

Part No. 060415-10, Rev. A
September 2016

OmniSwitch AOS Release 8

CLI Reference Guide

Alcatel-Lucent 
Enterprise

enterprise.alcatel-lucent.com

**This user guide documents AOS Release 8.3.1 for the
OmniSwitch 10K, OmniSwitch 9900, OmniSwitch 6900, OmniSwitch 6860, and OmniSwitch 6865.
The functionality described in this guide is subject to change without notice.**

	About This Guide	xxix
	Supported Platforms	xxix
	Who Should Read this Manual?	xxix
	When Should I Read this Manual?	xxix
	What is in this Manual?	xxx
	What is Not in this Manual?	xxx
	How is the Information Organized?	xxx
	Text Conventions	xxx
	Documentation Roadmap	xxxii
	Related Documentation	xxxiv
	Technical Support	xxxv
Chapter 1	Ethernet Port Commands	1-1
	interfaces	1-4
	interfaces speed	1-6
	interfaces crossover	1-8
	interfaces duplex	1-10
	interfaces alias	1-12
	clear interfaces	1-13
	interfaces max-frame-size	1-15
	interfaces flood-limit	1-16
	interfaces flood-limit action	1-18
	interfaces ingress-bandwidth	1-20
	interfaces pause	1-21
	interfaces link-trap	1-23
	interfaces ddm	1-24
	interfaces ddm-trap	1-25
	interfaces wait-to-restore	1-26
	interfaces wait-to-shutdown	1-28
	interfaces eee	1-30
	interfaces split-mode	1-31
	clear violation	1-33
	violation recovery-maximum	1-35
	violation recovery-time	1-37
	violation recovery-trap	1-39
	show interfaces	1-40
	show interfaces alias	1-44
	show interfaces status	1-46
	show interfaces capability	1-48
	show interfaces accounting	1-50

show interfaces counters	1-53
show interfaces counters errors	1-55
show interfaces flood-rate	1-57
show interfaces traffic	1-59
show interfaces ingress-rate-limit	1-61
show interfaces ddm	1-63
show interfaces split-mode	1-66
show transceivers	1-68
show violation	1-70
show violation-recovery-configuration	1-72
interfaces link-monitoring admin-status	1-74
interfaces link-monitoring time-window	1-76
interfaces link-monitoring link-flap-threshold	1-78
interfaces link-monitoring link-error-threshold	1-80
interfaces clear-link-monitoring-stats	1-82
show interfaces link-monitoring config	1-83
show interfaces link-monitoring statistics	1-86
interfaces tdr	1-88
show interfaces tdr-statistics	1-89
link-fault-propagation group	1-91
link-fault-propagation group source	1-93
link-fault-propagation group destination	1-95
link-fault-propagation group wait-to-shutdown	1-97
show link-fault-propagation group	1-98
interfaces beacon	1-100
show interfaces beacon	1-102

Chapter 2	Power over Ethernet (PoE) Commands	2-1
	lanpower service	2-3
	lanpower port admin-state	2-4
	lanpower type	2-5
	lanpower power	2-6
	lanpower power	2-6
	lanpower maxpower	2-8
	lanpower priority	2-10
	lanpower ni-priority	2-12
	lanpower priority-disconnect	2-14
	lanpower power-rule	2-16
	lanpower power-policy	2-19
	lanpower class-detection	2-21
	lanpower capacitor-detection	2-22
	lanpower usage-threshold	2-23
	lanpower dynamic-power-mgmt	2-24
	lanpower update-from	2-25
	show lanpower slot	2-26
	show lanpower power-rule	2-29
	show lanpower power-policy	2-31
	show lanpower class-detection	2-33
	show lanpower capacitor-detection	2-34
	show lanpower priority-disconnect	2-35
	show lanpower ni-priority	2-36

	show lanpower usage-threshold	2-37
	show lanpower update-from	2-38
Chapter 3	UDLD Commands	3-1
	udld	3-2
	udld port	3-3
	udld mode	3-4
	udld probe-timer	3-6
	udld echo-wait-timer	3-8
	clear udld statistics port	3-10
	show udld configuration	3-11
	show udld configuration port	3-13
	show udld statistics port	3-15
	show udld neighbor port	3-17
	show udld status port	3-19
Chapter 4	Source Learning Commands	4-1
	mac-learning	4-2
	mac-learning flush	4-4
	mac-learning flush domain all	4-5
	mac-learning flush domain vlan	4-7
	mac-learning flush domain spb	4-9
	mac-learning flush domain vxlan	4-11
	mac-learning static mac-address	4-13
	mac-learning multicast mac-address	4-15
	mac-learning aging-time	4-17
	mac-learning mode	4-19
	show mac-learning	4-20
	show mac-learning domain all	4-24
	show mac-learning domain vlan	4-27
	show mac-learning domain spb	4-31
	show mac-learning domain vxlan	4-34
	show mac-learning aging-time	4-37
	show mac-learning learning-state	4-38
	show mac-learning mode	4-40
	mac-ping	4-41
Chapter 5	VLAN Management Commands	5-1
	vlan	5-2
	vlan members untagged	5-4
	vlan members tagged	5-6
	vlan mtu-ip	5-8
	show vlan	5-10
	show vlan members	5-13
	pvlan	5-16
	pvlan secondary	5-18
	pvlan members	5-20
	show pvlan	5-22
	show pvlan mapping	5-24
	show pvlan members	5-26

Chapter 6	High Availability VLAN Commands	6-1
	server-cluster	6-2
	server-cluster vlan	6-4
	server-cluster mac-address	6-6
	server-cluster ip	6-8
	server-cluster igmp mode	6-10
	server-cluster ip-multicast	6-12
	server-cluster port	6-14
	server-cluster linkagg	6-16
	show server-cluster	6-18
Chapter 7	VLAN Stacking Commands	7-1
	ethernet-service svlan	7-2
	ethernet-service service-name	7-4
	ethernet-service nni	7-6
	ethernet-service svlan nni	7-8
	ethernet-service sap	7-10
	ethernet-service sap uni	7-12
	ethernet-service sap cvlan	7-14
	ethernet-service sap-profile	7-16
	ethernet-service sap sap-profile	7-19
	ethernet-service uni-profile	7-21
	ethernet-service uni uni-profile	7-24
	ethernet-service transparent-bridging	7-26
	show ethernet-service vlan	7-28
	show ethernet-service	7-30
	show ethernet-service sap	7-33
	show ethernet-service port	7-35
	show ethernet-service nni	7-38
	show ethernet-service uni	7-40
	show ethernet-service uni-profile	7-42
	show ethernet-service sap-profile	7-44
Chapter 8	Distributed Spanning Tree Commands	8-1
	spantree mode	8-3
	spantree protocol	8-5
	spantree vlan admin-state	8-7
	spantree mst region name	8-8
	spantree mst region revision-level	8-10
	spantree mst region max-hops	8-11
	spantree msti	8-13
	spantree msti vlan	8-15
	spantree priority	8-17
	spantree hello-time	8-20
	spantree max-age	8-22
	spantree forward-delay	8-24
	spantree bpdu-switching	8-26
	spantree path-cost-mode	8-28
	spantree pvst+compatibility	8-30
	spantree auto-vlan-containment	8-32
	spantree cist	8-34
	spantree vlan	8-36

spantree cist path-cost	8-38
spantree msti path-cost	8-41
spantree vlan path-cost	8-44
spantree cist mode	8-47
spantree loop-guard	8-49
spantree vlan mode	8-51
spantree cist connection	8-53
spantree vlan connection	8-55
spantree cist admin-edge	8-57
spantree vlan admin-edge	8-59
spantree cist auto-edge	8-61
spantree vlan auto-edge	8-63
spantree cist restricted-role	8-65
spantree vlan restricted-role	8-67
spantree cist restricted-tcn	8-69
spantree vlan restricted-tcn	8-71
spantree cist txholdcount	8-73
spantree vlan txholdcount	8-74
show spantree	8-75
show spantree cist	8-78
show spantree msti	8-82
show spantree vlan	8-87
show spantree ports	8-91
show spantree cist ports	8-94
show spantree msti ports	8-98
show spantree vlan ports	8-103
show spantree mode	8-109
show spantree mst	8-111
show spantree msti vlan-map	8-113
show spantree cist vlan-map	8-115
show spantree map-msti	8-117

Chapter 9	Shortest Path Bridging Commands	9-1
	spb bvlan	9-3
	spb isis bvlan ect-id	9-5
	spb isis control-bvlan	9-6
	spb isis bvlan tandem-multicast-mode	9-7
	spb isis bridge-priority	9-9
	spb isis interface	9-10
	spb ipvpn bind	9-12
	spb ipvpn redistrib	9-14
	show spb ipvpn bind	9-16
	show spb ipvpn redistrib	9-18
	show spb ipvpn route-table	9-20
	spb isis admin-state	9-22
	spb isis area-address	9-23
	spb isis source-id	9-24
	spb isis control-address	9-25
	spb isis spf-wait	9-26
	spb isis lsp-wait	9-28
	spb isis overload	9-30
	spb isis overload-on-boot	9-32

spb isis graceful-restart	9-34
spb isis graceful-restart helper	9-35
show spb isis info	9-36
show spb isis bvlans	9-39
show spb isis interface	9-41
show spb isis adjacency	9-43
show spb isis database	9-46
show spb isis nodes	9-49
show spb isis unicast-table	9-51
show spb isis services	9-53
show spb isis spf	9-55
show spb isis multicast-table	9-57
show spb isis multicast-sources	9-59
show spb isis multicast-sources-spf	9-61
show spb isis ingress-mac-filter	9-63

Chapter 10

Service Manager Commands	10-1
service spb	10-3
service vxlan	10-5
service description	10-8
service multicast-mode	10-10
service stats	10-12
service vlan-xlation	10-14
service admin-state	10-16
service vxlan udp-port	10-18
service vxlan vrf	10-19
service l2profile	10-20
service access	10-23
service access l2profile	10-25
service access vlan-xlation	10-27
service sap	10-29
service sap description	10-32
service sap trusted	10-34
service sap stats	10-36
service sap admin-state	10-38
service sdp	10-40
service bind-sdp	10-42
service rfp local-endpoint	10-44
service rfp remote-endpoint	10-47
show service l2profile	10-49
show service access	10-51
show service	10-54
show service ports	10-59
show service sap	10-62
show service sdp	10-65
show service sdp spb	10-68
show service sdp vxlan	10-71
show service bind-sdp	10-74
show service bind-sdp spb	10-77
show service bind-sdp vxlan	10-79
show service debug-info	10-81
show service info	10-84

	show service counters	10-86
	clear service counters	10-88
	show service rfp	10-90
	show service rfp configuration	10-93
Chapter 11	Loopback Detection Commands	11-1
	loopback-detection	11-2
	loopback-detection port	11-4
	loopback-detection service-access	11-6
	loopback-detection transmission-timer	11-8
	loopback-detection autorecovery-timer	11-9
	show loopback-detection	11-10
	show loopback-detection port	11-12
	show loopback-detection statistics port	11-15
Chapter 12	Link Aggregation Commands	12-1
	linkagg static agg size	12-3
	linkagg static agg name	12-6
	linkagg static agg admin-state	12-8
	linkagg static port agg	12-9
	linkagg lacp agg size	12-11
	linkagg lacp agg name	12-14
	linkagg lacp agg admin-state	12-15
	linkagg lacp agg actor admin-key	12-17
	linkagg lacp agg actor system-priority	12-18
	linkagg lacp agg actor system-id	12-20
	linkagg lacp agg partner system-id	12-22
	linkagg lacp agg partner system-priority	12-24
	linkagg lacp agg partner admin-key	12-26
	linkagg lacp port actor admin-key	12-28
	linkagg lacp port actor admin-state	12-31
	linkagg lacp port actor system-id	12-33
	linkagg lacp port actor system-priority	12-35
	linkagg lacp agg partner admin-state	12-37
	linkagg lacp port partner admin system-id	12-39
	linkagg lacp port partner admin-key	12-41
	linkagg lacp port partner admin system-priority	12-43
	linkagg lacp port actor port priority	12-45
	linkagg lacp port partner admin-port	12-47
	linkagg lacp port partner admin port-priority	12-48
	dhl name	12-50
	dhl num linka linkb	12-52
	dhl num admin-state	12-54
	dhl num vlan-map linkb	12-55
	dhl num pre-emption-time	12-57
	dhl num mac-flushing	12-59
	show dhl	12-61
	show dhl num	12-63
	show dhl num link	12-66
	linkagg range	12-68
	show linkagg	12-70
	show linkagg port	12-75

show linkagg accounting	12-81
show linkagg counters	12-83
show linkagg traffic	12-85
clear linkagg-statistics	12-86
show linkagg range	12-88

Chapter 13	Virtual Chassis Commands	13-1
	virtual-chassis configured-chassis-id	13-2
	virtual-chassis chassis-group	13-4
	virtual-chassis configured-chassis-priority	13-6
	virtual-chassis configured-control-vlan	13-8
	virtual-chassis configured-hello-interval	13-10
	virtual-chassis vf-link create	13-12
	virtual-chassis vf-link member-port	13-14
	virtual-chassis vf-link default-vlan	13-16
	virtual-chassis hello-interval	13-18
	virtual-chassis shutdown	13-20
	virtual-chassis vf-link-mode	13-21
	virtual-chassis auto-vf-link-port	13-22
	vc-takeover	13-23
	convert configuration	13-24
	show virtual-chassis topology	13-26
	show virtual-chassis consistency	13-31
	show virtual-chassis vf-link	13-34
	show virtual-chassis auto-vf-link-port	13-37
	show virtual-chassis chassis-reset-list	13-39
	show virtual-chassis slot-reset-list	13-41
	show virtual-chassis neighbors	13-43
	show configuration vcm-snapshot chassis-id	13-45
	virtual-chassis split-protection admin-state	13-46
	virtual-chassis split-protection linkagg	13-47
	virtual-chassis split-protection guard-timer	13-48
	virtual-chassis split-protection helper admin-state	13-49
	virtual-chassis split-protection helper linkagg	13-50
	show virtual-chassis split-protection status	13-51
	show virtual-chassis split-protection vc-units	13-52
	show virtual-chassis split-protection helper status	13-53

Chapter 14	Ethernet Ring Protection Commands	14-1
	erp-ring	14-2
	erp-ring rpl-node	14-5
	erp-ring wait-to-restore	14-7
	erp-ring enable	14-8
	erp-ring guard-timer	14-9
	erp-ring sub-ring	14-10
	erp-ring virtual-channel	14-13
	erp-ring revertive	14-15
	erp-ring clear	14-17
	erp-ring ethoam-event	14-18
	clear erp statistics	14-20
	show erp	14-22
	show erp statistics	14-25

Chapter 15	MVRP Commands	15-1
	mvrp	15-2
	mvrp port	15-3
	mvrp linkagg	15-5
	mvrp maximum-vlan	15-7
	mvrp registration	15-8
	mvrp applicant	15-10
	mvrp timer join	15-12
	mvrp timer leave	15-14
	mvrp timer leaveall	15-16
	mvrp timer periodic-timer	15-18
	mvrp periodic-transmission	15-20
	mvrp restrict-vlan-registration	15-22
	mvrp restrict-vlan-advertisement	15-24
	mvrp static-vlan-restrict	15-26
	show mvrp configuration	15-28
	show mvrp port	15-29
	show mvrp linkagg	15-32
	show mvrp timer	15-34
	show mvrp statistics	15-37
	show mvrp last-pdu-origin	15-41
	show mvrp vlan-restrictions	15-43
	mvrp clear-statistics	15-45
Chapter 16	802.1AB Commands	16-1
	lldp nearest-edge mode	16-3
	lldp transmit interval	16-4
	lldp transmit hold-multiplier	16-5
	lldp reinit delay	16-6
	lldp notification interval	16-7
	lldp lldpdu	16-8
	lldp notification	16-10
	lldp network-policy	16-12
	lldp med network-policy	16-14
	lldp tlv management	16-16
	lldp tlv dot1	16-18
	lldp tlv dot3	16-20
	lldp tlv med	16-22
	lldp tlv application	16-24
	lldp tlv application priority	16-26
	show lldp system-statistics	16-28
	show lldp statistics	16-30
	show lldp local-system	16-32
	show lldp local-port	16-34
	show lldp local-management-address	16-36
	show lldp config	16-38
	show lldp network-policy	16-41
	show lldp med network-policy	16-43
	show lldp remote-system	16-45
	show lldp remote-system med	16-47
	show lldp remote-system application-tlv	16-50
	show lldp agent-destination-address	16-52

	lldp trust-agent	16-54
	lldp trust-agent violation-action	16-56
	show lldp trusted remote-agent	16-58
	show lldp trust-agent	16-60
Chapter 17	SIP Commands	17-1
	sip-snooping admin-state	17-2
	sip-snooping port admin-state	17-3
	sip-snooping mode	17-5
	sip-snooping trusted server	17-7
	sip-snooping sip-control	17-9
	sip-snooping sos-call number	17-10
	sip-snooping sos-call dscp	17-11
	sip-snooping udp port	17-12
	sip-snooping tcp port	17-13
	sip-snooping threshold	17-15
	sip-snooping logging-threshold num-of-calls	17-17
	show sip-snooping call-records	17-18
	clear sip-snooping statistics	17-21
	show sip-snooping config	17-22
	show sip-snooping ports	17-24
	show sip-snooping statistics	17-25
	show sip-snooping registered-clients	17-28
Chapter 18	Automatic Fabric Commands	18-1
	auto-fabric admin-state	18-2
	auto-fabric interface	18-4
	auto-fabric discovery start	18-6
	auto-fabric protocols	18-7
	auto-fabric config-save interval	18-9
	auto-fabric config-save admin-state	18-10
	auto-fabric discovery-interval	18-11
	auto-fabric protocols spb default-profile	18-12
	auto-fabric protocols spb set-profile	18-14
	show auto-fabric config	18-15
	show auto-fabric config interface	18-17
Chapter 19	IP Commands	19-1
	ip interface	19-5
	ip interface rtr-port	19-8
	ip interface tunnel	19-10
	ip interface dhcp-client	19-12
	ip router primary-address	19-14
	ip router router-id	19-15
	ip static-route	19-16
	ip route-pref	19-18
	ip default-ttl	19-20
	ping	19-21
	traceroute	19-23
	ip directed-broadcast	19-25
	ip service	19-26
	ip service port	19-28

ip service source-ip	19-30
ip redistrib	19-32
ip access-list	19-34
ip access-list address	19-35
ip route-map action	19-37
ip route-map match ip address	19-39
ip route-map match ipv6 address	19-41
ip route-map match ip-next-hop	19-43
ip route-map match ipv6-next-hop	19-45
ip route-map match tag	19-47
ip route-map match ipv4-interface	19-49
ip route-map match ipv6-interface	19-51
ip route-map match metric	19-53
ip route-map match route-type	19-55
ip route-map match protocol	19-57
ip route-map set metric	19-59
ip route-map set metric-type	19-61
ip route-map set tag	19-63
ip route-map set community	19-65
ip route-map set local-preference	19-67
ip route-map set level	19-69
ip route-map set ip-next-hop	19-71
ip route-map set ipv6-next-hop	19-73
vrf	19-75
ip export	19-77
ip import	19-80
show ip export	19-82
show ip import	19-83
show ip global-route-table	19-85
arp	19-87
ip distributed-arp admin-state	19-89
clear arp-cache	19-90
ip dos arp-poison restricted-address	19-91
arp filter	19-92
clear arp filter	19-94
icmp type	19-95
icmp unreachable	19-97
icmp echo	19-99
icmp timestamp	19-101

Chapter 20

IPv6 Commands	20-1
ipv6 interface	20-3
ipv6 interface tunnel source destination	20-7
ipv6 address	20-8
ipv6 address global-id	20-10
ipv6 address local-unicast	20-11
ipv6 dad-check	20-13
ipv6 hop-limit	20-14
ipv6 pmtu-lifetime	20-15
ipv6 neighbor stale-lifetime	20-16
ipv6 neighbor	20-17
ipv6 prefix	20-19
ipv6 static-route	20-21
ipv6 route-pref	20-23
ipv6 virtual-source-mac	20-25
ping6	20-26
traceroute6	20-28
show ipv6 icmp statistics	20-30
show ipv6 interface	20-33
show ipv6 pmtu table	20-37
show ipv6 neighbors	20-39
clear ipv6 neighbors	20-41
show ipv6 prefixes	20-42
show ipv6 routes	20-44
show ipv6 route-pref	20-46
show ipv6 router database	20-47
show ipv6 tcp connections	20-49

	show ipv6 tcp listeners	20-51
	show ipv6 traffic	20-53
	show ipv6 tunnel configured	20-56
	show ipv6 tunnel 6to4	20-58
	show ipv6 udp ports	20-59
	show ipv6 information	20-60
	ipv6 redistrib	20-62
	ipv6 access-list	20-64
	ipv6 access-list address	20-65
	show ipv6 redistrib	20-67
	show ipv6 access-list	20-69
Chapter 21	IPsec Commands	21-1
	ipsec key	21-2
	ipsec security-key	21-4
	ipsec policy	21-6
	ipsec policy rule	21-9
	ipsec sa	21-10
	show ipsec policy	21-12
	show ipsec sa	21-14
	show ipsec key	21-16
	show ipsec ipv6 statistics	21-18
Chapter 22	RIP Commands	22-1
	ip load rip	22-2
	ip rip admin-state	22-3
	ip rip interface	22-4
	ip rip interface admin-state	22-6
	ip rip interface metric	22-8
	ip rip interface send-version	22-9
	ip rip interface recv-version	22-11
	ip rip interface ingress-filter	22-12
	ip rip interface egress-filter	22-13
	ip rip force-holddowntimer	22-14
	ip rip host-route	22-16
	ip rip route-tag	22-17
	ip rip interface auth-type	22-18
	ip rip interface auth-key	22-19
	ip rip update-interval	22-20

show command-log	59-32
show command-log status	59-34
show telnet	59-35
show ssh	59-36

Chapter 60	File Management Commands	60-1
	cd	60-2
	pwd	60-3
	mkdir	60-4
	rmdir	60-6
	ls	60-8
	rm	60-10
	cp	60-12
	scp	60-14
	mv	60-16
	chmod	60-18
	freespace	60-19
	fsck	60-20
	newfs	60-22
	vi	60-23
	tty	60-25
	show tty	60-27
	tftp	60-28
	sftp	60-29
	ftp	60-31
	show ftp	60-33

Chapter 61	Web Management Commands	61-1
	webview server	61-2
	webview access	61-3
	webview force-ssl	61-4
	webview http-port	61-5

	webview https-port	61-6
	show webview	61-7
Chapter 62	Configuration File Manager Commands	62-1
	configuration apply	62-2
	configuration error-file-limit	62-4
	show configuration status	62-6
	configuration cancel	62-8
	configuration syntax-check	62-9
	configuration snapshot	62-11
	show configuration snapshot	62-14
	write terminal	62-17
Chapter 63	SNMP Commands	63-1
	snmp station	63-3
	show snmp station	63-5
	snmp community-map	63-7
	snmp community-map mode	63-9
	show snmp community-map	63-10
	snmp security	63-12
	show snmp security	63-14
	show snmp statistics	63-16
	show snmp mib-family	63-18
	snmp-trap absorption	63-20
	snmp-trap to-webview	63-21
	snmp-trap replay-ip	63-22
	snmp-trap filter-ip	63-24
	snmp authentication-trap	63-26
	show snmp-trap replay-ip	63-27
	show snmp-trap filter-ip	63-29
	show snmp authentication-trap	63-31
	show snmp-trap config	63-32
	event-action	63-34
	show event-action	63-36
Chapter 64	OpenFlow Commands	64-1
	openflow back-off-max	64-2
	openflow idle-probe-timeout	64-3
	openflow logical-switch	64-4
	openflow logical-switch controller	64-7
	openflow logical-switch interfaces	64-9
	show openflow	64-11
	show openflow logical-switch	64-12
Chapter 65	DNS Commands	65-1
	ip domain-lookup	65-2
	ip name-server	65-3
	ipv6 name-server	65-5
	ip domain-name	65-7
	show dns	65-8

About This Guide

This *OmniSwitch AOS Release 8 CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch.

Supported Platforms

The information in this guide applies only to the following products:

- OmniSwitch 10K Series
- OmniSwitch 9900 Series
- OmniSwitch 6900 Series
- OmniSwitch 6860 Series
- OmniSwitch 6865 Series

Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features can be found in the *OmniSwitch AOS Release 8 Switch Management Guide*, *OmniSwitch AOS Release 8 Network Configuration Guide*, *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*, and *OmniSwitch AOS Release 8 Data Center Switching Guide*. Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

bold text	Indicates basic command and keyword syntax. Example: show snmp station
<i>italicized text</i>	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: no snmp station <i>ip_address</i> Italicized text that is not enclosed with straight brackets ([]) indicates required information.
[] (Straight Brackets)	Indicates optional parameters for a given command. Example: show aaa server [<i>server_name</i>] Here, you can enter either of the following options: show aaa server show aaa server <i>server_name</i> (where <i>server_name</i> is the user-specified server name, e.g., show aaa server myserver1) Note that this example includes <i>italicized text</i> . The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: port mirroring {enable disable} Here, you must choose one of the following: port mirroring enable or port mirroring disable
(Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string show health threshold [rx txrx memory cpu] separates the choices rx , txrx , memory , and cpu . Examples: show health threshold rx show health threshold txrx show health threshold memory show health threshold cpu
“ ” (Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: vlan 2 “new test vlan”

Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process. The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

Stage 1: Using the Switch for the First Time

Pertinent Documentation: *OmniSwitch Hardware Users Guide*
Release Notes

This guide provides all the information you need to get your switch up and running the first time. It provides information on unpacking the switch, rack mounting the switch, installing NI modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

Stage 2: Gaining Familiarity with Basic Switch Functions

Pertinent Documentation: *OmniSwitch Hardware Users Guide*
OmniSwitch AOS Release 8 Switch Management Guide

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the *OmniSwitch 10K Hardware Guide*. This guide provides specifications, illustrations, and descriptions of all hardware components, such as chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

The *OmniSwitch AOS Release 8 Switch Management Guide* is the primary users guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

Stage 3: Integrating the Switch Into a Network

Pertinent Documentation: *OmniSwitch AOS Release 8 Network Configuration Guide*
OmniSwitch AOS Release 8 Advanced Routing Configuration Guide
OmniSwitch AOS Release 8 Data Center Switching Guide

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *OmniSwitch AOS Release 8 Network Configuration Guide* contains overview information, procedures, and examples on how standard networking technologies are configured on the OmniSwitch.

The *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies (OSPF and BGP) and multicast routing protocols (DVMRP and PIM-SM).

The *OmniSwitch AOS Release 8 Data Center Switching Guide* includes configuration information for data center networks using virtualization technologies (SPBM and UNP), Data Center Bridging protocols (PFC, ETC, and DCBX), and FCoE/FC gateway functionality.

Anytime

The *OmniSwitch AOS Release 8 CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

Related Documentation

The following are the titles and descriptions of all the related OmniSwitch user manuals:

- *OmniSwitch 10K, 9900, 6900, 6860, 6865 Hardware Users Guides*

Describes the hardware and software procedures for getting an OmniSwitch up and running as well as complete technical specifications and procedures for all OmniSwitch chassis, power supplies, fans, and Network Interface (NI) modules.

- *OmniSwitch AOS Release 8 CLI Reference Guide*

Complete reference to all CLI commands supported on the OmniSwitch. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- *OmniSwitch AOS Release 8 Switch Management Guide*

Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- *OmniSwitch AOS Release 8 Network Configuration Guide*

Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP and IPX), security options (authenticated VLANs), Quality of Service (QoS), link aggregation, and server load balancing.

- *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*

Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP).

- *OmniSwitch AOS Release 8 Data Center Switching Guide*

Includes an introduction to the OmniSwitch data center switching architecture as well as network configuration procedures and descriptive information on all the software features and protocols that support this architecture. Chapters cover Shortest Path Bridging MAC (SPBM), Data Center Bridging (DCB) protocols, Virtual Network Profile (vNP), and FCoE/FC gateway functionality.

- *OmniSwitch AOS Release 8 Transceivers Guide*

Includes SFP and XFP transceiver specifications and product compatibility information.

- *OmniSwitch AOS Release 8 Specifications Guide*

Includes Specifications table information for the features documented in the Switch Management Guide, Network Configuration Guide, Advanced Routing Guide, and Data Center Switching Guide.

- *Technical Tips, Field Notices*

Includes information published by Alcatel-Lucent's Customer Support group.

- *Release Notes*

Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

Technical Support

An Alcatel-Lucent service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners.

With 24-hour access to Alcatel-Lucent's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent's technical support, open a new case or access helpful release notes, technical bulletins, and manuals.

Access additional information on Alcatel-Lucent's Service Programs:

1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports. This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

Filename: AlcatelIND1Port.mib

Module: alcatelIND1PortMIB

Filename: IETF_ETHERLIKE.mib

Module: EtherLike-MIB

A summary of the available commands is listed here.

Interfaces commands	interfaces interfaces speed interfaces crossover interfaces duplex interfaces alias clear interfaces interfaces max-frame-size interfaces flood-limit interfaces flood-limit action interfaces ingress-bandwidth interfaces pause interfaces link-trap interfaces ddm interfaces ddm-trap interfaces wait-to-restore interfaces wait-to-shutdown interfaces eee interfaces split-mode clear violation show interfaces show interfaces alias show interfaces status show interfaces capability show interfaces accounting show interfaces counters show interfaces counters errors show interfaces flood-rate show interfaces traffic show interfaces ingress-rate-limit show interfaces ddm show interfaces split-mode show transceivers show violation
Interface violation commands	violation recovery-maximum violation recovery-time violation recovery-trap show violation show violation-recovery-configuration clear violation
Link monitoring commands	interfaces link-monitoring admin-status interfaces link-monitoring time-window interfaces link-monitoring link-flap-threshold interfaces link-monitoring link-error-threshold interfaces clear-link-monitoring-stats show interfaces link-monitoring config show interfaces link-monitoring statistics
Time Domain Reflectometry (TDR) commands	interfaces tdr show interfaces tdr-statistics

Link fault propagation commands	link-fault-propagation group link-fault-propagation group source link-fault-propagation group destination link-fault-propagation group wait-to-shutdown show link-fault-propagation group
LED beacon commands	interfaces beacon show interfaces beacon

interfaces

Enables or disables auto negotiation or administrative status on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {*slot chassis/slot/***port** *chassis/slot/port[-port2]*} {**admin-state** | **autoneg** | **epp**} {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
admin-state enable	Enables administrative state.
admin-state disable	Disables administrative state.
autoneg enable	Enables auto negotiation.
autoneg disable	Disables auto negotiation.
epp enable	Enables Enhanced Port Performance.
epp disable	Disables Enhanced Port Performance.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If auto negotiation is disabled, auto MDIX, flow control, auto speed, and auto duplex are not accepted. See the [interfaces crossover](#) command on [page 1-8](#) and the [interfaces duplex](#) command on [page 1-10](#) for more information.
- When EPP is enabled the fiber port receiver performance is enhanced by increasing its sampling rate. This enhancement can help with port link connection reliability or CRC problems that may occur with direct copper cable interfaces.
- Autonegotiation cannot be disabled on 10GBase-T ports.

Examples

```
-> interfaces 3 autoneg disable
-> interfaces 3/1 autoneg disable
-> interfaces 3/1-4 autoneg disable
-> interfaces 2/1-5 admin-state enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

interfaces	Configures interface speed.
interfaces crossover	Configures crossover port settings.
interfaces duplex	Enables or disables flow (pause).
show interfaces alias	Displays interface line settings.
show interfaces	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

esmConfTable
esmPortCfgAutoNegotiation

interfaces speed

Configures interface line speed.

```
interfaces {slot chassis/slot / port chassis/slot/port [-port2]} speed {10 | 100 | 1000 | 10000 | auto | max
{10 | 100 | 1000}}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
auto	The switch automatically sets the line speed to match the attached device (auto-sensing).
10	Sets the interface to 10 Mbps.
100	Sets the interface to 100 Mbps.
1000	Sets the interface to 1000 Mbps (1 Gigabit).
10000	Sets the interface to 10000 Mbps (10 Gigabits).
2000	Sets the interface to 2000 Mbps for FibreChannel.
4000	Sets the interface to 4000 Mbps for FibreChannel.
8000	Sets the interface to 8000 Mbps for FibreChannel.
max 10	Sets the maximum speed to 10 Mbps.
max 100	Sets the maximum speed to 100 Mbps.
max 1000	Sets the maximum speed to 1000 Mbps (1 Gigabit).
max 4000	Sets the maximum speed to 4000 Mbps for FibreChannel.
max 8000	Sets the maximum speed to 8000 Mbps for FibreChannel.

Defaults

parameter	default
auto	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> interfaces 3/1 speed auto
-> interfaces 3 speed 100
```

```
-> interfaces 3/1-8 speed auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces](#) Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable  
  esmPortCfgSpeed
```

interfaces crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {*slot chassis/slot/ port chassis/slot/port[-port2]*} **crossover** {**auto** | **mdix** | **mdi**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
auto	The interface automatically detects the crossover settings.
mdix	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
mdi	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

Defaults

parameter	default
auto mdix mdi	auto

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If auto negotiation is disabled, then automatic crossover is also disabled. See the [interfaces](#) command for more information.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.

Examples

```
-> interfaces 3 crossover mdi
-> interfaces 3/1 crossover mdix
-> interfaces 3/1-4 crossover auto
```

Release History

Release 7.1.1; command introduced.

Related Commands[show interfaces](#)

Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

esmConfTable

esmPortCfgCrossover

interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} **duplex** {full | half | auto}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
full	Sets interface to full duplex mode.
half	Sets interface to half duplex mode.
auto	Switch automatically sets both the duplex mode settings to auto-negotiation.

Defaults

parameter	default
full half auto	full

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You can only configure one slot at a time. Repeat the command to configure additional slots.
- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- Gigabit and 10 Gigabit fiber ports only support full duplex.

Examples

```
-> interfaces 3/1 duplex auto
-> interfaces 3 duplex half
-> interfaces 3/1-4 auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

[interfaces](#)

Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.

[show interfaces](#)

Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

esmConfTable

esmPortAutoDuplexMode

interfaces alias

Configures a description (alias) for a single port.

interfaces port *chassis/slot/port* **alias** *description*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1).
<i>description</i>	A description for the port, which can be up to 40 characters long. Description tags with spaces must be enclosed within quotes (e.g., "IP Phone").

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You can only configure one port at time. You cannot configure an alias for multiple ports.
- To remove an alias use a description consisting of two quotes without any spaces (e.g., "").

Examples

```
-> interfaces 3/1 alias "switch port"  
-> interfaces 2/2 alias "IP Phone"  
-> interfaces 3/1 alias ""
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces alias](#) Displays port status (up or down) and any aliases for a port.

MIB Objects

```
ifXTable  
  ifAlias
```

clear interfaces

Resets all Layer 2 statistics counters or Time Domain Reflectometry (TDR) statistics counters.

clear interfaces {*slot chassis/slot* / **port** *chassis/slot/port[-port2]*} {**l2-statistics** [**cli**] | **tdr-statistics**}

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
cli	Clears the CLI statistics only.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- TDR is supported only on the OmniSwitch 6860.
- There is no global clear statistics command for TDR. The highest level granularity supported for clearing statistics is per *chassis/slot*.

Examples

```
-> clear interfaces 1/1/20 l2-statistics
-> clear interfaces 1/1/30 l2-statistics cli
-> clear interfaces 1/1/40 tdr-statistics
```

Release History

Release 7.1.1; command introduced.

Release 8.1.1; **tdr-statistics** parameter added.

Related Commands

- show interfaces counters** Displays general interface information, including when statistics were last cleared.
- show interfaces tdr-statistics** Displays the results of the last TDR test performed on a port.

MIB Objects

```
alCetherStatsTable  
  alCetherClearStats  
esmTdrPortTable  
  esmTdrPortClearResults
```

interfaces max-frame-size

Configures the maximum frame size for Gigabit Ethernet interfaces.

interfaces {*slot chassis/slot* / **port** *chassis/slot/port[-port2]*} **max-frame-size** *bytes*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>bytes</i>	Maximum frame size, in bytes. Valid range is 1518–9216.

Defaults

parameter	default
<i>bytes</i> (Gigabit Ethernet Packets)	9216
<i>bytes</i> (Ethernet Packets)	1553

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> interfaces 3/1 max-frame-size 1518
-> interfaces 3 max-frame-size 1518
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces](#) Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

esmConfTable
esmPortCfgMaxFrameSize

interfaces flood-limit

Configures the flood rate settings on a single port, a range of ports, or an entire Network Interface (NI).

```
interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} flood-limit {bcast | mcast | uucast | all} rate
{pps pps_num| mbps mbps_num | cap% cap_num | enable | disable | default} [low-threshold low_num]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
bcast	Specifies broadcast flood limit.
mcast	Specifies multicast flood limit.
uucast	Specifies unicast flood limit.
all	Specifies flood limit for all types of traffic.
<i>pps_num</i>	Packets per second.
<i>mbps_num</i>	Megabits per second.
<i>cap_num</i>	Percentage of port's capacity.
enable	Enables flood rate limits.
disable	Disables flood rate limits.
default	Sets default flood rate limits
<i>low_num</i>	Specifies the low threshold value, which must be lower than the high threshold value set for the <i>pps_num</i> , <i>mbps_num</i> , or <i>cap_num</i> value.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The packets-per-second (**pps**) setting is based on a 512 byte frame size. When configuring the threshold value as a percentage (**cap%**) or in megabits-per-second (**mbps**), only approximate limits can be achieved because values are always estimated based on the packet-per-second size (512 bytes).
- The **low-threshold** parameter is set to help with the auto-recovery of a port that was shutdown because of a STORM violated state. The shutdown action is configured through the **interfaces flood-limit action** command.

Examples

```
-> interfaces 3 flood-limit all rate cap% 50
-> interfaces 2/1 flood-limit bcast rate mbps 100
-> interfaces 1/1/1 flood-limit bcast rate mbps 60 low-threshold 40
-> interfaces 1/1/5 flood-limit mcast rate pps 2000 low-threshold 1000
```

Release History

Release 7.1.1; command introduced.

Release 8.2.1; **default** and **low-threshold** parameters added.

Related Commands

[show interfaces flood-rate](#) Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
  esmPortCfgFlow
dot3PauseTable
  dot3PauseAdminMode
```

interfaces flood-limit action

Configures the action on a single port, a range of ports, when the port reaches the storm violated state.

```
interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} flood-limit {bcast | mcast | uucast | all}  
action {shutdown | trap | default}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to configure.
<i>port</i>	Port number of the interface to configure.
<i>port2</i>	Last port number in a range of ports to configure.
bcast	Broadcast flood limit.
mcast	Multicast flood limit.
uucast	Unicast flood limit.
all	Flood limit for all types of traffic.
shutdown	When the high threshold is violated, port is put into a blocked state.
trap	When the high threshold is crossed, trap is sent with the violation reason.
default	When traffic reaches the high threshold, packets above that rate will be dropped.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When high threshold is violated, and the port needs to be put in blocked state, set the action as “**shutdown**”.
- Use the **low-threshold** parameter of the **interfaces flood-limit** command to assist with auto-recovery of a port that was shutdown.
- When high threshold is crossed, and a trap has to be sent with violation reason, set the action as “**trap**”.
- When traffic reaches high threshold, and the packets above that rate needs to be dropped, set the action as “**default**”.

Examples

```
-> interfaces 1/1/1 flood-limit bcast action shutdown  
-> interfaces 1/1/4 flood uucast action trap  
-> interfaces 1/1/11 flood-limit all action shutdown  
-> interfaces 1/1/14 flood mcast action default
```

Release History

Release 8.2.1; command introduced.

Related Commands

interfaces flood-limit	Configures the high and low threshold values for flood rate limiting.
show interfaces flood-rate	Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
  esmPortBcastThresholdAction
  esmPortMcastThresholdAction
  esmPortUucastThresholdAction
```

interfaces ingress-bandwidth

Configures the ingress bandwidth settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port[-port2]*} **ingress-bandwidth** {**mbps**| **enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
mbps	Specifies the ingress bandwidth in mpbs.
enable	Enables ingress bandwidth limiting.
disable	Disables ingress bandwidth limiting.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> interfaces 3 ingress-bandwidth enable
-> interfaces 3 ingress-bandwidth mbps 30
```

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces ingress-rate-limit Displays the ingress-rate-limit set for each interface port.

MIB Objects

```
esmConfTable
  esmPortIngressRateLimitEnable
```

interfaces pause

Configures whether or not the switch will transmit and/or honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

interfaces chassis/slot[/port[-port2]] pause {tx | rx | tx-and-rx | disable}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
tx	Allows interface to transmit PAUSE frames to peer switches.
rx	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer.
tx-and-rx	Allows the interface to transmit and honor PAUSE frames to/from peer switches.
disable	Disables flow control on the interface.

Defaults

By default, flow control is disabled on all switch interfaces.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported. In addition, flow control is not supported across a virtual fabric link (VFL).
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings override the configured settings as long as autonegotiation and flow control are both enabled for the interface.
- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.

Examples

```
-> interfaces 4/2 pause rx
-> interfaces 1/11 pause tx
-> interfaces 2/1 pause tx-and-rx
-> interfaces 3/1-6 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands**show interfaces status**

Displays interface line settings.

MIB Objects

esmConfTable

esmPortCfgPause

interfaces link-trap

Enables trap link messages. If enabled, a trap is generated whenever the port changes state.

interfaces [*slot chassis/slot* / **port** *chassis/slot/port* [-*port2*]] **link-trap** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
enable	Port link up/down traps are displayed on the NMS.
disable	Port link up/down traps are not displayed on the NMS.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> interfaces 3/1 link-trap enable
-> interfaces 3 link-trap enable
-> interfaces 3/1-6 link-trap enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces status](#) Displays interface line settings.

MIB Objects

```
esmConfigTable
  esmPortSlot
  esmPortIF
```

interfaces ddm

Configures the DDM administrative status.

```
interfaces ddm {enable | disable}
```

Syntax Definitions

enable	Enables DDM functionality.
disable	Disables DDM functionality.

Defaults

parameter	default
ddm	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm enable  
-> interfaces ddm disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces ddm](#) Displays the interface DDM status.

MIB Objects

```
ddmConfiguration  
  ddmConfig
```

interfaces ddm-trap

Configures the DDM administrative status or trap capability.

```
interfaces ddm-trap {enable | disable}
```

Syntax Definitions

enable	Enables DDM trap functionality.
disable	Disables DDM trap functionality.

Defaults

parameter	default
ddm-trap	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm-trap enable  
-> interfaces ddm-trap disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces ddm](#) Displays the interface DDM status.

MIB Objects

```
ddmConfiguration  
  ddmTrapConfig  
  ddmNotificationType
```

interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

interfaces {*slot chassis/slot/ port chassis/slot/port[-port2]*} **wait-to-restore** *num*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>num</i>	The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5 seconds.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 wait-to-restore 30
-> interfaces 1/1 wait-to-restore 10
-> interfaces 1/1-7 wait-to-restore 250
```

Release History

Release 7.3.2; command introduced.

Related Commands

[show interfaces](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

alaLinkMonConfigTable
alaLinkMonWaitToRestoreTimer

interfaces wait-to-shutdown

Configures the wait to shutdown timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link down event is detected. Other applications are notified of the link down event only after the wait to shutdown timer has elapsed.

interfaces {*slot chassis/slot/ port chassis/slot/port[-port2]*} **wait-to-shutdown** *num*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>num</i>	The number of milliseconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 10msec.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command can be used to reduce port flapping. If the port comes back up before the timer expires then the timer will be canceled and other applications will not be notified of the link down event.
- Set the wait-to-shutdown timer to zero to disable the timer.
- The WTS timer is not started when the switch is first booted. But administratively disabling the port will start the timer if enabled.
- The link-status of the remote port will be down when the WTS timer is running. This is due to the port being physically down and only the link-down event not being communicated to other applications.

Example

```
-> interfaces 1 wait-to-shutdown 30
-> interfaces 1/1 wait-to-shutdown 10
-> interfaces 1/1-7 wait-to-shutdown 250
```

Release History

Release 7.3.2; command introduced.

Related Commands**show interfaces**

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

alaLinkMonConfigTable
alaLinkMonWaittoShutdownTimer

interfaces eee

Enables or disabled Energy Efficient Ethernet.

interfaces {*slot chassis/slot/ port chassis/slot/port[-port2]*} **eee** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
enable	Enables EEE functionality.
disable	Disables EEE functionality.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 6900, 6860, 6865

Usage Guidelines

- EEE is only supported on 10GBase-T ports.
- Enabling EEE will start advertising EEE capability to peer ports. Disabling EEE will stop advertising EEE capability to peer ports.

Examples

```
-> interfaces 1/1 eee enable
-> interfaces 2 eee disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

[show interfaces](#) Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

N/A

interfaces split-mode

Configures the mode of the 4X10G capable ports.

```
interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} split-mode {auto | 4x10g | 40g}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
auto	Automatically detects if a 4X10G splitter cable is connected.
4x10g	Sets the port to the 4X10G splitter functionality.
40g	Sets the port to 40G functionality.

Defaults

parameter	default
enable disable	auto

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- This command is only supported on ports and platforms that support the 4X10G splitter cable functionality.
- The proper cable should be used based on the port's configuration. If set to 4X10G with a 40G cable connected, the port will only operate as a 10G port.

Examples

```
-> interfaces port 1/1/1 split-mode 4X10G
-> interfaces slot 2/1 split-mode auto
```

Release History

Release 7.3.4; command was introduced.

Related Commands**show interfaces split-mode**

Displays the configured and operational state of the 4X10G capable ports.

MIB Objects

esmPortModeTable
esmConfiguredMode

clear violation

Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation. This includes applying an existing application configuration.

```
clear violation {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When a violation is set on a physical port that is part of a link aggregate, the violation is set for the whole link aggregate. All ports on that link aggregate are brought down. When this command is applied to a link aggregate ID, all member ports of the link aggregate are activated.
- When this command is applied, all MAC addresses known to the port are cleared from the MAC address table for the switch.

Examples

```
-> clear violation port 1/10
-> clear violation port 2/1-5
-> clear violation linkagg 5
-> clear violation linkagg 10-20
```

Release History

Release 7.1.1; command introduced.

Related Commands**show violation**

Displays the address violations that occur on ports with LPS restrictions.

MIB Objects

portViolationTable
portViolationClearPort

violation recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation [*chassis/slot/port[-port2]*] **recovery-maximum** {**infinite** | **default** | *max_attempts*}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
infinite	Sets the recovery attempt to infinite auto recovery.
default	Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.
<i>max_attempts</i>	The maximum number of recovery attempts. Valid range is 0-50.

Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

parameter	default
<i>max_attempts</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
- When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.
- When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.
- The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.

- Once an interface is permanently shut down, only the **interfaces split-mode** command can be used to recover the interface.
- The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The $FTW = 2 * \text{maximum recovery number} * \text{recovery timer}$. For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds ($2 * 4 * 5=40$).

Examples

```
-> violation recovery-maximum 25
-> violation 1/2 recovery-maximum 10
-> violation 1/2/3 recovery-maximum 20
-> violation 1/2/4-9 recovery-maximum 50
-> violation 1/2/4-9 recovery-maximum default
-> violation 1/2/3 recovery-maximum 0
-> violation recovery-maximum infinite
-> violation recovery-maximum 0
```

Release History

Release 8.2.1; command was introduced.

Related Commands

[violation recovery-time](#)

Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.

[show interfaces](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

[show violation-recovery-configuration](#)

Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
  alaPortViolationRecoveryMaximum
```

violation recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation recovery-time *seconds*

violation {*chassis/slot/port[-port2]*} **recovery-time** {*seconds* / **default**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>seconds</i>	The number of seconds after which a port is reactivated. The valid range is 30-600 seconds. Specify 0 to disable the recovery timer.
default	Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the [interfaces split-mode](#) command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Set the recovery time to 0 to disable the violation recovery mechanism.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.

- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.
- When configuring the time for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

Examples

```
-> violation recovery-time 600
-> violation 1/2 recovery-time 100
-> violation 1/2/3 recovery-time 200
-> violation 1/2/4-9 recovery-time 500
-> violation 1/2/4-9 recovery-maximum default
-> violation 1/2/3 recovery-time 0
-> violation recovery-time 0
```

Release History

Release 8.2.1; command introduced.

Related Commands

Configures the maximum number of recovery attempts before a port is permanently shut down.

[show interfaces](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

[show violation-recovery-configuration](#)

Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
  alaPortViolationRecoveryTime
```

violation recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

violation recovery-trap {enable | disable}

Syntax Definitions

enable	Enables the ports to send violation recovery traps.
disable	Disables the ports from sending violation recovery traps.

Defaults

By default, sending of a violation recovery trap is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This is a global command that is applied to all ports on all modules.

Examples

```
-> violation recovery-trap enable
-> violation recovery-trap disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

violation recovery-time	Configures the time interval to automatically re-enable the ports that were shutdown due to a violation.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```

  esmViolationRecoveryTrap
```

show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

show interfaces [*slot chassis/slot* / **port** *chassis/slot/port*[-*port2*]]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The Link-Quality parameter and Enhanced Port Performance capabilities are only supported on the OS6900.
- EEE will be appended to the Autonegotiation output when EEE is enabled.

Examples

```
-> show interfaces 1/2

```

Lost Frames : 0, Collided Frames: 0,

output definitions

Slot/Port	Interface slot and port.
Operational Status	Interface status: up - port is operationally up. down - port is operationally down dormant - SFP/SFP+ transceiver is inserted into a port configured for Fibre Channel or Fibre Channel transceiver in inserted into a port configured for Ethernet and the link has become active.
Last Time Link Changed	The last time the configuration for this interface was changed.
Number of Status Change	The total number of times that the configuration of this interface has changed.
Type	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
SFP/XFP	The type of transceiver detected.
EPP	Enhanced Port Performance setting.
Link-Quality	The link quality of the connection: GOOD - The port will connect with no problems and transfer data with no errors. FAIR - The port may have intermittent problems connecting and maintaining its connection to a remote port and/or intermittent CRC's could occur. POOR - The port will have problems connecting and maintaining a connection with remote port. If the ports connect, it's likely CRC errors will occur. N/A - The port link quality is either very poor or the port type does not support the Link Quality capability.
MAC address	Interface MAC address.
WWPN	OmniSwitch 64-bit World Wide Port Name (WWPN) for each Fibre Channel port.
Bandwidth	Bandwidth (in megabits).
Duplex	Duplex mode (Half/Full/Auto).
Autonegotiation	The auto negotiation settings for this interface.
Long Accept	Long Frames status (enable/disable).
Runt Accept	Runt Frames status (enable/disable).
Long Frame Size	Long Frame Size (in Bytes).
Runt Size	Runt Frame Size (in Bytes).
Bytes Received	Number of Bytes received.
Rx Unicast Frames	Number of unicast frames received.
Rx Broadcast Frames	Number of broadcast frames received.
Rx M-cast Frames	Number of multicast frames received.
Rx Undersize Frames	Number of undersized frames received.
Rx Oversize Frames	Number of oversized frames received.
Rx Lost Frames	Number of Lost Frames received.

output definitions (continued)

Rx Error Frames	Number of error frames received.
Rx CRC Error Frames	Number of CRC error frames received. Only applies to frames that are less than or equal to Max/Long Frame Size. Frames larger than Long Frame Size are counted as OverSizeFrames.
Rx Alignments Err	Number of Alignments Error frames received.
Bytes Xmitted	Number of Bytes transmitted.
Tx Unicast Frames	Number of unicast frames transmitted.
Tx Broadcast Frames	Number of broadcast frames transmitted.
Tx M-cast Frames	Number of multicast frames r transmitted.
Tx Undersize Frames	Number of undersized frames transmitted.
Tx Oversize Frames	Number of oversized frames transmitted.
Tx Lost Frames	Number of Lost Frames transmitted.
Tx Collided Frames	Number of collision frames received or transmitted.
Tx Error Frames	Number of error frames transmitted.

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces alias

Displays interface line settings (e.g., speed and mode).

show interfaces [*slot chassis/slot* / *port chassis/slot/port[-port2]*] **alias**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no slot/port numbers are entered, line settings for all slots/ports on the switch are displayed.

Examples

```
-> show interfaces 1/2 alias
Legends:WTS - Wait to shutdown
# - WTS Timer is Running & port is in wait-to-shutdown state
Slot/   Admin   Link   WTR   WTS   Alias
Port   Status  Status (sec) (msec)
-----+-----+-----+-----+-----+-----
1/1    disable  down   5     #10   ""
```

output definitions

Slot/Port	Interface slot/port number.
Admin Status	The administrative status of the port.
Link Status	The link status of the port. Autonegotiation status (Enable/Disable).
WTS (msec)	The wait-to-shutdown configuration time.
WTR (sec)	The wait-to-restore configuration time.
Alias	The configured alias for the port..

Release History

```

show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

show interfaces [*slot* | *slot/port*[-*port2*]] **capability**

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Displays default settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

Examples

```
-> show interfaces 5/1 capability
Slot/Port  AutoNeg      Pause      Crossover      Speed      Duplex
-----+-----+-----+-----+-----+-----
 5/1  CAP      EN/DIS      EN/DIS      MDI/X/Auto  10/100/1G  Full/Half
 5/1  DEF              EN          EN          Auto        Auto        Auto
```

output definitions

Slot	The slot number.
Port	The port number
AutoNeg	In the row labeled CAP , the field displays the valid auto negotiation configurations for the port. In the row label DEF , the field displays the default auto negotiation settings for the port. The possible values are EN (enabled) or DIS (disabled).
Pause	In the row labeled CAP , the field displays the valid pause configurations for the port. In the row label DEF , the field displays the default pause settings for the port.

output definitions (continued)

Crossover	In the row labeled CAP , the field displays the valid cross over configurations for the port. In the row label DEF , the field displays the default cross over settings for the port. The possible values are Auto , MDI/X/Auto (MDI/MDIX/Auto), or -- (not configurable and/or not applicable).
Speed	In the row labeled CAP , the field displays the valid line speed configurations for the port. In the row label DEF , the field displays the default line speed settings for the port. The possible values are 10/100 , 100 , 1G , 10/100/1G , 10G , or Auto .
Duplex	In the row labeled CAP , the field displays the valid duplex configurations for the port. In the row label DEF , the field displays the default duplex settings for the port. The possible values are Full , Full/Half , or Auto .

Release History

Release 7.1.1; command introduced.

```

show interfaces accounting

Displays interface accounting information (e.g., packets received/transmitted and deferred frames received).

show interfaces [*slot chassis/slot* | **port** *chassis/slot/port[-port2]*] **accounting**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If no slot/port numbers are entered, accounting information for all slots/ports on the switch is displayed.
- The OmniSwitch 9900 supports different packet size ranges than the other OmniSwitch platforms. All packets sized 1024 octets or larger are classified into the “1024 to MAX” category. As a result, this command displays a different output on the OmniSwitch 9900.

Examples

The following command example shows the fields that are displayed on all OmniSwitch platforms, except for the OmniSwitch 9900:

```
-> show interfaces accounting
1/1/39:
  Rx Undersize           =                0, Tx Undersize       =                0,
  Rx Oversize           =                0, Tx Oversize       =                0,
  Rx Jabber              =                0,
  Rx/Tx 64 Octets        =            312890503,
  Rx/Tx 65 ~ 127 Octets  =            10496825,
  Rx/Tx 128 ~ 255 Octets =            189426,
  Rx/Tx 256 ~ 511 Octets =             39328,
  Rx/Tx 512 ~ 1023 Octets =              756,
  Rx/Tx 1024 ~ 1518 Octets =           48551,
  Rx/Tx 1519 ~ 4095 Octets =                0,
  Rx/Tx 4096 ~ MAX Octets =                0
```

The following command example shows the fields that are displayed on an OmniSwitch 9900 (the “Rx/Tx 1024 - MAX Octets” field replaces the “Rx/Tx 1024 - 1518 Octets”, “Rx/Tx 1519 - 4095 Octets”, and “Rx/Tx 4096 - MAX Octets” fields that are displayed on the other platforms:

```
-> show interfaces accounting
1/4/38:
Rx Undersize           =                0, Tx Undersize   =                0,
Rx Oversize           =                0, Tx Oversize   =                0,
Rx Jabber              =                0,
Rx/Tx 64 Octets       =           361616757,
Rx/Tx 65 ~ 127 Octets =           20510941,
Rx/Tx 128 ~ 255 Octets =           377413,
Rx/Tx 256 ~ 511 Octets =            45391,
Rx/Tx 512 ~ 1023 Octets =             2319,
Rx/Tx 1024 ~ MAX Octets =            63555,
```

output definitions

Rx Undersize	Number of undersized packets received.
Tx Undersize	Number of undersized packets transmitted.
Rx oversize	Number of oversized packets received.
Tx oversize	Number of oversized packets transmitted.
Rx Jabber	Number of Jabber packets received (longer than 1518 octets).
Rx/Tx Octets	Number of packets received and transmitted in each listed octet range.

show interfaces counters

Displays interface counters information (e.g., unicast, broadcast, and multi-cast packets received/transmitted).

show interfaces [slot chassis/slot / port chassis/slot[port[-port2]] counters

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no slot/port numbers are entered, counter information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces 3/1 counters
```

```
InOctets      = 54367578586897979,  OutOctets      = 5.78E19,
InUcastPkts   = 55654265276,      OutUcastPkts   = 5.78E20,
InMcastPkts   = 58767867868768777, OutMcastPkts   = 5465758756856,

InPauseFrames = 567798768768767,  OutPauseFrames = 786876,
```

output definitions

InOctets	Number of octets received.
OutOctets	Number of octets transmitted.
InUcastPkts	Number of unicast packets received.
OutUcastPkts	Number of unicast packets transmitted.
InMcastPkts	Number of multicast packets received.
OutMcastPkts	Number of unicast packets transmitted.
InBcastPkts	Number of broadcast packets received.
OutBcastPkts	Number of unicast packets transmitted.
InPauseFrames	Number of MAC control frames received.
OutPauseFrames	Number of MAC control frames transmitted.

show interfaces counters errors

Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] counters errors

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no slot/port numbers are entered, counter error information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces 2/1 counters errors
```

```
02/01,
  Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
  IfInErrors       = 6435346,  IfOutErrors = 5543,
  Undersize pkts   = 867568,  Oversize pkts = 5.98E8
```

output definitions

Slot/Port	Interface slot and port number.
Alignments Errors	Number of Alignments errors.
FCS Errors	Number of Frame Check Sequence errors.
IfInErrors	Number of received error frames.
IfOutErrors	Number of transmitted error frames.
Undersize pkts	Number of undersized packets.
Oversize pkts	Number of oversized packets (more than 1518 octets).

Release History

Release 7.1.1; command introduced.

show interfaces flood-rate

Displays interface peak flood rate settings.

show interfaces [*slot chassis/slot* / **port** *chassis/slot/port[-port2]*] **flood-rate**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show interfaces flood-rate
Slot/  Bcast   Bcast   Bcast   Ucast   Ucast   Ucast   Mcast   Mcast   Mcast
Port  Value    Type    Status  Value   Type    Status  Value   Type    Status
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1      496  mbps  enable      496  mbps  enable      496  mbps  disable
1/2      496  mbps  enable      496  mbps  enable      496  mbps  disable
1/3      496  mbps  enable      496  mbps  enable      496  mbps  disable
1/4      496  mbps  enable      496  mbps  enable      496  mbps  disable
1/5      496  mbps  enable      496  mbps  enable      496  mbps  disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Value	The value set based on the type of flood limiting.
Type	The type of flood limiting: mbps, pps, or %
Status	Status of the type of flood-limiting: enabled or disabled.

Release History

Release 7.1.1; command introduced.

Related Commands

show interfaces traffic

Displays interface traffic statistics.

show interfaces [*slot chassis/slot* / **port** *chassis/slot/port[-port2]*] **traffic**

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If no slot/port numbers are entered, traffic settings for all slots/ports on the switch are displayed.

Examples

```
-> show interfaces traffic
Slot/Port   Input packets   Input bytes   Output packets   Output bytes
-----+-----+-----+-----+-----
1/2         322             20624        5125             347216
3/2         322             20620        5133             347764
```

output definitions

Slot/Port	Interface slot and port numbers.
Input packets	Input packets detected.
Input bytes	Input bytes detected.
Output packets	Output packets detected.
Output bytes	Output bytes detected.

Release History

Release 7.1.1; command introduced.

show interfaces ingress-rate-limit

Displays the ingress-rate-limit set for each interface port.

show interfaces [*slot chassis/slot/ port chassis/slot/port[-port1]*] **ingress-rate-limit**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Slot number to display information about all ports on a specific slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If the slot number is not specified, then the switch back pressure feature must be enabled or disabled on an entire chassis.

Examples

```
-> show interfaces 1/1-4 ingress-rate-limit
Slot/ Rate Limit Burst Size Status
Port   (Mbps)      (MB)
-----+-----+-----+-----
1/1     496           19  disable
1/2     496           19  disable
1/3     496           19  disable
1/4     496           19  disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Rate Limit (Mbps)	Rate limit in Megabits.
Burst Size (MB)	Burst size in Megabytes.
Status	Status of rate limiting.

Release History

Release 7.1.1; command introduced.

show interfaces ddm

Displays the information for the specified transceivers.

show interfaces [*slot chassis/slot/ port chassis/slot/port[-port1]*] **ddm** [**w-low** | **w-high** | **status** | **a-low** | **a-high** | **actual**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Display all the transceivers on the specified slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).
w-low	Display the transceivers Warning Low value.
w-high	Display the transceivers Warning High value.
status	Display the administrative status of DDM.
a-low	Display the transceivers Alarm Low value.
a-high	Display the transceivers Alarm High value.
actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If the threshold values of the transceiver are '0' then NS (Not Supported) will be displayed in the DDM output display.

Examples

```
-> show interfaces transceiver W-Low
```

```
Slot/Port Temp C Voltage(V) Current(mA) Output (dBm) Input (dBm)
-----+-----+-----+-----+-----+-----+
1/1          48      5.15         50         2.50      2.50
1/2          47      5.35         49         2.43      2.43

```

```
-> show interfaces transceiver ddm
```

```

DDM Status      : enable
DDM Trap Status : disable

```

output definitions

Slot/Port	Interface slot and port numbers.
Temp C	The transceiver temperature, in degrees centigrade.
Voltage (V)	The transceiver supply voltage, in volts.
Current (mA)	The transceiver transmit bias current, in milliamps.
Output (dBm)	The transceiver output power, in decibels.
Input (dBm)	The transceiver received optical power, in decibels.
DDM Status	The administrative status of DDM.
DDM Trap Status	The administrative status of DDM traps.
Actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
Alarm High (AH)	Indicates the value at which the transceiver's functionality may be affected.
Warning High (WH)	Indicates the transceiver is approaching the High Alarm value.
Warning Low (WL)	Indicates the transceiver is approaching the Low Alarm value.
Alarm Low (AL)	Indicates the value at which the transceiver's functionality may be affected.
N/A	Indicates the transceiver does support DDM.
N/S	Indicates the transceiver does not support the DDM attribute.

Release History

Release 7.1.1; command introduced.

show interfaces split-mode

Displays the configured and operational state of the 4X10G capable ports.

show interfaces [*slot chassis/slot/ port chassis/slot/port[-port1]*] **split-mode**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	Display all the ports on the specified slot.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, information for all ports that support the splitter cable functionality is displayed.

Platforms Supported

OmniSwitch 6900

Usage Guidelines

The output is only displayed for those ports that support the splitter cable functionality.

Examples

```
-> show interfaces split-mode
Ch/
Slot/          Split-Mode
Port          Configured  Operational
-----+-----+-----+
1/1/1A        40G          40G
1/1/2A        4X10G        None
1/1/3A        AUTO         4X10G
1/1/4A        AUTO         None
<output truncated>
```

output definitions

Ch/Slot/Port	The chassis, slot, and port.
Configured	The configured split-mode of the port. (AUTO/4X10G/40G)
Operational	The currently operational mode of the port. (AUTO/4X10G/40G/None)

Release History

Release 7.3.4; command introduced.

Related Commands[interfaces split-mode](#)

esmConfiguredMode

show transceivers

Displays transceiver manufacturer and status information.

show transceivers [*slot slot*] [*chassis-id chassis*]

Syntax Definitions

slot Display all the ports on the specified slot.
chassis The chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show transceivers
Slot 2 Transceiver 1
  Manufacturer Name:      FIBERXON INC. ,
  Part Number:           FTM-8012C-SLG ,
  Hardware Revision:     10 ,
  Serial Number:         101680092800319 ,
  Manufacture Date:      090707 ,
  Laser Wave Length:     850nm,
  Admin Status:          POWER ON,
  Operational Status:    UP
```

output definitions

Manufacturer Name	The name of the transceiver's manufacturer.
Part Number	The part number of the transceiver.
Hardware Revision	The hardware revision of the transceiver.
Serial Number	The serial number of the transceiver.
Manufacturer Date	The manufacture date of the transceiver.
Laser Wave Length	The laser wavelength of the transceiver.
Admin Status	The administrative status of the transceiver.
Operational Status	The operational status of the transceiver.

Release History

Release 7.1.1; command introduced.

Related Commands

[show interfaces ddm](#) Displays the DDM administrative status or trap capability.

MIB Objects

N/A

show violation

Displays the address violations that occur on ports with LPS restrictions. This command displays a port violation for sticky port security when the maximum number of MAC address of the connected workstation that the switch learns.

show violation {**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

NA

Examples

In the following example, the **admin down** action for link aggregate 2 indicates that a port violation has occurred on one of the ports related to the link aggregate group with ID 2.

```
-> show violation
```

Port	Source	Action	Reason	Timer
1/1	src lrn	simulated down	lps shutdown	0
1/1	src lrn	simulated down	lps restrict	0
2	qos	admin down	policy	0

output definitions

Port	The slot and port numbers or link aggregate IDs on which address violations occurred
Source	Specifies the source application that detected the violation.
Action	Specifies the action that is taken when the violation is detected on the port. There are two types of actions: admin down - deactivates the physical port. simulated down - the port is put in blocking state.

output definitions

Reason	Specifies the reason for the violation.
Timer	Specifies the duration of the violation timer.

Release History

Release 7.1.1; command introduced.

Related Commands

[interfaces wait-to-restore](#) Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

show violation-recovery-configuration

Displays the global violation recovery configuration details (recovery trap, recovery maximum, and recovery time).

show violation-recovery-configuration [**port** *chassis/slot/port*[-*port2*] | **slot** *chassis/slot*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>chassis/slot</i>	The chassis and slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

NA

Examples

```
-> show violation-recovery-configuration
Global Recovery Trap      : enable
Global Recovery Maximum   : 20
Global Recovery Time      : 200
```

Port	Recovery Max	Recovery Time
1/1/1	10	300
1/1/2	10	300

```
-> show violation-recovery-configuration 3/1/1-2
Global Recovery Trap      : enable
Global Recovery Maximum   : 20
Global Recovery Time      : 200
```

Port	Recovery Max	Recovery Time
3/1/1	10	300
3/1/2	10	300

output definitions

Global Recovery Trap	Displays the global status of the violation trap recovery.
Global Recovery Maximum	Displays the global value set for the maximum violation recovery.
Global Recovery Time	Displays the global value set for the recovery time.
Port	Displays the chassis, slot and port numbers or link aggregate IDs on which address violations occurred.
Recovery Max	Displays the maximum number of retry configured.
Recovery Time	Displays the duration taken for recovery.

Release History

Release 8.2.1; command introduced.

Related Commands

clear violation	Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.
violation recovery-maximum	Configures the maximum number of recovery attempts allowed before the port is permanently shut down.
violation recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation.
violation recovery-trap	Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.
show violation

```

interfaces link-monitoring admin-status

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

```
interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} link-monitoring admin-status {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
enable	Enables link monitoring for the specified port.
disable	Disables link monitoring for the specified port.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.
- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.
- Enter a slot number to configure link monitoring for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.
- Link Monitoring can be enabled on individual ports that make up a virtual port such as a link aggregate or VFL, but not on the entire link aggregate or VFL virtual port.

Example

```
-> interfaces 1 link-monitoring admin-status enable
-> interfaces 1/1 link-monitoring admin-status enable
-> interfaces 1/1-7 link-monitoring admin-status enable
-> interfaces 2/5 link-monitoring admin-status disable
-> interfaces 2/5-20 link-monitoring admin-status disable
```

Release History

Release 7.3.2; command introduced.

MIB Objects

alaLinkMonConfigTable
alaLinkMonStatus

interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} link-monitoring time-window seconds

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>seconds</i>	The length of time during which the link is monitored. The valid range is 0–3600 seconds.

Defaults

By default, the time window value is set to 300 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 link-monitoring time-window 20
-> interfaces 1/1 link-monitoring time-window 40
-> interfaces 1/1-7 link-monitoring time-window 2500
```

Release History

Release 7.3.2; command introduced.

