
-> port-security learning-window 500 boot-up disable
-> port-security learning-window 2 convert-to-static enable no-aging enable
-> port-security learning-window 2 no-aging enable convert-to-static enable boot-up
enable learn-as-static enable mac-move enable
-> no port-security learning-window
```

Release History

Release 7.1.1; command introduced.

Release 7.2.1.R02; **no-aging** and **boot-up** parameters added.

Release 8.2.1; **learn-as-static** and **mac-move** parameters added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security learning-window	Displays the source learning window configuration.

MIB Objects

```
learnedPortSecurityGlobalGroup
  lpsLearningWindowTime
  lpsLearningWindowTimeWithStaticConversion
  lpsLearningWindowNoAging
  lpsLearningWindowBootupStatus
  lpsLearningWindowLearnAsStatic,
  lpsLearningWindowPseudoMacMove
```

port-security convert-to-static

Converts all MAC addresses dynamically learned on the LPS port(s) to static MAC addresses. This command does not apply to MAC addresses that are filtered.

port-security {**port** *chassis/slot/port[-port2]* / **chassis**} **convert-to-static**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	Specifies all the LPS ports on the chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Converting dynamic MAC addresses to static MAC addresses is not supported on Universal Network Profile (UNP) ports.
- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.
- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

Note. The **port-security convert-to-static** command is not supported on UNP ports.

Examples

```
-> port-security port 4/8 convert-to-static  
-> port-security chassis convert-to-static
```

Release History

Release 7.2.1.R02; command was introduced.

Related Commands**port-security**

Enables or disables Learned Port Security (LPS) on the switch port(s).

port-security maximum

Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

MIB Objects

learnedPortSecurityGlobalGroup

lpsConvertToStatic

port-security maximum

Specifies the maximum number of bridged MAC addresses that an LPS port(s) is allowed to learn.

port-security port *chassis/slot/port*[-*port2*] maximum *number*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The number of source MAC addresses that are allowed on this port. The valid range is 1–1000.

Defaults

By default, the number of MAC addresses allowed is set to 1.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

Examples

```
-> port-security port 2/14 maximum 25
-> port-security port 4/10-15 maximum 100
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security learn-trap-threshold	Configures the number of bridged MAC addresses to learn before sending a SNMP trap.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

MIB Objects

learnedPortSecurityTable
lpsMaxMacNum

port-security learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

port-security port *chassis/slot/port*[-*port2*] learn-trap-threshold *number*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The number of bridged MAC addresses to learn before sending a trap. The valid range is 0–1000.

Defaults

By default, the number of bridged MAC addresses to learn before sending a trap is set to the same value as the maximum number of bridged MAC addresses allowed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.
- If this threshold value is set to zero, a trap is sent for every MAC address learned on the LPS port.

Examples

```
-> port-security port 1/10 learn-trap-threshold 6  
-> port-security port 1/10-13 learn-trap-threshold 18
```

Release History

Release 7.1.1; command introduced.

Related Commands**port-security maximum**

Configures the maximum number of source MAC addresses that an LPS port is allowed to learn.

show port-security

Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

learnedPortSecurityTable

lpsLearnTrapThreshold

port-security port max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

port-security port *chassis/slot/port[-port2]* **max-filtering** *number*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The maximum number of filtered MAC addresses that are allowed on this port. The valid range is 0–100.

Defaults

By default, the maximum number of MAC addresses that can be filtered on an LPS port is 5.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the number of filtered MAC addresses learned on the port reaches the maximum, the violation mode (restrict, discard, or shutdown) configured for the port is applied.
- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Even after the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> port-security port 1/10 max-filtering 6
-> port-security port 1/10-13 max-filtering 18
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

learnedPortSecurityTable
lpsMaxFilteredMacNum

port-security mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

port-security port chassis/slot/port[-port2] mac-range [low mac_address / high mac_address]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
low mac_address	MAC address that defines the low end of a range of MACs (for example, 00:20:95:00:10:2A).
high mac_address	MAC address that defines the high end of a range of MACs (for example, 00:20:95:00:10:2F).

Defaults

parameter	default
high mac_address	ff:ff:ff:ff:ff:ff
low mac_address	00:00:00:00:00:00

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If **low** and **high** end MAC addresses are not specified with this command, then the range is set back to the default range value (00:00:00:00:00:00– ff:ff:ff:ff:ff:ff).
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match the configured authorized addresses are not allowed (filtered) on the port, regardless of the LPS learning window time limit or the maximum number of bridged addresses allowed. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

Examples

```
-> port-security port 4/20 mac-range low 00:20:95:00:fa:5c
-> port-security port 5/11-15 mac-range low 00:da:95:00:00:10 high
00:da:95:00:00:1f
-> port-security port 5/16-20 mac-range high 00:da:95:00:00:1f
-> port-security port 5/11-15 mac-range
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable  
  lpsLoMacRange  
  lpsHiMacRange  
  lpsRowStatus
```

port-security port violation

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

port-security port *chassis/slot/port*[-*port2*] violation {shutdown** | **restrict** | **discard**}**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
shutdown	The port is administratively disabled when the port receives unauthorized traffic. No further traffic is allowed on the port.
restrict	Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port. The port remains administratively enabled.
discard	Disables learning on the port when unauthorized traffic is received or the configured maximum number of MAC addresses is reached. The port remains administratively enabled.

Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table, but they are recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses attempting unauthorized access to the LPS port.

Examples

```
-> port-security port 2/14 violation restrict
-> port-security port 4/10-15 violation shutdown
-> port-security port 1/37 violation discard
```

Release History

Release 7.1.1; command introduced.
Release 7.2.1.R02; **discard** parameter added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
clear violation	Clears all port violations; allows the port to resume normal operation without a manual reset of the port or module.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable  
  lpsViolationOption
```

show port-security

Displays the Learned Port Security (LPS) configuration and table entries.

```
show port-security {port [chassis/slot/port[-port2] / slot chassis/slot]}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).

Defaults

By default, all ports with an LPS configuration are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the **port** parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the **slot** parameter with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses learned on the LPS enabled port that are within the specified MAC address range appear as a separate entries in the LPS table as dynamic MAC type addresses.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

Examples

```
-> show port-security port 1/1
Port: 1/1
Admin-State      :          ENABLED,
Operation Mode   :          ENABLED,
Max MAC bridged  :          3,
Trap Threshold   :          1,
Violation        :          RESTRICT
Max MAC filtered :          5,
Low MAC Range    :          00:00:00:00:00:00,
High MAC Range   :          ff:ff:ff:ff:ff:ff,
Violating MAC    :          NULL
```

MAC	VLAN	MAC TYPE	OPERATION
00:11:22:22:22:21	1	STATIC	bridging
00:11:22:22:22:22	1	STATIC	bridging
00:11:22:22:22:23	1	PSEUDO-STATIC	bridging

output definitions

Port	The module slot number and the physical port number on that module.
Admin-State	The LPS administrative state for the port (Enabled , Disabled , or Locked). Configured through the port-security command.
Operation Mode	The LPS operational mode for the port (Enabled , Disabled , Restricted , Shutdown , Discard , Locked , or Filtered-only).
Max MAC bridged	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the port-security maximum command.
Trap Threshold	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If disabled is displayed in this field, the trap threshold is not in force. Configured through the port-security learn-trap-threshold command.
Violation	The security violation mode for the port (restrict , shutdown , or discard). Configured through the port-security port violation command.
Max MAC filtered	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the port-security port max-filtering command.
Low MAC Range	MAC address that defines the lower end of a MAC address range. Configured through the port-security mac-range command.
High MAC Range	MAC address that defines the higher end of a MAC address range. Configured through the port-security mac-range command.
Violating MAC	The MAC Address that caused the violation on this port.
MAC	The MAC address learned dynamically or configured statically on the LPS port.
VLAN	The VLAN to which the LPS port belongs.
MAC TYPE	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port.
OPERATION	The operational status of the MAC address (bridging or filtering).

Release History

Release 7.1.1; command introduced.

Release 7.2.1.R02: **Admin-State** and **Violating MAC** fields added.

- lpsAgL2VlanId
- lpsAgL2MacAddressLearnType

show port-security brief

Displays the LPS port configuration for all the LPS ports.

show port-security brief

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The LPS port parameter values are displayed even if the LPS is disabled on the port.
- The operation mode displayed for the LPS port is based on a combination of the existing administrative status and the operational status of the port, the result of which is one of the following values:
 - Enabled
 - Restricted (only when the administrative status is enabled)
 - Shutdown (only when the administrative status is enabled)
 - Discard (only when the administrative status is enabled)
 - Disabled
 - Locked
 - Filtered_only

Examples

```
-> show port-security brief
```

Slot/ Port	Operation Mode	Max Bridge	Max Filter	Nb Macs Dyn Br	Nb Macs Dyn Fltr	Nb Macs Static Br	Nb Macs Static Fltr
1/1	ENABLED	5	100	5	10	0	0
1/2	ENABLED	5	100	0	10	5	0
1/3	RESTRICTED	5	100	5	100	0	0
1/4	SHUTDOWN	5	100	-	-	-	0
1/5	DISABLED	5	100	-	-	-	0
1/6	LOCKED	5	100	-	-	3	0

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (e.g., 1/2 specifies port 2 on slot 1).
Operation Mode	Displays the status of the LPS port.

output definitions

Max Bridge	The maximum number of bridged MAC addresses that are allowed on the LPS port. Configured through the port-security maximum command.
Max Filter	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the port-security port max-filtering command.
Nb Macs Dyn Br	Total number of bridged MAC addresses learned on the LPS port.
Nb Macs Dyn Fltr	Total number of filtered MAC addresses learned on the LPS port.
Nb Macs Static Br	Total number of bridged static MAC addresses (configured static and MAC addresses learned as pseudo-static) on the LPS port.
Nb Macs Static Fltr	Total number of filtered static MAC addresses configured on the LPS port.

Release History

Release 7.2.1.R02; command was introduced.

Related Commands

show port-security Displays the LPS configuration and table entries for individual LPS ports.

MIB Objects

```

  lpsMaxFilteredMacNum
  lpsMaxStaticMacNum
  lpsOperStatus
  lpsAdminStatus
```

show port-security learning-window

Displays the source learning window configuration.

show port-security learning-window

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the learning window time is not set, then no source learning time limit is applied to LPS ports.
- Even after the LPS learning window time expires, dynamic MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> show port-security learning-window
Learning-Window           = 2 min,
Convert-to-static         = DISABLE,
No Aging                  = DISABLE,
Boot Up                   = ENABLE,
Remaining Learning Window = 120 sec
Learn As Static           = ENABLE,
Mac Move                  = ENABLE,
```

output definitions

Learning-Window

The configured amount of time during which the LPS port can learn new MAC addresses. This value of this field is set to **INFINITY** when the learning time window is set to zero (no source learning time restriction on LPS ports).

Convert-to-static

Indicates whether or not dynamic bridged or pseudo-static MACs are converted to static MACs (**ENABLED** or **DISABLED**). This option is always disabled when the LPS learning window is set to infinity (zero).

output definitions

No Aging	Indicates whether or not bridged MAC addresses are learned as pseudo-static MAC addresses, which do not age out during the LPS learning window time period (DISABLED or ENABLED).
Boot Up	Indicates whether or not the LPS learning window automatically starts when the switch boots up (enabled or disabled).
Learn As Static	Indicates whether or not dynamic MAC addresses are automatically learned as static MAC addresses during the LPS learning window time period.
Mac Move	Indicates whether or not pseudo-static MAC addresses are allowed to move to a different port in the same VLAN during the LPS learning window time period.
Remaining Learning Window	The remaining amount of time during which the LPS port can learn MAC addresses. If the learning time window is set to INFINITY (zero), this field does not display in the show command output.

Release History

Release 7.1.1; command introduced.

Release 7.2.1.R02; **LPS Shutdown Config** field changed to **Learning-Window**, **No Aging** and **Boot Up** fields added.

Release 8.2.1; **Learn As Static** and **Mac Move** fields added.

48 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or “mirrored,” port transmits and receives network traffic normally and the “mirroring” port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

Filename: AlcatelIND1portMirMon.mib
Module: ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB

The following table summarizes the available commands:

Port Mirroring Commands	port-mirroring source destination port-mirroring show port-mirroring status
Port Monitoring Commands	port-monitoring source port-monitoring show port-monitoring status show port-monitoring file

port-mirroring source destination

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

port-mirroring *port_mirror_sessionid* **source** {*chassis/slot/port[-port2]* [*chassis/slot/port[-port2],...*]}
destination *chassis/slot/port* [**rpmir-vlan** *vlan_id*] [**bidirectional** | **inport** | **outport**] [**unblocked** *vlan_id*]
 [**enable** | **disable**]

port-mirroring *port_mirror_sessionid* **no source** [*chassis/slot/port[-port2]*] [*chassis/slot/port[-port2],...*]

Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
source	Specifies source port, or range of ports desired to be mirrored.
destination	Specifies the destination port, that receives all the mirrored packets.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports.
rpmir-vlan <i>vlan_id</i>	Specifies a reserved VLAN to carry the mirroring traffic.
bidirectional	Specifies bidirectional port mirroring.
inport	Specifies incoming unidirectional port mirroring.
outport	Specifies outgoing unidirectional port mirroring.
unblocked <i>vlan_id</i>	Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
enable	Enables port mirroring status.
disable	Disables port mirroring status.

Defaults

parameter	default
bidirectional inport outport	bidirectional
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Port mirroring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same network interface module.
- A mirroring port can not be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.
- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Use the **port mirroring source destination** command to define the mirrored port and enable port mirroring status. Use the **port mirroring** command to enable the port mirroring session.
- Specify the *vlan_id* number of the mirroring port that is to remain **unblocked** when the command is executed. The **unblocked** VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning Tree remains disabled on the unblocked VLAN.

Usage Guidelines - Remote Port Mirroring

- Use the **rpmir-vlan** parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring. Note that remote port mirroring is *not* supported on the OmniSwitch 9900.
- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- The QoS redirect feature can be used to override source learning.
- The **mac-learning** command can also be used to disable learning on the RPMIR VLAN ID.

Examples

```
-> port-mirroring 6 source 2/2
-> port-mirroring 6 source 2/3-5
-> port-mirroring 6 destination 1/12 rpmir-vlan 7
-> port-mirroring 6 no source 2/2-5

-> port-mirroring 7 source 2/3 destination 6/4 unblocked 750

-> port-mirroring 8 source 1/7 bidirectional
-> port-mirroring 8 no source 1/7

-> port-mirroring 9 source 1/23 inport
-> port-mirroring 9 destination 1/24
-> port-mirroring 9 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-mirroring

Enables, disables, or deletes a port mirroring session.

port-mirroring *port_mirror_sessionid* {**enable** | **disable**}

no port-mirroring *port_mirror_sessionid*

Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
enable	Enables port mirroring.
disable	Disables port mirroring.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- Use the [port-mirroring source destination](#) command to specify the mirrored ports and destination port. before using this command to enable or disable port mirroring activity for the particular port mirroring session.

Examples

```
-> port-mirroring 6 enable
-> port-mirroring 6 disable
-> no port-mirroring 6
```

port-monitoring source

Configures a port monitoring session.

port-monitoring *port_monitor_sessionid* **source** *chassis/slot/port* [**file** *filename* [**size** *filesize*] | **no file** | **overwrite** {**on** | **off**}] [**inport** | **outport** | **bidirectional**] [**timeout** *seconds*] [**enable** | **disable**] [**capture-type** {**full** | **brief**}]

Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>filename</i>	Specifies a file name and pathname for capturing information related to the monitoring session (for example, /flash/port2.enc).
<i>filesize</i>	Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
no file	<i>This option is not supported at this time.</i>
on	Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
off	Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
inport	Specifies incoming unidirectional port monitoring.
outport	Specifies outgoing unidirectional port monitoring.
<i>seconds</i>	Specifies the number of seconds after which the session is disabled.
enable	Enables the port monitoring status.
disable	Disables the port monitoring status.
full	Captures port monitoring information in detail.
brief	Captures only the concise port monitoring data transmitted.

Defaults

parameter	default
<i>filesize</i>	1
on off	on
bidirectional inport outport	bidirectional
<i>seconds</i>	0
enable disable	disable
capture-type	brief

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Port monitoring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same NI.
- If the port monitoring capture-type is set to **brief**, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to **full**, the entire packet is captured.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- The **/flash** directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.

Examples

```
-> port-monitoring 6 source 2/3
-> port-monitoring 6 source 2/3 file /flash/user_port size 2 enable
-> port-monitoring 6 source 2/3 file /flash/user_port capture-type full
```

Release History

Release 7.1.1; command introduced.

Related Commands

port-monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

port-monitoring *port_monitor_sessionid* {**disable** | **pause** | **resume**}

no port-monitoring *port_monitor_sessionid*

Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
disable	Disables the port monitoring session.
pause	Pauses the port monitoring session.
resumes	Resumes the port monitoring session.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

Examples

```
-> port-monitoring 6 pause
-> port-monitoring 6 disable
-> port-monitoring 6 resume
-> no port-monitoring 6
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

show port-mirroring status

Displays the status of mirrored ports.

show port-mirroring status [*port_mirror_sessionid*]

Syntax Definitions

port_mirror_sessionid Mirroring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

Examples

-> show port-mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off
6.	1/22	bidirectional	-	Enable	Off
6.	1/23	bidirectional	-	Enable	Off
6.	1/24	bidirectional	-	Enable	Off
6.	1/25	bidirectional	-	Enable	Off
6.	1/26	bidirectional	-	Enable	Off
6.	1/27	bidirectional	-	Enable	Off
6.	1/28	bidirectional	-	Enable	Off
6.	1/29	bidirectional	-	Enable	Off
6.	1/30	bidirectional	-	Enable	Off

output definitions

Session	The port mirroring session identifier.
Mirror Destination	The location of the mirrored port.
Mirror Direction	The direction of the mirroring or mirrored port, which can be bidirectional (the default), inport , or outport .

output definitions (continued)

Unblocked VLAN	The mirroring VLAN ID number.
Config Status	The configuration status of the session.
Oper Status	The current status of the mirroring or mirrored port.
Mirror Source	The location of the mirroring port.

-> show port-mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off
6.	1/22	bidirectional	-	Enable	Off
6.	1/23	bidirectional	-	Enable	Off
6.	1/24	bidirectional	-	Enable	Off
6.	1/25	bidirectional	-	Enable	Off
6.	1/26	bidirectional	-	Enable	Off
6.	1/27	bidirectional	-	Enable	Off
6.	1/28	bidirectional	-	Enable	Off
6.	1/29	bidirectional	-	Enable	Off
6.	1/30	bidirectional	-	Enable	Off

output definitions

Session	The port mirroring session identifier.
Mirror Destination	The location of the mirrored port.
Mirror Direction	The direction of the mirroring or mirrored port, which can be bidirectional (the default), inport , or outport .
Unblocked VLAN	The mirroring VLAN ID number.
Config Status	The configuration status of the session.
Oper Status	The current status of the mirroring or mirrored port.
Mirror Source	The location of the mirroring port.

Release History

Release 7.1.1; command introduced.

Related Commands

show port-monitoring status

Displays port monitoring status.

show port-monitoring status [*port_monitor_sessionid*]

Syntax Definitions

port_monitor_sessionid Monitoring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

Examples

-> show port-monitoring status

Sess	Mon.	Mon.	Over	Oper.	Admin	Capt.	Max.	File
	Src	Dir	write	Stat	Stat	Type	Size	Name
1.	1/2	Out	OFF	OFF	OFF	Brief	64K	/flash/pm.enc

output definitions

Sess	Session - The port monitoring session identifier.
Mon. Src	Monitor Source - The source ports that are monitored.
Mon Dir	Monitor Direction - The direction of the monitoring session, which can be bidirectional (the default), inport , or outport .
Overwrite	Whether files created by a port monitoring session can be overwritten. The default is ON.
Oper Stat	Operating Status - The current operating status of the port monitoring session (on/off).
Admin Stat	Admin Status - The current administrative status of the port monitoring session (on/off).
Capt Type	Capture type: Brief - captures only 64 bytes of data per traffic data packet. Full - captures the entire packet.
Max Size	Maximum Size - The maximum size of the port monitoring file.
File Name	The name of the port monitoring file.

Release History

Release 7.1.1; command introduced.

Related Commands

port-monitoring source	Configures a port monitoring session.
port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring file	Displays port monitoring data.

MIB Objects

```

show port-monitoring file

Displays port monitoring data.

show port-monitoring file *port_monitor_sessionid*

Syntax Definitions

port_monitor_sessionid Monitoring session identifier.

Defaults

A single line from the captured packet is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Only a single line from the captured packet is displayed, even though the full packet is captured. To view the entire packet, download the file and view it using compatible network analyzer tool.

Examples

-> show port-monitoring file 1

Destination	Source	Type	Data
01:80:C2:00:00:00	00:20:DA:8F:92:C6	BPDU	00:26:42:42:03:00:00:00:00:00

49 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

Filename: Alcatel-IND1-PORT-MIRRORING-MONITORING-MIB.mib
Module: AlcatelIND1PortMirMon

Filename: SFLOW-MIB.MIB
Module: sFlow

A summary of the available commands is listed here:

sflow agent
sflow receiver
sflow sampler
sflow poller
show sflow agent
show sflow receiver
show sflow sampler
show sflow poller

sflow agent

Configures a specific sFlow agent IP address.

sflow agent ip *ip_address*

no sflow agent ip *ip_address*

Syntax Definitions

ip_address The sFlow agent IP address.

Defaults

parameter	default
<i>ip-address</i>	0.0.0.0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured, 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

Examples

```
-> sflow agent ip 192.168.1.1  
-> no sflow agent ip 192.168.1.1
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; command deprecated. Use **ip service source-ip**.

Related Commands

[show sflow agent](#) Displays the agent table.

MIB Objects

```
mirmonSFlowObjects  
  alasFlowAgentConfigType  
  alasFlowAgentAddressType  
  alasFlowAgentAddress
```

sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

sflow receiver *receiver_index* {**name** *string* | **timeout** {*seconds* | **forever**} | **address** {*ip_address* | *ipv6_address*} | **udp-port** *port* | **packet-size** *size* **version** *num* | **release**}

Syntax Definitions

<i>receiver_index</i>	Specifies the receiver index.
<i>string</i>	Specifies the name.
<i>seconds</i> / forever	Specifies the timeout value.
<i>ip_address</i>	Specifies the 32-bit IPv4 address.
<i>ipv6_address</i>	Specifies the 128-bit IPv6 address.
<i>port</i>	Specifies the UDP (destination) port.
<i>size</i>	Specifies the maximum number of data bytes (<i>size</i>) that can be sent.
<i>num</i>	Specifies the version number.

Defaults

parameter	default
<i>string</i>	empty
<i>seconds</i>	0
<i>ip_address</i>	0.0.0.0(ipv4)
<i>port</i>	6343
<i>size</i>	1400
<i>version num</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **release** form at the end of the command to delete a receiver.

Examples

```
-> sflow receiver 1 name Golden Rcvr1 address 198.206.181.3
-> sflow receiver 1 release
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show sflow receiver](#) Displays the receiver table.

MIB Objects

```
sFlowRcvrTable
  sFlowRcvrIndex
  sFlowRcvrOwner
  sFlowRcvrTimeout
  sFlowRcvrMaximumDatagramSize
  sFlowRcvrAddressType
  sFlowRcvrAddress
  sFlowRcvrPort
  sFlowRcvrDatagramVersion
```

sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

sflow sampler *num* **port** *chassis/slot/port[-port]* {**receiver** *receiver_index* | **rate** *value* | **sample-hdr-size** *size*}

no sflow sampler [*chassis_id*]/*slot/port[-port]*

Syntax Definitions

<i>num</i>	Specifies the instance ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the rate value for packet sampling.
<i>size</i>	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.

Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0
<i>size</i>	128

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

Examples

```
-> sflow sampler 1 2/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 2/1-5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

  sFlowFsDataSource
  sFlowFsInstance
  sFlowFsReceiver
  sFlowFsPacketSamplingRate
  sFlowFsMaximumHeaderSize
```

sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

sflow poller *num* **port** *chassis/slot/port[-port]* {**receiver** *receiver_index* | **interval** *value*}

no sflow poller *num* [*chassis_id*]/*slot/port[-port]*

Syntax Definitions

<i>num</i>	Specifies the instance ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the maximum number of seconds between successive samples (interval value).

Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete a poller.