MIB Objects

alaLinkMonConfigTable
alaLinkMonTimeWindow

interfaces link-monitoring link-flap-threshold

Configures the number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown.

```
interfaces {slot chassis/slot / port chassis/slot/port[-port2]} link-monitoring link-flap-threshold  
link_flaps
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>link_flaps</i>	The number of link flaps. The valid range is 2-10.

Defaults

By default, the number of link flaps allowed is set to 5.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a slot number to configure the number of link flaps allowed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of link flaps allowed for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 link-monitoring link-flap-threshold 6  
-> interfaces 1/1 link-monitoring link-flap-threshold 3  
-> interfaces 1/1-7 link-monitoring link-flap-threshold 10
```

MIB Objects

alaLinkMonConfigTable
alaLinkMonLinkFlapThreshold

interfaces link-monitoring link-error-threshold

Configures the number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown. MAC errors refer to lost frames, error frames, alignment frames and cyclic redundancy check (CRC).

```
interfaces {slot chassis/slot/ port chassis/slot/port[-port2]} link-monitoring link-error-threshold mac_errors
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>mac_errors</i>	The number of MAC errors. The valid range is 1-100.

Defaults

By default, the number of MAC errors allowed is set to 5.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

Example

```
-> interfaces 1 link-monitoring link-error-threshold 30
-> interfaces 1/1 link-monitoring link-error-threshold 10
-> interfaces 1/1-7 link-monitoring link-error-threshold 35
```

Release History

Release 7.3.2; command introduced.

Related Commands

- show interfaces** Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

- show interfaces link-monitoring statistics** Displays the link monitoring statistics for the specified ports.

MIB Objects

alaLinkMonConfigTable
alaLinkMonLinkErrorThreshold

interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

interfaces {*slot chassis/slot/ port chassis/slot/port[-port2]*} **clear-link-monitoring-stats**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 clear-link-monitoring-stats
-> interfaces 1/1 clear-link-monitoring-stats
-> interfaces 1/1-7 clear-link-monitoring-stats
```

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces ddm	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonStatsTable
  alaLinkMonStatsClearStats
```

show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

show interfaces {slot *chassis/slot* | port *chassis/slot/port*[-*port2*]} link-monitoring config

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number for a specific module.
<i>slot</i> / <i>port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces 1 link-monitoring config
```

Slot/ Port	Status	Time Window (sec)	Link-flap Threshold	Link-error Threshold
---------------	--------	-------------------------	------------------------	-------------------------

```
-----+-----+-----+-----+-----
1/1    enabled    10         5         10
1/2    disabled   10         5         10
1/3    disabled   200        8         20
.
.
1/24   disabled   150        2         99
```

```
-> show interfaces 1/1-3 link-monitoring config
```

        (sec)
-----+-----+-----+-----+-----
1/2     disabled  10     5           10
```

output definitions

Slot/Port	Interface slot and port number.
Status	Link monitoring status (enable/disable).
Time Window	Time interval, in seconds, for which the link is monitored.
Link-flap threshold	Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
Link-error threshold	Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

Release History

Release 7.3.2; command introduced.

Related Commands

show interfaces	Displays information of the interface port status.
show interfaces link-monitoring statistics	Displays the Link Monitoring statistics.
interfaces link-monitoring admin-status	Enables or disables link monitoring.
interfaces link-monitoring time-window	Configures the monitoring of the time-window of the link.
interfaces link-monitoring link-flap-threshold	Configures the number of link flaps that are allowed before the port is shutdown.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

```

interfaces tdr

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

interfaces chassis/slot/port tdr enable

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

Examples

```
-> interfaces 1/1/1 tdr enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

clear interfaces	Clears the statistics of the last test performed on the port
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
esmTdrPortTable  
esmTdrPortTest
```

show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

show interfaces [*slot chassis/slot / chassis/slot/port*[-*port2*]] **tdr-statistics**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number. Use a hyphen to specify a range of ports.

Defaults

By default, TDR statistics are shown for all ports on all modules

Platforms Supported

OmniSwitch 6860

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces 1/1/3 tdr-statistics
Legend: Pair 1 - orange and white
        Pair 2 - green and white
        Pair 3 - blue and white
        Pair 4 - brown and white
```

```
Ch/Slot/ No of Cable Fuzzy  Pair1 Pair1  Pair2 Pair2  Pair3 Pair3  Pair4 Pair4 Test
port  pairs State Length State Length State Length State Length State Length Result
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/3  4    ok    0    ok    3    ok    3    ok    3    ok    3    success
```

output definitions

Legend	Eight-conductor data cable contains 4 pairs of twisted Pair Copper Cable wires. Each pair consists of a solid (or predominantly) colored wire and a white wire with a strip of the same color. The pairs are twisted together.
Slot/Port	The interface slot and port number.
No of pairs	The number of pairs in the cable for which the test results are valid.

output definitions (continued)

Cable State	State of a cable as returned by the TDR test. The state of the cable wire. (a) OK - Wire is working properly (b) Open - Wire is broken (c) Short - Pairs of wire are in contact with each other (d) Crosstalk - Signal transmitted on one pair of wire creates an undesired effect in another wire. (e) Unknown - Cable diagnostic test unable to find the state of a cable.
Fuzzy Length	The error in the estimated length of the cable.
Pair1 State	The state of the Pair 1 cable wire (OK, Open, Short, Crosstalk, or Unknown)
Pair1 Length	The length of the Pair 1 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair2 State	The state of the Pair 2 cable wire (OK, Open, Short, Crosstalk, or Unknown)
Pair2 Length	The length of the Pair 2 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair3 State	The state of the Pair 3 cable wire (OK, Open, Short, Crosstalk, or Unknown)
Pair3 Length	The length of the Pair 3 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair4 State	The state of the Pair 4 cable wire (OK, Open, Short, Crosstalk, or Unknown)
Pair4 Length	The length of the Pair 4 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Test Result	The status of the TDR test performed, success or fail.

Release History

Release 8.1.1 command was introduced.

Related Commands

interfaces tdr	Initiates the cable diagnostics on a port.
clear interfaces	Clears the statistics of the last test performed on the port.

```

link-fault-propagation group

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

link-fault-propagation group *group_id* [admin-status {enable | disable}]

no link-fault-propagation group {*group_id*[-*group_id2*]}

Syntax Definitions

<i>group_id</i>	A group ID number. The valid range is 1–8.
<i>group_id</i> [- <i>group_id2</i>]	A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.
enable	Enables LFP for the specified group.
disable	Disables LFP for the specified group.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

Example

```
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable  
  alaLFPGroupId  
  alaLFPGroupRowStatus
```

link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

```
link-fault-propagation group group_id source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
no link-fault-propagation group group_id source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported, regardless of the number of ports in each aggregate in a group.
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
- If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 source port 1/2
-> link-fault-propagation group 1 source port 1/2-5 2/3
-> link-fault-propagation group 1 source linkagg 1
-> link-fault-propagation group 1 source linkagg 1-3
```

```
-> link-fault-propagation group 1 source port 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 3/1-5 destination linkagg 6
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
  alaLFPGroupId
alaLFPConfigTable
  alaLFPConfigPort
  alaLFPConfigPortType
  alaLFPConfigRowStatus
```

link-fault-propagation group destination

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **destination** {**port** *chassis/slot/port[-port2]* | **linkagg** *agg_id[-agg_id2]*}

no link-fault-propagation group *group_id* **destination** {**port** *chassis/slot/port[-port2]* | **linkagg** *agg_id[-agg_id2]*}

Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported regardless of the number of ports in each aggregate in a group.
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
- A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.
- If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 destination port 1/4
-> link-fault-propagation group 1 destination port 1/5-8 2/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/2 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 1/2 2/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/6 1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/9
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 7.3.2; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
  alaLFPGroupId
alaLFPConfigTable
  alaLFPConfigPort
  alaLFPConfigPortType
  alaLFPConfigRowStatus
```

link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

link-fault-propagation group *group_id* **wait-to-shutdown** *seconds*

Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>seconds</i>	The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

Example

```
-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0
```

Release History

Release 7.3.2; command introduced.

Related Commands

  alaLFPGroupOperStatus
  alaLFPGroupWaitToShutdown
```

interfaces beacon

Configures the LED color and behavior for a port or group of ports.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} beacon [admin-status {enable | disable}]
[led-color color] [led-mode {solid | activity}]
```

```
no interfaces {slot chassis/slot | port chassis/slot/port[-port2]} beacon
```

Syntax Definitions

<i>chassis</i>	The chassis ID for the switch on which the LEDs are being configured. For standalone switches, use 1 .
<i>slot</i>	The slot ID for the switch on which the LEDs are being configured. For standalone switches, use 1 .
<i>port</i>	The port number of the interface LED you want to configure.
<i>-port2</i>	The last port number in a range of interface LEDs you want to configure. Be sure to insert a hyphen between port range numbers (for example, 7-10)
led-mode	Indicates that LED behavior (activity or solid) is being configured for the corresponding interface LEDs.
activity	The LEDs will blink when traffic is detected on the corresponding ports.
solid	The LEDs will remain solid whether or not traffic is detected on the corresponding ports.
led-color	Indicates that the LED color is being configured for the corresponding port(s).
<i>color</i>	The color to be displayed on the corresponding port LED(s). Options include yellow , white , red , magenta , green , blue , aqua and off .
admin-status	Indicates that the beacon LED administrative status is being configured for the corresponding port(s).
enable	Enables the beacon function on the corresponding port(s).
disable	Disables the beacon function on the corresponding port(s).
no	Adding the no syntax to the beginning of the command clears all information stored in the beacon settings table. Refer to Usage Guidelines below for more information.

Defaults

parameter	default
led-mode	activity
led-color	magenta
admin-status	enable

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Supported on the OmniSwitch 6900-Q32 and X72 models only.
- The **no interfaces beacon** command syntax clears the beacon settings from the **show interfaces beacon** table and resets LEDs to original factory-set behavior. (Once stored beacon settings are cleared, they can no longer be retrieved and beacon settings must be reconfigured.)
- The **interfaces beacon** command is supported on all Ethernet ports on the switch. However, when specifying a range in the command line, please note that The Beacon LED feature is not supported on sub-ports 'b', 'c', or 'd' when an interface is operating in 4X10G mode. Additionally, only Solid mode is supported on sub-port 'a' for 4X10G interfaces.

Examples

```
-> interfaces port 1/1/7-10 beacon led-mode solid admin-status enable led-color  
aqua  
-> interfaces slot 1/1 beacon led-color magenta  
-> no interfaces slot 1/1/1 beacon
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show interfaces beacon](#) Displays current interface beacon settings.

MIB Objects

  esmPortBeaconEntry  
  esmBeaconAdminState  
  esmBeaconLedColor  
  esmBeaconLedMode  
  esmBeaconRowStatus
```

show interfaces beacon

Displays current interface beacon settings.

show interfaces {slot *chassis/slot* | **port** *chassis/slot/port[-port2]}* **beacon**

Syntax Definitions

<i>chassis</i>	The chassis ID for the switch on which beacon settings are being shown. For standalone switches, use 1 .
<i>slot</i>	The slot ID for the switch on which beacon settings are being shown. For standalone switches, use 1 .
<i>port</i>	The port number for which beacon settings are being shown.
<i>-port2</i>	The last port number in a range for which beacon settings are being shown. Be sure to insert a hyphen between port range numbers (for example, 7-10)

Defaults

N/A

Platforms Supported

OmniSwitch 6900

Usage Guidelines

Supported on the OmniSwitch 6900-Q32 and X72 models only.

Examples

```
-> show interfaces beacon
Ch/Slot/Port  Admin-Stat  LED-Color  LED-Mode
-----+-----+-----+-----
1/1/1A        Disable     Magenta    Solid
1/1/2A        Disable     Blue       Activity
1/1/30A       Enable     Magenta    Solid
1/1/31A       Enable     Off        Solid
```

output definitions

Ch/Slot/Port	The chassis/slot/port ID for the switch on which beacon settings are being shown.
Admin-Stat	The beacon administrative status (Enable/Disable).
LED-Color	The LED color being displayed on the corresponding interface LED. Options include yellow , white , red , magenta , green , blue , aqua and off .
LED-Mode	The current LED behavior on the corresponding interface LED. Options include solid or activity (default).

Release History

Release 7.3.4; command introduced.

Related Commands

2 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch PoE-capable switches. Refer to the *OmniSwitch Hardware Users Guide* for further details.

Note. Note on Terminology. There are several general terms used to describe this feature. The terms *Power over Ethernet (PoE)*, *Power over LAN (PoL)*, *Power on LAN (PoL)*, and *Inline Power* are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the *OmniSwitch AOS Release 8 CLI Reference Guide* refer to the feature as *Power over Ethernet (PoE)*.

Note. Additional terms, such as *Powered Device (PD)* and *Power Source Equipment (PSE)* are terms that are not synonymous, but are directly related to PoE.

- *PD* refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- *PSE* refers to the actual hardware source of the electrical current for PoE (e.g., OmniSwitch PoE-capable switches).

PoE commands documented in this section comply with IEEE 802.3, 802.af, and 802.3at.

MIB information for the PoE commands is as follows:

Filename: AlcatelIND1InLinePowerEthernet_mib
Module: ALCATEL-IND1-INLINE-POWER-MIB

Filename: AaIETF_HUBMIB_POWER_ETHERNET_DRAFT_mib
Module: POWER-ETHERNET-MIB

A summary of the available commands is listed here:

lanpower service

Activates or stops PoE service on all ports in a specified slot.

lanpower {*chassis chassis* | *slot chassis/slot* } **service** {**start** | **stop**}

Syntax Definitions

<i>chassis</i>	The chassis on which the PoE power is being turned on or off.
<i>chassis/slot</i>	The slot on which the PoE power is being turned on or off.
start	Activates PoE on all ports in the specified slot.
stop	Turns off PoE on all ports in the specified slot.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> lanpower slot 2/1 service start  
-> lanpower chassis 1 service stop
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower port admin-state	Activates or stops PoE service on an individual port.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable  
  alaPethMainPseAdminStatus
```

lanpower port admin-state

Activates or stops PoE service on an individual port.

lanpower port *chassis/slot/port* admin-state {enable | disable}

Syntax Definitions

<i>chassis/slot/port</i>	The individual port on which the PoE power is being turned on or off.
enable	Activates PoE on the specified port.
stop	Turns off PoE on the specified port.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> lanpower port 2/1/1 admin-state enable
-> lanpower port 1/1/12 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower service	Activates or stops PoE service on all ports in a specified slot.
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
  pethPsePortAdminEnable
```

lanpower type

Assigns a user-defined port type to a specific port (when *chassis/slot/port* values are entered) or across all ports in a chassis or slot.

lanpower {**chassis** *chassis* / **slot** *chassis/slot* / **port** *chassis/slot/port*} **type** *string*

Syntax Definitions

<i>chassis</i>	The chassis on which a port type is being defined.
<i>chassis/slot</i>	The slot on which a port type is being defined.
<i>chassis/slot/port</i>	The specific port on which a port type is being defined.
<i>string</i>	A user-defined text string of up to nine (9) characters. This text string will be listed in the “Type” column in the lanpower update-from command output.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> lanpower slot 1/1 type test
-> lanpower port 1/1/23 type PDs
-> lanpower chassis 1 type test
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; command was updated.

Related Commands

[lanpower update-from](#) Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

pethPsePortTable
pethPsePortType

lanpower power

Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a chassis or slot.

lanpower {**chassis** *chassis* / **slot** *chassis/slot* / **port** *chassis/slot/port*} **power** *milliwatts*

Syntax Definitions

<i>chassis</i>	The chassis on which the port power is being defined.
<i>chassis/slot</i>	The slot on which the port power is being defined.
<i>chassis/slot/port</i>	The specific port on which the port power is being defined.
<i>milliwatts</i>	The maximum amount of power for a specified port or slot. Refer to default and range information below.

Defaults

model	ports	default	range
OS6860	all	30000	3000-30000
OS6860E (Enhanced)	1 through 4	60000	3000-60000
OS6860E (Enhanced)	5 and higher	30000	3000-30000
OS9900	1 through 8	72000	3000-72000
OS9900	9 and higher	30000	3000-30000

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.
- To globally specify the amount of inline power available to all ports in a slot, refer to the [lanpower maxpower command on page 2-8](#).
- Be sure that the value specified complies with specific power requirements for all attached PDs.
- Note that the power value for the **lanpower power** command is specified in milliwatts (mW); the related command, **lanpower maxpower**, is specified in watts (W).

Examples

```
-> lanpower slot 3/1 power 3200
-> lanpower port 1/1/24 power 25000
-> lanpower chassis 1 power 3000
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; command was updated.

Related Commands

[lanpower maxpower](#)

Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.

[lanpower update-from](#)

Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

alaPethPsePortTable

 alaPethPsePortPowerMaximum

lanpower maxpower

Specifies the maximum amount of power, in watts, assigned to a specified slot.

lanpower {*chassis chassis* / *slot chassis/slot* } **maxpower** *watts*

Syntax Definitions

<i>chassis</i>	The chassis containing PoE ports on which the maximum amount of inline power allowed is being configured.
<i>chassis/slot</i>	The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.
<i>watts</i>	The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the <i>OmniSwitch Hardware Users Guide</i> for additional PoE specifications.

Defaults

installed power supply	default	range
920W Power Supply (OS6860)	780W	37-780
600W Power Supply (OS6860)	450W	37-450

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- To specify the maximum amount of inline power available to a single port, refer to the [lanpower power](#).
- Note that the power value for the [lanpower maxpower](#) command is specified in watts (W); the related command, [lanpower power](#), is specified in milliwatts (mW).

Examples

```
-> lanpower slot 3/1 maxpower 400
-> lanpower chassis 1 maxpower 400
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

[lanpower power](#)

Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).

[lanpower update-from](#)

Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

alaPethMainPseTable

 alaPethMainPseMaxPower

lanpower priority

Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered). Levels include critical, high, and low.

lanpower {chassis *chassis* | slot *chassis/slot* | port *chassis/slot/port*} priority {critical | high | low}

Syntax Definitions

<i>chassis</i>	The chassis on which the PoE power priority is being set.
<i>chassis/slot</i>	The slot on which the PoE power priority is being set.
<i>chassis/slot/port</i>	The specific port on which the PoE power priority is being set.
critical	Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical ports is maintained as long as possible.
high	Intended for ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, power to high-priority ports is given second priority to critical devices.
low	Intended for ports that have low-priority devices attached. In the event of a power management issue, power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

Defaults

parameter	default
low high critical	low

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

Examples

```
-> lanpower slot 2/1 priority low
-> lanpower port 1/1/6 priority critical
-> lanpower chassis 1 priority low
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

[lanpower priority-disconnect](#)

Enables or disables the priority disconnect function on all ports in a specified slot.

[lanpower update-from](#)

Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

pethPsePortTable

 pethPsePortPowerPriority

lanpower ni-priority

Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.

lanpower {*chassis chassis* / *slot chassis/slot* } **ni-priority** {**critical** | **high** | **low**}

Syntax Definitions

<i>chassis</i>	The chassis on which the NI priority is being set.
<i>chassis/slot</i>	The slot on which the NI priority is being set.
critical	Intended for modules that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical NIs is maintained as long as possible.
high	Intended for modules that have important, but not mission-critical, devices attached. If other NIs in the chassis have been configured as critical, power to high-priority modules is given second priority to critical devices.
low	Intended for modules that have low-priority devices attached. In the event of a power management issue, power to low-priority modules is interrupted first (i.e., before critical- and high-priority NIs).

Defaults

parameter	default
low high critical	low

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

Examples

```
-> lanpower slot 2/1 ni-priority low
-> lanpower chassis 1 ni-priority low
```

Release History

Release 8.3.1; command was introduced.

Related Commands**show lanpower ni-priority**

Displays current Network Interface (NI) modules status for a specified chassis or slot.

MIB ObjectsN/A

lanpower priority-disconnect

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device.

lanpower {*chassis chassis* / *slot chassis/slot* } **priority-disconnect** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis on which the priority disconnect function is being enabled or disabled.
<i>chassis/slot</i>	The particular slot on which the priority disconnect function is being enabled or disabled.
enable	Enables priority disconnect on a specified port. When this function is enabled <i>and</i> a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power.
disable	Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to <i>any</i> incoming PD, regardless of its priority status.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> lanpower slot 2/1 priority-disconnect enable
-> lanpower chassis 1 priority-disconnect disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower priority	Specifies PoE power priority level to a port (when <i>chassis/slot/port</i> values are entered) or across all ports in a slot (if only <i>slot/port</i> values are entered).
lanpower update-from	Displays the PoE status and related statistics for all ports in a specified slot.
show lanpower priority-disconnect	Displays current priority disconnect status for a specified slot.

MIB Objects

alaPethMainPseTable
 alaPethMainPsePriorityDisconnect

lanpower power-rule

Specifies user-defined power rules that can be assigned to PoE ports.

```
lanpower power-rule rule-name [admin-state {enable | disable}] [power {on | off}] [at {minutes mm | time hh:mm}] [days {all | day [day...]} | date [date...}] [months {all | month}] [timezone {local-server | utc | originator-server}]
```

```
no lanpower power-rule rule-name [admin-state {enable | disable}] [power {on | off}] [at {minutes mm | time hh:mm}] [days {all | day [day...]} | date [date...}] [months {all | month}] [timezone {local-server | utc | originator-server}]
```

Syntax Definitions

<i>rule-name</i>	A user-defined name (up to 128 characters) for the power rule being configured.
admin-state	Specifies the admin-state for the power rule.
enable	Enables the power rule.
disable	Disables the power rule.
power	Specifies the power status (on or off) for devices connected to ports within the power rule.
on	Powers on devices on ports for which the rule is assigned.
off	Powers off devices on ports for which the rule is assigned.
at	Activates a power rule timer. Power rules are triggered on a specified date or day of the week or at a particular time, or after a specified amount of time has elapsed.
minutes	Sets a timer. Power rules will take effect when a specified number of minutes have elapsed.
<i>mm</i>	The number of minutes that will elapse before the power rules take effect.
time	Sets a timer. Power rules will take effect at a specified time of day.
<i>hh:mm</i>	The time of day that the power rule will take effect.
days	Specifies that the power rule will take effect on a particular day of the week.
all	Specifies that the power rule will take effect on all days of the week (Monday through Sunday).
<i>day</i>	Specifies a particular day of the month or week the power rule will take effect. When entering a day of the month, enter one or more numbers from 1 to 31 . When entering a day of the week, use three-digit abbreviations (e.g., mon , tue , wed , thu , fri , sat and sun). Any combination of days may be entered in any order. Refer to command line examples for more information.
month	Specifies that the power rule will take effect during a particular month.
all	Specifies that the power rule will take effect during all months of the year (January through December).

<i>month</i>	Specifies a particular month of the year the power rule will take effect. When entering a month, use three-digit abbreviations (e.g., jan, feb, mar, apr, may, jun, jul, aug, sep, oct, nov and dec). Any combination of months may be entered in any order. Refer to command line examples for more information.
timezone	Sets a timezone in which timer-based power rules will take effect.
local-server	Time as specified by a local server.
utc	Specifies that timer-based rules fall under Universal Time Coordinated (UTC) time.
originator-server	Time as specified via the network.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

Before a power rule can take effect, the rule must first be assigned to particular slots or ports via the [lanpower power-policy](#) command.

Examples

```
->lanpower power-rule RuleTest2 admin-state enable power on at minutes 10 days fri
thu tue months all timezone utc
-> lanpower power-rule new power on at time 18:30 days all months all timezone utc
->lanpower power-rule OutgoingPDs power off at time 6:00 days 1 2 3 6 9 12 31
months all timezone utc
-> lanpower power-rule NewRule admin-state enable power off at minutes 4 days all
months all timezone utc
```

Release History

Release 8.1.1; command was introduced.

lanpower power-policy

Allows users to bind existing power rules to particular slots or ports.

lanpower [*slot chassis/slot* | *port chassis/slot/port-port*] **power-policy** *policy-name* [**power-rule** *rule-name*]

no lanpower power-policy *name*

Syntax Definitions

<i>chassis/slot</i>	The slot on which the power policy (with its associated power rule) is being assigned. This syntax is used the first time the lanpower power-policy command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.
<i>chassis/slot/port-port</i>	The specific slot on which the power policy (with its associated power rule) is being assigned. Port values may be entered as a single port or range of ports. This syntax is used the first time the lanpower power-policy command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.
<i>policy-name</i>	A user-defined name (up to 128 characters) for the power policy being configured (or assigned to an existing power rule).
<i>rule-name</i>	This syntax is used the second time the lanpower power-policy command is entered, where a policy is being assigned to an existing power rule. See Usage Guidelines below for more information.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- One or more power rules must be created before using the **lanpower power-policy** command. For information on creating power rules, see the **lanpower power-rule** command on page 2-16.
- Using the **lanpower power-policy** command is a two-step process. First, use the command to assign the policy to specific slots or ports. For example:

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower port 1/1/1-12 power-policy NewPolicy
```

Next, run the command again to assign the policy (with its associated slots or ports) to an existing power rule. For example:

```
-> lanpower power-policy NewPolicy power-rule NewRule
```

- When assigning a policy to a slot or port, be sure to use the syntax, “**slot**” or “**port**”, before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.

Examples

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower power-policy NewPolicy power-rule NewRule
-> no lanpower power-policy NewPolicy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[lanpower power-rule](#)

Specifies user-defined power rules that can be assigned to PoE ports.

[show lanpower power-rule](#)

Displays current PoE power rule settings.

[show lanpower power-policy](#)

Displays existing power policies assigned to a slot, port or rule.

MIB Objects

```
alaPethPowerPolicyTable
  alaPethPowerPolicyRowStatus
alaPethPowerPortTable
  alaPethPowerPortPolicyName
  alaPethPowerPortRowStatus
```

lanpower class-detection

Enables or disables class detection of attached devices. When class detection is enabled, attached devices will automatically be limited to their class power, regardless of port power configuration.

lanpower {*chassis chassis* / *slot chassis/slot* } **class-detection** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis on which class detection is being enabled or disabled.
<i>chassis/slot</i>	The particular slot on which class detection is being enabled or disabled.
enable	Enables class detection on the specified slot.
disable	Disables class detection on the specified slot.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- Although class-detection is disabled by default, the OS6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> lanpower slot 1/1 class-detection enable
-> lanpower chassis 1 class-detection disable
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

[show lanpower class-detection](#) Displays class detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
  alaPethMainPseClassDetection
```

lanpower capacitor-detection

Enables or disables the capacitor detection method.

lanpower {*chassis chassis* / *slot chassis/slot* } **capacitor-detection** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis on which class detection is being enabled or disabled.
<i>chassis/slot</i>	The particular slot on which class detection is being enabled or disabled.
enable	Enables the capacitor detection method on the specified slot.
disable	Disables the capacitor detection method on the specified slot.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is *not* compatible with IEEE specifications. Please contact your Alcatel-Lucent sales engineer or Customer Support representative to find out which Alcatel-Lucent IP phones models need capacitive detection enabled.

Examples

```
-> lanpower slot 3/1 capacitor-detection enable
-> lanpower chassis 1 capacitor-detection disable
```

Release History

Release 8.1.1; command was introduced.

Release 8.3.1; command was updated.

Related Commands

[show lanpower capacitor-detection](#) Displays capacitor detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
  alaPethMainPseCapacitorDetect
```

lanpower usage-threshold

Tells the switch to watch for a user-defined, slot-wide threshold for PoE power usage, in percent. When the usage threshold is reached or exceeded, a notification is sent to the user.

lanpower {*chassis chassis* / *slot chassis/slot* } **usage-threshold** *num*

Syntax Definitions

<i>chassis</i>	The chassis for which usage threshold monitoring is being set.
<i>chassis/slot</i>	The slot for which usage threshold monitoring is being set.
<i>num</i>	The percentage of allowed usage from attached PoE devices before a notification is sent to the user.

Defaults

parameter	default
<i>num</i>	99

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

The **lanpower slot usage-threshold** does not affect the amount of PoE power allocated to a particular slot. The command is a monitoring method that tells the switch to send a “specified usage exceeded” notification (i.e., trap) only when a specified percentage has been reached.

Examples

```
-> lanpower slot 1/1 usage-threshold 50
-> lanpower chassis 1 usage-threshold 99
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

[show lanpower usage-threshold](#) Displays current usage threshold, in percent.

MIB Objects

pethMainPseTable
pethMainPseUsageThreshold

lanpower dynamic-power-mgmt

Enables dynamic power management for a chassis or slot.

lanpower {*chassis chassis* / *slot chassis/slot* } **usage-threshold** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis on which dynamic power management is being enabled or disabled.
<i>chassis/slot</i>	The particular slot on which dynamic power management is being enabled or disabled.
enable	Enables dynamic power management on the specified chassis or slot.
disable	Disables class detection on the specified chassis or slot.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

Slot ranges are supported in the command line syntax.

Examples

```
-> lanpower slot 1/1 dynamic-power-mgmt enable
-> lanpower chassis 1 dynamic-power-mgmt disable
```

Release History

Release 8.3.1; command was introduced.

MIB Objects

N/A

lanpower update-from

This command is used to update the PoE microcontroller firmware.

lanpower slot {*chassis/slot* | **all**} **update-from** *filename*

Syntax Definitions

<i>chassis/slot</i>	The slot to be updated.
all	Update all the chassis in a virtual chassis.
<i>filename</i>	The file name of the PoE firmware.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- The binary file must be placed in the */flash* directory of the Master.
- Once started, console messages will be displayed during the update procedure which may take up to 10 minutes.
- The lanpower service must be disabled during the update and minimal load should be placed on the switch. The update process must be allowed to finish prior to unplugging or configuring the units.

Examples

```
-> lanpower slot 1/1 update-from poe_binary_version.bin
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show lanpower update-from](#) Displays current PoE firmware update status.

MIB Objects

N/A

show lanpower slot

Displays the PoE status and related statistics for all ports in a specified slot.

show lanpower slot *chassis/slot*

Syntax Definitions

chassis The virtual chassis ID for which current inline power status and related statistics are to be displayed.

slot The slot for which current inline power status and related statistics are to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1
```

Port	Maximum(mW)	Actual Used(mW)	Status	Priority	On/Off	Class	Type

48	30000	0	Powered Off	Low	OFF	.	.

```
ChassisId 1 Slot 1 Max Watts 780
0 Watts Total Power Budget Used
750 Watts Total Power Budget Available
1 Power Supplies Available
BPS power: Not Available
```

output definitions

Port	A PoE port for which current status and related statistics are being displayed.
Maximum (mW)	The current maximum amount of power available to the corresponding PoE port, in milliwatts. For more information on this parameter, including default values and changing the settings, refer to the lanpower power command.
Actual Used (mW)	The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.
Status	Displays the port's current operational status. Options include Powered On , Powered Off , Searching , Fault , Deny and Test . Powered On indicates that PoE power activation is complete and the attached device is receiving power. Powered Off indicates that no PoE device is attached and/or the port is not receiving PoE power. Searching indicates that PoE activation has started and a powered device PD has been detected, but activation or class detection is incomplete. Fault indicates that PoE activation or class detection has failed. Deny indicates that PoE power management has denied power to the port due to priority disconnect or over subscription. Test indicates that the port has been forced on and will remain on until it is forced off by RTP functions.
Priority	The current priority level for the corresponding PoE port. Options include Critical , High , and Low . Critical should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. High indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. Low priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports). The default value is Low. Priority levels can be changed using the lanpower priority command.
On/Off	Displays whether a port has been manually turned on or off by the user. ON indicates that the port has been turned on by the user via the lanpower service command. OFF is the default value and can also indicate that the port has been turned off by the user via the lanpower service command.
Class	PoE class detected on the attached Powered Device. See the lanpower class-detection command on page 2-21 for more information.
Type	A user-defined name port type (i.e., text string) for the port. See the lanpower type command on page 2-5 for more information.
Max Watts	The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the lanpower maxpower command.
Total Power Budget Used	The amount of power being used by attached PoE devices.

output definitions (continued)

Total Power Budget Available	The amount of power budget remaining for PoE . If the total power budget remaining is exceeded, a power error will occur and the switch's chassis management software will begin shutting down power to PoE ports according to their priority levels.
Power Supplies Available	The number of power supplies currently installed and operating in the switch.
BPS power	The amount of power available from an OSBPS backup power supply. If no OSBPS is installed, the default value is Not Available .

Release History

Release 8.1.1; command was introduced.

Related Commands

[lanpower power-rule](#) Specifies user-defined power rules that can be assigned to PoE ports.

MIB Objects

N/A

show lanpower power-policy

Displays existing power policies assigned to a slot, port or rule.

```
show lanpower power-policy [policy-name slot / policy-name power-rule / policy-name port]
```

Syntax Definitions

policy-name The text string for an existing power policy.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

Entering the **show lanpower power-policy** command without the *policy-name* string provides top-level information for all existing policies, including associated power rules (if any). To view detailed information for a particular policy, specify the *policy-name* string in the command line, along with the policy's associated slot, port or rule. See Examples below for additional information.

Examples

```
-> show lanpower power-policy
```

```
Power-Policy name           Power-rules
```

```
-----+-----
```

```
Mar25                       RuleTest2
```

```
-> show lanpower power-policy Mar25 power-rule
```

```
Power-Policy name           : Mar25
Power-rules                   : RuleTest2
```

output definitions

Power-Policy name	The names of existing PoE power policies.
Power-rules	The power rules associated with the existing power policies.

Release History

Release 8.1.1; command was introduced.

Related Commands[lanpower power-policy](#)

Allows users to bind existing power rules to particular slots or ports.

MIB Objects

N/A

show lanpower class-detection

Displays class detection status on a specified slot.

show lanpower { chassis *chassis* / slot *chassis/slot* } class-detection

Syntax Definitions

chassis The chassis for which class detection is being displayed.
chassis/slot The slot for which class detection is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

- Although class-detection is disabled by default, the OS6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> show lanpower slot 1/1 class-detection
Class Detection disabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.

MIB Objects

N/A

show lanpower priority-disconnect

Displays current priority disconnect status for a specified slot.

show lanpower { chassis *chassis* / slot *chassis/slot* } priority-disconnect

Syntax Definitions

<i>chassis</i>	The chassis on which priority disconnect status is being displayed.
<i>chassis/slot</i>	The particular slot on which priority disconnect status is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower priority-disconnect	Enables or disables the priority disconnect function on all ports in a specified slot.
--	--

MIB Objects

N/A

show lanpower ni-priority

Displays current Network Interface (NI) modules status for a specified chassis or slot.

show lanpower { chassis *chassis* / slot *chassis/slot* } ni-priority

Syntax Definitions

<i>chassis</i>	The chassis on which NI priority is being displayed.
<i>chassis/slot</i>	The particular slot on which NI priority is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 9900, 6860, 6865

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

Release History

Release 8.3.1; command was introduced.

Related Commands

lanpower ni-priority	Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.
--------------------------------------	--

MIB Objects

3 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, and so on. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

Filename: AlcatelIND1UDLD.mib
Module: ALCATEL-IND1-UDLD-MIB

A summary of available commands is listed here:

udld
udld port
udld mode
udld probe-timer
udld echo-wait-timer
clear udld statistics port
show udld configuration
show udld configuration port
show udld statistics port
show udld neighbor port
show udld status port

Configuration procedures for UDLD are explained in “Configuring UDLD,” *OmniSwitch AOS Release 8 Network Configuration Guide*.

udld

Globally enables or disables UDLD protocol on the switch.

udld {enable | disable}

Syntax Definitions

enable	Globally enables UDLD on the switch.
disable	Globally disables UDLD on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The port shutdown by this command can be reset by using the **interfaces admin** command.

Examples

```
-> udld enable
-> udld disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld port	Enables or disables UDLD status on a specific port or a range of ports.
show udld configuration	Displays the global status of UDLD configuration.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

alaUdldGlobalStatus
alaUdldGlobalConfigUdldStatus

udld port

Enables or disables UDLD status on a specific port or a range of ports.

udld port *chassis/slot/port[-port2]* {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables UDLD status on a port.
disable	Disables UDLD status on a port.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The UDLD protocol must be enabled before using this command.

Examples

```
-> udld port 1/3 enable
-> udld port 1/6-10 enable
-> udld port 2/4 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
    alaUdldPortConfigUdldStatus
```

udld mode

Configures the UDLD operational mode on a specific port, a range of ports, or all ports.

```
udld [port [chassis/slot/port[-port2]]] mode {normal | aggressive}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
normal	Specifies UDLD operation in the normal mode.
aggressive	Specifies UDLD operation in the aggressive mode.

Defaults

parameter	default
normal aggressive	normal

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is not supported on aggregate ports.
- In case of faulty cable connection, the port which is configured in normal mode of operation is considered to be in the shutdown state.

Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/3 mode aggressive
-> udld port 2/4 mode normal
-> udld port 2/9-18 mode aggressive
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

alaUdldPortConfigTable
 alaUdldPortConfigUdldMode

udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all ports. Probe messages are transmitted periodically after this timer expires.

udld [*port* [*chassis/slot/port*[-*port2*]]] **probe-timer** *seconds*

no udld [*port* [*chassis/slot/port*[-*port2*]]] **probe-timer**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>seconds</i>	The probe-message transmission interval, in seconds.

Defaults

parameter	default
<i>seconds</i>	15

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

Examples

```
-> udld probe-timer 20
-> udld port 1/3 probe-timer 16
-> udld port 1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/3 probe-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

alaUdldPortConfigTable
alaUdldPortConfigUdldProbeIntervalTimer

udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

udld [*port* [*chassis/slot/port*[-*port2*]]] **echo-wait-timer** *seconds*

no udld [*port* [*chassis/slot/port*[-*port2*]]] **echo-wait-timer**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>seconds</i>	The echo based detection period, in seconds.

Defaults

parameter	default
<i>seconds</i>	8

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

Examples

```
-> udld echo-wait-timer 9
-> udld port 1/5 echo-wait-timer 12
-> udld port 1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/3 echo-wait-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

alaUdldPortConfigTable
alaUdldPortConfigUdldDetectionPeriodTimer

clear udld statistics port

Clears the UDLD statistics for a specific port or for all the ports.

clear udld statistics [*port chassis/slot/port*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

Examples

```
-> clear udld statistics port 1/4  
-> clear udld statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld statistics port	Displays the UDLD statistics for a specific port.

MIB Objects

alaUdldGlobalClearStats

show udld configuration

Displays the global status of UDLD configuration.

show udld configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show udld configuration
```

```
Global UDLD Status           : disabled,
Global UDLD Mode             : normal,
Global UDLD Probe Timer (Sec) : 15,
Global UDLD Echo-Wait Timer (Sec) : 8
Global UDLD Status : Disabled
```

output definitions

Global UDLD Status	Indicates the UDLD status on the switch. Options include enabled or disabled .
Global UDLD Mode	Indicates the UDLD mode on the switch. Options include normal or aggressive .
Global UDLD Probe Timer (Sec)	A probe-message is expected after this time period.
Global UDLD Echo-Wait Timer (Sec)	The detection of neighbor is expected with in this time period.
Global UDLD Status	Indicates the UDLD status on the switch. Options include enabled or disabled .

Release History

Release 7.1.1; command introduced.

Related Commands

1/18	disabled	normal	33	8
1/19	disabled	normal	33	8
1/20	disabled	aggressive	55	8
1/21	disabled	aggressive	55	8
1/22	disabled	aggressive	55	8
1/41	disabled	aggressive	77	8
1/42	enabled	aggressive	77	8
1/43	enabled	aggressive	77	8
1/44	enabled	aggressive	77	8
1/45	enabled	aggressive	77	8

```
-> show udld configuration port 1/44
```

```
Global UDLD Status                    : enabled,
Port UDLD Status                     : enabled,
Port UDLD State                      : bidirectional,
UDLD Op-Mode                         : aggressive,
Probe Timer (Sec)                    : 77,
Echo-Wait Timer (sec)                : 8
```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
UDLD-State	Indicates the state of interface determined by UDLD operation, which can be notapplicable , shutdown , undetermined or bidirectional .
Oper-Mode	Indicates the operational mode of UDLD protocol. Options include normal or aggressive .
Global UDLD Status	Indicates the UDLD status on the switch. Options include enabled or disabled .
Port UDLD Status	Indicates the UDLD status on a port. Options include enable or disable .
Probe Timer	A probe-message is expected after this time period.
Echo-Wait Timer	The detection of neighbor is expected with in this time period.

Release History

Release 7.1.1; command introduced.

Related Commands

udld mode	Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.
udld probe-timer	Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports.

4 Source Learning Commands

The Source Learning capability of OmniSwitch is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

Filename: AlcatelInd1MacAddress.mib
Module: ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

mac-learning
mac-learning flush
mac-learning flush domain all
mac-learning flush domain vlan
mac-learning flush domain spb
mac-learning flush domain vxlan
mac-learning static mac-address
mac-learning multicast mac-address
mac-learning aging-time
mac-learning mode
mac-ping
show mac-learning
show mac-learning domain all
show mac-learning domain vlan
show mac-learning domain spb
show mac-learning domain vxlan
show mac-learning aging-time
show mac-learning learning-state
show mac-learning mode

mac-learning

Configures the status of source MAC address learning on a VLAN, a single port, a range of ports, or on a link aggregate of ports.

```
mac-learning {vlan vlan[-vlan2] | port chassis/slot/port[-port2] / linkagg agg_id} {enable | disable}
```

Syntax Definitions

<i>vlan</i> [- <i>vlan2</i>]	The VLAN ID number. Use a hyphen to specify a range of VLAN IDs.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i>	The link aggregate ID number.
enable	Enables source learning.
disable	Disables source learning.

Defaults

By default, source learning is enabled on all ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configuring source learning is not supported on Learned Port Security (LPS) and Universal Network Profile (UNP) ports, as well as individual ports that are members of a link aggregate.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source learning is disabled on a port or link aggregate, dynamic learning of MAC addresses is stopped.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates on which source learning is disabled.
- Disabling source learning on a port or link aggregate is useful on a ring configuration, where switch A does not have to learn MAC addresses from switch B, or for a Transparent LAN Service, where service provider does not require the MAC addresses of the customer network.
- Disabling source learning on a VLAN is not supported on the OS6900.

Examples

```
-> mac-learning port 1/2 enable
-> mac-learning linkagg 10 disable
-> mac-learning vlan 10 disable
```

Release History

Release 7.1.1; command added.

Related Commands

show mac-learning learning-state Displays the source learning status of a port or link aggregate on the switch.

MIB Objects

s1MacLearningControlTable
s1MacLearningControlStatus

mac-learning flush

Clears the specified MAC addresses from the Source Learning MAC Address Table on the local switch.

mac-learning flush {dynamic | static | multicast | vlan *vlan_id* | } [**mac-address** *mac_address*]

Syntax Definitions

dynamic	Clears dynamically learned MAC addresses.
static	Removes static MAC addresses.
multicast	Removes static multicast MAC addresses.
<i>mac_address</i>	Enter the MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c).

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table.
- Static unicast and static multicast addresses are removed. This command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush vlan 20 port 1/2 dynamic
-> mac-learning flush vlan 20 linkagg 10 static
```

Release History

Release 7.3.1; command added.

Related Commands

[show mac-learning](#) Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
sLMacLearningControlTable
  sLMacLearningControlStatus
```

mac-learning flush domain all

Clears the specified MAC addresses from the Source Learning MAC Address Table for all learning domains on the local switch.

mac-learning flush domain all {dynamic | static}

Syntax Definitions

dynamic	Clears dynamically learned MAC addresses from all of the domains.
static	Removes static MAC addresses from all of the domains.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for all domains.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain all dynamic  
-> mac-learning flush domain all static
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

slMacLearningControlTable
slMacLearningControlStatus

mac-learning flush domain vlan

Clears the specified MAC addresses from the Source Learning MAC Address Table for the VLAN learning domain on the local switch.

mac-learning flush domain vlan {vlan *vlan_id*} {port *chassis/slot/port* | linkagg *agg_id*} | {dynamic | static | static-multicast} [**mac-address** *mac_address*]

Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	Enter a link aggregate ID number.
dynamic	Clears dynamically learned MAC addresses from the specified domain.
static	Removes static MAC addresses from the specified domain.
static-multicast	Removes static multicast MAC addresses from the specified domain. This parameter is not available for use with the all , spb , or evb parameters.
<i>mac_address</i>	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the VLAN domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain vlan vlan 20 port 1/2 dynamic
-> mac-learning flush domain vlan static
-> mac-learning flush domain vlan linkagg 10 static
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
s1MacLearningControlTable
s1MacLearningControlStatus
```

mac-learning flush domain spb

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Shortest Path Bridging (SPB) learning domain on the local switch.

mac-learning flush domain spb {**serviceid** *service_id* | **sap** *chassis/slot/port:encap* | **bind-sdp** *sdp_id[:service_id]* | **isid** *instance_id*} {**dynamic** | **static**} [**mac-address** *mac_address*]

Syntax Definitions

<i>service_id</i>	An existing SPB service ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port:encap</i>	The SPB access port and encapsulation (0 , all , <i>qtag</i> , or <i>outer_qtag.inner_qtag</i>) for an SPB Service Access Point (SAP).
<i>sdp_id[:service_id]</i>	Clears MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
<i>instance_id</i>	An SPB backbone service instance identifier (I-SID).
dynamic	Clears dynamically learned MAC addresses from the specified domain.
static	Removes static MAC addresses from the specified domain.
<i>mac_address</i>	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the SPB domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain spb dynamic
-> mac-learning flush domain spb sap 1/12:0 dynamic
-> mac-learning flush domain spb serviceid 10 isid 1500 dynamic
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain vxlan	Clears MAC addresses from the VXLAN learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

s1MacLearningControlTable
s1MacLearningControlStatus

mac-learning flush domain vxlan

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Virtual eXtensible LAN (VXLAN) learning domain on the local switch.

mac-learning flush domain vxlan {**serviceid** *service_id* | **sap** *chassis/slot/port:encap* | **bind-sdp** *sdp_id[:service_id]* | **vnid** *vxlan_id*} {**dynamic** | **static**} [**mac-address** *mac_address*]

Syntax Definitions

<i>service_id</i>	An existing VXLAN service ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port:encap</i>	The VXLAN access port and encapsulation (0 , all , <i>qtag</i> , or <i>outer_qtag.inner_qtag</i>) for a VXLAN Service Access Point (SAP).
<i>sdp_id[:service_id]</i>	Clears MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
<i>vxlan_id</i>	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1– 2147483647 (or 000.000.001– 255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).
dynamic	Clears dynamically learned MAC addresses from the specified domain.
static	Removes static MAC addresses from the specified domain.
<i>mac_address</i>	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the VXLAN domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain vxlan dynamic
-> mac-learning flush domain vxlan sap 1/12:0 dynamic
-> mac-learning flush domain vxlan serviceid 10 vnid 23000 dynamic
```

Release History

Release 7.3.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
mac-learning flush domain vlan	Clears MAC addresses from the VLAN learning domain.
mac-learning flush domain spb	Clears MAC addresses from the SPB learning domain.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
slMacLearningControlTable
slMacLearningControlStatus
```

mac-learning static mac-address

Configures a static destination unicast MAC address. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured MAC address, then they are forwarded to the specific MAC address port.

mac-learning {vlan *vlan_id* {port *chassis/slot/port* | linkagg *agg_id*}} **static mac-address** *mac_address* [**bridging** | **filtering**]

mac-learning flush [vlan *vlan_id* [port *chassis/slot/port* | linkagg *agg_id*]] **static** [**mac-address** *mac_address*]

Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1) that is assigned to the static MAC address.
<i>agg_id</i>	Enter a link aggregate ID number. See Chapter 12, “Link Aggregation Commands.”
<i>mac_address</i>	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.

Defaults

parameter	default
bridging filtering	bridging

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static addresses are removed.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.

- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c bridging
-> mac-learning vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01 filtering
-> mac-learning flush vlan 500 static
-> mac-learning flush vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c
-> mac-learning flush vlan 20 linkagg 5 static
-> mac-learning flush static
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1: **mac-learning flush** command replaced the **no mac-learning** command.

Related Commands

vlan members untagged	Assigns ports and link aggregates to a VLAN.

mac-learning multicast mac-address

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

mac-learning {vlan *vlan_id* {port *chassis/slot/port* | linkagg *agg_id* }} **multicast mac-address** *multicast_address* [**group** *group_id*]

mac-learning flush [vlan *vlan_id* [port *chassis/slot/port* | linkagg *agg_id*]] **multicast** [**mac-address** *multicast_address*]

Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The egress slot and port number (3/1) that is assigned to the static multicast MAC address.
<i>agg_id</i>	Enter a link aggregate ID number. See Chapter 12, “Link Aggregation Commands.”
<i>multicast_address</i>	Enter the destination multicast MAC Address to add to the MAC Address Table (for example, 01:00:39:59:f1:0c).
<i>group_id</i>	<i>This keyword cannot be user defined.</i>

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **mac-learning flush** command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, and so on, are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-learning vlan multicast mac-address** command. Also note that multicast addresses within the following ranges are not supported:

01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
 01:80:C2:XX.XX.XX
 33:33:XX:XX:XX:XX

- The configured (static) multicast MAC address is assigned to a fixed switch port or link aggregate ID and VLAN.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **boot.cfg** file includes the “**group group_id**” as the additional syntax for the **mac-learning static-multicast** command. The “**group group_id**” indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance.
- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **boot.cfg** file.

Examples

```
-> mac-learning vlan 1500 port 1/10 multicast mac-address 03:00:00:3a:44:12
-> mac-learning vlan 355 port 4/2-10 multicast mac-address 02:00:39:59:f1:0c
-> mac-learning vlan 455 linkagg 10 multicast mac-address 04:00:00:3a:44:13
-> mac-learning flush vlan 500 multicast
-> mac-learning flush vlan 1500 port 1/10 multicast mac-address 03:00:00:3a:44:12
-> mac-learning flush vlan 455 linkagg 10 multicast mac-address 04:00:00:3a:44:13
-> mac-learning flush multicast
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; **mac-learning flush** command replaced the **no mac-learning** command.

Related Commands

vlan members untagged	Assigns ports and link aggregates to a VLAN.
mac-learning static mac-address	Configures a static MAC address and assigns the address to a port or link aggregate.
show mac-learning	Displays Source Learning MAC Address Table information.

```

mac-learning aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

mac-learning aging-time {*seconds* | **default**}

no mac-learning aging-time

Syntax Definitions

seconds

Aging time value (in seconds). Do not use commas in value.

default

The aging time is set to the default value of 300 seconds.

Defaults

By default, the aging time is set to 300 seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **default** parameter to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported.
- Note that an inactive MAC address can take up to twice as long as the aging time value specified to be removed from the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC address ages out any time between 60 and 120 seconds of inactivity.
- The MAC address table aging time is also used as the timeout value for the Address Resolution Protocol (ARP) table. This timeout value determines how long the switch retains dynamically learned ARP table entries.

Examples

```
-> mac-learning aging-time 1200  
-> mac-learning aging-time default
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show mac-learning](#)

Displays Source Learning MAC Address Table information.

[show mac-learning aging-time](#)

Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

slMacAddressAgingTable

slMacAgingValue

mac-learning mode

Specifies the source learning mode for the chassis.

mac-learning mode [centralized | distributed]

Syntax Definitions

centralized	Enables centralized MAC source learning mode.
distributed	Enables distributed MAC source learning mode.

Defaults

By default, centralized MAC source learning mode is enabled for the chassis.

Platforms Supported

OmniSwitch 10K

Usage Guidelines

After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.

Examples

```
-> mac-learning mode centralized
-> mac-learning mode distributed
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show mac-learning mode](#) Displays the current status of the MAC source learning mode.

MIB Objects

sldistributedMacMode

show mac-learning

Displays Source Learning MAC Address Table information for the switch.

```
show mac-learning [summary | dynamic | static | multicast | bmac] [port chassis/slot/port] [linkagg  
agg_id] [mac-address mac_address] [remote [mac-address mac_address]]
```

Syntax Definitions

summary	Displays a summary of all the MAC address information.
dynamic	Displays only dynamically learned MAC addresses.
static	Displays only static MAC addresses with a permanent status.
multicast	Displays only multicast MAC addresses.
bmac	Displays only backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a Shortest Path Bridging (SPB) switch.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.
<i>mac_address</i>	A MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all MAC addresses contained in the table.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, a “&” will appear to the right of the address in the **show mac-learning** command display.

Examples

```
-> show mac-learning summary
```

```

output definitions

Domain	The domain in which the MAC address was learned or statically configured (VLAN, SPB, VXLAN, EVB).
Vlan/ServId/[ISId/vnID]	This field contains one of the following values depending on the domain type associated with the MAC address: <ul style="list-style-type: none"> The VLAN ID number. The SPB or VXLAN service ID number. The ISID number associated with the SPB service ID number. The VXLAN Network ID (VNID) number associated with the VXLAN service ID.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (dynamic, static, bmac).
Operation	The disposition of the MAC address (bridging, filtering, servicing).
Interface	The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29). In the SPB domain, this field displays the service access point (SAP) associated with the MAC address.

Release History

Release 7.1.1; command introduced.

Release 7.3.1; show command display modified to include domain and service information.

Release 7.3.4; **vnID** field added.

show mac-learning domain all

Displays MAC Address Table information for all source learning domains.

show mac-learning domain all [summary]

Syntax Definitions

summary Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain all summary

output definitions

Domain	The domain in which the MAC address was learned or statically configured (VLAN, SPB, VXLAN, EVB).
Vlan/ServId/[ISID/vnID]	This field contains one of the following values depending on the domain type associated with the MAC address: <ul style="list-style-type: none"> The VLAN ID number. The SPB or VXLAN service ID number. The ISID number associated with the SPB service ID number. The VXLAN Network ID (VNID) number associated with the VXLAN service ID.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (dynamic, static, bmac).
Operation	The disposition of the MAC address (bridging, filtering, servicing).
Interface	The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).

Release History

Release 7.1.1; command introduced.

Release 7.3.1; show command display modified to include domain information.

  slMacAddressGblDisposition
  slMacAddressGblRowStatus
  slMacAddressGblGroupField
```

show mac-learning domain spb

Displays MAC Address Table information for the Shortest Path Bridging (SPB) source learning domain.

show mac-learning domain spb [**isid** *instance_id* / **serviceid** *service_id* [**isid** *instance_id*]] [**sap** *chassis/slot/port:encap* | **bind-sdp** *sdp_id[:service_id]*] [**dynamic** | **static**] [**mac-address** *mac_address*] [**summary**]

Syntax Definitions

<i>instance_id</i>	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
<i>service_id</i>	An existing SPB service ID.
<i>chassis/slot/port:encap</i>	The SPB access port and encapsulation (0 , all , <i>qtag</i> , or <i>outer_qtag.inner_qtag</i>) for an SPB Service Access Point (SAP). For example, 1/1/2:10.
<i>mesh_id</i>	A SPB service distribution point (SDP) ID.
<i>sdp_id[:service_id]</i>	Displays MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
<i>mac_address</i>	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the SPB domain are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain spb summary
Mac Address Table Summary:
```

Domain	Static	Static-Multicast	Bmac	Dynamic
SPB	0	0	0	6

Total MAC Address In Use = 6

```
-> show mac-learning domain spb
Legend: Mac Address: * = address not valid,
```

Mac Address: & = duplicate static address,

show mac-learning domain vxlan

Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.

show mac-learning domain vxlan [**vnid** *vxlan_id* / **serviceid** *service_id* [**vnid** *vxlan_id*]] [**sap** *chassis/slot/port:encap* | **bind-sdp** *sdp_id[:service_id]*] [**dynamic** | **static**] [**mac-address** *mac_address*] [**summary**]

Syntax Definitions

<i>vxlan_id</i>	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1– 2147483647 (or 000.000.001– 255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).
<i>service_id</i>	An existing VXLAN service ID.
<i>chassis/slot/port:encap</i>	The VXLAN service access port and encapsulation (0 , all , <i>qtag</i> , or <i>outer_qtag.inner_qtag</i>) for a VXLAN Service Access Point (SAP). For example, 1/1/2:10.
<i>sdp_id[:service_id]</i>	Displays MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
<i>mac_address</i>	A MAC Address (for example, 00:00:39:59:f1:0c).
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the VXLAN domain are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Examples

```
-> show mac-learning domain vxlan summary
Mac Address Table Summary:
```

Domain	Static	Static-Multicast	Bmac	Dynamic
VXLAN	0	0	0	4

Total MAC Address In Use = 4

```
-> show mac-learning domain vxlan
Legend: Mac Address: * = address not valid,
```

Mac Address: & = duplicate static address,

VXLAN		5:5 46:91:54:dc:6e:41	dynamic	servicing	sdp:175:5

Total number of Valid MAC addresses above = 2

output definitions

Domain	The domain in which the MAC address was learned or statically configured (VLAN, SPB, VXLAN, EVB).
Vlan/ServId/[ISId/vnID]	This field contains one of the following values depending on the domain type associated with the MAC address: <ul style="list-style-type: none"> The VLAN ID number. The SPB or VXLAN service ID number. The ISID number associated with the SPB service ID number. The VXLAN Network ID (VNID) number associated with the VXLAN service ID.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (dynamic, static, bmac).

output definitions

Operation	The disposition of the MAC address (bridging, filtering, servicing).
Interface	The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29). In the SPB domain, this field displays the service access point (SAP) associated with the MAC address.

Release History

Release 7.1.1; command introduced.

Release 7.3.1; show command display modified to include domain and service information.

Release 7.3.4; VXLAN domain parameters and fields added.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information for the switch.

  slVxLanVnID

```

show mac-learning aging-time

Displays the current aging time value for the Source Learning MAC Address Table.

```
show mac-learning aging-time
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Note that the aging time is the same for all VLANs because it is not configurable on a per-VLAN basis. The aging time value on this platform is a global parameter that applies to all VLANs.

Examples

```
-> show mac-learning aging-time  
Mac Address Aging Time (seconds) = 300
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show mac-learning](#) Displays Source Learning MAC Address Table information.

MIB Objects

```
slMacAddressAgingTable  
slMacAgingValue
```

show mac-learning learning-state

Displays the source learning status of a VLAN, port, or link aggregate.

```
show mac-learning learning-state [vlan vlan[-vlan2] / port chassis/slot/port | linkagg agg_id]
```

Syntax Definitions

<i>vlan</i>	The VLAN ID number.
<i>-vlan2</i>	The last VLAN ID in a range of VLAN IDs.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_id</i>	Specifies the link aggregate identifier.

Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **port** or **linkagg** keywords along with the port ID and link aggregate ID to display the source learning status for a specific port or link aggregate ID.
- Use the **vlan** keyword along with the VLAN ID or a range of VLAN IDs to display the source learning status for the specified VLAN or range of VLANs.
- Output display for a range of port IDs is supported with this command. However, output display for a range of link aggregate IDs is not supported.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, the source learning status cannot be configured on individual ports which are members of the link aggregate.

Example

```
-> show mac-learning learning-state
```

```
port  source-learning
-----+-----
1/1   disabled
1/2   enabled
1/3   disabled
```

```
-> show mac-learning learning-state port 1/2
```

```
port source-learning
-----+-----
1/2    enabled
```

```
-> show mac-learning learning-state linkagg 10
```

```
port source-learning
-----+-----
0/10   disabled
```

output definitions

port	The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).
source-learning	The source learning status of the port or link aggregate (enabled or disabled). Configured through the mac-learning command.

```
-> show mac-learning learning-state vlan 1-5
```

```
      Vlan      Learning State
-----+-----
      1          Enabled
      5          Enabled
```

output definitions

Vlan	The VLAN ID numbers of the VLANs that are active.
Learning State	The MAC learning state of the VLANs.

Release History

Release 7.1.1; command introduced

Related Commands

show mac-learning mode

Displays the current source learning mode (centralized or distributed) for the switch.

show mac-learning mode

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show mac-learning mode
MAC Learning Mode Configuration = CENTRALIZED
New Configured MAC Learning Mode After Reboot = DISTRIBUTED
```

```
-> show mac-learning mode
MAC Learning Mode Configuration = DISTRIBUTED
```

Release History

Release 7.1.1; command introduced.

Related Commands

[mac-learning mode](#) Enables or disables the distributed MAC source learning mode.

MIB Objects

```
sLMacAddressTable
sLDistributedMacMode
```

mac-ping

Configure a MAC address ping for testing Layer 2 connectivity.

mac-ping *dst-mac mac* **vlan** *vlan-id* [**priority** *vlan-priority*] [**drop-eligible** {**true** | **false**}] [**count** *count*] [**interval** *delay*] [**size** *size*] [**isid-check** *isid*]

Syntax Definitions

<i>mac</i>	The destination MAC address to ping.
<i>vlan-id</i>	The VLAN on which the packets will be sent out. Valid range is 1-4094.
<i>vlan-priority</i>	Specifies both the internal priority of the Mac ping and the 802.1p value on the vlan tag header. Valid range is 0-7.
true / false	Specifies both the internal drop precedence of the MAC ping and the CFI bit on the vlan tag header. Default is false.
<i>count</i>	The number of packets to send in one ping iteration. Valid range is 1–5.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
<i>isid</i>	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Defaults

parameter	default
<i>vlan-priority</i>	0
<i>drop-eligible</i>	false
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	36 bytes

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The timeout for each ping request packet is 1 sec. This value is not configurable.
- Destination MAC cannot be a broadcast, multicast, or NULL address.

Examples

```
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10 count 5 size 100
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 1001 isid-check 1002
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show mac-learning](#)

5 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP), add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

MIB information is as follows:

Filename: AlcatelIND1VlanManager.mib
Module: ALCATEL-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

VLAN Management Commands	vlan vlan members untagged vlan members tagged vlan mtu-ip show vlan show vlan members
Private VLAN Commands	pvlan pvlan secondary pvlan members show pvlan show pvlan mapping show pvlan members

vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

vlan *vlan_id* [**admin-state** {**enable** | **disable**}] [**name** *description*]

no vlan *vlan_id*

Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies an individual VLAN. This value becomes the VLAN ID for the new VLAN.
enable	Enable VLAN administrative status.
disable	Disable VLAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration.
- All VLAN ports and routers are detached before the VLAN is removed. If the VLAN deleted is a default VLAN on the port, the port returns to default VLAN 1.
- If the VLAN deleted is not a default VLAN, then the ports are directly detached from the VLAN.
- A VLAN is not operationally active until at least one of the member ports of the VLAN is active and can forward traffic.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries (for example, **vlan 10-15**).
- When a VLAN is administratively disabled, static port assignments are retained but traffic is not forwarded from these ports.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.

Examples

```
-> vlan 200 name "Corporate VLAN"  
-> vlan 720 admin-state disable  
-> no vlan 1020
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan members untagged	Statically assigns ports to a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable  
  vlanNumber  
  vlanDescription  
  vlanAdmStatus  
  vlanOperStatus  
  vlanStatus
```

vlan members untagged

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

```
vlan vlan_id[-vlan_id] members {port chassis/slot/port[-port1] | linkagg agg_id[-agg_id]} untagged
```

```
no vlan vlan_id[-vlan_id] members {port chassis/slot/port[-port1] | linkagg agg_id[-agg_id]}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>vlan_id</i>	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
<i>slot/port[-port1]</i>	The slot number for the module and the physical port number (for example, 3/1 specifies port 1 on slot 3) or a range of physical port numbers on that module (for example, 3/1-16).
<i>agg_id[-agg_id]</i>	The link aggregate ID number or range of IDs to be assigned to the specified VLAN.

Defaults

VLAN 1 is the default VLAN for all ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- This command configures the port or link aggregate to send and receive untagged packets for the specified VLAN ID, which becomes the default VLAN of the port.
- Every switch port or link aggregate has only one configured default VLAN. The 802.1Q tagged ports, however, can have additional VLAN assignments, which are often referred to as *secondary* VLANs.

Examples

```
-> vlan 20 members port 4/1-24 tagged
-> vlan 20 members linkagg 2-4 untagged
-> no vlan 1-4 members port 4/1-24
-> no vlan 20 members linkagg 2-4
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

vpaTable
 vpaVlanNumber
 vpaIfIndex
 vpaType
 vpaState
 vpaStatus

vlan members tagged

Configures a port or link aggregate ID to send and receive 802.1q-tagged packets with the specified VLAN ID.

vlan *vlan_id*[-*vlan_id*] **members** {**port** *chassis/slot/port*[-*port*] | **linkagg** *agg_id*[-*agg_id*]} **tagged**

no vlan *vlan_id*[-*vlan_id*] **members** {**port** *chassis/slot/port*[-*port*] | **linkagg** *agg_id*[-*agg_id*]}

Syntax Definitions

<i>vlan_id</i>	The VLAN ID number for a pre-configured VLAN that will handle the 802.1Q-tagged traffic for this port. Use a hyphen to specify a range of VLAN IDs (for example, vlan 10-15). The valid range is 1–4094.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id</i> [- <i>agg_id</i>]	A link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

By default, all ports are untagged (they only carry untagged traffic for the default VLAN to which the port belongs).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- A port or link aggregate cannot be tagged with its own default VLAN ID.

Examples

```
-> vlan 100 members port 3/1 tagged
-> vlan 100 members port 4/1-10 tagged
-> vlan 100 members linkagg 10 tagged
-> vlan 100 members linkagg 1-4 tagged
-> no vlan 100 members port 3/1
```

Release History

```

vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

vlan *vlan_id* **mtu-ip** *size*

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
<i>size</i>	Packet size value specified in bytes.

Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, Gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. If the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).
- The maximum MTU size value for a VLAN is 9198.

Examples

```
-> vlan 200 mtu-ip 1280
-> vlan 1503 mtu-ip 9198
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.

MIB objects

```
vlanTable  
  vlanMtu
```

output definitions (continued)

oper	VLAN operational status: Ena (enabled) or Dis (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.
ip	IP router interface status: Ena (IP interface exists for the VLAN) or Dis (no IP router interface exists for the VLAN). Use the ip interface command to define an IP router interface for a VLAN.
mtu	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit. Configured through the vlan mtu-ip command.
name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified. Configured through the vlan command.

```
-> show vlan 200
Name                : PVLAN 200,
Type                : PVLAN Primary vlan,
Administrative State : enabled,
Operational State   : disabled,
IP Router Port      : disabled,
IP MTU              : 1500
```

output definitions

Name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified.
Type	The type of VLAN (such as Static VLAN, MTP VLAN, VCM IPC, VIP VLAN, UNP Dynamic VLAN, Backbone VLAN, Fibre Channel over Ethernet VLAN, PVLAN Primary vlan)
Administrative State	VLAN administrative status: enabled VLAN functions are enabled; disabled specifies that VLAN functions are disabled. Use the vlan command to change the VLAN administrative status.
Operational State	VLAN operational status: Ena (enabled) or Dis (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow.
IP Router Port	IP router port status: Ena (IP interface exists for the VLAN) or Dis (no IP router interface exists for the VLAN). Use the ip interface command to define an IP router interface for a VLAN.
IP MTU	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit.

vlanTable  
    vlanNumber  
    vlanDescription  
    vlanAdmStatus  
    vlanOperStatus  
    vlanStatus
```

show vlan members

Displays VLAN-port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port.

show vlan [*vlan_id*[-*vlan_id*]] **members** [**port** *chassis/slot/port*[-*port*]/ **linkagg** *agg_id*[-*agg_id*]]

Syntax Definitions

<i>vlan_id</i>	VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, vlan 10-15).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i>]	The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id</i>]	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the *vlan_id* is specified without a *slot/port* or *agg_id*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *agg_id* is specified without a *vlan_id*, then all VLAN assignments for that port are displayed.
- If both the *vlan_id* and *slot/port* or *agg_id* are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show vlan 10-15 port**). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.
- The following types of VPAs may appear in the “type” field based on the switch configuration:

VPA Type	Description
default	Statically configured default VLAN assignment for the port.
qtagged	Statically configured 802.1Q tagged secondary VLAN assignment for the port.
dynamic	VPA created dynamically as learned by MVRP.
mirror	Port is mirroring the VLAN assignment of another port created according to rules/policies.

VPA Type	Description
mirrored	VPA created dynamically for remote port mirroring.
spb	Port is associated with a Shortest Path Bridging (SPB) Backbone VLAN (BVLAN). When a port is configured as an SPB interface, the port is dynamically assigned to all BVLANS in the switch configuration.
UNP Untagged	Untagged VPA created dynamically for UNP.
UNP QTagged	802.1Q tagged VPA created dynamically for UNP.

Examples

```
-> show vlan members
vlan  port      type      status
-----+-----+-----+-----+
  1    1/1      default   inactive
  2    1/2      default   blocking
      11/4     qtagged   forwarding
  3    1/2      qtagged   blocking
      11/4     default   forwarding
      2/5     dynamic   forwarding
```

```
-> show vlan 10 members
port  type      status
-----+-----+-----+
 1/1  default   forwarding
 1/2  qtagged   forwarding
```

```
-> show vlan members port 3/2
vlan  type      status
-----+-----+-----+
  1    default   forwarding
  2    qtagged   forwarding
  5    dynamic   blocking
  3    qtagged   blocking
```

```
-> show vlan 1-11 members port 1/3
type      : default,
status     : inactive,
vlan admin : enabled,
vlan oper  : disabled,
```

output definitions

vlan	Numerical VLAN ID. Identifies the VLAN assignment of the port.
port	The slot number for the module and the physical port number on that module (for example 3/1 specifies port 1 on slot 3).
type	The type of VPA: default (configured default VLAN assignment for the port), qtagged (802.1Q-tagged secondary VLAN assignment for the port), mirror (port is mirroring the VLAN assignment of another port), dynamic (dynamically configured VLAN assignment for the port).

output definitions

status	The VPA status: inactive (port is not active), forwarding (traffic is forwarding on this VPA), blocking (traffic is not forwarding on this VPA)
vlan admin	VLAN administrative status: enabled enables VLAN functions to operate; disabled disables VLAN functions without deleting the VLAN. Use the vlan command to change the VLAN administrative status.
vlan oper	VLAN operational status: enabled or disabled . The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

    vlanOperStatus

```

pvlan

Creates a new Private VLAN (PVLAN) with the specified VLAN ID and an optional description. The specified VLAN ID will serve as the Primary VLAN for the PVLAN configuration.

pvlan *vlan_id*[-*vlan_id*] [**admin-state** {**enable** | **disable**}] [**name** *description*] **mtu-ip** *size*

no pvlan *vlan_id*[- *vlan_id*]

Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies the PVLAN. The valid range 2–4094.
enable	Enable the VLAN administrative status.
disable	Disable VLAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the PVLAN.
<i>size</i>	The Maximum Transfer Unit (MTU) size for the PVLAN.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specify a VLAN ID that does not already exist in the switch configuration.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- Enclose the description in double quotes if it contains more than one word with a space in between each word.

Examples

```
-> pvlan 200 name "Corporate PVLAN"
-> pvlan 200 admin-state disable
-> pvlan 300-302 admin-state enable
-> no pvlan 200
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan secondary	Creates a new Secondary VLAN and associates it with the Primary VLAN in a PVLAN configuration.
pvlan members	Assigns ports or link aggregates to a Primary or Secondary VLAN in a PVLAN configuration.
show pvlan	Displays a list of PVLANS configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```

  alaPrivateVlanID  
  alaPrivateVlanAdminState  
  alaPrivateVlanName  
  alaPrivateVlanType  
  alaPrivateVlanMtuIp
```

pvlan secondary

Creates a new Secondary VLAN and associates it with the Primary VLAN in a Private VLAN (PVLAN) configuration.

pvlan *vlan_id* **secondary** *vlan_id*[-*vlan_id*] **type** {**isolated** | **community**}

no pvlan *vlan_id* **secondary** *vlan_id*[- *vlan_id*]

Syntax Definitions

pvlan <i>vlan_id</i>	A numeric value that uniquely identifies the Primary VLAN. The valid range is 2–4094.
secondary <i>vlan_id</i>	A numeric value that uniquely identifies the Secondary VLAN to assign to the specified Primary VLAN. The valid range is 2–4094.
isolated	Configures the secondary VLAN as an Isolated VLAN.
community	Configures the secondary VLAN as a Community VLAN.

Defaults

parameter	default
N/A	

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the Secondary VLAN assignment.
- The Primary VLAN ID must already exist.
- The Secondary VLAN ID must not already exist.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- There can only be one Isolated Secondary VLAN associated with a Primary VLAN.

Examples

```
-> pvlan 200 secondary 250 type isolated
-> pvlan 200 secondary 251 type community
-> no pvlan 200 secondary 251
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan members	Assigns ports or link aggregates to a Primary or Secondary VLAN in a PVLAN configuration.
show pvlan	Displays a list of PVLANS configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```

  alaPrivateVlanMappingPrimaryVlanID  
  alaPrivateVlanMappingSecondaryVlanID  
  alaPrivateVlanMappingSecondaryVlanType
```

pvlan members

Configures a tagged or untagged VLAN-port association (VPA) between ports or link aggregates and the specified VLAN ID in a Private VLAN (PVLAN) configuration.

```
pvlan vlan_id members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]} {tagged | untagged} | isl}
```

```
no pvlan vlan_id members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]}
```

Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies a Primary VLAN or Secondary VLAN in a PVLAN configuration. The valid range is 2–4094.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number.
<i>agg_id[-agg_id]</i>	The link aggregate ID number or range of IDs. The ID must be in the range 1 to 128.
tagged	Configures the port or link aggregate ID to send and receive 802.1q-tagged packets with the specified PVLAN ID.
untagged	Configures the port or link aggregate ID to send and receive non-802.1q-tagged packets.
isl	Configures the port as an inter-switch link (ISL) port capable of carrying PVLAN traffic for all the VLANs that are members of a PVLAN between PVLAN-aware switches.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from the specified VLAN ID.
- The VLAN ID must already exist in the switch configuration.
- An ISL port can only be assigned to a Primary VLAN.
- When a port is assigned to a PVLAN configuration, the port type is determined by the type of VLAN to which the port is assigned. For example:
 - Ports assigned to a Primary VLAN are designated as promiscuous ports.
 - Ports assigned to a Secondary VLAN configured as a Community VLAN are designated as community ports.
 - Ports assigned to a Secondary VLAN configured as an Isolated VLAN are designated as isolated ports.

- A port or link aggregate can only belong to one Primary VLAN or one Secondary VLAN at any given time. The exception to this is on the OmniSwitch 9900, where multiple VPAs for one port are allowed with the following conditions:
 - Each VLAN tagged on the port must be of the same PVLAN type. For example, port 1/1/2 must belong to either all Primary VLANs, all Isolated Secondary VLANs, or all Community Secondary VLANs.
 - Each VLAN tagged on the port must belong to a different PVLAN domain. For example, port 1/1/2 can be tagged with Primary VLAN 200 and Primary VLAN 300 because both VLANs are in separate PVLAN domains.
- Only one untagged VPA is allowed per port.
- On ports with only tagged VPAs, all untagged traffic is dropped.

Examples

```
-> pvlan 200 members port 1/1/1-5 tagged
-> pvlan 200 members linkagg 2-4 untagged
-> pvlan 200 members port 1/1/20 isl
-> no pvlan 200 members port 1/1/1
-> no pvlan 200 members linkagg 2
```

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan	Displays a list of PVLANS configured on the switch.
show pvlan mapping	Displays the Primary VLAN and Secondary VLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

alaPrivateVlanPortAssociationTable
  alaPrivateVlanPortAssociationVlanID
  alaPrivateVlanPortAssociationPortIfIndex
  alaPrivateVlanPortAssociationVlanOption
  alaPrivateVlanPortAssociationPortType
```

show pvlan

Displays a list of Private VLANs (PVLANS) configured on the switch.

show pvlan [*vlan_id*[-*vlan_id*]]

Syntax Definitions

vlan_id PVLAN ID number.

Defaults

By default, a list of all PVLANS is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a VLAN ID with this command to display information about a specific VLAN in a PVLAN configuration.

Examples

```
-> show pvlan
pvlan  type      admin  oper  mtu      name
-----+-----+-----+-----+-----
200    Primary    Ena    Dis   1500    PVLAN 200
250    Isolated   Ena    Dis   1500    PVLAN 250
251    Community  Ena    Dis   1500    PVLAN 251
```

output definitions

pvlan	The PVLAN ID.
type	The type of PVLAN (Primary , Isolated , Community)
admin	PVLAN administrative status: Ena specifies that PVLAN functions are enabled; Dis specifies that PVLAN functions are disabled.
oper	PVLAN operational status: Ena (enabled) or Dis (disabled). The operational status remains disabled until an active port is assigned to the PVLAN. When the operational status is enabled, then PVLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A PVLAN must have an enabled administrative status before it can become operationally enabled.
mtu	The Maximum Transmission Unit size. Specifies the size of the largest data packet that the PVLAN port can transmit.
name	The user-defined text description for the PVLAN. By default, the PVLAN ID is displayed if the PVLAN description is not specified.

```

-> show pvlan 200
Name                : PVLAN 200,
Type                : PVLAN Primary vlan,
Administrative State : enabled,
Operational State   : disabled,
IP MTU              : 1500

```

output definitions

Name	The user-defined text description for the PVLAN. By default, the PVLAN ID is displayed if the PVLAN description is not specified.
Type	The type of PVLAN (Primary, Isolated, Community)
Administrative State	PVLAN administrative status: enabled or disabled .
Operational State	PVLAN operational status: enabled or disabled . The operational status remains disabled until an active port is assigned to the PVLAN.
IP MTU	The Maximum Transmission Unit size. Specifies the size of the largest data packet that the PVLAN port can transmit.

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan mapping	Displays the Primary VLAN and Secondary PVLAN mapping.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```

alaPrivateVlanPrimaryVlanID
alaPrivateVlanType
alaPrivateVlanAdminState
alaPrivateVlanOperState
alaPrivateVlan
alaPrivateVlanName

```

show pvlan mapping

Displays the Primary VLAN and Secondary PVLAN mapping in a Private VLAN (PVLAN) configuration.

show pvlan [*vlan_id*] **mapping**

Syntax Definitions

vlan_id PVLAN ID number.

Defaults

If no parameters are specified with this command, the mapping for all PVLANS is displayed by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a VLAN ID with this command to display information about a specific VLAN in a PVLAN configuration.

Examples

```
-> show pvlan mapping
Primary   Secondary
VLAN     VLAN     Type
-----+-----+-----
200      250      Isolated
200      251      Community
```

output definitions

Primary VLAN	The VLAN ID of a Primary VLAN.
Secondary VLAN	The VLAN ID of a Secondary VLAN that is mapped to the Primary VLAN ID.
Type	The type of Secondary VLAN (Primary, Isolated, Community).

Release History

Release 8.3.1; command introduced.

Related Commands

pvlan	Creates a new Primary VLAN with the specified VLAN ID and an optional description.
pvlan secondary	Creates a new Secondary VLAN that is assigned to a Primary VLAN.
show pvlan	Displays a list of PVLANS configured on the switch.
show pvlan members	Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

```
alaPrivateVlanMappingPrimaryVlanID  
alaPrivateVlanMappingSecondaryVlanID  
alaPrivateVlanMappingSecondaryVlanType
```

show pvlan members

Displays the VLAN-port associations (VPAs) for all or specific VLANs in a Private VLAN (PVLAN) configuration.

show pvlan [*vlan_id*[-*vlan_id*]] **members**

Syntax Definitions

vlan_id VLAN ID or range of IDs.

Defaults

If no parameters are specified with this command, a list of all PVLANS and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a VLAN ID or the range of VLAN IDs with this command to display information about a specific VLAN or for the range of VLAN IDs.

Examples

```
-> show pvlan members
pvlan  port      type          status      port-type
-----+-----+-----+-----+-----
200    1/10    default      inactive    promiscuous
200    1/11    qtagged      inactive    isl
250    1/15    qtagged      inactive    isolated
251    1/16    default      inactive    community
251    0/10    qtagged      inactive    community
```

```
-> show pvlan 200 members
port      type          status      port-type
-----+-----+-----+-----
1/10     default      inactive    promiscuous
1/11     qtagged      inactive    isl
0/10     qtagged      inactive    promiscuous
```

output definitions

pvlan	The PVLAN ID.
port	The port number.
type	The type of VPA: default (configured default VLAN assignment for the port) qtagged (802.1Q-tagged secondary VLAN assignment for the port)

output definitions

status	The VPA status: inactive (port is not active), forwarding (traffic is forwarding on this VPA) blocking (traffic is not forwarding on this VPA)
port-type	The PVLAN port type: Promiscuous —A port which is a member of a Primary VLAN. ISL —A port carrying VLAN traffic for all the VLANs that are members of a PVLAN between “PVLAN-aware” switches. (Isolated, Community, and Promiscuous). Community —A port which is a member of a Community VLAN. Isolated —A port which is a member of an Isolated VLAN.

Release History

Release 8.3.1; command introduced.

```

6 High Availability VLAN Commands

High availability (HA) VLANs send traffic intended for a single destination MAC address to multiple switch ports. The OmniSwitch HA VLAN feature provides an elegant and flexible way to connect server cluster nodes directly to the ingress network. This involves multicasting the service requests on the configured ports. The multicast criteria is configurable based on destination MAC and destination IP address. Egress ports can be statically configured on a server cluster or they can be registered by IGMP reports. The HA VLAN server cluster feature multicasts the incoming packets based on the server cluster configuration on the ports associated with the server cluster.

An HAVLAN is configured by specifying the match criteria, a VLAN and a port list. Match criteria is used to identify the incoming traffic that has to be processed by the HA VLAN server-clusters. The specified VLAN is an ingress and egress VLAN in the case of a L2 server-cluster. In the case of a L3 server-cluster, the VLAN is not configured explicitly, but the IP address specified in the match criteria determines the VLAN. The port list specifies the egress switch ports within the VLAN. The cluster is connected to these switch ports.

There are typically two modes of implementation of server clusters in HA VLAN.

Layer 2 - The server cluster is attached to a L2 switch on which the frames destined to the cluster MAC address are to be flooded on all interfaces.

Layer 3 - The server cluster is attached to a L3 switch on which the frames destined to the server cluster IP address are to be routed to the server cluster IP and then flooded on all interfaces.

For more information, see the application examples in Chapter 28, “Configuring High Availability VLANs” in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

MIB information is as follows:

Filename: AlcatelIND1VlanManager.mib
Module: ALCATEL-IND1-VLAN-MGR-MIB

Filename: AlcatelIND1MacAddress.mib
Module: ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

[server-cluster](#)
[server-cluster vlan](#)
[server-cluster mac-address](#)
[server-cluster ip](#)
[server-cluster igmp mode](#)
[server-cluster ip-multicast](#)
[server-cluster port](#)
[show server-cluster](#)

server-cluster

Configures a cluster with an ID, name, mode and the administrative state.

```
server-cluster cluster_id [name cluster_name] [mode {L2 | L3}] [admin-state {enable | disable}]
```

```
no server-cluster cluster_id
```

Syntax Definitions

<i>cluster_id</i>	A numerical identifier of the cluster. The valid range is 1–32.
<i>cluster_name</i>	Specifies a name (up to 32 characters) to represent the cluster.
L2	Specifies L2 for the cluster mode.
L3	Specifies L3 for the cluster mode.
enable	Enables the administrative state of the cluster.
disable	Disables the administrative state of the cluster.

Defaults

parameter	default
mode	L2
admin-state	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use **no** form of this command to remove the cluster ID from the switch configuration.
- Once the cluster mode is set, the mode cannot be changed.
- Use the **admin-state disable** parameter option to disable an existing cluster before attempting to modify any of the cluster parameters.

Examples

```
-> server-cluster 1
-> server-cluster 1 mode l2
-> server-cluster 1 name l2_cluster mode l2
-> server-cluster 2 name l3_cluster mode l3
-> no server-cluster 1
```

Release History

Release 7.2.1; command was introduced.

Related Commands

vlan	Creates and deletes VLANs.
server-cluster mac-address	Configures a MAC address, VLAN of the specified cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterName  
  alaHAVlanClusterAdminStatus  
  alaHAVlanClusterMode  
  alaHAVlanClusterRowStatus
```

server-cluster vlan

Configures a VLAN assignment for the specified cluster. This command is used to assign VLANs to an L2 cluster.

```
server-cluster cluster_id vlan vlan_id
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
<i>vlan_id</i>	The VLAN identifier to assign to the cluster. The valid range is 1–4094.

Defaults

NA

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- If the specified VLAN ID does not exist in the switch configuration, the cluster will remain operationally disabled.
- Modifying the existing VLAN assignment for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 vlan 10
-> server-cluster 5 vlan 10
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterVlan  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterRowStatus
```

server-cluster mac-address

Configures a MAC address assignment for the specified cluster. This command is used to assign a MAC address to an L2 cluster.

```
server-cluster cluster_id mac-address mac_address
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
<i>mac_address</i>	The MAC address of the cluster.

Defaults

NA

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- Modifying the existing MAC address assignment for a cluster is only allowed when the cluster is administratively disabled.
- The MAC address that is assigned to a cluster can be a unicast, L2 multicast, or IP multicast address. However reserved multicast MAC addresses cannot be assigned to the cluster.

Examples

```
-> server-cluster 1 vlan 10 mac-address 00 :11 :22 :33 :44
-> server-cluster 5 vlan 10
-> server-cluster 5 mac-address 01:
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterVlan  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterRowStatus
```

server-cluster ip

Configures an IP address and ARP entry for the specified cluster. This command is used to assign an IP address to an L3 cluster.

```
server-cluster cluster_id ip ip_address [mac-address {static mac_address | dynamic}]
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
<i>ip_address</i>	The unicast IP address to assign to the cluster.
<i>mac_address</i>	The MAC address for the static ARP entry.
dynamic	Dynamically resolve the ARP entry for the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP address.
- Reserved MAC address cannot be configured as an ARP.
- Modifying the existing IP address parameters for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 ip 10.135.33.203 mac-address static 00 :11 :22 :33 :44
-> server-cluster 3 ip 10.135.33.205 mac-address dynamic
-> server-cluster 5 ip 10.135.33.207
-> server-cluster 6 mac-address dynamic
-> server-cluster 7 mac-address static 00 :11 :22 :33 :44
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster mac-address	Configures a MAC address of the specified cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterIfIndex  
  alaHAVlanClusterInetAddressType  
  alaHAVlanClusterInetAddress  
  alaHAVlanClusterMacAddressType  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterMulticastStatus  
  alaHAVlanClusterMulticastInetAddressType  
  alaHAVlanClusterMulticastInetAddress  
  alaHAVlanClusterRowStatus
```

server-cluster igmp mode

Configures the IGMP mode status for specified cluster.

```
server-cluster cluster_id igmp-mode {enable | disable}
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
enable	Enables IGMP mode for cluster ports.
disable	Disables IGMP mode for cluster ports.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- When the IGMP mode is enabled for the cluster, the port list is dynamically learned using the IGMP protocol for the configured IP multicast address.
- For HA VLAN IGMP to work, IGMP must be enabled globally on the switch using the command **ip multicast admin-state enable** command.

Examples

```
-> server-cluster 4 igmp-mode enable  
-> server-cluster 4 igmp-mode disable
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
  alaHAVlanClusterId
  alaHAVlanClusterIfIndex
  alaHAVlanClusterInetAddressType
  alaHAVlanClusterInetAddress
  alaHAVlanClusterMacAddressType
  alaHAVlanClusterMacAddress
  alaHAVlanClusterMulticastStatus
  alaHAVlanClusterMulticastInetAddressType
  alaHAVlanClusterMulticastInetAddress
  alaHAVlanClusterRowStatus
```

server-cluster ip-multicast

Configures a multicast IP address for the specified cluster. This command configures an IP multicast address for an L3 cluster.

```
server-cluster cluster_id ip-multicast ipm_address
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
<i>ipm_address</i>	The multicast IP address to assign to the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP-address. IP address is configurable only for L3 clusters
- Cluster parameters like IP, multicast IP and MAC address can be modified only when the cluster admin status is disabled.

Examples

```
-> server-cluster 2 ip-multicast 226.0.0.12  
-> server-cluster 4 ip-multicast 226.0.0.14
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterIfIndex  
  alaHAVlanClusterInetAddressType  
  alaHAVlanClusterInetAddress  
  alaHAVlanClusterMacAddressType  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterMulticastStatus  
  alaHAVlanClusterMulticastInetAddressType  
  alaHAVlanClusterMulticastInetAddress  
  alaHAVlanClusterRowStatus
```

server-cluster port

Configures a port assignment for the port list of the specified cluster.

```
server-cluster cluster_id port {chassis/slot/port[-port2] | all}
```

```
no server-cluster cluster-id port {chassis/slot/port[-port2] | all}
```

Syntax Definitions

<i>cluster_id</i>	The numerical identifier of an existing server cluster.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number to assign to the cluster port list. Use a hyphen to specify a range of ports (1/15-20).
all	Assigns all of the ports that belong to the associated VLAN and NOT all ports on the NI. This parameter applies only to L3 clusters.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a port from the specified cluster port list.
- The cluster ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.
- The **all** parameter does not apply to L2 clusters.

Examples

```
-> server-cluster 1 port 1/21
-> server-cluster 2 port 1/21-23
-> server-cluster 5 port all
-> no server-cluster 1 port 1/21
-> no server-cluster 2 port 1/21-23
-> no server-cluster 3 port all
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable  
  alaHAVlanClusterId  
  alaHAVlanClusterPortIfIndex  
  alaHAVlanClusterPortRowStatus
```

server-cluster linkagg

Configures a link aggregate assignment for the port list of the specified cluster.

```
server-cluster cluster_id linkagg agg_id[-agg_id2]
```

```
no server-cluster cluster_id linkagg agg_id[-agg_id2]
```

Syntax Definitions

cluster_id

The numerical identifier of an existing server cluster.

agg_id[-*agg_id2*]

The link aggregate ID number to assign to the cluster port list. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a link aggregate ID from the specified cluster port list.
- The cluster ID and link aggregate ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.

Examples

```
-> server-cluster 3 linkagg 1  
-> server-cluster 4 linkagg 1-3  
-> no server-cluster 3 linkagg 1
```

Release History

Release 7.2.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable  
  alaHAVlanClusterId  
  alaHAVlanClusterPortIfIndex  
  alaHAVlanClusterPortRowStatus
```

show server-cluster

Displays the cluster configuration information for the switch. If the cluster configuration is set up to run over a Multi-Chassis Link Aggregation (MCLAG) configuration, this command also provides the status of the MCLAG link for the specified cluster.

show server-cluster [*cluster_id* [*port*]]

Syntax Definitions

cluster_id The numerical identifier of an existing server cluster.
port Displays the ports and/or link aggregates assigned to a specific cluster.

Defaults

Displays a list of all server clusters configured for the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Specify a cluster ID with this command to display information for a single cluster.
- Use the **port** parameter with the *cluster_id* parameter to display information about the ports assigned to the specified cluster.
- An asterisk (*) is displayed to indicate invalid cases, as shown in the command example.

Examples

```
-> show server-cluster
```

```
Legend: * = not valid
```

Cluster	Mode	Vlan	Mac Address	Ip Address	IGMP Address	Name

VFL Status                : Used

```

output definitions

Cluster ID	The numerical identifier of a cluster.
Cluster Name	The name representing the cluster.
Cluster Mode	Displays the cluster mode as L2 or L3 .
Cluster IP	The IP address associated with the cluster.
Cluster Mac Type	The type of cluster, Static or Dynamic .
Cluster Mac-Address	The MAC address associated with the cluster.
IGMP-mode	Specifies the status of IGMP-mode, Enabled or Disabled .
Cluster Multicast IP	The multicast IP address associated with the cluster.
Administrative State	Specifies the administrative status of the cluster, Enabled or Disabled .
Operational State	Specifies the operational status of the cluster, Enabled or Disabled .
Operational Flag	Specifies the reason the cluster is operationally down.
Multi-Chassis Status	Whether or not the HAVLAN configuration is consistent between two MCLAG peer switches (InSync or OutOfSync).
Multi-Chassis OutOfSync Reason	Indicates one of the following reasons the HAVLAN is out of sync between the two MCLAG peer switches: <ul style="list-style-type: none"> • Multi-Chassis Down • Cluster Operational State Down • Server Cluster Mode Mismatch • VLAN Mismatch • MAC Address Mismatch • IP Address Mismatch • ARP Type Mismatch • IGMP Status Mismatch • Multicast IP Address Mismatch • All-port Mode Not Supported • Sync In Progress • Non-VIP-VLAN Not Supported In L3 Mode
VFL Status	Indicates whether the MCLAG Virtual Fabric Link (VFL) is Used or Not-used for the cluster.

Release History

Release 7.2.1; command was introduced.

Release 7.2.1.R02: **Multi-Chassis Status, Multi-Chassis OutOfSync Reason, VFL Status** fields added.

7 VLAN Stacking Commands

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

Filename: AlcatelIND1VlanStacking.MIB
Module: Alcatel-IND1-VLAN-STACKING-MIB

Filename: AlcatelIND1VlanManager.MIB
Module: Alcatel-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

VLAN Stacking Service Mode	ethernet-service svlan ethernet-service uni-profile ethernet-service service-name ethernet-service nni ethernet-service svlan nni ethernet-service sap ethernet-service sap uni ethernet-service sap cvlan ethernet-service sap-profile ethernet-service sap sap-profile ethernet-service uni-profile ethernet-service uni uni-profile ethernet-service transparent-bridging show ethernet-service vlan show ethernet-service show ethernet-service sap show ethernet-service port show ethernet-service nni show ethernet-service uni show ethernet-service uni-profile show ethernet-service sap-profile
-----------------------------------	---

ethernet-service svlan

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic.

ethernet-service svlan {*svlan_id*[-*svlan_id2*]} [**admin-state** {**enable** | **disable**}] [**name** *description*]

no ethernet-service svlan {*svlan_id* [-*svlan_id2*]}

Syntax Definitions

<i>svlan_id</i> [- <i>svlan_id2</i>]	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
enable	Enables the SVLAN administrative status.
disable	Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
<i>description</i>	An alphanumeric string. Use quotes around the string if the VLAN name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

Defaults

By default, the Spanning Tree status is enabled in both the **per-vlan** and **flat** mode when the SVLAN is created

parameter	default
enable disable	enable
<i>description</i>	VLAN ID number

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the *svlan_id* specified already exists as a standard VLAN.

Note. Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.

Examples

```
-> ethernet-service svlan 1001-1005 admin-state enable name "Customer ABC"
-> no ethernet-service svlan 1001
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ethernet-service transparent-bridging](#) Displays a list of SVLANs configured from the switch

MIB Objects

vlanTable

- vlanNumber
- vlanDescription
- vlanType
- vlanAdmStatus
- vlanStatus

ethernet-service service-name

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

ethernet-service service-name *service_name* **svlan** *svlan_id*

no ethernet-service service-name *service_name* **svlan** *svlan_id*

Syntax Definitions

<i>service_name</i>	The name of the VLAN Stacking service; an alphanumeric string. Use quotes around string if the service name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
<i>svlan_id</i>	The VLAN ID number that identifies an existing SVLAN to associate with the VLAN Stacking service.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN association with that service is also removed.
- If the VLAN Stacking service is associated with a Service Access Point (SAP), then remove the SAP associations before attempting to remove the VLAN Stacking service.
- Each VLAN Stacking service is associated with one SVLAN. Specifying an additional VLAN ID for an existing service is not allowed.

Examples

```
-> ethernet-service service-name Marketing svlan 10  
-> no ethernet-service service-name Marketing svlan 10
```

Release History

Release 7.1.1; command introduced.

Related Commands**ethernet-service svlan**

Creates an SVLAN for customer traffic, a management VLAN for provider traffic for multicast traffic.

MIB Objects

```
alaEServiceTable  
  alaEServiceID  
  alaEServiceSVLAN  
  alaEServiceRowStatus
```

ethernet-service nni

Configures a switch port or link aggregate as a VLAN Stacking Network Network Interface (NNI) and optionally specifies the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).

ethernet-service nni {port *chassis/slot/port* [-*port2*] | **linkagg** *agg_id*[-*agg_id2*]} [**tpid** *tpid_value*] [[**stp** | **mvrp**] **legacy-bpdu** {**enable** | **disable**}]

no ethernet-service nni {port *chassis/slot/port* [-*port2*] | **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
<i>tpid_value</i>	Specifies the TPID value of the port.
enable	Enables the specified legacy BPDU support.
disable	Disables the specified legacy BPDU support.

Defaults

parameter	default
<i>tpid_value</i>	0x8100
stp legacy-bpdu enable disable	disable
mvrp legacy-bpdu enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to revert the VLAN Stacking NNI port or link aggregate back to a conventional switch port or aggregate.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN cannot be configured using standard VLAN management commands.
- NNI ports can be 802.1q tagged with normal VLANs. In this case, the TPID of the packets tagged with a normal VLAN must always be 0x8100 (regardless of the TPID of the NNI port). This allows the NNI port to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.
- Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches can cause flooding or an unstable network.

- If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.
- Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP MAC used:

STP	
Customer MAC	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}
Provider MAC address (802.1ad/D6.0)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}
Provider MAC address (Legacy MAC)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}

- STP legacy BPDU are supported only when the **flat** Spanning Tree mode is active on the switch.

Examples

```
-> ethernet-service 10 nni port 1/3-5
-> ethernet-service 255 nni port 2/10-15 tpid 88a8
-> ethernet-service 500 nni port 1/3-5 stp legacy-bpdu enable
-> no ethernet-service 10 nni port 1/3
-> no ethernet-service 255 nni linkagg 12-15
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni

Associates an NNI port with an SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

ethernet-service svlan {*svlan_id*[-*svlan_id2*]} **nni** {**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*]}

no ethernet-service svlan {*svlan_id*[-*svlan_id2*]} **nni** {**port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>svlan_id</i> [- <i>svlan_id2</i>]	The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
<i>chassis</i>	The chassis identifier.
<i>slot/por</i> [- <i>port2</i>]	The slot and port number (3/1) of an NNI port. Use a hyphen to specify a range of ports (3/1-5).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an association between an NNI port and an SVLAN.
- Only SVLAN IDs are accepted with this command. This SVLAN ID specified must already exist in the switch configuration.
- This command only applies to ports or link aggregates configured as VLAN Stacking NNI ports.
- NNI ports can be tagged with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.

Examples

```
-> ethernet-service svlan 10 nni port 1/3
-> ethernet-service svlan 255 nni port 2/10-15
-> ethernet-service svlan 500 nni linkagg 31-35
-> no ethernet-service svlan 10 nni port 1/3
-> no ethernet-service svlan 255 nni port 2/12
```

Release History

Release 7.1.1; command introduced.

Related Commands

  alaEServiceSapID  
  alaEServiceSapServiceID  
  alaEServiceSapProfile  
  alaEServiceSapRowStatus
```

ethernet-service sap uni

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

```
ethernet-service sap {sap_id} uni {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]}
```

```
no ethernet-service sap {sap_id} uni {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]}
```

Syntax Definitions

<i>sap_id</i>	The SAP ID number identifying the service instance.
<i>chassis</i>	The chassis identifier.
<i>slot/por</i> [-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>agg_id</i> [-agg_id2]	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- Only fixed ports can be configured as UNI ports.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the **ethernet-service sap cvlan** command.

Examples

```
-> ethernet-service sap 10 uni port 1/3
-> ethernet-service sap 10 uni port 2/10-15
-> ethernet-service sap 10 uni linkagg 31-40
-> no ethernet-service sap 10 uni port 1/10-15
-> no ethernet-service sap 10 uni linkagg 31
```

Release History

Release 7.1.1; command introduced.

Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.

MIB Objects

```
alaEServiceSapUniTable  
  alaEServiceSapUniSap  
  alaEServiceSapUniUni  
  alaEServiceSapUniRowStatus
```

ethernet-service sap cvlan

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

ethernet-service sap *sap_id* **cvlan** {**all** / *cvlan_id*[-*cvlan_id2*] / **untagged**}

no ethernet-service sap {*sap_id*} **cvlan** {**all** / *cvlan_id*[-*cvlan_id2*] / **untagged**}

Syntax Definitions

<i>sap_id</i>	The SAP ID number.
all	Applies the SAP profile to tagged and untagged frames.
<i>cvlan_id</i> [- <i>cvlan_id2</i>]	Applies the SAP profile to frames tagged with the specified CVLAN ID. Use a hyphen to specify a range of CVLAN IDs (for example, 10-12 applies the SAP profile to frames tagged with CVLAN 10, 11, or 12).
untagged	Applies the SAP profile only to untagged frames.

Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from an SAP configuration, the SAP is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic *and* traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Configuring the **all** and **untagged** parameters for the same SAP is not allowed. Specify only one of these two parameters per SAP.
- Either the **all** or **untagged** parameters can be configured for the SAP. In such an instance, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the SAP related service.
- Only one SAP, with the **all** or **untagged** option, is allowed per UNI. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** parameter or a CVLAN ID is allowed for SAP 20.
- If you do not specify **all** or **untagged** options with a UNI, then the default VLAN 4095 is set for the UNI and all untagged, untagged control traffic and unmatched tag traffic is dropped.

Examples

```
-> ethernet-service sap 10 cvlan 200
-> ethernet-service sap 10 cvlan all
-> ethernet-service sap 11 cvlan 100-150
-> ethernet-service sap 11 cvlan untagged
-> no ethernet-service sap 10 cvlan 200
-> no ethernet-service sap 10 cvlan all
-> no ethernet-service sap 10 cvlan 100-150
```

Release History

Release 7.1.1; command introduced.

  alaEServiceSapRowStatus
```

ethernet-service sap-profile

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

ethernet-service sap-profile *sap_profile_name* [**bandwidth not-assigned**] [[**shared** | **not-shared**] **ingress-bandwidth** *mbps*] [**cvlan-tag** {**preserve** | **translate**}] **priority** [**not-assigned** | **map-inner-to-outer-p** | **map-dscp-to-outer-p** | **fixed** *value*][**egress-bandwidth** *mbps*]

no ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

<i>sap_profile_name</i>	An alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").
bandwidth not-assigned	Specifies that the SAP profile does not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).
shared	Shares the ingress bandwidth limit across all SAP ports and CVLANs.
not shared	Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.
ingress bandwidth <i>mbps</i>	The maximum amount of bandwidth to be allowed for SAP ports, for the incoming traffic, in megabits per second. This parameter can be used only along with the shared option or not-shared option.
preserve	Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).
translate	Replaces the customer VLAN ID with the SVLAN ID.
priority not-assigned	Specifies that the SAP profile is not assigned with a priority value or priority mapping.
map-inner-to-outer-p	Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.
map-dscp-to-outer-p	Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.
fixed <i>value</i>	Sets the SVLAN (outer tag) priority bit to the specified value.
egress-bandwidth <i>mbps</i>	The maximum amount of bandwidth to be allowed for SAP ports, for the outgoing traffic, in megabits per second.

Defaults

parameter	default
shared not shared	shared
<i>mbps</i>	0
preserve translate	preserve
not-assigned map-inner-to-outer-p map-dscp-to-outer-p fixed <i>value</i>	fixed 0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the **ethernet-service sap sap-profile** command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- Configure the **ingress-bandwidth** or **egress-bandwidth** parameters to define rate limiting values for the SAP.

Examples

```
-> ethernet-service sap-profile video1 egress-bandwidth 10 cvlan-tag translate
priority map-inner-to-outer-p
-> ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan-tag
preserve
-> ethernet-service sap-profile voice2 shared ingress-bandwidth 10
-> no ethernet-service sap-profile video1
```

Release History

Release 7.1.1; command introduced.

Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a service.
- ethernet-service sap sap-profile** Associates a SAP profile with a SAP ID.

```

ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

```
ethernet-service sap sap_id sap-profile sap_profile_name
```

```
no ethernet-service sap sap_id
```

Syntax Definitions

<i>sap_id</i>	The SAP ID number.
<i>sap_profile_name</i>	The name of the SAP profile to associate with this SAP ID.

Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command along with the SAP ID to remove the SAP profile.
- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Do not specify a service name; doing so returns an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

Examples

```
-> ethernet-service sap 10 sap-profile CustomerC  
-> ethernet-service sap 11 sap-profile CustomerD  
-> ethernet-service sap 11 sap-profile default-sap-profile
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ethernet-service sap](#)

Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.

MIB Objects

alaEServiceSapTable

 alaEServiceSapID

 alaEServiceSapProfile

 alaEServiceSapRowStatus

ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

ethernet-service uni-profile *uni_profile_name* [**I2-protocol** {**stp** | **802.1x** | **802.1ab** | **802.3ad** | **mvrp** | **amap**} {**peer** | **discard** | **tunnel**}]

no ethernet-service uni-profile *uni_profile_name*

Syntax Definitions

<i>uni_profile_name</i>	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").
stp	Specifies how Spanning Tree BPDU is processed on the UNI port.
802.1x	Specifies how 802.1x control frames are processed on the UNI port.
802.1ab	Specifies how 802.1ab control frames are processed on the UNI port.
802.3ad	Specifies how 802.3ad and 802.3ah control frames are processed on the UNI port.
mvrp	Specifies how Multicast VLAN Registration Protocol packets are processed on the UNI port.
amap	Specifies how Alcatel Management Adjacency Protocol packets must be processed on the UNI port.
peer	Allows the UNI port to participate in the specified protocol.
discard	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.

Defaults

parameter	default
stp	tunnel
mvrp	tunnel
amap	tunnel
802.1x	tunnel
802.3ad	tunnel
802.1ab	tunnel

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a UNI profile.
- Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- Up to five unique UNI profile combinations, including the default profile, are allowed per switch. If a profile has the same processing settings as any other profile, then it is not considered unique.
- Not all of the control protocol parameters are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

Protocol	Reserved MAC	peer	discard	tunnel
stp	01:80:c2:00:00:00	no	yes	yes
802.1x	01:80:c2:00:00:03	yes	yes	yes
802.3ad	01:80:c2:00:00:02	yes	yes	yes
802.1ab	01:80:c2:00:00:0e	yes	yes	yes
mvrp	01:80:c2:00:00:21	no	yes	yes
amap	00:20:da:00:70:04	no	yes	yes

- If a user-configured UNI profile is *not* associated with a UNI port, then the default profile (default-uni-profile) is used to process control packets ingressing on the port.

Examples

```
-> ethernet-service uni-profile uni_1 l2-protocol stp mvrp discard
-> no ethernet-service uni-profile uni_1
```

Release History

Release 7.1.1; command introduced.

Related Commands

  alaEServiceUNIProfileAmapTreatment  
  alaEServiceUNIProfileRowStatus
```

ethernet-service uni uni-profile

Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

```
ethernet-service uni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} uni-profile uni_profile_name
```

```
no ethernet-service uni-profile uni_profile_name
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/por [-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
<i>uni_profile_name</i>	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

Defaults

The default profile (default-uni-profile) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command along with the **uni-profile** name to delete the uni-profile.
- This UNI specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter "default-uni-profile" with this command.

Examples

```
-> ethernet-service uni port 1/3 uni-profile uni_1
-> ethernet-service uni linkagg 1-5 uni-profile uni_2
-> ethernet-service uni port 2/10-15 uni-profile default-uni-profile
-> no ethernet-service uni-profile uni_1
```

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service sap sap-profile Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

ethernet-service sap uni Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).

MIB Objects

```

```

ethernet-service transparent-bridging

Configures transparent bridging which associates NNI ports with all VLANs even if they are not created on the switch.

ethernet-service transparent-bridging [**nmi port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*] {**enable** | **disable**}]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number.
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID.
enable	Enables the specified legacy BPDU support.
disable	Disables the specified legacy BPDU support.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Transparent bridging supports both global and port level enable/disable commands.
- Port level configuration is not accepted if transparent bridging is not enabled globally.
- If transparent bridging is disabled globally, all the port level transparent bridging configuration are deleted. The port level configuration must be re-configured after re-enabling transparent-bridging globally.
- Port level transparent bridging is allowed only when there is at least one SVLAN configure on NNI port.
- Transparent bridge is only supported on NNI ports.
- Transparent bridge can only be configured when STP is configured in flat mode.
- Transparent bridging cannot be configured when STP protocol mode set to MSTP.
- DHL and transparent bridging are not supported on the same NNI port.

Examples

```
-> ethernet-service transparent-bridging enable
-> ethernet-service nmi port 1/1/5 transparent-bridging enable
-> ethernet-service nmi linkagg 5 transparent-bridging enable
```

Release History

Release 8.3.1; command introduced.

show ethernet-service vlan

Displays a list of SVLANs configured on the switch.

show ethernet-service vlan [*svlan_id*-[*svlan_id2*]]

Syntax Definitions

svlan_id-[*svlan_id2*] The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).

Defaults

By default, all SVLANs are displayed if an SVLAN or range of SVLANs are not specified with this command.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a single SVLAN ID or a range of SVLAN IDs to display configuration information for the specific SVLANs.

Examples

```
-> show ethernet-service vlan
```

```

vlan          Type      name
-----+-----+-----
 4010        svlan      Customer ABC
 4020         mgmt      Provider Management
 4021        svlan      Customer XYZ

```

```
-> show ethernet-service vlan 1001
```

```

Name           : VLAN 1001,
Type           : Service Vlan,
Administrative State : enabled,
Operational State  : disabled,
IP Router Port   : disabled,
IP MTU          : 1500

```

```
-> show ethernet-service vlan 1000-1004
```

```

vlan  type  admin  oper  ip    mtu  name
-----+-----+-----+-----+-----+-----+-----
1000  vstk    Ena    Dis  Dis   1500  VLAN 1000
1001  vstk    Ena    Dis  Dis   1500  VLAN 1001
1002  vstk    Ena    Dis  Dis   1500  VLAN 1002
1003  vstk    Ena    Dis  Dis   1500  VLAN 1003
1004  vstk    Ena    Dis  Dis   1500  VLAN 1004

```

output definitions

vlan	The SVLAN ID number identifying the instance.
type	The type of SVLAN.
admin	The administrative state of the VLAN. (Ena or Dis).
oper	The operation status of the VLAN (Ena or Dis).
ip	The status of the IP router port (Ena or Dis).
mtu	The IP MTU value configured for the VLAN.
name	The user-defined text description for the SVLAN. By default, the SVLAN ID is specified for the description.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic application uses to distribute multicast traffic.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

```
vlanTable
  vlanNumber
  vlanDescription
  vlanSvlanTrafficType
```

show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service [**service-name** *service_name* / **svlan** *svlan_id* / **transparent-bridging**]

Syntax Definitions

service_name The name of an existing VLAN Stacking service. Use quotes around string if the service name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

svlan_id The VLAN ID number that identifies an existing SVLAN.

Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enter the name of a service to display configuration information for a specific service.
- Enter an SVLAN ID to display configuration information for all services that are associated with a specific SVLAN.

Examples

```
-> show ethernet-service
```

```
Service Name : VideoOne

  CVLAN(s)   : 10, 20
  sap-profile : sap-video1
SAP Id      : 30
  UNIs       : 1/3
  CVLAN(s)   : 30, 40
  sap-profile : sap-video2
```

```
-> show ethernet-service transparent-bridging
Global Transparent Bridging      : enabled,
```

output definitions

Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.
Global Transparent Bridging	Displays whether transparent bridging is enabled globally on the switch.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service service-name Creates a VLAN Stacking service and associates the service with an SVLAN.

ethernet-service transparent-bridging Displays a list of all or a range of configured SVLANs or the parameters of a specified SVLAN.

ethernet-service transparent-bridging Configures transparent bridging globally or on a port/linkagg.

show ethernet-service port

Displays configuration information for a VLAN Stacking service port.

show ethernet-service port {*chassis/slot/port* | **linkagg** *agg_id*}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specifying a slot/port or link aggregate ID number is required with this command.

Examples

```
-> show ethernet-service port 1/10
```

```
Interface : 1/10
Port Type  : UNI
  UNI Profile : default-uni-profile
  Default SVLAN : 4095
```

```
Service Name : svlan_service
  SVLAN      : 20
  NNI(s)     : No NNIs configured
  SAP Id     : 1
    UNIs      : 1/10
    CVLAN(s)  : 200
  sap-profile : translate_profile
```

```
-> show ethernet-service port 1/22
```

```
Interface : 1/22
Port Type  : NNI

Service Name : CustomerABC

    CVLAN(s)  : 500, 600
  sap-profile : default-sap-profile
```

```

Service Name : Video-Service
  SVLAN      : 300
  NNI(s)     : 1/22, 3/2
  SAP Id     : 20
    UNIs      : 1/1, 1/2
    CVLAN(s)  : 10, 20
    sap-profile : sap-video1
  SAP Id     : 30
    UNIs      : 1/3
    CVLAN(s)  : 30, 40
    sap-profile : sap-video2

```

output definitions

Interface	The slot and port number or link aggregate ID for the specified interface.
Port Type	The type of VLAN Stacking port (UNI or NNI).
Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking SAP.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service nni

Displays configuration information for VLAN Stacking Network Network Interface (NNI) ports.

show ethernet-service nni [*port chassis/slot/port* | *linkagg agg_id*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, all NNI ports are displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a *slot/port* or link aggregate ID number to display information for a single slot/port or link aggregate ID.

Examples

```
-> show ethernet-service nni
```

Port	TPID	Legacy BPDU		Transparent Bridging
		stp	mvrp	
1/22	0x8100	Disable	Disable	Enable
1/23	0x8100	Disable	Disable	Enable

```
-> show ethernet-service nni 1/23
```

Port	TPID	Legacy BPDU		Transparent Bridging
		stp	mvrp	
1/23	0x8100	Disable	Disable	Enable

output definitions

Port	The slot/port number or link aggregate ID for the NNI port.
TPID	The vendor TPID value configured for the NNI port.
stp	Whether Spanning Tree legacy BPDU processing is enabled for the NNI port.
mvrp	Whether MVRP legacy BPDU processing is enabled for the port.
Transparent Bridging	Whether transparent bridging is enabled or disabled.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service nni	Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

```

show ethernet-service uni

Displays a list of UNI ports configured for the switch and the profile association for each port.

show ethernet-service uni [*port chassis/slot/port* | *linkagg agg_id*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, profile information for all UNI ports is displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a *slot/port* or link aggregate ID number to display information for a single slot/port or link aggregate ID.

Examples

```
-> show ethernet-service uni
```

```

  Port      UNI Profile
  -----+-----
  1/1      uni-profile-default
  1/2      multi-site
  1/3      multi-site

```

```
-> show ethernet-service uni port 1/3
```

```

  Port      UNI Profile
  -----+-----
  1/3      multi-site

```

output definitions

Port	The slot/port number or link aggregate ID for the UNI port.
UNI Profile	The UNI profile associated with the port.

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service sap sap-profile Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

ethernet-service uni uni-profile Associates a VLAN Stacking UNI profile with a UNI port.

show ethernet-service uni-profile Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

MIB Objects

```
alaEServiceUniProfileTable  
  alaEServicePortID  
  alaEServicePortProfileID
```

show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

show ethernet-service uni-profile [*uni-profile-name*]

Syntax Definitions

uni-profile-name An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify a UNI profile name to display attributes for a single UNI profile.

Examples

```
-> show ethernet-service uni-profile
```

Profile Name	Stp	802.1x	802.3ad	802.1AB	MVRP	AMAP
uprofile-video1	tunnel	drop	peer	drop	tunnel	drop

output definitions

Profile Name	The name of the UNI profile.
Stp	Indicates how Spanning Tree traffic control packets are processed.
802.1x	Indicates how IEEE 802.1x control packets are processed.
802.3ad	Indicates how IEEE 802.3ad control packets are processed.
802.1AB	Indicates how IEEE 802.1AB control packets are processed.
MVRP	Indicates how the Multiple VLAN Registration Protocol packets are processed.
AMAP	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.

Release History

Release 7.1.1; command introduced.

Related Commands

- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.
- show ethernet-service uni** Displays the profile associations for VLAN Stacking User Network Interface (UNI) ports.

  alaEServiceUNIProfileAmapTreatment
```

show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

show ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

uni-profile-name An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Specify a SAP profile name to display attributes for a single SAP profile.
- The ingress bandwidth value is displayed in megabytes.

Examples

```
-> show ethernet-service sap-profile
```

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
default-sap-profile	0/0	Enable	Preserve	fixed	0
map_pbit	0/0	Enable	Preserve	in-out	P
sap1	24324/0	NA	Preserve	NA	NA
sap_1	0/0	NA	Preserve	NA	NA

```
-> show ethernet-service sap-profile sap-video1
```

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
sap-video1	20	Disable	Preserve	NA	NA

output definitions

Profile Name	The name of the SAP profile.
Ingr/Egr Bw	Ingress Egress Bandwidth - The maximum amount of ingress and egress bandwidth to allow for SAP ports.

output definitions

Ingr Bw Sharing	Ingress Bandwidth Sharing - The status of bandwidth sharing (enable , disable , or NA). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs.
Inner Tag Option	Indicates how the CVLAN tag is processed (translate or preserve). If set to preserve , the CVLAN tag is retained and the SVLAN is added to the frame. If set to translate , the CVLAN tag is changed to the SVLAN tag.
Priority Mapping	Indicates how the priority value is configured for the SVLAN (NA , in-out or fixed). If set to in-out , the CVLAN priority value is mapped to the SVLAN. If set to fixed , a user-specified priority value is used for the SVLAN priority.
Priority Value	Indicates the priority value mapped to the SVLAN (NA , default 0, a number, P , or DSCP). A number indicates a fixed, user-specified value is used; P indicates the CVLAN 802.1p bit value is used; DSCP indicates the CVLAN DSCP value is used.

Release History

Release 7.1.1; command introduced.

8 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the Alcatel-Lucent STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), and 802.1Q 2005 (MSTP).
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- A *per-VLAN* Spanning Tree operating mode that applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

Filename: AlcatelIND1VlanSTP.MIB
Module: STP-MGMT-MIB

A summary of the available commands is listed here:

Bridge commands	<code>spantree mode</code> <code>spantree protocol</code> <code>spantree priority</code> <code>spantree hello-time</code> <code>spantree max-age</code> <code>spantree forward-delay</code> <code>spantree bpdu-switching</code> <code>spantree path-cost-mode</code> <code>spantree vlan admin-state</code> <code>spantree auto-vlan-containment</code> <code>show spantree</code> <code>show spantree cist</code> <code>show spantree msti</code> <code>show spantree vlan</code> <code>show spantree mode</code>

PVST+ commands	<code>spantree pvst+compatibility</code>

spantree mode

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

spantree mode {flat | per-vlan}

Syntax Definitions

flat	One Spanning Tree instance per switch.
per-vlan	One Spanning Tree instance for each VLAN configured on a switch.

Defaults

By default, the Spanning Tree mode for the switch is set to per-VLAN.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.
- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see [Chapter 5, “VLAN Management Commands”](#)).

Note. Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

Examples

```
-> spantree mode flat
-> spantree mode per-vlan
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree protocol	Selects the Spanning Tree protocol for the specified instance.
spantree bpdu-switching	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpTable
  vStpNumber
  vStpMode
```

spantree protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance.

```
spantree [cist | vlan vlan_id] protocol {stp | rstp | mstp}
```

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1W Rapid Spanning Tree Protocol.
mstp	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol. This protocol is not supported on a per-VLAN basis.

Defaults

By default, the Spanning Tree protocol is set to RSTP.

parameter	default
cist vlan <i>vlan_id</i>	cist

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the optional **cist** or **vlan** parameter is not specified with this command, the protocol is set for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active.

Note. Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).

- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or per-VLAN Spanning Tree mode.
- Deleting all existing MSTIs is required before changing the protocol from MSTP to STP or RSTP.

Note. When the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to the default value. See the [spantree path-cost-mode](#) command page for more information.

Examples

```
-> spantree protocol mstp
-> spantree cist protocol mstp
-> spantree vlan 5 protocol rstp
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
  vStpInsNumber
  vStpInsMode
  vStpInsProtocolSpecification
```

spantree vlan admin-state

Enables or disables the Spanning Tree status for a VLAN.

```
spantree vlan vlan_id [-vlan_id2] admin-state {enable | disable}
```

Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i>]	An existing VLAN ID number. Use a hyphen to specify a range of VLANs (10-15).
enable	Enables Spanning Tree for the specified VLAN.
disable	Disables Spanning Tree for the specified VLAN.

Defaults

By default, the Spanning tree status is enabled for a VLAN instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

VLAN Spanning Tree instances are only active when the switch is running in the per-VLAN mode. However, configuring the VLAN Spanning Tree status is allowed in both modes (per-VLAN and flat).

Examples

```
-> spantree vlan 850-900 admin-state enable
-> spantree vlan 720-750 admin-state disable
-> spantree vlan 500 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
  vlanNumber
  vlanAdmStatus
  vlanOperStatus
  vlanStatus
```

spantree mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree mst region name *name*

no spantree mst region name

Syntax Definitions

name An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, the MST region name is left blank.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MST region name.

Note. It is not necessary to specify the region name to remove it.

- To change the existing region, use this command with a string value that is different than the existing region name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

Examples

```
-> spantree mst region name SalesRegion
-> spantree mst region name "Alcatel-Lucent Marketing"
-> no spantree mst region name
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

vStpMstRegionTable
 vStpMstRegionNumber
 vStpMstRegionConfigName

spantree mst region max-hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to assign the maximum number of hops a BPDU is allowed to traverse, before it is discarded and related information is aged out.

spantree mst region max-hops *max_hops*

Syntax Definitions

max_hops A numeric value that designates the maximum number of hops.

Defaults

By default, the maximum number of hops is set to 20.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and is used to determine the size of the region.
- The maximum hop count value is the initial value of the “remaining hops” parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the “remaining hops” count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

Examples

```
-> spantree mst region max-hops 40
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

vStpMstRegionTable
 vStpMstRegionNumber
 vStpMstRegionMaxHops

spantree msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

spantree msti *msti_id* [**name** *name*]

no spantree msti *msti_id* [**name**]

Syntax Definitions

<i>msti_id</i>	A numeric MSTI ID number. A range of VLANs is associated to an MSTI ID number.
<i>name</i>	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MSTI from the switch configuration.
- Use the **no** form of this command along with the **name** parameter to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- There is always one CIST per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10
-> spantree msti 20 name BldgOneST10
-> no spantree msti 20 name
-> no spantree msti 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstInstanceTable  
  vStpMstInstanceNumber  
  vStpMstInstanceName  
  vStpMstInstanceVlanBitmapAddition  
  vStpMstInstanceVlanBitmapDeletion  
  vStpMstInstanceVlanBitmapState
```

spantree msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

```
spantree msti msti_id vlan vlan_id[-vlan_id2]
```

```
no spantree msti msti_id vlan vlan_id[-vlan_id2]
```

Syntax Definitions

<i>msti_id</i>	A numeric MSTI identification number. A range of VLANs are associated to an MSTI ID number.
<i>vlan_id</i> [- <i>vlan_id2</i>]	A VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, vlan 10-15).

Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- To associate multiple VLANs in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10 vlan 100-115
-> spantree msti 20 vlan 122
-> no spantree msti 10 vlan 100-115
```

Release History

  vStpMstVlanAssignmentEntry  
  vStpMstVlanAssignmentMstiNumber
```

spantree priority

Configures the bridge priority value for the Common and Internal Spanning Tree (CIST) instance, a Multiple Spanning Tree Instance (MSTI), or a VLAN instance. This command is also used to configure the priority value for a port or link aggregate associated with the CIST, an MSTI, or a VLAN.

spantree [**cist** | **msti** *msti_id* | **vlan** *vlan_id*] [**port** *chassis/slot/port[-port2]* / **linkagg** *agg_id[-agg_id2]*]
priority *priority*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>msti_id</i>	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance. This parameter is configurable in both modes (flat or per-VLAN) but only if the flat mode protocol is set to MSTP.
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>priority</i>	A bridge or port priority value. The valid range for the bridge priority is 0–65535. The valid range for the port priority is 0–15. If MSTP is the active flat mode protocol, enter a value that is a multiple of 4096 (for example, 4096, 8192, 12288).

Defaults

- By default, the bridge priority value is set to 32768 for the CIST, an MSTI, and a VLAN instance.
- By default, the port or link aggregate priority value is set to 7.

parameter	default
cist msti <i>msti_id</i> vlan <i>vlan_id</i>	cist

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge. The port priority value is used to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

- The lower the bridge or port priority number assigned, the higher the priority that is associated with the bridge or port.
- If none of the optional instance parameters (**cist**, **msti**, or **vlan**) or **port** and **linkagg** parameters are specified with this command, the bridge priority is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist**, **msti**, and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified priority values are not applied unless the supporting mode (flat for CIST/MSTI or per-VLAN for a VLAN instance) is active.
- To configure the bridge priority with this command, specify the instance (**cist**, **msti**, or **vlan**) and the priority value; do not specify a port number or link aggregate ID.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- When the protocol is changed to/from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address. In regards to the priority for an MSTI, only the four most significant bits are used.
- To configure the port priority with this command, specify the instance (**cist**, **msti**, or **vlan**), a port number or link aggregate ID that is associated with that instance, and the priority value.
- The port priority value configured with this command is only applied to the specified instance. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- The port priority specifies the value of the priority field contained in the first byte of the port ID. The second byte contains the physical switch port number.

Examples

The following command examples set the bridge priority for the specified instance:

```
-> spantree priority 8192
-> spantree cist priority 8192
-> spantree vlan 2 priority 32679
-> spantree msti 1 priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
      8192, 12288, 16384 ... 61440
-> spantree msti 1 priority 8192
```

The following command examples set the port priority for the specified instance:

```
-> spantree port 1/10 priority 10
-> spantree cist port 1/10 priority 10
-> spantree cist linkagg 10 priority 1
-> spantree vlan 200 port 2/1 priority 15
-> spantree vlan 2 linkagg 5 priority 2
-> spantree msti 2 port 1/24 priority 5
-> spantree msti 3 linkagg 6-8 priority 10
```

Release History

Release 7.1.1; command introduced.

  vStpInsPriority  
  vStpInsBridgeAddress
```

spantree hello-time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

```
spantree [cist | vlan vlan_id] hello-time seconds
```

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Specifies the Hello time value in seconds. The valid range is 1–10.

Defaults

By default, the bridge hello time value is set to 2 seconds.

parameter	default
cist vlan <i>vlan_id</i>	cist

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- If the optional **cist** or **vlan** parameter is not specified with this command, the hello time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified hello time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree hello-time 5
-> spantree cist hello-time 5
-> spantree vlan 10 hello-time 3
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

vStpInsTable  
  vStpInsNumber  
  vStpInsMode  
  vStpInsBridgeHelloTime
```

spantree max-age

Configures the bridge maximum age time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that the Spanning Tree Protocol information learned from the network on any port is retained. This information is discarded when it ages beyond the maximum age value.

spantree [**cist** | **vlan** *vlan_id*] **max-age** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Max-age time in seconds. The valid range is 6–40.

Defaults

By default, the bridge maximum age time value is set to 20 seconds.

parameter	default
cist vlan <i>vlan_id</i>	cist

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A low maximum age time causes the Spanning Tree Algorithm to reconfigure more often.
- If the optional **cist** or **vlan** parameter is not specified with this command, the maximum age time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified maximum age time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the maximum age time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree max-age 10
-> spantree cist max-age 10
-> spantree vlan 10 max-age 30
```

Release History

Release 7.1.1; command introduced.

spantree forward-delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

spantree [**cist** | **vlan** *vlan_id*] **forward-delay** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Forward delay time, in seconds. The valid range is 4–30.

Defaults

By default, the bridge forward delay time value is set to 15 seconds.

parameter	default
cist vlan <i>vlan_id</i>	cist

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- If the optional **cist** or **vlan** parameter is not specified with this command, the forward delay time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified forward delay time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree forward-delay 30
-> spantree cist forward-delay 30
-> spantree vlan 5 forward-delay 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

  vStpInsBridgeForwardDelay
```

spantree bpdu-switching

Enables or disables the switching of Spanning Tree BPDU for VLAN and CIST instances if the switch is running in the per-VLAN mode.

```
spantree {vlan vlan_id | cist} bpdu-switching {enable | disable}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
enable	Enables BPDU switching for the specified instance.
disable	Disables BPDU switching for the specified instance.

Defaults

By default, BPDU switching is disabled for VLAN or CIST instance.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- Use the **vlan** parameter along with the *vlan_id* to enable or disable BPDU switching for a particular VLAN.
- Use the **cist** parameter to enable or disable BPDU switching for the CIST instance.

Examples

```
-> spantree mode flat
-> spantree bpdu-switching enable
-> spantree bpdu-switching disable
-> spantree cist bpdu-switching enable
-> spantree cist bpdu-switching disable

-> spantree mode per-vlan
-> spantree vlan 10 bpdu-switching enable
-> spantree vlan 10 bpdu-switching disable
```

Release History

Release 7.1.1; command introduced.

MIB Objects

vStpInsTable

vStpInsBpduSwitching

spantree path-cost-mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

spantree path-cost-mode {auto | 32bit}

Syntax Definitions

auto	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
32bit	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

Defaults

By default, the path cost mode is set to **auto**.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- All path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **spantree path-cost-mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

Examples

```
-> spantree path-cost-mode 32bit  
-> spantree path-cost-mode auto
```

Release History

Release 7.1.1; command introduced.

Related Commands

[spantree protocol](#) Configures the protocol for the flat mode CIST instance or a per-VLAN mode VLAN instance.

MIB Objects

vStpBridge

vStpPathCostMode

spantree pvst+compatibility

Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

spantree pvst+compatibility {port *chassis/slot/port*] | linkagg *agg_id*} {enable | disable | auto}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot number and port number of the physical port.
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number.
enable	Enables the PVST+ mode.
disable	Disables the PVST+ mode.
auto	IEEE BPDUs are used until a PVST+ BPDU is detected.

Defaults

PVST+ is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in per-VLAN mode.
- Specify **pvst+compatibility enable** to enable all the ports on the switch to handle PVST+ BPDUs.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

Examples

```
-> spantree pvst+compatibility enable
-> spantree pvst+compatibility disable
-> spantree port 1/3 pvst+compatibility enable
-> spantree port 2/2 pvst+compatibility auto
-> spantree linkagg 2 pvst+compatibility enable
```

Release History

Release 7.1.1; command introduced.

spantree auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

```
spantree [msti msti_id] auto-vlan-containment {enable | disable}
```

Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number. A range of VLANs are associated to an MSTI ID number.
enable	Enables automatic VLAN containment.
disable	Disables automatic VLAN containment.

Defaults

By default, automatic VLAN containment is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **spantree auto-vlan-containment** command but do not specify an *msti_id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, specify the *msti_id* for the instance and use the **disable** form of this command.
- Use the **enable** form of this command and specify an *msti_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. However, if the port path cost is administratively set to zero, then the path cost is reset to the default value.
- Note that when AVC is disabled, a port assigned to a VLAN that is not mapped to a specific instance, can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

Examples

```
-> spantree auto-vlan-containment enable
-> spantree auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment enable
```

Release History

Release 7.1.1; command introduced.

spantree cist

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the CIST instance.
disable	Disables Spanning Tree on the specified port for the CIST instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the CIST instance regardless of which Spanning Tree operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree cist port 4/1 enable
-> spantree cist port 4/2-5 disable
-> spantree cist linkagg 16 disable
-> spantree cist linkagg 22-26 enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

spantree vlan

Configures the Spanning Tree status on a port or a link aggregate of ports for a VLAN instance.

MIB Objects

vStpInsPortTable

 vStpInsPortNumber

 vStpInsPortEnable

spantree vlan

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the specified VLAN instance.

```
spantree vlan vlan_id [-vlan2] {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {enable | disable}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the specified instance.
disable	Disables Spanning Tree on the specified port for the specified instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which Spanning Tree operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the per-VLAN mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that when this occurs, ports will *not* bridge BPDU unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree vlan 2 port 4/1 enable  
-> spantree vlan 2 port 4/2-5 disable
```

```
-> spantree vlan 3 linkagg 16 disable
-> spantree vlan 3 linkagg 22-25 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist	Configures the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the per-VLAN or flat mode.
spantree vlan admin-state	Enables or disables Spanning Tree instance for the specified VLAN.
spantree bpdu-switching	Enables or disables the switching of Spanning Tree BPDU for all VLAN instances if the switch is running in the per-VLAN mode.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortEnable
```

spantree cist path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree cist {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} path-cost path_cost
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the [spantree path-cost-mode](#) command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000

Link Speed	IEEE 802.1D Recommended Value
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> spantree cist port 4/1 path-cost 19
-> spantree cist port 4/2-5 path-cost 19
-> spantree cist linkagg 16 path-cost 12000
-> spantree cist linkagg 17-20 path-cost 12000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree path-cost-mode	Selects a 32-bit or automatic path cost mode for the switch.
spantree msti path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortPathCost
```

spantree msti path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree msti msti_id {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} path-cost path_cost
```

Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified MSTI regardless of which operating mode (flat or per-VLAN) is active for the switch. However, if MSTP is not the selected flat mode protocol, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti_id* value, the specified path cost value is applied to the CIST instance.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 35000 for MSTI 3.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. Using a 16-bit path cost value is not an option.

- If zero is entered for the *path_cost* value, then the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If the *path_cost* value for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

Examples

```
-> spantree msti 0 port 4/1 path-cost 35000
-> spantree msti 0 port 1/20-24 path-cost 12000
-> spantree msti 2 linkagg 10 path-cost 20000
-> spantree msti 2 linkagg 10-12 path-cost 65000
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree cist path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable  
  vStpInsPortNumber  
  vStpInsPortPathCost
```

spantree vlan path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] / linkagg agg_id [-agg_id2]} path-cost path_cost
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the [spantree path-cost-mode](#) command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1S recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000

Link Speed	IEEE 802.1D Recommended Value
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> spantree vlan 200 port 4/1 path-cost 4
-> spantree vlan 200 port 4/2-5 path-cost 4
-> spantree vlan 300 linkagg 16 path-cost 200000
-> spantree vlan 500 linkagg 24-28 path-cost 20000
```

Release History

Release 7.1.1; command introduced.

Related Commands

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

[spantree cist path-cost](#)

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.

[spantree msti path-cost](#)

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortPathCost
```

spantree cist mode

Configures manual mode (forwarding or blocking) or dynamic mode to manage the state of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

spantree cist {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} mode {forwarding | dynamic | blocking}

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
forwarding	Sets the port state to forwarding.
dynamic	Port state is determined by the Spanning Tree algorithm.
blocking	Sets the port state to blocking.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree cist port 4/1 mode forwarding
-> spantree cist port 4/2-5 mode forwarding
-> spantree cist linkagg 10 mode blocking
-> spantree cist linkagg 15-20 mode forwarding
```

Release History

Release 7.1.1; command introduced.

Related Commands

[spantree mode](#)

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

[spantree loop-guard](#)

Configures the Spanning Tree mode for a port or a link aggregate of ports for the specified VLAN instance.

MIB Objects

vStpInsPortTable

 vStpInsPortNumber

 vStpInsPortManualMode

spantree loop-guard

Enables or disables the STP loop-guard on a port or link aggregate.