Examples

```
-> sflow poller 1 1/1 receiver 2 interval 20
-> sflow poller 1 2/6-10 receiver 1 interval 30
-> no sflow poller 1 2/6-10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

sFlowCpTable

 sFlowCpDataSource

 sFlowCpInstance

 sFlowCpReceiver

 sFlowCpInterval

show sflow agent

Displays the sFlow agent table.

show sflow agent

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- It is necessary to execute the **ip interface** command to make a loopback0 IP address as the fixed primary address of the switch to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

Examples

```
-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version   = 1.3; Alcatel-Lucent; 6.1.1
Agent IP        = 127.0.0.1
```

output definitions

Agent Version	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
Agent address	IP address associated with the agent. Configured through the sflow agent command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show sflow receiver [*num*]

Syntax Definitions

num Specifies the receiver index.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show sflow receiver
Receiver 1
Name      = Golden
Address   = IP_V4  198.206.181.3
UDP Port  = 6343
Timeout   = 65535
Packet Size= 1400
DatagramVer= 5
```

output definitions

Name	Name of the entry to claim.
Address	IP address of the sFlow collector.
UDP Port	Destination port for sFlow datagrams.
Timeout	Time remaining before the sampler is released and stops sampling.
Packet size	Maximum number of data bytes that can be sent in a single sample datagram.
Datagram ver	Version of sFlow datagrams that should be sent.

Release History

Release 7.1.1; command was introduced.

50 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

Filename: IETF_RMON.mib
Module: RMON-MIB

The following table summarizes the available commands:

rmon probes
show rmon probes
show rmon events

rmon probes

This command enables or disables types of RMON probes.

```
rmon probes {stats | history | alarm} [entry_number] {enable | disable}
```

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
<i>entry_number</i>	The entry number in the list of probes (<i>optional</i>).
enable	Enables the RMON probe.
disable	Disables the RMON probe.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show rmon probes](#)

Displays a list of RMON probes or a single RMON probe.

[show rmon events](#)

Displays a list of RMON logged events or a single RMON event.

MIB Objects

ETHERSTATSTABLE

etherStatsStatus

HISTORYCONTROLTABLE

historyControlStatus

ALARMTABLE

alarmStatus

show rmon probes

Displays a list of RMON probes or a single RMON probe.

show rmon probes [**stats** | **history** | **alarm**] [*entry_number*]

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
<i>entry_number</i>	The entry number in the list of probes (<i>optional</i>).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry_number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes entry-number** command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

Examples

```
-> show rmon probes stats
```

Entry	Slot/Port	Flavor	Status	Duration	System Resources
4001	4/1	Ethernet	Active	00:25:00	275 bytes
4008	4/8	Ethernet	Active	00:25:00	275 bytes
4005	4/5	Ethernet	Active	00:25:00	275 bytes

-> show rmon probes history

Entry	Slot/Port	Flavor	Status	Duration	System Resources
1	4/1	History	Active	00:25:00	9063 bytes
10240	4/5	History	Active	00:14:00	601 bytes
10325	4/8	History	Active	00:14:00	601 bytes

-> show rmon probes alarm

Entry	Slot/Port	Flavor	Status	Duration	System Resources
11235	4/8	Alarm	Active	00:07:00	835 bytes

-> show rmon probes stats 4005

Probe's Owner: OmniSwitch Auto Probe on Slot 4, Port 5
 Entry 4005
 Flavor = History, Status = Active
 Time = 48 hrs 54 mins,
 System Resources (bytes) = 275

-> show rmon probes history 10325

Probe's Owner: Analyzer-p:128.251.18.166 on Slot 4, Port 5
 History Control Buckets Requested = 2
 History Control Buckets Granted = 2
 History Control Interval = 30 seconds
 History Sample Index = 5859
 Entry 10325
 Flavor = History, Status = Active
 Time = 48 hrs 53 mins,
 System Resources (bytes) = 601

-> show rmon probes alarm 11235

Probe's Owner: Analyzer-t:128.251.18.166 on Slot 4, Port 8
 Alarm Rising Threshold = 5
 Alarm Falling Threshold = 0
 Alarm Rising Event Index = 26020
 Alarm Falling Event Index = 0
 Alarm Interval = 10 seconds
 Alarm Sample Type = delta value
 Alarm Startup Alarm = rising alarm
 Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008
 Entry 11235
 Flavor = Alarm, Status = Active
 Time = 48 hrs 48 mins,
 System Resources (bytes) = 1677

output definitions

Probe's Owner	Description and interface (location) of the probe.
Slot/Port	The Slot/Port number (interface) that this probe is monitoring.
Entry	The Entry number in the list of probes.
Flavor	Whether the probe type is Ethernet, History, or Alarm.

output definitions (continued)

Status	The status of the probe— Creating (the probe is under creation), Active (the probe is Active), or Inactive (the probe is inactive).
Duration	Elapsed time (hours/minutes/seconds) since the last change in status.
System Resources	Amount of memory that has been allocated to this probe.

Release History

Release 7.1.1; command was introduced.

Related Commands

rmon probes	Enables or disables types of RMON probes.
show rmon events	Displays RMON logged events.

MIB Objects

ETHERSTATSTABLE
 etherStatsIndex
HISTORYCONTROLTABLE
 historyControlIndex
ALARMTABLE
 alarmIndex

show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

show rmon events [*entry_number*]

Syntax Definitions

entry_number The entry number in the list of probes (*optional*).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To display a list of logged events, omit the *entry_number* from the command line.
- To display statistics for a particular event, include the *entry_number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events** *entry_number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

Examples

```
-> show rmon events
```

Entry	Time	Description
1	00:08:00	etherStatsPkts.4008: [Falling trap] "Falling Event"
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

```
-> show rmon events 2
```

Entry	Time	Description
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

output definitions

Entry	The entry number in the list of probes.
Time	Time (hours, minutes, and seconds) since the last change in status.
Description	Description of the Alarm condition detected by the probe.

Release History

Release 7.1.1; command was introduced.

Related Commands

[rmon probes](#)

Enables or disables types of RMON probes.

[show rmon probes](#)

Displays RMON probes or a single RMON probe.

51 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

Filename: AlcatelIND1System.MIB
Module: ALCATEL-IND1-SYSTEM-MIB

A summary of the available commands is listed here.

swlog
swlog appid
swlog output
swlog output flash-file-size
swlog clear
show log swlog
show swlog

swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

swlog {[enable | disable] | remote command-log {enable| disable} | preamble | hash-time-limit *num* | duplicate-detect | console level *num*}

no swlog

Syntax Definitions

enable	Enables the switch logging functionality.
disable	Disables the switch logging functionality.
command-log enable	Enables the logging of commands to syslog.
command-log disable	Enables the logging of commands to syslog.
preamble	Enables or disables the display of the preamble to the console.
hash-time-limit <i>num</i>	Configures the amount of elapsed time for an entry to no longer be considered a duplicate entry.
duplicate-detect	Enables or disables the duplicate detection capability.
level <i>num</i>	The severity level filter keyword or numeric value for the application ID. (see table for swlog appid command).

Defaults

By default, switch logging is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to enable or disable the **preamble** and **duplicate-detect** setting.
- The syslog preamble includes the level, appid and timestamp that precedes the actual log messages.
- If duplicate entries are received within the configured **hash-time-limit**, only a single entry will be logged along with the number of times duplicated.

Examples

```
-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble
```

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

systemSwitchLoggingGroup
 systemSwitchLoggingEnable

swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

```
swlog appid {all | string} {library {all | string} | subapp {all | num}} {disable | enable | level {level | num}} [vrf num]
```

Syntax Definitions

<i>string</i>	An application or library identification keyword.
subapp <i>num</i>	A numerical equivalent value for the subapp ID.
disable	Enables the logging of the associated application.
enable	Disables the logging of the associated application.
level <i>level</i> <i>num</i>	The severity level filter keyword or numerical equivalent value for the application ID (<i>see table below</i>). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.
vrf <i>num</i>	The VRF ID.

Supported Levels	Numeric Equivalents	Description
off	0	Disabled
alarm	1	Highest severity. The system is about to crash and reboot.
error	2	System functionality is reduced.
alert	3	A violation has occurred.
warning	4	A unexpected, non-critical event has occurred.
info	5	Any other non-debug message (default).
debug1	6	A normal event debug message.
debug2	7	A debug-specific message.
debug3	8	All debug messages.

Defaults

Default severity level is **info**.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **show swlog appid all** command to display all available registered applications.

Examples

```
-> swlog appid all subid all enable
-> swlog appid mvrpNi subapp 1 level 8
-> show swlog appid mvrpNi
Application Name                : mvrpNi,
```

SubAppl ID	Sub Application Name	Level	VRF	Level
1	main	error	VRF	1-64 info

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
  systemSwitchLoggingLevelAppName
  systemSwitchLoggingLevel
  systemSwitchLoggingVrf
```

swlog output

Enables or disables switch logging output to the console, file, or data socket (remote session).

swlog output {**tty** {**enable** | **disable**} | **console** | **flash** | **socket** *ip_address* [**vrf-name** *name*]}

no swlog output {**console** | **flash** | **socket** *ip_address*}

Syntax Definitions

tty enable	Enables switch logging to a connected Telnet session.
tty disable	Disables switch logging to a connected Telnet session.
console	Specifies console output. When enabled, switch logging output is printed to the user console.
flash	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
socket	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
<i>ip_address</i>	The IPv4 or IPv6 address for the remote session host.
<i>name</i>	Specifies the VRF to be used to access the remote syslog server.

Defaults

parameter	default
console flash socket	flash and console

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- You can send output to a syslog server using the **socket** keyword, followed by the IP address of the remote host. Up to 12 servers can be configured.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
-> swlog output socket 14.1.1.1 vrf-name vrf1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **vrf-name** parameter added.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
  systemSwitchLoggingFlash
  systemSwitchLoggingSocket
  systemSwitchLoggingSocketIpAddr
  systemSwitchLoggingConsole
systemSwitchLoggingHostTable
  systemSwitchLoggingHostIpAddr
  systemSwitchLoggingHostPort
  systemSwitchLoggingHostStatus
  systemSwitchLoggingHostVrfName
```

swlog clear

Clears the files that store switch logging data.

swlog clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.

Examples

```
-> swlog clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingClear
```

show log swlog

Displays stored switch logging information.

show log swlog

show log swlog [timestamp *mm/dd/yyyy hh:mm:ss*] [slot *num*]

Syntax Definitions

mm/dd/yyyy hh:mm:ss

Specify the starting time for the switch logging information to be displayed. Use the format *mm/dd/yyyy hh:mm:ss* where *mm* represents the month, *dd* is the day, *yyyy* is the year, *hh* is the hour, *mm* is the minutes and *ss* is the seconds. Use four digits to specify the year.

num

The slot number to display the logging information for. *Currently not supported.*

Default

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the switch logging display is too long, you may use the **swlog clear** command to clear all of the switch logging information.
- The use of **grep** and the **timestamp** parameter can be used to filter the log files.
- When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command. Only those users who provide the valid ASA credentials are allowed to view the data. For more information on Authenticated Switch Access - Enhanced Mode mode, refer chapter Managing Switch Security in *OmniSwitch AOS Release 8 Switch Management Guide*.

Examples

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command.

```
-> show log swlog
Username: test
Password:  *****
```

show log swlog | grep error and **show log swlog | grep more** commands are not supported in enhanced mode.

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Adds or removes a filter level for a specified subsystem.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
swlog clear	Clears the files that store switch logging data.
show swlog	Displays switch logging information.

MIB Objects

N/A

show swlog

Displays switch logging information (e.g., switch logging status, log devices, application IDs with non-default severity level settings).

show swlog [**library** | **appid** {**all** | *string*}]

Syntax Definitions

library The slot number to display the logging information for. Currently not supported.

string The name of the appid to display.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```
-> show swlog
Operational Status           : Running,
File Size per file           : 125K bytes,
Log Device                    : console flash socket,
Log Device                    : ipaddr 1.2.3.4 vrf mgt(1),
Syslog FacilityID            : local0(16),
Remote command-log           : Disabled,
Hash Table entries age limit : 60 seconds,
Switch Log Preamble          : Enabled,
Switch Log Debug              : Disabled,
Switch Log Duplicate Detection : Enabled,
Console Display Level        : info
```

output definitions

Application ID	The Application ID (subsystem) for which the Severity Level is not set to the info (6) default setting.
Operational Status	Displays wheter switch logging is enabled or disabled.
File Size per file	The maximum file size of the switch log file.
Log Device	Which devices are the switch log messages being sent to.
Log Device	Which devices are the switch log messages being sent to.
Syslog FacilityID	Syslog FacilityID
Remote command-log	Status of remote command logging.
Hash Tables entries age limit	The elapsed time for duplicate entries.

output definitions

Switch Log Preamble	Status of displaying message preamble on console.
Switch Log Debug	Status of swlog debug.
Switch Log Duplicate Detection	Status of duplicate detection.
Console Display Level	The console severity level of the above-referenced Application ID.

Release History

Release 7.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.

MIB Objects

systemSwitchLoggingHostVrfName

52 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

Filename: AlcatelIND1Health.mib
Module: healthMIB

A summary of the available commands is listed here:

health threshold
health interval
show health configuration
show health
show health all

health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and flash usage.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user.

health threshold {*rx percent* | *txrx percent* | **memory percent** | **cpu percent** | **flash percent**}

Syntax Definitions

rx	Specifies the maximum input (RX) traffic threshold.
txrx	Specifies the maximum output/input (TX/RX) traffic threshold.
memory	Specifies the maximum RAM memory usage threshold.
cpu	Specifies the maximum CPU usage threshold.
flash	Specifies the maximum flash usage threshold.
<i>percent</i>	The new threshold value, in percent, for the corresponding resource (rx , txrx , memory , cpu , flash). The valid range is 1–100.

Defaults

parameter	default
<i>percentage</i>	80

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to [page 52-5](#), or refer to the chapter titled “Diagnosing Switch Problems” in the *OmniSwitch AOS Release 7 Network Configuration Guide*.
- To view the current health threshold values, use the [show health configuration](#) command.

Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show health configuration](#) Displays the current health threshold settings.

MIB Objects

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
  healthThreshFlashLimit
```

health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

health interval *seconds*

Syntax Definitions

seconds Sampling interval (in seconds). Valid entries are 10, 12, 15, 20, 30.

Defaults

parameter	default
<i>seconds</i>	10

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Decreasing the polling interval may impact switch performance.

Examples

```
-> health interval 20
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show health](#) Displays the current health sampling interval.

MIB Objects

HealthThreshInfo
healthSamplingInterval

show health configuration

Displays current health configuration settings.

show health configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show health configuration
Rx Threshold                = 80,
TxRx Threshold              = 80,
CPU Threshold               = 80,
Memory Threshold           = 80,
Flash Threshold            = 80,
Sampling Interval (Secs)   = 10
```

output definitions

Rx Threshold	The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>incoming traffic</i> on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the health threshold command.
TxRx Threshold	The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>all incoming and outgoing traffic</i> . As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the health threshold command.
CPU Threshold	Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the health threshold command.

output definitions (continued)

Memory Threshold	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the health threshold command.
Flash Threshold	Displays the current flash usage threshold. The default value is 80 percent and can be changed using the health threshold command.
Sampling Interval	Displays the sampling interval time period in seconds. Sampling interval can be changed using the health interval command.

Release History

Release 7.1.1; command introduced.

Related Commands

health threshold	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage and CPU usage.
health interval	Configures the sampling interval between health statistics checks.

MIB Objects

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
```

show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

show health [*port chassis/slot/port* | *slot chassis/slot[-slot2]*] [*statistics*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	To view a specific port, enter the slot and port number (3/1) along with the port keyword (port 3/1).
<i>slot[-slot2]</i>	To view a series of slots, enter the range of slot numbers along with the slot keyword (1-10).
statistics	Optional command syntax. It displays the same information as the show health command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

Examples

```
-> show health
```

CMM Resources	Current	1 Min Avg	1 Hr Avg	1 Day Avg
CPU	0	0	0	0
Memory	30	30	24	24

```
-> show health port 4/3
```

Port 04/03 Resources	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
Receive	80	01	01	01	01
Transmit/Receive	80	01	01	01	01

Receive	Traffic received by the switch.
Transmit/Receive	Traffic transmitted and received by the switch.
Memory	Switch memory.
CPU	Switch CPU.
Limit	Currently configured device threshold levels.
Curr	Current device bandwidth usage.
1 Min Avg	Average device bandwidth usage over a 1-minute period.
1 Hr Avg	Average device bandwidth usage over a 1-hour period.
1 Hr Max	Maximum device bandwidth usage over a 1-hour period (the maximum of the 1 minute averages).

Release History

Release 7.1.1; command introduced.

Related Commands

[show health all](#)

Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

MIB Objects

```
healthModuleTable
  healthModuleSlot
  healthModuleRxLatest
  healthModuleRx1MinAvg
  healthModuleRx1HrAvg
  healthModuleRx1HrMax
  healthModuleRxTxLatest
  healthModuleRxTx1MinAvg
  healthModuleRxTx1HrAvg
  healthModuleRxTx1HrMax
  healthModuleMemoryLatest
  healthModuleMemory1MinAvg
  healthModuleMemory1HrAvg
  healthModuleMemory1HrMax
  healthModuleCpuLatest
  healthModuleCpu1MinAvg
  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

show health all {memory | cpu | rx | txrx}

Syntax Definitions

memory	Displays the RAM memory health statistics for all active NI modules in the switch.
cpu	Displays the CPU health statistics for all active NI modules.
rx	Displays the health statistics for traffic <i>received</i> on all active NI modules.
txrx	Displays the health statistics for traffic both <i>transmitted and received</i> on all active NI modules.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show health all memory
```

```
* - current value exceeds threshold
```

Memory	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
01	80	40	40	40	40
02	80	40	40	40	40
03	80	40	40	40	40
04	80	40	40	40	40
05	80	40	40	40	40
06	80	40	40	40	40
07	80	40	40	40	40
13	80	40	40	40	40

output definitions

Memory (Cpu, TXX, RX)	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if show health all cpu is entered, Cpu is used as the column header.
Limit	Current usage threshold for the specified resource type, on the corresponding slot (in percent). The usage threshold refers to the maximum amount of the resource's total bandwidth that can be used by switch applications before a notification is sent to the user. The default value for all resource types is 80 percent. This threshold can be changed using the health threshold command.
Curr	Current usage of the resource on the corresponding slot, in percent (the amount of the total resource bandwidth actually being used by the switch applications).
1 Min Avg	Average usage of the resource on the corresponding slot over a one minute period.
1 Hr Avg	Average usage of the resource on the corresponding slot over a one hour period.
1 Hr Max	The highest average hourly usage for the resource on the corresponding slot.

Release History

Release 7.1.1; command introduced.

Related Commands

show health

Displays the health statistics for the switch.

  healthModuleRxTx1HrMax
  healthModuleMemoryLatest
  healthModuleMemory1MinAvg
  healthModuleMemory1HrAvg
  healthModuleMemory1HrMax
  healthModuleCpuLatest
  healthModuleCpu1MinAvg
  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

53 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

Filename: AlcatelIND1Eoam.MIB
Module: Alcatel-IND1-ETHERNET-OAM-MIB

Filename: IETF_802_1ag.MI
Module: IEEE8021-CFM-MIB

A summary of the available commands is listed here:

EthOAM vlan Configuration Commands	ethoam vlan
EthOAM Domain Configuration Commands	ethoam domain ethoam domain mhf ethoam domain id-permission

ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

ethoam vlan *vlanid_list* **primary-vlan** *vlan_id*

no ethoam vlan *vlanid_list*

Syntax Definitions

vlanid_list A list of VLAN Identifiers (e.g., '10 30-40' or '10').
vlan_id VLAN Identifier (e.g., '20').

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either 'mhf' is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan *vlan_id*) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

Examples

```
-> ethoam vlan 10 primary-vlan 20
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam vlan](#)

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

MIB Objects

```

ethoam domain

Creates an Ethernet domain with a specific name.

ethoam domain *md_name* **format** {**none** | **dnsname** | **mac-address-uint** | **string**} **level** *num*

no ethoam domain *name*

Syntax Definitions

<i>md_name</i>	Specifies the domain name.
none	This format is supported for the inter-op with ITU-T Y.1731.
dnsname	Domain Name like string, globally unique text string derived from a DNS name.
mac-address-uint	MAC address + 2-octet (unsigned) integer.
string	Character String.
<i>num</i>	MD Level and it ranges from 0 to 7.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Maximum domain length is 43.
- Use format as 'none' for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs, and MIPs configured in the MD.

Examples

```
-> ethoam domain MD format none level 3
-> ethoam domain MD1 format string level 4
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam

Displays the information of all the Management Domains (MD) configured on the bridge.

show ethoam domain

Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

dot1agCfmMdTable

dot1agCfmMdName

dot1agCfmMdFormat

dot1agCfmMdLevel

ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

ethoam domain *md_name* mhf {none | explicit | default}

Syntax Definitions

<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
default	MHFs can be created.

Defaults

parameter	default
none explicit default	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD mhf default
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam Displays the information of all the Management Domains (MD) configured on the bridge.

MIB Objects

```
dotlagCfmMdTable
  dotlagCfmMdName
  dotlagCfmMdMhfCreation
```

ethoam domain id-permission

Configures the ID-permission value for MD entry.

ethoam domain *md_name* **id-permission** {**none** | **chassisid**}

Syntax Definitions

<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present. System name shall be filled as Chassis ID.

Defaults

parameter	default
none chassisid	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD id-permission chassisid
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dotlagCfmMdTable
  dotlagCfmMdName
  dotlagCfmMdIdPermission
```

ethoam association

Creates Maintenance Association (MA) entry.

```
ethoam association ma_name format {vpnid | unsignedint | string | primaryvid | icc-based} domain  
md_name primary-vlan vlan_id
```

```
no ethoam association ma_name domain md_name
```

Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
vpnid	As specified in RFC 2685 VPN ID.
unsignedint	2-octet unsigned integer.
string	Character String.
primaryvid	Primary VLAN ID (12 bits represented in a 2-octet integer).
icc-based	This format is supported for inter-op with ITU-T.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>vlan_id</i>	Primary VLAN Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as 'icc-based' to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.

Examples

```
-> ethoam association MA format string domain MD primary-vlan 100
```

Release History

Release 7.3.1; command was introduced.

ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

ethoam association *ma_name* **domain** *md_name* **mhf** {**none** | **default** | **explicit** | **defer**}

Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdMhfCreation'.

Defaults

parameter	default
none explicit default defer	defer

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANs associated with this primary VID.

Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

Release History

Release 7.3.1; command was introduced.

Related Commands

show ethoam domain association

Displays the information of a specified MA in a Management Domain configured on the bridge.

ethoam association id-permission

Configure id-permission value for MA Entry.

ethoam association *ma_name* **domain** *md_name* **id-permission** {**none** | **chassisid** | **defer**}

Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
defer	The contents of the Sender ID TLV are determined by the corresponding MD object 'dot1agCfmMdIdPermission'.

Defaults

parameter	default
none chassisid defer	defer

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

MA must be created before it is modified.

Examples

```
-> ethoam association MA domain MD id-permission defer
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam domain association](#)

Displays the information of a specified MA in a Management Domain configured on the bridge.

[show ethoam domain](#)

ethoam association ccm-interval

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

ethoam association *ma_name* **domain** {*md_name* | *mac_address*} **ccm-interval** {**interval-invalid** | **interval100ms** | **interval1s** | **interval10s** | **interval1m** | **interval10m**}

Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain command on page 53-5 .
interval-invalid	Specifies that no CCMs are sent by a MEP.
interval100ms	Specifies the CCMs are sent every 100 milli seconds.
interval1s	Specifies that CCMs are sent every 1 second.
interval10s	Specifies that CCMs are sent every 10 seconds.
interval1m	Specifies that CCMs are sent every minute.
interval10m	Specifies that CCMs are sent every 10 minutes.

Defaults

parameter	default
interval-invalid interval100ms interval1s interval10s interval1m interval10m	interval10s

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The *ma_name* should be unique amid all those used by or available to the service provider within a domain.

Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

Release History

Release 7.3.1; command was introduced.

ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

ethoam association *ma_name* **domain** {*md_name* | *mac_add*} **endpoint-list** *mep_id*[-*mep_id2*]

no ethoam association *ma_name* **domain** {*md_name* | *mac_add*} **endpoint-list** *mep_id*[-*mep_id2*]

Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain command on page 53-5 .
<i>mac_add</i>	Specifies the CFM system MAC address.
<i>mep_id</i> [- <i>mep_id2</i>]	Specifies the MEP number. Use a hyphen to specify a range of MEP numbers.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma_name* should be unique within a domain.

Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

Release History

Release 7.3.1; command was introduced.

clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

clear ethoam statistics [**domain** *md_name* **association** *ma_name* **endpoint** *mep_id*]

Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mep_id</i>	MEP Identifier. Valid Range is 1-8191.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Statistics are cleared for all MEPs if a specific MEP is not entered with this command.

Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam statistics](#) Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

    alaCfmGlobalClearStats
```

ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

```
ethoam default-domain mhf {none | default | explicit}
```

```
no ethoam default-domain
```

Syntax Definitions

none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.

Defaults

Default value is none.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain mhf default
```

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

ethoam default-domain id-permission {none | chassisid}

no ethoam default-domain

Syntax Definitions

none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

Defaults

Default value is none.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain id-permission chassisid
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam default-domain configuration](#) Displays the default domain configuration.

MIB Objects

```

ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

ethoam default-domain primary-vlan {*vlan_id*} [**level** {**no-level** | *num*}] [**mhf** {**none** | **default** | **explicit** | **defer**}] [**id-permission** {**none** | **chassisid** | **defer**}]

no ethoam default-domain

Syntax Definitions

<i>vlan_id</i>	VLAN Identifier.
no-level	MD level is inherited from the default domain level.
<i>num</i>	MD Level. Valid range is 0 to 7.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	MHF defers to the default domain MHF value.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype, and Chassis ID TLV are to be present.
defer	ID permission defers to the default domain ID permission value.

Defaults

parameter	default
no-level / <i>num</i>	no-level
none explicit default defer	defer
none chassisid defer	defer

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANs associated with this primary VID.

Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassisid level 3 mhf default.  
-> ethoam default-domain primary-vlan 10 id-permission chassisid  
-> ethoam default-domain primary-vlan 10 level 3  
-> ethoam default-domain primary-vlan 10 mhf default  
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

ethoam endpoint *mep_id* **domain** *md_name* **association** *ma_name* **direction** {**up** | **down**} {**port** *chassis/slot/port* | **virtual** | **linkagg** *agg_id*} [**primary-vlan** *vlan_id*]

no ethoam endpoint *mep_id* **domain** *md_name* **association** *ma_name*

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Association name for the created Ethernet OAM Association.
up	For UP MEP.
down	For DOWN MEP.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Physical slot and port number on which MEP needs to be created.
virtual	Keyword for creating virtual MEP.
<i>agg_id</i>	Linkagg Identifier on which MEP needs to be created.
<i>vlan_id</i>	VLAN Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
- For creating a virtual MEP the value of port must be given the keyword “virtual”.

Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> no ethoam endpoint 10 domain MD association MA
```

Release History

Release 7.3.1; command was introduced.

```

ethoam endpoint admin-state

Configures the administrative state of MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name admin-state  
{enable | disable}
```

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables MEP.
disable	Administratively disables MEP.

Defaults

The default value is disable.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The *mep_id* specified must already exist in the switch configuration.

Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

Release History

Release 7.3.1; command was introduced.

ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name rfp {enable | disable}
```

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables RFP on MEP.
disable	Administratively disables RFP on MEP.

Defaults

The default value of RFP is disable.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The *mep_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
```

ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name ccm {enable | disable}
```

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.
enable	Enables MEP to generate CCMs.
disable	Disables MEP to generate CCMs.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA ccm enable
```

Release History

Release 7.3.1; command was introduced.

ethoam endpoint priority

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

ethoam endpoint *mep_id* **domain** {*md_name* | *mac_address*} **association** *ma_name* **priority**
ccm_ltm_priority

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>ccm_ltm_priority</i>	Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

Defaults

parameter	default
<i>ccm_ltm_priority</i>	7

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA priority 6
```

Release History

Release 7.3.1; command was introduced.

ethoam endpoint lowest-priority-defect

Configures the lowest priority fault alarm for the lowest priority defect for a MEP.

ethoam endpoint *mep_id* **domain** {*md_name* | *mac_address*} **association** *ma_name* **lowest-priority-defect** *lowest_priority_defect*

Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>lowest_priority_defect</i>	The lowest priority defect that can generate a Fault alarm. Possible values are xcon , rem-err-xcon , no-defect , mac-rem-err-xcon , err-xcon , and all-defect .

Defaults

parameter	default
<i>lowest_priority_defect</i>	mac-rem-err-xcon

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain esd.alcatel-lucent.com association alcatel-sales
lowest-priority-defect all-defect
```

Release History

Release 7.3.1; command was introduced.

ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

ethoam linktrace {**target-macaddress** *mac_address* | **target-endpoint** *t_mepid*} **source-endpoint** *s_mepid* **domain** {*md_name* | *mac_address*} **association** *ma_name* [**flag** [**fdb-mpdb** | **fdbonly**]] [**hop-count** *hop_count*]

Syntax Definitions

<i>mac_address</i>	Target MAC address to be transmitted.
<i>t_mepid</i>	Specifies the MEP for which the Loopback message is targeted.
<i>s_mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
domain <i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
fdbonly	Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
<i>hop_count</i>	Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2 ³² .

Defaults

parameter	default
flag	fdbonly

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD
association flag fdbonly hop-count 32
Transaction Id: 6943
```

```
-> ethoam linktrace target-endpoint 15 source 4 domain MD association
Transaction Id: 6934
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam domain](#)

Displays the information of a specified Management Domain configured on the bridge.

dotlagCfmMepTransmitLtmResult
dotlagCfmMepTransmitEgressIdentifier
```

ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

ethoam loopback {**target-endpoint** *t_mepid* | **target-macaddress** *mac_address*} **source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* [**number** *num*] [**data** *string*] [**vlan-priority** *vlan_priority*] [**drop-eligible** {**true** | **false**}]

Syntax Definitions

<i>t_mepid</i>	Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address to be transmitted.
<i>s_mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>num</i>	Number of loopback messages. The valid range is 1-10.
<i>string</i>	Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.
true	Sets the drop eligibility bit in the VLAN tag to true.
false	Sets the drop eligibility bit in the VLAN tag to false.

Defaults

parameter	default
<i>num</i>	1
<i>vlan_priority</i>	CCM priority
drop-eligible { true false }	true

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms

ethoam fault-alarm-time

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

ethoam fault-alarm-time *centiseconds* **endpoint** *mep_id* **domain** *md_name* **association** *ma_name*

no ethoam fault-alarm-time **endpoint** *mep_id* **domain** *md_name* **association** *ma_name*

Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Alarm timeout value, in centiseconds. The valid range is 250–1000.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
<i>centiseconds</i>	250

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.alcatel-lucent.com
association alcatel_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.alcatel-lucent.com
association alcatel_sales
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show ethoam domain
association end-point](#)

MIB Objects

DotlagCfmMep

dotlagCfmMepFngAlarmTime

ethoam fault-reset-time

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

ethoam fault-reset-time *centiseconds* **endpoint** *mep_id* **domain** *md_name* **association** *ma_name*

no ethoam fault-reset-time endpoint *mep_id* **domain** *ma_name* **association** *ma_name*

Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
<i>centiseconds</i>	1000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.alcatel-lucent.com
association alcatel_sales
-> no ethoam fault-reset-time end-point 100 domain esd.alcatel-lucent.com
association alcatel_sales
```

Release History

Release 7.3.1; command was introduced.

ethoam one-way-delay

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

ethoam one-way-delay {**target-endpoint** *t_mepid* | **target-macaddress** *mac_address*} **source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* [**vlan-priority** *vlan_priority*]

Syntax Definitions

<i>t_mepid</i>	Target MEP ID. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.

Defaults

parameter	default
<i>vlan_priority</i>	7

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating 1DM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP_OK or RMEP_FAILED, before initiating 1DM. So **target-macaddress** can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the 1DM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP's VLAN.
- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

Release History

Release 7.3.1; command was introduced.

    alaCfmMepOWDTPriority
```

ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

ethoam two-way-delay {**target-endpoint** *t_mepid* | **target-macaddress** *mac_address*} **source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* [**vlan-priority** *vlan_priority*]

Syntax Definitions

<i>t_mepid</i>	Target MEP ID. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.

Defaults

parameter	default
<i>vlan_priority</i>	7

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP_OK or RMEP_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure an SAA for continuous two-way frame delay measurement.

Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply from 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

Displays the information of a specific Management Domain configured on the bridge.

show ethoam domain *md_name*

Syntax Definitions

md_name Specifies the management domain name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam domain MD
Total number of MAs configured in this MD = 1
MD Attributes
  MD-Format : string,
  MD-Level : level-3,
  MD-MHFstatus : mhfNone,
  MD-IdPermission : sendIdNone
  Maintenance Association : MA
    MA-Format : string,
    Primary Vlan : 199,
    Associated Vlan-list : none,
    Total Number of Vlans : 1,
    MA-MHFstatus : mhfNone,
    MA-IdPermission : sendIdNone,
    CCM-interval : interval10s,
    MEP-List(MEP-Id) : 10
```

output definitions

MD-level	The level at which the MD was created.
MD-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MD. Options include none , explicit , or default .
Maintenance Association	The name of the maintenance association.
Vlan	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
MA-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MA. Options include none , explicit , or default .

output definitions (continued)

CCM-interval	The interval between the CCM transmissions.
MEP-Id	Indicates the Maintenance End Point.

Release History

Release 7.3.1; command was introduced.

md_name Specifies the management domain name.
ma_name Specifies the name of the Ethernet OAM Association.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam domain MD association MA
Total number of MEPs configured in this MA = 1
MA-Format : string,
Primary Vlan : 100,
Associated Vlan-list : none,
Total Number of Vlans : 1,
MA-MHFstatus : mhfDefer,
MA-IdPermission : sendIdDefer,
CCM-interval : interval10s,
MEP-List(MEP-Id) : 1-5,
```

Legend: MEP-Id: * = Inactive Endpoint

MEP-ID	Admin State	Direction	Mac-Address	Port	Primary Vlan
1	disable	up	00:E0:B1:A0:78:A3	virtual	100

output definitions

Primary Vlan	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
MA-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MA. Options include none , explicit , or default .
CCM-interval	The interval between the CCM transmissions.
MEP-ID	Indicates the Maintenance End Point.
Admin State	Indicates the administrative state (up or down) of the MEP.

output definitions (continued)

Direction	The direction of the MEP.
MAC Address	The MAC address of the MEP.
Port	The slot/port number of the Bridge port to which the MEP is attached.

show ethoam domain association end-point

Displays the information of a specific MEP in a Management Domain configured on the bridge.

show ethoam domain *md_name* **association** *ma_name* **end-point** *mep_id*

Syntax Definitions

<i>md_name</i>	Specifies the management domain name.
<i>ma_name</i>	Specifies the name of the Ethernet OAM Association.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam domain MD association MA endpoint 10
Admin State : disable,
Direction : up,
Slot/Port: virtual,
MacAddress: 00:E0:B1:A0:78:A3,
Fault Notification : FNG_RESET,
CCM Enabled : disabled,
RFP Status : enabled,
CCM Linktrace Priority : 7,
CCM Not Received : false,
CCM Error defect : false,
CCM Xcon defect : false,
MEP RDI defect : false,
MEP Last CCM Fault : not specified,
MEP Xcon Last CCM Fault : not specified,
MEP Error Mac Status : false,
MEP Lbm NextSeqNumber : 0,
MEP Ltm NextSeqNumber : 32157,
Fault Alarm Time : 250,
Fault Reset Time : 1000,
Lowest PrDefect Allowed : DEF_MAC_REM_ERR_XCON,
Highest PrDefect Present : DEF_NONE
```

output definitions

Admin State	Indicates the administrative state (up or down) of the MEP.
Direction	The direction of the MEP.

output definitions (continued)

Slot/Port	The slot/port number of the Bridge port to which the MEP is attached. If the value is virtual, it indicates a virtual port.
MAC Address	The MAC address of the MEP.
Fault Notification	Indicates the current state of the MEP Fault Notification Generator State Machine, which can be FNG_RESET , FNG_DEFECT , FNG_REPORT_DEFECT , FNG_DEFECT_REPORTED , or FNG_DEFECT_CLEARING .
RFP Status	Indicates the status of the RFP.
CCM Enabled	Indicates whether the MEP generates CCMs (enabled) or not (disabled).
CCM Linktrace Priority	Indicates the priority value for CCMs and LTMs transmitted by the MEP.
CCM Not Received	Indicates if CCMs are not being received (true) or received (false) from at least one of the configured remote MEPs.
CCM Error defect	Indicates if a stream of erroneous CCMs is being received (true) or not (false) from a MEP in this MA.
CCM Xcon defect	Indicates if a stream of CCMs is being received (true) or not (false) from a MEP that belongs to another MA.
MEP RDI Received	Indicates that any other MEP in this MA is transmitting the RDI bit. Options include true or false .
MEP Last CCM Fault	The last-received CCM that triggered a MA fault.
MEP Xcon Last CCM Fault	The last-received CCM that triggered a cross-connect fault.
MEP Error Mac Status	Indicates a port status TLV. Options include true or false .
MEP Lbm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LBM.
MEP Ltm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LTM.
Fault Alarm Time	The time interval during which one or more defects should be detected before the fault alarm is issued
Fault Reset Time	The time interval during which the fault alarm is re-enabled to process faults
Lowest PrDefect Allowed	The lowest priority defect that allowed to generate fault alarm.
Highest PrDefect Present	The highest priority defect since the MEPs Fault Notification Generator in reset state.

show ethoam remote-endpoint domain

Displays the information of all remote MEPs learned as a part of the CCM message exchange.

show ethoam remote-endpoint domain *md_name* **association** *ma_name* **end-point** *s_mepid* [**remote-mep** *r_mepid*]

Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>ma_name</i>	Specifies the name of the Ethernet OAM Association.
<i>s_mepid</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>r_mepid</i>	The remote MEP. The valid range is 1–8191.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam remote-endpoint domain MD association MA endpoint 10
Legends: PortStatusTlv: 1 = psBlocked, 2 = psUp, 0 = psNoTlv
         InterfaceStatusTlv: 1 = ifUp, 2 = ifDown, 4 = ifUnknown, 0=ifNoTlv
```

RMEP-ID	RMEP Status	OkFailed Time	Mac Address	port Tlv	I/f Tlv	RDI value	Ch-id Subtype	Ch-id
20	RMEP_OK	634600	00:E0:B1:6E:41:65	2	1	false	LCL-ASND	DUT-1
30	RMEP_OK	334600	00:E0:B1:6E:41:64	2	1	false	LCL-ASND	DUT-2

output definitions

MEP-ID	Indicates the Maintenance End Point.
RMEP Status	The operational state of the remote MEP Remote State machines for this MEP, which can be RMEP_IDLE , RMEP_START , RMEP_FAILED , or RMEP_OK .
OkFailed Time	The time (SysUpTime) when the Remote MEP state machine last entered either the RMEP_FAILED or RMEP_OK .
MacAddress	The MAC address of the remote MEP.
Port Status Tlv	The MAC status TLV last received.
I/f Status Tlv	The interface status TLV last received.

Note: Output shown above is not accurate as it is adjusted to display it in the single row. Following are modified:

P/S Tlv - Port Status Tlv
I/F Tlv - I/F Status Tlv
Ch-id Subtype - Chassis ID Subtype
Ch-id - Chassis ID
LCL-ASND - LOCALLY_ASSIGNED

show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

show ethoam linktrace-reply domain *md_name* association *ma_name* endpoint *s_mepid* tran-id *num*

Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>s_mepid</i>	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.
<i>num</i>	Specifies the Transaction ID or sequence number returned from a previously transmitted LTM.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- “LTM operation successful. Target is reachable.” – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- “LTM operation unsuccessful. Target not reachable.” – This message suggests that LTM is successfully initiated but the target is not reachable.
- “LTM operation unsuccessful. Target is reachable.” – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- “LTM operation in progress.” – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- “LTM Timed out.”- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
Ttl : 63,
  LTM Forwarded : yes,

output definitions

Ttl	Time to live field for the returned LTR.
LTM Forwarded	Indicates whether the LTM was forwarded or not.
Terminal MEP	Indicates whether the MP reported in the reply Ingress/Egress TLV is a MEP.
Last Egress Identifier	Identifies the MEP linktrace initiator that originated, or the responder that forwarded, the LTM to which this LTR is the response.
Next Egress Identifier	Identifies the linktrace responder that transmitted this LTR, and can forward the LTM to the next hop.
Relay Action	Indicates how the dataframe targeted by the LTM would be passed to Egress bridge port. Options include RLY_HIT , RLY_FDB , or RLY_MPDB .
Ingress Action	Indicates how the dataframe targeted by the LTM would be received on the receiving MP. Options include ING_NONE , ING_OK , ING_DOWN , ING_BLOCKED , or ING_VID .
Ingress Mac	The MAC address returned in the ingress MAC address field.
Egress Action	Indicates how the dataframe targeted by the LTM would be passed through Egress bridge port. Options include ING_NONE , ING_OK , ING_DOWN , ING_BLOCKED , or ING_VID .
Egress Mac	The MAC address returned in the egress MAC address field.

Release History

Release 7.3.1; command was introduced.

Related Commands

ethoam linktrace

Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

show ethoam linktrace-tran-id

Displays the transaction identifiers returned by previously generated LTMs from a specified MEP.

show ethoam linktrace-tran-id domain {*md_name* / *mac_address*} **association** *ma_name* **endpoint** *mep_id*

Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>mep_id</i>	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam linktrace-tran-id domain esd.alcatel-lucent.com association alcatel-
sales endpoint 3
S.No   Transaction Id
-----+-----
      1    13357,
      2    13358,
      3    13359,
```

output definitions

S.No	Indicates the sequence number.
Transaction Id	Indicates the Transaction Identifier returned from a previously transmitted LTM.

Release History

Release 7.3.1; command was introduced.

Related Commands**ethoam linktrace**

Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

show ethoam vlan

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

show ethoam vlan *vlan_id*

Syntax Definitions

vlan_id VLAN ID, primary or non-primary VID (e.g. '10').

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam vlan 10
Primary Vlan : 10,
Associated Vlan-list : 15-20 25 50-80
```

```
-> show ethoam vlan 15
Primary Vlan : 10,
Associated Vlan-list : 15-20 25 50-80
```

Release History

Release 7.3.1; command was introduced.

show ethoam statistics

Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

show ethoam statistics domain {*md_name* / *mac_address*} [**association** *ma_name*] [**end-point** *mep_id*]

Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Specifies the name of Ethernet OAM Association.
<i>mep_id</i>	Specifies a MEP for a specific MA.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ethoam statistics domain MD
MEP-ID  CCM  CCM Seq  LBR  LBR Out  LBR  LBR Bad  Unexpected  MA
        Out   Error   In   of order  Out   MSDU    LTR In

-----+-----+-----+-----+-----+-----+-----+-----+-----
          3    105      0      0          0      0          0          0
```

output definitions

MEP-Id	The MEP ID configured in the specified MA.
CCM Out	The total number of CCMs transmitted.
CCM Seq Error	The total number of out-of-sequence CCMs received from all remote MEPs.

output definitions

LBR In	The total number of valid, in-order LBRs received.
LBR Out of order	The total number of valid, out-of-order LBRs received.
LBR Out	The total number of LBRs transmitted.
LBR Bad MSDU	The total number of LBRs received whose mac_service_data_unit did not match.
Unexpected LTR In	The total number of unexpected LTRs received.

  dotlagCfmConfigErrorListErrorType
```

show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

show ethoam one-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* [**mac-address** *mac_address*]

Syntax Definitions

<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>mac_address</i>	MAC Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Dash ('-') in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when IDM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

Examples

```
-> show ethoam one-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258
00:d0:95:ef:66:88	5896	282
00:d0:95:ef:88:88	2584	-
00:d0:95:ef:66:55	2698	4782

```
-> show ethoam one-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258

output definitions

Remote Mac address	Remote MAC address.
Delay	Physical slot and port number.
eJitter	Type of an error.

Release History

Release 7.3.1; command was introduced.

Related Commands

[ethoam one-way-delay](#) Initiates one-way-delay messages from a particular MEP to an RMEP.

MIB Objects

```

```

show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

show ethoam two-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* [**mac-address** *mac_address*]

Syntax Definitions

<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>mac_address</i>	MAC Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If '0' appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash ('-') appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

Examples

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
```

```
00:d0:95:ef:44:44
```

54 Service Assurance Agent Commands

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video. Use SAAs to verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. The SAA feature uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). Use ETH-LB/DMM to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

Filename: AlcatelIND1Eoam.MIB
Module: Alcatel-IND1-ETHERNET-OAM-MIB

Filename: IETF_802_1ag.MIB
Module: IEEE8021-CFM-MIB

Filename: Alcatel-IND1-SAA-MIB.MIB
Module: ALCATEL-IND1-SAA-MIB

A summary of the available commands is listed here:

SAA Commands	saa saa start saa stop
EthOAM SAA Commands	saa type ethoam-loopback saa type ethoam-two-way-delay
IP SAA Command	saa type ip-ping
Layer 2 SAA Command	saa type mac-ping
SPB SAA Commands	saa spb saa spb reset saa spb flush show saa spb
XML SAA Commands	saa xml show saa xml
SAA Show Commands	show saa show saa type config show saa statistics

saa

Configures a Service Assurance Agent (SAA).

saa string [**descr** *description*] [**interval** *interval*] [**jitter-threshold** *jitter_thresh*] [**rtt-threshold** *rtt_thresh*]

no saa string

Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (for example “SAA 10”).
<i>description</i>	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing SAA”).
<i>interval</i>	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10 to 1500.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>rtt_thresh</i>	The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

Defaults

parameter	default
<i>description</i>	DEFAULT
<i>interval</i>	150 minutes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt_thresh</i>	0 (disabled)

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.
- The **descr** and **interval** parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.
- If the **descr** and/or **interval** parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.
- If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.

- If none of the optional parameters are specified and the given SAA exists, the CLI will return an error message, as duplicate entries are not allowed.
- Any number of SAAs can be configured (MAX 127). It is recommended not to start many aggressive SAAs (having session interval ≤ 10). To achieve proper scheduling of all the started SAA (aggressive and relaxed) it is recommended not to start more than 50 SAAs.
- When SAA processes an iteration of a session, it will compare the results against the following criteria to see if an SNMP trap should be sent. A trap with the session name is sent if:
 - At least one packet is lost.
 - Warning: Average RTT/Jitter within 10% of threshold.
 - Critical: Average RTT/Jitter at or above threshold.

Examples

```
-> saa saa1 descr "saa for ip-ping"  
-> saa saa1 jitter-threshold 100 rtt-threshold 500  
-> saa saa2 descr "Monitoring Default VRF-interface" interval 160  
-> saa saa2 interval 120  
-> no saa saa1
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.2; **jitter-threshold** and **rtt-threshold** parameters added.

Related Commands

show saa Displays SAA configuration information.

show saa statistics Displays SAA statistics.

MIB Objects

```
alaSaaCtrlTable

  alaSaaCtrlRowStatus  
  alaSaaCtrlDescr  
  alaSaaCtrlInterval  
  alaSaaCtrlJitterThreshold  
  alaSaaCtrlRTTThreshold
```

saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

```
saa string type ip-ping destination-ip ip_address source-ip ip_address type-of-service tos [num-pkts count] [inter-pkt-delay delay] [payload-size size]
```

Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
destination-ip <i>ip_address</i>	The IPv4 address of the destination to ping.
source-ip <i>ip_address</i>	The IPv4 address of the source.
<i>tos</i>	The type of service. Valid range is 0 – 255.
<i>count</i>	The number of packets to send in one ping iteration. The valid range is 1–100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.

Defaults

parameter	default
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	24 bytes

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets * inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.

- Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.
- The timeout for each ping request packet is 1 sec. This value is not configurable.

Examples

```
-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-  
of-service 4  
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-  
of-service 5  
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-  
of-service 8 inter-pkt-delay 1000  
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-  
of-service 2 num-pkts 5  
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-  
of-service 35 payload-size 1518  
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-  
of-service 5 inter-pkt-delay 1500 num-pkts 8 pkt-size 1000
```

  alaSaaIpCtrlPayloadSize  
  alaSaaIpCtrlNumPkts
```

saa type mac-ping

Configure SAA for a MAC address including the VLAN, VLAN ID, number of packets and inter-packet delay parameters.

```
saa string type mac-ping destination-mac mac_address vlan vlan_id [vlan-priority vlan_priority]
[drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size]
[isid-check isid]
```

Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>mac_address</i>	The destination MAC address to ping.
<i>vlan_id</i>	The VLAN on which the L2 SAA Packets will be sent out. Valid range is 1-4094.
<i>vlan_priority</i>	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
true	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
false	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
<i>data</i>	User specified string to be included in the packet (Data TLV).
<i>count</i>	The number of packets to send in one ping iteration. The valid range is 1-100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 36-1500 bytes.
<i>isid</i>	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Defaults

parameter	default
<i>vlan_priority</i>	0
true false	false
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	36 bytes

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets * inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- The timeout for each ping request packet is 1 sec. This value is not configurable.
- If data-TLV is specified & payload size is not specified, then payload size will be increased internally to accommodate the data TLV.
- If data TLV & payload size both are specified and payload size is less than [dataTLV + 36] bytes (for time-stamping and other packet info), then the CLI will be rejected.
- Destination-MAC cannot be broadcast/multicast address.
- Timeout for each ping request packet is 1 sec. This value is non-configurable.

Examples

```
-> saa saa1 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10
-> saa saa3 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 drop-eligible
true
->saa saa4 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 inter-pkt-delay
100
-> saa saa5 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 num-pkts 10
-> saa saa6 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 payload-size
400
-> saa saa7 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 vlan-priority 3
-> saa saa8 type mac-ping destination-mac 00:11:11:11:11:11 vlan 1001 isid-check
1002
```

```

saa spb

Configures session parameters for the Shortest Path Bridging (SPB) SAA. The SPB feature dynamically discovers SPB-enabled switches. Each discovered switch is identified by the pairing of a SPB VLAN (BVLAN) and the backbone MAC address (BMAC) for the switch. SPB advertises these BVLAN-BMAC pairs to the SAA feature, which in turn creates and starts MAC ping sessions based on the parameters configured with this command.