```
spantree {port chassis/slot/port[-port2] / linkagg linkagg_id [-linkagg_id2]} loop-guard {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (example 10-20).
enable	Enables STP loop-guard.
disable	Disables STP loop-guard.

Defaults

STP loop-guard is disabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.
- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.
- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.
- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance, the alternate or secondary ports takeover until the root port recovers from the error state.
- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
- If a spanning tree channel is blocked by loop-guard and the channel breaks, spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.

- The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.
- Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.
- When a VLAN is disabled, all the VLAN port associations recover from the error state.
- The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.
- STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

Examples

```
-> spantree port 1/1/2 loop-guard enable
-> spantree linkagg 1 loop-guard enable
-> spantree port 1/1/2 loop-guard disable
-> spantree linkagg 1 loop-guard disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

[show spantree ports](#)

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

MIB Objects

```
vStpPortConfigTable
  vStpPortConfigIfIndex
  vStpPortConfigLoopGuard
```

spantree vlan mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or a link aggregate of ports for the specified VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] / linkagg agg_id [-agg_id2]} mode {dynamic | blocking | forwarding}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
dynamic	Port state is determined by the Spanning Tree algorithm.
blocking	Sets the port state to blocking.
forwarding	Sets the port state to forwarding.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree vlan 255 port 4/1-4 mode forwarding
-> spantree vlan 355 port 1/24 mode dynamic
-> spantree vlan 450 linkagg 1 mode dynamic
-> spantree vlan 450 linkagg 1-5 mode dynamic
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

spantree cist mode

Configures the Spanning Tree mode for a port or a link aggregate of ports for the CIST instance.

MIB Objects

vStpInsPortTable

 vStpInsPortNumber

 vStpInsPortManualMode

spantree cist connection

Configures the connection type for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {**port** *chassis/slot/port* [-*port2*] | **linkagg** *agg_id* [-*agg_id2*]} **connection** {**noptp** | **ptp** | **autoptp**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point to point link.
ptp	Defines port connection type as point to point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree cist port 7/24 connection noptp
-> spantree cist port 7/25-28 connection ptp
```

```
-> spantree cist linkagg 5-10 connection autoptp
-> spantree cist linkagg 5-10 connection autoptp
```

  vStpInsPortOperConnectionType
```

spantree vlan connection

Configures the connection type for a port or a link aggregate of ports for a VLAN instance.

```
spantree vlan vlan_id {port chassis/slot/port [-port2] | linkagg agg_id [-agg_id2]} connection {noptp | ptp | autoptp}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [<i>-port2</i>]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id</i> [<i>-agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point to point link.
ptp	Defines port connection type as point to point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree vlan 255 port 7/24 connection noptp
-> spantree vlan 255 port 7/25-27 connection ptp
-> spantree vlan 255 linkagg 3 connection autoptp
-> spantree vlan 255 linkagg 3-7 connection autoptp
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortAdminConnectionType
  vStpInsPortOperConnectionType
```

spantree cist admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} admin-edge {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the administrative edge port status for the specified port-CIST instance.
disable	Disables the administrative edge port status for the specified port-CIST instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active on the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> spantree cist linkagg 15 admin-edge enable
-> spantree cist linkagg 4-10 admin-edge enable
-> spantree cist port 8/25 admin-edge disable
-> spantree cist port 2/2-5 admin-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch
spantree vlan admin-edge	Configures the administrative edge port status for a port or a link aggregate of ports for a specific VLAN instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or a link aggregate of ports for the flat mode CIST instance.
spantree vlan auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortAdminEdge
```

spantree vlan admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for a VLAN instance.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} admin-edge {enable | disable}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the administrative edge port status for the specified port-VLAN instance.
disable	Disables the administrative edge port status for the specified port-VLAN instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is configured to run in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 4 linkagg 15 admin-edge enable
-> spantree vlan 5 linkagg 12-14 admin-edge enable
-> spantree vlan 255 port 8/23 admin-edge disable
-> spantree vlan 3 port 2/2-5 admin-edge enable
```

spantree vlan auto-edge

Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] / linkagg agg_id [-agg_id2]} auto-edge {enable | disable}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled (on).

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevent the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 255 port 8/23 auto-edge disable
-> spantree vlan 4 port 2/2-10 auto-edge enable
-> spantree vlan 100 linkagg 10 auto-edge disable
-> spantree vlan 200 linkagg 1-5 auto-edge enable
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or aggregate of ports for the flat mode CIST instance.
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.

MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortAutoEdge
```

spantree cist restricted-role

Configures the restricted role status for a port or a link aggregate of ports. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a root port is selected, the restricted port is selected as an Alternate Port.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} restricted-role {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted role status for the specified port.
disable	Disables the restricted role status for the specified port.

Defaults

By default, the restricted role status for the port is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.

Examples

```
-> spantree cist linkagg 15-20 restricted-role enable
-> spantree cist port 8/23 restricted-role disable
-> spantree cist port 8/24-27 restricted-role disable
-> spantree cist linkagg 10 restricted-role disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

 vStpInsPortNumber

 vStpInsPortRestrictedRole

spantree cist restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} restricted-tcn {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables the restricted TCN status for the specified port-CIST instance.
disable	Disables the restricted TCN status for the specified port-CIST instance.

Defaults

By default, the restricted TCN status for the port is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist linkagg 15 restricted-tcn enable
-> spantree cist port 8/23 restricted-tcn disable
-> spantree cist port 2/2-4 restricted-tcn enable
-> spantree cist linkagg 10-14 restricted-tcn disable
```

spantree cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

spantree cist txholdcount *value*

Syntax Definitions

value A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist txholdcount 5
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan txholdcount	Configures the BPDU transmission rate limit for the specified VLAN instance.

MIB Objects

vStpInsTable

spantree vlan txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the VLAN instance.

```
spantree vlan vlan_id txholdcount {value}
```

Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>value</i>	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified **txholdcount** status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 3 txholdcount 6
```

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist txholdcount	Configures the BPDU transmission rate limit for the CIST instance.

MIB Objects

```
vStpInsTable  
  vStpInsBridgeTxHoldCount
```

show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or the per-VLAN mode VLAN instances.

show spantree

Syntax Definitions

N/A

Defaults

NA

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays a list of VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays a list of MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree
```

```
Spanning Tree Path Cost Mode : 32 BIT
Bridge STP Status Protocol Priority(Prio:SysID)
-----+-----+-----+-----+-----+-----
      1      ON      RSTP      32768 (0x8000:0x0000)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (32 BIT or AUTO). Configured through the spantree path-cost-mode command.
Bridge	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol.
STP Status	The Spanning Tree state for the CIST instance (ON or OFF).
Protocol	The Spanning Tree protocol applied to the instance (STP or RSTP). Configured through the spantree protocol command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.

```

-> spantree mode flat
-> spantree protocol mstp

-> show spantree
  Spanning Tree Path Cost Mode : AUTO
  Msti STP Status Protocol Priority (Prio:SysID)
-----+-----+-----+-----+-----
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)
    3      ON      MSTP   32771 (0x8000:0x0003)

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (32 BIT or AUTO). Configured through the spantree path-cost-mode command.
Msti	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the spantree msti command. Note that MSTI 0 also represents the CIST instance that is always present on the switch.
STP Status	The Spanning Tree state for the MSTI (ON or OFF).
Protocol	The Spanning Tree protocol applied to this instance. Configured through the spantree protocol command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.

```

-> spantree mode per-vlan
-> show spantree

  Spanning Tree Path Cost Mode : AUTO
  Spanning Tree PVST+ Mode      : Enable
  Vlan STP Status Protocol Priority
-----+-----+-----+-----+-----
    1      ON      STP   32768 (0x8000)
    2      ON      STP   32768 (0x8000)
    3      ON      STP   32768 (0x8000)
    4      ON      STP   32768 (0x8000)
    5      ON      STP   32768 (0x8000)
    6      ON      STP   32768 (0x8000)
    7      ON      STP   32768 (0x8000)

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (32 BIT or AUTO). Configured through the spantree path-cost-mode command.
Spanning Tree PVST+ Mode	Indicates whether the PVST + status is enabled or disabled. Configured through the spantree pvst+compatibility command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the vlan commands
STP Status	The Spanning Tree state for the instance (ON or OFF). Configured through the spantree vlan admin-state command.

output definitions (continued)

Protocol	The Spanning Tree protocol applied to this instance (STP or RSTP). Configured through the spantree protocol command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guideline

This command displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode. See second example below.

Examples

```
-> spantree mode flat
-> show spantree cist
Spanning Tree Parameters for Cist
Spanning Tree Status :                ON,
Protocol              :                IEEE Multiple STP,
mode                 :                FLAT (Single STP),
Auto-Vlan-Containment:                Enabled ,
Priority              :                32768 (0x8000),
Bridge ID            :                8000-00:d0:95:01:39:2c,
CST Designated Root :                8000-00:d0:95:01:39:2c,
Cost to CST Root    :                0,
Next CST Best Cost  :                0,
Designated Root     :                8000-00:d0:95:01:39:2c,
Cost to Root Bridge :                0,
Root Port           :                None,
Next Best Root Cost :                0,
Next Best Root Port :                None,
TxHoldCount         :                3,
Topology Changes    :                0,
Topology age        :                00:00:00,
  Current Parameters (seconds)
    Max Age          =                20,
    Forward Delay    =                15,
    Hello Time       =                2
  Parameters system uses when attempting to become root
    System Max Age   =                20,
```

```

        System Forward Delay =    20,
        System Hello Time    =    10
    BPDU Switching Enabled

-> spantree mode per-vlan
-> show spantree cist

Per Vlan Spanning Tree is enforced !! (Per VLAN mode)
INACTIVE Spanning Tree Parameters for Flat Mode
Spanning Tree Status :                ON,
Protocol              :                IEEE Rapid STP,
Priority              :                32768 (0x8000),
TxHoldCount          :                5,
System Max Age (seconds) =            10,
System Forward Delay (seconds) =      10,
System Hello Time (seconds) =         5

```

output definitions

Spanning Tree Status	The Spanning Tree state for the instance (ON or OFF).
Protocol	The Spanning Tree protocol applied to the CIST (STP , RSTP , or MSTP). Configured through the spantree protocol command.
Mode	The Spanning Tree operating mode for the switch (per-vlan or flat). Configured through the spantree mode command.
Auto-Vlan-Containment	The auto VLAN containment status for the instance (Enabled or Disabled). AVC prevents a port that has no VLANs mapped to a Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Configured through the spantree auto-vlan-containment command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.

output definitions (continued)

Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (hh:mm:ss or dd days and hh:mm:ss).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the spantree max-age command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the spantree forward-delay command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the spantree hello-time command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

```
show spantree msti [msti_id]
```

Syntax Definitions

msti_id An existing MSTI ID number.

Defaults

By default, displays information for all MSTIs.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This command displays Spanning Tree bridge information for an MSTI regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> spantree mode flat
-> spantree protocol mstp
-> show spantree msti
```

```
Spanning Tree Path Cost Mode : AUTO
Msti STP Status Protocol Priority (Prio:SysID)

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (32 BIT or AUTO) Configured through the spantree path-cost-mode command.
Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the spantree msti command.
STP Status	The Spanning Tree state for the instance (ON or OFF).
Protocol	The Spanning Tree protocol applied to the instance (STP , RSTP , or MSTP). This value is not configurable for an MSTI. Configured through the spantree protocol command.
Mode	The Spanning Tree operating mode for the switch (per-vlan or flat). Configured through the spantree mode command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.

output definitions (continued)

Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
TxHoldCount	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (hh:mm:ss or dd days and hh:mm:ss).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

show spantree vlan

Displays Spanning Tree bridge information for a per-VLAN mode VLAN instance.

show spantree vlan [*vlan_id*]

Syntax Definitions

vlan_id An existing VLAN ID number.

Defaults

By default, displays information for all VLAN instances.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vlan_id* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- This command displays Spanning Tree bridge information for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

Examples

```
-> spantree mode per-vlan
-> show spantree vlan
  Spanning Tree Path Cost Mode : AUTO
  Vlan STP Status Protocol Priority

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (32 BIT or AUTO). Configured through the spantree path-cost-mode command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the vlan commands
STP Status	The Spanning Tree state for the instance (ON or OFF).
Protocol	The Spanning Tree protocol applied to the VLAN instance (STP or RSTP). Note that MSTP is not supported for a VLAN instance. Configured through the spantree protocol command.
Mode	The Spanning Tree operating mode for the switch (per-vlan or flat). Configured through the spantree mode command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the spantree priority command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.

output definitions (continued)

Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (hh:mm:ss or dd days and hh:mm:ss).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the spantree max-age command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the spantree forward-delay command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the spantree hello-time command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree msti	Displays the Spanning Tree bridge information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree ports

Displays Spanning Tree port information.

show spantree ports [**forwarding** | **blocking** | **active** | **configured**]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance.

Defaults

parameter	default
forwarding blocking active configured	all ports

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays port information for the VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays port information for the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays port information for the MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree ports
```

output definitions

Bridge, Msti, or Vlan

The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode. The MSTI number when MSTP is the active protocol in the flat mode. The VLAN ID number when STP or RSTP is the active protocol in the per-VLAN mode.

Port

The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).

Oper Status

The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, learning, and forwarding.

output definitions (continued)

Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the spantree msti path-cost or spantree vlan path-cost command.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: root , designated , alternate , and backup .
loop-guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port. Configured through the spantree loop-guard command.
Note	Displays a note if the port has entered the error violation state (ERR); then the port role of the port instance in that row becomes insignificant.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree cist ports	Displays Spanning Tree port information for the flat mode CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree vlan ports	Displays Spanning Tree port information for VLAN instances when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist ports [**forwarding** | **blocking** | **active** | **configured**]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the CIST instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
forwarding blocking active configured	all ports

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode.

Examples

```
-> show spantree cist ports
```

```

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the spantree vlan path-cost command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: root , designated , alternate , and backup .
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: PTP , NPT , or NS (nonsignificant). Shows the current operational state of the port connection type. See the spantree vlan connection command for more information.
Op Edg	Operational connection type: EDG . Shows the current operational state of the port connection type. See the spantree vlan connection command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.

```

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. The lower the number, the higher the priority.
Adm St	The Spanning Tree administrative status of the port: enabled or disabled .
Man. Mode	The manual mode setting for the port: yes indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; no indicates that the Spanning Tree Algorithm is managing the port state. Configured through the spantree vlan path-cost command.
Config Cost	The configured path cost value for this port. Configured through the spantree vlan path-cost command.
Adm Cnx	The administrative connection type: PTP , NPT , or AUT . Configured through the spantree vlan connection command.
Adm Edg	The edge port administrative status: yes indicates that the port is an admin edge port; no indicates that the port is not an admin edge port. Configured through the spantree vlan connection command.
Aut Edg	The edge port automatic status: yes indicates that the port is an automatic edge port; no indicates that the port is not an automatic edge port. Configured through the spantree cist auto-edge or spantree vlan auto-edge command.
Rstr Tcn	The restricted TCN capability: yes indicates that the port supports the restricted TCN capability; no indicates that the port does not support the restricted TCN capability. Configured through the spantree cist restricted-tcn or spantree vlan restricted-tcn command.
Rstr Role	The restricted role port status: yes indicates that the port is a restricted role port; no indicates that the port is not a restricted role port. Configured through the spantree cist restricted-role or spantree vlan restricted-role command.

Release History

Release 7.1.1; command introduced.

Related Commands

[show spantree ports](#)

Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.

[show spantree msti ports](#)

Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id*] **ports** [**forwarding** | **blocking** | **active** | **configured**]

Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number.
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the MSTI instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the MSTI instance.
active	Displays a list of active ports associated with the MSTI instance.
configured	Displays Spanning Tree administrative port parameters for the MSTI instance.

Defaults

parameter	default
<i>msti_id</i>	all MSTIs
forwarding blocking active configured	all ports

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This command displays Spanning Tree port information for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

output definitions

Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the spantree msti command.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the spantree msti path-cost command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
RSTR Role/ Root Guard	The role of the port for this Spanning Tree instance. Possible port roles are: root , designated , alternate , master , and backup .
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: PTP , NPT , or NS (nonsignificant). Shows the current operational state of the port connection type. See the spantree vlan connection command for more information.

output definitions (continued)

Op Edg	Operational connection type: EDG . Shows the current operational state of the port connection type. See the spantree vlan connection command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
PVST+ Cfg	Indicates the current PVST+ port configuration (auto , enable or disable).
PVST+ Stat	Indicates the current status of the PVST+ mode (On or Off).

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. It is a numeric value and the lower the number, the higher the priority. Configured through the spantree priority command.
Adm St	The Spanning Tree administrative status of the port: enabled - ENA or disabled - DIS.
Man. Mode	The manual mode setting for the port: yes indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; no indicates that the Spanning Tree Algorithm is managing the port state. Configured through the spantree vlan path-cost command.
Config Cost	The configured path cost value for this port. Configured through the spantree msti path-cost command.
Adm Cnx	The administrative connection type: PTP , NPT , or AUT . Configured through the spantree vlan connection command.
Adm Edg	The edge port administrative status: yes indicates that the port is an admin edge port; no indicates that the port is not an admin edge port. Configured through the spantree vlan connection command.

output definitions (continued)

Aut Edg	The edge port automatic status: yes indicates that the port is an automatic edge port; no indicates that the port is not an automatic edge port. Configured through the spantree cist auto-edge or spantree vlan auto-edge command.
Rstr Tcn	The restricted TCN capability: yes indicates that the port supports the restricted TCN capability; no indicates that the port does not support the restricted TCN capability. Configured through the spantree cist restricted-tcn or spantree vlan restricted-tcn command.
Rstr Role	The restricted role port status: yes indicates that the port is a restricted role port; no indicates that the port is not a restricted role port. Configured through the spantree cist restricted-role or spantree vlan restricted-role command.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree vlan ports

Displays Spanning Tree port information for a VLAN instance.

show spantree vlan [*vlan_id*[-*vlan_id2*]] **ports** [**forwarding** | **blocking** | **active** | **configured**]

Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i>]	An existing VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, vlan 10-15).
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the VLAN instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the VLAN instance.
active	Displays a list of active ports associated with the VLAN instance.
configured	Displays Spanning Tree administrative port parameters for the VLAN instance.

Defaults

parameter	default
<i>vlan_id</i>	all VLAN instances
forwarding blocking active configured	all ports

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., **show spantree vlan 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- This command displays Spanning Tree port information for a VLAN instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when a VLAN ID is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

Examples

```
-> show spantree vlan ports
```

output definitions

Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the vlan commands
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the spantree vlan path-cost command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: root , designated , alternate , master , and backup .
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: PTP , NPT , or NS (nonsignificant). Shows the current operational state of the port's connection type. See the spantree vlan connection command for more information.
Op Edg	Operational connection type: EDG . Shows the current operational state of the port's connection type. See the spantree vlan connection command for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for this port's segment.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the spantree priority command.
Adm St	The Spanning Tree administrative status of the port: enabled or disabled . Configured through the spantree vlan command to enable or disable Spanning Tree on a port.

output definitions (continued)

Man. Mode	The manual mode setting for the port: yes indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; no indicates that the Spanning Tree Algorithm is managing the port state. Configured through the spantree loop-guard command.
Config Cost	The configured path cost value for this port. Configured through the spantree vlan path-cost command.
Adm Cnx	The administrative connection type: PTP , NPT , or AUT . Configured through the spantree vlan path-cost command.
Adm Edg	The edge port administrative status: yes indicates that the port is an admin edge port; no indicates that the port is not an admin edge port. Configured through the spantree vlan connection command.
Aut Edg	The edge port automatic status: yes indicates that the port is an automatic edge port; no indicates that the port is not an automatic edge port. Configured through the spantree cist auto-edge or spantree vlan auto-edge command.
Rstr Tcn	The restricted TCN capability: yes indicates that the port supports the restricted TCN capability; no indicates that the port does not support the restricted TCN capability. Configured through the spantree cist restricted-tcn or spantree vlan restricted-tcn command.
Rstr Role/Root Guard	The restricted status of the port: Yes indicates that the port is restricted from becoming the root; No indicates that the port is not restricted from becoming the root. Configured through the spantree cist restricted-role or spantree vlan restricted-role command.
PVST+ Cfg	The type of BPDU used on the port: AUTO indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; ENA indicates that PVST+ BPDUs are used; DIS indicates that IEEE BPDUs are used. Configured through the spantree pvst+compatibility command.
PVST+ Stat	Indicates whether or not the PVST+ interoperability status is enabled (ENA) or disabled (DIS) for the port. Configured through the spantree pvst+compatibility command.

Release History

Release 7.1.1; command was introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
show spantree cist ports	Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree mode

Displays the current global Spanning Tree mode parameter values for the switch.

show spantree mode

Syntax Definition

N/A

Defaults

NA

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The global parameters for spanning tree can be activated or configured using the related commands.

Examples

```
-> show spantree mode
```

```
Spanning Tree Global Parameters
  Current Running Mode   : Per VLAN,
  Current Protocol       : N/A (Per VLAN),
  Path Cost Mode         : 32 BIT,
  Auto Vlan Containment : N/A
  Cisco PVST+ mode      : Disabled
  Vlan Consistency check : Disabled
```

output definitions

Current Running Mode	The spantree mode active on the switch. (Flat or Per VLAN)
Current Protocol	The spantree protocol active on the switch.
Path Cost Mode	The path cost mode value configured on the switch. (AUTO or 32 BIT)
Auto Vlan Containment	The Auto VLAN containment mode configured on the switch (Enabled or Disabled).
Cisco PVST+ mode	The PVST+ mode configured on the switch (Enabled or Disabled).
Vlan Consistency check	Specifies if VLAN consistency check is Enabled or Disabled on the switch.

Related Commands

spantree mode	Assigns a flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch.
spantree protocol	Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the per-VLAN mode.
spantree path-cost-mode	Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.
spantree pvst+compatibility	Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.
spantree auto-vlan-containment	Enables or disables Auto VLAN Containment (AVC).

show spantree mst

Displays the Multiple Spanning Tree (MST) information for a MST region or the specified port or link aggregate on the switch.

show spantree mst {**region** | **port** *chassis/slot/port* | **linkagg** *agg_id*}

Syntax Definitions

chassis The chassis identifier.
slot/port[-*port2*] The slot number and port number of the physical port.
agg_id[-*agg_id2*] The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Specify the port number or link aggregate ID along with the **port** or **linkagg** keyword to get information related to the specified port or link aggregate.

Examples

```
-> show spantree mst region
```

```
Configuration Name   = Region 1
Revision Level       = 0
Configuration Digest = 0xac36177f 50283cd4 b83821d8 ab26de62
Revision Max hops    = 20
Cist Instance Number = 0
```

```
-> show spantree mst port 1/2
```

MST	Role	State	Pth	Cst	Edge	Boundary	Op	Cnx	Vlans
0	DIS	DIS		0	NO	YES	NS		1
12	DIS	DIS		0	NO	YES	NS		

```
-> show spantree mst linkagg 4
```

```
MST  Role  State Pth Cst  Edge Boundary Op Cnx Vlans
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
  0  DESG   FORW      6000  NO    NO    NS    1
  1  DESG   FORW      0    NO    NO    NS
  2  DESG   FORW      0    NO    NO    NS
```

output definitions

Configuration Name	An alphanumeric string that identifies the name of the MST region. Use the spantree mst region name command to define this value.
Revision Level	A numeric value that identifies the MST region revision level for the switch.
Configuration Digest	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the spantree msti and spantree msti vlan commands to define VLAN to MSTI associations.
Revision Max hops	The number of maximum hops authorized for region information. Configured through the spantree mst region max-hops command.
Cist Instance Number	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch. Note that this instance is also known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```
vStpMstRegionTable
  vStpMstRegionNumber
  vStpMstRegionConfigDigest
  vStpMstRegionConfigName
  vStpMstRegionConfigRevisionLevel
  vStpMstRegionCistInstanceNumber
  vStpMstRegionMaxHops
```

show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

```
show spantree msti [msti_id] vlan-map
```

Syntax Definitions

msti_id An existing MSTI ID number.

Defaults

By default, the VLAN to MSTI mapping is displayed for all MSTIs.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an *msti_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

Examples

```
-> show spantree msti vlan-map
```

```
Cist
Name          :
VLAN list     : 1-9,14-4094
```

```
Msti 1
Name          :
VLAN list     : 10-11
```

```
Msti 2
Name          :
VLAN list     : 12-13
```

```
-> show spantree msti 2 vlan-map
```

```
Msti 2
Name          : MS1,
VLAN list     : 12-13
```

output definitions

Cist Instance	Identifies MSTI VLAN mapping information for the CIST instance.
Msti	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.

output definitions (continued)

Name	An alphanumeric value that identifies an MSTI name. Use the spantree msti command to define an MSTI name.
VLAN list	The range of VLAN IDs that are associated with this MSTI.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.

show spantree cist vlan-map

Displays the range of VLANs associated with the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist vlan-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

Examples

```
-> show spantree cist vlan-map
```

```
Cist
Name           : CIST1,
VLAN list      : 1-9,14-4094
```

output definitions

Name	An alphanumeric value that identifies the name of the CIST. Use the spantree msti command to define a name for this instance.
VLAN list	The range of VLAN IDs that are associated with the CIST instance.

Release History

Release 7.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.

9 Shortest Path Bridging Commands

The Alcatel-Lucent OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. SPB-M uses the Provider Backbone Bridge (PBB) network model to encapsulate (using IEEE 802.1ah headers) and tunnel customer traffic through the network backbone. The shortest path trees (SPTs) upon which the PBB network infrastructure operates are determined using a version of the Intermediate System-to-Intermediate System (IS-IS) link state protocol that supports TLV extensions for SPB (ISIS-SPB).

The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free, SPTs through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the 802.1ah MAC-in-MAC method for data encapsulation. SPBM services transport the encapsulated traffic over the ISIS-SPB infrastructure.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the ISIS-SPB backbone. For commands used to configure and verify the SPBM services layer, see [Chapter 10, “Service Manager Commands.”](#)

MIB information for the SPB commands is as follows:

Filename: ALCATEL-IND1-ISIS-SPB-MIB
Module: alcatelIND1IsisSpbMib

Filename: ALCATEL-IND1-VLAN-MGR-MIB
Module: alcatelIND1VLANMgrMIB

A summary of the available commands is listed here:

Global SPB Commands	<code>spb isis admin-state</code> <code>spb isis area-address</code> <code>spb isis bridge-priority</code> <code>spb isis source-id</code> <code>spb isis control-address</code> <code>spb isis spf-wait</code> <code>spb isis lsp-wait</code>
SPB Backbone VLAN (BVLAN) Commands	<code>spb bvlan</code> <code>spb isis bvlan ect-id</code> <code>spb isis control-bvlan</code> <code>spb isis bvlan tandem-multicast-mode</code>
SPB Interface Commands	<code>spb isis interface</code>

SPB IP VPN Commands

show spb isis services
show spb isis spf
show spb isis multicast-table
show spb isis multicast-sources
show spb isis multicast-sources-spf
show spb isis ingress-mac-filter

spb bvlan

Configures an SPB backbone VLAN (BVLAN).

spb bvlan {*bvlan_id*[-*bvlan_id2*]} [**admin-state** {**enable** | **disable**}] [**name** *description*]

no spb bvlan *bvlan_id*

Syntax Definitions

<i>bvlan_id</i> [- <i>bvlan_id2</i>]	A numeric value that uniquely identifies an individual BVLAN. The valid ID range is 1–4094. Use a hyphen to specify a range of BVLAN IDs (10-20).
enable	Enables the VLAN administrative status.
disable	Disables the VLAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable disable	enable
<i>description</i>	VLAN ID

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a BVLAN from the switch configuration. All BVLAN ports are detached before the BVLAN is removed.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with a space in between.
- The BVLAN configuration must be the same on each SPB bridge to ensure proper ISIS-SPB neighbor discovery and shortest path calculations throughout the provider backbone bridge (PBB) network.
- BVLANs differ from standard VLANs as follows:
 - No Spanning Tree control—the Spanning Tree protocol is automatically disabled on each BVLAN, and all ports associated with each BVLAN will remain in a forwarding state. However, Spanning Tree can remain operational on other types of VLANs.
 - No source MAC address learning—normal hardware learning is disabled on BVLANs. Instead, the forwarding database (FDB) is populated by the ISIS-SPB protocol.
 - There is no flooding of unknown destination or multicast frames.
 - Ingress filtering based on the source MAC address—frames received on ports that do not have an incoming source MAC address pre-programmed by ISIS-SPB are discarded.
- All BVLANs are automatically associated with all ISIS-SPB interfaces. Adding or removing BVLANs from a specific SPB interface is not allowed.

- The maximum number of BVLANs supported is four.
- BVLANs and standard VLANs can co-exist on the same bridge ports.

Examples

```
-> spb bvlan 200 name BVLAN-200
-> spb bvlan 720 admin-state disable
-> spb bvlan 500 name BVLAN-500 admin-state enable
-> no spb bvlan 1020
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb isis control-bvlan	Configures a control BVLAN
spb isis bvlan ect-id	Assigns an equal cost tree (ECT) algorithm ID to the specified BVLAN.
spb isis bvlan tandem-multicast-mode	Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN).
spb isis interface	Configures ISIS-SPB network interfaces.
show spb isis bvlan	Displays the BVLAN configuration for the switch.

MIB Objects

```
vlanTable
  vlanNumber
  vlanDescription
  vlanAdmStatus
  vlanOperStatus
  vlanType
```

spb isis bvlan ect-id

Configures the equal cost tree (ECT) identifier for the specified SPB backbone VLAN (BVLAN). The ECT ID assigns a tie-breaking algorithm to the BVLAN that is used for shortest path tree (SPT) calculations.

```
spb isis bvlan bvlan_id ect-id ect_id
```

Syntax Definitions

<i>bvlan_id</i>	An existing BVLAN ID.
<i>ect_id</i>	An ECT algorithm ID. The valid range is 1–16.

Defaults

By default, the next available ECT ID number is automatically assigned to a BVLAN when the BVLAN is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use this command to change the existing ECT ID number for the specified BVLAN on each SPB bridge, as necessary, to make sure the specified BVLAN uses the same ECT ID throughout the network.
- The BVLAN ID specified with this command must already exist in the switch configuration.

Examples

```
-> spb isis bvlan 200 ect-id 5  
-> spb isis bvlan 720 ect-id 10
```

Release History

Release 7.3.1; command introduced.

Related Commands

spb bvlan	Creates a SPB backbone VLAN (BVLAN).
show spb isis bvlan	Displays the SPB BVLAN configuration for the switch.

MIB Objects

```
alcatelIND1IsisSpbEctStaticTable  
  alcatelIND1IsisSpbEctStaticEntryBaseVid
```

spb isis control-bvlan

Designates an existing BVLAN that will serve as the control BVLAN for the bridge. Only one BVLAN per bridge is designated as the control BVLAN, which is used to exchange ISIS-SPB control packets with neighboring SPB bridges on behalf of all the BVLANs configured for that bridge.

spb isis control-bvlan *bvlan_id*

Syntax Definitions

bvlan_id An existing BVLAN ID.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The control BVLAN ID is the VLAN tag that is applied to ISIS-SPB control frames.
- Configuring an existing BVLAN as the control BVLAN does not exclude that VLAN from carrying data traffic for the SPB domain. In other words, a single VLAN can serve as both a regular BVLAN and the control BVLAN at the same time.

Examples

```
-> spb isis control-bvlan 200
-> spb isis control-bvlan 720
```

Release History

Release 7.3.1; command introduced.

Related Commands

[spb bvlan](#) Configures an SPB BVLAN.

MIB Objects

```
alcatelIND1IsisSpbSys
  alcatelIND1IsisSpbSysControlBvlan
```

spb isis bvlan tandem-multicast-mode

Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN). This mode is only applicable to associated SPB service instances that are configured to use the tandem replication mode for multicast traffic.

```
spb isis bvlan bvlan_id tandem-multicast-mode {sgmode | gmode}
```

Syntax Definitions

<i>bvlan_id</i>	An existing BVLAN ID.
sgmode	Specifies the source and group (S,G) mode for the BVLAN.
gmode	Specifies the any source and group (*,G).

Defaults

By default, BVLANs are configured to use the (S,G) mode.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The (S,G) mode identifies a source-specific multicast distribution tree.
- The (*,G) mode identifies a shared multicast distribution tree.

Examples

```
-> spb isis bvlan 200 tandem-multicast-mode gmode  
-> spb isis bvlan 720 tandem-multicast-mode sgmode
```

Release History

Release 7.3.1; command introduced.

```

spb isis interface

Configures the specified port or link aggregate as an ISIS-SPB interface on which protocol data units (PDUs) are sent and received to detect neighbors and form adjacencies with other SPB bridges in the network.

spb isis interface {port *chassis/slot/port*[-*port2*] / linkagg *agg_id*[-*agg_id2*]} [admin-state {enable | disable}] [hello-interval *seconds*] [hello-multiplier *count*] [metric *metric*]

no spb isis interface [port *chassis/slot/port*[-*port2*] / linkagg *agg_id*[-*agg_id2*]]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Administratively enables the SPB interface.
disable	Administratively disables the SPB interface.
<i>seconds</i>	The amount of time, in seconds, to wait between each transmission of a hello packet from this interface. The valid range is 1–20000.
<i>count</i>	An integer value that is multiplied by the hello interval time to determine the amount of time, in seconds, a receiving bridge holds onto the hello packets transmitted from this interface. The valid range is 2–100.
<i>metric</i>	An integer value that specifies the link cost to reach the destination BMAC. The valid range is 1–16777215.

Defaults

parameter	default
enable disable	enable
<i>seconds</i>	9
<i>count</i>	3
<i>metric</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the ISIS-SPB interface.
- When configuring a link aggregate as an SPB interface, make sure the link aggregate ID number already exists in the switch configuration.

- All SPB interfaces are automatically assigned to all existing BVLANs. There is one ISIS-SPB instance per switch, and each BVLAN and SPB interface are associated with that instance.
- If the SPB interface metric value is set to a different value for each side of a link, the highest metric value is applied to the entire link.
- Administratively enabling ISIS-SPB on the switch triggers ISIS hello packet transmissions on all SPB interfaces.
- SPB interfaces are typically the Network Network Interface (NNI) ports that carry encapsulated customer data traffic through the Provider Backbone Bridging (PBB) network.
- Note that configuring a port or link aggregate as an SPB interface does not prevent configuration of other VLAN tagging on that port. In other words, the SPB interface can forward regular traffic for other VLAN types in addition to encapsulated SPBM traffic.

Examples

```
-> spb isis interface port 4/7
-> spb isis interface port 4/7 hello-interval 60
-> spb isis interface linkagg 3
-> spb isis interface linkagg 3 hello-multiplier 10
-> spb isis interface port 1/10 hello-interval 20 hello-multiplier 5 metric 2
-> no spb isis interface port 4/7
-> no spb isis interface linkagg 3
```

Release History

Release 7.3.1; command introduced.

```

spb ipvpn bind

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IP gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

```
spb ipvpn bind vrf {vrf_name | default} isid instance_id gateway ip_address {all-routes | import-route-map route_map_name}
```

```
no spb ipvpn bind vrf {vrf_name | default} isid instance_id gateway ip_address
```

Syntax Definitions

<i>vrf_name</i> default	The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter default to specify the default VRF instance.
<i>instance_id</i>	An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.
<i>ip_address</i>	The IPv4 address of an IP interface that is associated with the specified VRF instance.
all-routes	Imports or exports all routes for this bind entry.
<i>route_map_name</i>	The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.
- The specified VRF name, ISID, gateway IP address, and optional route map name must already exist in the local switch configuration.
- Only one ISID can be bound to a single VRF/IP gateway.
- The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IP address is associated with an active IP interface that is associated with the VRF instance.
- An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IP routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IP address as the next hop.

- Routing over SPB requires a physical loopback port configuration in which a pair of loopback ports provide connectivity between VRFs and SPB service access points (SAPs). A VRF-ISID binding identifies the loopback port configuration that will do Layer 3 forwarding on the VRF side of the loopback and SPB bridging on the SAP side of the loopback.

Examples

```
-> spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1 all-routes
-> spb ipvpn bind vrf2 isid 2000 gateway 20.2.2.1 import-route-map rm_vrf2
-> no spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1
```

Release History

Release 7.3.2; command introduced.

Related Commands

[spb ipvpn redistrib](#)

Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

[show spb ipvpn bind](#)

Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

MIB Objects

```
alcatelIND1SpbIPVPNBindTable
  alcatelIND1SpbIPVPNBindTableEntryTopIx,
  alcatelIND1SpbIPVPNBindVrfName,
  alcatelIND1SpbIPVPNBindIsid,
  alcatelIND1SpbIPVPNBindGateway
  alcatelIND1SpbIPVPNBindImportRouteMap
  alcatelIND1SpbIPVPNBindRowStatus
```

spb ipvpn redist

Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

```
spb ipvpn redist {source-vrf {vrf_name | default} | source-isid instance_id} destination-isid instance_id
{all-routes | route-map route_map_name}
```

```
no spb ipvpn redist {source-vrf vrf_name | source-isid instance_id} destination-isid instance_id
```

Syntax Definitions

<i>vrf_name</i> default	The source VRF instance from which routes are redistributed. Enter default to specify the default VRF instance.
source-isid <i>instance_id</i>	The source ISID from which routes are redistributed.
destination-isid <i>instance_id</i>	The destination ISID to which routes from either the source VRF or source ISID are redistributed.
all-routes	Imports or exports all routes for this bind entry.
<i>route_map_name</i>	The name of an existing route map to use for filtering routes that are redistributed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.

Examples

```
-> spb ipvpn redist source-isid 1000 destination-isid 2000 all-routes
-> spb ipvpn redist source-isid 2000 destination-isid 1000 all-routes
-> spb ipvpn redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000
-> no spb ipvpn redist source-vrf vrf1 destination-isid 3000
-> no spb ipvpn redist source-isid 2000 destination isid 1000
```

Release History

Release 7.3.2; command introduced.

Related Commands

```

show spb ipvpn bind

Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

```
show spb ipvpn bind [vrf {vrf_name | default}] [isid instance_id]
```

Syntax Definitions

vrf_name / **default** The name of a VRF instance that is associated with an SPB IPVPN binding. Enter **default** to specify the default VRF instance.

instance_id An ISID number that is associated with an SPB IPVPN binding.

Defaults

By default, all SPB IPVPN bindings are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **vrf** and **isid** parameters to display the configuration for specific bindings.

Examples

```
-> show spb ipvpn bind
```

Legend: * indicates bind entry is active

SPB IPVPN Bind Table:

VRF	ISID	Gateway	Route-Map
* ospf	4001	1.1.1.2	
* ospf1	4003	2.2.2.2	

Total Bind Entries: 2

output definitions

VRF	The name of the VRF instance associated with this binding.
ISID	The ISID number associated with this binding.
Gateway	The gateway IP address associated with this binding. This is the IP address specified for an IP interface that is associated with the VRF in this binding.
Route-Map	The name of an IP route map or All Routes .

Release History

Release 7.3.2; command introduced.

Related Commands

```

show spb ipvpn redist

Displays the SPB IPVPN redistribution configuration for the switch. This configuration controls the redistribution of IP VPN routes from ISID to ISID or from VRF to ISID.

show spb ipvpn redist [vrf | [isid]

Syntax Definitions

vrf Displays the VRF redistribution table.
isid Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **isid** parameter to display the contents of the ISID redistribution table (ISID to ISID).
- Use the **vrf** parameter to display the contents of the VRF redistribution table (VRF to ISID).

Examples

```
-> show spb ipvpn redist
```

```
Legend: * indicates redist entry is active

```

Routes: 30

output definitions

ISID	The ISID number associated with this route.
Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, /24 indicates the destination IP address has a 24-bit mask (255.255.255.0).
Gateway	IP address of the gateway from which this route was learned.
Source Bridge (Name : BMAC)	The name and BMAC address of the SPB BEB switch that advertised the route.
Metric	The metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

Release History

Release 7.3.2; command introduced.

Syntax Definitions

enable	Administratively enables ISIS-SPB for the switch.
disable	Administratively disables ISIS-SPB for the switch.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When the ISIS-SPB status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> spb isis admin-state enable  
-> spb isis admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show spb isis info](#) Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IisisSpbSys  
  alcatelIND1IisisSpbSysAdminState
```

spb isis area-address

Configures the area address for the ISIS-SPB instance.

```
spb isis area-address area_address
```

Syntax Definitions

area_address A 3-byte integer that specifies the ISIS-SPB area address to join.

Defaults

By default, the area address is set to 0.0.0. for ISIS-SPB.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The area address is entered in decimal format with this command but is converted and sent out as a hex value on the wire. For example, if the decimal value entered is “73.00.00”, then the hex value actually sent out on the wire is “49.00.00”.
- The default setting of 0.0.0 is the area address typically used for ISIS-SPB.
- Changing the area address with this command is allowed, but make sure to configure each bridge that will participate in the ISIS-SPB instance with the same area address value.
- ISIS-SPB and ISIS-IP instances may co-exist on the same bridge.

Examples

```
-> spb isis area-address 1.1.1  
-> spb isis area-address 0.0.0
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show spb isis info](#) Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys  
  alcatelIND1IsisSpbSysAreaAddress
```

spb isis source-id

Configures the shortest path (SP) source identifier value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in multicast tandem replication mode.

spb isis source-id {*source_id* | **auto**}

Syntax Definitions

source_id A source identifier entered as *xx-xx-xx*, where *xx* is a hexadecimal value.
auto Changes the source ID back to the default value.

Defaults

By default, the last three least significant bytes of the system ID is used for the source ID.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The source ID is the high order 3 bytes for the Group Address DA for the SPB bridge. Note that only 20 bits are used; the top 4 bits are not used.

Examples

```
-> spb isis source-id 00-2a-1d
-> spb isis source-id 07-0b-d3
-> spb isis source-id auto
```

Release History

Release 7.3.1; command introduced.

Related Commands

MIB Objects

```
alcatelIND1IisisSpbSys
  alcatelIND1IisisSpbmSysSPSourceId
```

spb isis control-address

Changes the ISIS-SPB control MAC address, which is used as the destination address for ISIS-SPB control packets.

spb isis control-address {alll1 | alll2 | allis}

Syntax Definitions

alll1	All Level 1 Intermediate Systems (01:80:C2:00:00:14).
alll2	All Level 2 Intermediate Systems (01:80:C2:00:00:15).
allis	All Intermediate Systems (09:00:2B:00:00:05).

Defaults

By default, the control MAC address is set to AllL1.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Changing the ISIS-SPB control MAC address on the OmniSwitch can enhance interoperability with third-party ISIS-SPB devices.

Examples

```
-> spb isis control-address alll1
-> spb isis control-address alll2
-> spb isis control-address allis
```

Release History

Release 7.3.2; command introduced.

Related Commands

[show spb isis info](#) Displays the status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
  alcatelIND1IsisSpbSysControlAddr
```

spb isis spf-wait

Configures the time intervals between the first, second, and subsequent ISIS-SPB shortest path first (SPF) calculations.

spb isis spf-wait [**initial-wait** *milliseconds* | **second-wait** *milliseconds*] **max-wait** *milliseconds*]

Syntax Definitions

initial-wait <i>milliseconds</i>	Specifies the number of milliseconds to wait before triggering an initial SPF calculation after a topology change. The valid range is 10–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait <i>milliseconds</i>	Specifies the minimum number of milliseconds to wait between the first and second SPF calculation. The valid range is 1–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
max-wait <i>milliseconds</i>	Specifies the maximum number of milliseconds to wait between two consecutive SPF calculations. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.

Defaults

parameter	default
max-wait <i>milliseconds</i>	1000
initial-wait <i>milliseconds</i>	100
second-wait <i>milliseconds</i>	300

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- To reset all three of the SPF wait time intervals back to their default values, use the **spb isis spf-wait** command without specifying any parameters.
- Subsequent SPF calculations, if required, are generated at exponentially increasing intervals of the SPF **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 1000 milliseconds, then the next SPF calculation is triggered after 2000 milliseconds and the next SPF calculation after that is triggered at 4000 milliseconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the SPF wait interval will stay at the maximum value until there are no more SPF calculations scheduled during that interval. After a full interval without any SPF calculations, the SPF wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis spf-wait max-wait 2500 initial-wait 1000 second-wait 1500
-> spb isis spf-wait max-wait 5000
-> spb isis spf-wait initial-wait 1000
-> spb isis spf-wait second-wait 2000
-> spb isis spf-wait
```

Release History

Release 7.3.1; command was introduced.

Related Commands

  alcatelIND1IisisSpbProtocolSpfInitialWait
  alcatelIND1IisisSpbProtocolSpfSecondWait
```

spb isis lsp-wait

Configures the time intervals between the first, second and subsequently generated link state PDU (LSP).

```
spb isis lsp-wait {max-wait milliseconds | initial-wait milliseconds| second-wait milliseconds}
```

Syntax Definitions

max-wait <i>milliseconds</i>	Specifies the maximum number of seconds to wait between two consecutively generated LSPs. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.
initial-wait <i>milliseconds</i>	Specifies the number of seconds to wait before triggering an initial LSP generation after a topology change. The valid range is 0–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait <i>milliseconds</i>	Specifies the minimum number of seconds to wait between the first and second generated LSPs. The valid range is 1000–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

Defaults

parameter	default
max-wait <i>milliseconds</i>	1000
initial-wait <i>milliseconds</i>	0
second-wait <i>milliseconds</i>	300

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- To reset all three of the LSP wait time intervals back to their default values, use the **spb isis lsp-wait** command without specifying any parameters.
- Subsequent LSP, if required, are generated at exponentially increasing intervals of the LSP **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 10 seconds, then the next LSP is generation is triggered after 20 seconds and the next LSP generated after that is triggered at 40 seconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the LSP wait interval will stay at the maximum value until there are no more LSP generations during that interval. After a full interval without any LSP generations, the LSP wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis lsp-wait max-wait 2000 initial-wait 1000 second-wait 1500
-> spb isis lsp-wait max-wait 5000
-> spb isis lsp-wait initial-wait 2500
-> spb isis lsp-wait second-wait 3000
-> spb isis lsp-wait
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[spb isis spf-wait](#)

Configures the time intervals between the first, second, and subsequent shortest path first (SPF) calculations.

[show spb isis info](#)

Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IisisSpbProtocolConfig
  alcatelIND1IisisSpbProtocolLspMaxWait
  alcatelIND1IisisSpbProtocolLspInitialWait
  alcatelIND1IisisSpbProtocolLspSecondWait
```

spb isis overload

Configures the LSP database overload state for the local ISIS-SPB switch and optionally specifies the amount of time the switch remains in this state. When the overload state is enabled, the switch signals to other ISIS-SPB switches that it is not able to accept transit traffic.

spb isis overload [**timeout** *seconds*]

no spb isis overload

Syntax Definitions

seconds Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

parameter	default
<i>seconds</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router (for example, it will not be used for other transit traffic).
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> spb isis overload timeout 70  
-> no spb isis overload
```

Release History

Release 7.3.1; command was introduced.

Related Commands

- spb isis overload-on-boot** Configures the ISIS-SPB instance to operate in an overload state during bootup for a specified time period.
- show spb isis info** Displays status and configuration information for the ISIS-SPB instance.

MIB Objects

```
alcatelIND1IisisSpbSysSetOverload  
alcatelIND1IisisSpbSysOverloadTimeout  
alcatelIND1IisisSpbSysOverloadStatus
```

spb isis overload-on-boot

Configures the ISIS-SPB switch to operate in the overload state after a system bootup for the specified amount of time.

spb isis overload-on-boot [*timeout seconds*]

no spb isis overload-on-boot

Syntax Definitions

seconds Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the ISIS-SPB switch will not operate in the overload state after a bootup.

parameter	default
<i>seconds</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent the switch from entering the overload state after bootup.
- An ISIS-SPB switch operating in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the switch to operate in the overload state after a bootup and until the timeout value expires or the **no** form of this command is used.
- The **no spb isis overload** command does not influence the overload-on-boot function.

Examples

```
-> spb isis overload-on-boot timeout 80
-> no spb isis overload-on-boot
```

Release History

Release 7.3.1; command was introduced.

Related Commands

spb isis overload

Sets the ISIS-SPB switch to operate in the overload state.

show spb isis info

spb isis graceful-restart

Configures graceful restart of the bridge. It allows ISIS-SPB to reconverge faster, minimizing service interruption.

spb isis graceful-restart

no spb isis graceful-restart

Syntax Definitions

N/A

Defaults

By default, the graceful restart functionality is enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the SPB bridge.
- When graceful restart is enabled, the bridge can either be a helper (which helps a neighbor router to restart) or a restarting router, or both.

Examples

```
-> spb isis graceful-restart  
-> no spb isis graceful-restart
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[spb isis graceful-restart helper](#) Configures the helper mode of routers for graceful restart.

MIB Objects

```
alcatelIND1IsisSpbProtocolConfig  
alcatelIND1IsisSpbProtocolGracefulRestart
```

spb isis graceful-restart helper

Administratively enables and disables the ISIS-SPB bridge to operate in the helper mode in response to a bridge performing a graceful restart.

spb isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the bridge.
disable	Disables the helper mode on the bridge.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When graceful restart is enabled, the helper mode is enabled by default.

Examples

```
-> spb isis graceful-restart helper disable
```

Release History

Release 7.3.1; command was introduced.

```

output definitions

System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
System Hostname	The system name assigned to the SPB bridge. Configured through the system name command.

output definitions (continued)

SPSourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode. Configured through the spb isis source-id command.
SPBM System Mode	Indicates if the SP source ID was manually set (manual) using the spb isis source-id command or automatically allocated (auto) using the last three least significant bytes of the System ID.
BridgePriority	The bridge priority value assigned to the SPB bridge. Configured through the spb isis bridge-priority command.
MT ID	The IS-IS Multi Topology ID.
Control BVLAN	The SPB base VLAN assigned to exchange ISIS-SPB control traffic with other SPB bridges. Configured through the spb isis control-bvlan command.
Area Address	The IS-IS area address for this ISIS-SPB instance. Configured through the spb isis area-address command.
Level Capability	The level capability of the bridge. Only Level 1 (L1) is supported.
Admin State	The state of the SPB instance for the bridge (Up or Down). Configured through the spb isis admin-state command.
LSDB Overload	The LSP database overload state of the switch. Configured through the spb isis overload command.
Last Enabled	The date and time when the ISIS-SPB instance was last enabled for the bridge.
Last SPF	The date and duration of the last shortest path first (SPF) calculation.
SPF Wait	The SPF wait time intervals used to trigger SPF calculations after a topology change. Configured through the spb isis spf-wait command.
LSP Lifetime	The Lifetime of the LSP, in seconds.
LSP Wait	The LSP wait time intervals used to trigger LSP generations. Configured through the spb isis lsp-wait command.
Graceful Restart	Indicates if graceful restart is Enabled or Disabled . Configured through the spb isis graceful-restart command.
GR helper-mode	Indicates if the graceful restart helper mode is Enabled or Disabled . Configured through the spb isis graceful-restart helper command.
# of L1 LSPs	The number of LSPs for Level-1 adjacency.
Control Address	The destination MAC address used for ISIS-SPB control frames. Configured through the spb isis control-address command.

Release History

Release 7.3.1; command was introduced.
 Release 7.3.2; **Control Address** field added.

Related Commands

show spb isis spf	Displays the shortest path first (SPF) information to all known SPB bridges for a specific BVLAN.
show spb isis bvlan	Displays the ISIS-SPB backbone VLAN (BVLAN) configuration for the bridge.

show spb isis bvlans

Displays the ISIS-SPB backbone VLAN (BVLAN) configuration for the bridge.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command also displays the equal cost tree (ECT) algorithm that is assigned to each BVLAN.

Examples

```
-> show spb isis bvlans
```

```
SPB ISIS BVLANS:
```

BVLAN	ECT-algorithm	In Use	Services mapped	Num ISIDS	Tandem Multicast	Root Bridge (Name : MAC Address)
501	00-80-c2-01	NO	NO	0	GMODE	BRIDGE-3:00:d1:95:00:30:02
502	00-80-c2-02	NO	NO	0	SGMODE	
503	00-80-c2-03	YES	NO	4	SGMODE	
504	00-80-c2-04	YES	NO	4	SGMODE	

```
BVLANS:          4
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN. Configured through the spb bvlan command.
ECT-algorithm	The equal cost tree (ECT) algorithm index (1–16) assigned to the BVLAN. Configured through the spb isis bvlan ect-id command.
In Use	Indicates whether or not the BVLAN is in use.
Services Mapped	Indicates whether or not any local services are mapped to the BVLAN.
Num ISIDS	The number of services known to the BVLAN.
Tandem Multicast	The tandem multicast mode (SGMODE or GMODE) for the BVLAN. Configured through the spb isis bvlan tandem-multicast-mode command.
Root Bridge (Name : MAC Address)	The system name and bridge MAC address of the root bridge. This value is displayed only for GMODE configurations.

Release History

Release 7.3.1; command was introduced.

Related Commands

Displays the ISIS-SPB network interface configuration for the bridge.

MIB Objects

N/A

show spb isis interface

Displays the ISIS-SPB network interface configuration for the switch.

show spb isis interface

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command also shows the operational and administrative status of the interface.
- When an SPB interface is created, the interface is automatically assigned to each SPB BVLAN in the switch configuration.

Examples

```
-> show spb isis interface
SPB ISIS Interfaces:
```

Interface	Level	CircID	Oper state	Admin state	Link Metric	Hello Intvl	Hello Mult
1/1	L1	1	DOWN	UP	10	9	3
1/2	L1	2	UP	UP	10	9	3
1/3	L1	3	DOWN	UP	10	9	3
1/4	L1	4	DOWN	UP	10	9	3
1/5	L1	5	DOWN	UP	10	9	3
1/6	L1	6	DOWN	UP	10	9	3
1/7	L1	7	DOWN	UP	10	9	3
1/10	L1	9	DOWN	UP	10	9	3

Interfaces : 8

output definitions

Interface	The slot/port or link aggregate ID of the SPB interface.
Level	The IS-IS Area Level (L1) for the interface.
CircID	The circuit ID of the interface.
Oper-state	The operational state of the interface (UP or DOWN).
Admin-state	The administrative state of the interface (UP or DOWN).
Link Metric	The metric value of the router for the corresponding area level.

output definitions

Hello Interval	The number of seconds the interface waits between Hello PDU transmissions.
Hello Multiplier	The number that is multiplied by the Hello Interval to determine the hold time.

Release History

show spb isis adjacency

Displays information about the ISIS-SPB adjacencies created for the SPB bridge.

show ip isis adjacency [detail]

Syntax Definitions

detail Displays additional information about the ISIS-SPB adjacencies.

Defaults

By default, a summary list of adjacency information is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip isis adjacency
SPB ISIS Adjacency:
System
(Name : SystemId)                Type State Hold Interface
-----+-----+-----+-----
      bridge2 : 00d0.9506.4c62    L1   UP   27     1/1
      bridge3 : 00d0.9507.9732    L1   UP   20     1/2
```

Adjacencies : 2

output definitions

Name	The system name assigned to the adjacent SPB bridge.
SystemId	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
Type	The level (LI) of the adjacent bridge.
State	The state of the adjacency (UP or DOWN).
Hold	The adjacency hold time, in seconds.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
Adjacencies	The total number of adjacent SPB bridges.

```

```

Adjacencies : 1

output definitions

SystemID	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
B-MAC	The backbone MAC address (system ID) of the adjacent bridge. This is the address that is used as the source address for encapsulated customer traffic that is tunneled through SPB services.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
State	The state of the adjacency (UP or DOWN).
Hold Time	The adjacency hold time, in seconds.
Adj Level	The adjacency level (L1) of the SPB bridge.
ExtLocalCktId(YES)	The circuit ID that the peer bridge has assigned to this adjacency.
Restart Support	Indicates if graceful restart is Enabled or Disabled .
Restart Status	Indicates whether the adjacent SPB bridge is helping the local bridge to restart (Not currently being helped or Currently being helped).
Restart Suppressed	Indicates whether or not the advertisement of LSPs is suppressed per the request of adjacent SPB bridge (Enabled or Disabled).
Hostname	The system name assigned to the adjacent SPB bridge.
Up Time	Indicates the time period in seconds, during which the SPB bridge was in the adjacency.
Priority	The bridge priority value of the adjacent SPB bridge.

output definitions

Max Hold	Indicates the maximum hold time of the adjacent SPB bridge.
NLPIDs	The Network Layer Protocol ID (NLPID) of the adjacent bridge (SPB NLPID = 0xC1).

Release History

Release 7.3.1; command was introduced.

Related Commands

Release History

Release 7.3.1; command was introduced.

Related Commands**show spb isis adjacency**

Displays information about the ISIS-SPB adjacencies created for the SPB bridge.

show spb isis nodes

Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

N/A

show spb isis nodes

Displays the discovered node-level parameter values for all of the ISIS-SPB switches participating in the topology.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command displays the system name, system ID, SPsource ID, and bridge priority parameter values for the bridges discovered within the ISIS-SPB topology.

Examples

```
-> show spb isis nodes
SPB ISIS Nodes:
```

System Name	System Id	SourceID	BridgePriority
Bridge-1	00e0.b1e7.0188	0x70188	32768 (0x8000)
Bridge-2	00e0.b1e7.0bd3	0x70bd3	32768 (0x8000)
Bridge-4	e8e7.3200.2a1d	0x02a1d	32768 (0x8000)
Bridge-5	e8e7.3233.1891	0x31891	32768 (0x8000)
Bridge-6	e8e7.3233.199d	0x3199d	32768 (0x8000)
Bridge-7	e8e7.3233.1a29	0x31a29	32768 (0x8000)
Bridge-8	e8e7.3233.1c81	0x31c81	32768 (0x8000)

output definitions

System Name	The system name assigned to the SPB bridge.
System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
SourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode.
BridgePriority	The bridge priority value assigned to the SPB bridge.

Release History

Release 7.3.1; command was introduced.

show spb isis bvlan	Displays status and configuration information for the SPB instance.
show spb isis multicast-table	Displays the multicast forwarding information for the specified service instance identifier (I-SID).

MIB Objects

N/A

show spb isis services

Displays the service instance identifier (I-SID) mapping for bridges participating in the SPB topology. This command provides a network-wide view of existing services to help verify that SPB services are correctly advertised and learned by ISIS-SPB.

show spb isis services [*isid instance_id* | *bvlan bvlan_id*]

Syntax Definitions

instance_id An existing I-SID number.
bvlan_id The VLAN ID of an existing BVLAN.

Defaults

By default, the mapping for all I-SIDs in the SPB topology is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **isid** *instance_id* number to display information for a specific service instance.
- Use the **bvlan** *bvlan_id* parameter to display information for a specific BVLAN.

Examples

```
-> show spb isis services
```

Legend: * indicates locally configured ISID

SPB ISIS Services Info:

MIB Objects

N/A

show spb isis ingress-mac-filter

Displays the ingress MAC filter for multicast traffic for a given BVLAN operating in the (*,G) mode.

show spb isis ingress-mac-filter [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*] | **bvlan** *bvlan_id* | **bmac** *mac_address*]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>bvlan_id</i>	The VLAN ID of an existing BVLAN.
<i>mac_address</i>	The source MAC address of the multicast traffic allowed on the specified BVLAN and physical port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the optional command parameters to display specific information with this command.
- Each of the optional command parameters can be combined with any of the other optional parameters within the same command line.

Examples

```
-> show spb isis ingress-mac-filter
SPB ISIS Ingress MAC Table (for GMODE bvlan only):
      Inbound      Multicast source MAC
  BVLAN  Interface  (Name : MAC Address)

10 Service Manager Commands

The Alcatel-Lucent OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard, and Virtual eXtensible LAN (VXLAN), as defined in the IETF “VXLAN: A Framework for Overlaying Layer 2 Virtualized Networks over Layer 3 Networks” standard.

- The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free paths through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the MAC-in-MAC method for data encapsulation. An SPBM service transports the encapsulated traffic over the ISIS-SPB infrastructure.
- VXLAN is a Layer 2 overlay network that is used to segment and tunnel device traffic. The backbone (control plane) layer is built through a flooding and learning process. A VXLAN service transports encapsulated traffic through the network. This allows Layer 2 communication between local and remote devices over a Layer 3 network.

The OmniSwitch Service Manager application provides the ability to configure and manage a service-based architecture consisting of the following logical entities that are required to provision a service:

- **Access Port**—A port or link aggregate configured as an SPB or VXLAN access port. This type of port defines the point at which traffic from other provider networks or directly from customer networks enters the network infrastructure. The access port is also associated with a Layer 2 profile that specifies how to process protocol control frames received on the port.
- **SPBM or VXLAN Service**—A flooding domain for network traffic. A service defines a Virtual Forwarding Instance (VFI) that is capable of learning device MAC addresses from the access side and from the network side and then switching the traffic based on this information.
- **Service Access Point (SAP)**—A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID or a VXLAN service ID and specifies the type of customer traffic (untagged, single-tagged, double-tagged, or all) to encapsulate and tunnel through the network infrastructure.
- **Service Distribution Point (SDP)**—An SDP provides a logical point at which customer traffic is directed from one backbone edge switch to another. SDPs are used to set up distributed services, which consist of at least one SAP on a local node, one SAP on a remote node, and an SDP binding the service on both nodes.
- **Bind-SDP**—Represents the binding of a service instance to an SDP. The SDP then distributes the service connectivity to other backbone edge switches.
- **Service Instance Identifier (I-SID)**—An SPB backbone service instance that will tunnel the encapsulated data traffic through the network infrastructure. The I-SID is bound to an SPB backbone VLAN (BVLAN) ID and a Service Manager SPB service ID when the service is created.

- **Virtual Network Identifier (VNID)**—The VNID is a 24-bit segment ID (also referred to as a VXLAN segment ID) that is used to identify encapsulated VM frames. A VNID is bound to a Service Manager VXLAN service ID when the service is created.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the service-based architecture. For commands used to configure and verify the ISIS-SPB backbone, see [Chapter 9, “Shortest Path Bridging Commands.”](#)

MIB information for the Service Manager commands is as follows:

Filename: ALCATEL-IND1-SERVICE-MGR-MIB
Module: alcatelIND1ServiceMgrMIB

A summary of the available commands is listed here:

Service Commands	service spb service vxlan service description service multicast-mode service stats service vlan-xlation service admin-state service vxlan udp-port service vxlan vrf show service show service ports show service sap show service debug-info show service info
Service Access Port Commands	service l2profile service access service access l2profile service access vlan-xlation show service l2profile show service access
Service Access Point (SAP) Commands	service sap service sap description service sap trusted service sap stats service sap admin-state
Service Distribution Point (SDP) Commands	service sdp service bind-sdp show service sdp show service sdp spb show service sdp vxlan show service bind-sdp show service bind-sdp spb show service bind-sdp vxlan
Statistics Commands	clear service counters show service counters
Remote Fault Propagation (RFP)	service rfp local-endpoint service rfp remote-endpoint show service rfp show service rfp configuration

service spb

Configures a Shortest Path Bridging (SPB) service and associates that service with a backbone service instance identifier (I-SID) and BVLAN. An SPB service connects multiple customer sites together across a provider-managed core network by creating a virtual zero-hop, Layer 2 switched domain.

This section describes the base command along with the other optional command keywords that are used to configure SPB service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

```
service service_id[-service_id2] spb isid instance_id[-instance_id2] bvlan bvlan_id[:x]
  [description desc_info]
  [multicast-mode {head-end | tandem | hybrid}]
  [stats {enable | disable}]
  [vlan-xlation {enable | disable}]
  [admin-state {enable | disable}]
```

```
no service service_id spb
```

Syntax Definitions

<i>service_id</i> [- <i>service_id2</i>]	A unique numerical value to identify a specific SPB service. The valid service ID range is 1–32767. Use a hyphen to configure a range of SPB service IDs (10-13).
<i>instance_id</i> [- <i>instance_id2</i>]	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214. Use a hyphen to configure a range of I-SIDs (300-303).
<i>bvlan_id</i> [: <i>x</i>]	The VLAN ID number of an existing SPB BVLAN. To specify a range of BVLANS to assign to a range of services, append the “:x” syntax, where “x” is the number of BVLANS to assign in sequence (for example, 4000:4 would assign BVLANS 4000, 4001, 4002, and 4003).

Defaults

When an SPB service is created without specifying any of the optional parameter values, the service is created with the following default values:

parameter	default
tandem head-end hybrid	head-end
description <i>desc_info</i>	no description added
stats { enable disable }	disable
vlan-xlation { enable disable }	disable
admin-state { enable disable }	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- To remove an SPB service, administratively disable the service (including any associated SAPs and SDPs) then use the **no** form of this command and specify the service ID of the disabled service.
- SPB services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the SPB service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- An SPB service provides E-LAN connectivity for customer traffic and is identified by an I-SID. Services are bound to service access ports (SAPs) on the access side. On the network side they are automatically bound to service distribution points by the ISIS-SPB protocol.
- Each SPB service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (Mesh SDP) and then switching the traffic based on this information.

Examples

```
-> service 100 spb isid 1000 bvlan 4001
-> service 200 spb isid 2000 bvlan 4001 vlan-xlation enable multicast-mode head-end
description "SPB service for ISID 2000 in Head-end mode"
-> service 1-100 spb isid 1000-1100 bvlan 4000:4 multicast-mode tandem description
"100 SPB Services with ISIDs from 1000-1100 and BVLANS from 4000-4003"
-> no service 100 spb
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for specifying a range of IDs, ISIDs, and BVLANS added.

Related Commands

[show service](#) Displays the service configuration for the bridge.

  alaSvcDescription
  alaSvcStatsAdminStatus
  alaSvcMulticastMode
  alaSvcAdminStatus
  alaSvcSapVlanXlation
```

service vxlan

Configures a Virtual eXtensible LAN (VXLAN) service. This section describes the base command along with the other optional command keywords that are used to configure VXLAN service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

```
service service_id[-service_id2] vxlan vnid {vxlan_id[-vxlan_id2] | xxx.xxx.xxx[-xxx.xxx.xxx]}
  [description desc_info]
  [multicast-mode [tandem | head-end | hybrid]
  [stats {enable | disable}]
  [vlan-xlation {enable | disable}]
  [admin-state {enable | disable}]
```

```
no service service_id vxlan
```

Syntax Definitions

<i>service_id</i> [- <i>service_id2</i>]	A unique numerical value to identify a specific VXLAN service. The valid service ID range is 1–32767. Use a hyphen to specify a range of VXLAN services.
<i>vxlan_id</i> [- <i>vxlan_id2</i>]	A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1– 2147483647 (or 000.000.001–255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).

Defaults

When a VXLAN service is created without specifying any of the optional parameter values, the service is created with the following default values:

parameter	default
description <i>desc_info</i>	no description added
tandem head-end hybrid	hybrid
stats {enable disable}	disable
vlan-xlation {enable disable}	disable
admin-state {enable disable}	disable

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- To remove a VXLAN service, administratively disable the service then use the **no** form of this command and specify the service ID of the disabled service.

- VXLAN services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the VXLAN service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- A VXLAN service provides E-LAN connectivity for customer traffic and is bound to a Service Access Ports (SAP) on the access side. On the network side, the service is bound to a unicast or multicast Service Distribution Point (SDP).
- Each VXLAN service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (mesh SDP) and then switching the traffic based on this information.