```
saa spb [auto-create] [auto-start] [interval interval] [vlan-priority vlan_priority] [drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size] [jitter-threshold jitter_thresh] [rtt-thresh rtt_thresh] [keep]
```

Syntax Definitions

auto-create	Automatically creates a SPB SAA session for each discovered BVLAN-BMAC pair.
auto-start	Automatically starts each SPB SAA session.
<i>interval</i>	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10–1500.
<i>vlan_priority</i>	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
true	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
false	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
<i>data</i>	User specified string to be included in the packet (Data TLV).
<i>count</i>	The number of packets to send in one ping iteration of the test. Valid range is 1–100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>rtt_thresh</i>	The round-trip time threshold value, in microseconds. A trap is generate when this value is crossed. The valid range is 0–1000000.
keep	Retains SPB SAA session information even when SPB signals that a BMAC or BVLAN no longer exists.

Defaults

parameter	default
auto-create	off
auto-start	off
<i>interval</i>	150 minutes
<i>vlan-priority</i>	0
drop-eligible {true false}	false
<i>data</i>	null
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	32 bytes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt-thresh</i>	0 (disabled)
keep	off

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The **auto-create** and **auto-start** parameters enable the SPB SAA functionality required to automatically create and start this type of SAA session.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets * inter-pkt-delay) is less than 10 sec.
- SPB SAA sessions cannot be modified but are automatically configured with “SPB” as the owner of the session so they can be easily identified within the applicable SAA **show** command displays.
- The SAA ID for an SPB SAA is the prefix SPB- combined with the BVLAN and BMAC pairing used to generate the session. For example, SPB-*bvlan-bmac* (SPB-4000-e8-e7-32-07-98-cd).

Examples

```
-> saa spb auto-create auto-start interval 160 num-pkts 50 inter-pkt-delay 100 keep
-> saa spb auto-create vlan-priority 3 drop-eligible true payload-size 400
-> saa spb auto-create auto-start jitter-threshold 100 rtt-threshold 500
-> saa spb keep
```

Release History

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When this command is used, the SPB SAA session parameters are set to the following default values:

parameter	default
auto-create	off
auto-start	off
<i>interval</i>	150 minutes
<i>vlan-priority</i>	0
<i>drop-eligible</i>	false
<i>data</i>	null
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	32 bytes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt-thresh</i>	0 (disabled)
keep	off

Examples

```
-> saa spb reset
```

saa type ethoam-loopback

Configures the SAA for ETH-LB, including the number of packets and inter-packet delay parameters.

```
saa string type ethoam-loopback {target-endpoint t_mepid | target-mac address mac_address} source-
endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [drop-eligible
{true | false}] [data data] [num-pkts num] [inter-pkt-delay delay]
```

Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>t_mepid</i>	The ID of the destination MEP.
<i>mac_address</i>	The MAC address of the destination.
<i>s_mepid</i>	The ID of the source MEP.
<i>md_name</i>	The domain to which the source MEP belongs.
<i>ma_name</i>	The association to which the source MEP belongs.
<i>vlan_priority</i>	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
true	Sets the drop eligibility bit in the VLAN tag to true.
false	Sets the drop eligibility bit in the VLAN tag to false.
<i>data</i>	User specified string that is included in the packet.
<i>num</i>	The number of packets to send during loopback. Valid range is 1– 100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

Defaults

parameter	default
drop-eligible {true false}	false
num-pkts <i>num</i>	5
<i>delay</i>	1000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When **target-endpoint** is specified then it must be learned before initiating loopback.
- When **target-endpoint** is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **drop-eligible**, **data**, **num-pkts**, and **inter-pkt-delay** are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** can be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets * inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, association, and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The **data** parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.

Examples

```
-> saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false
-> saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true data « monitor association mal »
num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false data « monitor association mal
» num-pkts 6
-> saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true inter-pkt-delay 500
```

Release History

Release 7.3.1; command was introduced.

saa type ethoam-two-way-delay

Configures SAA for ETH-DMM, including the number of packets and inter-packet delay parameters.

```
saa string type {ethoam-two-way-delay} {target-endpoint t_mepid | target-mac address mac_address}
source-endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [num-
pkts num] [inter-pkt-delay delay]
```

Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>t_mepid</i>	The ID of the destination MEP.
<i>mac_address</i>	The MAC address of the destination.
<i>s_mepid</i>	The ID of the source MEP.
<i>md_name</i>	The domain to which the source MEP belongs.
<i>ma_name</i>	The association to which the source MEP belongs.
<i>vlan_priority</i>	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
<i>num</i>	The number of packets to send during loopback. Valid range is 1– 100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

Defaults

parameter	default
<i>num</i>	5
<i>delay</i>	1000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The SAA should exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- The source MEP-ID, MD, and MA must be created before initiating DMM.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When the **target-endpoint** parameter is specified, then it must be learned before initiating DMM.
- When the **target-endpoint** parameter is specified and learned, ETH-DMM will be transmitted irrespective of whether the RMEP state is OK or failed.

- The **num-pkts** and **inter-pkt-delay** parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** values can be modified, but the **pkt-size** value cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets * inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- Target MEP/MAC, source MEP, domain, association, and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The timeout for each DMM packet is 1 sec. This value is not configurable.

Examples

```
-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain
md1 association mal vlan-priority 5
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain
md1 association mal vlan-priority 5 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 inter-pkt-delay 500
```

Release History

Release 7.3.1; command was introduced.

  alaSaaEthoamCtrlSrcMepId
  alaSaaEthoamCtrlDomainName
  alaSaaEthoamCtrlAssociationName
  alaSaaEthoamCtrlNumPkts
  alaSaaEthoamCtrlInterPktDelay
  alaSaaEthoamCtrlVlanPriority
```

saa start

Starts the SAA test.

```
saa string start [at yyyy-mm-dd,hh:mm:ss.ds]
```

Syntax Definitions

<i>string</i>	An existing SAA ID string.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to start the SAA.

Defaults

By default, the SAA test is started immediately.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the **saa stop** command to stop an SAA test that is already running.
- Use the **at** option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another **saa start** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the **saa start** command is given after an SAA is started, then the CLI will return error.
- If the SAA type is configured with a source IP that does not exist or is not active, then the packet will not be transmitted and no error will be returned. Swlogs will be updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an SAA of type 'ip-ping' is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the SAA type is configured with a source MEP that does not exist or is not active (admin down), then the packet will not be transmitted and no error will be returned on the CLI console. Swlogs will be updated.
- It is recommended that all the SAAs be rescheduled if the system time is being changed.

Examples

```
-> saa saa2 start at 2009-09-12,09:00:00  
-> saa saa4 start
```

Release History

Release 7.3.1; command was introduced.

Related Commands

saa stop

Stops the SAA test.

```
saa string stop [never | at yyyy-mm-dd,hh:mm:ss.ds]
```

Syntax Definitions

<i>string</i>	An existing SAA ID string.
never	Specifies that the SAA test will not be stopped unless the saa stop command is used with the at option.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to start the SAA.

Defaults

By default, the test is stopped immediately.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a 'started' state before giving the command unless the start and stop times are scheduled. If the SAA is not in a 'started' state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

Examples

```
-> saa saa1 stop  
-> saa saa2 stop never
```

saa xml

Configures SAA XML parameters that determine when and where an SAA XML history file is created.

saa spb [*file-name xml_filename*] [**interval** *interval*] [**admin-state** {**enable** | **disable**}]

Syntax Definitions

<i>xml_filename</i>	The name of the file where SAA history entries are stored. This file must reside in the /flash/network directory on the local switch.
<i>interval</i>	The amount of time, in minutes, between each generation of the XML history file. Valid range is from 5–15000.
enable	Enables XML history file generation.
disable	Disables XML history file generation.

Defaults

parameter	default
<i>xml_filename</i>	saa.xml
<i>interval</i>	20 minutes
admin-state { enable disable }	Disabled

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When this function is enabled, SAA will periodically generate an XML file containing the following entries:

- SAA name and ID
- Iteration number
- Last run time
- Reason
- Packets sent/Received
- RTT min/avg/max
- Jitter min/avg/max
- Subports

Examples

```
-> saa xml interval 60 admin-state enable
-> saa xml file-name switch1_saa.xml interval 120 admin-status enable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

[show saa xml](#)

show saa

Displays SAA session information.

show saa [*string* / {**descr** *description*}] [**owner** *saa_owner*]

Syntax Definitions

<i>string</i>	An existing SAA ID.
<i>description</i>	An existing SAA description string.
<i>saa_owner</i>	The owner name associated with the SAA session.

Defaults

By default, information is displayed for all SAA sessions.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *string* or **descr** *description* parameter to display information for a specific SAA.
- Use the **owner** *saa_owner* parameter to display only those sessions initiated by a specific owner. The owner of an SAA session is not user configurable, but identifies the entity that created the session.
- When an SAA is created, an owner name is assigned to the agent. This name is based on the Alcatel-Lucent application that generated the SAA and is not configurable. For example:
 - CLI SAA owner name = “USER”
 - OmniVista owner name = “OV”
 - Shortest Path Bridging owner name = “SPB” (SAA ID is SPB-*bvlan-bmac*)

Examples

```
-> show saa

show saa type config

Displays the SAA configuration for the specified SAA type.

```
show saa [string] type {mac-ping | ip-ping | ethoam-loopback | ethoam-two-way-delay} config
```

Syntax Definitions

<i>string</i>	An existing SAA ID.
mac-ping	Displays MAC Ping SAAs.
ip-ping	Displays IP Ping SAAs.
ethoam-loopback	Displays ETH-LB SAAs.
ethoam-two-way-delay	Displays ETH-DMM SAAs.

Defaults

By default, all SAAs with the specified type are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *string* parameter to display information for a specific SAA
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.

Examples

```
-> show saa type ip-ping config
SAA : saa20
  SAA-type           : ip-ping,
  Status             : started,
  Start At           : -
  Stop At            : 2010-02-08,12:00:00.0
  Description        : datacenter1,

show saa spb

Displays the SAA configuration for the Shortest Path Bridging (SPB) SAA.

show saa spb

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command displays the SAA parameters that are applied to SPB SAA sessions. Use the **show saa** command to get specific session status and information.

Examples

```
-> show saa spb
```

```
SPB creation parameters:
```

```
Auto-create           : Disabled,  
Auto-start            : Disabled,  
Interval(minutes)    : 150,  
Jitter Threshold (ms) : 0,  
RTT Threshold (ms)   : 0,  
Payload-Size (bytes) : 32,  
Num-pkts              : 5,  
Inter-pkt-delay      : 1000,  
Drop Eligible        : False,  
Vlan-priority         : 0,  
Keep                  : Disabled,  
Data                  : ""
```

Release History

Release 7.3.2; command was introduced.

Related Commands

saa spb	Configures a SPB SAA.
saa spb reset	Resets SPB SAA parameters to their default values.
saa spb flush	Clears SPB SAA sessions and rebuilds the sessions based on learned SPB information.

show saa xml

Displays the SAA XML file generation parameter configuration.

show saa xml

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show saa xml
```

```
XML file creation parameters:  
Admin status   : Disabled,  
File           : saa.xml,  
Interval       : 20
```

output definitions

Admin status	The status (Enabled or Disabled) of SAA XML history file generation.
File	The name of the XML file to which SAA writes session history entries.
Interval	The amount of time, in minutes, between each generation of the XML history file.

Release History

Release 7.3.2; command was introduced.

Related Commands

show saa statistics

Display SAA statistics.

show saa [*string*] **statistics** [**aggregate** | **history**]

Syntax Definitions

<i>string</i>	An existing SAA ID string.
aggregate	Displays aggregate results for the specified SAA.
history	Displays a results history for the specified SAA.

Defaults

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations of each SAA test and in each SAA history, iteration information of first 20 received packets are stored.
- Specify the SAA ID to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

Examples

```
-> show saa statistics
Legend: eth-lb = ethoam-loopback
       eth-dmm = ethoam-two-way-delay
       - = Delay or jitter value not available
```

Aggregate Record:

55 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1ConfigMgr.mib
Module: ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS

A summary of available commands is listed here:

reload secondary
reload slot
reload all
reload from
issu from
write memory
issu slot
reload chassis-id
copy running certified
modify running-directory
copy flash-synchro
takeover
show running-directory
show reload
show microcode
show issu status
usb
usb auto-copy
mount
umount
show usb statistics
auto-config-abort
image integrity check
image integrity get-key

reload secondary

Reloads the secondary CMM from the *certified* directory.

reload [*chassis-id chassis*] **secondary** [*in* [*hours:*] *minutes* | *at* *hour:minute* [*month day* / *day month*]]

reload secondary cancel

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>in</i> [<i>hours:</i>] <i>minutes</i>	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
<i>at</i> <i>hour:minute</i>	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i> / <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
<i>cancel</i>	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

OmniSwitch 10K

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

Release History

Release 7.1.1; command introduced.

Related Commands

[reload from](#)

reload all

Reloads both Chassis Management Modules (CMMs) from the *certified* directory.

reload [**chassis-id** *chassis*] **all** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* | *day month*]]

reload all cancel

Syntax Definitions

<i>chassis</i>	The chassis identifier.
in [<i>hours:</i>] <i>minutes</i>	Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.
at <i>hour:minute</i>	Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i> <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
cancel	Cancels a pending time delayed reload.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Can be issued from the Primary CMM only.

Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot Reloads a specific NI module.

MIB Objects

```
chasEntPhysicalTable
  chasEntPhysAdminStatus
chasGlobalControl
  chasGlobalControlDelayedResetAll
```

reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

reload [**chassis-id** *chassis*] **from** *image_dir* {**rollback-timeout** *minutes* | **no rollback-timeout** [**in** [*hours:*] *minutes* | **at** *hour:minute*] [**redundancy-time** *minutes*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>image_dir</i>	The directory that contains the image files to be loaded onto the switch.
rollback-timeout <i>minutes</i>	Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the <i>certified</i> directory. The valid range of rollback timeout minutes is 1–15.
no rollback-timeout	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
in [<i>hours:</i>] <i>minutes</i>	Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
at <i>hour:minute</i>	Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
redundancy-time <i>minutes</i>	Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the <i>certified</i> directory.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.
- If the **redundnacy-time** parameter is entered, any reboot of the Primary CMM prior to the redundancy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

Examples

```
-> reload working rollback-timeout 5
-> reload working no rollback-timeout
-> reload working no rollback-timeout in 50
-> reload working rollback-timeout 10 at 12:50
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload all Reboots both CMMs from the *certified* directory.

reload chassis-id

Reloads the specified chassis id when running in virtual chassis mode.

reload chassis-id *chassis* [**all**] [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

reload chassis-id cancel

Syntax Definitions

<i>chassis</i>	The chassis identifier.
in [<i>hours:</i>] <i>minutes</i>	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
at <i>hour:minute</i>	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i> / <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
cancel	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

Release History

Release 7.3.1; command introduced.

Related Commands

reload from Reloads both CMMs from the specified directory.

  chasEntPhysAdminStatus
chasControlRedundantTable
  chasControlDelayedRebootTimer
```

copy certified

Copies the contents of the *certified* directory to the specified directory.

copy certified *image_dir* [**make-running-directory**]

Syntax Definitions

image_dir

The directory that the contents of the *certified* directory will be copied to.

make-running-directory

Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.

Examples

```
-> copy certified mydir  
-> copy certified mydir make-running-directory
```

Release History

Release 7.1.1; command introduced.

Related Commands

chasControlModuleTable  
  chasControlVersionMngt  
  chasControlWorkingVersion
```

issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

issu from *image_dir* [**redundancy-time** *minutes*]

Syntax Definitions

image_dir Specifies the pathname for the directory that contains the image files.
redundancy-time *minutes* This parameter is not supported with the **issu** command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

Examples

```
-> issu from myissu
```

Release History

Release 7.1.1; command introduced.

Related Commands

[issu slot](#) Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

MIB Objects

```
chasEntModuleTable  
  chasControlWorkingVersion  
  chasControlRedundancyTime
```

issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

issu slot *num*

Syntax Definitions

num Specifies the slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K

Usage Guidelines

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

Examples

```
-> issu slot 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

[issu from](#) Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

```
chasEntPhysicalTable  
  entPhysicalIndex
```

write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

write memory [flash-synchro]

Syntax Definitions

flash-synchro Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the *certified* directory. Use the [show running-directory](#) command to check where the switch is running from.

Examples

```
-> write memory  
-> write memory flash-synchro
```

Release History

Release 7.1.1; command introduced.

Related Commands

[copy flash-synchro](#) Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
configManager  
  configWriteMemory
```

copy running certified

Copies the current *running* directory configuration to the *certified* directory on both CMMs.

copy running certified [flash-synchro]

Syntax Definitions

flash-synchro Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used to overwrite the contents of the *certified* directory with the configuration from the *running* directory. This should only be done if the *running* configuration has been verified.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM *certified* directory. Beginning in 7.3.1 the flash-synchro functionality is done automatically; entering the **flash-synchro** parameter is no longer required.
- In 7.3.3 the flash-synchro parameter will display an error on the OS6900 if there is no secondary CMM.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the *certified* directory. To view where the switch is running from, see the [show running-directory](#) command.
- This command may take up to two minutes to complete.

Examples

```
-> copy running certified
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; **flash-synchro** parameter no affect; the functionality is performed automatically.

Related Commands

[copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
  chasControlWorkingVersion
```

copy flash-synchro

Copies the *certified* directory version of the primary CMM software to the *certified* directory of the secondary CMM.

copy flash-synchro

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K

Usage Guidelines

- This command is used to synchronize the *certified* directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.
- This command is a shorter version of the ‘**copy running certified flash-synchro**’ command. Beginning in 7.3.1 the flash-synchro functionality is done automatically; this command is no longer required.

Examples

```
-> copy flash-synchro
-> configure copy flash-synchro
```

Release History

Release 7.1.1; command introduced.

Related Commands

[copy running certified](#)

Copies the RUNNING DIRECTORY configuration to the *certified* directory on the primary CMM.

MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
```

show running-directory

Shows the current state of version and configuration management for a CMM.

show running-directory

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Once a switch boots up and is running, it runs either from the *working*, *certified*, or a *user-defined* directory. If the switch is running from the *certified* directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.
- Depending on the switch configuration there may be a small delay before the information is displayed.

Examples

The following is an example of the display on OmniSwitch 10K switches:

```
-> show running-directory
```

```
CONFIGURATION STATUS
  Running CMM           : PRIMARY,
  CMM Mode              : MONO CMM,
  Current CMM Slot     : A,
  Running configuration : CERTIFIED,
  Certify/Restore Status : CERTIFIED,
SYNCHRONIZATION STATUS
  Flash Between CMMs   : SYNCHRONIZED
  Running Configuration : SYNCHRONIZED
BOOT STATUS
  Machine State        : SHUTDOWN
```

output definitions

Running CMM	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
CMM Mode	Whether there are one or two CMMs installed or Virtual Chassis mode.
Current CMM Slot	The slot of the primary CMM, A or B.
Running Configuration	The current RUNNING DIRECTORY.
Certify/Restore Status	Indicates if the CMM has been certified.

output definitions (continued)

Flash Between CMMs	SYNCHRONIZED: Flash between CMMs is identical. NOT SYNCHRONIZED: Flash between CMMs is not identical.
Running Configuration	SYNCHRONIZED: RUNNING CONFIGURATION has been saved to the RUNNING DIRECTORY. NOT SYNCHRONIZED: RUNNING CONFIGURATION has not been saved to the RUNNING DIRECTORY.
Machine State	SHUTDOWN - When in VC mode, this indicates the chassis has shutdown due to the 'virtual-chassis shutdown' command or when the chassis has shutdown due to a VC error. It is only displayed if the chassis is in the shutdown state.

Release History

Release 7.1.1; command introduced.

Related Commands

reload all	Reboots the switch.
copy flash-synchro	Copies the <i>certified</i> directory version of the primary CMM software to the <i>certified</i> directory of the secondary CMM.

MIB Objects

```

chasControlModuleTable
  chasControlSynchronizationStatus
  chasControlCertifyStatus
  chasControlRunningVersion
chasEntPhysicalTable
  chasEntPhysOperStatus
  entPhysicalIndex
chasControlReloadTable
  chasControlReloadStatus

```

show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

show reload [[*chassis-id chassis*] [*status | all status*]]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
status	Displays whether or not either of the CMMs are scheduled for a reload.
all status	Displays whether or all the modules are scheduled for a reload.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload secondary	Reboots the primary or secondary CMM to its startup software configuration.
reload from	Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

MIB Objects

chasControlModuleTable

 chasControlDelayedActivateTimer

chasGlobalControl

 chasGlobalControlDelayedResetAll

show microcode

Displays microcode versions installed on the switch.

show microcode [**working** | **certified** | **loaded** | **issu** | *image_dir*]

Syntax Definitions

working	Specifies the <i>working</i> directory.
certified	The chassis identifier when running in virtual chassis mode.
loaded	Specifies the loaded (i.e., currently-active) microcode versions.
issu	Specifies the <i>issu</i> directory.
<i>image_dir</i>	Specifies the <i>user-defined</i> directory.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no additional parameters are entered microcode information for the RUNNING CONFIGURATION is displayed.

Examples

```
-> show microcode
Package           Release           Size           Description
-----+-----+-----+-----
Ros.img           7.1.1.403.R01    1828255       Alcatel-Lucent OS
Reni.img          7.1.1.403.R01    1359435       Alcatel-Lucent NI
```

output definitions

Package	File name.
Release	Version number.
Size	File size.
Description	File description.

Release History

Release 7.1.1; command introduced.

Related Commands**usb**

Displays the archive history for microcode versions installed on the switch.

MIB ObjectsN/A

usb

Enables access to the device connected to the USB port.

usb {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Must use an Alcatel-Lucent certified USB device.
- If a Alcatel-Lucent certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

usb auto-copy

Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

MIB Objects

```
systemServices
  systemServicesUsbEnable
```

usb auto-copy

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

usb auto-copy {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the automatic copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/10000/working* or */uflash/6900/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.

Examples

```
-> usb auto-copy enable  
-> usb auto-copy disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands**usb**

Enables access to the device connected to the USB interface.

show usb statistics

Displays the status USB setting and features.

show usb statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show usb statistics
Filesystem          1K-blocks      Used Available Use% Mounted on
/dev/sdb1           500732         261216    239516   52% /vroot/uflash
  Host scsi6: usb-storage
    Vendor: Alcatel-Lucent
    Product: USB
  Serial Number: AA04012700031693
    Protocol: Transparent SCSI
    Transport: Bulk
      usb: enabled
usb auto-copy: disable
auto-copy in progress: No
```

output definitions

usb	Status of USB device interface.
usb auto-copy	Status of USB auto-copy feature.
auto-copy in progress	Is the switch currently in the process of performing an auto-upgrade.

Release History

Release 7.1.1; command was introduced.

Related Commands

usb	Enables access to the device connected to the USB interface.
usb auto-copy	Allows backup files from the USB device to be automatically copied to the switch immediately after the USB device is connected.
mount	Mounts the /uflash file system.

MIB Objects

```

  systemServicesUsbDisasterRecoveryEnable
```

show issu status

Displays the status of ISSU.

show issu status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Pending
 2         ISSU Pending
 3         ISSU Pending
```

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Complete
 2         ISSU Complete
 3         ISSU Complete
```

output definitions

Slot	Specifies the slot number.
ISSU-Status	Indicates the ISSU status for a slot: Pending - Slot has not been reset; upgrade is not complete. Complete - Slot has been reset; upgrade is complete.

Release History

Release 7.1.1; command was introduced.

Related Commands**issu from**

Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

N/A

auto-config-abort

Aborts the Automatic Remote Configuration download process.

auto-config-abort

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use this command to stop the Automatic Remote Configuration download process.

Examples

```
-> auto-config-abort
```

Release History

Release 7.3.4; command was introduced.

Related Commands

N/A

MIB Objects

N/A

image integrity check

Verifies whether the SHA256 hash key of an image file located in the specified directory matches the SHA256 hash key in the specified key file.

image integrity check *image_dir* **key-file** *filename*

Syntax Definitions

<i>image_dir</i>	The directory on the switch that contains the image file to verify. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).
<i>filename</i>	The name of the file that contains the key for the image file in the specified directory. Enter the name of the key file or include the full path (for example, “hash.txt” or “/flash/hash.txt”).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the name of the key file is specified without the directory path, the switch will look for the key file in the same directory specified for the image file.
- The following format is used to store the hash key values in the key file:
Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

Example

```
-> image integrity check /flash/working key-file /flash/hash.txt  
This operation may take several minutes...
```

```
Success: Key matched.
```

Release History

Release 8.3.1; command introduced.

Related Commands**[image integrity get-key](#)**

Calculates and displays the SHA256 key for image files.

MIB Objects

```
systemServicesAction  
systemServicesArg1  
systemServicesArg2
```

image integrity get-key

Displays the SHA256 hash key of the image present in the specified location.

image integrity get-key *image_dir*

Syntax Definitions

image_dir The directory on the switch that contains the image file. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When this command is entered, the SHA256 hash of the image files in the specified directory is calculated and displayed. It can be manually verified against the hash provided in the file.
- To store the hash key value in a text file that can be used with the **image file integrity check** command, use the following format:
Uos.img:f0ff173eff38e43e0598663da2185a363fcb5bd407201d7537d0a6b9f58670e

Example

```
-> image integrity get-key /working
This operation may take several minutes...
```

```
Image Name                      SHA256 Key
-----+-----
Uos.img                      c64d6b23312a6f9c4b99642b31ed0e87e600bce58d6fdd089d09e1f8077bd208
```

```
-> image integrity get-key /flash/certified
This operation may take several minutes...
```

```
Image Name                      SHA256 Key
-----+-----
Uos.img                      3d4d488a73eb798325bacb5793ef0d67bdf377527278a6732270d3a4801bb44b
```

Release History

Release 8.3.1; command introduced.

Related Commands**[image integrity check](#)**

Verifies the SHA256 hash key for the image file matches the key specified in a text file.

MIB Objects

```
systemServicesAction  
systemServicesArg1  
systemServicesArg2
```

56 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

Additional Information. Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

MIB information for the Chassis Management and Monitoring commands is as follows:

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1System.MIB
Module: ALCATEL-IND1-SYSTEM-MIB

A summary of available commands is listed here:

Management Commands	<code>system contact</code> <code>system name</code> <code>system location</code> <code>system date</code> <code>system time</code> <code>system timezone</code> <code>system daylight-savings-time</code> <code>update uboot</code> <code>update fpga-cpld</code> <code>reload slot</code> <code>power slot</code> <code>temp-threshold</code> <code>powersupply enable</code> <code>powersupply powersave</code> <code>hash-control</code> <code>bluetooth</code>
Monitoring Commands	<code>license</code> <code>show hardware-info</code> <code>show chassis</code> <code>show cmm</code> <code>show slot</code> <code>show module</code> <code>show module long</code> <code>show module status</code> <code>show powersupply</code> <code>show fan</code> <code>show fantray</code> <code>show temperature</code> <code>show hash-control</code> <code>show bluetooth status</code> <code>show me</code> <code>show tcam utilization</code> <code>show tcam utilization detail</code> <code>show tcam app-groups</code>
Licensing Commands	<code>license</code> <code>show license-info</code>

system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

system contact *text_string*

Syntax Definitions

text_string

The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “**Jean Smith Ext. 477 jsmith@company.com**”.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"  
-> system contact engineering-test@company.com
```

Release History

Release 7.1.1; command introduced.

Related Commands

system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.
license	Displays the basic system information for the switch.

MIB Objects

system
systemContact

system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

system name *text_string*

Syntax Definitions

text_string The new system name. The system name can range from 1 to 32 characters in length. No spaces are allowed in the system name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Spaces are not allowed in the system name.

Examples

```
-> system name OmniSwitch10K
-> system name OS10K
```

Release History

Release 7.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact of the switch (for example, an individual or a department).
system location	Specifies the current physical location of the switch.
license	Displays the basic system information for the switch.

MIB Objects

system
 systemName

system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

system location *text_string*

Syntax Definitions

text_string

The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “**NMS Test Lab**”.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> system location "NMS Test Lab"  
-> system location TestLab
```

Release History

Release 7.1.1; command introduced.

Related Commands

[system contact](#)

Specifies the administrative contact of the switch (for example, an individual or a department).

[system name](#)

Modifies the current system name of the switch.

[license](#)

Displays the basic system information for the switch.

MIB Objects

system

systemLocation

system date

Displays or modifies the current system date on the switch.

system date [*mm/dd/yyyy*]

Syntax Definitions

mm/dd/yyyy

The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the [system timezone command on page 56-8](#).

Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

Release History

Release 7.1.1; command introduced.

Related Commands

[system time](#)

Displays or modifies the current system time on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

MIB Objects

```
systemServices
  systemServicesDate
```

system time

Displays or modifies the switch current system time.

system time [*hh:mm:ss*]

Syntax Definitions

hh:mm:ss

The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If you do not specify a new system time in the command line, the current system time is displayed.
- Setting the year to 1970 is not supported. The system interprets 1970 as meaning the internal clock has never been set and will reset to the year 2014.

Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

Release History

Release 7.1.1; command introduced.

Related Commands

[system date](#)

Displays or modifies the current system date on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

MIB Objects

systemServices

systemServicesTime

system timezone

Displays or modifies the time zone for the switch.

system timezone [*timezone_abbrev*]

Syntax Definitions

timezone_abbrev Specifies a time zone for the switch and sets the system clock to run on UTC. If you specify a time zone abbreviation, the hours offset from UTC is automatically calculated by the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

Examples

```
-> system timezone mst
```

Release History

Release 7.1.1; command introduced.

Related Commands

[system date](#) Displays or modifies the current system date on the switch.
[system time](#) Displays or modifies the current system time on the switch.

MIB Objects

systemServices

- systemServicesTimezone
- systemServicesTimezoneStartWeek
- systemServicesTimezoneStartDay
- systemServicesTimezoneStartMonth
- systemServicesTimezoneStartTime
- systemServicesTimezoneOffset
- systemServicesTimezoneEndWeek
- systemServicesTimezoneEndDay
- systemServicesTimezoneEndMonth
- systemServicesTimezoneEndTime
- systemServicesEnabledDST

system daylight-savings-time

Displays the Daylight Savings Time (DST) setting for the configured timezone.

system daylight-savings-time [enable | disable]

Syntax Definitions

enable | disable enable

Defaults

parameter	default
Timezone supports DST	enabled
Timezone does not support DST	disabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the configured timezone supports DST it is automatically enabled.
- If the configured timezone does not support DST it is automatically disabled.

Examples

```
-> system daylight-savings-time  
Daylight Savings Time (DST) is ENABLED.
```

Release History

Release 7.1.1; command introduced.

Related Commands

system time	Displays or modifies the current system time on the switch.
system timezone	Displays or modifies the timezone for the switch.
system date	Displays or modifies the current system date on the switch.

MIB Objects

```
systemServices  
  systemServicesTimezone  
  systemServicesEnabledDST
```

update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update uboot {cmm *slot* | ni {all | *slot*} file *filename*}

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM).
all	Specifies that the update is performed for all slots within a chassis.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

Examples

```
-> update uboot ni all file 9999.tar.gz
-> update uboot cmm 1 file /flash/temp/9999.tar.gz
```

Release History

Release 7.1.1; command introduced.

Related Commands

[reload slot](#) Reloads the specified NI module.

MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

update fpga-cpld

Updates the FPGA/CPLD versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

```
update fpga-cpld {cmm slot| ni {daughter | slot } file filename}
```

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM).
daughter	Specifies the number of the daughter board on the NI module.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

Examples

```
OS10K-> update fpga-cpld ni 4 file 9999.vme
OS10K-> update fpga-cpld cmm 1 file /flash/temp/9999.vme
```

Release History

Release 7.1.1; command introduced.
Release 7.3.4; **fpga** parameter changed to **fpga-cpld**.

Related Commands

reload slot Reloads the specified NI module.

MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

reload slot

Reloads or reboots a specified Network Interface (NI) module.

reload slot *slot*

Syntax Definitions

slot Specifies the slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The **reload slot** command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected

Examples

```
-> reload slot 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.
power slot	Turns the power on or off for a specified Network Interface (NI) module.
show slot	Shows the hardware information and the current status for Network Interface (NI) modules currently running in the chassis.

MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  reset
```

power slot

Turns the power on or off for a specified Network Interface (NI) module.

power slot *chassis/slot*

no power slot *chassis/slot*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The chassis slot number containing the NI module being powered on or off.

Defaults

N/A

Platforms Supported

OmniSwitch 10K

Usage Guidelines

Use the **no** form of this command to power off an NI module.

Examples

```
-> power slot 1  
-> power slot 7
```

Release History

Release 7.1.1; command introduced.

Related Commands

reload slot	Reloads the specified NI module.
show slot	Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  powerOn  
  powerOff
```

powersupply enable

Enables the power supply unit identified by the PSU-ID.

powersupply enable [*slot*]

no powersupply enable [*slot*]

Syntax Definitions

slot Slot number of power supply.

Defaults

N/A

Platforms Supported

OmniSwitch 10K

Usage Guidelines

N/A

Release History

Release 7.1.1; command introduced.

Related Commands

power slot Turns the power on or off for a specified Network Interface (NI) module.

MIB Objects

N/A

powersupply powersave

Enables the power saving functionality on the switch.

powersupply powersave {enable | disable}

Syntax Definitions

enable | disable Enables or disables the power saving functionality.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K

Usage Guidelines

- When enabled unneeded power-supplies are shut down to conserve energy, only the power supplies required to provide N+1 redundancy remain on.
- If enabled and power is lost to all active power supplies simultaneously the switch will lose power since N+1 redundancy applies only to the active power supplies.
- If the power-save mode is disabled, all available power supplies are switched on at all times.

Release History

Release 7.1.1; command introduced.

Related Commands

[show powersupply](#) Displays the hardware information and current status for chassis power supplies.

MIB Objects

chasEntPhysicalTable
chasEntPhysAdminStatus

hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}

hash-control extended no udp-tcp-port

Syntax Definitions

brief	Sets hashing to brief mode.
extended	Sets hashing to extended mode.
udp-tcp-port	Sets extending hashing to use UDP/TCP ports.
enable disable	Enables or disables the load balancing of non-unicast traffic on a link aggregate.

Defaults

parameter	default
hash-control	brief
udp-tcp-port	disabled
non-ucast	disabled

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

Release History

Release 7.2.1; command introduced.

Related Commands

[show hash-control](#) Displays the current hash control setting for the switch.

MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

bluetooth

Enables or disables bluetooth connectivity and configures bluetooth power level.

bluetooth {admin-state [enable | disable] | transmit-power [low | high]}

Syntax Definitions

enable | disable Enables or disables the bluetooth interface.
low | high Configures the bluetooth power level to low or high.

Defaults

parameter	default
enable / disable	enable
low high	low

Platforms Supported

OmniSwitch 6860

Usage Guidelines

This command will configure all USB interfaces in a virtual chassis.

Examples

```
-> bluetooth admin-state enable
-> bluetooth transmit-power high
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show bluetooth status Displays the current bluetooth settings.
show me Executes an LED blink pattern for 10 seconds that is used by the bluetooth application to identify the connected switch.

MIB Objects

```
systemServices
  systemServicesUsbEnable
  systemServicesBluetoothTxPower

output definitions

System Description	The description for the current system. This description shows the current software version and the system date.
System Object ID	The SNMP object identifier for the switch.
System Up Time	The amount of time the switch has been running since the last system reboot.
System Contact	An user-defined administrative contact for the switch. This field is modified using the system contact command.
System Name	A user-defined text description for the switch. This field is modified using the system name command.

output definitions (continued)

System Location	The user-defined physical location of the switch. This field is modified using the system location command.
System Services	The number of current system services.
System Date & Time	The current system date and time. This field is modified using the system date and system time commands.
Flash Space: Primary CMM: Available (bytes)	The available flash memory space available on the <i>primary</i> management module of the switch.
Flash Space: Primary CMM: Comments	Comments regarding the available flash memory space available on the primary management module of the switch, if applicable.

Release History

Release 7.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact for the switch(for example, an individual or a department).
system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.

MIB Objects

```
system
  systemContact
  systemName
  systemLocation
```

show hardware-info

Displays the current system hardware information. Includes CPU, flash, RAM, NVRAM battery, jumper positions, BootROM, and miniboot and FPGA information.

show hardware info

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show hardware-info
CPU Type                : PowerPC 8245,
Flash Manufacturer      : TOSHIBA,
Flash size              : 67108864 bytes (64 MB),
RAM Manufacturer        : (null),
RAM size                : 268435456 bytes (256 MB),
NVRAM Battery OK ?     : YES,
BootROM Version         : 6.1.2.20.R02 ,
Backup Miniboot Version : 6.1.2.20.R02,
Default Miniboot Version : 6.1.2.20.R02,
Product ID Register     : 54
Hardware Revision Register : 00
CPLD Revision Register  : 06
XFP Module ID           : 02
```

output definitions

CPU Type	The manufacturer and model number of the CPU used on the CMM.
Flash Manufacturer	The manufacturer of the flash memory used on the CMM.
Flash size	The total amount of flash memory (file space) on the CMM. This field specifies the total flash memory size only and does not indicate the amount of memory free or memory used.
RAM Manufacturer	The manufacturer of the RAM memory used on the CMM.
RAM size	The total amount of RAM memory on the CMM. This field specifies the total RAM memory only and does not indicate the amount of memory free or memory used.

output definitions (continued)

NVRAM Battery OK	The current status of the NVRAM battery. If the battery is OK, YES is displayed in this field. If the battery charge becomes low, NO is displayed in this field.
BootROM Version	The current BootROM version.
Backup Miniboot Version	The current backup miniboot version.
Default Miniboot Version	The current default miniboot version.
Product ID Register	The register number of the product ID.
Hardware Revision Register	The register number of the hardware revision.
CPLD Revision Register	The register number of the CPLD revision.
XFP Module ID	The ID number of the XFP module.

Release History

Release 7.1.1; command introduced.

Related Commands

Examples

-> show chassis

```
Chassis 1
  Model Name:                OS10K,
  Description:               Chassis,
  Part Number:               902274-10,
  Hardware Revision:         002,
  Serial Number:             E23L9052,
  Manufacture Date:          JUN 09 2004,
  Admin Status:              POWER ON,
  Operational Status:        UP,
  Free Slots:                 5,
  Power Left:                 200,
  Number Of Resets:          115,
  MAC Address                 00:d0:95:87:14:33
```

output definitions

Model Name	The factory-set model name for the switch. This field cannot be modified.
Description	The factory-set description for the switch. This field cannot be modified.
Part Number	The Alcatel-Lucent part number for the chassis.
Hardware Revision	The hardware revision level for the chassis.
Serial Number	The Alcatel-Lucent serial number for the chassis.
Manufacture Date	The date the chassis was manufactured.
Admin Status	The current power status of the chassis. Chassis information is obtained from a running CMM. Hence the value is always POWER ON.

output definitions (continued)

Operational Status	The current operational status of the chassis.
Free Slots	The number of free slots available for NIs.
Power Left	The power remaining for additional NIs.
Number of Resets	The number of times the CMM has been reset (reloaded or rebooted) since the last cold boot of the switch.
MAC Address	The base MAC address of the chassis.

Release History

Release 7.1.1; command introduced.

Related Commands

show hardware-info	Displays the current system hardware information.
show powersupply	Displays the hardware information and current status for chassis power supplies.
show fan	Displays the current operating status of chassis fans.

MIB Objects

```
chasChassisTable
  chasFreeSlots
  chasPowerLeft
```

show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch.

show cmm [*slot*]

Syntax Definitions

slot Specifies the CMM by slot number or letter.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

Examples

```
-> show cmm 1
Module in slot CMM-A
  Model Name:           OS10K,
  Description:          CMM,
  Part Number:          902271-10,
  Hardware Revision:    002,
  Serial Number:        E23L9059,
  Manufacture Date:     JUN 08 2004,
  FPGA Physical-1      December 24 2009,
  Admin Status:         POWER ON,
  Operational Status:   UP,
  Power Consumption:    888,
  CPU Model             MPC8572 Motorola,
  MAC Address:          00:d0:95:a3:e5:09,
```

output definitions

Model Name	The model name of the switch. Note that on chassis-based switches, CMM modules are made up of two major subcomponents: the fabric board and the processor board. Fabric boards are denoted as OS10*00-CMM and processor boards are denoted as CMM-PROC. Information for each board is displayed separately.
Description	A factory-defined description of the associated board (for example, BBUS Bridge or PROCESSOR).
Part Number	The Alcatel-Lucent part number for the board.
Hardware Revision	The hardware revision level for the board.
Serial Number	The Alcatel-Lucent serial number for the board.

output definitions (continued)

Manufacture Date	The date the board was manufactured.
FPGA Physical-1	FPGA version.
Admin Status	The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON.
Operational Status	The current operational status of the CMM.
Power Consumption	The current power consumption for the CMM.
CPU Model	The CPU Model type.
MAC Address	The MAC address assigned to the chassis.

Release History

Release 7.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.
show slot	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
show module	Displays the basic information for either a specified module or all the modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.
license	Displays the status and configuration of Switch Fabric Modules (SFMs) on chassis-based switches.

MIB Objects

N/A

show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

show slot [*slot*]

Syntax Definitions

slot The slot number for a specific NI module installed in the chassis. If no slot number is specified, information for all the NI modules is displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

Examples

```
-> show slot 1
Module in slot 1
  Model Name:           OS10-GNI-C48,
  Description:         10-1000 RJ45,
  Part Number:         902434-90,
  Hardware Revision:   A07,
  Serial Number:       H03Q0008,
  Manufacture Date:    JAN 31 2007,
  FPGA - Physical 1:   007,
  Daughter FPGA - Physical 1: 002,
  Daughter FPGA - Physical 2: 002,
  Admin Status:        POWER ON,
  Operational Status:  UP,
  Power Consumption:   200,
  CPU Model Type      : Motorola MPC854
  MAC Address:         00:d0:95:01:04:
  ASIC - Physical 1:   BCM56620_A1,
  ASIC - Physical 2:   BCM56620_A1,
  ASIC - Physical 3:   BCM56620_A1,
  ASIC - Physical 4:   BCM56620_A1,
  ASIC - Physical 5:   BCM56620_A1,
  ASIC - Physical 6:   BCM56620_A1,
  UBOOT Version:      7.1.1.412.R01,
```

output definitions

Model Name	The NI module name. For example, OS9-GNI-C24 indicates a twenty four-port 10/100/1000BaseT Ethernet module.
Description	A general description of the NI. For example, 24pt 10/100/1000BaseT Mod indicates a twenty four-port 10/100/1000BaseT Ethernet module.
Part Number	The Alcatel-Lucent part number for the NI.
Hardware Revision	The hardware revision level for the NI.
Serial Number	The Alcatel-Lucent serial number for the NI printed circuit board (PCB).
Manufacture Date	The date the NI was manufactured.
FPGA/Daughter FPGA	The FPGA versions.
Admin Status	The current power status of the NI. Options include POWER ON or POWER OFF.
Operational Status	The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
Power Consumption	The current power consumption for the module.
CPU Model Type	The CPU model type.
MAC Address	The MAC address assigned to the NI.
ASIC - Physical	General information regarding the NI module ASICs.
UBOOT Version	UBOOT version of the NI.

Release History

Release 7.1.1; command introduced.

Related Commands

Slot   Status      Admin-Status  Rev      MAC
-----+-----+-----+-----+-----
CMM-A  UP            POWER ON     N/A     00:d0:95:a3:e5:09
SLOT-1 UP            POWER ON     N/A     00:d0:95:a3:e5:0b
```

output definitions

Slot	The chassis slot position of the module. For detailed slot numbering information, refer to the “Chassis and Power Supplies” chapter of the <i>Hardware User Guide</i> . Refer to page 56-28 for additional information on CMM callouts.
Operational Status	The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
Admin-Status	The current power status of the module. Options include POWER ON or POWER OFF.
Firmware Rev	The firmware version for module ASICs.
MAC	For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.

Release History

Release 7.1.1; command introduced.

Related Commands

[show module](#)

Displays the basic information for either a specified module or all the modules installed in the chassis.

[show module long](#)

Displays the detailed information for either a specified module or all the modules installed in the chassis.

MIB Objects

N/A

show powersupply

Displays the hardware information and current status for chassis power supplies.

show powersupply [*slot*] [**powersave status**]

Syntax Definitions

slot The slot number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.

powersave status Displays the status of the power saving functionality.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Power supplies 5-8 are for the optional power supply shelf on OS10K.
- The power-save feature is only supported on the OS10K.

Examples

```
-> show powersupply
```

Slot	PS	Total Power	Power Used	Input Voltage	PS Type	Status	Location
1		2400	0	0	AC	UP	Internal
2		2400	0	0	AC	UNPLUG	Internal
3		2400	564	226	AC	UP	Internal
4		2400	504	226	AC	UP	Internal
5		--	--	--	--	--	--
6		--	--	--	--	--	--
7		--	--	--	--	--	--
8		--	--	--	--	--	--

```
-> show powersupply
```

Slot	PS	Total Power	Power Used	PS Type	Status	Location	Airflow
1		450	201	AC	UP	Internal	Front to Rear
2		450	50	AC	UP	Internal	Front to Rear

```
-> show powersupply 1
```

```
Module in slot PS-1
  Model Name:          YM-2451DDR,
  Module Type:        DC/DC Power Supply, Front to Rear Airflow
  Description:        OS-PS-450W-D
  Hardware Revision:  B0,
  Serial Number:      1020000417,
  Manufacture Date:   May 14 2010,
  Operational Status: UP,
  Power Provision:    450W
```

output definitions

Model Name	The power supply model number.
Description	A description of the associated power supply. This field reflects the model name in most cases.
Part Number	The Alcatel-Lucent part number for the power supply.
Hardware Revision	The hardware revision level for the power supply.
Serial Number	The Alcatel-Lucent serial number for the power supply.
Manufacture Date	The date the power supply was manufactured.
Operational Status	The operational status of the power supply. Options include UP or DOWN.
Power Provision	The number of watts provided by this power supply.
PS	The slot number of the power supply.
Total Power	The number of watts provided by this power supply.
Power Used	The number of watts being used by this power supply.
Input Voltage	The input line voltage of this power supply.
PS type	The type of power supply. AC or DC.
Operational Status	The operational status of the power supply. Options include UP, DOWN, or UNPLUG.
Location	The location of the power supply. Options include Internal or External. Slots 5-8 are for the optional power shelf.
Airflow	Direction of airflow.

Release History

Release 7.1.1; command introduced.

Related Commands

[show chassis](#) Displays the basic configuration and status information for the switch chassis.

MIB Objects

N/A

show fan

Displays the current operating status of chassis fans.

show fan [*slot*]

Syntax Definitions

slot Specifies the slot number of the fantray.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guideline

N/A

Examples

```
-> show fan
Chassis Fan  Status
-----+-----
  1      1  Running
  1      2  Running
  1      3  Running
  1      4  Not Running
```

output definitions

Chassis/Tray	The chassis/tray ID.
Fan	The fan number describing the fan position.
Status/Functional	The current operational status of the corresponding fan.
Speed	The speed of the fan.
Airflow	-

Release History

Release 7.1.1; command introduced.

Related Commands**show fantray**

Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

MIB Objects

N/A

show fantray

Displays the current operating status of chassis fantrays.

show fantray [*slot*]

Syntax Definitions

slot Specifies the slot number of the fantray.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guideline

N/A

Examples

```
-> show fantray
      | Working | Fan
Tray | Status | Fans | Load %
-----+-----+-----+-----
  1   ON   4    50
```

output definitions

Chassis/Tray	The chassis/Tray ID.
Status	The current operational status of the fantray.
Working Fans	The number of working fans.
Fan Load %	The load of the fantray.

Release History

Release 7.1.1; command introduced.

Related Commands

[show fantray](#) Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

MIB Objects

N/A

show temperature

Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

show temperature [**fabric** *[index]*] | **slot** *[index]*] | **fantray** *[index]*] | **cmm** *[index | cmm_letter]*] | **chassis-id** *chassis]*

Syntax Definitions

<i>index</i>	Specifies the index number.
<i>cmm_letter</i>	Specifies the CMM letter.
<i>chassis</i>	The ID number of the chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Refer to the appropriate *Hardware Users Guide* for detailed information about temperature thresholds for a specific OmniSwitch model.

Examples

```
-> show temperature
Chassis/Device | Current | Range | Danger | Thresh | Status
-----+-----+-----+-----+-----+-----
1/CMM          | 25      | 15-89 | 89     | 64     | UNDER THRESHOLD
```

output definitions

Chassis/Device	The device being measured (CMM, Fabric, or NI)
Current	The current CPU temperature in Celsius.
Range	The supported threshold range.
Danger	The danger threshold value. This value is based on the switch model and is not configurable.
Thresh	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.
Status	Whether the current temperature has reached the threshold.

Release History

Release 7.1.1; command introduced.

Related Commands

[temp-threshold](#)

Sets the chassis warning temperature threshold.

[show fan](#)

Shows the hardware information and current status for the chassis fans.

 chasDangerTempThreshold

show hash-control

Displays the current hash control settings for the switch.

show hash-control [non-ucast]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

N/A

Examples

```
-> show hash-control
Hash Mode      = brief,
Udp-Tcp-Port  = disabled
```

```
-> show hash-control non-ucast
Hash Status = Enabled,
Hash Mode : Normal
```

output definitions

Hash Mode	The current Hash Mode.
Udp-Tcp-Port	Status of UDP/TCP hashing.
Non-ucast Hash Status	Status of Non-ucast Hash status.

Release History

Release 7.2.1; command introduced.

Related Commands

[hash-control](#) Configures the hash mode of the switch.

MIB Objects

alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

show license-info

Displays all the licensed applications installed on the switch.

show license-info

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.
- The module type will continue to display as 'U16L' even after upgrading a 'U16' to a 'U16E'.

Examples