Examples

```
-> service 10 vxlan vnid 1000 description "VxLAN service for VNID 1000 in hybrid
multicast mode" admin-state enable
-> service 20 vxlan vnid 2000 multicast-mode headend description "VxLAN Service for
VNID 2000 in headend mode only" admin-state enable
-> service 30 vxlan vnid 3000 multicast-mode tandem description "VxLAN Service for
VNID 3000 in tandem mode only" admin-state enable
-> service 1-100 vxlan vnid 1000-1100 stats enable description "100 VxLAN Services
with VNIDs from 1000-1100"
-> no service 20 vxlan
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service description	Modifies the description information for the service.
service multicast-mode	Modifies the multicast replication mode for the service.
service stats	Modifies the status of statistics collection for the service.
service vlan-xlation	Modifies the status of VLAN translation for the service.
service admin-state	Modifies the administrative status for the service.
service vxlan udp-port	Configures the UDP destination port for all encapsulated VXLAN frames.
service vxlan vrf	Configures the current VRF instance for the VXLAN segment.
service sdp	Manually configures a unicast or multicast VXLAN SDP.
service bind-sdp	Binds VXLAN services to VXLAN SDPs.
show service	Displays the service configuration for the bridge.

MIB Objects

alaSvcBaseInfoTable
 alaSvcId
 alaSvcType
 alaSvcVnid
 alaSvcDescription
 alaSvcAdminStatus
 alaSvcAllocationType
 alaSvcStatsAdminStatus
 alaSvcMulticastMode
 alaSvcSapVlanXlation

service description

Configures a description for the specified service.

service {*service_id* | **all**} **description** *desc_info*

no service {*service_id* | **all**} **description**

Syntax Definitions

<i>service_id</i>	An existing service ID number.
all	Applies this command to all service ID numbers.
<i>desc_info</i>	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the service is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified service ID.
- This command adds or modifies a description for an existing service. However, the **description** parameter is also used to specify a description at the time the service is created.

Examples

Adding or modifying a description for an existing service:

```
-> service 100 description "SPB service for ISID 1234"  
-> service 200 description "VXLAN service for VNID 24000"  
-> service 200 no description
```

Configuring a new service with a description:

```
-> service 100 isid 1234 bvlan 3000 description "SPB service for ISID 1234"  
-> service 200 vxlan vnid 24000 description "VXLAN service for VNID 24000"
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service stats	Configures the statistics collection status for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable  
  alaSvcId  
  alaSvcDescription
```

service multicast-mode

Configures the multicast replication mode for the specified service.

```
service {service_id | all} multicast-mode {head-end | tandem | hybrid}
```

Syntax Definitions

<i>service_id</i>	An existing service ID number.
all	Applies this command to all service ID numbers.
tandem	Specifies the tandem replication mode for the service.
head-end	Specifies the head-end replication mode for the service.
hybrid	Specifies the hybrid replication mode for the service. This mode uses both the head-end and tandem methods.

Defaults

By default, an SPB service is configured to use the head-end mode and a VXLAN service is configured to use the hybrid mode.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When an SPB service is configured to use the head-in mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- When a VXLAN service is configured to use the head-in mode, traffic is sent through a unicast SDP (an SDP configured with a far-end IP address).
- When a VXLAN service is configured to use the tandem mode, PIM routing is used and traffic is sent through a multicast SDP (an SDP configured with a multicast group address).
- The following multicast mode functionality is supported for VXLAN services:
 - **Tandem:** In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This requires the manual configuration of a multicast SDP object to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
 - **Head-end:** In this mode, unicast SDP objects are also manually configured to tunnel traffic to the far-end nodes. In this case, however, PIM multicast routing is not required. Any broadcast, unknown unicast, and multicast (BUM) traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
 - **Hybrid:** In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.

- Make sure that the same multicast mode is used across all nodes for a given BVLAN. Tandem nodes and head-end nodes cannot communicate with each other.
- This command configures the multicast mode for an existing service. However, the **multicast-mode {head-end | tandem | hybrid}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the multicast mode for an existing service:

```
-> service 100 multicast-mode hybrid
-> service 150 multicast-mode head-end
-> service all multicast-mode tandem
```

Configuring the multicast mode for a new service:

```
-> service 100 spb isid 2345 bvlan 3000 multicast-mode tandem
-> service 150 vxlan vnid 24000 multicast-mode head-end
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service stats	Configures the statistics collection status for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
  alaSvcId
  alaSvcMulticastMode
```

service stats

Configures ingress and egress statistics collection for packets flowing through the service access point (SAP) or service distribution point (SDP) bindings associated with the specified service.

```
service {service_id | all} stats {enable | disable}
```

Syntax Definitions

<i>service_id</i>	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Administratively enables statistics gathering for the service.
disable	Administratively disables statistics gathering for the service.

Defaults

By default, statistics collection is disabled when the service is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command configures statistics collection for an existing service. However, the **stats {enable | disable}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring statistics collection for an existing service:

```
-> service 100 stats enable
-> service all stats enable
-> service 100 stats disable
-> service all stats disable
```

Configuring statistics collection for a new service:

```
-> service 200 isid 2345 bvlan 3000 stats enable
-> service 300 isid 3456 bvlan 2000 stats disable
-> service 200 vxlan vnid 24000 stats enable
-> service 200 vxlan vnid 24000 stats disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable  
  alaSvcId  
  alaSvcStatsAdminStatus
```

service vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.

```
service {service_id | all} vlan-xlation {enable | disable}
```

Syntax Definitions

<i>service_id</i>	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Enables VLAN translation for the service.
disable	Disables VLAN translation for the service.

Defaults

By default, VLAN translation is disabled when the service is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enabling translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.
- This command configures the VLAN translation status for an existing service. However, the **vlan-xlation {enable | disable}** parameter is also used to specify the status at the time a service is created.

Examples

Configuring the status for an existing service:

```
-> service 100 vlan-translation enable
-> service all vlan-translation enable
-> service 100 vlan-translation disable
-> service all vlan-translation disable
```

Configuring the status for a new service:

```
-> service 200 isid 2345 bvlan 3000 vlan-translation enable
-> service 300 isid 3456 bvlan 2000 vlan-translation disable
-> service 200 vxlan vnid 24000 vlan-translation enable
-> service 200 vxlan vnid 24000 vlan-translation disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service stats	Configures the statistics collection status for the specified service.
service admin-state	Configures the administrative status of the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable  
  alaSvcId  
  alaSvcSapVlanXlation
```

service admin-state

Configures the administrative status of the specified service.

```
service {service_id | all} admin-state {enable | disable}
```

Syntax Definitions

<i>service_id</i>	An existing service ID number.
all	Applies this command to all service ID numbers.
enable	Administratively enables the service.
disable	Administratively disables the service.

Defaults

By default, the administrative status is disabled when the service is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Disable the administrative status of the service and any associated service access points (SAPs) and service distribution points (SDPs) before attempting to remove a service.
- Disabling the administrative status does not remove the service configuration from the bridge.
- This command configures the administrative status for an existing service. However, the **admin-state {enable | disable}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the status for an existing service:

```
-> service 100 admin-state enable
-> service all admin-state enable
-> service 100 admin-state disable
-> service all admin-state disable
```

Configuring the status for a new service:

```
-> service 200 isid 2345 bvlan 3000 admin-state enable
-> service 300 isid 3456 bvlan 2000 admin-state disable
-> service 200 vxlan vnid 24000 admin-state enable
-> service 200 vxlan vnid 24000 admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service spb	Configures an SPB service.
service vxlan	Configures a VXLAN service.
service description	Configures a description for the specified service.
service multicast-mode	Configures the multicast replication mode for the specified service.
service stats	Configures the statistics collection status for the specified service.
service vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable  
  alaSvcId  
  alaSvcAdminStatus
```

service vxlan udp-port

Configures the UDP destination port for all encapsulated VXLAN frames on the gateway switch. Use this command to support previous implementations of the VXLAN functionality that did not use the well-known UDP port 4789. Note that only gateway devices using the same destination UDP port number can exchange encapsulated VXLAN frames.

```
service vxlan udp-port {udp_port_num | default}
```

Syntax Definitions

<i>udp_port_num</i>	The UDP destination port number to use for VXLAN traffic.
default	Use the well-known UDP destination port number (4789) for VXLAN traffic.

Defaults

By default, the well-known UDP port number 4789 is used in the default VRF instance.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.

Examples

```
-> service vxlan udp-port 8472  
-> service vxlan udp-port default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service vxlan vrf	Configures the VRF instance for the VXLAN segment.
service vxlan	Configures a VXLAN service.
show service info	Displays the destination UDP port value applied to VXLAN traffic.

MIB Objects

```
alaSvcMgrSysTable  
  alaSvcMgrVxlanDestUdpPort
```

service vxlan vrf

Configures the current VRF instance for the VXLAN gateway.

```
service vxlan vrf {vrf_name | default}
```

Syntax Definitions

<i>vrf_name</i>	The name of an existing VRF instance.
default	Use the default VRF instance.

Defaults

By default, the default VRF instance is used.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Administratively disable all configured SDPs first before changing the VRF instance for the VXLAN segment.
- If the VRF instance that is associated with a VXLAN segment is removed, the VXLAN segment is automatically assigned to the default VRF instance.
- Avoid configuring the same Loopback0 address in multiple VRF instances. Each VRF instance should have a unique Loopback0 address.

Examples

```
-> service vxlan vrf IpVxlan  
-> service vxlan vrf default
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service vxlan	Configures a VXLAN service.
show service info	Displays the current VRF instance for the VXLAN network.

MIB Objects

```
alaSvcMgrSysTable  
  alaSvcMgrVxlanCurrentVrf
```

service l2profile

Configures a Layer 2 profile that is applied to an access (customer facing) port. This profile is used to specify how to process Layer 2 control frames ingressing on the access port.

service l2profile *profile-name* [**stp** | **802.1x** | **802.1ab** | **802.3ad** | **gvrp** | **mvrp** | **amap**] [**peer** | **discard** | **tunnel**]

no service l2profile *profile-name*

Syntax Definitions

<i>profile-name</i>	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").
stp	Specifies how to process Spanning Tree BPDU.
802.1x	Specifies how to process 802.1x control frames.
802.1ab	Specifies how to process 802.1ab control frames.
802.3ad	Specifies how to process 802.3ad control frames.
gvrp	Specifies how to process GARP VLAN Registration Protocol packets.
mvrp	Specifies how to process Multiple VLAN Registration Protocol packets.
amap	Specifies how to process Alcatel-Lucent Management Adjacency Protocol packets.
peer	Allows the access port to participate in the specified protocol. Control packets are not sent to the network side of the node.
discard	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.

Defaults

If no parameters are specified with this command, the new profile inherits all the following protocol settings from the default profile (**def-access-profile**):

parameter	default
stp	tunnel
802.1x	discard
802.1ab	discard
802.3ad	peer
gvrp	tunnel
mvrp	tunnel
amap	discard

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a Layer 2 profile. Removing the **def-access-profile** is not allowed.
- Remove any profile associations with access ports before attempting to modify or delete the profile.
- Not all of the control protocols are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

Protocol	Reserved MAC	peer	discard	tunnel
STP	01-80-C2-00-00-00	no	yes	yes
802.1x	01-80-C2-00-00-03	no	yes	yes
802.1ab	01-80-C2-00-00-0E	no	yes	yes
802.3ad	01-80-C2-00-00-02	yes	no	no
GVRP	01-80-C2-00-00-21	no	yes	yes
MVRP	01-80-C2-00-00-21	no	yes	yes
AMAP	00-20-DA-00-70-04	no	yes	no

- If a user-configured Layer 2 profile is *not* associated with an access port, then the **def-access-profile** is used to process control packets that ingress on the port.

Examples

```
-> service l2profile sap_1_profile stp discard
-> no service l2profile sap_1_profile
-> service l2profile DropL2
-> service l2profile DropL2 stp discard gvrp discard 802.1ab discard
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service access l2profile	Assigns a Layer 2 profile to the specified service access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.

MIB Objects

```
alaServiceMgrPortProfileTable  
  alaServiceMgrPortProfileID  
  alaServiceMgrPortProfileStpBpduTreatment  
  alaServiceMgrPortProfile8021xTreatment  
  alaServiceMgrPortProfile8021ABTreatment  
  alaEServiceUNIPProfileGvrpTreatment  
  alaServiceMgrPortProfileAmapTreatment  
  alaServiceMgrPortProfile8023ADTreatment
```

service access

Configures a switch port or link aggregate as an access port on which device traffic enters or leaves a service domain.

service access {**port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]} [**description** *port_description*]

service access {**port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]} **no description**

no service access {**port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>port_description</i>	An alphanumeric string (1–128 characters).

Defaults

parameter	default
<i>port_description</i>	No description

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to revert the port mode back to a regular switch port or link aggregate. Make sure the access port is not associated with any Service Access Points (SAPs) before attempting to change the port mode.
- Use the **no** form of the **description** parameter to remove only the description information from the access port. This option does not remove the access port designation, just the description text that was assigned to the port.
- Access ports are required to configure a SAP. A SAP is the point at which customer traffic enters and exits the service. SAPs are not configurable on other port types.

Examples

```
-> service access port 1/1/3-10
-> service access linkagg 10-12
-> service access port 1/1/6 description "Voice Access Port"
-> service access port 2/1/6 description "L3 VPN Loopback Port"
-> service access linkagg 100 description "Server Access Port"
-> service access port 2/1/6 no description
-> no service access port 1/1/3
-> no service access linkagg 10
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.2; **description** parameter added.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72)..

Related Commands

service l2profile	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames that ingress on the access port.
service access l2profile	Assigns a Layer 2 profile to the specified service access port.
service access vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.
show service access	Displays the access (customer-facing) port configuration for the bridge.

MIB Objects

```
alaServiceMgrPortTable
  alaServiceMgrPortID
  alaServiceMgrPortMode
  alaServiceMgrPortDescription
```

service access l2profile

Assigns an existing Layer 2 profile to the specified service access port. This profile determines how Layer 2 protocol frames received on the access port are processed.

```
service access {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} l2profile {default | profile-name}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
default	Assigns the default profile to the specified port.
<i>profile-name</i>	The name of an existing Layer 2 profile.

Defaults

By default, the default Layer 2 profile (**def-access-profile**) is assigned when a port is configured as a service access port.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **default** parameter with this command to revert the associated profile back to the default profile settings.
- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- Specify a profile name that already exists in the switch configuration.

Examples

```
-> service access port 1/3 l2profile sap_1_profile
-> service access linkagg 10 l2profile sap_1_profile
-> service access port 1/3 l2profile default
-> service access linkagg 10 l2profile default
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service l2profile	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.
show service access	Displays the access (customer-facing) port configuration for the switch.

MIB Objects

```
alaServiceMgrPortTable  
  alaServiceMgrPortID  
  alaServiceMgrPortMode  
  alaServiceMgrPortPortProfileID
```

service access vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.

service access {**port** *chassis/slot/port[-port2]* / **linkagg** *agg_id[-agg_id2]*} **vlan-xlation** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables VLAN translation for the specified port.
disable	Disables VLAN translation for the specified port.

Defaults

By default, VLAN translation is disabled when a port or link aggregate is configured as an access port.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to interfaces configured as network ports.
- Enabling VLAN translation on a access port implicitly enables translation for all SAPs associated with that port. However, translation must also be enabled for the services associated with these SAPs. This ensures that all SAPs associated with a service will apply VLAN translation.

Examples

```
-> service access port 1/3 vlan-xlation enable
-> service access linkagg 10 vlan-xlation enable
-> service access port 1/3-10 vlan-xlation disable
-> service access linkagg 10-15 vlan-xlation disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service vlan-xlation	Configures the status of egress VLAN translation for the specified SPB service.
show service access	Displays the access (customer-facing) port configuration for the switch.

MIB Objects

```
alaServiceMgrPortTable  
  alaServiceMgrPortID  
  alaServiceMgrPortMode  
  alaServiceMgrPortVlanXlation
```

service sap

Configures a Service Access Point (SAP) by associating a SAP ID with a Shortest Path Bridging (SPB) service or a Virtual eXtensible LAN (VXLAN) service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of network traffic to map to the associated service.

This section describes the base command along with the other optional command keywords that are used to configure SAP parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default value.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
  [:0 | :all | :qtag[-qtag2] / :outer_qtag.inner_qtag]
  [description desc_info]
  [trusted | un-trusted [priority]]
  [stats {enable | disable}]
  [admin-state {enable | disable}]
```

```
no service service_id sap {port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]} [:0 | :all | :qtag[-qtag2] / :outer_qtag.inner_qtag]
```

Syntax Definitions

<i>service_id</i>	An existing SPB or VXLAN service ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag [- <i>qtag2</i>]	Specifies a VLAN ID tag for ingress traffic on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:outer_qtag . <i>inner_qtag</i>	Specifies an outer VLAN ID tag and an inner VLAN tag for ingress traffic on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

When a SAP is created without specifying any optional parameter values, the SAP is created with the following defaults:

parameter	default
:0 :all :qtag / :outer_qtag.inner_qtag	:0 (null - untagged traffic)
description <i>desc_info</i>	No description added
trusted un-trusted [<i>priority</i>]	trusted
stats enable disable	disable
admin-state enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a SAP from the specified service.
- The **:all** (wild card) parameter is also configurable as the inner tag value for double-tagged packets (for example, “10:all” specifies double-tagged packets with an outer tag equal to VLAN 10 and an inner tag with any VLAN ID value).
- Specify only ports or link aggregates that are configured as service access ports (see [service access](#)). This command does not apply to network ports.
- Configuring SAPs with different encapsulation types for the same access port is allowed.
- When specifying a range of VLAN IDs with this command on an OmniSwitch 6900-Q32 or OmniSwitch 6900-X72, consider the following guidelines:
 - Each service access port supports a maximum of 8 SAPs that are created with a range of VLANs.
 - A total of 255 service access ports can support a range of VLANs at any given time.
 - The range of VLANs specified for the SAPs of a service access port cannot overlap each other.
 - For double-tagged SAPs, separate range commands can be specified for both outer and inner VLAN tags.
 - The outer VLAN range space is shared with the same space as QTAG SAP. The combined limit is 8 unique ranges per service access port. This is in addition to the 8 unique inner VLAN range per service access port.

Examples

```

-> service 100 sap port 1/1:0
-> service 100 sap port 1/1:50 description "Server1 to VXLAN10 SAP"
-> service 100 sap port 2/10:100.200 admin-state enable
-> service 100 sap port 2/10:500.all untrusted stats enable
-> service 100 sap linkagg 5:10
-> service 200 sap linkagg 2:20.30
-> service 200 sap linkagg 9:all untrusted 3 stats enable admin-state enable
-> no service 100 sap port 1/1:50 description
-> no service 100 sap port 2/10:100.200
-> no service 200 sap linkagg 9:all

```

```
-> service 10 sap port 1/11-20:21-30 description "SAPs on ports 1/11 to 1/20 with
tag 21 to 30"
-> service 20 sap linkagg 1-10:100 un-trusted description "Untrusted SAPs for lag
1-10 with tag 100"
-> service 30 sap port 1/2:10-20 description "SAP on port 1/2 with only one VP for
tag 10-20"
-> service 30 sap linkagg 11:10-20 description "SAP on lag 11 with only one VP for
tag 10-20"
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service objects only supported on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Related Commands

service description	Configures a description for the specified SAP ID.
service sap trusted	Configures the trust mode for the specified SAP ID.
service sap stats	Configures statistics collection for the specified SAP ID.

  alaSapPortId
  alaSapEncapValue
  alaSapType
  alaSapDescription
  alaSapTrusted
  alaSapPriority
  alaSapStatsAdminStatus
  alaSapAdminStatus
```

service sap description

Configures a description for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} description desc_info
```

```
no service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag] description
```

Syntax Definitions

<i>service_id</i>	An existing SPB or VXLAN service ID number.
<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag [- <i>qtag2</i>]	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
<i>desc_info</i>	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the SAP is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified SAP.
- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service 10 sap port 1/2:10 description "CE1 to SPB10 SAP"
-> service 13 sap linkagg 20:100.200 description "CE2 to SPB13 SAP"
```

```
-> service 15 sap port 1/11-20:21-30 description "SAPs on ports 1/11 to 1/20 with
tag 21 to 30"
-> service 30 sap port 1/2:10-20 description "SAP on port 1/2 with only one VP for
tag 10-20"
-> service 10 sap port 1/2:10 no description
-> service 13 sap linkagg 20:100.200 no description
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service objects only supported on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Related Commands

service sap	Configures a SAP by associating a SAP ID with a SPB service.
service sap trusted	Configures the trust mode for the specified SAP ID.
service sap stats	Configures statistics collection for the specified SAP ID.
service sap admin-state	Configures the administrative status for the specified SAP ID.
show service ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
  alaSapPortId
  alaSapEncapValue
  alaSapDescription
  alaSapSvcId
```

service sap trusted

Configures the trust mode for the specified Service Access Port (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

A trusted SAP can accept 802.1p values in incoming packets; an untrusted SAP will set any 802.1p values to zero in incoming packets, unless an 802.1p value is configured with this command.

```
service service_id sap {port chassis/slot/port | linkagg agg_num} [:0 | :all | :qtag /
:outer_qtag.inner_qtag] {trusted | un-trusted [priority]}
```

Syntax Definitions

<i>service_id</i>	An existing SPB or VXLAN service ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
<i>:qtag[-qtag2]</i>	Specifies a VLAN ID tag for traffic received on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
<i>:outer_qtag.inner_qtag</i>	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic received on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
trusted	Allows the SAP to use the priority value obtained from tagged packets received on the SAP port. Untagged packets use the default port priority value.
un-trusted	Sets the priority value to zero for tagged and untagged packets received on the SAP. This is the priority assigned to tagged and untagged packets received on an untrusted SAP.
<i>priority</i>	The priority value to set for tagged and untagged packets received on an untrusted SAP. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

By default, the SAP is trusted with the priority set to best effort (zero). These default values are set when a port is configured as an access port and then associated with the SAP.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **un-trusted** and the *priority* parameter options to assign an 802.1p priority value to ingress packets processed by the SAP. When the **un-trusted** parameter is used without specifying a priority value, a value of zero is automatically assigned to the ingress packets.
- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
- Administratively disabling the SAP is not required to change the trust mode for the SAP.
- When the trust mode is changed from untrusted to trusted, the priority value is automatically set to the default best effort priority value (zero).
- Note that untagged Layer 2 control packets (for example, BPDU, GVRP, and AMAP) are always tunneled (if enabled) through the provider backbone bridge (PBB) network with the default EXP bits set to 7, so that they can arrive at the destination bridge at the highest COS queue of 7. As a result, trusted and untrusted SAPs configured on the access ports will not affect the Layer 2 control packets ingressing on the access ports.
- Configuring the trust mode on an access port is not allowed. These settings are configured for the SAP to which the access port is associated.

Examples

```
-> service 10 sap 1/2:10 trusted
-> service 13 linkagg 20 trusted
-> service 10 sap 1/2:10 un-trusted
-> service 13 linkagg 20 un-trusted 5
-> service 20 sap linkagg 1-10:100 un-trusted
-> service 30 sap linkagg 11:10-20 trusted
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service objects only supported on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Related Commands

service sap	Configures a SAP by associating a SAP ID with a SPB service.
service sap description	Configures a description for the specified SAP ID.
service sap stats	Configures statistics collection for the specified SAP ID.
service sap admin-state	Configures the administrative status for the specified SAP ID.
show service ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
  alaSapPortId
  alaSapEncapValue
  alaSapTrusted
  alaSapPriority
  alaSapSvcId
```

service sap stats

Configures ingress and egress statistics collection for packets flowing through the specified SAP ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} stats {enable | disable}
```

Syntax Definitions

<i>service_id</i>	An existing SPB or VXLAN service ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag[-qtag2]	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables statistics collection for the SAP.
disable	Disables statistics collection for the SAP.

Defaults

By default, statistics collection is disabled for the SAP.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Specify the service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service 100 sap port 1/2:10 stats enable
-> service 101 sap linkagg 20:all stats enable
-> service 100 sap port 1/2:10 stats disable
-> service 101 sap linkagg 20:all stats disable
```

```
-> service 10 sap port 1/11-20:21-30 stats enable
-> service 30 sap linkagg 11:10-20 stats disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service objects only supported on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Related Commands

service sap	Configures a SAP by associating a SAP ID with a SPB service.
service sap description	Configures a description for the specified SAP ID.
service sap trusted	Configures the trust mode for the specified SAP ID.
service sap admin-state	Configures the administrative status for the specified SAP ID.
show service ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
  alaSapPortId
  alaSapEncapValue
  alaSapStatsAdminStatus
  alaSapSvcId
```

service sap admin-state

Configures the administrative status for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} { :0 | :all | :qtag[-qtag2]
| :outer_qtag.inner_qtag } admin-state {enable | disable}
```

Syntax Definitions

<i>service_id</i>	An existing SPB or VXLAN service ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
<i>:qtag[-qtag2]</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30)
<i>:outer_qtag.inner_qtag</i>	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables the administrative status for the SAP.
disable	Disables the administrative status for the SAP.

Defaults

By default, the administrative status of the SAP is enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
- Disabling the SAP administrative status does not remove the SAP configuration from the bridge.
- If an access port goes down, all SAPs associated with that port are operationally taken down as well.

Examples

```
-> service 10 sap port 1/2:10 admin-state enable
-> service 13 sap linkagg 20 admin-state enable
-> service 10 sap port 1/2:10 admin-state disable
-> service 13 sap linkagg 20 admin-state disable
-> service 10 sap port 1/11-20:21-30 admin-state enable
-> service 30 sap linkagg 11:10-20 admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service objects only supported on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.

Related Commands

service sap	Configures a SAP by associating a SAP ID with a SPB service.
service description	Configures a description for the specified SAP ID.
service sap trusted	Configures the trust mode for the specified SAP ID.
service sap stats	Configures statistics collection for the specified SAP ID.
show service ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
  alaSapPortId
  alaSapEncapValue
  alaSapAdminStatus
  alaSapSvcId
```

service sdp

Configures a Service Distribution Point (SDP) for Virtual eXtensible LAN (VXLAN) traffic. This type of SDP is used to tunnel unicast or multicast traffic between VXLAN Tunnel End Points (VTEPs).

Configuring an SDP is automatically done for Shortest Path Bridging (SPB) services; this command is only for VXLAN services.

```
service sdp sdp_id vxlan {far-end ip_address | multicast-group mc_group_address} [ttl {ttl_num | default}] [description desc_info] [admin-state {enable | disable}]
```

```
no service sdp sdp_id [description]
```

Syntax Definitions

<i>sdp_id</i>	The ID number to assign to the SDP object.
<i>ip_address</i>	The IP address of the Loopback0 interface for the far-end VTEP node. The Loopback0 address is required on every VTEP node.
<i>mc_group_address</i>	The multicast IP address of the group to which this service will join.
<i>ttl_num</i>	A Time-to-Live (TTL) value that is inserted into the TTL field of the IP header when the VXLAN encapsulated frames are sent from this node. The valid range is 1–255.
default	Sets the TTL value to the default value of 64.
<i>desc_info</i>	An ASCII text string up to 160 characters in length.
enable	Enables the administrative status of the SDP.
disable	Disables the administrative status of the SDP.

Defaults

parameter	default
ttl {default ttl_num}	64
description desc_info	No description.
admin-state {enable disable}	enable

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **no** form of this command to delete the SDP object, only if the SDP is not bound to any services. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP.
- When the **far-end** option is used, this command specifies a single destination unicast IP address that identifies the far-end VTEP node to which the SDP will tunnel traffic. This IP address is the Loopback0 address configured on every VTEP node. The SDP is then bound to a VXLAN service to direct one-way VXLAN encapsulated traffic to that single far-end node. This object is similar to the unicast SDP in SPB.

- When the **multicast-group** option is used, this command specifies the multicast group address to which all broadcast, unknown unicast, and multicast (BUM) traffic is sent to the VTEP nodes that subscribe to the PIM multicast group will receive this type of traffic. In this mode, the **ttl** parameter value is included in the IP header of the VXLAN encapsulation header:
- If the IP address of a VTEP node is learned, thus creating a dynamic unicast SDP through the discovery process, the unicast traffic is sent to the VTEP node that is associated with that learned IP address. This object is similar to multicast SDP in SPB.
- The administrative status of the VXLAN SDP affects all SDP bindings that are bound to this object.

Examples

```
-> service sdp 10 vxlan multicast-group 224.2.1.1 ttl 20 description "PIM Group
224.2.1.1"
-> service sdp 10 ttl 5
-> service sdp 20 far-end 10.10.10.2 description "Unicast to NodeB"
-> service sdp 20 admin-state disable
-> no service sdp 10 description
-> no service sdp 10
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service bind-sdp	Binds VXLAN services to VXLAN SDPs.
service vxlan	Configures a VXLAN service.

  alaSdpSvcType
  alaSdpFarEndIpAddress
  alaSdpDescription
  alaSdpAdminStatus
  alaSdpAllocationType
  alaSdpDynamicType
  alaSdpAdminTTL
```

service bind-sdp

Configures the binding of a Virtual eXtensible LAN (VXLAN) service to a Service Distribution Point (SDP). This is done to allow VXLAN traffic to reach other nodes in the same group (multicast SDP) or reach a single node (unicast SDP).

```
service service_id bind-sdp sdp_id1 [sdp_id2 sdp_id3 ...] [description desc_info]
```

```
service service_id[-service_id2] bind-sdp sdp_id [description desc_info]
```

```
no service service_id bind-sdp sdp_id [description]
```

Syntax Definitions

<i>service_id</i> [- <i>service_id2</i>]	An existing VXLAN service ID to bind to the SDP. Use a hyphen to specify a range of services to bind to the SDP.
<i>sdp_id</i>	An existing SDP ID number to bind to the service. Use a space to specify additional SDP IDs to bind to the specified service (for example, 10 20 30 40 50).
<i>desc_info</i>	An ASCII text string up to 160 characters in length.

Defaults

parameter	default
description <i>desc_info</i>	No description.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **no** form of this command to delete the SDP binding. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP binding.
- There is no control of the SDP administrative status; this type of service object is always enabled.
- A tandem mode VXLAN service can be bound only to one multicast SDP.
- A head-end mode VXLAN service can be bound only to unicast SDPs.
- A hybrid mode service can be bound with *both* of the following:
 - One multicast SDP for a group of member VTEPs.
 - Many unicast SDPs for VTEPs that do not participate in a multicast group.
- Only static SDPs (created with an SDP ID between 1–32767) can be manually bound to a VXLAN service; otherwise, an error message is returned.

Examples

```
-> service 1 bind-sdp 10 description "Bind to PIM Group 224.2.1.1"
-> service 2 bind-sdp 20 description "Unicast Bind to 1.1.1.20 VTEP"
```

```
-> service 3 bind-sdp 30 40 50 60 70 80 90
-> service 1-100 bind-sdp 10 description "Bind Services 1-100 to PIM Group
225.2.1.1"
-> service 200-250 bind-sdp 20 description "Bind Services 200-250 to 1.1.1.20 VTEP"
-> no service 1 bind-sdp 10 description
-> no service 2 bind-sdp
```

Release History

Release 7.3.4; command was introduced.

  alaSdpBindDescription
```

service rfp local-endpoint

Configures a local end point for an SPB Remote Fault Propagation (RFP) domain. Creating a local RFP end point identifies the local switch as a Maintenance End Point (MEP) in the RFP domain.

```
service rfp rfp_id local-endpoint lep_id [admin-state {enable | disable}] [ccm-interval {interval100ms | interval1s | interval10s | interval1m | interval10m | interval-invalid}] [level number] type spb
```

```
no service rfp rfp_id [local-endpoint lep_id]
```

Syntax Definitions

<i>rfp_id</i>	A unique numerical value to identify an RFP domain that maps to a reserved OAM domain. The valid RFP ID range is 1–32767.
<i>lep_id</i>	A numerical value to identify an end point of the specified RFP domain ID on the local switch. The valid range is 1–8191. This value serves as the virtual UP MEP ID for the RFP end point.
enable	Administratively enables the local end point.
disable	Administratively disables the local end point.
interval100ms	Send a Continuity Check Messages (CCM) every 100 milliseconds.
interval1s	Send a CCM every 1 second.
interval10s	Send a CCM every 10 seconds.
interval1m	Send a CCM every minute.
interval10m	Send a CCM every 10 minutes.
interval-invalid	Send a CCM by a MEP.
<i>number</i>	A unique numerical value to assign as the OAM domain level for the RFP domain. The valid range is 0-7.

Defaults

When a local end point is created for an RFP domain without specifying any of the optional parameter values, the end point is created with the following default values:

parameter	default
enable disable	enable
ccm-interval	interval1s
<i>number</i>	7

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove the RFP domain configuration from the switch (for example, **no service rfp 1**). To remove the local end point ID only, use the **no** form of this command with the **local-endpoint** parameter (for example, **no service rfp local-endpoint**).

- An RFP domain consists of a local end point configured with this command and a remote end point list configured with the **service rfp remote-endpoint** command. An SPB service is bound to the remote end point list to identify the Service Access Point (SAP) to monitor.
- The local end point ID number identifies local BEB devices in the RFP domain; this is also the number used as the virtual UP MEP ID.
- Creating more than one RFP domain with the same domain level value is not allowed. Up to eight RFP domains are allowed as long as they each are created with a different level number. Each RFP domain created counts towards the maximum limit of Ethernet OAM domains allowed.
- When this command is used to create an RFP end point, the switch automatically creates the following reserved Ethernet OAM elements that are mapped to each RFP domain:
 - Maintenance Domain (MD) named “RFP_OVER_SPB_DOMAIN_LEVEL7”, where the level number is the value specified with this command. Each time an RFP end point is created, a new maintenance domain is created with the level number specified with this command.
 - Maintenance Association (MA) named “RFP_OVER_SPB_ASSOCIATION”. The same MA name is used for all RFP domains.
 - A primary VLAN, where the VLAN ID used is the SPB control BVLAN. This same VLAN is used as the primary VLAN for all RFP domains.
 - Virtual UP Maintenance End Point (MEP) that will advertise CCM to the network. Each CCM contains a proprietary OUI TLV that specifies I-SID information and the state of the port associated with the I-SID. CCM packets are sent using the CCM interval value specified with this command. The local end point ID specified with this command serves as the virtual UP MEP ID.

Examples

```
-> service rfp 1000 local-endpoint 1 ccm-interval INTERVALS1s type SPB
-> service rfp 1000 local-endpoint 1 admin-status enable
-> service rfp 2000 local-endpoint 1 admin-status enable ccm-interval INTERVALS1s
level 6 type SPB
-> service rfp 300 local-endpoint 40 ccm-interval INTERVALS1s type level 5 SPB
-> service rfp 300 local-endpoint 40 admin-status enable
-> no service rfp 1 local-endpoint 1000
```

Release History

  alaRfpSpbLocalEndPointMaintAssociation
```

service rfp remote-endpoint

Configures a remote end point list for an SPB Remote Fault Propagation (RFP) domain. The list consists of the MEP IDs on remote BEBs and local SPB service ID numbers. This command triggers the sending of a Continuity Check Message (CCM) to advertise the status of the specified local SPB services to the specified remote MEP IDs.

service rfp *rfp_id* **remote-endpoint** *rep_id* **service-id** *service_id*[-*service_id2*]

no service rfp *rfp_id* **remote-endpoint** *rep_id* [**service-id** *service_id*[-*service_id2*]]

Syntax Definitions

<i>rfp_id</i>	An existing RFP ID number.
<i>rep_id</i>	A numerical value to identify the MEP ID of a remote BEB. The valid range is 1–8191.
<i>service_id</i> [- <i>service_id2</i>]	An existing SPB service ID to bind to the RFP domain. Use a hyphen to specify a range of SPB services (for example, 10-12 specifies services 10, 11, and 12).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to remove the RFP end point or an SPB service ID from the end point list.
- To identify a BEB as a participating member of an RFP domain, first configure a local RFP end point with the **service rfp local-endpoint** command to create the RFP domain ID then use this command to configure the remote end point. Both types of end points use the same RFP ID, but the RFP ID specified for the remote end point must already exist.
- The MEP ID specified with this command is the end-point ID configured on the remote BEB using the **service rfp local-endpoint** command.
- One or more SPB services are bound to the RFP remote end point to identify the Service Access Point (SAP) to monitor within the RFP domain. An SPB service is associated with an SPB service instance ID (I-SID); the service is then associated with a SAP. A SAP binds together the service and the access port on which device traffic enters the SPB service domain.
- Each SPB service bound to an RFP domain identifies the SAP information (such as access port status and I-SID) that is advertised in the proprietary TLV of CCM packets. Each CCM may contain information for multiple SPB services.
- Although binding multiple SPB services to an RFP domain is allowed, monitoring SAPs associated with only one SPB service is recommended.

Examples

```
-> service rfp 1000 remote-endpoint 2 service-id 10-14
-> service rfp 1000 remote-endpoint 3 service-id 20
-> no service rfp 1000 remote-endpoint 2 service-id 10
-> no service rfp 1000 remote-endpoint 2
-> no service rfp 1000
```

Example when the RFP ID does not exist because a local end point with that ID was not created:

```
-> service rfp 2000 remote-endpoint 2 service-id 10
ERROR: RFP Domain (2000) does not exist
```

Release History

Release 7.3.4; command was introduced.

Related Commands

- [service rfp local-endpoint](#) Configures a local end point that is associated with the remote end point through the RFP ID.
- [show service rfp](#) Displays the configuration and status of RFP for SPB domains.

```

show service l2profile

Displays the Layer 2 profile configuration information for the bridge. This type of profile is applied to access (customer-facing) ports and specifies how to process Layer 2 protocol frames received on this type of port.

show service l2profile [*profile_name*]

Syntax Definitions

profile_name An existing Layer 2 profile name. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).

Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *profile-name* parameter to display information for a specific profile. Entering a profile name is case sensitive.
- If there are no profiles configured for the bridge, this command still displays the information for the default profile (def-access-profile). This profile is applied to access ports that were not associated with a specific profile.

Examples

```
-> show service l2profile
Profile Name: def-access-profile,
STP      : tunnel,      802.1X : drop,      802.3AD : peer,      802.1AB : drop,
GVRP     : tunnel,      AMAP   : drop,      MVRP    : tunnel

Profile Name: DropL2,
STP      : drop,        802.1X : drop,      802.3AD : drop,      802.1AB : drop,
GVRP     : drop,        AMAP   : drop,      MVRP    : tunnel

Profile Name: CiscoTunnel,
STP      : tunnel,      802.1X : drop,      802.3AD : drop,      802.1AB : drop,
GVRP     : tunnel,      AMAP   : drop,      MVRP    : tunnel

->show service l2profile DropL2
Profile Name: DropL2,
STP      : drop,        802.1X : drop,      802.3AD : drop,      802.1AB : drop,
GVRP     : drop,        AMAP   : drop,      MVRP    : tunnel
```

output definitions

Profile Name	The name of the Layer 2 profile.
Stp	Indicates how Spanning Tree traffic control packets are processed.
802.1x	Indicates how IEEE 802.1x control packets are processed.
802.3ad	Indicates how IEEE 802.3ad control packets are processed.
802.1AB	Indicates how IEEE 802.1AB control packets are processed.
GVRP	Indicates how GARP VLAN Registration Protocol packets are processed.
AMAP	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.
MVRP	Indicates how Multiple VLAN Registration Protocol packets are processed.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

service l2profile	Configures a Layer 2 profile that is applied to a service access port.

show service access

Displays the access (customer-facing) port configuration for the bridge.

show service access [**port** *chassis/slot/port*[-*port2*] / **linkagg** *agg_id*[-*agg_id2*]] [**sap**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
sap	Displays the Service Access Points (SAPs) associated with the specified access port.

Defaults

By default, all service access ports are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **port** and **linkagg** parameters to display the configuration for a specific port or link aggregate.
- Use the **sap** parameter to display the SAPs associated with the specified port.

Examples

```
-> show service access
Port      Link  SAP   SAP   Vlan
Id        Status Type  Count Xlation L2Profile      Description

1/13      Down  Dynamic 100   N      def-access-profile  UNP Dynamic Access Port

Total Access Ports: 4
```

output definitions

Port Id	The access port number or link aggregate ID number.
Link Status	The status of the link connection to the access port (Up or Down).
SAP Type	Whether or not the SAP associated with the access port was created statically or dynamically (Manual or Dynamic).
SAP Count	The number of service access points (SAPs) that are associated with the access port.
VLAN Xlation	Whether or not VLAN translation is enabled on the access port.
L2Profile	The name of the Layer 2 profile associated with the access port. Configured through the service l2profile command.
Description	An optional description configured for the access port. By default, the description is blank.

```
-> show service access port 1/23 sap
Legend: * denotes a dynamic object
```

Identifier	Adm	Oper	Stats	T:P	ServiceId	Vlan		Sap	Description
						Isid/Vnid	Xlation		
sap:1/23:0	Down	Down	N	Y:x	20	1500	N	-	
sap:1/23:all	Up	Down	N	N:3	10	2300	N	VXLAN	SAP
sap:1/23:9.1	Down	Down	N	Y:x	20	1500	N	-	

```
Total SAPs: 3
```

output definitions

Identifier	The SAP identifier, which consists of the access port and encapsulation value.
Adm	The administrative state of the SAP (Up or Down).
Oper	The operational state of the SAP (Up or Down).
Stats	Whether or not statistics collection is enabled for the SAP (Yes or No).
T:P	Whether or not the 802.1p priority value of traffic mapped to this SAP is trusted. (Y or N). If this value is set to untrusted (N), then the traffic is marked with the specified 802.1p priority value. For example, Y:x indicates traffic priority is trusted; N:3 indicates traffic priority is untrusted and should be marked with an 802.1p value of 3.
ServiceId	The ID number of the service associated with the SAP.
Isid/Vnid	An SPB service instance identifier (ISID) or a VXLAN network identifier (VNID). The value of this field depends on whether an SPB service or VXLAN service is associated with the SAP.
Vlan Translation	Whether or not VLAN translation is enabled for the SAP (Yes or No).
Sap Description	An optional description configured for the SAP. By default, the description is blank.

Release History

Release 7.3.1; command was introduced.

Release 7.3.2; **description** field added.

Release 7.3.4; **sap** parameter added; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

show service

Displays information about the services configured on the switch.

```
show service [spb | vxlan | service_id]
```

Syntax Definitions

spb	Displays only the Shortest Path Bridging (SPB) services.
vxlan	Displays only the Virtual eXtensible LAN (VXLAN) services.
<i>service_id</i>	An existing service ID number. Displays additional details about the specified service.

Defaults

By default, a list of all services is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **spb** parameter to display additional information about SPB services.
- Use the **vxlan** parameter to display additional information about VXLAN services.
- The service ID is a unique number that identifies a specific service. Information associated with the service ID is displayed.

Examples

```

ServiceId	The service ID number.
Adm	The administrative state of the service (Up or Down).
Oper	The operational state of the service (Up or Down).
Stats	Whether or not statistics collection is enabled for the service.
SAP Count	The number of Service Access Points (SAPs) associated with this SPB service.
Bind Count	The number of Service Distribution Points (SDPs) bound to this SPB service.

output definitions

Isid	The service instance identifier that identifies the SPB service instance within the provider backbone bridging (PBB) network. This field is displayed only for SPB services.
BVlan	The VLAN ID number for the backbone VLAN to which the SPB service is mapped. This field is displayed only for SPB services.
Vnid	The VXLAN network identifier (VNID) that identifies a VXLAN segment. The decimal notation format of the VNID is also included (for example, VNID 1000 is also represented as 0.1.56). This field is displayed only for VXLAN services.
MCast Mode	The multicast replication mode (Headend , Tandem , or Hybrid) for the service.
T/R	The number of packets transmitted and received for this service. This field is displayed only for SPB services.

output definitions

Service Id	The service identifier.
Description	An optional description configured for the service. By default, the description is blank.
ISID	The service instance identifier (I-SID) number for the SPB service. This field is only displayed for SPB services.
BVlan	The VLAN ID number for the SPB backbone VLAN (BVLAN). This field is only displayed for SPB services.

output definitions

VNID	The VXLAN network identifier for the VXLAN segment. This field is only displayed for VXLAN services.
Multicast-Mode	The multicast replication mode for the specified service (tandem , headend , or hybrid).
Tx/Rx Bits	The number of bits transmitted and received for this service. This field is only displayed for SPB services.
Admin Status	The administrative state of the service (Up or Down).
Oper Status	The operational state of the service (Up or Down).
Stats Status	Whether statistics collection is enabled for the service (Yes or No).
Vlan Translation	Whether VLAN translation is enabled for the service (Yes or No).
Service Type	The type of service (SPB or VXLAN).
Allocation Type	Whether the service was manually or dynamically created (Static or Dynamic).
MTU	The largest frame size, in octets, that the service can handle.
SAP Count	The number of SAPs associated with this service.
SDP Bind Count	The number of SDPs bound to this service.
Ingress Pkts	The number of packets that have ingress on this SAP.
Ingress Bytes	The number of bytes that have ingress on this service.
Egress Pkts	The number of packets that have egress on this service.
Egress Bytes	The number of bytes that have egress on this service.
Mgmt Change	The date and time of the last configuration change for this service.
Status Change	The date and time of the last operational status change for this service.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; **vlan** parameters added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

show service sdp	Displays the SDP configuration for the bridge.
show service bind-sdp	Displays the Mesh SDP bindings for the bridge.

show service ports

Displays the virtual ports associated with the specified Shortest Path Bridging (SPB) or Virtual eXtensible LAN (VXLAN) service.

show service [*service_id* | **isid** *instance_id* | **vnid** *vxlan_id*] **ports**

Syntax Definitions

<i>service_id</i>	An existing service ID number.
<i>instance_id</i>	Displays the virtual ports associated with the specified SPB service instance identifier (I-SID) number. The valid range is 256–16777214.
<i>vxlan_id</i>	Displays the virtual ports associated with the specified VXLAN network identifier (VNID). The valid range is 1– 2147483647 (or 000.000.001–255.255.255 in decimal notation format).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified SPB or VXLAN service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the SPB or VXLAN service.

Intf	The bridge interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service.
Description	An optional description configured for the service.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; **vxlان** parameters added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

show service	Displays the service configuration for the bridge.
show service sap	Displays the service access point (SAP) configuration for a specific SAP associated with the specified SPB service.

MIB Objects

N/A

show service sap

Displays the configuration information for the specified Service Access Point (SAP) ID associated with the specified service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
show service spb service_id sap {port chassis/slot/port | linkagg agg_num} [:0 | :all | :qtag1 |
:outer_qtag.inner_qtag]
```

Syntax Definitions

<i>service_id</i>	An existing service ID number.
<i>chassis/slot/port</i>	The slot and port number of the Service Access Port.
<i>agg_id</i>	The link aggregate ID number (0–31) of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A SAP is a type of virtual port that is associated with the specified service.
- A SAP determines which traffic (untagged, single-tagged, or double-tagged) is mapped to the service associated with this SAP.

Examples

```
-> show service 525 sap port 1/11:2524

```

output definitions

SAP Id	The access port and encapsulation associated with the service.
Description	An optional description configured for the SAP. By default, the description is blank.
Admin Status	The administrative state of the SAP (Up or Down).
Oper Status	The operational state of the SAP (Up or Down).
Stats Status	Whether statistics collection is enabled for the SAP (Yes or No).
Vlan Translation	Whether VLAN translation is enabled for the SAP (Yes or No).
Service Type	The type of service associated with this SAP (SPB or VXLAN).
Allocation Type	Whether the service was manually or dynamically created (Static or Dynamic).
Trusted	Whether the SAP is trusted (Yes or No).
Priority	The 802.1p priority assigned to traffic mapped to this SAP. Applied only when the SAP is not trusted and a priority is specified.
Ingress Pkts	The number of packets that have ingressed on this SAP.
Ingress Bytes	The number of bytes that have ingressed on this SAP.
Egress Pkts	The number of packets that have egressed on this SAP.
Egress Bytes	The number of bytes that have egressed on this SAP.
Mgmt Change	The date and time of the last configuration change for this SAP.
Status Change	The date and time of the last operational status change for this SAP.

Release History

Release 7.3.4; command was introduced; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

- show service** Displays the service configuration for the bridge.
- show service ports** Displays the virtual ports (SAP and SDPs) associated with the specified SPB or VXLAN service.

output definitions

SdpId	A unique SDP identification number, dynamically generated by ISIS-SPB or manually configured for VXLAN services. To manually configure for VXLAN services, use the service sdp command.
FarEnd/Group Addr	The IP address (loopback0) or multicast group IP address associated with the far-end VXLAN node of this SDP. Configured through the service sdp command.
FarEnd SysId:BVlan	The System ID (bridge MAC address) and associated BVLAN of the far-end SPB node of the tunnel defined by this SDP.
Adm	The administrative state of the SDP (Up or Down).
Oper	The operational state of the SDP (Up or Down).
Svc Type	The type of service traffic that this SDP will tunnel (SPB or VXLAN). Configured through the service sdp command for VXLAN services.

```
-> show service sdp 10
```

```
VxLAN SDP 10 Info
  SDP-Id       : 10,           Description    : 224.2.1.1 Group,
  Service Type  : VxLAN,       FarEnd/Group  : 224.2.1.1,
  Admin Status  : Up,         Oper Status   : Up,
  TTL          : 64 (default),
  Allocation Type : Static,     SDP Bind Count : 3,
  Mgmt Change   : 05/15/2014 18:38:33, Status Change  : 05/15/2014 18:40:23
```

SDP-Id	A unique SDP identification number manually configured for VXLAN services. Configured through the service sdp command.
Description	An optional ASCII text description for this SDP.
Service Type	The type of service traffic that this SDP will tunnel (SPB or VXLAN). Configured through the service sdp command for VXLAN services.
FarEnd/Group	The IP address (loopback0) or multicast group IP address associated with the far-end VXLAN node of this SDP. Configured through the service sdp command.
Admin Status	The administrative state of the SDP (Up or Down).
Oper Status	The operational state of the SDP (Up or Down).
TTL	The time-to-live (TTL) value for this SDP.
Allocation Type	Whether the SDP was statically or dynamically created. An SDP for an SPB service is generated dynamically; an SDP for a VXLAN service is generate statically or dynamically through the UNP feature.
SDP Bind Count	The number of services bound to this SDP.
Mgmt Change	The date and time of the last manual change to this SDP.
Status Change	The date and time of the last status change to this SDP.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN fields added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

show service sdp spb	Displays SDP information specific to SPB services.
show service sdp vxlan	Displays SDP information specific to VXLAN services.
show service	Displays the service configuration for the bridge.
show service bind-sdp	Displays the Mesh SDP configuration for the bridge.

show service sdp spb

Displays the Service Distribution Point (SDP) configuration for SPB services.

show service sdp spb [**sysid** *mac_address* | **bvlan** *bvlan_id*]

Syntax Definitions

mac_address The System ID (BMAC) of the far-end SPB node of the service tunnel defined by this SDP.

bvlan_id The VLAN ID number of an existing SPB BVLAN.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **sysid** and **bvlan** parameters to display additional information about SPB SDPs.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDPs are not saved to the switch configuration file.

```

output definitions

SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB.
FarEnd SysId:BVlan/GroupMac	The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
SourceId	The shortest path (SP) source ID of the bridge.
Oper	The operational state of the SDP (Up or Down).
Intf/Isid	The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.
Bind Count	The number of services bound to this SDP.
FarEnd SystemName / PortList	The system name and port list of the far-end SPB node.

Release History

Release 7.3.1; command was introduced.
 Release 7.3.4; **sysid** and **bvlan** parameters added.

Related Commands

show service sdp	Displays the SDP configuration for the switch.
show service sdp vxlan	Displays SDP information specific to VXLAN services.

show service sdp vxlan

Displays the Service Distribution Point (SDP) configuration for Virtual eXtensible LAN (VXLAN) services.

show service sdp vxlan [**far-end** *ip_address* / **multicast-group** *mc_group_address*]

Syntax Definitions

ip_address The IP address of the loopback0 interface for the far-end VXLAN Tunnel End Point (VTEP) node. The loopback0 address is required on every VTEP node.

mc_group_address The multicast IP address of the group to which the service will join.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **far-end** and **multicast-group** parameters to display only VXLAN SDPs associated with a specific far-end IP address or a specific multicast group IP address.
- Manual configuration of SDPs and SDP bindings for VXLAN services is required.
- Dynamic SDP bindings are not saved to the switch configuration file.

Examples

```
-> show service sdp vxlan
Legend: (*) dyn unicast object
VxLAN SDP Info
```

SdpId	FarEnd/Group	Addr	Adm	Oper	Intf	Bind		Description

```
Total SDPs: 1
```

SdpId	A unique SDP identification number manually configured for VXLAN services.
FarEnd/Group Addr	The IP address (loopback0) or multicast group IP address associated with the far-end VXLAN node of this SDP.
Adm	The administrative state of the SDP (Up or Down).
Oper	The operational state of the SDP (Up or Down).
Intf	The VXLAN interface on which the VXLAN node was discovered for a unicast SDP (this field is blank for a multicast SDP).
Bind Count	The number of services bound to this SDP.
ttl	The time-to-live (TTL) value for this SDP.
Description	An optional ASCII text description for this SDP.

Release History

Release 7.3.4; command was introduced.

Related Commands

service sdp	Configures an SDP for a VXLAN service.
show service sdp	Displays the SDP configuration for the switch.
show service sdp spb	Displays SDP information specific to SPB services.
show service	Displays the service configuration for the bridge.
show service bind-sdp	Displays the Mesh SDP configuration for the bridge.

```

show service bind-sdp

Displays the Service Distribution Point (SDP) binding configuration for the switch.

```
show service bind-sdp [sdp_id[:service_id]]
```

Syntax Definitions

sdp_id[:service_id] Displays SDP bindings with the specified SDP ID and/or service ID number.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Manual configuration of SDPs and SDP bindings for VXLAN services is required.
- Dynamic SDP bindings are not saved to the switch configuration file.

Examples

```
-> show service bind-sdp
```

Legend: * denotes a dynamic object

show service bind-sdp spb

Displays the Service Distribution Point (SDP) binding configuration for Shortest Path Bridging (SPB) services.

```
show service bind-sdp [spb | isid instance_id]
```

Syntax Definitions

spb Displays SPB SDP bindings.

instance_id Displays SPB SDP bindings associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDP bindings are not saved to the switch configuration file.

Examples

```
-> show service bind-sdp spb
```

Legend: * denotes a dynamic object

Total Bind-SDPs: 10

output definitions

SvcId	The ID number of the SPB service that is bound to the SDP.
SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB and bound to the service number.

output definitions

Isid	The service instance identifier (I-SID) number for the SPB service.
FarEnd SysId:BVlan	The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
Oper	The operational state of the SDP binding (Up or Down).
Intf	The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.
FarEnd SystemName	The system name of the far-end SPB node.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; **isid** parameter added.

Related Commands

show service bind-sdp vxlan

Displays the Service Distribution Point (SDP) binding configuration for Virtual eXtensible LAN (VXLAN) services.

show service bind-sdp [**vxlan** | **vnid** *vxlan_id*]

Syntax Definitions

vxlan Displays VXLAN SDP bindings.

vxlan_id An existing VXLAN network identifier (VNID). The valid range is 1–2147483647 (or 000.000.001–255.255.255 in decimal notation format).

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

Usage Guidelines

- Use the **vxlan** parameter to display information for all VXLAN bindings.
- Use the **vnid** parameter to display information for a specific VNID.
- Manual configuration of SDPs and SDP bindings for VXLAN services is required.

Examples

```
-> show service bind-sdp vxlan
```

Legend: * denotes a dynamic object

show service debug-info

Displays debug information for the virtual ports associated with the service.

show service {*service_id* | **isid** *instance_id* | **vnid** *vxlan_id*} **debug-info**

Syntax Definitions

<i>service_id</i>	An existing service ID number.
<i>instance_id</i>	Displays debug information for the SPB service associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.
<i>vxlan_id</i>	Displays debug information for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1–2147483647 (or 000.000.001–255.255.255 in decimal notation format).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the service.

Examples

```
-> show service 20 debug-info
Legend: (*) dyn unicast object (+) remote mcast object (#) local mcast object
SPB Service 20 Debug Info
Admin : Up, Oper : Down, Stats : N, Mtu : 9194, VlanXlation : N,

  VNID  : 25000 (0.97.168), MCast-Mode : Hybrid,
  VFI   : 1,          McIdx  : 4095,      StatsHandle: 0
```

Identifier	Adm	Oper	Stats	Sap Trusted:Priority/		Sap Description/		Stats/	
				Sdp	FarEnd Addr	Intf	Sdp	Intf Name	VP
sap:1/22:0	Up	Down	N		Y:x	1/22	TOR-5	1	0
sap:1/22:all	Up	Down	N		N:0	1/22	-	4	0
sap:1/22:2.5	Up	Down	N		Y:x	1/22	-	5	0

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Adm	The administrative state of the virtual port (Up or Down).
Oper	The operational state of the virtual port (Up or Down).
Stats	Whether statistics collection is enabled for the virtual port.
Sap Trusted : Priority	Whether the Service Access Point (SAP) virtual port associated with the service is trusted or assigns a priority value.
Sdp SystemId : BVlan	The system ID (base MAC) and associated BVLAN for a Service Distribution Point (SDP) virtual port associated with the service. This value is displayed only for SPB services.
Sdp FarEnd Addr	The IP address (Loopback0) or multicast group IP address associated with the far-end VXLAN node of the SDP. This value is displayed only for VXLAN services.
Intf	The switch interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service.
Sap Description	The description for the SAP that is associated with the service.
Sdp Systemname	The system name for the SDP bridge that is associated with the service. This value is displayed only for SPB services.
Sdp Intf Name	The name assigned to the VXLAN interface. This value is displayed only for VXLAN services.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; **vxlan** parameters and display fields added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

show service ports	Displays the virtual port (SAP and SDP) configuration for the specified service.
show service	Displays the service configuration for the bridge.
show service access	Displays the service access port configuration for the switch.

MIB ObjectsN/A

show service info

Displays the Service Manager configuration for the local switch.

show service info

Syntax Definitions

N/A

Defaults

By default, the UDP port value is set to 4789.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The display output of this command also includes SPB and VXLAN information, such as the system MAC address and name used by SPB and the UDP port and VRF used by VXLAN.

Examples

```
-> show service info
Service Manager System Info
  SPB System Id      : 00e0.b1e7.09a3,      SPB System Name   : TechPubs6900,
  Service Trap      : Disable,             SAP Trap          : Disable,
  SDP Trap          : Disable,             Bind Trap         : Disable,
  Trap Rate Per Min: 60,
  Stats Admin State: Enable,               Stats Owner       : SvcMgr,
  VxLAN Udp Port    : 4789,                VxLAN Current VRF: Default,
  Mgmt Change       : 10/05/2014 13:45:10, Status Change     : 10/05/2014 13:45:10
```

output definitions

SPB System Id	The base MAC address of the local switch.
SPB System Name	The system name associated with the local switch.
Service Trap	The status (Enable or Disable) of trap generation for service status changes.
SAP Trap	The status (Enable or Disable) of trap generation to for SAP status changes.
SDP Trap	The status (Enable or Disable) of trap generation for SDP status changes.
Bind Trap	The status (Enable or Disable) of trap generation for service bind status changes.
Trap Rate Per Min	The maximum number of traps that can be sent per minuter.
Stats Admin State	The administrative status (Enable or Disable) of the statistics collection function.

output definitions

Stats Owner	The system application in control of statistics collection.
VxLAN Udp Port	The UDP destination port for the Virtual eXtensible Local Area Network (VXLAN) feature.
VxLAN Current VRF	The name of the VRF instance for the VXLAN feature.
Mgmt Change	The date and time of the last administrative status change.
Status Change	The date and time of the last operational status change.

Release History

Release 7.3.4; command was introduced; VXLAN fields added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

[show service](#) Displays information about the services configured on the switch.

MIB Objects

```

show service counters

Displays the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified service.

show service {*service_id* | **vnid** *vlan_id*} **counters**

Syntax Definitions

<i>service_id</i>	An existing service ID number.
<i>vlan_id</i>	Displays statistics for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1– 2147483647 (or 000.000.001–255.255.255 in decimal notation format).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enter an existing service ID number to display statistics for a specific service.
- Use the **vnid** parameter to display statistics for a specific VXLAN network identifier. A VNID identifies a specific VXLAN network segment.

Examples

```
-> show service 20 counters
Legend: * denotes a dynamic object
```

Identifier	Ing Pkts	Ing Byte Count	Egr Pkts	Egr Byte Count
sap:1/1:10	1234	12345678	12	123
sap:1/1:15	1234	12345678	12	123
sap:8/2	1234	12345678	12	123
sap:2/3:20.25*	1234	12345678	12	123
sdp:32768:100	34	5678	4321	12345678

```
-> show service vnid 1000 counters
Legend: * denotes a dynamic object
```

Identifier	Ing Pkts	Ing Byte Count	Egr Pkts	Egr Byte Count
sap:1/5:20	1200	12345678	12	123
sap:2/10:30.35*	1200	12345678	12	123
sdp:32769:200	60	5678	4321	12345678

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Ing Pkts	The number of packets received on the virtual port.
Ing Byte Count	The ingress packet byte count for the virtual port.
Egr Pkts	The number of packets sent on the virtual port.
Egr Byte Count	The egress packet byte count for the virtual port.

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; **vnid** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

show service	Displays the service configuration for the bridge.
show service ports	Displays the virtual ports associated with the specified service.
clear service counters	Clears the traffic statistics for the specified service and associated virtual ports.

MIB Objects

```
alaSvcBaseInfoTable
  alaSvcIngressPacketCount
  alaSvcIngressByteCount
  alaSvcEgressPacketCount
  alaSvcEgressByteCount
```

clear service counters

Clears the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified SPB service.

```
clear service [service_id] [sap {port chassis/slot/port / linkagg agg_id}][:0 | :all | :qtag |
:outer_qtag.inner_qtag] | mesh-sdp sdp_id] counters
```

Syntax Definitions

<i>service_id</i>	An existing SPB service ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number of the service access port.
<i>agg_id</i>	The link aggregate ID number (0–31) of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wild-card SAP. All tagged traffic that is not classified into another SAP is mapped to the wild-card SAP.
:qtag	Specifies a VLAN ID tag for traffic that ingresses on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic that ingresses on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
<i>sdp_id</i>	An existing mesh SDP ID.

Defaults

By default, all statistics counters for the specified service are cleared.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **sap** parameter options with this command to clear the statistics for a specific SAP ID. A SAP ID is comprised of an access port (*slot/port* or *agg_id*) and an encapsulation value (**:0**, **:all**, **:qtag**, or **:outer_qtag.inner_qtag**) that is used to identify the type of customer traffic to map to the associated service.
- Use the **mesh-sdp** *sdp_id* parameter to clear the statistics for a specific mesh SDP.

Examples

```
-> clear service counters
-> clear service 100 counters
-> clear service sap 8/2:all counters
-> clear service mesh-sdp counters
```

Release History

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added (only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Related Commands

[show service counters](#)

Displays the traffic statistics for the specified SPB service and associated virtual ports.

show service rfp

Displays the configuration and status of SPB Remote Fault Propagation (RFP) domains.

show service rfp [*rfp_id* [**local-sap-status**]]

Syntax Definitions

<i>rfp_id</i>	An existing RFP ID number.
local-sap-status	Displays information about the local SPB service elements that are bound to the specified RFP ID.

Defaults

By default, information for all RFP domains is displayed.

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Enter an existing RFP ID number to display statistics for a specific RFP domain.
- Use the **local-sap-status** parameter to display SPB service information for the specified RFP ID.

Examples

```
-> show service rfp
```

```
Local system (Name: SystemId) = bridge1 : E8:E7:32:B8:9C:98
Total number of services information =6
Total Number of RFP domain          =2

```

```
-> show service rfp 1000
```

```
Local system (Name: SystemId) = bridge1 : E8:E7:32:B8:9C:98
Total number of services information =6
Total Number of RFP domain          =2
RFP Remote RMEP System B-VLAN ISID Service Admin
      EndPoint Status (Name: SystemId) Id State
-----+-----+-----+-----+-----+-----+-----+-----
1000 2 RMEP_OK bridge2:E8:E7:32:B8:9C:95 4001 10000 10 Enable
1000 3 RMEP_OK bridge3:E8:E7:32:B8:9C:90 4002 20000 20 Enable
1000 4 RMEP_OK bridge4:E8:E7:32:B8:9C:88 4003 30000 30 Enable
```

output definitions

RFP	The RFP ID number. Configured through the service rfp local-endpoint command.
Remote EndPoint	The ID number for the RFP remote end point. Configured through the service rfp remote-endpoint command.
RMEP Status	The status of the remote Maintenance End Point (MEP).
System (Name: SystemId)	The name and bridge MAC address of the remote SPB switch.
B-VLAN	The SPB backbone VLAN that serves as the primary VLAN for the RFP domain. The SPB control BVLAN is automatically used for each RFP OAM domain.
ISID	The SPB service instance ID. The ISID is bound to an SPB service ID, which in turn is bound to an SPB access port. This binding creates a Service Access Point (SAP), which is configured through the service sap command.
Service Id	An SPB service ID number. Configured through the service spb command and associated with the RFP ID through the service rfp remote-endpoint command.
Admin State	The administrative status (Enable or Disable) of the SAP port on the local chassis.

```
-> show service rfp 1000 local-sap-status
```

```
Local endpoint ID = 10
```

```
Local system (Name: SystemId) = bridge1 : E8:E7:32:B8:9C:98
```

Service Sap Id		Admin	Oper	Remote EndPoint	R-Endpoint Status
10	sap:1/11:10	Enable	Up	2	RMEP_OK
20	sap:1/10:10	Enable	Up	3	RMEP_OK
30	sap:2/11:10	Enable	Violation	4	RMEP_FAILED
40	sap:2/12:10	Enable	Down	4	RMEP_FAILED
50	sap:2/13:10	Enable	Down	4	RMEP_FAILED

Local endpoint ID	The ID number of the local RFP end point.
Local system (Name: SystemId)	The name and bridge MAC address of the local SPB switch.
Service Id	An SPB service ID number. Configured through the service spb command and associated with the RFP ID through the service rfp remote-endpoint command.
Sap	The Service Access Point to which the SPB service ID is associated through the configured through the service sap command
Admin State	The administrative status (Enable or Disable) of the SAP.
Oper	The operation status (Up, Down, Violation) of the SAP.
Remote EndPoint	The ID number for the RFP remote end point. Configured through the service rfp remote-endpoint command.
R-Endpoint Status	The status of the remote Maintenance End Point (MEP).

Release History

Release 7.3.4; command was introduced.

```

output definitions

RFP domain number	The RFP ID number. that is mapped to the OAM domain.
Admin State	The administrative status (Enable or Disable) of the RFP domain.
Level	The Maintenance Domain (MD) level.
Type	The type of RFP domain (SPB is the only type currently supported).
Maintenance Domain	The name of the reserved MD assigned to the RFP domain.
Maintenance Association	The name of the Maintenance Association (MA) for the RFP (MD). The same MA name is used for all RFP domains.
Control B-VLAN	The SPB control BVLAN that serves as the primary VLAN for the RFP OAM domain.
Virtual UP MEP ID	The local end point ID for the RFP domain.
CCM interval	The time interval at which a Continuity Check Message (CCM) is sent for this domain.
Remote Endpoint service ID	The RFP ID number for the remote end point. The SPB service ID number associated with the remote end point ID.

11 Loopback Detection Commands

Loopback Detection (LBD) automatically detects the loop and shutdown the port involved in the loop. This prevents forwarding loops on ports that have forwarded network traffic which has looped back to the originating switch. LBD detects and prevents Layer 2 forwarding loops on a port either in the absence of other loop detection mechanisms such as STP/RSTP/MSTP, or when these mechanisms cannot detect it (for example, a client's equipment may drop BPDUs, or the STP protocol may be restricted to the network edge). On a linkagg port, if one port of linkagg is getting shutdown due to LBD, then all the ports of linkagg will go to shutdown state.

Loopback Detection is enabled system wide and on a per-port basis. Once a loop is discovered, the port from which the loop originated is placed into an “Inactive” state and when the two ports of a switch is connected to each other through a hub, either the ports will be shutdown or it will be in normal state.

A provider network with a set of multiple switches interconnected together can be logically viewed as a large single switch. The large single switch provides service access points to customers' networks. Configuration faults in customer networks can result in loops spanning both provider and customer networks. This can result in broadcast storms. In order to protect provider's network from broadcast storms, loops that involve SAP ports need to be detected and broken.

The LBD can detect and break loops created on the service-access interface.

For a service-access interface, LBD can be enabled for a specific port or linkagg. LBD for service-access points allows shutting down only the specific interface of the link involved in the loop.

When loopback occurs, a trap is sent and the event is logged. The port which is shutdown due to LBD is automatically recovered if autorecovery-timer is set or the port can manually be enabled again when the problem is resolved.

MIB information for the Loopback Detection commands is as follows:

Filename: alcatelIND1LBD.mib
Module: ALCATEL-IND1-LBD-MIB

A summary of available commands is listed here:

loopback-detection
loopback-detection port
loopback-detection service-access
loopback-detection transmission-timer
loopback-detection autorecovery-timer
show loopback-detection
show loopback-detection port
show loopback-detection statistics port

loopback-detection

Enables or disables Loopback Detection (LBD) or remote origin LBD globally on the switch.

loopback-detection [**remote-origin**] {**enable** | **disable**}

Syntax Definitions

enable	Enables LBD on the switch.
disable	Disables LBD on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- LBD can be enabled globally and per port without any dependency but loopback-detection will be operational only if LBD is enabled globally and also on the specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- Enabling the **remote-origin** LBD option allows the switch to process the LBD frames originated from a remote system. The port from which the LBD frames originated will be shut down.

Examples

```
-> loopback-detection enable
-> loopback-detection disable
-> loopback-detection remote-origin enable
-> loopback-detection remote-origin disable
```

Release History

Release 7.3.4; command was introduced.
Release 8.2.1; **remote-origin** parameter added.

Related Commands

loopback-detection port	Enables or disables LBD on a specific port.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigStatus  
alaLbdGlobalRemoteConfigStatus
```

loopback-detection port

Enables or disables LBD or remote-origin LBD on a specific port.

loopback-detection port *chassis/slot/port[-port2]* [**remote-origin**] {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables LBD on the specified port.
disable	Disables LBD on the specified port.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Loopback Detection must be enabled globally to enable LBD functionality on a specific port.
- For per port remote origin LBD to work, both LBD and remote origin LBD must be enabled globally.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- When a LBD port joins a link aggregate, the LBD configuration on the joined port is removed.

Examples

```
-> loopback-detection port 1/1/1 enable
-> loopback-detection port 1/1/1-8 enable
-> loopback-detection port 1/1/2 remote-origin enable
-> loopback-detection port 1/1/3-5 remote-origin enable
-> loopback-detection port 1/1/2 remote-origin disable
-> loopback-detection port 1/1/3-5 remote-origin disable
```

Release History

Release 7.3.4; command was introduced.

Release 8.2.1; **remote-origin** parameter added.

Related Commands

- loopback-detection** Enables or disables LBD globally on the switch.
- show loopback-detection** Displays LBD configuration information.
- show loopback-detection port** Displays LBD port configuration information.

MIB Objects

```
alaLbdPortConfigTable
  alaLbdPortConfigEntry
  alaLbdPortConfigIndex
  alaLbdPortConfigLbdAdminStatus
  alaLbdPortConfigLbdOperStatus
  alaLbdPortRemoteConfigAdminStatus
```

loopback-detection service-access

Allows to detect and break loops created on service access interface. Enables or disables LBD on a specific port or range of ports or linkagg or range of linkagg for service access interface.

loopback-detection service-access {port *chassis/slot/port*[-*port2*] / linkagg *agg_id*[-*agg_id2*]} {enable | disable}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables LBD on the specified port or linkagg.
disable	Disables LBD on the specified port or linkagg.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Before configuring LBD using the **service-access** option, the port or linkagg must be configured for service access. Use the **service access** command to configure the port or linkagg for service access.
- The **service-access** option allows shutting down only the specific interface of the link involved in the loop.
- The linkagg must be formed by ports with same path cost.
- LBD is applicable on a linkagg only if the linkagg is configured as a service access interface.
- LBD cannot be configured on a linkagg that has member ports running LBD configuration and vice versa.
- When a linkagg is in violation or shutdown state, the member ports cannot be deleted from the linkagg.

Examples

```
-> loopback-detection service-access port 1/1/1 enable
-> loopback-detection service-access port 1/1/1-8 enable
-> loopback-detection service-access linkagg 1 enable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

  alaLdbUserPortConfigLdbInterfaceType
```

loopback-detection transmission-timer

Configures the LBD transmission timer on the switch. The transmission time is the time period between the consecutive LBD packet transmissions.

loopback-detection transmission-timer *seconds*

Syntax Definitions

seconds The time period in seconds between LBD packet transmissions. The valid range is from 5 to 600 seconds.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the timer value is not configured, the default value of 30 seconds is assigned to the transmission period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection transmission-timer 200
```

Release History

Release 7.3.4; command was introduced.

Related Commands

- [loopback-detection](#) Enables or disables LBD globally on the switch.

MIB Objects

alaLbdGLobalConfigTransmissionTimer

loopback-detection autorecovery-timer

Configures the LBD autorecovery timer on the switch. The autorecovery time is the time period in which the switch is recovered from the shutdown state.

loopback-detection autorecovery-timer *seconds*

Syntax Definitions

seconds The time period in seconds in which the switch is recovered from the shutdown state. The valid range is from 30 to 86400 seconds.

Defaults

parameter	default
<i>seconds</i>	300

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the timer value is not configured, the default value of 300 seconds is assigned to the autorecovery period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection autorecovery-timer 200
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show loopback-detection

Displays the global LBD configuration information for the switch.

show loopback-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use this command to display the global configuration of LBD.
- To view information for a specific port, use the [show loopback-detection port](#) command.

Examples

```
-> show loopback-detection
Global LBD Status           : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
```

output definitions

Global LBD Status	The current status of LBD of the switch (enabled or disabled).
Global Remote-origin LBD Status	The current status of remote-origin LBD of the switch (enabled or disabled).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time in which the switch recovered from the shutdown state.

Release History

Release 7.3.4; command was introduced.

Release 8.2.1; “Global Remote-origin LBD Status” field added.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for all ports on the switch.
show violation	Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

MIB Objects

```
alaLbdGlobalConfigStatus  
alaLbdGlobalRemoteConfigStatus  
alaLbdGlobalConfigTransmissionTimer  
alaLbdGlobalConfigAutorecoveryTimer
```

show loopback-detection port

Displays the LBD configuration information for the specified port or linkagg ID.

show loopback-detection {**port** [chassis/slot/port] | **linkagg** *agg_id*}

Syntax Definitions

port	Displays the LBD configuration for all ports.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The command can be used only on LBD enabled port or linkagg.

Examples

```
-> show loopback-detection port
Slot/Port      Admin State      Remote-origin Status  OperState
-----+-----+-----+-----
1/1/1          enabled          enabled                Remote ShutDown
1/1/2          enabled          disabled               Normal
```

```
-> show loopback-detection port 1/1/1
Global LBD Status           : enabled,
Global Remote-origin LBD Status : enabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Port LBD Status              : enabled,
Port Remote-origin LBD Status : enabled,
Port LBD State                : Remote ShutDown,
Remote Src Mac                : E8:E7:32:9A:5A:4E,
Remote BridgeId               : E8:E7:32:9A:5A:3F,
Port LBD Type                  : normal-edge,
```

```
-> show loopback-detection port 1/1/2
Global LBD Status           : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Port LBD Status              : enabled,
Port Remote-origin LBD Status : disabled,
Port LBD State                : Normal,
```

```

Port LBD Type                : service-edge

-> show loopback-detection linkagg 1
Global LBD Status            : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Linkagg LBD Status           : disabled,
Linkagg Remote-origin LBD Status : disabled,
Linkagg LBD State            : Inactive,
Linkagg LBD Type             : service-access

```

output definitions

Global LBD Status	The current status of LBD of the switch (enabled or disabled).
Global Remote-origin LBD Status	The current status of remote-origin LBD of the switch (enabled or disabled).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time interval in seconds in which the switch is recovered from the shut down state.
Slot/Port	The slot/port number LBD port.
Admin State	The administrative state of the port (enabled or disabled).
Oper State	The operational state of the port (Normal or Inactive).
Port LBD Status	Displays the administrative status of the port.
Port Remote-origin LBD Status	Displays the remote-origin LBD status of the port.
Port LBD State	Displays the current operational state of the port.
Remote Src Mac	Displays the MAC address of the remote system. The Remote Src Mac is displayed, only if remote-origin LBD is enabled on the system.
Remote BridgeId	Displays the bridge ID of the remote system. The Remote BridgeId is displayed, only if remote-origin LBD is enabled on the system.
Port LBD Type	Displays the type of the interface – whether a normal edge interface or a service access interface.
Linkagg LBD Status	Displays the administrative status of the linkagg.
Linkagg Remote-origin LBD Status	Displays the remote-origin LBD status of the linkagg.
Linkagg LBD State	Displays the current operational state of the linkagg.
Linkagg LBD Type	Displays the type of the interface – whether a normal edge interface or a service access interface.

Release History

Release 7.3.4; command was introduced.

Release 8.2.1; fields added to display LBD remote origin information.

Related Commands

show loopback-detection statistics port

Displays LBD statistics information for a specific port on the switch.

show loopback-detection statistics port *chassis/slot/port*

Syntax Definitions

chassis The chassis identifier.
slot/port The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The linkagg ID is not displayed if the linkagg is operationally down.

Examples

```
-> show loopback-detection statistics port 1/1/1
LBD Port Statistics
LBD Packet Send                            : 1,
Invalid LBD Packet Received              : 0,
Member of Link Aggregation               : -
```

```
-> show loopback-detection statistics port 1/1/3
LBD Port Statistics
LBD Packet Send                            : 1,
Invalid LBD Packet Received              : 0,
Member of Aggregation                    : 2
```

output definitions

LBD Packet Send	The number of LBD packet sent from the port.
Invalid LBD Packet Received	The number of invalid LBD packets received on the port.
Member of Aggregation	The linkagg ID in which the port is a member.

Release History

Release 7.3.4; command was introduced.

Related Commands

12 Link Aggregation Commands

Link aggregation combines multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

Filename: AlcatelIND1LAG.MIB
Module: ALCATEL-IND1-LAG-MIB

A summary of available commands is listed here:

Static link aggregates	<code>linkagg static agg size</code> <code>linkagg static agg name</code> <code>linkagg static agg admin-state</code> <code>linkagg static port agg</code>
Dynamic link aggregates	<code>linkagg lacp agg size</code> <code>linkagg lacp agg name</code> <code>linkagg lacp agg admin-state</code> <code>linkagg lacp agg actor admin-key</code> <code>linkagg lacp agg actor system-priority</code> <code>linkagg lacp agg actor system-id</code> <code>linkagg lacp agg partner system-id</code> <code>linkagg lacp agg partner system-priority</code> <code>linkagg lacp agg partner admin-key</code> <code>linkagg lacp port actor admin-key</code> <code>linkagg lacp port actor admin-state</code> <code>linkagg lacp port actor system-id</code> <code>linkagg lacp port actor system-priority</code> <code>linkagg lacp agg partner admin-state</code> <code>linkagg lacp port partner admin system-id</code> <code>linkagg lacp port partner admin-key</code> <code>linkagg lacp port partner admin system-priority</code> <code>linkagg lacp port actor port priority</code> <code>linkagg lacp port partner admin-port</code> <code>linkagg lacp port partner admin port-priority</code>
Dual Home Link (DHL) Active-Active	<code>dhl name</code> <code>dhl num linka linkb</code> <code>dhl num admin-state</code> <code>dhl num vlan-map linkb</code> <code>dhl num pre-emption-time</code> <code>dhl num mac-flushing</code> <code>show dhl</code> <code>show dhl num</code> <code>show dhl num link</code>
Static and dynamic	<code>linkagg range</code> <code>show linkagg range</code> <code>show linkagg</code> <code>show linkagg port</code> <code>show linkagg accounting</code> <code>show linkagg counters</code> <code>show linkagg traffic</code> <code>clear linkagg-statistics</code>

linkagg static agg size

Creates a static aggregate group between two switches. A static aggregate group contains static links.

linkagg static agg *agg_id[-agg_id2]* **size** *size* [**name** *name*] [**admin-state** {**enable** | **disable**}] [**multi-chassis active**] [**hash** {**source-mac** | **destination-mac** | **source-and-destination-mac** | **source-ip** | **destination-ip** | **source-and-destination-ip** | **tunnel-protocol**}]

no linkagg static agg *agg_id[-agg_id2]*

Syntax Definitions

<i>agg_id[-agg_id2]</i>	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
<i>size</i>	The maximum number of links allowed in the aggregate group.
<i>name</i>	The name of the static aggregate group. Can be any alphanumeric string. A group name with spaces must be contained within quotes (for example, "Static Group 1").
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.
source-ip	Selects the source IP hashing option.
destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.
tunnel-protocol	Selects the tunnel protocol hashing option.

Defaults

parameter	default
enable disable	enable
<i>hash_option</i>	source-and-destination-IP (Layer 3 traffic) source-and-destination-mac (Layer 2 traffic)

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group or a range of static aggregate groups from the configuration.

- Link aggregation cannot be configured on an AppMon enabled port.
- If the static aggregate has any attached ports you must delete the attached ports with the **no** form of the **linkagg static port agg** command before you remove the static link aggregate ID. Delete the attached ports using the **no linkagg static port** command.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
 - Disassociate all ports currently associated with the aggregate.
 - Delete the aggregate from the switch configuration.
 - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended to avoid any loss of traffic.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, if the **source-mac** option is specified for L2 hashing:
 - If the global hash-control is in brief mode, hashing is based on source MAC address only.
 - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.
- For example, if the **source-ip** option is specified for L3 hashing:
 - If the global hash-control is in brief mode, hashing is based on source IP address only.
 - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg lacp agg size** command to create a dynamic aggregation (LACP) group.

Examples

```
-> linkagg static agg 3-10 size 8
-> linkagg static agg 4 size 2 admin-state disable
-> linkagg static agg 4 size 2 multichassis-active
-> linkagg static agg 4 size 2 hash source-and-destination-ip
-> no linkagg static agg 3-10
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; **tunnel-protocol** parameter added.

Related Commands

[show linkagg](#)

  alclnkaggAggLacpType  
  alclnkaggAggName  
  alclnkaggAggAdminState  
  alclnkAggPeerRangeOperMax
```

linkagg static agg name

Configures a name for an existing static aggregate group.

linkagg static agg *agg_id*[-*agg_id2*] **name** *name*

no linkagg static agg *agg_id*[-*agg_id2*] **name**

Syntax Definitions

agg_id[-*agg_id2*]

The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

name

The name of the static aggregation group, can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, "Static Group 1")

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a name from a static aggregate or from a range of static aggregates.
- You must assign names to static link aggregate IDs individually.
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static agg 2 name accounting
-> no linkagg static agg 2-10 name
```

Release History

Release 7.1.1; command introduced.

Related Commands

alclnkaggAggNumber

alclnkaggAggName

linkagg static agg admin-state

Enables or disables the administrative state of a static link aggregation group.

```
linkagg static agg agg_id[-agg_id2] admin-state {enable | disable}
```

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

Examples

```
-> linkagg static agg 2 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable  
  alclnkaggAggNumber  
  alclnkaggAggAdminState
```

linkagg static port agg

Configures a slot and port for a static aggregate group.

linkagg static port *chassis/slot/port[-port2]* **agg** *agg_id*

no linkagg static port *chassis/slot/port[-port2]*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
<i>agg_id</i>	The ID number corresponding to the static aggregate group.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to the same static aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static port 2/1-5 agg 4  
-> no linkagg static port 2/1-5
```

Release History

Release 7.1.1; command introduced.

linkagg lacp agg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

```
linkagg lacp agg agg_id[-agg_id2] size size
  [name name]
  [admin-state {enable | disable}]
  [actor admin-key actor_admin_key]
  [actor system-priority actor_system_priority]
  [actor system-id actor_system_id]
  [partner system-id partner_system_id]
  [partner system-priority partner_system_priority]
  [partner admin-key partner_admin_key]
  [multi-chassis active]
  [hash (source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip |
source-and-destination-ip | tunnel-protocol)]
```

```
no linkagg lacp agg agg_id[-agg_id2] size size
```

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
<i>size</i>	The maximum number of links that can belong to the aggregate.
<i>name</i>	The name of the dynamic aggregate group. can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, "Dynamic Group 1").
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch.
<i>partner_system_id</i>	The MAC address of the aggregate group of the remote system which is attached to the aggregate group of the switch.
<i>partner_system_priority</i>	The priority of the remote system to which the aggregation group is attached.
<i>partner_admin_key</i>	The administrative key for the remote partner of the aggregation group.
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.
source-ip	Selects the source IP hashing option.

destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.
tunnel-protocol	Selects the tunnel protocol hashing option.

Defaults

parameter	default
enable disable	enable
<i>hash_option</i>	source-and-destination-ip (Layer 3 traffic) source-and-destination-mac (Layer 2 traffic)

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- Link aggregation cannot be configured on an AppMon enabled port.
- You must disable the group with the **linkagg lacp agg admin-state** command before you can delete a dynamic link aggregate group.
- Optional parameters for the dynamic aggregate group can be configured when the aggregate is created. The dynamic aggregate group can be modified after the optional parameters are assigned.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
 - Disassociate all ports currently associated with the aggregate.
 - Delete the aggregate from the switch configuration.
 - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, if the **source-mac** option is specified for L2 hashing:
 - If the global hash-control is in brief mode, hashing is based on source MAC address only.
 - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN,

Ethertype, and source module ID/port.

- For example, if the **source-ip** option is specified for L3 hashing:
 - If the global hash-control is in brief mode, hashing is based on source IP address only.
 - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg static agg size** command to create static aggregate groups. See [page 12-3](#) for more information about this command.

Examples

```
-> linkagg lacp agg 2-5 size 4
-> linkagg lacp agg 3 size 2 admin-state disable actor system-priority 65535
-> no linkagg lacp agg 2-5 size 4
```

Release History

Release 7.1.1; command introduced.

```

linkagg lacp agg name

Configures a name for a dynamic aggregate group.

linkagg lacp agg *agg_id* **name** *name*

no linkagg lacp agg *agg_id*[-*agg_id2*] **name**

Syntax Definitions

agg_id[-*agg_id2*]

The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).

name

The name of the dynamic aggregate group. Can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, "Dynamic Group 1").

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a name from a single or a range of dynamic aggregate groups simultaneously.
- Assign names to individual dynamic link aggregate groups separately.

Examples

```
-> linkagg lacp agg 2 name finance  
-> no linkagg lacp agg 2-5 name
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

linkagg lacp agg admin-state

Configures the administrative state of a dynamic aggregate group or a range of dynamic aggregate groups.

linkagg lacp agg *agg_id*[-*agg_id2*] admin-state {enable | disable}

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the operation of a dynamic aggregate group cannot be performed.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.
- You can also enable or disable the admin-state for a range of link aggregate IDs simultaneously, using this command.

Examples

```
-> linkagg lacp agg 2 admin-state disable
-> linkagg lacp agg 2-10 admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

Configures the administrative key associated with a dynamic aggregate group.

linkagg lacp agg *agg_id*[-*agg_id2*] **actor admin-key** *actor_admin_key*

no linkagg lacp agg *agg_id*[-*agg_id2*] **actor admin-key**

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group.

Defaults

parameter	default
<i>actor_admin_key</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

Examples

```
-> linkagg lacp agg 3-5 actor admin-key 2
-> no linkagg lacp agg 3-5 actor admin-key
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

linkagg lacp agg actor system-priority

Configures the priority of the dynamic aggregate group.

```
linkagg lacp agg agg_id[-agg_id2] actor system-priority actor_system_priority
```

```
no linkagg lacp agg agg_id[-agg_id2] actor system-priority
```

Syntax Definitions

agg_id[-*agg_id2*]

The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).

actor_system_priority

The priority of the dynamic aggregate group of the switch in relation to other aggregate groups.

Defaults

parameter	default
<i>actor_system_priority</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.
- To assign or remove the actor system-priority for a series of link aggregate IDs, specify the range of link aggregate IDs with the **agg** keyword. Use a hyphen to separate the first and last link aggregate IDs of a range.

Examples

```
-> lacp linkagg 3 actor system-priority 100  
-> no lacp linkagg 3 actor system-priority
```

Release History

Release 7.1.1; command introduced.

```

```
no linkagg lacp agg agg_id[-agg_id2] actor system-id
```

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

Defaults

parameter	default
<i>actor_system_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the MAC address assignment (actor system ID) from a dynamic link aggregate or a range of dynamic link aggregates simultaneously.
- You can configure the MAC address for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

Examples

```
-> linkagg lacp agg 2 actor system-id 00:20:da:81:d5:b0  
-> no linkagg lacp agg 3-10 actor system-id  
-> no linkagg lacp agg 11 actor system-id
```

  [expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
<i>actor_admin_key</i>	The administrative key associated with this dynamic aggregate group.
actor admin-state	See the linkagg lacp port actor admin-state command.
<i>actor_system_id</i>	The MAC address of this dynamic aggregate group on the switch.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group.
<i>partner_admin_system_id</i>	The MAC address of the dynamic aggregate group of the remote switch.
<i>partner_admin_key</i>	The administrative key for the remote partner of the dynamic aggregation group.

<i>partner_admin_system_priority</i>	The priority of the remote system to which the dynamic aggregation group is attached.
partner admin-state	See the linkagg lacp agg partner admin-state command.
<i>actor_port_priority</i>	The priority of the actor port.
<i>partner_admin_port</i>	The administrative state of the partner port.
<i>partner_admin_port_priority</i>	The priority of the partner port.

Defaults

parameter	default
[active] [timeout]...	active, timeout, aggregate

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to a dynamic link aggregate must be configured to the same link speed.
- Ports that belong to the same dynamic aggregate group need not be configured sequentially and can be on any Network Interface (NI).

Examples

```
-> linkagg lacp agg 3/1 actor admin-key 0
-> no linkagg lacp agg 3/1 actor admin-key
```

Release History

Release 7.1.1; command introduced.

```

linkagg lacp port actor admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

linkagg lacp port *chassis/slot/port[-port2]* **actor admin-state** {[**active**] [**timeout**] [**aggregate**] [**synchronize**] [**collect**] [**distribute**] [**default**] [**expire**] | **none**}

no linkagg lacp port *chassis/slot/port[-port2]* **actor admin-state** {[**active**] [**timeout**] [**aggregate**] [**synchronize**] [**collect**] [**distribute**] [**default**] [**expire**] | **none**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
active	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
collect	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.
expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]....	active, timeout, aggregate

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin-state is set to **none**, all bit values are restored to their default configurations.

Examples

```
-> linkagg lacp port 4/2 actor admin-state synchronize collect distribute
-> no linkagg lacp port 4/2 actor admin-state synchronize collect
-> linkagg lacp port 4/2 actor admin-state none
```

Release History

Release 7.1.1; command introduced.

```

linkagg lacp port actor system-id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

linkagg lacp port *chassis/slot/port[-port2]* **actor system-id** *actor_system_id*

no linkagg lacp port *chassis/slot/port[-port2]* **actor system-id**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

Defaults

parameter	default
<i>actor_system_id</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the actor system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the system ID for a range of local ports simultaneously. Use a hyphen to separate the first and last port IDs of a range after the **port** keyword.

Examples

```
-> linkagg lacp port 3/1-10 actor system-id 00:20:da:06:ba:d3
-> no linkagg lacp port 3/1-10 actor system-id
```

Release History

MIB Objects

AlcLnkAggAggPortTable

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortPartnerAdminPortPriority

dhl name

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

dhl *dhl_num* [**name** *name*]

no dhl *dhl_num*

Syntax Definitions

dhl_num

The DHL session ID number. Valid range is 1–1000.

name

The name of the DHL session.

Defaults

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a DHL session ID from the switch configuration.
- Use the optional **name** parameter to specify a name for the DHL session.
- Only one DHL session can be configured on a switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

Examples

```
-> dhl 1 name dhl_session1  
-> no dhl 1
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl num linka linkb	Associates a pair of links (port or linkagg) with the DHL session.
dhl num admin-state	Configures the administrative status of the DHL session.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable  
  alaDHLSessionIndex  
  alaDHLSessionDescr
```

dhl num linka linkb

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

```
dhl dhl_num linka {port chassis/slot/port | linkagg agg_id} linkb {port chassis/slot/port | linkagg agg_id}
```

```
no dhl dhl_num linka {port chassis/slot/port | linkagg agg_id} linkb {port chassis/slot/port | linkagg agg_id}
```

Syntax Definitions

<i>dhl_num</i>	An existing DHL session ID number.
<i>chassis</i>	The chassis ID number.
<i>slot</i>	The slot number to designate as a link for the DHL session.
<i>port</i>	The physical port number to designate as a link for the DHL session.
<i>agg_id</i>	The link aggregate ID number to designate as a link for the DHL session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA and linkB are associated with each of the VLAN that the DHL session will protect. Any VLAN not associated with both the links or only associated with one of the links is unprotected.
- DHL linkA *and* linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port the is enabled for transparent bridging.
- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.
- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.

- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

Examples

```
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 linka linkagg 1 linkb port 1/2
-> dhl 1 linka port 1/1 linkb linkagg 1
-> dhl 1 linka linkagg 1 linkb linkagg 2
-> no dhl 1 linka port 1/1 linkb port 1/2
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
AlaDHLLinksTable
  alaDHLLinksSessionIndex
  alaDHLLinkslinkA
  alaDHLLinkslinkB
```

dhl num admin-state

Enables or disables the administrative state of a DHL session.

```
dhl dhl_num admin-state {enable | disable}
```

Syntax Definitions

<i>dhl_num</i>	An existing DHL session ID number.
enable	Enables the DHL session.
disable	Disables the DHL session.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state cannot be enabled until a linkA port and a linkB port are associated with the specified DHL session ID number.

Examples

```
-> dhl 1 admin-state enable  
-> dhl 1 admin-state disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable  
  alaDHLSessionAdminStatus
```

dhl num vlan-map linkb

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

```
dhl dhl_num vlan-map linkb {vlan_id[-vlan_id]}
```

```
no dhl dhl_num vlan-map linkb {vlan_id[-vlan_id]}
```

Syntax Definitions

dhl_num

A DHL session ID number.

vlan_id[-vlan_id]

A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1–4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- A DHL session has to be created before a VLAN-MAP can be configured.
- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.
- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.
- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.
- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.
- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA are moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
- If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB are moved to linkA.
- If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

Examples

```
-> vlan 10-30
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl 1 name dhl_session1
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 vlan-map linkb 18-20
-> no dhl 1 vlan-map linkb 18-20
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
alaDHLVlanMapTable
  alaDHLVlanMapSessionIndex
  alaDHLVlanMapVlanStart
  alaDHLVlanMapVlanEnd
  alaDHLVlanMapRowStatus
```

dhl num pre-emption-time

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

dhl *dhl_num* **pre-emption-time** *seconds*

Syntax Definitions

<i>dhl_num</i>	A DHL session ID number.
<i>seconds</i>	The number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0–600.

Defaults

parameter	default
<i>seconds</i>	30 seconds

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.
- If the pre-emption timer value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.
- If a link fails when the pre-emption timer is active, that is when the remaining pre-emption time value is not equal to 0, then the timer will be halted.
- When the pre-emption timer is active for a particular link and if the other link goes down, then the VLANs of the link that is down are automatically moved to the port for which the pre-emption timer is active.
- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

Examples

```
-> dhl 1 pre-emption-time 40sec
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.

show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

alaDHLSessionTable
 alaDHLSessionPreemptionTime

dhl num mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

```
dhl dhl_num mac-flushing {none | raw | mvrp}
```

Syntax Definitions

<i>dhl_num</i>	A DHL session ID number.
none	Flushing of the MAC address tables does not occur.
raw	Method of flushing when VPAs of the links moved across them due to link up/down or configuration change (VLAN-map). The switch determines the MAC addresses within the affected VLANs
mvrp	Method of flushing when one link fails and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

Defaults

parameter	default
none raw mvrp	none

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden', then changes cannot be made to the MVRP configuration on the dual homed links.
- If the MAC-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the `show dhl` command displays the active MAC-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the MAC-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to 'forbidden'.
- If VLANs are moved across the dual homed links as a result of configuration changes, then MAC-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly.

Examples

```
-> dhl 1 mac-flushing none
-> dhl 1 mac-flushing raw
```

Release History

Release 8.2.1; command was introduced.

show dhl *dhl_num*

Syntax Definitions

dhl_num A DHL session ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show dhl 1
DHL session name      : Arice,
Admin state           : Up,
Operational state     : Up,
Pre-emption time      : 40 sec,
Mac-flushing          : Raw-Flushing,
Active Mac-flushing   : Raw-Flushing,

Protected VLANs       : 10-20,23,25,30-100,600,700,800,

linkA:
  Port                 : 1/2,
  Operational state    : Up

  Un protected VLANs  : 900,1980,1987,234,
  Active VLAN         : 10-20,23,25,30-100,600,700,800,

linkB:
  Port                 : 1/1,
  Operational state    : Down,
  Un protected VLANs  : 1730-1800,
  Vlan-map             : 30-100,600,
  Active Vlans        : none,
```

output definitions

DHL session Name	The user-defined text description of the DHL session.
Admin state	The current administrative status of the DHL session.
Operational state	The operational state of the DHL session.

output definitions

Pre-emption time	The delay-interval in seconds to move the VLANs back to their original links.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	The active Mac-flushing technique that is enabled on the specified DHL session.
Protected VLANs	The common VLANs that contain both the dual homed links, for example linkA and linkB.
linkA	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkA.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
Active VLANs	The VLANs that are in an active state.
linkB	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkB.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
VLAN-map	The DHL VLAN map for linkB. This specifies the VLANs that are operational on DHL linkB from the common pool of VLANs between DHL linkA and linkB.
Operational VLANs	The VLANs that are in an operational state.

linkagg range

Modifies the range of standard and MC-LAG link aggregation identifiers.

linkagg range local {*agg_id-agg_id* / none} **peer** {*agg_id-agg_id* / none} **multi-chassis** {*agg_id-agg_id* / none}

Syntax Definitions

<i>agg_id-agg_id</i>	The first or last identifier in the range.
local	The range of standard local aggregate identifiers.
peer	The range of standard peer aggregate identifiers.
multi-chassis	The range of MC-LAG aggregate identifiers.
none	No aggregate identifiers range is specified.

Defaults

parameter	default
local	0-47
peer	48-95
multi-chassis	96-127

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command in conjunction with the MC-LAG feature to change the maximum number of MC-LAG link aggregates that can be configured.
- The switch must be rebooted for the ranges to take affect.
- The maximum number of combined standard and MC-LAG link aggregates is 128.

Examples

```
-> linkagg range local 0-9 peer 10-19 multi-chassis 20-127
-> linkagg range local none peer none multi-chassis 0-127
```

Release History

Release 7.1.1; command introduced.

Related Commands

show linkagg range Displays the link aggregate ranges.

```

show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

show linkagg [**agg** *agg_id*[-*agg_id2*]]

Syntax Definitions

agg_id[-*agg_id2*] The link aggregate ID number corresponding to the aggregate group. Configured through the **linkagg static agg size** or **linkagg lacp agg size** command. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, information for all aggregate groups is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an aggregate number is specified, only the information about the relevant aggregate group is displayed. The fields included in the display depend on whether the aggregate group is static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

Examples

No aggregate group is specified:

```
-> show linkagg
```

Number	Aggregate	SNMP Id	Size	Admin State	Oper State	Att/Sel Ports
1	Static	40000001	8	ENABLED	UP	2 2
2	Dynamic	40000002	4	ENABLED	DOWN	0 0
3	Dynamic	40000003	8	ENABLED	DOWN	0 2
4	Dynamic	40000004	8	ENABLED	UP	3 3
5	Static	40000005	2	DISABLED	DOWN	0 0

Output fields are defined here:

output definitions

Number	The aggregate group number.
Aggregate	The type of aggregate group, which can be Static or Dynamic .
SNMP Id	The SNMP ID associated with the aggregate group.
Size	The number of links in this aggregate group.

output definitions (continued)

Admin State	The current administrative state of the aggregate group, which can be ENABLED or DISABLED . You can modify this parameter with the linkagg static agg admin-state command (see page 12-8) for static aggregate groups and with the linkagg lacp agg admin-state command (see page 12-15) for dynamic aggregate groups.
Oper State	The current operational state of the aggregate group, which can be UP or DOWN .
Att Ports	The number of ports actually attached to this aggregate group.
Sel Ports	The number of ports that could possibly attach to the aggregate group.

A static aggregate is specified:

```
-> show linkagg agg 5
Static Aggregate
SNMP Id           : 40000005,
Aggregate Number  : 5,
SNMP Descriptor   : Omnichannel Aggregate Number 5 ref 40000005 size 2,
Name              : AGG5,
Admin State       : ENABLED,
Operational State : DOWN,
Aggregate Size    : 2,
Number of Selected Ports : 0,
Number of Reserved Ports : 0,
Number of Attached Ports : 0,
Primary Port      : NONE
```

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this static aggregate group.
Aggregate Number	The group number.
SNMP Descriptor	The standard MIB name for this static aggregate group.
Name	The name of this static aggregate group. You can modify this parameter with the linkagg static agg name command (see page 12-6).
Admin State	The administrative state of this static aggregate group, which can be ENABLED or DISABLED . You can modify this parameter with the linkagg static agg admin-state command (see page 12-8).
Operational State	The operational state of this static aggregate group, which can be UP or DOWN .
Aggregate Size	The number of links configured for this static aggregate group.
Number of Selected Ports	The number of ports that could possibly attach to this static aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this static aggregate group. (Note: This field is not relevant for static aggregate groups.)

output definitions (continued)

Number of Attached Ports	The number of ports actually attached to this static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A dynamic aggregate group is specified:

```
-> show linkagg agg 1-2
```

```
Dynamic Aggregate
SNMP Id           : 40000002,
Aggregate Number  : 2,
SNMP Descriptor   : Dynamic Aggregate Number 2 ref 40000002 size 4,
Name              : AGG 2,
Admin State       : ENABLED,
Operational State : DOWN,
Aggregate Size    : 4,
Number of Selected Ports : 0,
Number of Reserved Ports : 0,
Number of Attached Ports : 0,
Primary Port      : NONE,
LACP
MACAddress        : [00:1f:cc:00:00:00],
Actor System Id   : [00:20:da:81:d5:b0],
Actor System Priority : 50,
Actor Admin Key   : 120,
Actor Oper Key    : 0,
Partner System Id : [00:20:da:81:d5:b1],
Partner System Priority : 70,
Partner Admin Key : 220,
Partner Oper Key  : 0
```

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this dynamic aggregate group.
Aggregate Number	The group number of this dynamic aggregate group.
SNMP Descriptor	The standard MIB name for this dynamic aggregate group.
Name	The name of this dynamic aggregate group. You can modify this parameter with the linkagg lacp agg name command (see page 12-14).
Admin State	The administrative state of this dynamic aggregate group, which can be ENABLED or DISABLED . You can modify this parameter with the linkagg lacp agg admin-state command (see page 12-15).
Operational State	The operational state of this dynamic aggregate group, which can be UP or DOWN .
Aggregate Size	The number of links configured for this dynamic aggregate group.
Number of Selected Ports	The number of ports available to this dynamic aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.
Number of Attached Ports	The number of ports actually attached to this dynamic aggregate group.

output definitions (continued)

Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
MACAddress	The MAC address associated with the primary port.
Actor System Id	The MAC address of this dynamic aggregate group. You can modify this parameter with the linkagg lacp agg actor system-id command (see page 12-20).
Actor System Priority	The priority of this dynamic aggregate group. You can modify this parameter with the linkagg lacp agg actor system-priority command (see page 12-18).
Actor Admin Key	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the linkagg lacp agg actor admin-key command (see page 12-17).
Actor Oper Key	The operational key associated with this dynamic aggregate group.
Partner System Id	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the linkagg lacp agg partner system-id command (see page 12-22).
Partner System Priority	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the linkagg lacp agg partner system-priority command (see page 12-24).
Partner Admin Key	The administrative key for the remote partner of the dynamic aggregation. You can modify this parameter with the linkagg lacp agg partner admin-key command (see page 12-26).
Partner Oper Key	The operational key of the remote system to which the dynamic aggregation group is attached.

Release History

Release 7.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg accounting	Displays statistics for packet frames received and transmitted on link aggregate member ports.
show linkagg counters	Displays statistics for the number of packet frames and errors received and transmitted on link aggregate member ports.

show linkagg port

Displays information about link aggregation ports.

show linkagg [**agg** *agg_id*[-*agg_id2*]] **port** [*chassis/slot/port*]

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number corresponding to the aggregate group. Use a hyphen to specify a range of IDs (10-20).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number of the link aggregation port.

Defaults

By default, all link aggregation ports are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If a particular slot or port is specified, the fields displayed depend upon whether the port belongs to a static aggregate group or a dynamic (LACP) aggregate group.
- If only a link aggregate or a range of link aggregates is specified along with the **agg** keyword, the ports and related information for only the specified link aggregate IDs are displayed.
- If multi-chassis feature is activated on the switch, the show command displays the link aggregates as MC-Static and MC-Dynamic as shown in the second example.

Examples

```
-> show linkagg port
```

```
Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
-----+-----+-----+-----+-----+-----+-----+-----
  2/1    Static          2001  ATTACHED    1  UP   UP   YES
```

Multi-chassis active:

```
-> show linkagg port
```

```
Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
-----+-----+-----+-----+-----+-----+-----+-----
  2/1    MC-Static        2001  ATTACHED    1  UP   UP   YES
```

```
-> show linkagg agg 1-5 port
```

Slot/Port	Aggregate	SNMP Id	Status	Agg Oper	Link Prim
1/16	Static	2016	CONFIGURED	1 UP	UP YES
1/17	Static	2017	CONFIGURED	2 UP	UP NO
3/1	Static	3001	CONFIGURED	3 UP	UP NO
3/2	Static	3045	CONFIGURED	4 UP	UP NO
3/3	Static	3069	CONFIGURED	5 UP	UP NO

Output fields are defined here:

output definitions

Slot/Port	The slot/port associated with the aggregate group.
Aggregate	The type of aggregate group associated with the port, either Static or Dynamic .
SNMP Id	The SNMP ID associated with the aggregate group.
Status	The current status of the port, which can be CONFIGURED , PENDING , SELECTED , or RESERVED .
Agg	The number of the aggregate groups associated with this port.
Oper	The operational status of the port.
Link	The physical link status of the port.
Prim	Specifies if the port is the primary port of the aggregate. The primary port is the lowest numbered port in a link aggregate.

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1
```

```
Static Aggregable Port
SNMP Id           : 4001,
Slot/Port         : 4/1,
Administrative State : ENABLED,
Operational State : DOWN,
Port State        : CONFIGURED,
Link State        : DOWN,
Selected Agg Number : 2,
Port position in the aggregate: 0,
Primary port      : NONE
```

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port, which can be ENABLED or DISABLED .
Operational State	The current operational state of the port, which can be UP or DOWN .
Port State	The current operational state of the port, which can be CONFIGURED , PENDING , SELECTED , or RESERVED .

output definitions (continued)

Link State	The current operational state of the link from this port to its remote partner, which can be UP or DOWN .
Selected Agg Number	The number associated with the static aggregate group to which the port is attached.
Port position in the aggregate	The rank of this port within the static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A port that belongs to a static link aggregate is specified:

```
-> show linkagg agg 1
```

```
Static Aggregate
SNMP Id           : 40000001,
Aggregate Number  : 1,
SNMP Descriptor   : Omnichannel Aggregate Number 1 ref 40000001 size 4,
Name              : ,
Admin State       : ENABLED,
Operational State : DOWN,
Aggregate Size    : 4,
Number of Selected Ports : 0,
Number of Reserved Ports : 0,
Number of Attached Ports : 0,
Primary Port      : NONE
```

A port that belongs to a dynamic aggregate is specified:

```
-> show linkagg port 2/1
```

```
Dynamic Aggregable Port
SNMP Id           : 2001,
Slot/Port         : 2/1,
Administrative State : ENABLED,
Operational State  : DOWN,
Port State        : CONFIGURED,
Link State        : DOWN,
Selected Agg Number : NONE,
Primary port      : UNKNOWN,

Output fields are defined here:

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port, which can be ENABLED or DISABLED .
Operational State	The current operational state of the port, which can be UP or DOWN .
Port State	The current operational state of the port, which can be CONFIGURED , PENDING , SELECTED , or AGGREGATED .
Link State	The current operational state of the link from this port to its remote partner, which can be UP or DOWN .
Selected Agg Number	The number associated with the dynamic aggregate group to which the port is attached.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Actor System Priority	The actor system priority of this port. You can modify this parameter with the linkagg lacp port actor system-priority command (see page 12-35).
Actor System Id	The actor system ID (i.e., MAC address) of this port. You can modify this parameter with the linkagg lacp port actor system-id command (see page 12-33).
Actor Admin Key	The actor administrative key value for this port. You can modify this parameter with the linkagg lacp port actor admin-key command (see page 12-28).
Actor Oper Key	The actor operational key associated with this port.
Partner Admin System Priority	The administrative priority of the remote system to which this port is attached. You can modify this parameter with the linkagg lacp port partner admin system-priority command (see page 12-43).
Partner Oper System Priority	The operational priority of the remote system to which this port is attached.
Partner Admin System Id	The administrative MAC address associated with the system ID of a remote partner. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the linkagg lacp port partner admin system-id command (see page 12-39).
Partner Oper System Id	The MAC address that corresponds to the system ID of the remote partner.

output definitions (continued)

Partner Admin Key	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the linkagg lacp port partner admin-key command (see page 12-41).
Partner Oper Key	The current operational value of the key for the protocol partner.
Attached Agg ID	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
Actor Port	The port number locally assigned to this port.
Actor Port Priority	The actor priority value assigned to the port. You can modify this parameter with the linkagg lacp port actor port priority command (see page 12-45).
Partner Admin Port	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the linkagg lacp port partner admin-port command (see page 12-47).
Partner Oper Port	The operational port number assigned to the port by the protocol partner of the port.
Partner Admin Port Priority	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. You can modify this parameter with the linkagg lacp port partner admin port-priority command (see page 12-48).
Partner Oper Port Priority	The priority value assigned to the this port by the partner.
Actor Admin State	The administrative state of the port. You can modify this parameter with the linkagg lacp port actor admin-state command (see page 12-31).
Actor Oper State	The current operational state of the port.
Partner Admin State	The administrative state of the partner port. You can modify this parameter with the linkagg lacp agg partner admin-state command (see page 12-37).
Partner Oper State	The current operational state of the partner port.

show linkagg accounting

Displays statistics collected for packets transmitted and received on link aggregate ports.

show linkagg accounting

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Statistics are displayed for all link aggregate IDs configured on the switch.
- Statistics are collected for undersized and oversized packets, packets of a certain size, and Jabber frames.

Examples

```
-> show linkagg accounting
```

```
Link Agg 10
rx undersize packets      = 0
tx undersize packets      = 0
rx oversize packets       = 0
tx oversize packets       = 0
rx packets 64             = 3073753
rx packets 65_127         = 678698
rx packets 128_255        = 21616
rx packets 256_511        = 21062
rx packets 512_1023       = 2
rx packets 1024_1518      = 84
rx packets 1519_4095      = 0
rx packets 4096_9216      = 0
rx jabber frames          = 0
```

Release History

Release 8.3.1; command introduced.

Related Commands

[show linkagg counters](#)

Displays statistics collected for the type and number of packets transmitted and received on link aggregate ports.

[show linkagg traffic](#)

Displays the total number of packets and bytes that are received and transmitted on link aggregate ports.

[clear linkagg-statistics](#)

Clears statistics for all link aggregates or for specific aggregate IDs.

show linkagg counters

Displays statistics collected for the type and number of packet frames transmitted and received on link aggregate ports.

show linkagg counters [errors]

Syntax Definitions

errors Display the number of errors received on the link aggregate member ports.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Statistics are displayed (in bytes or frame count) for all link aggregate IDs configured on the switch.
- Error statistics include the number of alignment, frame check (FCS), received, and transmitted errors.

Examples

```
-> show linkagg counters
```

```
Link Agg 10
InOctets           = 54367578586897979
OutOctets          = 5.78E19

MIB Objects

```
alclnkaggAggIdTrafficTable
  alcInputPackets
  alcInputBytes
  alcOutputPackets
  alcOutputBytes
```

clear linkagg-statistics

Clears statistics for all link aggregates or for a specific aggregate ID or range of IDs.

```
clear linkagg-statistics [agg agg_id[-agg_id2]]
```

Syntax Definitions

agg_id[-*agg_id2*] The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, statistics are cleared for all link aggregates.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command sets all statistic counters to zero.

Examples

```
-> clear linkagg-statistics  
-> clear linkagg-statistics agg 10  
-> clear linkagg-statistics agg 11-15
```

Release History

Release 8.3.1; command introduced.

```

show linkagg range

Displays information about the configured or operational link aggregate range identifiers for standard and MC-LAG link aggregates.

show linkagg range [operation | config]

Syntax Definitions

operation Displays the operational ranges.
config Displays the configured ranges.

Defaults

By default, both the operational and configured ranges are shown.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **operation** parameter to display only the operational link aggregate identifiers.
- Use the **config** parameter to display only the configured link aggregate identifiers.
- A chassis reboot is required for the configured values to become operational.

Examples

```
-> show linkagg range
```

	Operational		Configured	
	Min	Max	Min	Max
Local	0	127	0	0
Peer	0	127	0	0
Multi-Chassis	0	127	0	127

output definitions

Operational Min/Max	The currently operational ranges.
Configured Min/Max	The currently configured ranges.
Local	The local link aggregate identifiers.
Peer	The peer link aggregate identifiers.
Multi-Chassis	The multi-chassis link aggregate identifiers.

Release History

Release 7.1.1; command introduced.

Related Commands

```

13 Virtual Chassis Commands

A Virtual Chassis is a group of switches managed through a single management IP address and that behave as a single bridge or router. It provides both node level and link level redundancy for devices connecting to the aggregation layer via dual-homed standard 802.3ad link aggregation mechanisms. The use of Virtual Chassis provides node level redundancy without the need to use redundancy protocols such as STP and VRRP between the edge and the aggregation/core layer.

MIB information for the Virtual Chassis commands is as follows:

Filename: ALCATEL-IND1-VIRTUAL-CHASSIS-MIB.mib

Filename: ALCATEL-IND1-VC-SPLIT-PROTECTION-MIB.mib

A summary of available commands is listed here:

Virtual Chassis Commands	virtual-chassis configured-chassis-id virtual-chassis chassis-group virtual-chassis configured-chassis-priority virtual-chassis configured-control-vlan virtual-chassis configured-hello-interval virtual-chassis vf-link create virtual-chassis vf-link member-port virtual-chassis vf-link default-vlan virtual-chassis hello-interval virtual-chassis shutdown virtual-chassis vf-link-mode virtual-chassis auto-vf-link-port vc-takeover convert configuration show virtual-chassis topology show virtual-chassis consistency show virtual-chassis vf-link show virtual-chassis auto-vf-link-port show virtual-chassis chassis-reset-list show virtual-chassis slot-reset-list show virtual-chassis consistency show virtual-chassis neighbors show configuration vcm-snapshot chassis-id
Virtual Chassis Split Protection Commands	virtual-chassis split-protection admin-state virtual-chassis split-protection linkagg virtual-chassis split-protection guard-timer virtual-chassis split-protection helper admin-state virtual-chassis split-protection helper linkagg show virtual-chassis split-protection status show virtual-chassis split-protection vc-units show virtual-chassis split-protection helper status

virtual-chassis configured-chassis-id

Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual-chassis mode.

virtual-chassis [**chassis-id** *oper_chassis*] **configured-chassis-id** *config_chassis*

no virtual-chassis [**chassis-id** *oper_chassis*] **configured-chassis-id** *config_chassis*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>config_chassis</i>	Chassis ID number (1-6 on OS6900 / 1-2 on OS10K). The configured/next chassis identifier.

Defaults

parameter	default
<i>oper_chassis</i>	0 (standalone mode; no virtual chassis operation is allowed)

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to change the chassis ID back to “0” (the default). When the chassis ID is set to “0”, the switch operates in standalone mode and all virtual chassis related configuration commands are no longer active for the switch.
- The operational chassis identifier parameter is only optional when the switch is running in standalone mode or at start up time, within the *vcsetup.cfg*, when the switch is coming up in virtual chassis mode. The same restrictions apply to the no form of the command.
- The operational chassis identifier is a mandatory parameter whenever the system is running in virtual chassis mode. This prevents modifying the chassis identifier of all switches at the same time and causing a duplicate chassis identifier.
- Two switches that have the same chassis identifier are not allowed to operate in virtual chassis mode. If a duplicate chassis identifier is detected one of the switches will be in an inconsistent role and its status will be set to Duplicate-Chassis-ID.
- The configured chassis identifier will only take effect after the next reboot of the target chassis.
- Virtual chassis is only supported between two switches of the same type. For example, virtual chassis is not supported between an OmniSwitch 10K and an OmniSwitch 6900.
- The no form of this command can only be used if there are no VFLs configured on the switch.
- Snapshots produced through the **show configuration vcm-snapshot**, **show configuration snapshot virtual chassis** or **write memory** commands always include the operational chassis identifier.

Examples

```
-> virtual-chassis configured-chassis-id 1 //Standalone mode
-> virtual-chassis chassis-id 0 configured-chassis-id 1
-> no virtual-chassis chassis-id 0 configured-chassis-id
-> no virtual-chassis configured-chassis-id
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
  virtualChassisOperChasId
  virtualChassisConfigChassisId
```

virtual-chassis chassis-group

Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number. The group ID number uniquely identifies switches operating in the same virtual chassis.

virtual-chassis [**chassis-id** *oper_chassis*] **chassis-group** *group*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>group</i>	Virtual chassis group identifier (0-255), which is used to identify a group of chassis belonging to the same virtual chassis.

Defaults

parameter	default
<i>group</i>	Derived from last byte of Master chassis MAC address

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Each virtual chassis domain must use a different group ID number to differentiate the domain within the network environment.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode the chassis group can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode the chassis group can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the same chassis group value is set for all switches that will participate on the same virtual chassis group. Failure to adhere to this recommendation followed by a system reset will prevent the switches whose values are different from joining the same virtual chassis group.
- When determining the chassis group ID the last byte of the Master chassis MAC address is used. For example, if the Master's MAC address is xx:xx:xx:xx:xx:7e, the chassis group will be 126 (equivalent to hex 7e).

Examples

```
-> virtual-chassis chassis-id 1 chassis-group 10
-> virtual-chassis chassis-id 0 chassis-group 10
-> virtual-chassis chassis-group 10 // All switches
```

Release History

Release 7.3.1; command introduced.

Release 7.3.4; Chassis group ID based on Master MAC address introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable  
  virtualChassisOperChasID  
  virtualChassisGroup
```

virtual-chassis configured-chassis-priority

Sets the configured chassis priority for a chassis specified by its operational chassis identifier.

virtual-chassis [**chassis-id** *oper_chassis*] **configured-chassis-priority** *priority*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>priority</i>	Configured chassis priority (0-255) which defines the user preference above all other election criteria, for the target chassis to become the master of the virtual chassis.

Defaults

parameter	default
<i>priority</i>	OS6900-Q32 - 120 All others - 100

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The greatest configured-chassis-priority will become the Master chassis. Without setting this value the smallest chassis identifier becomes the key parameter used to determine which switch will become the Master.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- The configured chassis priority will only take effect after the next reboot of the target switch.

Examples

Standalone mode:

```
-> virtual-chassis chassis-priority 50
-> virtual-chassis chassis-id 0 chassis-priority 50
```

All switches:

```
-> virtual-chassis configured-chassis-priority 50
-> virtual-chassis chassis-id 0 configured-chassis-priority 50
```

Chassis 2 only:

```
-> virtual-chassis chassis-id 2 configured-chassis-priority 75 //Chassis 2 only
```

Release History

Release 7.3.1.R01; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable  
  virtualChassisOperChasID  
  virtualChassisConfigPriority
```

virtual-chassis configured-control-vlan

Sets the configured control VLAN for a chassis specified by its operational chassis identifier.

virtual-chassis [**chassis-id** *oper_chassis*] **configured-control-vlan** *vlan*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>vlan</i>	Configured/next virtual chassis control VLAN (2-4094), which is used for all internal control communication between switches over the VFL.

Defaults

parameter	default
<i>vlan</i>	4094

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This configured control VLAN will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the value is for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10
```

All switches:

```
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable  
  virtualChassisOperChasID  
  virtualChassisConfigControlVlan
```

virtual-chassis configured-hello-interval

Sets the virtual chassis configured hello interval parameter on the switch. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

virtual-chassis [**chassis-id** *oper_chassis*] **configured-hello-interval** *hello*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>hello</i>	Configured/next virtual chassis hello interval in seconds (1-10), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

Defaults

parameter	default
<i>hello</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The configured value will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode, the configured hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- The hello timeout is a fixed value and defined as 120 seconds. This is the minimum time interval that a switch will wait without receiving any hello packets from a peer switch before declaring that the adjacency towards that switch was lost.
- It is strongly recommended that the hello interval be the same for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10
```

All switches:

```
-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10
```

Release History

Release 7.3.1; command introduced.

Release 7.3.3; command deprecated.

Related Commands

MIB Objects

```
virtualChassisGlobalTable
  virtualChassisOperChasID
  virtualChassisConfigHelloInterval
```

virtual-chassis vf-link create

Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the virtual chassis operation between the two switches.

virtual-chassis [**chassis-id** *oper_chassis*] **vf-link** *vfl_id* **create**

no virtual-chassis [**chassis-id** *oper_chassis*] **vf-link** *vfl_id*

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>vfl_id</i>	The VFL link identifier (0).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Although a virtual fabric link can be configured while the switch is running either in standalone or virtual chassis mode, a VFL can only become operational when the chassis operates in virtual chassis mode.
- Use the no form of this command to remove the VFL configuration from the switch.
- Although the switch supports runtime configuration of the VFL and its member ports, configuring the VFL at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- This command is valid only when the VFL mode is set to static.

Examples

```
-> virtual-chassis vf-link 0 create
-> virtual-chassis chassis-id 0 vf-link 0 create
-> no virtual-chassis vf-link 0
-> no virtual-chassis chassis-id 0 vf-link 0

-> virtual-chassis chassis-id 1 vf-link 0 create
-> virtual-chassis chassis-id 2 vf-link 0 create
-> no virtual-chassis chassis-id 1 vf-link 0
-> no virtual-chassis chassis-id 2 vf-link 0
```

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover	Converts an existing standalone configuration to a virtual chassis configuration.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisLinkTable  
  virtualChassisOperChasID  
  virtualChassisLinkID  
  virtualChassisVflRowStatus
```

virtual-chassis vf-link member-port

Adds member ports to a given virtual fabric link (VFL).

```
virtual-chassis [chassis-id oper_chassis] vf-link vfl_id member-port [oper_chassis]/slot/port
```

```
no virtual-chassis [chassis-id oper_chassis] vf-link vfl_id member-port [oper_chassis]/slot/port
```

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>vfl_id</i>	The VFL link identifier (0).
<i>oper_chassis/slot/port</i>	The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Although virtual-fabric link (VFL) member ports can be configured while the switch is running either in standalone or virtual chassis mode, a configured virtual-fabric link (VFL) member port can only become operational when the chassis operates in virtual chassis mode.
- Use the no form of this command to remove a member port from the virtual-fabric link (VFL).
- When a switch is running in virtual chassis mode, a virtual-fabric link member port must be fully specified including *oper_chassis/slot/port*.
- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, a virtual-fabric link (VFL) member ports can only be created or removed exactly in one switch at a time. In other words, we are not allowed to create or remove a virtual chassis link member port with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.
- A maximum of 16 member ports can be added or assigned to each virtual-fabric link (VFL).
- All virtual-fabric link (VFL) member ports must operate at the same speed.
- Only interfaces that operate at 10 Gbps or 40 Gbps can be added or assigned to a virtual-fabric link. (**Note:** 10GBaseT ports cannot be assigned to a VFL).
- Only interfaces operating in full-duplex mode can be added or assigned to a virtual-fabric link.

- It is recommended to configure virtual-fabric link (VFL) member ports across multiple network interface modules (NI) for resilience reasons.
- Virtual-fabric link (VFL) member ports can only be configured on interfaces that are fixed ports, network ports or priority flow control enabled ports. For instance, interfaces configured as Q-tag ports or ERP ports cannot be configured as virtual-fabric link member ports.
- When a switch is running in virtual chassis mode, the interface related to the last active virtual-fabric link member port cannot be administratively disabled.
- When a switch is running in virtual chassis mode, the last active virtual-fabric link member port cannot be deleted using the no form of the present command.
- When a switch is running in virtual chassis mode, the network interface module (NI) that hosts the last active virtual-fabric link member port cannot be administratively reset or powered off.
- This command is valid only when the VFL mode is set to static.

Examples

```
-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1
-> virtual-chassis chassis-id 1 vf-link 1 member-port 1/2/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> no virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1
-> no virtual-chassis chassis-id 1 vf-link 1 member-port 1/2/1
```

Release History

Release 7.3.1; command introduced.

MIB Objects

```
virtualChassisLinkTable
  virtualChassisOperChasID
  virtualChassisLinkId
  virtualChassisVflMemberPortIfindex
  virtualChassisVflMemberPortRowStatus
```

virtual-chassis vf-link default-vlan

Configures the default VLAN for the virtual fabric link (VFL).

virtual-chassis [**chassis-id** *oper_chassis*] **vf-link** *vfl_id* **default-vlan** *vlan*

no virtual-chassis [**chassis-id** *oper_chassis*] **vf-link** *vfl_id* **default-vlan**

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>vfl_id</i>	The VFL link identifier (0).
<i>vlan</i>	The default VLAN (1-4094) for the specified VFL.

Defaults

parameter	default
<i>vlan</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This configured VLAN will become the default untagged VLAN for the VFL.
- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- Use the **no** form of this command to set the default VLAN back to 1.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, a virtual-fabric link (VFL) default VLAN can only be configured exactly in one switch at a time. In other words, we are not allowed to configure the virtual chassis link default VLAN with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.
- It is strongly recommended that the user set the same value of default VLAN for all virtual-fabric links on all switches that will participate on the same virtual chassis topology. Failure to adhere to this recommendation may cause end to end connectivity problems in the network.

Examples

Standalone mode:

```
-> virtual-chassis vf-link 0 default-vlan 5
-> virtual-chassis chassis-id 0 vf-link 0 default-vlan 5
-> no virtual-chassis vf-link 0 default-vlan
-> no virtual-chassis chassis-id 0 vf-link 0 default-vlan
```

Chassis 1:

```
-> virtual-chassis chassis-id 1 vf-link 0 default-vlan 5  
-> no virtual-chassis chassis-id 1 vf-link 0 default-vlan
```

Release History

Release 7.3.1; command introduced.

Release 7.3.4; command deprecated.

Related Commands

show virtual-chassis vf-link Displays information about the virtual fabric link on the switch.

MIB Objects

```
virtualChassisLinkTable  
    virtualChassisOperChasID  
    virtualChassisLinkID  
    virtualChassisLinkOperDefaultVlan
```

virtual-chassis hello-interval

Sets the virtual chassis configured hello interval parameter on the chassis. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

```
virtual-chassis [chassis-id oper_chassis] hello-interval hello
```

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>hello</i>	The operational/current virtual chassis hello interval in seconds (1–2000), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

Defaults

parameter	default
<i>hello</i>	2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode, the hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the hello interval be the same for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis hello-interval 10  
-> virtual-chassis chassis-id 0 hello-interval 10
```

Virtual chassis mode:

```
-> virtual-chassis hello-interval 10 //All chassis  
-> virtual-chassis chassis-id 2 configured-hello-interval 10 //Chassis 2 only
```

Release History

Release 7.3.3; command introduced.

```

virtual-chassis shutdown

Disables all front-panel port including the user ports and all the VFL member ports on a chassis isolating the chassis from the rest of the virtual chassis topology.

virtual-chassis shutdown [**chassis-id** *oper_chassis*]

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command will disable all front panel ports, including the user ports and all virtual-fabric link (VFL) member ports on the specified switch.
- After running this command remote access to the target switch is only possible through the local EMP port on that switch.
- The target switch must be reloaded to bring its ports back to an operational state.
- This command is only functional when executed through the master chassis of a system operating in virtual chassis mode.
- After the shutdown command is executed, the target switch assumes the role of master and remains isolated from all other switches in the virtual chassis topology.

Examples

```
-> virtual-chassis shutdown chassis-id 2
```

Release History

Release 7.3.1; command introduced.

Related Commands

[show virtual-chassis consistency](#) Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

N/A

virtual-chassis vf-link-mode

Configures the Virtual Chassis mode. Virtual Chassis mode determines whether the VFLs are created automatically or statically.

virtual-chassis vf-link-mode {static | auto}

Syntax Definitions

N/A

Defaults

parameter	default
vf-link-mode	auto (if no vcsetup.cfg file exists).

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If the chassis boots without a **vcsetup.cfg** file the mode defaults to auto.
- If the chassis boots with a **vcsetup.cfg** file and the 'virtual-chassis vf-link-mode' CLI does not exist, the mode will be set to static. Otherwise, the mode will be set as configured in the **vcsetup.cfg** file.
- Changing the mode is only allowed for all chassis or the local chassis. Specific chassis configuration is not allowed.

Examples

```
-> virtual-chassis vf-link-mode auto
-> virtual-chassis vf-link-mode static
```

Release History

Release 7.3.4; command introduced.

Related Commands

show virtual-chassis vf-link Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisGlobalTable
  virtualChassisOperChasID

```

virtual-chassis auto-vf-link-port

Configures the port to be an automatic VFL port.

[no] virtual-chassis auto-vf-link-port *chassis/slot/port*

Syntax Definitions

chassis/slot/port The operational chassis identifier, slot, and port.

Defaults

chassis type	default
OS6900-X/T Models	The last 5 ports including ports on expansion slots. Note: Transceiver does not have to be present for port to be eligible as a default port.
OS6900-Q32	The last 5 ports that have a transceiver or 40G-to-10G splitter cable plugged in.
OS10K	The first port of each 10G or 40G module.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is allowed only if VFL mode is auto.
- Refer to the defaults table above for information on which ports are default automatic VFL ports.

Examples

```
-> virtual-chassis auto-vf-link-port 1/1/1
-> no virtual-chassis auto-vf-link-port 1/1/1
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show virtual-chassis auto-vf-link-port](#) Displays a summary of the auto VFL ports.

MIB Objects

```

```

vc-takeover

This command causes a reload of the master chassis from the running configuration in a virtual chassis environment.

vc-takeover

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If there are no slave chassis present in the system, the command will be rejected.
- This is equivalent to reloading the master chassis from the current running directory using the [reload from](#) command. However, this command includes an additional check for the existence of a slave chassis before executing.

Examples

```
-> vc-takeover
WARNING - Working Changes Will Be Lost, Confirm VC takeover (Y/N) :
```

Release History

Release 7.3.2; command introduced.

Related Commands

[reload from](#) Reloads the master or slave chassis from the specified directory.

MIB Objects

N/A

convert configuration

Converts an existing standalone configuration to a virtual chassis configuration.

convert configuration to *dir* [reload]

Syntax Definitions

<i>dir</i>	The name of the directory to store the virtual chassis configuration.
reload	Reloads the switch after converting the configuration.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command will automatically create the new configuration files *vcsetup.cfg* and *vcboot.cfg* within the specified directory. The *vcsetup.cfg* file contains the virtual chassis manager configuration, which is specific to each individual switch. The contents of the *vcsetup.cfg* files are unique to each switch and distinct between switches. The *vcboot.cfg* file contains the generic application configuration, which is global to the entire virtual chassis topology. As a result, the *vcboot.cfg* files should have the same contents between distinct switches.
- This command will automatically copy the image files of the current running directory into the specified *dir* directory.
- This command is only accepted in standalone mode after a valid chassis identifier (1-6) has been configured on the switch. The command is rejected when executed in a switch already running in virtual chassis mode.
- The directory will be automatically created if it does not exist.
- The current standalone configuration files (e.g. *boot.cfg*) that may exist in the directory will remain intact. When the switches come up in virtual chassis mode following a conversion using this command, the *vcboot.cfg* files present on distinct switches may be different. However, the *vcboot.cfg* files must be the same on all switches running in virtual chassis mode. As a result, the *vcboot.cfg* file of the master will overwrite the *vcboot.cfg* file on the slave chassis and the slave will automatically reboot.

Examples

```
-> convert configuration to vc_dir
```

Release History

Release 7.3.1; command introduced.

Related Commands

show configuration snapshot Displays the configured and operational parameters related to the virtual chassis feature on the switch.

MIB Objects

N/A

show virtual-chassis topology

This command is used to provide a detailed status of the virtual chassis topology.

show virtual-chassis [**chassis-id** {*oper_chassis*}] **topology**

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command can be executed on any CMM within any switch of the system.
- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- A chassis-id of 100 or 101 is used to indicate a duplicate chassis-id.

Examples

```
-> show virtual-chassis topology
```

```
Legend: Licenses - A: Advanced; B: Data Center
```

```

output definitions

Oper-Chassis-ID (Chas)	Operational/current virtual chassis chassis identifier.
Config Chas ID	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Role (Role)	<p>Chassis Role</p> <p>Unassigned: Role undefined as election has not completed yet.</p> <p>Master: Chassis is central point of management and control.</p> <p>Slave: Chassis is an active or functional participant of the virtual chassis topology, but it is not the main entry point for management and control purposes.</p> <p>Inconsis: Chassis is not an active or functional participant of the virtual chassis topology due to some inconsistent parameter, which does not match the match the master chassis' settings.</p> <p>Startup-Err: Chassis is in start up error mode because it was unable to come up in virtual chassis mode. When a chassis assumes the Startup-Err role, its chassis status will be equal to either Invalid-Chassis-Id or Invalid-License, which are described later in this section.</p>
Previous-Chassis-Role	Previous chassis role before the last transition.

output definitions

Chassis-Status (Status)	<p>Chassis Status</p> <p>Init: Status undefined as the chassis has not completed its initialization.</p> <p>Running: The chassis is fully operational.</p> <p>Invalid-Chassis-Id: The chassis is not operational in virtual chassis mode because no valid chassis identifier has been found in the configuration. Typically this means that the vsetup.cfg file is corrupted, empty or contains an invalid (e.g. out of range) chassis ID identifier.</p> <p>Invalid-License: The chassis is not operational in virtual chassis mode because no valid advanced license has been found.</p> <p>Hello-Down: The chassis is isolated from the rest of the virtual chassis topology participants because hello packets have not been received for a period of time greater than the hello timeout.</p> <p>Duplicate-Chassis: This chassis is not fully operational because its operational chassis identifier matches the chassis ID of another chassis within the virtual chassis topology. As a result, a new operational chassis identifier from the range (101-102) will be allocated to this chassis.</p> <p>Mis-Image: The chassis is not fully operational because its image versions are not consistent with the master chassis' images. In other words, the image version are not compatible and some of the software components running on this chassis are unable to interface with the software operating in the master chassis.</p> <p>Mis-Chassis-Type: The chassis is not fully operational because its chassis type (i.e. OS10K, OS6900) is not consistent with the master chassis' type. Different chassis types cannot be mixed in the same virtual chassis topology.</p> <p>Mis-Hello-Interval: The chassis is not fully operational because its operational hello interval is not consistent with the master chassis' operational hello interval.</p> <p>Mis-Control-Vlan: The chassis is not fully operational because its operational control VLAN is not consistent with the master chassis' operational control VLAN.</p> <p>Mis-Chassis-Group: The chassis is not fully operational because its chassis group does not match the master chassis' chassis group and the chassis is connected directly or indirectly to the master chassis through virtual-fabric links. This chassis is unable to join the active virtual chassis topology whose master chassis is part of.</p> <p>Mis-License-Config: The chassis is not fully operational because its license settings do not match the master chassis' license configuration. An exact match is required to allow successful operation within the same virtual chassis topology.</p> <p>Split-Topology: The chassis is not fully operational and all of its front panel user ports (excluding the virtual-fabric link member ports) are operationally down because a topology split has occurred. This chassis became isolated from the master chassis after all of its active virtual-fabric member ports went down or the virtual chassis manager hello timeout has expired.</p>
Chassis-Group (Group)	virtual chassis group identifier. Used to identify a group of chassis belonging to the same virtual chassis.
Chassis-MAC (MAC-Address)	Chassis MAC address.

output definitions

Up-Time	Chassis up time.
Designated-NI	Designated network interface module (NI), which is the module responsible for managing the inter-process communication infrastructure responsible for control communication between distinct switches within the virtual chassis topology. Only VFL capable network interface modules can be elected as designated NI. The valid designated NI values are (1) for the OS6900 platform and (1-8) for the OS10K platform. When no VFL capable network interface modules are present on a switch, the designated NI is zero (0).
Primary-CMM	Primary CMM slot.
Secondary-CMM	Secondary CMM slot.
Chassis-Type	The switch chassis type (OS6900 or OS10K).
License	The licenses installed on the chassis.
Hello-Interval	The hello-interval configured for the chassis.
Oper-Chassis-Priority (Pri)	Operational/current chassis priority, which defines the user preference, above all other election criteria, for a switch to become the master chassis of the virtual chassis topology. The greater this value the more likely a switch is to be elected as the master chassis.
Config-Chassis-Priority	Configured/next chassis priority, which defines the user preference above all other election criteria.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Number-of-Neighbors	Total number of neighbor switches that are part of the active virtual chassis topology for a given chassis group.
VFLink Mode	The VFLink mode of the chassis: Static or Auto.
Number-of-Direct-Neighbors	Number of directly attached neighbor switches that are part of the active virtual chassis topology for a given chassis group These are switches directly connected to the local switch through a virtual-fabric link (VFL).
Neighbor	The operational chassis identifier of neighbor switch.
Is-Direct	Flag identifying whether a particular neighbor is directly attached to a given switch.
Shortest-Path	The shortest path from a given switch to a neighbor switch using the notation <i>chassis/vfl_id</i> .