```
->show license-info
```

VC	Device	License	Type	Time (Days) Remaining
0	0	Advanced	Permanent	NA

output definitions

VC	Virtual chassis identifier.
Device	Slot number of NI.
License	Displays the feature license installed on the switch. Advanced, Data Center, U16L
Type	The type of license: Demo or Permanent.
Time (Days) Remaining	Time of days remaining for a demo license. Display as 'NA' for permanent licenses.

Release History

Release 7.2.1; command was introduced.

Related Commands

[license](#) Activates the license for licensed protocols on the switch.

MIB Objects

```
alaVcCapManSwLicensingInfoTable  
  alaVcLicensedvcSlot  
  alaVcLicensedMask

```

show bluetooth status

Displays the current bluetooth configuration.

show bluetooth status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guideline

N/A

Examples

```
-> show bluetooth status
Admin Status      : disabled,
Transmit Power    : low,
```

```
Chassis      Operational Status
-----+-----
1            Not Present
```

output definitions

Admin Status	Whether bluetooth is enabled or disabled.
Transmit Power	Whether transmit power is high or low.
Chassis	The chassis identifier.
Operational Status	notPresent - No bluetooth device present. connectionInactive - Bluetooth device present but inactive. connectionActive - Bluetooth device present and active.

Release History

Release 8.1.1; command introduced.

Related Commands**bluetooth**

Enables or disables bluetooth connectivity and configures bluetooth power level.

MIB Objects

N/A

show me

Executes an LED blink pattern for 10 seconds that is used by the bluetooth application to identify the connected switch.

show me

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guideline

Use this command in a virtual chassis to identify which switch currently has bluetooth connectivity.

Examples

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

Release History

Release 8.1.1; command introduced.

Related Commands

[bluetooth](#) Enables or disables bluetooth connectivity and configures bluetooth power level.

MIB Objects

N/A

show tcam utilization

Displays runtime information about the Ternary Content Addressable Memory (TCAM) utilization for each stage of each TCAM on each slot of the switch.

show tcam utilization [*chassis/slot*] [*chassis/slot/tcam*]

Syntax Definitions

chassis/slot A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

chassis/slot/tcam A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

Defaults

By default, TCAM utilization is displayed for the entire switch.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- The utilization is represented in terms of the minimum-sized entry supported by the TCAM.
- This command replaces the **show qos slice** command only on the OmniSwitch 9900; the **show qos slice** command is still available on the other OmniSwitch platforms.

Examples

```
-> show tcam utilization
```

57 Chassis MAC Server (CMS) Commands

The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:

- Base chassis MAC address
- Ethernet Management Port (EMP)
- VLAN router ports

Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.

The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.

MIB information for the Chassis MAC Server commands is as follows:

Filename: AlcatelIND1MacServer.MIB
Module: Alcatel-IND1-MAC-SERVER-MIB

A summary of the available commands is listed here:

mac-range eeprom
show mac-range
show mac-range alloc

mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

Note. Use caution when modifying the default MAC range. Improper use of this command can disable your system and adversely affect your network. Contact Alcatel-Lucent Customer Support for further assistance.

mac-range eeprom *start_mac_address count*

Syntax Definitions

<i>start_mac_address</i>	The first MAC address in the modified range. Enter the MAC address in the following format: xx:xx:xx:xx:xx:xx , where x is a hex value (0–f).
<i>count</i>	Specifies the number of MAC addresses in the range (1–256).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Because the factory-installed 32 MAC addresses are sufficient for most network configurations, this command should only be used by qualified network administrators for special network requirements.
- After modifying a MAC address range by using the **mac-range eeprom** command, you must reboot the switch. Otherwise, MAC addresses for existing VLAN router ports will not be allocated properly.
- All MAC addresses in a range must be contiguous (i.e., there cannot be any gaps in the sequence of MAC addresses).

Examples

```
-> mac-range eeprom 00:20:da:23:45:35 32
```

Release History

Release 7.1.1; command introduced.

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Because the switch currently supports one MAC address range only, index position 1 displays.

Examples

```
-> show mac range
```

Mac Range	Row Status	Local/Global	Start Mac Addr	End Mac Addr
01	ACTIVE	GLOBAL	00:d0:95:6a:79:6e	00:d0:95:6a:79:8d

output definitions

Mac Range	The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.
Row Status	The current status of the MAC range. The status ACTIVE refers to MAC addresses that are available for allocation to VLAN router ports and other applications.
Local/Global	The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as <i>EEPROM</i> MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays.
Start Mac Addr	The first MAC address in the MAC address range.
End Mac Addr	The last MAC address in the MAC address range.

Release History

Release 7.1.1; command introduced.

Related Commands

mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

MIB Objects

```
chasMacAddressRangeTable
  chasMacRangeIndex
  chasGlobalLocal
  chasMacAddressStart
  chasMacAddressCount
  chasMacRowStatus
```

show mac-range alloc

Displays all allocated addresses from the MAC range table.

show mac-range [*index*] **alloc**

Syntax Definitions

index Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show mac-range alloc
Range      Mac Address          Application      Id
-----+-----+-----+-----
01         00:d0:95:6b:09:40  CHASSIS         0
01         00:d0:95:6b:09:41  802.1X          0
01         00:d0:95:6b:09:5f  CHASSIS         1
```

output definitions

Range	The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to page 57-4 for more information.
Mac Address	Current MAC address allocated for a specific application.

output definitions (continued)

Application	The application for which the allocated MAC address is being used. Current options include VLAN , 802.1X , and CHASSIS . VLAN refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. CHASSIS refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).
Id	An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

Release History

Release 7.1.1; command introduced.

58 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

Filename: AlcatelIND1Ntp.mib
Module: alcatelIND1NTPMIB

A summary of available commands is listed here:

ntp server
ntp server synchronized
ntp server unsynchronized
ntp client
ntp src-ip preferred
ntp broadcast
ntp broadcast-client
ntp broadcast-delay
ntp key
ntp key load
ntp authenticate
ntp master
ntp interface
ntp max-associations
ntp broadcast
ntp peer
ntp vrf-name
show ntp status
show ntp client
show ntp client server-list
show ntp server client-list
show ntp server status
show ntp keys
show ntp peers
show ntp server disabled-interfaces

ntp server

Specifies an NTP server from which the switch will receive updates.

ntp server {*ip_address*} [**key** *key_id*] [**minpoll** *poll*] [**version** *version*] [**prefer**]

no ntp server {*ip_address*}

Syntax Definitions

<i>ip_address</i>	The IP address of the NTP server to be added or deleted to the client's server list.
<i>key_id</i>	The key identification number that corresponds to the specified NTP server. The value ranges from 1 to 65534.
<i>poll</i>	It specifies the minimum polling interval for NTP message. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The maximum poll interval is fixed at 10 (1,024 s). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 4 (16 s), or increase to the maximum limit of 10.
<i>version</i>	The version of NTP being used. This will be 1, 2, 3, or 4.
prefer	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.

Defaults

Parameter	Default
<i>version</i>	4
<i>exponent</i>	6
prefer	not preferred

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The client will poll the server for a time update when the **minpoll** time is exceeded.
- NTP authentication must be disabled before adding or removing an NTP server.

Examples

```
-> ntp server 1.1.1.1
-> ntp server spartacus
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server spartacus minpoll 5
-> no ntp server 1.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp client Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpConfig
  alaNtpPeerAddressType
  alaNtpPeerType
  alaNtpPeerAuth
  alaNtpPeerMinpoll
  alaNtpPeerVersion
  alaNtpPeerPrefer
  alaNtpPeerAddress
```

ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

ntp server synchronized

Syntax Definitions

N/A

Defaults

By default, NTP synchronization is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

Examples

```
-> ntp server synchronized
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp server unsynchronized](#) Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

MIB Objects

```
alaNtpConfig  
  alaNtpPeerTests
```

ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

ntp server unsynchronized

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

Examples

```
-> ntp server unsynchronized
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp server synchronized](#)

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

MIB Objects

```
alaNtpConfig  
  alaNtpPeerTests
```

ntp client

Enables or disables NTP time synchronization discipline.

ntp client admin-state {enable | disable}

Syntax Definitions

enable	Enables NTP.
disable	Disables NTP.

Defaults

NTP protocol is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the [ntp server](#) command. Up to 12 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

Examples

```
-> ntp client enable  
-> ntp client disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp server](#) Specifies an NTP server from which the switch will receive updates.

MIB Objects

alaNtpEnable

ntp src-ip preferred

Configures a source IP address to use as the source for NTP packets.

```
ntp src-ip preferred {default | no-loopback0 | ip_address}
```

```
no ntp src-ip preferred
```

Syntax Definitions

default	The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the EMP-VC IP address will be used. If no EMP-VC IP address is configured, the preferred IP address will be used. If no preferred IP address is configured the first available IP address on the switch will be used.
no-loopback0	The Loopback0 address will not be used for the source IP address field and either the preferred IP address (if configured) or the first available IP address on the switch will be used.
<i>ip_address</i>	The IP address to be used in the source IP field.

Defaults

By default, the NTP source IP preferred setting is set to the **default** parameter.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default The Loopback0 address, if configured, will be used for the source IP address.
- If no Loopback0 is configured, the VC-EMP IP address will be used for the source IP address.
- If no VC-EMP IP address is configured, the preferred IP address will be used for the source IP address.
- If no preferred IP address is configured the first available IP address on the switch will be used as the source IP address.
- When configuring a preferred IP address, that address must already exist on the switch.
- If the configured preferred IP address is the same as the IP address that would have been automatically chosen by the switch, then the 'ntp src-ip preferred' command will not be included in the output of the 'configuration snapshot' command since only non-default settings are included in the output.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

Examples

```
-> ntp src-ip preferred 192.168.10.1
-> ntp src-ip preferred no-loopback0
-> ntp src-ip preferred default
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; command deprecated. Use **ip service source-ip**.

Related Commands

[show ntp status](#)

Displays the NTP configuration and status.

MIB Objects

N/A

ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

ntp broadcast-client {enable | disable}

Syntax Definitions

enable	Enables the client broadcast mode.
disable	Disables the client broadcast mode.

Defaults

Broadcast mode is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp broadcast-delay](#) Sets the broadcast delay time in microseconds.

MIB Objects

alaNtpBroadcastEnable

ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

ntp broadcast-delay *microseconds*

Syntax Definitions

microseconds The number of microseconds for the broadcast delay.

Defaults

parameter	default
<i>microseconds</i>	4000

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp broadcast](#) Enables or disables the client's broadcast mode.

MIB Objects

alaNtpBroadcastDelay

ntp key

Labels the specified authentication key identification as trusted or untrusted.

ntp key *key* [**trusted** | **untrusted**]

Syntax Definitions

<i>key</i>	The key number matching an NTP server.
trusted	Signifies that the specified key is trusted and can be used for authentication.
untrusted	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

Defaults

By default, all authentication key are untrusted.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to 'trusted' status to allow NTP to use the key for authentication.

Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ntp key Sets the public key the switch uses when authenticating with the specified NTP server.

ntp client Enables or disables NTP operation on the switch.

MIB Objects

alaNtpAccessKeyIdTable
 alaNtpAccessKeyIdKeyId
 alaNtpAccessKeyIdTrust

ntp key load

Loads the current key file into memory.

ntp key load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

Examples

```
-> ntp key load
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|-------------------|---|
| ntp key | Labels the specified authentication key identification as trusted or untrusted. |
| ntp server | Specifies an NTP server from which this switch will receive updates. |

MIB Objects

alaNtpAccessRereadkeyFile

ntp authenticate

Enables or disables the authentication on a configured NTP server.

ntp authenticate {enable | disable}

Syntax Definitions

enable	Enables authentication for NTP server.
disable	Disables authentication for NTP server.

Defaults

By default, NTP authentication is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using **ntp client** command.
- Before enabling the NTP operation, NTP server must be specified using the **ntp server** command.
- NTP authentication must be disabled before adding or removing an NTP server.

Examples

```
-> ntp authenticate enable  
-> ntp authenticate disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ntp status Displays the information about the current NTP status.

MIB Objects

alaNtpAuthenticate

ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

ntp master *stratum_number*

Syntax Definitions

stratum_number Integer value ranging from 2 to 16.

Defaults

Parameter	Default
<i>stratum_number</i>	16

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

Examples

```
-> ntp master 4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ntp status](#) Displays current NTP status.

MIB Objects

alaNtpConfig
alaNtpSysStratum

ntp interface

Enables or Disables NTP server functionality for an interface.

```
ntp interface {interface_ip} {enable | disable}
```

Syntax Definitions

<i>interface_ip</i>	IP address of an interface on which NTP server functionality is to be disabled.
enable	Enables NTP server functionality on an interface.
disable	Disables NTP sever functionality on an interface.

Defaults

By default, NTP server functionality is enabled on all the interfaces.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

Examples

```
-> ntp interface 10.10.10.1 disable  
-> ntp interface 10.10.10.1 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ntp status](#) Displays current NTP status.

MIB Objects

```
alaNtpAccessRestrictedTable  
  alaNtpAccessRestrictedIpAddress
```

ntp max-associations

Configures the maximum number of associations on the switch.

ntp max-associations *number*

Syntax Definitions

number Maximum no of client/server and peer associations. Integer value ranging from 0 to 128.

Defaults

By default, 32 associations are allowed on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 128.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

Examples

```
-> ntp max-associations 20
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ntp status](#) Displays current NTP status.

MIB Objects

```
alaNtpConfig  
  alaNtpMaxAssociation
```

ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

```
ntp broadcast {broadcast_addr} [version version] [minpoll poll interval]
```

```
no ntp broadcast {broadcast_addr}
```

Syntax Definitions

<i>broadcast_addr</i>	Subnet for which broadcast updates are regularly sent.
<i>version</i>	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
<i>poll interval</i>	Polling interval for NTP broadcast message. This value is measured in seconds.

Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to be defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5  
-> no ntp broadcast 10.145.59.255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ntp broadcast](#)

Enables or disables the client's broadcast mode.

[ntp broadcast-delay](#)

Sets the broadcast delay time in microseconds

MIB Objects

alaNtpPeerTable

 alaNtpPeerType

 alaNtpPeerVersion

 alaNtpPeerMinpoll

ntp peer

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

ntp peer {*ip_address*} [**key** *key_id*] [**version** *version*] [**minpoll** *poll interval*]

no ntp peer {*ip_address*}

Syntax Definitions

<i>ip_address</i>	IP address of the remote peer.
<i>key_id</i>	Authentication key for the remote peer.
<i>version</i>	NTP packet version to be used for the peer association.
<i>poll interval</i>	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x).
- *ip-address* is the mandatory parameter to be entered in the command while *key id* is the optional parameter. If *key id* is not specified, then peering will not be authenticated.

Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

Release History

Release 7.1.1; command was introduced.

Related Commands[show ntp peers](#)

Displays current NTP peer association.

MIB Objects

alaNtpPeerTable

alaNtpPeerType

alaNtpPeerAuth

alaNtpPeerVersion

 alaNtpPeerMinpoll

show ntp status

Displays the information about the current NTP status.

show ntp status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

Example

```
-> show ntp status
Current time:                Thu, Jun 14 2012 21:05:46.313 (UTC),
Last NTP update:            -,
Server reference:           0.0.0.0,
Client mode:                 disabled,
Broadcast client mode:      disabled,
Broadcast delay (microseconds): 4000,
Server qualification:       synchronized,
Stratum:                     16,
Maximum Associations Allowed: 32,
Authentication:             disabled,
Source IP Configuration:    default
VRF Name:                   default
```

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
Server qualification	Server qualification status.

Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.
Max-Association	Maximum association on the switch that restricts the number of client/server and peer association
Authentication	Whether Authentication is enabled or disabled
Source IP Configuration	Source IP Configuration type which is configured.
Source IP	Source IP address for NTP that send updates to clients. Note: This field is displayed only if the value of "Source IP Configuration" is set to "Preferred".
VRF Name	Name of the VRF.

Release History

Release 7.1.1; command introduced.

Release 7.3.1; **vrf** parameter added.

Related Command

ntp client	Enables or disables NTP operation on the switch.
ntp server	Specifies an NTP server from which the switch will receive updates
ntp server synchronized	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.
ntp max-associations	Configures the maximum number of associations on the switch.
ntp master	Specifies the stratum value for unsynchronized switch
ntp broadcast	Enables or disables the client's broadcast mode.
show ntp client	Displays information about the current client NTP configuration.
show ntp client server-list	Displays a list of the servers with which the NTP client synchronizes
show ntp server client-list	Displays the basic server information for a specific NTP server or a list of NTP servers

show ntp client

Displays information about the current client NTP configuration.

show ntp client

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

Examples

```
-> show ntp client
Current time:                Tue, Jun 26 2012 17:52:47.619 (UTC),
Last NTP update:            (null),
Server reference:           0.0.0.0,
Client mode:                 disabled,
Broadcast client mode:      disabled,
Broadcast delay (microseconds): 4000,
Server qualification:       synchronized
VRF Name:                   default
```

output definitions

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
Server Qualification	Indicates whether the server must be synchronized or not.
VRF Name	Name of the VRF.

Release History

Release 7.1.1; command was introduced.

Related Command

show ntp client server-list

Displays a list of the servers with which the NTP client synchronizes.

show ntp client server-list

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to display tabular information on the current NTP client to server association status.

Examples

```
-> show ntp client server-list
IP Address      Ver  Key  St    Delay    Offset    Disp
=====+====+=====+=====+=====+=====+=====
*198.206.181.70  4    0    2     0.167    0.323    0.016
=198.206.181.123 4    0    16    0.000    0.000    0.000
```

output definitions

IP Address	The server IP address. "+" indicates an active peer "-" indicates a pasive peer "=" indicates a client "*" indicates current system peer "^" indicates a broadcast server "^" indicates a broadcast client
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 7.1.1; command was introduced.

```

output definitions

IP address	The server IP address.
Host mode	The host mode of this remote association.
Peer mode	The peer mode of this remote association.
Prefer	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
Version	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.
Minpoll	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
Maxpoll	The maximum poll time.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Dispersion	The dispersion value received from the server in its timestamp.
Root distance	The total round trip delay (in seconds) to the primary reference source.
Precision	The advertised precision of this association.

output definitions (continued)

Reference IP	The IP address identifying the peer's primary reference source.
Status	The peer selection and association status.
Uptime count	The time period (in seconds) during which the local NTP server was associated with the switch.
Reachability	The reachability status of the peer.
Unreachable count	Number of times the NTP entity was unreachable.
Stats reset count	The time delay (in seconds) since the last time the local NTP server was restarted.
Packets sent	Number of packets sent.
Packets received	Number of packets received.
Duplicate packets	Number of duplicated packets received.
Bogus origin	Number of bogus packets.
Bad authentication	Number of NTP packets rejected for not meeting the authentication standards.
Bad dispersion	Number of bad dispersions.
Last Event	The last event.

show ntp keys

Displays information about all authentication keys.

show ntp keys

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

Examples

```
-> show ntp keys
Key      Status
=====+=====
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

output definitions

Key	The key number corresponding to a key in the key file.
Status	Whether the key is trusted or untrusted.

Release History

Release 7.1.1; command was introduced.

Related Command

ntp key Labels the specified authentication key identification as trusted or untrusted.

ntp key load Loads the current key file into memory.

MIB Objects

alaNtpAccessKeyIdTable

show ntp peers

Displays the information about the current status on the NTP peer association.

show ntp peers

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

Examples

```
-> show ntp peers
```

IP Address	Ver	Key	St	Delay	Offset	Disp
172.23.0.202	4	0	3	0.300	0.404	0.0024
10.255.24.120	4	0	3	0.016	0.250	0.0017

output definitions

IP Address	Peer IP Address
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 7.1.1; command was introduced.

Related Command**ntp client**

Enables or disables NTP operation on the switch.

show ntp status

Displays the information about the current NTP status.

show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

59 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

	OmniSwitch
Telnet(v4)	6
FTP(v4)	4
SSH + SFTP(v4)	8
HTTP	4

MIB information for commands in this chapter are as follows:

Filename: AlcatelInd1SessionMgr.mib
Module: AlcatelIND1SessionMgrMIB

Filename: AlcatelIND1AAA.mib
Module: Alcatel-IND1-AAA-MIB

Filename: AlcatelIND1System.mib
Module: Alcatel-IND1ConfigMgr.mib

Filename: AlcatelIND1Ssh.mib
Module: ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

session login-attempt
session login-timeout
session banner
session timeout
session prompt
session xon-xoff
show prefix
user profile save
user profile reset
history
command-log
kill
exit
who
whoami
show session config
show session xon-xoff
more
telnet
ssh
ssh enforce-pubkey-auth
show command-log status
show telnet
show ssh

session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

session login-attempt *integer*

Syntax Definitions

integer The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

Defaults

Default is 3 login attempts.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> session login-attempt 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.
session login-timeout	Sets or resets the amount of time the user can take to accomplish a successful login to the switch.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

sessionMgr
 sessionLoginAttempt

session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

session login-timeout *seconds*

Syntax Definitions

seconds The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

Defaults

Login timeout default is 55 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> session login-timeout 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.
session login-attempt	Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

sessionMgr
 sessionLoginTimeout

session banner

Sets or resets the file name of the user-defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

```
session {cli | ftp | http} banner file_name
```

```
no session {cli | ftp | http} banner
```

Syntax Definitions

cli	Creates/modifies the CLI banner file name.
ftp	Creates/modifies the FTP banner file name.
http	Creates/modifies the HTTP banner file name.
<i>file_name</i>	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

Examples

```
-> session cli banner /switch/banner.txt
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show session config**

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

SessionConfigTable

 SessionType

 SessionBannerFileName

session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

```
session {cli | http | ftp} timeout minutes
```

Syntax Definitions

cli	Sets the inactivity timeout for CLI sessions.
http	Sets the inactivity timeout for HTTP sessions.
ftp	Sets the inactivity timeout for FTP sessions.
<i>minutes</i>	Inactivity timeout value (in minutes). Valid range 1 to 596523.

Defaults

parameter	default
<i>minutes</i>	4

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

Examples

```
-> session cli timeout 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show session config](#) Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable  
  SessionType  
  SessionInactivityTimerValue
```

session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

session prompt default [*string*]

Syntax Definitions

string Prompt string. Maximum length 31 characters.

Defaults

parameter	default
<i>string</i>	->

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

Examples

```
-> session prompt default -->
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show session config](#) Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

SessionConfigTable
 SessionType
 sessionDefaultPromptString

session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

```
session xon-xoff {enable | disable}
```

Syntax Definitions

enable	Enables XON-XOFF on the console port.
disable	Disables XON-XOFF on the console port.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show session xon-xoff	Displays whether the console port is enabled or disabled for XON-XOFF.
------------------------------	--

MIB Objects

```
sessionXonXoffEnable
```

show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

`show prefix`

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

Examples

```
-> show prefix
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show prefix](#)

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

MIB Objects

N/A

user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

user profile save

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the **user profile reset** command to set values to their factory defaults.

Examples

```
-> user profile save
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|------------------------------------|--|
| show prefix | Defines substitute command text for the switch's CLI command keywords. |
| user profile reset | Resets the alias, prompt and more values to their factory defaults. |

MIB Objects

N/A

user profile reset

Resets the alias, prompt, and more values to their factory defaults.

user profile reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> user profile reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show prefix](#)

Defines substitute command text for the switch's CLI command keywords.

[user profile save](#)

Saves the user account settings for aliases, prompts and the more screen.

MIB Objects

N/A

!

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!{! | *n*}

Syntax Definitions

- !** Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
- n*** Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You can use the [history](#) command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

Examples

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
vlan  type  admin  oper  ip    mtu   name
-----+-----+-----+-----+-----+-----+-----
   1   std    Ena    Ena   Dis   1500  VLAN 1
  10   std    Ena    Ena   Ena   1500  VLAN 10
  12   std    Ena    Ena   Ena   1500  VLAN 12
  14   std    Ena    Ena   Ena   1500  VLAN 14
  30   vip    Ena    Ena   Ena   1500  VIP VLAN 30
  40   vip    Ena    Ena   Ena   1500  VIP VLAN 40
4094  mcm    Ena    Ena   Dis   9198  MCM IPC
```

Release History

Release 7.1.1; command was introduced.

Related Commands**history**

Sets the number of commands that will be stored in the CLI's history buffer.