Release History

Release 7.3.1; command introduced.

Release 7.3.4; VFLink mode introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
virtual-chassis chassis-group	Assigns a globally unique chassis group identifier to a switch. Each peer switch in a virtual chassis domain must use the same group ID number.
virtual-chassis configured-chassis-priority	Sets the configured chassis priority for a switch specified by its operational chassis identifier.
virtual-chassis configured-control-vlan	Sets the configured control VLAN for a switch specified by its operational chassis identifier.
virtual-chassis configured-hello-interval	Configures the virtual chassis hello interval parameter on the switch.

show virtual-chassis consistency

This command is used to provide a detailed status of the parameters taken into account to determine the consistency of a group of switches participating in the virtual chassis topology.

show virtual-chassis [**chassis-id** *oper_chassis*] **consistency**

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command provides a list of parameters that must be configured consistently on all switches that will participate on the virtual chassis topology to allow correct system operation.
- In order to determine the consistency of a given parameter, the switch will compare the value of such parameters on a given switch with the settings of the master chassis. Therefore consistency is always defined as a comparison with the master chassis.
- The following parameters are considered consistent if they match the settings of the master chassis: chassis type, license, chassis group, operational control VLAN, configured control VLAN, operational hello interval and configured hello interval.
- The configured chassis identifier parameter is considered consistent if it is different than the settings of the master chassis.

Examples

```
-> show virtual-chassis consistency
```

```
Legend: * - denotes mandatory consistency which will affect chassis status
        Licenses - A: Advanced; B: Data Center
```

Chassis-Group*	0	0	OK
Hello-Interval	10	10	OK
Oper-Control-Vlan*	4094	4094	OK
Config-Control-Vlan	4094	4094	OK

output definitions

Chassis-ID (Chas)	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
Config-Chassis-ID (Conf Chas ID)	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Type (Chas Type)	The switch chassis type (OS6900 or OS10K).
License	The licenses installed on the chassis.
Chassis-Group (Chas Group)	virtual chassis group identifier. Used to identify a group of chassis belonging to the same active virtual chassis topology.
Hello-Interval	Operational/current hello-interval.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Status	<p>Defines whether a given switch's parameter is considered consistent with the master chassis' settings. The possible values are:</p> <p>OK: The switch is operating in virtual chassis mode and the given switch's parameter value is consistent with the settings of the master chassis.</p> <p>NOK: The switch is operating in virtual chassis mode and the given switch's parameter value is inconsistent with the settings of the master chassis.</p> <p>N/A: The switch is operating in virtual chassis mode, but the virtual chassis topology has not converged and therefore a master chassis is not yet known.</p> <p>Disabled: The switch is operating in standalone mode, in which there can be no virtual chassis master and hence the concept of consistency does not apply.</p>

Release History

Release 7.3.1; command introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
virtual-chassis chassis-group	Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number.
virtual-chassis configured-chassis-priority	Sets the chassis priority for a chassis specified by its operational chassis identifier.
virtual-chassis configured-control-vlan	Sets the configured control VLAN for a chassis specified by its operational chassis identifier.
virtual-chassis configured-hello-interval	Sets the configured hello interval parameter on the switch.

MIB Objects

  virtualChassisConfigControlVlan  
  virtualChassisOperHelloInterval  
  virtualChassisConfigHelloInterval
```

show virtual-chassis vf-link

Displays a summary of the configured and operational parameters related to the virtual fabric links on the virtual chassis topology.

show virtual-chassis [*chassis-id oper_chassis*] **vf-link** *vfl_id* **member-port** [*oper_chassis/slot/port*]

Syntax Definitions

<i>oper_chassis</i>	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.
<i>vfl_id</i>	The VFL identifier.
<i>oper_chassis/slot/port</i>	The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command can be executed on any switch within the virtual chassis topology.

Examples

```
-> show virtual-chassis vf-link
VFLink mode: static
```

Chassis/VFLink ID	Oper	Primary Port	Config Port	Active Port	Def Vlan
1/0	Up	1/1/3	2	2	1
2/0	Up	2/1/3	2	2	1

```
-> show virtual-chassis chassis-id 1 vf-link
```

Chassis/VFLink ID	Oper	Primary Port	Config Port	Active Port	Def Vlan
1/0	Up	1/1/3	2	2	1

```
-> show virtual-chassis vf-link member-port
```

Chassis/VFLink ID	Chassis/Slot/Port	Oper	Is Primary
1/0	1/1/1	Up	No
1/0	1/1/3	Up	Yes
2/0	2/1/1	Up	No
2/0	2/1/3	Up	Yes

```
-> show virtual-chassis chassis-id 1 vf-link member-port
Chassis/VFLink ID  Chassis/Slot/Port  Oper      Is Primary
-----+-----+-----+-----
1/0                 1/1/1                Up        No
1/0                 1/1/3                Up        Yes
```

output definitions

Chassis/VFLink ID	Pair operational/current virtual chassis chassis identifier and virtual-fabric link (VFL) identifier.
Oper	Virtual-fabric link (VFL) operational status. The possible values are Up and Down .
Primary Port	Primary port of the virtual-fabric link (VFL) trunk, which is the port where non-unicast packets destined a remote chassis are sent out.
Config Port	Number of ports configured to operate as virtual-fabric link (VFL) member ports, i.e. ports that potentially may join a virtual-fabric link (VFL).
Active Port	Number of virtual-fabric link (VFL) member ports that are operational, i.e. the LACP protocol is fully operational for those ports.
Def Vlan	Operational default VLAN on the virtual-fabric link (VFL).
Chassis/Slot/Port	The operational <i>chassis/slot/port</i> tuple identifying a particular virtual-fabric link (VFL) member port.
Is Primary	Indicates is this port is the primary port of the VFL.

Release History

Release 7.3.1; command introduced.
 Release 7.3.4; VFLink mode introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
virtual-chassis vf-link create	Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the Virtual Chassis operation between the two switches.
virtual-chassis vf-link member-port	Configures member ports for the virtual fabric link (VFL).
virtual-chassis vf-link default-vlan	Configures the default VLAN for the VFL.

MIB Objects

```
virtualChassisLinkTable  
  virtualChassisOperChasID

  virtualChassisVflMemberPortRowStatus
```

show virtual-chassis auto-vf-link-port

Displays a summary of the auto VFL ports.

show virtual-chassis [**chassis-id** *oper_chassis*] **auto-vf-link-port** [*chassis/slot/port*]

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

oper_chassis/slot/port The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command can be executed on any switch within the virtual chassis topology.

Examples

```
-> show virtual-chassis auto-vf-link-port
Chassis/Slot/Port   VFL ID           VFL member status
-----+-----+-----
1/1/1               1/0              Down
1/1/3               1/1              Up
```

output definitions

Chassis/Slot/Port	The chassis/slot/port identifier.
VFL ID	The VFL identifier.
VFL member status	The status of the VFL member port. Up or Down.

Release History

Release 7.3.4; command introduced.

Related Commands

[virtual-chassis auto-vf-link-port](#) Configures the port to be an automatic VFL port.

MIB Objects

```

```

show virtual-chassis chassis-reset-list

This command displays the list of all chassis that must be reset along with a specified chassis in order to prevent a virtual chassis topology split.

show virtual-chassis [**chassis-id** *oper_chassis*] **chassis-reset-list**

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
-> show virtual-chassis chassis-reset-list
Chas  Chassis reset list
-----+-----
1      1
2      2

-> show virtual-chassis chassis-id 1 chassis-reset-list
Chas  Chassis reset list
-----+-----
1      1
```

output definitions

Chas	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
Chassis reset list	A list of operational chassis identifiers, which define which switches must be reset, along with the switch given by Chas in order to prevent a split of the virtual chassis topology.

Release History

Release 7.3.1; command introduced.

Related Commands

show virtual-chassis topology Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisChassisResetListTable  
  virtualChassisOperChasId  
  virtualChassisChassisResetList
```

show virtual-chassis slot-reset-list

For a given chassis and network interface module (NI), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split.

show virtual-chassis [*chassis-id oper_chassis*] **slot-reset-list**

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- On the OmniSwitch 6900, the slot number depicted in this command always refers to the main board of the switch (i.e. slot number 1). In other words, this command does not present the status related to expansion boards.

Examples

```
-> show virtual-chassis slot-reset-list
Chas Slot  Reset status
-----+-----+-----
1     1     Split
2     1     Split

-> show virtual-chassis chassis-id 1 slot-reset-list
Chas Slot  Reset status
-----+-----+-----
1     1     Split
```

output definitions

Chas	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
-------------	---

output definitions

Slot	Slot number identifying a particular network interface module (NI). For OS6900 switches, the slot number is always be equal to 1.
Reset Status	For the network interface module (NI) identified by the pair (Chas, Slot), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split according to the following definitions. Supported: The network interface module can be reset without splitting the virtual chassis topology. Split: Resetting this network interface module will cause a virtual chassis topology split.

Release History

Release 7.3.1; command introduced.

show virtual-chassis neighbors

This command displays a list of which neighbors are connected via which VFL for a virtual chassis.

show virtual-chassis [**chassis-id** *oper_chassis*] **neighbors**

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
-> show virtual-chassis neighbors
```

```
Chas VFL VFL VFL VFL VFL
ID   0   1   2   3   4
----+---+---+---+---+---
  1   2   3   4   5   6
  2   1   3   4   5   6
  3   1   2   4   5   6
  4   1   2   3   5   6
  5   1   2   3   4   6
  6   1   2   3   4   5
```

```
-> show virtual-chassis chassis-id 2 neighbors
```

```
Chas VFL VFL VFL VFL VFL
ID   0   1   2   3   4
----+---+---+---+---+---
  2   1   3   4   5   6
```

output definitions

Chas ID	Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
VFL	The VLF identifier connecting to the remote chassis listed in the table.

Release History

Release 7.3.3; command introduced.

Related Commands

[show virtual-chassis topology](#) Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

  virtualChassisVflDirectNeighborChasId
```

show configuration vcm-snapshot chassis-id

Displays a snapshot of the switch specific virtual chassis configuration for a switch running in virtual chassis mode.

show configuration vcm-snapshot chassis-id *oper_chassis*

Syntax Definitions

oper_chassis Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When a switch operates in standalone mode, this command is not supported. In this case, we must use the **show configuration snapshot virtual chassis** to obtain a snapshot of the switch specific virtual chassis configuration.

Examples

```
-> show configuration vcm-snapshot chassis-id 1
! Virtual Chassis Manager:
virtual-chassis chassis-id 1 configured-chassis-id 1
virtual-chassis chassis-id 1 vf-link 0 create
virtual-chassis chassis-id 1 vf-link 0 member-port 1/8/1
virtual-chassis chassis-id 1 configured-control-vlan 4091
virtual-chassis chassis-id 1 chassis-group 1

! IP:
ip interface local chassis-id 1 emp address 10.255.76.21 mask 255.255.255.0
```

Release History

Release 7.3.1; command introduced.

Related Commands

[show configuration snapshot](#) Displays the configured and operational parameters related to the virtual chassis feature on the switch.

MIB Objects

N/A

virtual-chassis split-protection admin-state

Enable or disables the VC split protection feature.

```
virtual-chassis split-protection admin-state {enable | disable}
```

Syntax Definitions

enable	Enables VC split protection.
disable	Disables VC split protection.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- VCSP cannot be enabled before assigning a link aggregate.
- VCSP cannot be enabled on a device that is already running the helper functionality.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection admin-state enable  
-> virtual-chassis split-protection admin-state disable
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.
virtual-chassis split-protection linkagg	Assigns a link aggregate for use with VCSP.

MIB Objects

```
alaVCSPConfigInfo  
  alaVCSPAdminState
```

virtual-chassis split-protection guard-timer

Configures the timer value for how long the master will wait to receive VCSP PDUs before beginning transmission of VCSP PDUs.

virtual-chassis split-protection guard-timer *time*

Syntax Definitions

time Time interval to wait on boot up before choosing any state. The valid range is 30–100 seconds.

Defaults

parameter	default
<i>time</i>	30 seconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Changes to the Guard timer only take affect after reboot or by disabling and re-enabling VC split protection.

Examples

```
-> virtual-chassis split-protection guard-timer 60
```

Release History

Release 7.3.4.R02; command was introduced.

Related Commands

[show virtual-chassis split-protection status](#) Displays all the information related to VCSP when enabled.

MIB Objects

virtual-chassis split-protection helper admin-state

Enables or disables the helper functionality on the helper device.

virtual-chassis split-protection helper admin-state {enable | disable}

Syntax Definitions

enable Enables VC split protection helper functionality.
disable Disables VC split protection helper functionality.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use this command on the helper device to enable the helper functionality.
- The helper functionality cannot be enabled on a device that is running VCSP.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection helper admin-state enable  
-> virtual-chassis split-protection helper admin-state disable
```

Release History

Release 7.3.4.R02; command was introduced.

14 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. The implementation of ERP on Alcatel-Lucent OmniSwitch is based on ERP Version 2 (ITU-T G.8032/Y.1344 to 2010) using the Ring Automatic Protection Switching (R-APS) protocol to coordinate and prevent network loops within a bridged Ethernet ring.

ERPV2 supports multi-rings and ladder to ladder networks. ERPV2 functionalities allow configuration of Sub-Rings within a Master Ethernet Ring, interconnected nodes and shared links between the rings.

MIB information for Ethernet Ring Protection commands is as follows:

Filename: AlcatelIND1Erp.mib
Module: ALCATEL-IND1-ERP-MIB

A summary of available commands is listed here:

[erp-ring](#)
[erp-ring rpl-node](#)
[erp-ring wait-to-restore](#)
[erp-ring enable](#)
[erp-ring guard-timer](#)
[erp-ring sub-ring](#)
[erp-ring virtual-channel](#)
[erp-ring revertive](#)
[erp-ring clear](#)
[erp-ring ethoam-event](#)
[clear erp statistics](#)
[show erp](#)
[show erp statistics](#)

erp-ring

Creates an Ethernet Ring Protection (ERP) using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring. The specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

```
erp-ring ring_id port1 {chassis/slot/port | linkagg agg_id} port2 {chassis/slot/port | linkagg agg_id}
service-vlan vlan_id level level_num [guard-timer guard_timer] [wait-to-restore-timer wtr_timer]
[enable | disable]
```

```
no erp-ring ring_id
```

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.
<i>vlan_id</i>	The service VLAN ID number. The valid range is 1 to 4094.
<i>level_num</i>	The MEG level number for the service VLAN. The valid range is 0 to 7.
<i>guard-timer</i>	The guard timer value, in centi seconds, for the ring node.
<i>wtr-timer</i>	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP ring.
disable	Administratively disables the ERP ring.

Defaults

parameter	default
<i>guard_timer</i>	50
<i>wtr_timer</i>	5
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Administratively disable the ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of 64 rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- Create an ERP type NNI-SVLAN binding before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 port1 1/1 port2 2/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

Release History

Release 7.1.1; command introduced.

Related Commands

show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates an NNI-SVLAN binding.

MIB Objects

```
alaErpRingTable
  alaErpRingServiceVid
  alaErpRingMEGLevel
  alaErpRingStatus
  alaErpRingPort1
  alaErpRingPort2
  alaErpRingWaitToRestore
  alaErpRingGuardTimer
  alaErpRingRowStatus
```

erp-ring rpl-node

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

```
erp-ring ring_id rpl-node {port chassis/slot/port | linkagg agg_id}
```

```
no erp-ring ring_id rpl-node
```

Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.

Defaults

NA

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled. RPL configuration applied to the Ethernet ring while it is enabled is rejected.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

Examples

```
-> erp-ring 1 rpl-node port 2/1  
-> erp-ring 2 rpl-node linkagg 2  
-> no erp-ring 2 rpl-node
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring wait-to-restore	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingPortEntry  
  alaErpRingPortIfIndex  
  alaErpRingPortType
```

erp-ring wait-to-restore

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

```
erp-ring ring_id wait-to-restore wtr_timer
```

```
no erp-ring ring_id wait-to-restore
```

Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1 to 2147483647.
<i>wtr_timer</i>	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1 to 12.

Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

Examples

```
-> erp-ring 1 wait-to-restore 6  
-> no erp-ring 1 wait-to-restore
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring rpl-node	Configures a Ring Protection Link (RPL) port connection.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId  
  alaErpRingWaitToRestoreTimer
```

erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

erp-ring *ring_id* {**enable** / **disable**}

Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1 to 2147483647.
enable	Enables the specified ring ID.
disable	Disables the specified ring ID.

Defaults

By default, ERP rings are disabled when they are created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The specified ring ID must exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

Examples

```
-> erp-ring 1 enable  
-> erp-ring 1 disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId  
alaErpRingStatus
```

erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

```
erp-ring ring_id guard-timer guard_timer
```

```
no erp-ring ring_id guard-timer
```

Syntax Definitions

ring_id An existing ERP ring ID number. The valid range is 1 to 2147483647.
guard_timer The guard timer value. The valid range is 1–200 centi-secs.

Defaults

parameter	default
<i>guard_timer</i>	50

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> erp-ring 1 guard-timer 10  
-> no erp-ring 1 guard-timer
```

Release History

Release 7.1.1; command introduced.

Related Commands

alaErpRingId  
alaErpRingGuardTimer
```

erp-ring sub-ring

Creates an Ethernet Ring Protection (ERP) sub-ring.

erp-ring *ring_id* **sub-ring-port** {*chassis/slot/port* | **linkagg** *agg_id*} **service-vlan** *vlan_id* **level** *level_num* [**guard-timer** *guard_timer*] [**wait-to-restore-timer** *wtr_timer*] [**enable** | **disable**]

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.
<i>vlan_id</i>	The service VLAN ID number. The valid range is 1 to 4094.
<i>level_num</i>	The MEG level number for the service VLAN. The valid range is 0 to 7.
<i>guard_timer</i>	The guard timer value, in centi-secs, for the ring node.
<i>wtr_timer</i>	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP sub-ring.
disable	Administratively disables the ERP sub-ring.

Defaults

parameter	default
<i>guard_timer</i>	50
<i>wtr_timer</i>	5
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a sub-ring from the switch configuration. Administratively disable ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.
- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.

- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of four rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding must be created before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 sub-ring-port 1/1 service-vlan 10 level 2 enable
-> erp-ring 2 sub-ring-port linkagg 1 port2 2/10 service-vlan 20 level 2
-> no erp-ring 2
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates a NNI-SVLAN binding.

  alaErpRingWaitToRestore  
  alaErpRingGuardTimer  
  alaErpRingRowStatus
```

erp-ring virtual-channel

Enables or disables an Ethernet Ring Protection (ERP) Ring Virtual Channel.

erp-ring *ring_id* **virtual-channel** [**enable** | **disable**]

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables the ERP virtual channel. If enabled, Ring Automatic Protection Switching (R-APS) protocol messages are encapsulated and transmitted over a virtual channel configured on the major ring.
disable	Administratively disables the ERP virtual channel. If disabled, R-APS messages are terminated at the interconnection nodes between the rings but not blocked at the Ring Protection Link (RPL) of the sub-ring.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by Ring ID must be created before configuring the virtual channel state for ring node.

Examples

```
-> erp-ring 2 virtual-channel disable
-> erp-ring 1 virtual-channel enable
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects`alaErpRingTable``alaErpRingId``alaErpRingVirtualChannel`

erp-ring revertive

Enables or Disables revertive mode on the specified node.

erp-ring *ring_id* revertive [enable | disable]

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL automatically reverts to the “Blocked” state when the failed link recovers.
disable	Administratively Disables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL does not automatically revert to “Blocked” state when the failed link recovers.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by the Ring ID must be created using the [erp-ring](#) command, before configuring the revertive mode for ring node.

Examples

```
-> erp-ring 1 revertive enable
-> erp-ring 2 revertive disable
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring clear

Clears any pending state (for example, non-revertive restoring).

erp-ring *ring_id* clear

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
clear	Clears any pending state on the ring.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 clear
```

Release History

Release 7.3.1; command introduced.

Related Commands

erp-ring ethoam-event

Configures a ring port to accept a “loss of connectivity” event from Ethernet OAM for a remote endpoint.

```
erp-ring ring_id ethoam-event {chassis/slot/port | linkagg agg_id} remote-endpoint mep_id
```

```
no erp-ring ring_id ethoam-event {chassis/slot/port | linkagg agg_id}
```

Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.
<i>mep_id</i>	The remote endpoint ID.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 ethoam-event 1/1 remote-endpoint 10
-> erp-ring 1 ethoam-event linkagg 1 remote-endpoint 10
```

Release History

Release 7.3.1; command introduced.

clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

clear erp statistics [**ring** *ring_id* [**port** *chassis/slot/port* | **linkagg** *agg_id*]]

Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/2
-> clear erp statistics ring 5 linkagg 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

show erp [**ring** *ring_id*] [**port** *chassis/slot/port* | **linkagg** *agg_id*]

Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1 to 2147483647.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_id</i>	The link aggregate ID number.

Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> show erp
```

```
Legends: *   to Inactive Configuration
          WTR to Wait To Restore
          MEG to Maintenance Entity Group
```

Ring ID	Ring Port1	Ring Port2	Ring Status	Serv VLAN	WTR Timer (min)	Guard Timer (csec)	MEG Level	Ring State	Ring Node

15 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs.

A summary of the available commands is listed here:

- mvrp**
- mvrp port**
- mvrp maximum-vlan**
- mvrp registration**
- mvrp applicant**
- mvrp timer join**
- mvrp timer leave**

mvrp

Enables or disables MVRP globally on the switch.

mvrp {enable | disable}

Syntax Definitions

enable	Enables MVRP globally on the switch.
disable	Disables MVRP globally on the switch.

Defaults

By default, MVRP is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Disabling MVRP globally deletes all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the per-VLAN mode.

Examples

```
-> mvrp enable
-> mvrp disable
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

[show mvrp configuration](#) Displays the global configuration for MVRP.

MIB Objects

alaMvrpGlobalStatus

mvrp port

Enables or disables MVRP on specific ports on the switch.

```
mvrp port chassis/slot/port[-port2] {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8)
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, MVRP is disabled on all the ports.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, VLAN Stacking User ports) do not support MVRP.

Examples

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

alaMvrpPortStatus

mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

mvrp linkagg *agg_id*[-*agg_id2*] {**enable** | **disable**}

Syntax Definitions

<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables MVRP for the specified link aggregate ID.
disable	Disables MVRP for the specified link aggregate ID.

Defaults

By default, MVRP is disabled on all the ports.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created.

Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

MIB Objects

alaMvrpPortConfigTable
alaMvrpPortStatus

mvrp maximum-vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

mvrp maximum-vlan *vlan_limit*

Syntax Definitions

vlan_limit The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

Defaults

The default value is 256.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration takes effect only after the MVRP is disabled and re-enabled on the switch. The VLANs learnt earlier are retained if this operation is not performed.

Examples

```
-> mvrp maximum-vlan 100
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

MIB Objects

alaMvrpMaxVlanLimit

mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

mvrp {**port** *chassis/slot/port*[- *port2*] | **linkagg** *agg_id*[-*agg_id2*]} **registration** {**normal** | **fixed** | **forbidden**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
normal	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
fixed	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
forbidden	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLANs created earlier is de-registered.

Defaults

parameter	default
normal fixed forbidden	normal

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 registration forbidden
-> mvrp port 1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal
```

Release History

MIB Objects

alaMvrpPortConfigTable

alaMvrpPortConfigRegistrarMode

mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

mvrp {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} applicant {participant | non-participant | active}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
participant	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
non-participant	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
active	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

Defaults

parameter	default
participant non-participant active	active

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 applicant active
-> mvrp port 1/3 applicant participant
-> mvrp port 1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

[show mvrp linkagg](#)

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

alaMvrpPortConfigtable
alaMvrpPortConfigApplicantMode

mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **timer join** *timer_value*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>timer_value</i>	Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

Defaults

parameter	default
<i>timer-value</i>	600 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer join 600
-> mvrp port 1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

Release History

alaMvrpPortConfigLeaveAllTimer

alaMvrpPortConfigPeriodicTimer

mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

mvrp {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **timer leave** *timer_value*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>timer-value</i>	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
<i>timer_value</i>	1800 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (16.66 milliseconds). Leave timer must be at least be greater than twice the join timer plus 100 milliseconds.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

mvrp {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **timer leaveall** *timer_value*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>timer_value</i>	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
<i>timer-value</i>	30000 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- LeaveAll timer value must be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer leaveall 30000
-> mvrp port 1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port*[- *port2*] | linkagg *agg_id*[-*agg_id2*]} **timer periodic-timer** *timer_value*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>timer_value</i>	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

Defaults

parameter	default
<i>timer-value</i>	<i>1 second</i>

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1

mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

```
mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} periodic-transmission {enable | disable}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables periodic transmission status on a port.
disable	Disables periodic transmission status on a port.

Defaults

By default, periodic-transmission status is disabled on all the ports.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 periodic-transmission enable
-> mvrp port 1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

MIB Objects

alaMvrpPortConfigTable

alaMvrpPortConfigPeriodicTransmissionStatus

mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

mvrp {port *chassis/slot/port* [- *port2*] | linkagg *agg_id*[-*agg_id2*]} **restrict-vlan-registration** **vlan** *vlan_list*

no mvrp {port *chassis/slot/port* [- *port2*] | linkagg *agg_id*[-*agg_id2*]} **restrict-vlan-registration** **vlan** *vlan_list*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>vlan_list</i>	The VLAN ID or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1 restrict-vlan-registration vlan 6-10
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

```

mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

mvrp {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **restrict-vlan-advertisement** **vlan** *vlan_list*

no mvrp {port *chassis*/slot/port[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **restrict-vlan-advertisement** **vlan** *vlan_list*

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP VLAN advertisement is not restricted.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

```
mvrp {linkagg agg_id[-agg_id2] | port chassis/slot/port[-port2]} static-vlan-restrict vlan vlan_list
```

```
no mvrp {linkagg agg_id[-agg_id2] | port chassis/slot/port[-port2]} static-vlan-restrict vlan vlan_list
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.

Examples

```
-> mvrp port 1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/2 static-vlan-restrict vlan 5
-> mvrp port 1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/2 static-vlan-restrict vlan 6-9

output definitions

Port	Displays the slot and port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.
LeaveAll Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.
Periodic Tx Status	The transmission status of MVRP, enable or disable .

Release History

Release 7.2.1; command introduced.
 Release 7.2.1.R02; Support for OS10K added.

Related Commands

mvrp port

Enables or disables MVRP on specific ports on the switch.

mvrp

Configures VLAN dynamic registration mode to MVRP and deletes all static configuration of previous mode along with the dynamic data.

show mvrp linkagg

Displays the MVRP configurations for linkaggs, including timer values, registration and applicant modes.

show mvrp linkagg [*agg_id*[-*agg_id2*]] [**enabled** | **disabled**]

Syntax Definitions

agg_id[-*agg_id2*] The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

enabled To display only the enabled ports.

disabled To display only the disabled ports.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show mvrp linkagg 1-3
```

Port	Status	Join Timer (msec)	Leave Timer (msec)	LeaveAll Timer (msec)	Periodic Timer (sec)	Registration Mode	Applicant Mode	Periodic Tx Status
0/1	enabled	600	1800	30000	2	fixed	participant	enabled
0/2	enabled	600	1800	30000	2	fixed	participant	enabled
0/3	enabled	600	1800	30000	2	fixed	participant	enabled

```
-> show mvrp linkagg 1
```

```
MVRP Enabled : yes,
Registrar Mode : normal,
Applicant Mode : participant,
Join Timer (msec) : 600,
Leave Timer (msec) : 1800,

show mvrp timer

Displays the timer values configured for all the ports or a specific port.

show mvrp [*port chassis/slot/port*[- *port2*] | **linkagg** *agg_id*[-*agg_id2*]] **timer** {**join** | **leave** | **leaveall** | **periodic-timer**}

Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i>]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
join	To display only the join timer.
leave	To display only the leave timer.
leaveall	To display only the leaveall timer.
periodic-timer	To display only the periodic-timer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg_id* or *slot/port* parameter with this command to display the timer values configured for a specific port.

Examples

```
-> show mvrp timer
```

Port	Join Timer (msec)	Leave Timer (msec)	LeaveAll Timer (sec)	Periodic Timer (msec)
1/1	600	1800	30000	2
1/2	600	1800	30000	5
1/3	600	1800	30000	1
1/4	600	1800	30000	1

```
-> show mvrp port 1/21 timer
```

```
Join Timer (msec) : 600,  
Leave Timer (msec) : 1800,
```

```

LeaveAll Timer (msec) : 30000,
Periodic-Timer (sec) : 1
-> show mvrp port 1/21 timer join

Join Timer (msec) : 600

-> show mvrp port 1/21 timer leave

Leave Timer (msec) : 1800

-> show mvrp port 1/21 timer leaveall

LeaveAll Timer (msec) : 30000

-> show mvrp port 1/21 timer periodic-timer

Periodic-Timer (sec) : 1

-> show mvrp timer join

Legend : All timer values are in milliseconds
Port      Join Timer
-----+-----
1/1       600
1/2       600

```

output definitions

Port	Displays the slot/port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.

output definitions (continued)

LeaveAll Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

mvrp timer join	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
mvrp timer leave	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
mvrp timer leaveall	Specifies the frequency with which the LeaveAll messages are communicated.
mvrp timer periodic-timer	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

show mvrp {port chassis/slot/port[- port2] | linkagg agg_id[-agg_id2]} statistics

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg_id* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 statistics
```

```

```

output definitions

New Received	The number of new MVRP messages received on the switch.
Join In Received	The number of MVRP Join In messages received on the switch
Join Empty Received	The number of MVRP Join Empty messages received on the switch.
Leave In Received	The number of MVRP Leave In messages received on the switch.
In Received	The total MVRP messages received on the switch.
Empty Received	The number of MVRP Empty messages received on the switch.
Leave All Received	The number of MVRP Leave All messages received on the switch.

output definitions (continued)

New Transmitted	The number of new MVRP messages sent by the switch.
Join In Transmitted	The number of MVRP Join In messages sent by the switch.
Join Empty Transmitted	The number of MVRP Join Empty messages sent by the switch.
Leave Transmitted	The number of MVRP Leave messages sent by the switch.
In Transmitted	The number of MVRP In messages sent by the switch.
Empty Transmitted	The number of MVRP empty messages sent by the switch.
LeaveAll Transmitted	The number of Leave All messages sent by the switch.
Failed Registrations	The number of failed registrations.
Total Mrp PDU Received	The number of total MRP PDUs received by the switch.
Total Mrp Msgs Received	The number of total MRP messages received by the switch.
Total Mrp Msgs Transmitted	The number of total MRP messages sent by the switch.
Invalid Msgs Received	The number of invalid messages received by the switch.

Release History

show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

show mvrp {port chassis/slot/port[- port2] | linkagg agg_id[-agg_id2]} last-pdu-origin

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show mvrp port 1/1-3 last-pdu-origin
```

```
Port      Last PDU Origin
-----+-----

```

```
Port      Last PDU Origin
-----+-----
1/1      00:d0:95:ee:f4:64
```

output definitions

Port	Displays the slot and port number.
Last PDU origin	The source MAC address of the last PDU message received on the specific port.

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

[show mvrp linkagg](#)

Displays the MVRP configuration for a specific port or an aggregate of ports.

[show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

alaMvrpPortStatsTable
alaMvrpPortLastPduOrigin

show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

show mvrp {port chassis/slot/port[- port2] | linkagg agg_id[-agg_id2]} vlan-restrictions

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the *agg_id* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 vlan-restrictions
```

VLAN ID	Static Registration	Restricted Registration	Restricted Applicant
1	LEARN	FALSE	FALSE
2	LEARN	FALSE	FALSE
3	LEARN	FALSE	FALSE
4	LEARN	FALSE	FALSE
5	LEARN	FALSE	FALSE
6	LEARN	FALSE	FALSE
7	LEARN	FALSE	FALSE
11	RESTRICT	FALSE	FALSE
12	RESTRICT	FALSE	FALSE
53	LEARN	TRUE	FALSE
55	LEARN	FALSE	TRUE

output definitions

VLAN ID	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
Static Registration	Indicates if the port is restricted (RESTRICT) or not restricted (LEARN) from becoming a member of the static VLAN.

output definitions (continued)

Restricted Registration	Indicates if the VLAN is restricted (TRUE) or not restricted (FALSE) from dynamic registration on the port.
Restricted Applicant	Indicates if the VLAN is restricted for advertisement from the port (TRUE) or not (FALSE).

Release History

Release 7.2.1; command introduced.

Release 7.2.1.R02; Support for OS10K added.

Related Commands

mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

mvrp [*port chassis/slot/port [-port2]* | *linkagg agg_id[-agg_id2]*] **clear-statistics**

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the *agg_id* or *slot/port* parameter with this command to clear MVRP statistics for a specific port.

Examples

```
-> mvrp clear-statistics
-> mvrp port 1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

Release History

Release 7.2.1; command introduced.
Release 7.2.1.R02; Support for OS10K added.

Related Commands

[show mvrp statistics](#) Displays the MVRP statistics for all the ports, aggregates, or specific ports.

16 802.1AB Commands

802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of it. The information is exchanged as an LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

Alcatel-Lucent's version of 802.1AB complies with the following:

- IEEE 802.1AB-2009 Station and Media Access Control Discovery
- ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices.

MIB information for the 802.1AB commands is as follows:

MIB Filename: LLDP-MIB.mib, LLDP-TC-MIB.mib, LLDP-EXT-DOT1-MIB.mib,
LLDP-EXT-DOT3-MIB.mib, LLDP-EXT-MED-MIB.mib

MIB v2 Filenames: LLDP-V2-MIB.mib, LLDP-V2-TC-MIB.mib, LLDP-EXT-DOT1-V2-MIB.mib,
LLDP-EXT-DOT3-V2-MIB.mib, LLDP-EXT-MED-MIB.mib

A summary of available commands is listed here:

- lldp nearest-edge mode**
- lldp transmit interval**
- lldp transmit hold-multiplier**
- lldp reinit delay**
- lldp notification interval**
- lldp lldpdu**
- lldp notification**
- lldp network-policy**
- lldp med network-policy**
- lldp tlv management**
- lldp tlv dot1**
- lldp tlv dot3**
- lldp tlv med**
- lldp tlv application**
- lldp tlv application priority**
- show lldp system-statistics**
- show lldp statistics**
- show lldp local-system**
- show lldp local-port**
- show lldp local-management-address**
- show lldp config**
- show lldp network-policy**
- show lldp med network-policy**
- show lldp remote-system**
- show lldp remote-system med**
- show lldp remote-system application-tlv**
- show lldp agent-destination-address**
- lldp trust-agent**
- lldp trust-agent violation-action**
- show lldp trusted remote-agent**
- show lldp trust-agent**

Configuration procedures for 802.1AB are explained in “Configuring 802.1AB,” *OmniSwitch AOS Release 8 Network Configuration Guide*.

lldp nearest-edge mode

Enables or disables the nearest-edge mode for the switch. When enabled, the switch will use the LLDP destination MAC address (01:20: DA: 02:01:73) to send LLDPDUs.

lldp nearest-edge mode {enable | disable}

Syntax Definitions

enable	Enables the nearest-edge mode.
disable	Disables the nearest-edge mode.

Defaults

NA

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.
- This mode is used to learn the Management VLAN ID from a centralized Remote Configuration management switch.

Examples

```
-> lldp nearest-edge mode enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show lldp local-system](#) Displays local system information.

MIB Objects

lldpDestMac

lldp transmit interval

Sets the transmit time interval for LLDPDUs.

lldp transmit interval *seconds*

Syntax Definitions

seconds The transmit interval between LLDPDUs, in seconds. The valid range is 5 - 32768.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The LLDP protocol must be enabled before using this command.

Examples

```
-> lldp transmit interval 40
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

- lldp transmit hold-multiplier** Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
- show lldp local-system** Displays local system information.

MIB Objects

lldpConfiguration
lldpv2MessageTxInterval

lldp transmit hold-multiplier

Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

lldp transmit hold-multiplier *num*

Syntax Definitions

num The transmit hold multiplier value. The valid range is 2-10.

Defaults

parameter	default
<i>num</i>	4

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The Time To Live is a multiple of transmit interval and transmit hold multiplier.

Examples

```
-> lldp transmit hold-multiplier 6
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

[lldp transmit interval](#) Sets the transmit time interval for LLDPDUs.
[show lldp local-system](#) Displays local system information.

MIB Objects

```
lldpConfiguration  
  lldpv2MessageTxHoldMultiplier
```

lldp reinit delay

Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.

lldp reinit delay *seconds*

Syntax Definitions

seconds The number of seconds to reinitialize the ports status after a status change. The valid range is 1-10.

Defaults

parameter	default
<i>seconds</i>	2

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The LLDP protocol must be enabled before using this command.

Examples

```
-> lldp reinit delay 4
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

[lldp transmit interval](#) Sets the minimum time interval between successive LLDPDUs transmitted.

[show lldp local-system](#) Displays local system information.

MIB Objects

lldpConfiguration
 lldpv2ReinitDelay

lldp notification interval

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

lldp notification interval *seconds*

Syntax Definitions

seconds The minimum number of seconds for generating a notification-event.
The valid range is 5-3600.

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDP protocol and notification must be enabled before using this command.
- In a specified interval, it is not possible to generate more than one notification-event.

Examples

```
-> lldp notification interval 25
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

- [lldp notification](#) Specifies the switch to control per port notification status about the remote device change.
- [show lldp local-system](#) Displays local system information.

MIB Objects

```
lldpConfiguration
  lldpv2NotificationInterval
```

lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port[-port2]* | **slot** *chassis/slot* | **chassis**} **lldpdu** {**tx** | **rx** | **tx-and-rx** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
tx	Transmits LLDPDUs.
rx	Receives LLDPDUs.
tx-and-rx	Transmits and receives LLDPDUs.
disable	Disables LLDPDUs transmission and reception.

Defaults

parameter	default
tx rx tx-and-rx disable	tx-and-rx
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The port can be set to receive, transmit, or transmit and receive LLDPDUs using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.

- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 lldpdu tx-and-rx
-> lldp slot 3 lldpdu tx
-> lldp chassis lldpdu disable
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

lldp notification

Specifies the switch to control per port notification status about the remote device change.

MIB Objects

```
lldpv2PortConfigTable
  lldpv2PortConfigIfIndex
  lldpv2PortConfigDestAddressIndex
  lldpv2PortConfigAdminStatus
```

lldp notification

Specifies the switch to control per port notification status about the remote device change.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port[-port2]* | **slot** *chassis/slot* | **chassis**} **notification** {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables the notification of local system MIB changes.
disable	Disables the notification.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 notification enable
-> lldp slot 1 notification disable
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.
lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

MIB Objects

```
lldpPortConfigTable
  lldpv2PortConfigPortNum
  lldpv2PortConfigDestAddressIndex
  lldpv2PortConfigNotificationEnable
```

lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

lldp network-policy *policy_id* **application** {**voice** | **voice-signaling** | **guest-voice** | **guest-voice-signaling** | **softphone-voice** | **video-conferencing** | **streaming-video** | **video-signaling**} **vlan** {**untagged** | **priority-tag** | *vlan-id*} [**l2-priority** *802.1p_value*] [**dscp** *dscp_value*]

no lldp network-policy *policy_id* - [*policy_id2*]

Syntax Definitions

<i>policy_id</i> - [<i>policy_id2</i>]	A network policy identifier (0-31) which is associated to a port. Supported only with the no form of the command
voice	Specifies a voice application type.
voice-signaling	Specifies a voice-signaling application type.
guest-voice	Specifies a guest-voice application type.
guest-voice-signaling	Specifies a guest-voice-signaling application type.
softphone-voice	Specifies a softphone-voice application type.
video-conferencing	Specifies a video-conferencing application type.
streaming-video	Specifies a streaming-video application type.
video-signaling	Specifies a video-signaling application type.
untagged	Specifies that a VLAN port is untagged.
priority-tag	Specifies the internal priority that would be assigned to the VLAN.
<i>vlan_id</i>	VLAN identifier. Valid range is 1–4094.
<i>802.1p_value</i>	The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
<i>dscp_value</i>	Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

Defaults

parameter	default
<i>802.1p_value</i> for voice application	5
<i>802.1p_value</i> for other applications	0
<i>dscp_value</i>	0

By default, the VLAN ID is configured in the voice network profile.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the **no** form of this command.

Examples

```
-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged 12-
priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 12-priority 2 dscp 43
-> no lldp network-policy 10

-> no lldp network-policy 10-20
```

Release History

Release 8.1.1; command introduced.

Related Commands

|--|--|
| lldp tlv med | Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs. |
| show lldp network-policy | Displays the network policy details for a given policy ID. |
| show lldp med network-policy | Displays the network policy configured on a slot or port. |

MIB Objects

```
alaLldpXMedLocMediaPolicyTable
  alaLldpXMedLocMediaPolicyId
  alaLldpXMedLocMediaPolicyAppType
  alaLldpXMedLocMediaPolicyVlanType
  alaLldpXMedLocMediaPolicyVlanID
  alaLldpXMedLocMediaPolicyPriority
  alaLldpXMedLocMediaPolicyDscp
  alaLldpXMedLocMediaPolicyUnknown
  alaLldpXMedLocMediaPolicyTagged
  alaLldpXMedLocMediaPolicyRowStatus
```

lldp med network-policy

Associates an existing network policy per LLDP agent per port, slot, or chassis. Also specifies the LLDP destination MAC address sent in LLDPDUs.

lldp [**nearest-bridge** | **nearest-customer** | **non-tpmr** | **all**] {**port** *chassis/slot/port* | **slot** *chassis/slot* | **chassis**} **med network-policy** *policy_id* - [*policy_id2*]

no lldp {**port** *chassis/slot/port* | **slot** *chassis/slot* | **chassis**} **med network-policy** *policy_id* - [*policy_id2*]

Syntax Definition

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>chassis/slot</i>	The chassis ID and slot number for a specific module (3/1).
chassis	Specifies all switch ports.
<i>policy_id</i> - [<i>policy_id2</i>]	A network policy identifier (0–31).

Defaults

NA

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disassociate a network policy from a port.
- The network policy must already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

Examples

```
-> lldp chassis med network-policy 22
-> lldp slot 1/1 med network-policy 1-4 5 6
-> lldp por 2/1/3 med network-policy 12
-> no lldp slot 2/3 med network-policy 12
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the MED Network Policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable  
  alaLldpXMedLocMediaPolicyPortIfIndex  
  alaLldpXMedLocMediaPolicyId  
  alaLldpXMedLocMediaPolicyPortRowStatus
```

lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port*[-*port2*] | **slot** *chassis/slot* / *chassis*} **tlv management** {**port-description** | **system-name** | **system-description** | **system-capabilities** | **management-address**} {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
port-description	Enables or disables the transmission of port description TLV in LLDPDU.
system-name	Enables or disables the transmission of system name TLV in LLDPDU.
system-description	Enables or disables transmission of system description TLV in LLDPDU.
system-capabilities	Enables or disables transmission of system capabilities TLV in LLDPDU.
management-address	Enables or disables transmission of management address on per port.
enable	Enables management TLV LLDPDU transmission.
disable	Disables management TLV LLDPDU transmission.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/2 tlv management port-description enable
-> lldp slot 2 tlv management management-address enable
-> lldp slot 3 tlv management system-name disable
-> lldp chassis tlv management system-capabilities enable
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
show lldp local-system	Displays local system information.
show lldp local-port	Displays per port information.
show lldp remote-system	Displays per local port and information of remote system.

MIB Objects

```
lldpv2PortConfigTable
  lldpv2LocPortPortNum
  lldpv2PortConfigTLVsTxEnable
lldpv2ConfigManAddrTable
  lldpv2ConfigManAddrPortsTxEnable
```

lldp tlv dot1

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port*[-*port2*] | **slot** *chassis/slot* / *chassis*} **tlv dot1** {**port-vlan** | **vlan-name**} {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
port-vlan	Enables or disables transmission of port VLAN TLV in LLDPDU.
vlan-name	Enables or disables transmission of VLAN name TLV in LLDPDU.
enable	Enables 802.1 TLV LLDPDU transmission.
disable	Disables 802.1 TLV LLDPDU transmission.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- If one TLV is included then the other TLV is automatically included when you use this command.

- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 5/1 tlv dot1 port-vlan enable
-> lldp slot 3 tlv dot1 vlan-name enable
-> lldp slot 3 tlv dot1 vlan-name disable
```

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
show lldp statistics	Displays per port statistics.
show lldp local-port	Displays per port information.

MIB Objects

```

  lldpv2PortConfigPortNum
lldpv2Xdot1ConfigPortVlanTable
  lldpv2Xdot1ConfigPortVlanTxEnable
lldpv2Xdot1ConfigVlanNameTable
  lldpv2Xdot1ConfigVlanNameTxEnable
```

lldp tlv dot3

Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port* [-*port2*]} **slot** *chassis/slot / chassis* } **tlv dot3 mac-phy** {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables 802.3 TLV LLDPDU transmission.
disable	Disables 802.3 TLV LLDPDU transmission.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 2/4 tlv dot3 mac-phy enable
-> lldp slot 2 tlv dot3 mac-phy disable
```

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

  lldpv2Xdot3PortConfigTLVsTxEnable
```

lldp tlv med

Specifies the switch to control per port LLDP-MED (Media Endpoint Device) TLVs to be incorporated in the LLDPDU.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port* [-*port2*] | **slot** *chassis/slot* / *chassis*} **tlv med** {**power** | **capability**} {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
capability	Enables or disables transmission of LLDP-MED capabilities TLV in LLDPDU.
enable	Enables LLDP-MED TLV LLDPDU transmission.
disable	Disables LLDP-MED TLV LLDPDU transmission.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command will be lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.

- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp 4/4 tlv med power enable
-> lldp 4/3 tlv med capability enable
-> lldp 4 tlv med power disable
```

Release History

Related Commands

[lldp tlv management](#)

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

[lldp tlv dot1](#)

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

[lldp tlv dot3](#)

Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

MIB Objects

```
lldpv2PortConfigTable
  lldpv2PortConfigPortNum
lldpv2XMedPortConfigTable
  lldpv2XMedPortConfigTLVsTxEnable
```

lldp tlv application

Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port. This TLV is only configurable for the nearest-bridge LLDP agent.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port* [-*port2*]} **slot** *chassis/slot* / *chassis*} **tlv application** {**enable** | **disable**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
enable	Enables Application Priority TLV LLDPDU transmission.
disable	Disables Application Priority TLV LLDPDU transmission.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 2/4 tlv application enable
-> lldp slot 2 tlv application disable
```

Release History

Release 7.3.2; command introduced.

Related Commands

lldp tlv application priority	Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.
show lldp config	Displays per port statistics.

MIB Objects

```
lldpXdot1dcbxConfigApplicationPriorityTable
  lldpXdot1dcbxConfigApplicationPriorityTxEnable
```

lldp tlv application priority

Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.

lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge** | **all**] {**port** *chassis/slot/port[-port2]* | **slot** *chassis/slot* | **chassis**} **tlv application** {**fcoe** | **iscsi** | **ethertype** *etype* | **tcp-sctp-port** *protocol* | **udp-dccp-port** *protocol* | **port** *protocol*} **priority** *priority*

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
all	All LLDP agents.
<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
chassis	Specifies the whole chassis.
fcoe	Advertise the specified priority value to use for FCoE traffic.
iscsi	Advertise the specified priority value to use for SCSI traffic.
<i>etype</i>	Advertise the specified priority value to use for this Ethertype.
<i>protocol</i>	Advertise the specified priority value to use for the specified protocol.

Defaults

parameter	default
enable disable	disable
non-tpmr nearest-customer nearest-bridge	nearest-bridge

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The LLDPDU must be enabled and set to transmit and receive before using this command.
- The Application Priority TLV must be enabled for transmission.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

```
-> lldp port 1/1/3 tlv application fcoe priority 3
-> lldp port 1/1/3 tlv application tcp-sctp-port 3192 priority 5
```

Release History

Release 7.3.2; command introduced.

Related Commands

[lldp tlv application](#)

Enables or disables Application Priority TLV in LLDPDUs.

[show lldp config](#)

Displays the LLDP port configuration.

MIB Objects

```
alaXdot1dcbxAdminApplicationPriorityAppTable
  alaXdot1dcbxAdminApplicationPriorityAEPriority
```

show lldp system-statistics

Displays system-wide statistics.

show lldp system-statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show lldp system-statistics
Local LLDP Agent System Statistics:
  Remote Systems Last Change = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts = 2,
  Remote Systems MIB Deletes = 0,
  Remote Systems MIB Drops = 0,
  Remote Systems MIB Age Outs = 0
```

output definitions

Remote Systems Last Change	The last change recorded in the tables associated with the remote system.
Remote Systems MIB Inserts	The total number of complete inserts in the tables associated with the remote system.
Remote Systems MIB Deletes	The total number of complete deletes in tables associated with the remote system.
Remote Systems MIB Drops	The total number of LLDPDUs dropped because of insufficient resources.
Remote Systems MIB Age Outs	The total number of complete age-outs in the tables associated with the remote system.

Release History

Release 7.1.1; command introduced.

Related Commands

lldp notification

Specifies the switch to control per port notification status about the remote device change.

lldp notification interval

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

MIB Objects

lldpStatistics

lldpStatsRemTablesLastChangeTime

lldpStatsRemTablesInserts

lldpStatsRemTablesDeletes

lldpStatsRemTablesDrops

lldpStatsRemTablesAgeouts

show lldp statistics

Displays per port statistics.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port* [*-port2*] **slot** *chassis/slot*] **statistics**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.

Defaults

By default, statistics for all LLDP ports are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the *slot/port* option is not specified, statistics for the chassis are displayed.
- If the statistics are zero they are not displayed.

Examples

```
-> show lldp statistics
```

Slot/Port	LLDPDU Tx	LLDPDU TxLenErr	LLDPDU Rx	LLDPDU Errors	LLDPDU Discards	TLV Unknown	TLV Discards	Device Ageouts
1/1	453	0	452	0	0	0	0	0
1/2	452	0	453	0	0	0	0	0
1/5	452	0	473	0	0	476	476	0

2/2	452	0	963	0	0	0	0	0
2/3	480	0	459	0	0	0	0	2

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
LLDPDU Tx	The total number of LLDPDUs transmitted on the port.
LLDPDU Rx	The total number of valid LLDPDUs received on the port.
LLDPDU Errors	The total number of invalid LLDPDUs discarded on the port.
LLDPDU Discards	The total number of LLDPDUs discarded on the port.
TLV Unknown	The total number of unrecognized LLDP TLVs on the port.
TLV Discards	The total number of LLDP TLVs discarded on the port.
Device Ageouts	The total number of complete age-outs on the port.

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands**lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

show lldp local-system

Displays local system information.

show lldp local-system

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype      = 4 (MAC Address),
  Chassis ID              = 00:d0:95:e9:c9:2e,
  System Name             = OS6900-DC1,
  System Description      = 7.3.2.315.R01 Development, June 03, 2013.,
  Capabilites Supported   = Bridge, Router,
  Capabilites Enabled     = Bridge, Router,
  LLDPDU Transmit Interval = 30 seconds,
  TTL Hold Multiplier     = 4,
  LLDPDU Transmit Delay   = 2 seconds,
  Reintialization Delay   = 2 seconds,
  MIB Notification Interval = 5 seconds
  Management Address Type = 1 (IPv4),
  Management IP Address   = 10.255.11.100,
```

output definitions

Chassis ID Subtype	The subtype that describe chassis ID.
Chassis ID	The chassis ID (MAC address).
System Name	The name of the system.
System Description	The description of the system.
Capabilites Supported	The capabilities of the system.
Capabilites Enabled	The enabled capabilities of the system.
LLDPDU Transmit Interval	The LLDPDU transmit interval.
TTL Hold Multiplier	The hold multiplier used to calculate TTL.

output definitions (continued)

LLDPDU Transmit Delay	The minimum transmit time between successive LLDPDUs.
Reinitialization Delay	The minimum time interval before the reinitialization of local port objects between port status changes.
MIB Notification Interval	The minimum time interval between consecutive notifications of local system MIB change.
Management Address Type	The type of management address used in LLDPDU.
Management IP Address	The management IP address. The loopback0 IP address is configured for the management IP address to be transmitted.

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

lldp reinit delay	Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.
lldp transmit hold-multiplier	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
lldp transmit interval	Sets the minimum time interval between successive LLDPDUs transmitted.

Displays per port information.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port* [*-port2*]] **slot** *chassis/slot* **local-port**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show lldp local-port
Local Slot 1/Port 1 LLDP Info:
  Port ID                = 1001 (Locally assigned),
  Port Description       = Alcatel-Lucent OS6900 TOR 1/1,
Local Slot 1/Port 2 LLDP Info:
  Port ID                = 1002 (Locally assigned),
  Port Description       = Alcatel-Lucent OS6900 TOR 1/2,
Local Slot 1/Port 3 LLDP Info:
  Port ID                = 1003 (Locally assigned),
  Port Description       = Alcatel-Lucent OS6900 TOR 1/3,
Local Slot 1/Port 4 LLDP Info:
  Port ID                = 1004 (Locally assigned),
  Port Description       = Alcatel-Lucent OS6900 TOR 1/4,
Local Slot 1/Port 5 LLDP Info:
  Port ID                = 1005 (Locally assigned),
  Port Description       = Alcatel-Lucent OS6900 TOR 1/5,
```

output definitions

Port ID	The port ID (Port MAC).
Port Description	The description of the port (which includes the port number and the AOS version).

Release History

Release 7.1.1; command introduced.

Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands**lldp tlv management**

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

show lldp config

Displays the general LLDP configuration information for LLDP ports.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port* [*-port2*] | **slot** *chassis/slot*] **config** [**application-tlv**]

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
application-tlv	Displays Application Priority TLV parameters.

Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp config
```

Slot/Port	Admin Status	Notify Trap	Std TLV Mask	Mgmt Address	802.1 TLV	802.3 Mask	MED Mask	App-Prio TLV
1/1	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled
1/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled

1/1	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled
1/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled
1/1	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled
1/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Disabled
1/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00	Enabled

output definitions

Slot/Port	Specifies the LLDP slot and port number.
Admin Status	Specifies the Administrative status of the LLDP port. The options are - Disabled, Rx, Tx, and Rx+Tx.
Notify Trap	Specifies if the Notify Trap feature is disabled or enabled on a particular port
Std TLV Mask	Specifies the standard TLV mask set for the port.
Mgmt Address	Specifies whether transmission of the per port IPv4 management address is enabled or disabled.
802.1 TLV	Specifies whether 802.1 TLV status is enabled or disabled on the LLDP port.
802.3 Mask	Specifies the standard 802.3 mask set for the port.
MED Mask	Specifies the standard MED mask set for the port.
App-Prio TLV	Specifies whether the Application Priority TLV status is enabled or disabled for the LLDP port.

```
-> show lldp config application-tlv
```

```
Slot/
Port  Selector                Protocol      Priority
-----+-----+-----+-----+
1/2   Ethertype                0x8906       3
1/2   Tcp/Sctp                 3260         4
1/20  Tcp/Sctp                 3190         3

show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

```
show lldp network-policy [policy_id]
```

Syntax Definitions

policy_id Policy identifier for a network policy definition. Valid range is between 0 and 31.

Defaults

By default, all configured policies are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a policy ID with this command to display information for a specific policy.

Examples

```
-> show lldp network-policy
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan
```

Network Policy ID	Application Type	Vlan Id	Layer2 Priority	DSCP Value
1	voice	4000	7	33
12	guest-voice	-	-	44
21	streaming-voice	0	4	11
31	guest-voice-signaling	23	2	1

```
-> show lldp network-policy 21
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan
```

Network Policy ID	Application Type	Vlan Id	Layer2 Priority	DSCP Value
21	streaming-voice	0	4	11

output definitions

Network Policy ID	Policy identifier for a network policy definition.
Application Type	Indicates the type of application configured on the port or VLAN.
VLAN ID	The VLAN ID assigned to the port on which the network policy is configured.

output definitions

Layer2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

Release History

Release 8.1.1 command introduced.

Related Commands

[lldp network-policy](#) Configures a local network policy on a switch for an application type.

show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

show lldp [**nearest-bridge** | **nearest-customer** | **non-tpmr** | **all**] [**slot** *chassis/slot* | **port** *chassis/slot/port*]
med network-policy

Syntax Definitions

nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
all	Specifies that all three LLDP agents must be supported.
<i>chassis/slot</i>	The chassis ID and slot number for a specific module (3/1).
<i>chassis/slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

By default, all ports with associated policies are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a slot or slot/port number with this command to display information for a specific slot or port.

Examples

```
-> show lldp slot 1/1 med network-policy
```

```
chassis/slot/port      Network Policy ID
-----+-----
 1/1/1                 1 3 5 7 21 23 30 31
 1/1/2                 1 2 3 4 7 8 9 10
 .
 .
 .
```

output definitions

Chassis/Slot/Port	Slot number for the module and physical port number on that module.
Network Policy ID	Policy identifier for a network policy definition.

Release History

Release 8.1.1; command introduced.

Related Commands

```

show lldp remote-system

Displays per local port and information of remote system.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port* [**-port2**] | **slot** *chassis/slot*] **remote-system**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.

Defaults

By default, a list of all lldp ports is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show lldp remote-system
Remote LLDP Agents on Local Slot/Port: 2/47,
  Chassis ID Subtype      = 4 (MAC Address),

output definitions

Remote LLDP Agents on Local Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Chassis ID Subtype	The sub type that describes chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID
Port ID	The port ID (Port MAC).
Port Description	The description of the port (which includes the port number and the AOS version).
System Name	The name of the system.
System Description	The description of the system.
Capabilites Supported	The capabilities of the system.
Capabilites Enabled	The enabled capabilities of the system.

Release History

show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port* [-*port2*] | **slot** *chassis/slot*] **remote-system med** {**network-policy** | **inventory**}

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.
network-policy	Display network-policy TLVs from remote Endpoint Devices.
inventory	Display inventory management TLVs from remote Endpoint Devices.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp port 2/47 remote-system med network-policy
Slot/ Remote  Application      Unknown   Tagged   Vlan   Layer2   DSCP
Port   ID          Type           Policy   Flag   Flag   Id       Priority  Value
-----+-----+-----+-----+-----+-----+-----+-----+-----
1/22   1           Voice(01)      Defined  Untag   345    4        34
1/22   2           Guest Voice(4)  Defined  Untag   50     3        46
```

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.

output definitions (continued)

Application Type	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling
Unknown Policy Flag	Whether the network policy for the specified application type is currently defined or unknown.
Tagged Flag	Whether the specified application type is using a tagged or an untagged VLAN.
VLAN ID	The VLAN identifier (VID) for the port.
Layer 2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

```
-> show lldp port 2/47 remote-system med inventory
```

```

show lldp remote-system application-tlv

Displays remote system Application Priority TLV information for a single port or all ports on a slot.

show lldp [**non-tpmr** | **nearest-customer** | **nearest-bridge**] [**port** *chassis/slot/port2*[-*port*] | **slot** *chassis/slot*] **remote-system application-tlv**

Syntax Definitions

non-tpmr	The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
nearest-customer	The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
nearest-bridge	The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i>]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	The slot number for a specific module.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp remote-system application-tlv
```

Slot/ Port	Remote ID	Selector	Protocol	Priority
1/2	1	Ethertype	35078	3 [fcoe]
1/2	1	Tcp/Sctp	3260	4 [iscsi]
1/20	1	Tcp/Sctp	3190	3
1/20	1	Udp/Dccp	300	4
1/20	1	Tcp/Udp/Sctp/Dccp	300	4

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.

output definitions (continued)

Selector	The protocol selector.
Protocol	The protocol Ethertype or well-known port.
Priority	The 802.1p priority value for the specified protocol to use.

Release History

Release 7.3.2; command introduced.

Related Commands

lldp tlv application	Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port.
lldp tlv application priority	Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.
show lldp config	Displays the general LLDP configuration information for LLDP ports.

3           Nearest-Customer-Bridge  00-80-C2-00-00-00
```

output definitions

Lldp Agent	The LLDP agent identifier.
Name	The name of the LLDP agent.
Destination MAC address	The destination MAC address of the LLDP agent.

Release History

Release 7.3.1; command introduced.

Related Commands

lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, slot, or port.

MIB Objects

```
lldpv2DestAddressTable  
  lldpv2AddressTableIndex  
  lldpv2DestMacAddress
```

lldp trust-agent

Enables or disables the security mechanism globally (chassis level) or for a slot or a single port. By enabling LLDP security mechanism on a port, LLDP CMM task brings the LLDP status of the port as trusted and monitors the port for any LLDP security violation.

lldp {*chassis/slot/port* | *chassis/slot* | **chassis**} **trust-agent** [**admin-state**] {**enable** | **disable**}} [**chassis-id-subtype** {**chassis-component** | **interface-alias** | **port-component** | **mac-address** | **network-address** | **interface-name** | **locally-assigned** | **any**}]

Syntax Definitions

<i>chassis/slot/port</i>	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).
<i>chassis/slot</i>	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis	Specifies all the ports in the chassis.
enable	Enables LLDP security mechanism.
disable	Disables LLDP security mechanism.
chassis-component	The chassis component is used for validating the remote agent.
interface-alias	The alias configured for the interface is used for validating the remote agent.
port-component	The port component is used for validating the remote agent.
mac-address	The MAC address is used for validating the remote agent.
network-address	The network address is used for validating the remote agent.
interface-name	The interface name is used for validating the remote agent.
locally-assigned	The locally assigned component is used for validating the remote agent, that is the chassis information, which can be locally assigned (the local configuration)
any	The remote agent with any chassis ID sub type is accepted as a trust agent.

Defaults

'any' - If the chassis ID sub type is not configured for validating the remote agent, by default, the first remote agent is accepted as a trust agent considering any of the chassis ID sub types.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By enabling security on chassis/slot level, the ports that come under the respective level are monitored for any LLDP security violation.
- If the chassis ID sub type is not configured for validating the remote agent, then the LLDP learns the first remote agent with available chassis ID TLV (Time, Length, Value) received in the PDU.
- After a link up is received on a LLDP security enabled port, LLDP CMM waits for three times the LLDP timer interval (30 seconds). If no LLDP PDU is received after link up that has no remote agent, the port is moved to a violation state.
- If a trusted remote agent already exists, and if no LLDP remote agent is learned even after three times the LLDP timer interval (30 seconds), the port is moved to a violation state. If a new LLDP remote agent is learned after the link toggle, then the port is moved to a violation state.
- If the same chassis ID and port ID already exist in the trusted remote agent database but on a different port, then the port remote agent is learned and the port is moved to a violation state. If a new LLDP remote agent is learned on a port that has a trusted LLDP remote agent, then the port is moved to a violation state.

Examples

```
-> lldp chassis trust-agent admin-state enable
-> lldp chassis trust-agent chassis-id-subtype chassis-component
```

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.
show lldp trust-agent	Displays information on local LLDP agent or port.

MIB Objects

```
alaLldpTrustAdminStatus
  alaLldpTrustChassisIdSubType
```

lldp trust-agent violation-action

Sets the action to be performed when a violation is detected.

lldp {*chassis/slot/port* | *chassis/slot* | **chassis**} **trust-agent violation-action** {**trap-and-shutdown** | **trap** | **shutdown**}

Syntax Definitions

<i>chassis/slot/port</i>	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).
<i>chassis/slot</i>	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
chassis	All switch ports.
trap-and-shutdown	Shuts down the port and sends a trap notification when a violation is detected.
trap	Sends a trap notification when a violation is detected.
shutdown	Shuts down the port when a violation is detected.

Defaults

By default, trust agent violation action is set to 'trap'.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the port is in a shutdown state, clear the violation on the port by using the command “**interfaces chassis/slot[/port[-port2]] clear-violation-all**”
- Clearing the violation on a port does not clear the trusted remote agent existing on that port. To clear the trusted remote agent, disable the LLDP security mechanism on the port.
- If the port is in a shutdown state due to violation and the port link is toggled, only the link goes up. The port still remains in the violation state and the trusted remote agent existing on that port is not cleared.

Examples

```
-> lldp chassis trust-agent violation-action trap
-> lldp slot 3 trust-agent violation-action shutdown
```

Release History

Release 8.3.1; command introduced.

Related Commands**lldp trust-agent**

Sets the status of trust admin status for a port.

show lldp trusted remote-agent

Displays information on trusted remote-agents.

show lldp trust-agent

Displays information on local LLDP agent or port.

MIB Objects`alaLldpTrustAction`

show lldp trusted remote-agent

Displays information on trusted remote-agents.

show lldp [*chassis/slot* | *chassis/slot/port*] **trusted remote-agent**

Syntax Definitions

<i>chassis/slot</i>	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
<i>chassis/slot/port</i>	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the slot/port or slot parameter to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trusted remote-agent** command output.