MIB Objects

N/A

command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

command-log {enable | disable}

Syntax Definitions

enable	Creates a file called command.log in the switch's /flash directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
disable	Disables logging of current session commands to the command.log file.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

Examples

```
-> command-log enable
-> command-log disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show command-log	Displays the contents of the command.log file.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

sessionCliCommandLogEnable

kill

Kills an active session. The command takes effect immediately.

kill *session_number*

Syntax Definitions

session_number Number of the session you want to kill.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

Examples

```
-> kill 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

who Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

MIB Objects

SessionMgr
 sessionIndex
 sessionRowStatus

exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> exit
```

Release History

Release 7.1.1; command was introduced.

Related Commands

kill Kills an active session. The command takes effect immediately.

MIB Objects

```
SessionMgr  
  sessionIndex  
  sessionRowStatus
```

whoami

Displays the current user session.

whoami

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **who** command to display all sessions on the switch.

Examples

```
-> whoami
Session number = 5
  User name      = admin,
  Access type    = telnet,
  Access port    = NI,
  IP address     = 121.251.17.76,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.
Access type	Type of access protocol used to connect to the switch.
Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Release History

Release 7.1.1; command was introduced.

Related Commands

- who** Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).
- kill** Kills another user's session.

MIB Objects

SessionActive

```
sessionIndex  
sessionAccessType  
sessionPhysicalPort  
sessionUserName  
sessionUserReadPrivileges  
sessionUserWritePrivileges  
sessionUserProfileNumber  
sessionUserIpAddress  
sessionRowStatus
```

who

Displays all active login sessions.

who

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You can identify your current login session by using the IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

Examples

```
-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.
Access type	Type of access protocol used to connect to the switch.

output definitions (continued)

Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Possible values for command domains and families are listed here:

Release History

Release 7.1.1; command was introduced.

Related Commands

whoami	Displays current user session.
kill	Kills another user's session.

MIB Objects

```
SessionActive
  sessionIndex
  sessionAccessType
  sessionPhysicalPort
  sessionUserName
  sessionUserReadPrivileges
  sessionUserWritePrivileges
  sessionUserProfileNumber
  sessionUserIpAddress
  sessionRowStatus
```

show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

show session config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

Examples

```
-> show session config
```

```
Cli Default Prompt           = ->
Cli Banner File Name        = ,
Cli Inactivity Timer in minutes = 60
Ftp Banner File Name        = ,
Ftp Inactivity Timer in minutes = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds       = 60
Maximum number of Login Attempts = 2
```

output definitions

Cli Default Prompt	Default prompt displayed for CLI sessions.
Cli Banner File Name	Name of the file that contains the banner information that will appear during a CLI session.
Cli Inactivity Timer in minutes	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
Ftp Banner File Name	Name of the file that contains the banner information that will appear during an FTP session.
Ftp Inactivity Timer in minutes	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
Http Inactivity Timer in minutes	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

output definitions (continued)

Login Timer in seconds	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
Maximum number of Login Attempts	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

Release History

Release 7.1.1; command was introduced.

Related Commands

session prompt	Configures the default CLI prompt for console and Telnet sessions.
session banner	Sets the file name of the user-defined banner.
session timeout	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface.
session login-attempt	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
session login-timeout	Sets the amount of time the user can take to accomplish a successful login to the switch.

MIB Objects

```
SessionConfigTable
  sessionType
  sessionBannerFileName
  sessionInactivityTimerValue
  sessionDefaultPromptString
```

show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

```
show session xon-xoff
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the [session xon-xoff](#) command), traffic to the console port may be stopped.

Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[session xon-xoff](#) Enables/disables the XON-XOFF protocol on the console port.

MIB Objects

```
sessionXonXoffEnable
```

more

Enables the more mode for your console screen display.

more *filename*

Syntax Definitions

filename The file to display.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

Examples

```
-> more textfile.txt
-> write terminal | more
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
[vrf name] telnet {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

Syntax Definitions

<i>name</i>	Name of the VRF.
default	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
enable disable	Enables or disables telnet access.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the Telnet session.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The default directory for Telnet is **/flash**.

Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
-> vrf vrfl telnet admin-state enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

ssh Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.

show telnet Displays the current configuration specifying the ports the telnet daemons are listening on.

MIB Objects

SystemServices

- systemServicesArg1
- systemServicesAction
- alaIpTelnetAdminStatus

ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

```
[vrf name] ssh {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

Syntax Definitions

<i>name</i>	Name of the VRF.
default	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
enable disable	Enables or disables Secure Shell.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the Secure Shell.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

You must have a valid username and password for the specified host.

Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:

-> vrf vrf1 ssh admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

telnet	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.
ssh enforce-pubkey-auth	Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.
show command-log	Displays the status of Secure Shell, SCP/SFTP on the switch.
show ssh	Displays the current configuration specifying the ports SSH daemons are listening on.

MIB Objects`aaaAcctSTable``aaacsInterface``alaSshConfigGroup``alaIpSshAdminStatus`

ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

`ssh enforce-pubkey-auth {enable | disable}`

Syntax Definitions

enable Enforces only SSH public key authentication.
disable Enforces both SSH public key and password authentication.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ssh enforce-pubkey-auth enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[telnet](#) Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

MIB Objects

alaSshConfigGroup
 alaSshPubKeyEnforceAdminStatus

show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to [page 59-16](#).

show command-log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date      : FRI JAN 09 00:20:01
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date      : FRI JAN 09 00:19:44
  Ip Addr   : 128.251.19.240
  Result    : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date      : FRI JAN 09 00:18:49
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS
```

output definitions

Command	The exact syntax of the command, as entered by the user.
UserName	The name of the user session that entered the command. For more information on different user session names, refer to the user command on page 38-47 , or the “Managing Switch User Accounts” chapter in the <i>OmniSwitch AOS Release 8 Switch Management Guide</i> .
Date	The date and time, down to the second, when the command was entered.
IpAddr	The IP address of the terminal from which the command was entered.
Result	The outcome of the command entry. Options include SUCCESS and ERROR . For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

Release History

Release 7.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

sessionCliCommandLogEnable

show command-log status

Shows the current status of the command logging function (i.e., enabled or disabled).

`show command-log status`

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show command-log status
CLI command logging : Enable
```

output definitions

CLI command logging	The current status of command logging on the switch. Options include Disable and Enable .
----------------------------	---

Release History

Release 7.1.1; command was introduced.

Related Commands

[command-log](#) Enables or disables command logging on the switch.

MIB Objects

`sessionCliCommandLogStatus`

60 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

Filename: AlcatelIND1System.mib
Module: ALCATEL-IND1-SYSTEM-MIB

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1Ssh.mib
Module: ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

File System	cd pwd mkdir rmdir ls rm cp scp mv chmod freespace fsck newfs
System Services	vi tty show tty tftp sftp ftp show ftp

cd

Changes the current working directory of the switch.

`cd [path]`

Syntax Definitions

path Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

Defaults

The default working directory of the switch is `/flash`.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> cd
-> cd /flash/certified
```

Release History

Release 7.1.1; command introduced.

Related Commands

<code>pwd</code>	Displays the current working directory of the switch.
<code>mkdir</code>	Creates a new directory.
<code>rmdir</code>	Deletes an existing directory.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.
<code>rm</code>	Deletes the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
  systemServicesWorkingDirectory
```

pwd

Displays the current working directory of the switch.

pwd

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The **pwd** command can also be used on the secondary CMM.

Examples

```
-> pwd  
/flash
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Deletes the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices  
  systemServicesWorkingDirectory
```

mkdir

Creates a new directory.

mkdir [*options*] [*path*] /*dirname*

Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i>	The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
<i>dirname</i>	A user-defined name for the new directory.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mkdir [OPTIONS] DIRECTORY...
```

```
Create DIRECTORY
```

```
Options:
```

```
  -m      Mode
  -p      No error if exists; make parent directories as needed
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Deletes the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

rmdir

Deletes an existing directory.

rmdir [*options*] *dirname*

Syntax Definitions

options Use the '?' on the command line for a list of options.
dirname The name of the existing directory to be removed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> rmdir ./working  
-> rmdir flash/working  
-> rmdir ?  
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:

```
-p|--parents      Include parents  
--ignore-fail-on-non-empty
```

Release History

Release 7.1.1; command introduced.

Related Commands

<code>cd</code>	Changes the current working directory of the switch.
<code>pwd</code>	Displays the current working directory of the switch.
<code>mkdir</code>	Creates a new directory.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

ls

Displays the contents of a specified directory or the current working directory.

ls [*options*] [*path/filename*]

Syntax Definitions

options Use the '?' on the command line for a list of options.
filename Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: ls [-lAacCdeFilnpLRrSsTtuvwxXhk] [FILE]...
```

List directory contents

Options:

```
-l      List in a single column
-A      Don't list . and ..
-a      Don't hide entries starting with .
-C      List by columns
-c      With -l: sort by ctime
--color[={always,never,auto}]  Control coloring
-d      List directory entries instead of contents
-e      List full date and time
-F      Append indicator (one of */=@|) to entries
-i      List inode numbers
-l      Long listing format
-n      List numeric UIDs and GIDs instead of names
-p      Append indicator (one of */=@|) to entries
-L      List entries pointed to by symlinks
-R      Recurse
-r      Sort in reverse order
-S      Sort by file size
-s      List the size of each file, in blocks
-T N    Assume tabstop every N columns
```

```
-t      With -l: sort by modification time
-u      With -l: sort by access time
-v      Sort by version
-w N    Assume the terminal is N columns wide
-x      List by lines
-X      Sort by extension
-h      List sizes in human readable format (1K 243M 2G)
```

Release History

Release 7.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

rm

Permanently deletes an existing file.

rm [*options*] [*path/filename*]

Syntax Definitions

options Use the '?' on the command line for a list of options.
filename Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: rm [OPTIONS] FILE...
```

```
Remove (unlink) FILEs
```

```
Options:
```

```
-i        Always prompt before removing
-f        Never prompt
-R, -r    Recurse
```

Release History

Release 7.1.1; command introduced.

Related Commands**cp**

Copies an existing file or directory.

MIB Objects

systemServices

systemServicesArg1

 systemServicesAction

cp

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

`cp [options] source destination`

Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>source</i>	The name of the existing file to be copied.
<i>destination</i>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
-> cp ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:

<code>-a</code>	Same as <code>-dpR</code>
<code>-R, -r</code>	Recurse
<code>-d, -P</code>	Preserve symlinks (default if <code>-R</code>)
<code>-L</code>	Follow all symlinks

```
-H      Follow symlinks on command line
-p      Preserve file attributes if possible
-f      Force overwrite
-i      Prompt before overwrite
-l,-s   Create (sym)links
```

Release History

Release 7.1.1; command introduced.

Related Commands

[mv](#) Moves an existing file or directory to a new location.

MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

scp

Copies an existing file in a secure manner.

```
scp [options] user_name@remote_ip_addr:[path/]source [path/]target
```

```
scp [options] [path/]source user_name@remote_ip_addr:[path/]target
```

Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>user_name@remote_ip_addr:</i>	The username along with the IPv4 or IPv6 address of the remote switch.
<i>path/</i>	Specifies the path containing the file to be copied and the path where the file will be copied.
<i>source</i>	The name of the file(s) to be copied.
<i>target</i>	The new user-defined file name for the resulting file copy.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
-> scp ?
usage: scp [-l246BCpqrvt] [-c cipher] [-F ssh_config] [-i identity_file]
          [-l limit] [-o ssh_option] [-P port] [-S program]
          [[user@]host1:]file1 ... [[user@]host2:]file2
```

Release History

Release 7.1.1; command introduced.

Related Commands

mv Moves an existing file or directory to a new location.

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY
```

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:

```
-f      Don't prompt before overwriting
-i      Interactive, prompt before overwrite
```

Release History

Release 7.1.1; command introduced.

Related Commands

- rm** Renames an existing file or directory.
cp Copies an existing file or directory.

MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesArg2  
  systemServicesAction
```

chmod

Changes the write privileges for a specified file.

```
chmod {+w | -w} [path/]file
```

Syntax Definitions

<code>+w</code>	Enables read-write privileges for the file.
<code>-w</code>	Disables write privileges for the file—i.e., the file becomes read-only.
<code>path/</code>	The path containing the file for which privileges are being changed.
<code>file</code>	The name of the file for which read-write privileges are being changed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```
-> chmod +w vlan.config  
-> chmod -w flash/backup_configs/vlan.config
```

Release History

Release 7.1.1; command introduced.

Related Commands

[freespace](#) Changes the write privileges for a specified file.

MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

freespace

Displays the amount of free space available in the **/flash** directory.

freespace [/flash | /uflash]

Syntax Definitions

/flash The amount of free space is shown for the **/flash** directory.

/uflash The amount of free space is shown for the **/uflash** directory.

Defaults

N/A

Usage Guidelines

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Examples

```
-> freespace /flash
/flash 3143680 bytes free
```

```
-> freespace
/flash 3143680 bytes free
```

Release History

Release 7.1.1; command introduced.

Related Commands

[fsck](#)

Performs a file system check, including diagnostic information in the event of file corruption. If the **fsck** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

MIB Objects

SystemFileSystemTable
systemFileSystemFreespace

fsck

Performs a file system check, including diagnostic information in the event of file corruption.

fsck /uflash {repair | no-repair}

Syntax Definitions

/uflash	Indicates that the file system check will be performed on the /uflash directory.
repair	Attempt to repair any problems found.
no-repair	Do not attempt to repair any problems found.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command provides the option to automatically repair errors.

Examples

```
-> fsck /uflash repair
```

```
/uflash/ - disk check in progress ..  
/uflash/ - Volume is OK
```

```
total # of clusters: 14,773  
# of free clusters: 4,132  
# of bad clusters: 0  
total free space: 8,264 Kb  
max contiguous free space: 5,163,008 bytes  
# of files: 46  
# of folders: 3  
total bytes in files: 21,229 Kb  
# of lost chains: 0  
total bytes in lost chains: 0
```

Release History

Release 7.1.1; command introduced.

Related Commands

freespace

Displays the amount of free space available in the **/flash** directory.

MIB Objects

systemServices

 systemServicesArg1

 systemServicesAction

newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

newfs /uflash

Syntax Definitions

/uflash This indicates that the complete file system will be replaced.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

Examples

```
-> newfs /uflash
```

Release History

Release 7.1.1; command introduced.

Related Commands

N/A

MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

vi [*options*] [*path*]/*filename*

Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i> /	The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
<i>filename</i>	The name of the existing file being viewed or edited.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: vi [OPTIONS] [FILE]...
```

```
Edit FILE
```

```
Options:
```

```
-c      Initial command to run ($EXINIT also available)
-R      Read-only
-H      Short help regarding available features
```

Release History

Release 7.1.1; command introduced.

Related Commands

tty Displays current TTY settings.

MIB Objects

```
systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
```

tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

tty *lines columns*

Syntax Definitions

lines The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

columns The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

Defaults

parameter	default
<i>lines</i>	24
<i>columns</i>	80

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

Examples

```
-> tty 10 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show tty**

Displays current TTY settings.

MIB Objects

systemServicesTtyLines

 systemServicesTtyColumns

show tty

Displays current TTY settings.

```
show tty
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Shows the settings made with the `tty` command.
- This command can also be used on the secondary CMM.

Examples

```
-> show tty
lines = 24, columns = 80
```

Release History

Release 7.1.1; command introduced.

Related Commands

`tty` Specifies the number of TTY lines and columns to be displayed.

MIB Objects

```

```

tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

tftp [*options*] *host* [*port*]

Syntax Definitions

<i>options</i>	Enter a question mark (?) to get a list of options.
<i>host</i>	Specifies the IP address of the TFTP server.
<i>port</i>	Specifies the port for the TFTP transfer.

Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

N/A

sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

sftp [*options*] {*ip_address*}

Syntax Definitions

options Enter a question mark (?) to get a list of options.
ip_address Specifies the IPv4 or IPv6 address for the SFTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

cd path	Change remote path to 'path'.
lcd path	Change local directory to 'path'.
chmod mode path	Change permissions of file 'path' to 'mode'.
help	Display command help information.
get remote-path [local path]	Download a file from the remote path to the local path.
lls [path]	Display local directory listing.
ln oldpath newpath	Creates a symbolic link (symlink) to the remote file.
symlink oldpath newpath	Creates a symbolic link (symlink) to the remote file.
mkdir path	Create local directory.
lpwd	Print local working directory.
ls [path]	Display remote directory listing.
mkdir path	Create remote directory.
put local-path [remote-path]	Upload file.
pwd	Display remote working directory.
exit	Quit the sftp mode.
quit	Exit the sftp mode.
rename oldpath newpath	Rename a remote file.

rmdir path	Remove remote directory.
rm path	Delete remote file.
version	Show the current SFTP version.
?	Synonym for help. Displays command help information.

Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-lCv] [-B buffer_size] [-b batchfile] [-F ssh_config]
          [-o ssh_option] [-P sftp_server_path] [-R num_requests]
          [-S program] [-s subsystem | sftp_server] host
sftp [[user@]host[:file [file]]]
sftp [[user@]host[:dir[/]]]
sftp -b batchfile [user@]host
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ftp Starts an FTP session.

ssh Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

MIB Objects

```

  systemServicesAction
```

ftp

Starts an FTP session.

ftp {port [default | *service_port*] | admin-state [enable | disable] | *ip_address*}

[vrf *name*] ftp admin-state [enable | disable]

Syntax Definitions

<i>name</i>	The name of the VRF.
default	Sets the port back to the default of 21.
<i>service_port</i>	The TCP service port number. Must be 21 or between between 20000-20999.
enable disable	Enables or disables FTP access.
<i>ip_address</i>	Specifies the IPv4 address for the FTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
-> vrf vrf1 ftp admin-state enable
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; **vrf** parameter added.

Related Commands

```

61 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

Filename: AlcatelInd1WebMgt.mib
Module: alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

[webview server](#)
[webview access](#)
[webview force-ssl](#)
[webview http-port](#)
[webview https-port](#)
[show webview](#)

webview server

Enables or disables the web management server on the switch.

[*vrf name*] webview server {enable | disable}

Syntax Definitions

<i>name</i>	The name of the VRF.
enable	Enables the web management server on the switch.
disable	Disables the web management server on the switch.

Defaults

parameter	default
WebView Server	Enabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

Examples

```
-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtServerStatus
```

webview access

Enables or disables web management access on the switch.

[*vrf name*] webview access {enable | disable}

Syntax Definitions

<i>name</i>	The name of the VRF.
enable	Enables the web management access on the switch.
disable	Disables the web management access on the switch.

Defaults

parameter	default
WebView Access	Enabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If Web Access is enabled, the WebView Server is automatically enabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

Examples

```
-> webview access enable
-> webview access disable
-> vrf vrf1 webview access enable
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

Related Commands

webview server	Enables/disables the web server on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtAdminStatus
```

webview force-ssl

Enables or Disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

webview force-ssl {enable | disable}

Syntax Definitions

enable	Enables the requirement to use SSL to access the switch when using WebView.
disable	Disables the requirement to use SSL to access the switch when using WebView.

Defaults

parameter	default
Force SSL	Enabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtSsl
```

webview http-port

Changes the port number for the embedded web management server.

```
webview http-port {default | port port}
```

Syntax Definitions

default	Restores the port to its default (80) value.
<i>port</i>	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
<i>port</i>	80

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview http-port port 1025
-> webview http-port default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpPort
```

webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

```
webview https-port {default | port port}
```

Syntax Definitions

default	Restores the port to its default (443) value.
<i>port</i>	The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
<i>port</i>	443

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview https-port port 1026
-> webview https https-port default
```

Release History

Release 7.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpsPort
```

show webview

Displays web management configuration information.

`[vrf name] show webview`

Syntax Definitions

name The name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

Examples

```
-> show webview
```

```
WebView Server = Disabled
WebView Access = Disabled
WebView Force-SSL = Enabled
WebView HTTP-Port = 80
WebView HTTPS-Port = 4433
```

```
vrf1::-> show webview
WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTP-Port = 80,
WebView HTTPS-Port = 443
```

output definitions

WebView Server	Indicates whether web management server is enabled or disabled.
WebView Access	Indicates whether web management access is enabled or disabled.
Force SSL	Indicates whether Force SSL is enabled or disabled. If this is enabled it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.
Web Management Http Port	The port configured for the HTTP connection.
Web Management Https Port	The port configured for a secure HTTP connection (SSL enabled).

Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

Related Commands

webview server	Enables/disables web management server on the switch.
webview access	Enables/disables webview access on the switch.
webview force-ssl	Enables/disables SSL on the switch.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtServerStatus
  alaInd1WebMgtAdminStatus
  alaInd1WebMgtSsl
  alaInd1WebMgtHttpPort
  alaInd1WebMgtHttpsPort
```

62 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

Filename: AlcatelIND1System.mib
Module: Alcatel-IND1ConfigMgr.mib

A summary of the available commands is listed here:

configuration apply
configuration error-file-limit
show configuration status
configuration cancel
configuration syntax-check
configuration snapshot
show configuration snapshot
write terminal

configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

configuration apply *filename* [**at** *hh:mm month dd* [*year*]] | [**in** *hh[:mm]*] [**verbose**]

Syntax Definitions

<i>filename</i>	The name of the configuration text file to be applied to the switch (e.g., newfile1).
at <i>hh:mm</i> { <i>dd month month dd</i> } [<i>year</i>]	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59. Values for <i>dd</i> range from 01 through 31. Values for month range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
in <i>hh[:mm]</i>	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59.
verbose	When verbose is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

Defaults

By default, **verbose** error checking is not performed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.
- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword

represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to [page 38-51](#).

Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

Note. When the **configuration apply** command is entered *without at or in* syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration syntax-check Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
  configFileName
  configFileMode
  configFileAction
  configTimerFileName
  configTimerFileTime
```

configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension. When the maximum number of **.err** files is exceeded, any new error file will overwrite the **.err** file with the oldest timestamp.

configuration error-file-limit *number*

Syntax Definitions

number Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

Defaults

parameter	default
<i>number</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the **/flash** directory.

Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

configuration cancel Cancels a pending timer session for a configuration file.

MIB Objects

alcatelIND1ConfigMgrMIBObjects
configErrorFileMaximum

show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

show configuration status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A timer session can be scheduled using the **configuration apply** command. For more information, refer to [page 62-2](#).
- The screen output **File configuration </path/filename>: scheduled at dd/mm hh:mm** indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration </path/filename>: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the **write memory** command.

Examples

```
-> show configuration status
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- configuration cancel** Cancels a pending timer session for a configuration file.
- configuration error-file-limit** Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
- write memory** Copies the running configuration (RAM) to the working directory.

MIB Objects

```
configTimerFileGroup  
  configTimerFileStatus
```

configuration cancel

Cancels a pending timer session for a configuration file.

configuration cancel

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> configuration cancel
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|---|--|
| configuration apply | Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file. |
| show configuration status | Displays whether there is a pending timer session scheduled for a configuration file. |

MIB Objects

```
configTimerFileGroup  
configTimerClear
```

configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

configuration syntax-check *path/filename* [**verbose**]

Syntax Definitions

<i>path/filename</i>	The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, /flash/working/asc.1.snap .
verbose	When verbose is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When verbose is <i>not</i> specified in the command line, cursory information (number of errors and error log file name) will be printed to the console <i>only if a syntax or configuration error is detected</i> .

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

Examples

```
-> configuration syntax-check vlan_file1
..
```

Note. When the **configuration syntax-check** command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

Release History

Release 7.1.1; command was introduced.

```

configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

configuration snapshot *feature_list* [*path/filename*]

Syntax Definitions

<i>feature_list</i>	The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Current snapshot-supported network features are listed below.
<i>path/filename</i>	A user-defined name for the resulting snapshot file. For example, test_snmp_snap . You may also enter a specific path for the resulting file. For example, the syntax /flash/working/test_snmp_snap places the test_snmp_snap file in the switch's /flash/working directory.

snapshot-supported features

802.1q	ipmr	rdp
aaa	ipms	rip
aip	ipx	ripng
all	ipv6	session
bgp	linkagg	slb
bridge	module	snmp
chassis	ntp	stp
health	ospf	system
interface	ospf3	vlan
ip	pmm	vrrp
ip-helper	policy	webmgt
ip-routing	qos	udld
netsec		

Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

Examples

```
-> configuration snapshot all
-> configuration snapshot new_file1 qos health aggregation
-> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

show configuration snapshot [*feature_list*]

Syntax Definitions

feature_list Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma.

snapshot-supported features

802.1q	ipmr	rdp
aaa	ipms	rip
aip	ipx	ripng
all	ipv6	session
bgp	linkagg	slb
bridge	module	snmp
chassis	ntp	stp
health	ospf	system
interface	ospf3	vlan
ip	pmm	vrrp
ip-helper	policy	webmgmt
ip-routing	qos	udld
netsec		

Defaults

By default, this command shows configuration information for *all* features.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- To show a list of features on the switch, use the **show configuration snapshot ?** syntax.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

! AAA :
aaa authentication default "local"
aaa authentication console "local"
user "public" read All write All no auth authkey 391b0e74dbd13973d703ccea4a8e30
```

63 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

Filename: IETFsnmpCommunity.MIB
Module: IETF SNMP-COMMUNITY.MIB

MIB information for Trap Manager commands is as follows:

Filename AlcatelIND1TrapMgr.MIB
Module: ALCATEL-IND1-TRAP-MGR.MIB

MIB information for SNMP Agent commands is as follows:

Filename: AlcatelIND1SNMPAgent.MIB
Module: ALCATEL-IND1-SNMP-AGENT.MIB

A summary of the available commands is listed here:

SNMP station commands	snmp station show snmp station
SNMP community map commands	snmp community-map snmp community-map mode show snmp community-map
SNMP security commands	snmp security show snmp security show snmp statistics show snmp mib-family
SNMP trap commands	snmp-trap absorption snmp-trap to-webview snmp-trap replay-ip snmp-trap filter-ip snmp authentication-trap show snmp-trap replay-ip show snmp-trap filter-ip show snmp authentication-trap show snmp-trap config
Event commands	event-action show event-action

snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

snmp station {*ip_address* | *ipv6_address*} [[*udp_port*] [*username*] [**v1** | **v2** | **v3**] [**enable** | **disable**]]

no snmp station {*ip_address* | *ipv6_address*}

Syntax Definitions

<i>ip_address</i>	The IP address to which SNMP unicast traps will be sent.
<i>ipv6_address</i>	The IPv6 address to which SNMP unicast traps will be sent.
<i>udp_port</i>	A UDP destination port.
<i>username</i>	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
v1	Specifies that traps are sent using SNMP version 1.
v2	Specifies that traps are sent using SNMP version 2.
v3	Specifies that traps are sent using SNMP version 3.
enable	Enables the specified SNMP station.
disable	Disables the specified SNMP station.

Defaults

parameter	default
<i>udp_port</i>	162
v1 v2 v3	v3
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the no form of the command to remove an existing SNMP station.
- When adding an SNMP station, you must specify an IP address *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- When modifying an SNMP station, you must specify an IP address *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.

Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1
```

Release History

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show snmp station
ipAddress/udpPort
```

ipAddress/udpPort	status	protocol	user
199.199.100.200/8010	enable	v3	NMSuserV3MD5DES
199.199.101.201/111	disable	v2	NMSuserV3MD5
199.199.102.202/8002	enable	v1	NMSuserV3SHADES
199.199.103.203/8003	enable	v3	NMSuserV3SHADES
199.199.104.204/8004	enable	v3	NMSuserV3SHA

output definitions

IPAddress	IP Address of the SNMP management station.
UDP Port	UDP port number.
Status	The Enabled/Disabled status of the SNMP management station.
Protocol	The version of SNMP set for this management station.
User	The user account name.

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

MIB Objects

```
trapStationTable
  trapStationIP
  trapStationPort
  trapStationUser
  trapStationProtocol
  trapStationRowStatus
alaTrapInetStationTable
  alaTrapInetStationIPType
  alaTrapInetStationIP
  alaTrapInetStationPort
  alaTrapInetStationRowStatus
  alaTrapInetStationProtocol
  alaTrapInetStationUser
```

snmp community-map

Configures and enables a community string on the switch and maps it to an existing user account name.

```
snmp community-map community_string [{user useraccount_name] | {enable | disable}}
```

```
no snmp community-map community_string
```

Syntax Definitions

<i>community_string</i>	A community string in the form of a text string. This string must be between 1 and 32 characters.
<i>useraccount_name</i>	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
enable	Enables SNMP community string mapping.
disable	Disables SNMP community string mapping.

Defaults

By default, SNMP community map authentication is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.
- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

Examples

```
-> snmp community-map community1 user testname1  
-> snmp community-map community1 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

snmp community-map mode Enables the local community strings database.

MIB Objects

```
SNMPCommunityTable  
  snmpCommunityIndex  
  snmpCommunitySecurityName  
  snmpCommunityStatus
```

snmp community-map mode

Enables the local community strings database.

snmp community-map mode {enable | disable}

Syntax Definitions

enable	Enables SNMP community map database.
disable	Disables SNMP community map database.

Defaults

parameter	default
Community mode	disabled

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the [snmp community-map](#) command.

Examples

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[snmp community-map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guideline

N/A

Examples

```
-> show snmp community-map  
Community mode : enabled
```

```
status  community string                user name  
-----+-----+-----  
enabled test_string1                    bb_username  
enabled test_string2                    rr_username  
disabled test_string3                    cc_username  
disabled test_string4                    jj_username
```

output definitions

Status	The Enabled/Disabled status of the community string.
Community String	The text that defines the community string.
User Name	The user account name.

Release History

Release 7.1.1; command was introduced.

Related Commands**snmp community-map**

Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

N/A

snmp security

Configures SNMP security settings.

snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only}

Syntax Definitions

no-security	The switch will accept all SNMP v1, v2, and v3 requests.
authentication set	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
authentication all	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
privacy set	The switch will accept <i>only</i> authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
privacy all	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
trap-only	All SNMP get, get-next, and set requests will be rejected.

Defaults

By default, the SNMP security default is set to **privacy all**, which is the highest level of security.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	v1 get v2 get v3 non-auth get/ get-next	v3 auth set	v3 auth get/ get-next	v3 encryp set	v3 encryp get/ get-next
no-security	accepted	accepted	accepted	accepted	accepted	accepted
authentication set	rejected	accepted	accepted	accepted	accepted	accepted
authentication all	rejected	rejected	accepted	accepted	accepted	accepted
privacy set	rejected	rejected	rejected	accepted	accepted	accepted
privacy all	rejected	rejected	rejected	rejected	accepted	accepted
trap-only	rejected	rejected	rejected	rejected	rejected	rejected

Examples

```
-> snmp security no-security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

output definitions

From RFCxxxx	Displays the RFC number that defines the SNMP MIB objects listed.
MIB Objects	Name of the MIB object listed as an SNMP statistic.
= (integer)	The number of times the MIB object has been reported to the SNMP management station since the last reset.

Release History

Release 7.1.1; command was introduced.

Related Commands

[snmp security](#) Configures the SNMP security settings.

MIB Objects

N/A

show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

show snmp mib-family [*table_name*]

Syntax Definitions

table_name The name of the MIB table to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

Examples

```
-> show snmp mib-family trapStationTable
MIP ID   MIB TABLE NAME                               FAMILY
-----+-----+-----
 73733   trapStationTable                             snmp
```

output definitions

MIP ID	Identification number for the MIP associated with this MIB Table.
MIB Table Name	Name of the MIB table.
Family	Command family to which this MIB table belongs.

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap filter-ip Displays the SNMP trap filter information.

MIB Objects

N/A

snmp-trap absorption

Enables or disables the trap absorption function.

snmp-trap absorption {enable | disable}

Syntax Definitions

enable	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
disable	Disables SNMP trap absorption.

Defaults

By default, trap absorption is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To view the current trap absorption status, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap absorption enable  
-> snmp-trap absorption disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.
---------------------------------------	---

MIB Objects

```
trapFilterTable  
  trapAbsorption
```

snmp-trap to-webview

Enables the forwarding of traps to WebView.

`snmp-trap to-webview {enable | disable}`

Syntax Definitions

enable	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
disable	Disables WebView forwarding.

Defaults

By default, WebView forwarding is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To view the current WebView forwarding status, use the `show snmp-trap config` command.

Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.
---------------------------------------	--

MIB Objects

```
trapFilterTable
  trapToWebView
```

snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

```
snmp-trap replay-ip {ip_address | ipv6_address} [seq_id]
```

Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station to which traps will be replayed from the switch.
<i>ipv6_address</i>	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
<i>seq_id</i>	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the [show snmp station](#) command on page [page 63-5](#) to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

Examples

```
-> snmp-trap replay-ip 172.12.2.100  
-> snmp-trap replay-ip 300::1
```

Release History

Release 7.1.1; command was introduced.

snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

snmp-trap filter-ip {*ip_address* | *ipv6_address*} *trap_id_list*

no snmp-trap filter-ip {*ip_address* | *ipv6_address*} *trap_id_list*

Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station for which trap filtering is being enabled or disabled.
<i>ipv6_address</i>	The IPv6 address for the SNMP station for which trap filtering is being enabled or disabled.
<i>trap_id_list</i>	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

Defaults

By default, SNMP trap filtering is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip_address* *trap_id_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip_address* *trap_id_list*.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
```

snmp authentication-trap

Enables or disables SNMP authentication failure trap forwarding.

snmp authentication-trap {enable | disable}

Syntax Definitions

enable	Enables authentication failure trap forwarding. When enabled, the standard authentication failure trap is sent each time an SNMP authentication failure is detected.
disable	Disables authentication failure trap forwarding.

Defaults

By default, authentication failure trap forwarding is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

MIB Objects

trapConfigTable

 trapConfigEntry

event-action

This command will cause the specified script to be run when the specified event occurs.

event-action {**trap** *trigger_string* **script** *script_string* / **script-time-limit** *num*}

no event-action trap *name*

Syntax Definitions

<i>trigger_string</i>	The name of the trigger. In the case of a trap, this is the trap name.
<i>script_string</i>	The path and the name of the script to run.
<i>num</i>	The maximum amount of time a script can run (30-600).
<i>name</i>	The name of the trap to remove the event from.

Defaults

parameter	default
script-time-limit	60 seconds.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the prefix for the script is not **/flash/python**, the path will be assumed to be under that directory.
- Each event can only be assigned a single script but a script can be assigned to multiple events.
- Only users that have write privileges for the AAA partition management family can create scripts in the **/flash/python** directory.
- The **show snmp-trap config** command can be used to view the list of traps available on the switch.

Examples

```
-> event-action trap linkDown script /flash/python/link_event.py
-> event-action trap stpNewRoot script stp_event.py
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show event-action](#)

Shows the scripts and statistics associated with the events.

MIB Objects

```
alaEventActionTable  
  alaEventActionType  
  alaEventActionName  
  alaEventActionScriptName  
  alaEventActionRowStatus
```

show event-action

Shows the scripts and statistics associated with the events.

show event-action [**statistics** | **trap** *name* [**statistics**]]

Syntax Definitions

name The name of the trap to display statistics for.

statistics Displays the statistics for all configured events or a specific trap.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show event-action
```

```

type          name          script (/flash/python/...)
-----+-----+-----+-----
trap   linkDown          link_event.py
trap   stpNewRoot        stp_event.py
trap   sessionAuthenticationTrap  catchAll.py

```

```
-> show event-action statistics
```

```

Type          Name          Script Last Launched          Launch
-----+-----+-----+-----+-----
trap   linkDown          2014-10-23 13:45:34          2

```

output definitions

Type	The type of event trigger.
Name	The name of the event. In the case of a trap, this is the trap name.
Script	The name and location of the script associated with the event.
Script Last Launched	The date and time the script was last run.
Launch Count	The number of times the script has been launched by the event.

Release History

Release 7.3.4; command was introduced.

Related Commands

[event-action](#)

This command will cause the specified script to be run when the specified event occurs.

MIB Objects

```
alaEventActionTable  
  alaEventActionType  
  alaEventActionName  
  alaEventActionScriptName
```

64 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

Filename: ALCATEL-IND1-OPENFLOW-MIB.mib
Module: alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

OpenFlow Commands	openflow back-off-max openflow idle-probe-timeout openflow logical-switch openflow logical-switch controller openflow logical-switch interfaces show openflow show openflow logical-switch
--------------------------	--

openflow logical-switch

Configures an OpenFlow Logical Switch. An OpenFlow Logical Switch consists of a portion of the switch's resources that are managed by an OpenFlow Controller (or set of Controllers) via the OpenFlow Agent.

openflow logical-switch *name* [**probe-time** *num* / **failure-detect-time** *num* | **tcp-buffer-size** *num* | **dpid** *string*] [**admin-state** {**enable** | **disable**}] [**mode** {**normal** | **api** | **pfc-channel**}] [**version** {**1.0** | **1.3.1**}+] [**learned-mac-update** {**enable** | **disable**}] [**vlan** *vlan_id*]

no openflow logical-switch *<name>*

Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
probe-time <i>num</i>	Configures probe-time for a logical switch in the pfc-channel mode which will override the existing global idle-probe-time for sending echo-requests to the OpenFlow Controller. (1-60)
failure-detect-time <i>num</i>	Configures the failure-detect-time for a logical switch in the pfc-channel mode for detecting a disconnection to the OpenFlow Controller if there was no echo reply or message from the controller. (1-60)
tcp-buffer-size <i>num</i>	Configures the TCP buffer size for socket connection to OpenFlow controllers configured for the logical-switch in pfc-channel mode. (2-32)
dpid <i>string</i>	Configures a unique 8-byte Datapath Identifier (DPID) for a logical switch in pfc-channel mode. Value must be entered in hex format only (starting with 0x) and must be less than 8-bytes.
admin-state enable	Enables the Logical Switch.
admin-state disable	Disables the Logical Switch.
normal	Configures the Logical Switch to run in Normal Mode.
api	Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.
pfc-channel	Configures the Logical Switch for NEC pfc-channel mode.
1.0	Configures the Logical Switch to run OpenFlow Version 1.0.
1.3.1	Configures the Logical Switch to run OpenFlow Version 1.3.1.
learned-mac-update	Forwards new source learned MAC addresses to a WLAN controller.
<i>vlan_id</i>	The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093.

Defaults

parameter	default
probe-time <i>num</i>	5 seconds
failure-detect-time <i>num</i>	4 seconds
tcp-buffer-size <i>num</i>	2 KB
dpid <i>string</i>	Top 16-bit unique index of logical switch and bottom 48 bits of router MAC
enable disable	enable
normal api	normal
1.0 1.3.1	1.0, 1.3.1

Platforms Supported

OmniSwitch 10K, 6900, 6860

Usage Guidelines

- Up to three (3) OpenFlow Logical Switches can be configured on an OmniSwitch.
- Use the no form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.
- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- “vlan” is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.
- OpenFlow version 1.0 and 1.3.1 use TCP port 6633.

Examples

```
-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> openflow logical-switch vswitchnec mode pfc-channel
-> no openflow logical-switch vswitch1
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow logical-switch Displays information about all of the configured OpenFlow Logical Switches.

MIB Objects

```
alaOpenflowLogicalSwitchTable  
  alaOpenflowLogicalSwitch  
  alaOpenflowLogicalSwitchAdminState  
  alaOpenflowLogicalSwitchMode  
  alaOpenflowLogicalSwitchVersions  
  alaOpenflowLogicalSwitchVlan
```

openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

openflow logical-switch *name* **controller** *ip_address* [:*port*] [**priority** *num*] **admin-state** {**enable** | **disable**}

no openflow logical-switch *name* **controller** *ip_address* [:*port*]

Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
<i>ip_address</i>	The IP address of Controller.
<i>port</i>	The Controller IP Port (1 - 65535).
priority <i>num</i>	Configure the priority to a controller for a logical-switch in pfc-channel mode (0-2). 0 = highest, 2 = lowest.
enable	Enables the connection to the Controller.
disable	Disables the connection to the Controller.

Defaults

parameter	default
<i>port</i>	6633
enable disable	enable
priority <i>num</i>	2

Platforms Supported

OmniSwitch 10K, 6900, 6860

Usage Guidelines

- Only IPv4 addresses are supported.
- If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc. continues unaffected while the Controllers are disconnected.
- Use the priority parameter to configure the priority for a specified controller. If controllers have the same priority the one configured first will have priority.

Examples

```
-> openflow logical-switch vswitch1 controller 1.2.3.4
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 admin-state enable
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634
-> openflow logical-switch vswitchnec controller 2.2.2.2 priority 1
-> no openflow logical-switch vswitch1 controller 1.2.3.4
```

Release History

Release 7.3.4; command introduced.

Related Commands

show openflow logical-switch Displays information about all of the configured OpenFlow Logical Switches.

MIB Objects

```
alaOpenflowControllerTable
  alaOpenflowControllerLogicalSwitch
  alaOpenflowControllerIpType
  alaOpenflowControllerIp
  alaOpenflowControllerPort
  alaOpenflowControllerAdminState
```

openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

openflow logical-switch *name* **interfaces** {**port** *chassis/slot/port1*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*] | **type** {**trunk** | **access**}} | [**native-vlan** *vlan*] | [**vlan-tag** *vlan*[-*vlan2*]]}

no openflow logical-switch *name* **interfaces** {**port** *chassis/slot/port1*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number.
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number.
trunk	Configures the interface type as trunk.
access	Configures the interface type as access.
native-vlan <i>vlan</i>	The default VLAN for an interface in the logical switch. Traffic on this port will be untagged for the native vlan. Traffic on all other VLANs on this port will be tagged. (2-4093)
vlan-tag <i>vlan</i> [- <i>vlan2</i>]	The list of allowed tagged VLANs for an interface. Traffic on these allowed VLAN(s) of the ports and Untagged traffic will not carry an 802.1q tag. Traffic on all other VLANs on the port will be dropped. (2-4093)

Defaults

parameter	default
type	access

Platforms Supported

OmniSwitch 10K, 6900, 6860

Usage Guidelines

Native-vlan and vlan-tag are valid parameters only if the logical switch mode is pfc-channel.

Examples

```
-> openflow logical-switch vswitch1 interfaces port 1/1/1
-> no openflow logical-switch vswitch1 interfaces port 1/1/1
-> openflow logical-switch vswitch2 interfaces linkagg 5
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> openflow logical-switch vswitchnec interfaces port 1/1/20 type trunk
-> openflow logical-switch vswitchnec interfaces port 1/1/20 native-vlan 3
-> openflow logical-switch vswitchnec interfaces port 1/1/20 vlan-tag 4-5
```

Release History

Release 7.3.4; command introduced

Related Commands

show openflow logical-switch Displays information about all of the configured Logical Switches.

MIB Objects

```
alaOpenflowInterfaceTable  
  alaOpenflowInterfaceLogicalSwitch  
  alaOpenflowInterface
```

show openflow

Displays global OpenFlow configuration parameters.

show openflow

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860

Usage Guidelines

N/A

Examples

```
-> show openflow
Back-off Max      : 60,
Idle Probe Timeout : 15
```

output definitions

Back-off Max	The configured maximum back off time, in seconds, for Controller connection attempts (Range = 1 - 60, Default = 60).
Idle Probe Timeout	The configured idle probe timeout value, in seconds (Range = 1– 60, Default = 15).

Release History

Release 7.3.4; command introduced

Related Commands

- [openflow back-off-max](#) Configures the maximum amount of time allowed for Controller connection attempts.
- [openflow idle-probe-timeout](#) Configures the idle probe timeout value.

MIB Objects

```
alaOpenflowGlobalBackoffMax
alaOpenflowGlobalIdleProbeTimeout
```

show openflow logical-switch

Displays information about configured OpenFlow Logical Switches.

show openflow logical-switch [*name* | **controllers** | **interfaces** [**vlan**s | **port** | **linkagg**] | **details**]

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
controllers	The controllers assigned to this logical switch.
interfaces	The interfaces assigned to this logical switch.
details	The details of the logical switch.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860

Usage Guidelines

- Enter a Logical Switch name to display only information about a specific Logical Switch.
- The DPID, TCP-Buffer-Size, Probe-Time, and Failure-Detect-Time are only applicable for a logical switch in PFC mode.

Examples

```
-> show openflow logical-switch
```

Logical Switch	Admin State	Mode	Versions	VLAN	Ctrlrs	Intf	Flows
vswitch1	Ena	Norm	1.0	1	1	4	0
vswitch2	Dis	Norm	1.0, 1.3.1	5	3	4	2
vswitchnec	Ena	PFC	1.0, 1.3.1	N/A	1	0	0

```
-> show openflow logical-switch details
```

```
Logical-Switch: vswitchnec
DPID           = 0x1234567890123456
TCP-Buffer-Size = 2 Kilobytes
Probe-Time     = 5 Sec
Failure-Detect-Time = 4 Sec
```

output definitions

Logical Switch	The Logical Switch name
Admin State	The Logical Switch administrative state (Enabled/Disabled).
Mode	The Logical Switch operational Mode (Normal/API/PFC).

output definitions

Versions	The OpenFlow versions enabled on the Logical Switch (1.0/1.3.1).
VLAN	The default VLAN for all ports assigned to the Logical Switch. Zero (0) indicates no VLAN configured.
Ctrlrs	The number of Controllers configured for the Logical Switch (up to three (3) Controllers can be configured per Logical Switch).
Intf	The number of interfaces (ports and link aggregations) configured for the Logical Switch.
Flows	The number of flows pushed to the Logical Switch by its Controllers.
Controller	The controller IP address and port.
Role	Current role of the controller. Equal, Master, or Slave.
Oper State	Current connection state of the controller (invalid, operDisabled, sendError, init, connecting, backoff, exchangingHello, active, idle, disconnected).
DPID	The DPID configured for the logical switch.
TCP-Buffer-Size	TCP Send Buffer size for socket towards controller for the logical switch.
Probe-Time	The probe-time configured for the logical switch name.
Failure-Detect-Time	The failure-detect-time configured for the logical switch.

Release History

Release 7.3.4; command introduced

Related Commands

openflow logical-switch	Configures an OpenFlow Logical Switch.
openflow logical-switch controller	Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.
openflow logical-switch interfaces	Configures a range of interfaces to/from a Logical Switch.

65 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

Filename: AlcatelIND1System.mib
Module: ALCATEL-IND1-SYSTEM.MIB

A summary of the available commands is listed here.

[ip domain-lookup](#)
[ip name-server](#)
[ipv6 name-server](#)
[ip domain-name](#)
[show dns](#)

ip domain-lookup

Enables or disables the DNS resolver.

ip domain-lookup

no ip domain-lookup

Syntax Definitions

N/A

Defaults

By default, the DNS resolver is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

Examples

```
-> ip domain-lookup  
-> no ip domain-lookup
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip name-server	Specifies the IP addresses of up to three servers to query on a host lookup.
ipv6 name-server	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS  
    systemDNSEnableDnsResolver
```

ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

```
ip name-server server_address1 [server_address2 [server_address3]]
```

Syntax Definitions

<i>server_address1</i>	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
<i>server_address2</i>	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
<i>server_address3</i>	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1  
-> ip name-server 10.255.11.66
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip domain-lookup](#)

Enables or disables the DNS resolver.

[ip domain-name](#)

Sets or deletes the default domain name for DNS lookups.

[show dns](#)

Displays the current DNS resolver configuration and status.

MIB Objects

systemDNS

systemDNSNsAddr1

systemDNSNsAddr2

systemDNSNsAddr3

ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

```
ipv6 name-server server_ipv6_address1 [server_ipv6_address2 [server_ipv6_address3]]
```

Syntax Definitions

<i>server_ipv6_address1</i>	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
<i>server_ipv6_address2</i>	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
<i>server_ipv6_address3</i>	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

                  : f1bc::202:fd40:f3
```

output definitions

Resolver is	Indicates whether the DNS resolver is enabled or disabled.
domainName	Indicates the default domain name assigned to the DNS lookups. This value is set using the ip domain-name command.
IPv4 nameServer(s)	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the ip name-server command.
IPv6 nameServer(s)	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the ipv6 name-server command.

A Software License and Copyright Statements

This appendix contains Alcatel-Lucent and third-party software vendor license and copyright statements.

Alcatel-Lucent License Agreement

ALCATEL-LUCENT SOFTWARE LICENSE AGREEMENT

IMPORTANT. Please read the terms and conditions of this license agreement carefully before opening this package.

By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.

1. **License Grant.** This is a license, not a sales agreement, between you (the “Licensee”) and Alcatel-Lucent. Alcatel-Lucent hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that Alcatel-Lucent products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **Alcatel-Lucent’s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of Alcatel-Lucent and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with Alcatel-Lucent and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** Alcatel-Lucent considers the Licensed Files to contain valuable trade secrets of Alcatel-Lucent, the unauthorized disclosure of which could cause irreparable harm to Alcatel-Lucent. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold Alcatel-Lucent harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation Alcatel-Lucent's reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** Alcatel-Lucent warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. Alcatel-Lucent further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to Alcatel-Lucent for either replacement or, if so elected by Alcatel-Lucent, refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALCATEL-LUCENT AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** Alcatel-Lucent's cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to Alcatel-Lucent for the Licensed Materials. IN NO EVENT SHALL ALCATEL-LUCENT BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALCATEL-LUCENT HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between Alcatel-Lucent and Licensee, if any, Alcatel-Lucent is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and Alcatel-Lucent has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to Alcatel-Lucent and certifying to Alcatel-Lucent in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. Alcatel-Lucent may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by Alcatel-

Lucent, Licensee agrees to return to Alcatel-Lucent or destroy the Licensed Materials and all copies and portions thereof.

10. Governing Law. This License Agreement shall be construed and governed in accordance with the laws of the State of California.

11. Severability. Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

12. No Waiver. The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

13. Notes to United States Government Users. Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with Alcatel-Lucent's reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

14. Third Party Materials. Licensee is notified that the Licensed Files contain third party software and materials licensed to Alcatel-Lucent by certain third party licensors. Some third party licensors are third party beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "[Third Party Licenses and Notices](#)" on page -4 for the third party license and notice terms.

Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: **/flash/foss**.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used into this release at the following URL: <https://service.esd.alcatel-lucent.com/portal/page/portal/EService/release>

VLAN Stacking Commands

```

ethernet-service svlan {svlan_id[-svlan_id2]} [admin-state {enable | disable}] [name
    description]
no ethernet-service svlan {svlan_id [-svlan_id2]}

```

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

```