Examples

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype mac-address

-> show lldp trusted remote-agent
```

```
Trusted Remote LLDP Agents on Local Slot/Port: 1/7
  Chassis ID Subtype      = 4 (MAC Address),
  Chassis ID              = 00:e0:b1:7a:e6:3c,
  Port ID Subtype         = 7 (Locally assigned),
  Port ID                 = 1017
```

output definitions

Trusted Remote LLDP Agents on Local Slot/Port	The slot number to which the remote trusted agent is associated and the physical port number on that module.
Chassis ID Subtype	The sub type that describes the chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID.
Port ID	The port ID (Port MAC).

Release History

Release 8.3.1; command introduced.

Related Commands

[lldp trust-agent](#)

Sets the status of trust admin status for a port.

[lldp trust-agent violation-action](#)

Sets the action to be performed when a violation is detected.

[show lldp trust-agent](#)

Displays information on local LLDP agent/port.

MIB Objects

N/A

show lldp trust-agent

Displays information of the local LLDP agent or port.

show lldp [*chassis/slot* | *chassis/slot/port*] **trust-agent**

Syntax Definitions

<i>chassis/slot</i>	The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
<i>chassis/slot/port</i>	The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the *slot/port* or *num* (slot number) values to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trust-agent** command output correctly.
- If LLDP security is disabled this command correctly displays the 'Admin Status' as 'Disabled'; however the other output parameters will display their default values.

Examples

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype chassis-component
-> show lldp trust-agent
```

Slot/Port	Admin Status	Violation Action	Violation Status	Chassis Subtype
1/1	Enabled	Trap Only	Trusted	1(Chassis Component)
1/2	Enabled	Trap Only	Trusted	1(Chassis Component)
1/3	Enabled	Trap Only	Trusted	1(Chassis Component)
1/4	Disabled	Shutdown	Violated	1(Chassis Component)
1/5	Enabled	Shutdown	Trusted	1(Chassis Component)
1/6	Enabled	Trap-and-Shutdown	Trusted	1(Chassis Component)
1/7	Disabled	Trap-and-Shutdown	Violated	1(Chassis Component)
1/8	Enabled	Trap Only	Trusted	1(Chassis Component)
1/9	Enabled	Trap Only	Trusted	1(Chassis Component)
1/10	Enabled	Trap Only	Trusted	1(Chassis Component)

output definitions

Slot/Port	The LLDP slot and port number.
Admin Status	Indicates the administrative status of the LLDP port, Enabled or Disabled
Violation Action	Indicates the action performed when a violation is detected. The options are - Trap Only , Trap-and-Shutdown , and Shutdown Only .
Violation Status	The violation status of the port, Trusted or Violated
Chassis Subtype	The sub type that describes the chassis ID.

Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.

MIB Objects

N/A

17 SIP Commands

SIP Snooping feature address the key challenge of real time delivery and monitoring requirements for media streams from SIP devices. SIP snooping feature provides plug and play support to the device, where it automatically identifies the ports used. It also enhances the security of device.

SIP Snooping prioritizes voice and video traffic over non-voice traffic. To summarize, SIP Snooping:

- Identifies and marks the SIP and its corresponding media streams. Each media stream contains Real Time Protocol (RTP) and Real Time Control Protocol (RTCP) flows. Marking is done using the DSCP field in the IP header.
- Provides user configured QOS treatment for SIP/RTP/RTCP traffic flows based on its marking.
- Also snoops voice quality metrics of media streams from their RTCP packets and displays them to the user with knowledge of media reception quality in real time and helps to diagnose the problems on their quality. Also in addition, trap will be generated when voice quality parameters like Jitter, Round trip time, Packet-lost, R-factor and MOS values of media streams crosses user configured threshold.

This chapter includes SIP commands and their descriptions..

MIB information for SIP commands is as follows:

Filename: AlcatelIND1SIPSnooping.MIB
Module: ALCATEL-IND1-CHASSIS-MIB

A summary of the available commands is listed here:

sip-snooping admin-state
sip-snooping port admin-state
sip-snooping mode
sip-snooping trusted server
sip-snooping sip-control
sip-snooping sos-call number
sip-snooping sos-call dscp
sip-snooping udp port
sip-snooping tcp port
sip-snooping threshold
sip-snooping logging-threshold num-of-calls
show sip-snooping call-records
clear sip-snooping statistics
show sip-snooping config
show sip-snooping ports
show sip-snooping statistics
show sip-snooping registered-clients

sip-snooping admin-state

Enables or disables the SIP snooping on the switch.

sip-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables SIP snooping
disable	Disables SIP snooping

Defaults

By default, SIP-snooping is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If SIP snooping is disabled at the port level, enabling SIP snooping globally will not override the configuration of that port.
- If SIP snooping is disabled and enabled, it is mandatory that the phones re-register for successful DSCP marking.

Examples

```
-> sip-snooping admin-state enable  
-> sip-snooping admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

sip-snooping port admin-state	Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate of ports.
show sip-snooping ports	Shows the SIP snooping port level data.
show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

aluSIPsnoopingStatus

sip-snooping port admin-state

Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate.

sip-snooping {**port** *chassis/slot/port[-port2]* | **linkagg** *agg_num*} **admin-state** {**enable** | **disable**}

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_num</i>	A link aggregate ID number.
enable	Enables SIP snooping to mirror all SIP PDU that ingress on that port
disable	Disables SIP snooping and will not mirror SIP PDU that ingress on that port.

Defaults

By default, SIP snooping is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- SIP snooping must be enabled globally to activate port/linkagg level configuration.
- Even after SIP snooping is globally disabled, port/linkagg level configuration is saved. This configuration will be used when SIP snooping is enabled globally again.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by the linkagg configuration. Port level configuration will be activated if the port leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 admin-state enable
-> sip-snooping linkagg 1 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show sip-snooping ports](#) Shows the SIP snooping port level data.

MIB Objects

aluSIPsnoopingSlotPortIndex

aluSIPsnoopingRowStatus

sip-snooping mode

Configures the SIP snooping mode for the specified port or link aggregate.

sip-snooping {port *chassis/slot/port[-port2]* | linkagg *agg_num*} mode {force-edge | force-non-edge | automatic}

Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_num</i>	The link aggregate ID number.
force-edge	Media TCAM entries to be created for dialogs that transverse the specific port
force-non-edge	No Media TCAM entries for dialogs that transverse the specific port.
automatic	Sets to default mode. The port's edge/non-edge mode is derived by the switch/router based on LLDP received or not on the port.

Defaults

By default, the SIP snooping mode is set to automatic.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- Force-edge-port/force-non-edge port option to overwrite default port mode learned by either received or not received switch/router capability through LLDP.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 mode force-edge  
-> sip-snooping linkagg 1 mode force-non-edge
```

Release History

Release 8.1.1; command was introduced.

Related Commands

sip-snooping trusted server

Configure the IP addresses of the trusted servers on a switch.

```
sip-snooping trusted-server [ip_address1 ip_address2 ip_address ...ip_address8]
```

```
no sip-snooping trusted-server {ip_address | all}
```

Syntax Definitions

ip_address1[-*ip_address2*] The IP address of one or more trusted servers.
all Specifies all the IP addresses.

Defaults

By default, no trusted servers are configured. All SIP based calls using any call server will be supported.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used to configure the IP addresses of the trusted servers. If a trusted server is configured, then only the calls initiated through those servers will be supported.
- A maximum of 8 trusted servers can be configured.
- If no trust servers are configured, all SIP based calls using any call server will be supported.
- Use the **no** form of the command to remove any trusted IP or all trusted IP addresses.

Examples

```
-> sip-snooping trusted-server 192.254.32.22 192.254.32.33  
-> no sip-snooping trusted-server 192.254.32.22  
-> no sip-snooping trusted-server all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

```

sip-snooping sos-call number

Configures the SOS call strings in SIP snooping.

sip-snooping sos-call number *string1 string2 ... string4*

no sip-snooping sos-call number {*string* / **all**}

Syntax Definitions

string1 ... string4

Specifies the SOS call string.

all

Specifies all the SOS call strings.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used for the configuration of the SOS call strings. A maximum of 4 SOS call strings can be configured for an exact match on the “to” URI (user part only)
- No support of regular expression. If no string is specified, no SOS call can be identified in the system.
- Use **no** form of this command to remove existing SOS call strings.

Examples

```
-> sip-snooping sos-call number "911" "2233"  
-> no sip-snooping sos-call number "911"  
-> no sip-snooping sos-call number all
```

Release History

Release 8.1.1; command was introduced.

```

sip-snooping sos-call dscp

Configures the SOS-Call RTP/RTCP DSCP marking.

sip-snooping sos-call dscp *num*

Syntax Definitions

num Specifies the DSCP number.

Defaults

The default configuration is 46 EF.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command is used for the configuration of the SOS-Call RTP/RTCP DSCP marking. A built-in rate limiter of 128 kbps is configured to rate limit a uni-direction media stream being marked by the switch.
- SOS calls are identified only for the Audio media type. All other media type calls are considered normal calls.

Examples

```
-> sip-snooping sos-call dscp 56
```

Release History

Release 8.1.1; command was introduced.

Related Commands

MIB Objects

aluSIPsnoopingSOSCallRTPDSCP

sip-snooping udp port

Configures the UDP port for SIP Snooping.

```
sip-snooping udp-port udp-port1 udp-port 2 ... udp-port 8
```

```
no sip-snooping udp-port {udp-port | all}
```

Syntax Definitions

udp-port 1 ... udp-port 8

Specifies the UDP port for SIP snooping.

all

Specifies all the UDP ports designated for SIP snooping.

Defaults

By default no UDP ports and SIP mirroring is performed with the method name and SIP2.0 strings.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A maximum of 8 UDP ports can be configured on a switch.
- Use **no** form of this command to remove any UDP port configured earlier.

Examples

```
-> sip-snooping udp-port 5260 5060  
-> no sip-snooping udp-port 5260  
-> no sip-snooping udp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show sip-snooping config](#) Shows the configuration done for SIP snooping.

aluSIPsnoopingSIPUDPPort6  
aluSIPsnoopingSIPUDPPort7  
aluSIPsnoopingSIPUDPPort8
```

sip-snooping tcp port

Configures the Server listening TCP ports for SIP Snooping.

sip-snooping tcp-port *tcp-port1 tcp-port 2 ... tcp-port 8*

no sip-snooping tcp-port {*tcp-port* | **all**}

Syntax Definitions

tcp-port 1 ... tcp-port 8

Specifies the TCP port for SIP snooping.

all

Specifies all the SOS call strings.

Defaults

By default, TCP port is 5260.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A maximum of 8 TCP ports can be configured on a switch.
- The default port will be overwritten if the user configures any other port.
- Use the **no** form of this command to remove any TCP port configured earlier.

Examples

```
-> sip-snooping tcp-port 5260 5060
-> no sip-snooping tcp-port 5260
-> no sip-snooping tcp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

aluSIPsnoopingSIPTCPPort7
aluSIPsnoopingSIPUDPPort8

sip-snooping threshold

Configure the various thresholds of SIP snooping.

sip-snooping threshold {**audio** | **video** | **other**} {**jitter** *jitter_ms_num* | **packet-lost** % *num* | **round-trip-delay** *round_trip_delay_ms_num* | **r-factor** *rfactor_num* | **mos** *mos_num*}

Syntax Definitions

audio	Specify threshold for audio.
video	Specify threshold for video.
other	Specify threshold for other.
<i>jitter_ms_num</i>	Specify jitter in milliseconds. The valid range is 0–300.
% <i>num</i>	Specify packet lost in percentage. The valid range is 0–99%
<i>round_trip_delay_ms_num</i>	Set round trip delay in milliseconds. The valid range is 0–500
<i>rfactor_num</i>	Specify R-factor number. The valid range is 0–100
<i>mos_num</i>	Specify MOS number. The valid range is 0–5.

Defaults

parameter	default
RTCP monitoring	Enable
Jitter Threshold (audio/video/other)	50/100/100 ms
Packet-lost Threshold (audio/video/other)	10 /20/20%
RTT Threshold (audio/video/other)	180 /250/250 ms
R-factor Threshold (audio/video/other)	70/80/80
MOS Threshold (audio/video/other)	3.6/3.0/3.0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Setting a threshold value to 0 disables threshold checking for that parameter.

Examples

```
-> sip-snooping threshold audio jitter 50
-> sip-snooping threshold audio packet-lost 10
-> sip-snooping threshold video jitter 80
-> sip-snooping threshold video round-trip-delay 180
```

```

sip-snooping logging-threshold num-of-calls

Configures the threshold for the number of calls to be logged into the flash file.

sip-snooping logging-threshold num-of-calls *num*

Syntax Definitions

num Specifies the maximum number of calls to be logged.

Defaults

By default, 200 calls can be logged.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is used to configure the threshold for the number of calls to be logged into the flash file.

Examples

```
-> sip-snooping logging-threshold num-of-calls 300
```

Release History

Release 8.1.1; command was introduced.

alaSIPsnoopingRegisteredClientAddr
```

18 Automatic Fabric Commands

The Dynamic Auto-Fabric feature can be used to bring up AOS compatible devices by automating some tedious and complex steps including Link Aggregate formation, and SPB neighbor adjacency formation. Dynamic recognition of the neighboring elements will allow a quick, out-of-the box configuration. The focus area for this feature is data center but the feature is applicable in campus LAN environment to reduce administrative overhead.

Upon boot-up the system will automatically attempt auto discovery of LACP, SPB, MVRP, and IP connections if configuration files are not available in the device. The feature allows to build a true fabric when a device is plugged to the network and automates edge port configuration with profiles.

MIB information for the Auto Fabric commands is as follows:

Filename: ALCATEL-IND1-AUTO-FABRIC-MIB.mib
Module: alcatelIND1AUTOFABRICMIB

A summary of available commands is listed here:

auto-fabric admin-state
auto-fabric interface
auto-fabric discovery start
auto-fabric protocols
auto-fabric config-save interval
auto-fabric config-save admin-state
auto-fabric discovery-interval
auto-fabric protocols spb default-profile
auto-fabric protocols spb set-profile
show auto-fabric config
show auto-fabric config interface

auto-fabric admin-state

Enables or disables the Automatic Fabric functionality globally for the switch.

```
auto-fabric admin-state {enable | disable {remove-global-config | remove-vc-reload}}
```

Syntax Definitions

enable	Enables Automatic Fabric functionality for the switch.
disable	Disables Automatic Fabric functionality for the switch. When disabled, the global configuration settings discovered for MVRP, SPB, and IP are removed
remove-global-config	Disables Automatic Fabric functionality for the switch. This parameter option performs the same function as the disable parameter.
remove-vc-reload	Reboots a switch running in the Virtual Chassis (VC) of one mode to run in the standalone mode with Automatic Fabric discovery disabled. <i>This parameter option is not supported on the OmniSwitch 6860 and OmniSwitch 6865.</i>

Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric operation is based on the administrative status setting specified with this command.
- When Automatic Fabric is globally disabled for the switch, the following configuration settings are removed unless they were previously saved to the switch configuration file:
 - Spanning Tree is set back to the default 1x1 mode. This only occurs if there are no VLAN registrations on any port or link aggregate.
 - SPB is globally disabled, which removes BVLANS 4000-4015 and administratively disables SPB. This only occurs if there are no SPB adjacencies formed on any ports or link aggregates.
 - Automatic Fabric stops trying to learn IP routing protocols and neighbors on interfaces not already configured with a routing protocol. The configuration for IP interfaces on which routing protocols were previously discovered is not removed.
 - For any other scenario, administrator intervention is needed to remove the configuration.
- The **remove-global-config** and **remove-vc-config** parameters are only used in combination with the **disable** option.
- The **remove-vc-config** parameter is only meant for use when a switch has booted up in a VC of one mode. Do not use this option if the switch boots up as part of a VC configuration, where the switch is connected to other switches in the VC.

- When this command is used with the **remove-vc-config** parameter, the following process is triggered:
 - 1 Any Automatic Fabric configuration is cleared.
 - 2 The Automatic Fabric feature is disabled.
 - 3 A **boot.cfg** file is created in the `/flash/working` directory.
 - 4 The switch is automatically rebooted in standalone mode with a configuration file and the automatic management features will no longer run.

Examples

```
-> auto-fabric admin-state enable
-> auto-fabric admin-state disable
-> auto-fabric admin-state disable remove-global-config
-> auto-fabric admin-state disable remove-vc-reload
```

Release History

Release 7.3.2; command introduced.

Release 7.3.4; **remove-global-config** and **remove-vc-reload** parameters added-

Related Commands

auto-fabric interface	Enables or disables Automatic Fabric discovery on one or more ports.
show auto-fabric config interface	Displays the Automatic Fabric configuration applied to switch ports.

MIB Objects

```
alaAutoFabricGlobalStatus
alaAutoFabricRemoveGlobalConfig
alaAutoFabricRemoveVCReload
```

auto-fabric interface

Enables or disables the Automatic Fabric functionality for one or more switch ports.

auto-fabric interface *chassis/slot/port[-port2]* **admin-state** {**enable** | **disable**}

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables Automatic Fabric functionality globally or on an interface.
disable	Disables Automatic Fabric functionality on the specified interface. When disabled, the configuration settings discovered for MVRP, SPB, and IP are removed from the port.

Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric status for a port is based on the administrative status setting specified with this command.
- The Automatic Fabric status for a specific port takes precedence over the global Automatic Fabric status for the switch. For example, if Automatic Fabric is enabled for the switch but disabled on a port, then the discovery process is not run on the port.

Examples

```
-> auto-fabric interface 1/1/1 admin-state disable
-> auto-fabric interface 1/1/5-10 admin-state enable
```

Release History

Release 7.3.2; command introduced.

Related Commands

[auto-fabric admin-state](#)

Globally enables or disables Automatic Fabric for the switch.

[show auto-fabric config interface](#)

Displays the Automatic Fabric configuration applied to switch ports.

MIB Objects

alaAutoFabricPortConfigTable

alaAutoFabricPortConfigStatus

auto-fabric discovery start

Manually starts the Automatic Fabric discovery process.

auto-fabric discovery start

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command can be used to manually begin the Automatic Fabric discovery process after the switch has booted and the discovery window has elapsed.

Examples

```
-> auto-fabric discovery start
```

Release History

Release 7.3.2; command introduced.

Related Commands

show auto-fabric config	Displays the global Automatic Fabric configuration.
show auto-fabric config interface	Displays Automatic Fabric configuration applied on interfaces.

MIB Objects

```
alaAutoFabricGlobalDiscovery
```

auto-fabric protocols

Enables or disables the Automatic Fabric discovery process for a particular protocol.

```
auto-fabric protocols {lacp | mvrp | spb | ip {ospfv2 | ospfv3 | isis | all} | loopback-detection}
{interface chassis/slot/port-port2 | chassis} admin-state {enable | disable}
```

Syntax Definitions

lacp	Selects the Link Aggregation Control Protocol.
mvrp	Selects the Multiple VLAN Registration Protocol.
spb	Selects the Shortest Path Bridging protocol.
ospfv2	Selects the Open Shortest Path First version 2 protocol.
ospfv3	Selects the Open Shortest Path First version 3 protocol.
isis	Selects the Intermediate System-Intermediate System protocol.
all	Selects all the supported IP routing protocols (OSPFv2, OSPFv3, and IS-IS).
loopback-detection	Selects Loopback Detection for UNP SPB access ports. Access ports are used to create SPB Service Access Points (SAP).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis	All Automatic Fabric ports on the chassis. Use this parameter to globally configure the discovery status for the selected protocol.
enable	Enables the discovery status for the selected protocol.
disable	Disables the discovery status for the selected protocol.

Defaults

- Automatic Fabric discovery is globally enabled for all the protocols when the switch boots up without a configuration file.
- Automatic Fabric discovery is globally enabled for all protocols, except MVRP, when the switch boots up with an existing configuration file. In this case, the global default setting for MVRP is disabled.
- Automatic Fabric discovery is enabled for LACP, MVRP, and SPB on all eligible interfaces by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If no interface is specified with this command, the discovery status for the protocol is enabled or disabled globally for the switch.
- The **interface** and **chassis** parameters are only used in combination with the **lacp**, **mvrp**, and **spb** parameters.

- The interface setting for LACP, MVRP, and SPB discovery overrides the global setting. For example, if SPB discovery is globally enabled for the switch but disabled on port 2/1/1, then the port does not participate in the SPB discovery process.

Examples

```
-> auto-fabric protocols lacp admin-state disable
-> auto-fabric protocols mvrp admin-state enable
-> auto-fabric protocols spb interface 1/1/3 admin-state disable
-> auto-fabric protocols loopback-detection admin-state disable
-> auto-fabric protocols ip ospfv2 admin-state enable
-> auto-fabric protocols ip ospfv3 admin-state disable
-> auto-fabric protocols ip isis admin-state disable
```

Release History

Release 7.3.2; command introduced.

Release 7.3.4; **loopback-detection** and **ip** parameters added.

Release 8.3.1; default setting for global MVRP discovery is disabled when switch boots up with an existing configuration file.

Related Commands

auto-fabric admin-state	Enables or disables Automatic Fabric functionality.
auto-fabric discovery start	Manually starts the Automatic Fabric discovery process.
show auto-fabric config interface	Displays the Automatic Fabric configuration applied on interfaces.
show auto-fabric config	Displays the global Automatic Fabric configuration.

alaAutoFabricPortMVRPProtocolStatus
```

auto-fabric config-save interval

Configures the time interval for saving the automatically discovered configuration to the switch configuration file.

auto-fabric config-save interval *seconds*

Syntax Definitions

seconds The amount of time between automatic saves of the discovered configuration. Range is 60 - 3600 seconds.

Defaults

parameter	default
<i>seconds</i>	300

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The automatic save time interval specified with this command is only valid when the automatic configuration save status is enabled. This is done through the **auto-fabric config-save admin-state** command.

Examples

```
-> auto-fabric config-save interval 600
```

Release History

Release 7.3.2; command introduced.

Related Commands

auto-fabric config-save admin-state Enables or disables automatically saving of the discovered configuration to the switch configuration file

show auto-fabric config Displays the Automatic Fabric configuration.

MIB Objects

alaAutoFabricGlobalConfigSaveTimer

auto-fabric config-save admin-state

Enables or disables automatically saving of the discovered configuration to the switch configuration file.

auto-fabric config-save admin-state {enable | disable}

Syntax Definitions

enable	Enables automatically saving the discovered configuration to the switch configuration file.
disable	Disables automatically saving the discovered configuration to the switch configuration file.

Defaults

By default, automatically saving the discovered configuration is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When this function is enabled, the amount of time specified through the **auto-fabric config-save interval** command is active. An automatic save is performed whenever the specified amount of time elapses.

Examples

```
-> auto-fabric config-save admin-state disable
```

Release History

Release 7.3.2; command introduced.

Related Commands

auto-fabric config-save interval	Configures the amount of time to wait between automatic saves of the discovered configuration.
show auto-fabric config	Displays the Automatic Fabric configuration.

MIB Objects

alaAutoFabricGlobalConfigSaveTimerStatus

auto-fabric discovery-interval

Configures when the switch will automatically start the Automatic Fabric discovery process.

auto-fabric discovery-interval *minutes*

Syntax Definitions

minutes The discovery interval time. The valid range is 2–3600 minutes.

Defaults

By default, the discovery interval timer is set to zero (disabled).

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When a switch boots up without a configuration file, discovery is automatically started for a one time, initial run even when the interval timer is disabled.
- Set the value of this timer to more than two times the value of the switch MAC address aging time. This will allow time for inactive MAC addresses to age out on Automatic Fabric ports before the next discovery interval is started.

Examples

```
-> auto-fabric discovery-interval 60
```

Release History

Release 7.3.2; command introduced.

Release 7.3.4; timer default value changed to zero (disabled).

Related Commands

[show auto-fabric config](#) Displays the Automatic Fabric configuration.

MIB Objects

alaAutoFabricGlobalDiscoveryTimer

auto-fabric protocols spb default-profile

Configures the default Service Access Point (SAP) profile that the Universal Network Profile (UNP) feature uses to dynamically create SAPs for traffic received on UNP SPB access ports.

auto-fabric protocols spb default-profile {single-service | auto-vlan}

Syntax Definitions.

single-service	Dynamically creates a SAP profile only for untagged traffic on the UNP SPB access port.
auto-vlan	Dynamically creates a SAP for each VLAN tag received on a UNP SPB access port. When this option is selected, the single-service option is automatically triggered for untagged traffic.

Defaults

By default, the switch is set to use the **auto-vlan** option.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID and specifies the type of customer traffic (untagged or tagged) to encapsulate and tunnel through the SPB network infrastructure.
- Once the SPB adjacencies and UNP access ports are configured through Automatic Fabric discovery, traffic received on UNP access ports triggers the switch to dynamically create a SAP for the traffic based on the SAP profile selected with this command.

Examples

```
-> auto-fabric protocols spb default-profile single-service  
-> auto-fabric protocols spb default-profile auto-vlan
```

Release History

Release 7.3.4; command introduced.

Related Commands

auto-fabric protocols spb set-profile	Configures the default SAP profile for a specific port or range of ports on the switch.
show auto-fabric config	Displays the global Automatic Fabric configuration.
show auto-fabric config interface	Displays Automatic Fabric configuration applied on interfaces.

MIB Objects

alaAutoFabricSPBDefaultProfile

auto-fabric protocols spb set-profile

Configures the default SAP profile for a specific port or range of ports on the switch.

```
auto-fabric protocols spb set-profile {single-service | auto-vlan} interface chassis/slot/port[-port2]
```

Syntax Definitions

single-service	Defines single default service SAP profile. Only untagged traffic on the UNP-SPB port is learnt in this profile.
auto-vlan	The incoming traffic is automatically learnt. The SAP bindings for the concerned VLANs are automatically created based on the traffic sensed.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1) on which the SAP profile will be enabled. Use a hyphen to specify a range of ports (3/1-8).

Defaults

By default, the **auto-vlan** option is used for Automatic Fabric ports.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The SAP profile configured for the specified port or range of ports overrides the default SAP profile configured for the switch.

Examples

```
-> auto-fabric protocols spb set-profile single-service interface 1/1/1  
-> auto-fabric protocols spb set-profile auto-vlan interface 1/2/1-4
```

Release History

Release 7.3.4; command introduced.

Related Commands

show auto-fabric config	Displays the auto-fabric configuration.
show auto-fabric config interface	Displays auto-fabric configuration applied on interfaces.

MIB Objects

```
alaAutoFabricPortConfigTable  
  alaAutoFabricPortConfigIfIndex  
  alaAutoFabricPortSPBDefaultProfile

show auto-fabric config

Displays the Automatic Fabric configuration.

show auto-fabric config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show auto-fabric config
Auto-fabric Status      : Disable,
Config Save Timer Status : Disabled,
Config Save Timer Interval : 300 seconds,
Default UNP SAP Profile : Auto-vlan,
Discovery Interval      : 1 minute(s),
Discovery Status        : Idle,
LACP Discovery Status   : Enabled,
LBD Discovery Status    : Enabled,
MVRP Discovery Status   : Disabled,
OSPFv2 Discovery Status : Enabled,
OSPFv3 Discovery Status : Enabled,
ISIS Discovery Status   : Enabled,
SPB Discovery Status    : Enabled
```

output definitions

Auto-Fabric Status	The global status of the Automatic Fabric functionality.
Config Save Timer Status	Displays the status of the Automatic Fabric configuration save timer.
Config Save Timer Interval	Displays how often the discovered Automatic Fabric configuration is saved to the switch configuration file.
Default UNP SAP Profile	Displays the default SAP profile for the switch.
Discovery Interval	Displays how often the Automatic Fabric discovery process will run.
Discovery Status	Displays whether the global discovery process is running or idle.
LACP Discovery Status	Displays the global status of Automatic Fabric discovery for the LACP protocol.

output definitions (continued)

LBD Discovery Status	Displays the status of the Loopback Detection on dynamically created UNP Service Access Points (SAPs).
MVRP Discovery Status	Displays the global status of Automatic Fabric discovery for the MVRP protocol.
OSPFv2 Discovery Status	Displays the global status of Automatic Fabric discovery for the OSPFv2 protocol.
OSPFv3 Discovery Status	Displays the global status of Automatic Fabric discovery for the OSPFv3 protocol.
ISIS Discovery Status	Displays the global status of Automatic Fabric discovery for the ISIS protocol.
SPB Discovery Status	Displays the global status of Automatic Fabric discovery for the SPB protocol.

Release History

Release 7.3.2; command introduced.

Release 7.3.4; **OSPFv2 Discovery Status**, **OSPFv3 Discovery status**, **ISIS Discovery Status**, **LBD Discovery Status**, and **Default UNP SAP Profile** output fields added.

Related Commands

show auto-fabric config interface

Displays the Automatic Fabric configuration applied on interfaces.

show auto-fabric config interface [*chassis/slot*[-*slot2*] | *chassis/slot/port*[-*port2*]]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i> [- <i>slot2</i>]	The slot number. Use a hyphen to specify a range of slot numbers (1/1-5 displays ports on slots 1 through 5).
<i>slot/port</i> [- <i>port2</i>]	The chassis ID, slot, and port number. Use a hyphen to specify a range of ports (1/1/2-10 displays ports 1 through 10).

Defaults

By default, the Automatic Fabric configuration for all switch ports is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

To display the global and port-level configuration for specific interfaces, specify a port number this command.

Examples

```
->show auto-fabric config interface
```

Port	Admin Status	LACP	SPB-M	MVRP	SAP Profile	Oper Status
1/1/1	disabled	enabled	enabled	disabled	single-service	disabled
1/1/2	enabled	enabled	enabled	disabled	auto-vlan	disabled
1/1/3	enabled	enabled	enabled	enabled	auto-vlan	disabled
1/1/4	enabled	enabled	disabled	enabled	auto-vlan	disabled
1/1/5	enabled	enabled	enabled	enabled	auto-vlan	disabled
1/1/6	enabled	enabled	enabled	enabled	auto-vlan	disabled

output definitions

Port	The chassis ID, slot, and port number.
Admin-Status	The Automatic Fabric administrative status for the port.
LACP	The LACP discovery status for the port.
SPB-M	The SPB-M discovery status for the port.
MVRP	The MVRP discovery status for the port.
SAP Profile	The default SAP profile assigned to the port.
Operational Status	The Automatic Fabric operational status for the port.

```

-> show auto-fabric config interface 1/1/1
Auto-Fabric Interface Config:

19 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the **ping** command that is used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

Note. If all devices are on the same VLAN or if the IP interfaces are created on multiple VLANs to enable routing of packets, packets can be forwarded using IP. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: [Chapter 22, “RIP Commands,”](#) [Chapter 26, “OSPF Commands.”](#) For more information on VLANs and RIP, see the applicable chapters in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the IP commands is as follows:

Filename: IpForward.mib
Module: IpForward

Filename: Ip.mib
Module: Ip

Filename: AlcatelIND1Ip.mib
Module: alcatelIND1IPMIB

Filename: AlcatelIND1Iprm.mib
Module: alcatelIND1IPRMMIB

A summary of the available commands is listed here:

ip interface

Configures an IP interface to enable IP routing on a VLAN or allow remote access. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

```
ip interface {if_name | emp | master emp | local chassis-id chassis} [{address | vip-address}
ip_address] [mask subnet_mask] [admin-state [enable | disable]] [vlan vlan_id] [forward | no forward]
[local-proxy-arp | no local-proxy-arp] [e2 | snap] [primary | no primary]
```

```
no ip interface if_name
```

Syntax Definitions

<i>if_name</i>	Text string of the interface name. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing”). This value is case sensitive.
emp	Modifies the shared EMP port IP address.
master emp	Modifies the EMP port IP address of the master chassis when operating in virtual chassis mode.
local chassis-id chassis	Modifies the EMP port IP address of the local chassis.
address ip_address	An IP host address (for example, 10.0.0.1, 171.15.0.20) to specify the IP router network.
vip-address ip_address	An IP host address for a Virtual IP (VIP) VLAN. This type of IP address is used only in a Multi-Chassis Link Aggregation (MC-LAG) configuration.
<i>subnet_mask</i>	A valid IP address mask (for example, 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.
<i>vlan_id</i>	An existing VLAN ID number (1–4094). Specify a multi-chassis VLAN ID if the IP interface is for a VIP VLAN.
forward	Enables forwarding of IP frames to other subnets.
no forward	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
local-proxy-arp	Enables Local Proxy ARP on the specified interface. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.
e2	Enter e2 or ethernet2 to specify Ethernet-II encapsulation.
snap	SNAP encapsulation.
primary	Designates the specified IP interface as the primary interface for the VLAN.
no primary	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

Defaults

parameter	default
<i>ip_address</i>	0.0.0.0
<i>subnet_mask</i>	IP address class
enable disable	enable
<i>vlan_id</i>	none (unbound)
forward no forward	forward
local-proxy-arp no local-proxy-arp	no local-proxy-arp
e2 snap	e2
primary no primary	First interface bound to a VLAN.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multinetting is supported (except on the OmniSwitch 9900). As a result, it is possible to configure up to 16 IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- To configure a virtual IP interface for an MC-LAG VLAN (VIP VLAN), use the **vip-address** parameter and specify a multi-chassis VLAN ID for the interface **vlan** parameter.
- When local proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. The same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it always remains operationally active.

Examples

```
-> ip interface "Marketing"
-> ip interface "Payroll address" 18.12.6.3 vlan 255
```

```
-> ip interface "Human Resources" 10.200.12.101 vlan 500 no forward snap
-> ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp primary
```

ip interface rtr-port

Associates an IP interface with a VLAN and a port or link aggregate.

ip interface *if_name* **address** *ip_address/mask* **vlan** *vlan_id* **rtr-port** {**port** *chassis/slot/port* | **linkagg** *agg_id*} {**tagged** | **untagged**}

Syntax Definitions

<i>if_name</i>	Text string. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing”). This value is case sensitive.
<i>ip_address</i>	IP host address to specify this IP interface.
<i>mask</i>	IP mask to specify this IP interface.
<i>vlan_id</i>	An unused VLAN on the system to which this IP interfaces is associated.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1) of the physical port bound to the IP Interface.
<i>agg_id</i>	The linkagg-ID of the linkagg bound to the IP Interface.
tagged	Whether the assigned linkagg or port is tagged for the specified VLAN.
untagged	Whether the assigned linkagg or port is untagged for the specified VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- You can create a VLAN, configure an IP interface on it, and add a single port or link aggregate to this VLAN as a tagged or untagged using this command.
- The vlan associated with the router-port must be a new, unused VLAN. This VLAN is a routing-only VLAN with a single port or linkagg.
- Configuration to add additional members to this VLAN using **vlan members untagged/vlan members tagged** command, or to delete this VLAN directly using **no vlan** command is rejected. This VLAN can only be deleted by deleting the associated IP interface using the **no** form of the **ip interface** command.
- If you modify this IP interface such that it's no longer bound to this VLAN, the corresponding VLAN is deleted.

Examples

```
-> ip interface "test address" 10.0.0.1/8 vlan 30 rtr-port port 1/1/1 tagged
-> ip interface "test1 address" 20.0.0.1/8 vlan 40 rtr-port port 1/1/2 untagged
-> ip interface "test address" 10.0.0.1/8 vlan 30 rtr-port linkagg 6 tagged
-> ip interface "test1 address" 20.0.0.1/8 vlan 40 rtr-port linkagg 7 untagged
```

ip interface tunnel

Configures the end points for a GRE or IPIP tunnel.

```
ip interface if_name tunnel [source ip_address] [destination ip_address] [protocol {ipip | gre}]
```

Syntax Definitions

<i>if_name</i>	Text string. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing”). This value is case sensitive.
source <i>ip_address</i>	Source IP address of the tunnel.
destination <i>ip_address</i>	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip gre	ipip

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

You can configure an interface as either a VLAN or tunnel interface.

Examples

```
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

ip interface dhcp-client

Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.

```
ip interface dhcp-client [vlan vlan_id] [release | renew] [option-60 opt60_string] [admin {enable | disable}] [local-proxy-arp | no local-proxy-arp]
```

```
no ip interface dhcp-client
```

Syntax Definitions

dhcp-client	Reserved IP interface name indicating this interface use DHCP to obtain an IP address from a DHCP server.
<i>vlan_id</i>	An existing VLAN ID number (1–4094).
release	Releases the DHCP server assigned IP address.
renew	Renews the DHCP server assigned IP address.
<i>opt60_string</i>	The option-60 field value to be included in DHCP discover/request packets.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.
local-proxy-arp	Enables Local Proxy ARP on the specified interface. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.

Defaults

parameter	default
<i>opt60_string</i>	OmniSwitch-xxxx (xxxx = Platform, for example, 6900)
enable disable	enable
local-proxy-arp no local-proxy-arp	no local-proxy-arp

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the DHCP-client IP interface.
- Only one DHCP client IP interface can be assigned per switch but it can belong to any VLAN and any VRF instance.
- If the system name has not been configured, it will be updated using the option-12 field. If the option-12 string is greater than 19 characters the remaining characters will be truncated.
- The minimum lease time accepted on the DHCP-client interface is 5 minutes.

Examples

```
-> ip interface dhcp-client vlan 100
-> ip interface dhcp-client admin enable
-> ip interface dhcp-client release
-> ip interface dhcp-client renew
-> ip interface dhcp-client option-60 OmniSwitch
-> no ip interface dhcp-client
```

ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

ip router primary-address *ip_address*

Syntax Definitions

ip_address 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The router primary address must be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis.

Examples

```
-> ip router primary-address 172.22.2.115
```

Release History

Release 7.1.1; command introduced

Related Commands

 alaDrcTmIpRouterPrimaryAddress

ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

ip router router-id *ip_address*

Syntax Definitions

ip_address 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis.
- The router ID is used by OSPF and BGP for unique identification of the router in the network.

Examples

```
-> ip router router-id 172.22.2.115
```

Release History

ip static-route

Creates/deletes an IP static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ip static-route *ip_address* [**mask** *mask*] {**gateway** *gateway_address* [**tag** *num*] [**name** *string*] [**bfd-state** {**enable** | **disable**}] | **interface** *interface_name* | **follows** *ip_address*} [**metric** *metric*]

no ip static-route *ip_address* [**mask** *mask*] [**gateway** *gateway_address* [**tag** *num*] [**name** *string*] {**bfd-state** {**enable** | **disable**}} \ **interface** *interface_name* | **follows** *ip_address*] [**metric** *metric*]

Syntax Definitions

<i>ip_address</i>	Destination IP address of the static route.
<i>mask</i>	Subnet mask corresponding to the destination IP address.
gateway <i>ip_address</i>	IP address of the next hop used to reach the destination IP address.
tag <i>num</i>	Tag to be used for route. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
name <i>string</i>	Name to be used for route.
interface <i>interface_name</i>	Interface of the next hop used to reach the destination IP address.
follows <i>ip_address</i>	The recursive static route follows this IP address. The recursive route uses the same gateway (and interface) or nexthop that is used to reach this host address.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

Defaults

parameter	default
<i>metric</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the **ip route-pref** command.
- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- A static route is active if the interface it is using is “UP”.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.

- If directly connected, NAT routers interface name can be used instead of gateway IP address, provided the router is enabled for proxy-ARP to handle ARP requests for the route addresses.

Examples

```
-> ip static-route 171.11.1.1 gateway 171.11.2.1
-> ip static-route 171.11.1.1 interface Int1
-> ip static-route 12.0.0.0/8 interface Int1
-> ip static-route 171.11.0.0 follows 192.168.10.1
```

ip route-pref

Configures the route preference of a router.

```
[vrf vrf_name] ip route-pref {static | rip | ospf | isisl2 | isisl1 | ibgp | ebgp | import} value
```

Syntax Definitions

<i>vrf_name</i>	The alphanumeric name (1–20 characters) assigned to the VRF instance.
static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF routes.
isisl2	Configures the route preference of ISIS L2 routes.
isisl1	Configures the route preference of ISIS L1 routes.
rip	Configures the route preference of RIP routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
import	Configures the route preference for the routes that are imported.
<i>value</i>	Route preference value.

Defaults

parameter	default
static <i>value</i>	2
ospf <i>value</i>	110
isisl2 <i>value</i>	118
isisl1 <i>value</i>	115
rip <i>value</i>	120
ebgp <i>value</i>	190
ibgp <i>value</i>	200
import <i>value</i>	210

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Route preference of local routes cannot be changed.

Examples

```
-> ip route-pref ebgp 20
-> ip route-pref rip 60
-> ip route-pref import 210
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** and **import** parameters added.

  alaIprmRtPrefEntryType
  alaIprmRtPrefEntryValue
```

ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet travels before being discarded.

ip default-ttl *hops*

Syntax Definitions

hops TTL value, in hops. Valid range is 1–255.

Defaults

parameter	default
<i>hops</i>	64

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

Examples

```
-> ip default-ttl 30
```

Release History

Release 7.1.1; command introduced

Related Commands

[show ip config](#) Displays IP configuration parameters.

MIB Objects

IpDefaultTTL

ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the IP address or hostname of the destination. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described below.

```
ping {ip_address / hostname} [source-interface ip_interface] [count count] [size packet_size] [interval seconds] [timeout seconds] [data-pattern string] [dont-fragment] [tos tos_val]
```

Syntax Definitions

<i>ip_address</i>	IPv4 address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
source-interface <i>ip_interface</i>	IP address or interface name to use as the source IP for the ping packets.
<i>count</i>	Number of frames to be transmitted.
<i>packet_size</i>	Size of the data portion of the packet sent for this ping, in bytes. Valid range is 1–65507.
interval <i>seconds</i>	Polling interval. The switch polls the host at time intervals specified in seconds.
timeout <i>seconds</i>	Number of seconds the program waits for a response before timing out.
data-pattern <i>string</i>	The data pattern to be used in the data field of the ping packets.
dont-fragment	Sets the don't-fragment bit in the IP packet.
tos <i>tos_val</i>	Type of Service field in the IP header.

Defaults

parameter	default
<i>count</i>	6
<i>packet_size</i>	64
interval <i>seconds</i>	1
timeout <i>seconds</i>	5
dont-fragment	0
tos <i>tos_val</i>	0
data-pattern <i>string</i>	Repeating sequence of ASCII characters 0x4 onwards to 0xff

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If you change the default values, they are only applied to the current ping. The next time you use the ping command, the default values are used unless you again enter different values.

Examples

```
-> ping 10.255.11.242

PING 10.255.11.242: 56 data bytes
64 bytes from 10.255.11.242: icmp_seq=0. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=1. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=2. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=3. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=4. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=5. time=0. ms
----10.255.11.242 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0

-> ping 10.0.0.1 source-interface mgmt
-> ping 10.0.0.1 tos 1
-> ping 10.0.0.1 timeout 10
-> ping 10.0.0.1 interval 10
-> ping 10.0.0.1 dont-fragment
-> ping 10.0.0.1 data-pattern AB
```

Release History

Related Commands

[traceroute](#) Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute {*ip_address* / *hostname*} [**max-hop** *max_hop_count*] [**min-hop** *min_hop_count*] [**source-interface** *ip_interface*] [**probes** *probe_count*] [**timeout** *seconds*] [**port** *port_number_value*]

Syntax Definitions

<i>ip_address</i>	IPv4 address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>max_hop_count</i>	Maximum hop count for the trace. The valid range is 1–255.
<i>min_hop_count</i>	Minimum hop count for the trace. The valid range is 1–30.
<i>ip_interface</i>	Source IP interface to be used in the traceroute packets.
<i>probe_count</i>	The number of packets (retry) sent for each hop-count. The valid range is 1–10000.
<i>seconds</i>	The time to wait for the response of each probe packet.
<i>port_number_value</i>	The destination port number to be used in the probing packets.

Defaults

parameter	default
max-hop <i>max_hop_count</i>	30
min-hop <i>min_hop_count</i>	1
source-interface <i>ip_interface</i>	Outgoing IP interface as per route lookup
probes <i>probe_count</i>	3
timeout <i>seconds</i>	5
port <i>port_number_value</i>	33334

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

When using this command, you must enter the name of the destination as part of the command line (either the IP address or host name).

Examples

```
-> traceroute 128.251.17.224

traceroute to 128.251.17.224, 30 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 0 ms  16.6667 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
 4  128.251.17.224 0 ms  0 ms  0 ms

-> traceroute 128.251.17.224 max-hop 3
traceroute to 128.251.17.224, 3 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 16.6667 ms  0 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
-> traceroute 10.0.0.1 source-interface mgmt
-> traceroute 10.0.0.1 min-hop 3
-> traceroute 10.0.0.1 probes 3
-> traceroute 10.0.0.1 timeout 10
-> traceroute 10.0.0.1 port-number 1025
```

Release History

Release 7.1.1; command introduced

Related Commands

[show ip routes](#) Displays the IP Forwarding table.

MIB Objects

N/A

ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1s in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

ip directed-broadcast {enable | disable}

Syntax Definitions

on	Enables IP directed broadcasts.
off	Disables IP directed broadcasts.

Defaults

The default value is **disable**.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Directed broadcasts are used in denial-of-service attacks. In a DoS attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address. This results in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Directed broadcasts must not be enabled.

Examples

```
-> ip directed-broadcast enable
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show ip routes	Displays the IP Forwarding table.
show ip config	Displays IP configuration parameters.

MIB Objects

alaIpDirectedBroadcast

ip service

Enables (opens) or disables (closes) well-known or user-defined TCP/UDP service ports. Selectively enabling or disabling these types of ports provides an additional method for protecting against unauthorized switch access or Denial of Service (DoS) attacks.

```
[vrf vrf_name] ip service {all | service_name / port service_port} admin-state {enable | disable}
```

Syntax Definitions

<i>vrf_name</i>	The name of an existing VRF instance in which services are to be enabled or disabled.
all	Configures access to all TCP/UDP ports.
<i>service_name</i>	The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section for a list of supported service names.)
<i>service_port</i>	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the “Usage Guidelines” section for a list of well-known port numbers.) If a user-defined port number is specified, the valid range is 20000–20999.
enable	Enables access to the service.
disable	Disables access to the service.

Defaults

All TCP/UDP ports are open by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, and so on.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the “Example” section for more information.
- When specifying a service port number, the **port** keyword is required and that only one port number is allowed in a single command.

- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443
ntp	123
snmp	161

- If a VRF is specified, the service is enabled or disabled in the specified VRF. By default, the services are enabled in the 'default' VRF.

Examples

```
-> ip service all admin-state disable
-> ip service ftp admin-state enable
-> ip service port 20000 admin-state enable
-> vrf vrfl ip service ftp admin-state enable
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

[ip service port](#) Configures a user-defined TCP/UDP port for the specified service.
[show ip service](#) Displays the IP service TCP/UDP port configuration and status.

MIB Objects

```
alaIpServiceTable
  alaIpServiceType
  alaIpServicePort
  alaIpServiceStatus
alaIpPortServiceTable
  alaIpPortServicePort
  alaIpPortServiceStatus
```

ip service port

Configures a user-defined TCP/UDP service port for the specified service.

```
ip service {service_name} port {default | service_port}
```

Syntax Definitions

<i>service_name</i>	The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section for a list of supported service names.)
<i>service_port</i>	A TCP/UDP service port number (Refer to the table in the “Usage Guidelines” section for a list of supported service names.) Valid range is the default service port number or 20000-20999.
default	Sets the port back to the well-known port for the specified service.

Defaults

By default, the service uses the well-known TCP/UDP port number for that service.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **default** parameter with this command to set the port for the specified service back to the well-known default port for that service. For example, if the FTP port was previously changed to “20000”, then the **ip service ftp port default** command would set the FTP port back to “21”.
- The following table lists the **ip service port** command options for specifying TCP/UDP services and also includes the default well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443

The **ntp** and **snmp** services are not supported with the **ip service port** command.

- Use the **ip service** command to enable or disable the status for a well-known or user-defined TCP/UDP service port.

Examples

```
-> ip service ftp port 20000
-> ip service ftp port default
-> ip service telnet port 20003
```

```
-> ip service telnet port default
```

Release History

Release 7.1.1; command introduced

Related Commands

[ip service](#)

Enables or disables well-known or user-defined service ports.

[show ip service](#)

Displays the IP service TCP/UDP port configuration and status.

alaIpServiceTable  
  alaIpServiceType  
  alaIpServicePort  
  alaIpServiceStatus
```

ip service source-ip

Configures a user-defined source IP address as the outgoing IP interface for the IP service.

```
[vrf vrf_name] ip service source-ip {Loopback0 | interface_name} [tftp] [telnet] [tacacs] [swlog] [ssh]
[snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]
```

```
[vrf vrf_name] no ip service source-ip {Loopback0 | interface_name} [tftp] [telnet] [tacacs] [swlog]
[ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]
```

Syntax Definitions

<i>vrf_name</i>	Name of the VRF.
Loopback0	Uses the Loopback0 interface as the source IP for the IP service.
<i>interface_name</i>	Specifies the name of the interface.
tftp	Configures the source IP address to be used by TFTP.
telnet	Configures the source IP address to be used by TELNET.
tacacs	Configures the source IP address to be used by TACACS.
swlog	Configures the source IP address to be used by SWLOG.
ssh	Configures the source IP address to be used by SSH.
snmp	Configures the source IP address to be used by SNMP.
sflow	Configures the source IP address to be used by sFlow.
radius	Configures the source IP address to be used by RADIUS.
ntp	Configures the source IP address to be used by NTP.
ldap	Configures the source IP address to be used by the LDAP server.
ftp	Configures the source IP address to be used by FTP.
dns	Configures the source IP address to be used by DNS.
all	Configures the source IP address to be used by all the applications.

Defaults

By default, the outgoing interface is taken as the source IP address for all the applications.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If for a particular application, specific source IP address is configured and the “all” option is also set, the configured source IP address for the application is used as the outgoing interface.
- Use the **no** form of this command to revert to the default behavior.
- This feature is supported on non-default VRF.

Examples

```
-> ip service source-ip loopback0 ntp
-> ip service source-ip ipVlan100 ftp
-> no ip service source-ip loopback0 ntp
```

Release History

Release 7.3.4; command introduced

Related Commands

MIB Objects

```
alaIpServiceSourceIPTable
  AlaIpServiceSourceIPAppIndex
  alaIpServiceSourceIPName
```

ip redistrib

Controls the conditions for redistributing IPv4 routes between different protocols.

```
[vrf vrf_name] ip redistrib {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map route_map_name} [admin-state {enable | disable}]
```

```
no ip redistrib {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} [all-routes | route-map | route_map_name]
```

Syntax Definitions

<i>vrf_name</i>	The name of an existing VRF instance.
local	Redistributes local routes.
static	Redistributes static routes.
import	Redistributes routes to other routing protocols that are imported.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
isis	Specifies IS-IS as the source or destination (into) protocol.
bgp	Specifies BGP as the source or destination (into) protocol.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
<i>route_map_name</i>	Name of an existing route map that controls the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

If a VRF name is not specified with this command, routes are redistributed within the context of the active VRF instance.

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. If a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route is greater than 15 (RIP_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.

- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ip redistrib rip into bgp route-map rip-to-bgp1
-> ip redistrib rip into bgp route-map rip-to-bgp2
-> no ip redistrib rip into bgp route-map rip-to-bgp2
-> ip redistrib ospf into rip route-map ospf-to-rip
-> ip redistrib ospf into rip route-map ospf-to-rip disable
-> ip redistrib import into ospf route-map R1 status enable
```

Release History

Release 7.1.1; command introduced

Release 7.3.1; **vrf** and **import** parameters added.

Release 7.3.2; **all-routes** parameter added.

Related Commands

show ip redistrib	Displays the route map redistribution configuration.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip import	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

ip access-list *access-list-name*

no ip access-list *access-list-name*

Syntax Definitions

access-list-name Name of the access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ip access-list access1  
-> no ip access-list access1
```

Release History

Release 7.1.1; command introduced

Related Commands

[ip access-list address](#) Adds IPv4 addresses to the specified IPv4 access list.

[show ip access-list](#) Displays the details of the access list.

MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

ip access-list *access-list-name* **address** *address/prefixLen* [**action** {**permit** | **deny**}] [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}]

no ip access-list *access-list-name* **address** *address/prefixLen*

Syntax Definitions

<i>access-list-name</i>	Name of the access list.
<i>address/prefixLen</i>	IP address/prefix length to be added to the access list.
permit	Permits the IP address.
deny	Denies the IP address.
all-subnets	Permits or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Permits or denies only those routes that exactly match the IP address and the mask length.
aggregate	Permits an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit deny	permit
all-subnets no-subnets aggregate	all-subnets

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* must exist before you add multiple addresses to the list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
```

```
-> ip access-list access1 address 10.1.1.0/24 redistrib-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

Release History

Release 7.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
show ip access-list	Displays the contents of an IPv4 access list.

  alaRouteMapAccessListRowStatus
```

ip route-map action

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

```
ip route-map route_map_name [sequence-number number] action {permit | deny}
```

```
no ip route-map route_map_name [sequence-number number]
```

Syntax Definitions

<i>route_map_name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
permit	Selects a route.
deny	Filters a route.

Defaults

parameter	default
<i>number</i>	50
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route_map_name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

Examples

```
-> ip route-map route1 sequence-number 10 action permit  
-> no ip route-map route1
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip route-map Displays the configured IP route maps.

```

ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

ip route-map *route_map_name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

no ip route-map *route_map_name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv4 access list that contains IPv4 addresses to match.
<i>ip_address/prefixLen</i>	The destination IP address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IP address.
permit	Permits a route based on the IP address or prefix constrained by redist-control.
deny	Denies a route based on the IP address or prefix constrained by redist-control.

Defaults

parameter	default
<i>number</i>	50
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny**, then the route is not selected. If the best matching address is type **permit** and the route map action is **deny**, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number**, and *access-list-name* (if used) must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redistribute no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redistribute no-subnets deny
-> ip route-map routel sequence-number 10 match ip-address list1
-> no ip route-map routel sequence-number 10 match ip-address list1
```

Release History

Release 7.1.1; command introduced

Related Commands

```

ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

ip route-map *route_map_name* [**sequence-number** *number*] **match ipv6-address** { *access-list-name* | *ipv6_address/prefixLen* [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

no ip route-map *route_map_name* [**sequence-number** *number*] **match ipv6-address** *ipv6_address/prefixLen* [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

Syntax Definitions

<i>route_map_name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv6 access list that contains IPv6 addresses to match.
<i>ipv6_address/prefixLen</i>	The destination IPv6 address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IPv6 address.
permit	Permits a route based on the IPv6 address or prefix constrained by redist-control .
deny	Denies a route based on the IPv6 address or prefix constrained by redist-control .

Defaults

parameter	default
<i>number</i>	50
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny**, then the route is not selected. If the best matching address is type **permit** and the route map action is **deny**, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redistrib-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redistrib-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ipv6-address list1
-> no ip route-map route1 sequence-number 10 match ipv6-address list1
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

ip route-map *route_map_name* [**sequence-number** *number*] **match ip-nexthop** {*access-list-name* | *ip_address/prefixLen* [**permit** | **deny**]}

no ip route-map *route_map_name* [**sequence-number** *number*] **match ip-nexthop** {*access-list-name* | *ip_address/prefixLen* [**permit** | **deny**]}

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IP address.
<i>ip_address/prefixLen</i>	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IP nexthop.
deny	Denies a route based on the IP nexthop.

Defaults

parameter	default
<i>number</i>	50
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not selected. If the best matching nexthop is type **permit** and the route map action is **deny**, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number**, and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map routel sequence-number 10 match ip-nexthop list1
-> no ip route-map routel sequence-number 10 match ip-nexthop list1
-> ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
```

```

ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

ip route-map *route_map_name* [**sequence-number** *number*] **match ipv6-nexthop** {*access-list-name* | *ipv6_address/prefixLen*} [**permit** | **deny**]

no ip route-map *route_map_name* [**sequence-number** *number*] **match ipv6-nexthop** {*access-list-name* | *ipv6_address/prefixLen*} [**permit** | **deny**]

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IPv6 address.
<i>IPv6_address/prefixLen</i>	The IPv6 address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IPv6 nexthop.
deny	Denies a route based on the IPv6 nexthop.

Defaults

parameter	default
<i>number</i>	50
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not selected. If the best matching nexthop is type **permit** but the route map action is **deny**, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number**, and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> no ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
```

ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

```
ip route-map route_map_name [sequence-number number] match ipv4-interface interface_name
```

```
no ip route-map route_map_name [sequence-number number] match ipv4-interface interface_name
```

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>interface_name</i>	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map routel sequence-number 10 match ipv4-interface int4  
-> no ip route-map routel sequence-number 10 match ipv4-interface int4
```

Release History

ip route-map match ipv6-interface

Matches the IPv6 interface name specified in the route map with the one that the routing protocol learned the route on.

```
ip route-map route_map_name [sequence-number number] match ipv6-interface interface_name
```

```
no ip route-map route_map_name [sequence-number number] match ipv6-interface interface_name
```

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>interface_name</i>	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map routel sequence-number 10 match ipv6-interface int6  
-> no ip route-map routel sequence-number 10 match ipv6-interface int6
```

ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

ip route-map *route_map_name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

no ip route-map *route_map_name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	The metric value that matches a specified metric.
<i>deviation</i>	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.

ip route-map match route-type

Matches the specified route type with actual route type of the route.

ip route-map *route_map_name* [**sequence-number** *number*] **match route-type** {**internal** | **external** [**type1** | **type2**] | **level1** | **level2**}

no ip route-map *route_map_name* [**sequence-number** *number*] **match route-type** {**internal** | **external** [**type1** | **type2**] | **level1** | **level2**}

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
internal	Matches OSPF/BGP internal routes.
external	Matches OSPF/BGP external routes.
type1	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.

ip route-map match protocol

Matches the protocol specified in the route map with the protocol of the route.

```
ip route-map route_map_name [sequence-number number] match protocol {local | static | rip | ospf | isis | bgp}
```

```
no ip route-map route_map_name [sequence-number number] match protocol {local | static | rip | ospf | isis | bgp}
```

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
local	Matches a local interface route.
static	Matches a static route.
rip	Matches a RIP route.
ospf	Matches an OSPF route.
isis	Matches an IS-IS route.
bgp	Matches a BGP route.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **match protocol** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match protocol local
-> no ip route-map route1 sequence-number 10 match protocol local
```

Configures the metric value of the route being distributed.

ip route-map *route_map_name* [**sequence-number** *number*] **set metric** *metric* [**effect** {**add** | **subtract** | **replace** | **none**}]

no ip route-map *route_map_name* [**sequence-number** *number*] **set metric** *metric* [**effect** {**add** | **subtract** | **replace** | **none**}]

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	Configures the metric value of the route. A value of 0 is not allowed.
add	Adds the configured metric value to the actual metric value.
subtract	Subtracts the configured metric value from the actual metric value.
replace	Replaces the actual metric value with the configured metric value.
none	Uses the actual metric value of the route. The configured metric value is ignored. Use any value except 0.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

ip route-map *route_map_name* [**sequence-number** *number*] **set local-preference** *value*

no ip route-map *route_map_name* [**sequence-number** *number*] **set local-preference** *value*

Syntax Definitions

<i>route_map_name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>value</i>	Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

Defaults

parameter	default
<i>number</i>	50

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

vrf [*vrf_name* / **default**] [**profile** {**max** | **low**}]

no vrf *vrf_name*

Syntax Definitions

<i>vrf_name</i>	The alphanumeric name (1–20 characters) assigned to the VRF instance.
default	Optional. Selects the default VRF instance.
max	Creates a VRF with the maximum profile capabilities.
low	Creates a VRF with the minimum (lowest) capabilities. Low profile VRFs use less system resources.

Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
<i>vrf_name</i> / default	default VRF instance
max low	max profile

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a VRF instance. Deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. In addition, if the name specified does not exist, a VRF instance is automatically created. As a result, it is possible to create instances or delete a wrong instance accidentally.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.
- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.

- The type of profile assigned to a VRF instance determines the routing protocols and capabilities supported within that instance. For example, low profile VRFs only support IPv4 and VRRP with routing capabilities restricted to static and imported routes. In addition, limiting low profiles to 9 routes and 3 IP interfaces is highly recommended.
- Profiles are not configurable for the default VRF, which provides full routing capabilities.
- Changing the profile for an existing VRF instance is not allowed. To change the profile, first delete the VRF then create it again with a different profile.

Examples

```
-> vrf IpOne
IpOne:: ->

IpOne:: -> vrf IpTwo
IpTwo:: ->

IpTwo:: -> vrf
->

IpTwo:: -> vrf default
->

-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100
->

-> vrf IpThree profile low
IpThree::->
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **max** and **low** parameters added to define VRF profiles.

Related Commands

show vrf	Displays the VRF instance configuration for the switch.
show vrf-profiles	Displays the VRF profile resources for the switch.
ip export	Exports VRF routes to the Global Routing Table (GRT).
ip import	Imports VRF routes from the GRT.

  alaVirtualRouterProfile
```

ip export

Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes

```
[vrf vrf_name] ip export {all-routes | route-map route_map_name / to-all-vrfs {all-routes | route-map route_map_name}}
```

```
[vrf vrf_name] no ip export
```

Syntax Definitions

<i>vrf_name</i>	The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.
all-routes	Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.
<i>route_map_name</i>	The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.
all-routes	Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.
to-all-vrfs route-map <i>route_map_name</i>	The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.
- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter exported VRF routes can contain any of the following match and set options:
 - Match options: ip-address, ip-next-hop, tag, protocol, ipv4-interface, metric, route-type
 - Set options: tag, metric
- This command does not support a route-map with **redist-control** of aggregate.
- Only one route map per source VRF or ISID is allowed for filtering exported routes.

- Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.
- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is not supported.

Examples

The following commands export routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

```
-> ip export route-map R1
-> ip export all-routes
-> ip export to-all-vrfs all-routes
-> ip export to-all-vrfs route-map R2
-> no ip export
```

The following commands export routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

```
-> vrf vrf2 ip export route-map R1
-> vrf vrf2 ip export all-routes
-> vrf vrf2 ip export to-all-vrfs all-routes
-> vrf vrf2 ip export to-all-vrfs route-map R2
-> no vrf vrf2 ip export
```

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

```
-> vrf vrf1
vrf1::-> ip export route-map R1
vrf1::-> ip export all-routes
vrf1::-> ip export to-all-vrfs all-routes
vrf1::-> ip export to-all-vrfs route-map R2
vrf1::-> no ip export
```

Release History

Release 7.3.1; command introduced.

Release 7.3.2; **all-routes** and **to-all-vrfs** parameters added.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip export	Displays the export route configuration details.
show ip global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmExportRouteMap  
alaIprmExportToAllVrfsRouteMap
```

ip import

Imports VRF or Shortest Path Bridging (SPB) service instance identifier (ISID) routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

```
[vrf dest_vrf_name] ip import {vrf {src_vrf_name | default} | isid instance_id} {all-routes | route-map route_map_name}
```

```
[vrf dest_vrf_name] no ip import {vrf {src_vrf_name | default} | isid instance_id}
```

Syntax Definitions

<i>dest_vrf_name</i>	The name of the destination VRF instance into which routes are imported from the GRT.
<i>src_vrf_name</i>	Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.
default	Default VRF. The routes are imported from the default VRF instance.
<i>instance_id</i>	An existing ISID number that identifies a SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.
all-routes	Imports all routes from the source VRF instance. Imported routes are not filtered.
<i>route_map_name</i>	The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

Defaults

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF instance or ISID.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter imported VRF or ISID routes can contain any of the following match and set parameter options:
 - Match options: ip-address, ip-next-hop, tag, metric
 - Set options: tag
- This command does not support a route-map with redist-control of aggregate.

- Only one route map per source (imported) VRF or ISID is allowed.
- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is not supported.
- Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

Examples

```
-> ip import vrf V1 route-map R2
-> ip import vrf V2 all-routes
-> ip import isid 1500 route-map R1
-> ip import isid 2000 all-routes
-> no ip import vrf V1
-> no ip import isid 1500
```

Release History

Release 7.3.1; command introduced.

Release 7.3.2; **isid** and **all-routes** parameters added.

Related Commands

arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

```
arp ip_address mac_address [alias] [arp-name name] [interface interface_name] [port chassis/slot/port] [linkagg agg_id]
```

```
no arp ip_address [alias]
```

Syntax Definitions

<i>ip_address</i>	IP address of the device you are adding to the ARP table.
<i>mac_address</i>	MAC address of the device in hexadecimal format (for example, 00.00.39.59.f1.0c).
alias	Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address. <i>This parameter is not supported on the OmniSwitch 9900.</i> The proxy feature can also be enabled for an IP interface using the ip interface command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.
<i>name</i>	The name to assign to this ARP entry.
<i>interface_name</i>	Name of the interface to be used for ARP resolution.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the *ip_address* parameter instead of a unicast address.
- Using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.

- As most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), it is not required to specify permanent ARP cache entries.
- Only the IP address is required when deleting an ARP entry from the table.

Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
-> arp 171.11.1.1 00:05:02:c0:7f:11 interface int1
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **interface** parameter added.

Related Commands

- ip distributed-arp admin-state** Deletes all dynamic entries from the ARP table.
- ip interface** Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
- show arp** Displays the ARP table.

MIB Objects

```
ipNetToMediaTable
  ipNetToMediaIfIndex
  ipNetToMediaNetAddress
  ipNetToMediaPhyAddress
  ipNetToMediaType
alaIpNetToMediaTable
  alaIpNetToMediaPhyAddress
  alaIpNetToMediaProxy
```

ip distributed-arp admin-state

Enables or disables the distributed ARP feature.

ip distributed-arp admin-state {enable | disable}

Syntax Definitions

enable	Dynamically assigns a Network Interface (NI) as the designated-NI for all the ARP entries on an IP interface.
disable	Disables the distributed ARP feature.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 6900

Usage Guidelines

- Use this feature to dynamically assign a Network Interface (NI) as the designated-NI for all the ARP entries. The NI with maximum number of active ports for that IP subnet is assigned.
- To reset or update the dynamically assigned NI, the feature must be disabled and then enabled.

Examples

```
-> ip distributed-arp admin-state enable
-> ip distributed-arp admin-state disable
```

Release History

Release 7.3.4; command introduced

Related Commands

show ip arp utilization	Displays the designated NIs for the interfaces and the NI utilization.
show ip interface	Displays the configuration and status of IP interfaces.

MIB Objects

alaIpDistributedArp

clear arp-cache

Deletes all dynamic entries from the ARP table.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the [ip service](#) command.
- Dynamic entries remain in the ARP table until they time out. The switch uses the MAC Address table timeout value as the ARP timeout value. Use the [mac-learning aging-time](#) command to set the timeout value.

Examples

```
-> clear arp-cache
```

Release History

Release 7.1.1; command introduced

Related Commands

- | | |
|----------------------------|--|
| ip service | Adds a permanent entry to the ARP table. |
| show arp | Displays the ARP table. |

MIB Objects

alaIpClearArpCache

arp filter

Configures an ARP filter that determines if ARP Request packets containing a specific IP address are processed by the switch or discarded.

arp filter *ip_address* [**mask** *ip_mask*] [*vlan_id*] [**sender** | **target**] [**allow** | **block**]

no arp filter *ip_address*

Syntax Definitions

<i>ip_address</i>	The IP address to use for filtering ARP packet IP addresses.
<i>ip_mask</i>	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (for example, mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
<i>vlan_id</i>	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
sender	The sender IP address in the ARP packet is used for ARP filtering.
target	The target IP address in the ARP packet is used for ARP filtering.
allow	ARP packets that meet filter criteria are processed.
block	ARP packets that meet filter criteria are discarded.

Defaults

parameter	default
<i>vlan_id</i>	0 (no VLAN)
<i>ip_mask</i>	255.255.255.255
sender target	target
allow block	block

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

Release History

Release 7.1.1; command introduced

Related Commands

clear arp filter	Clears all ARP filters from the filter database.
ip interface	Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show ip arp utilization	Displays the ARP filter configuration.

MIB Objects

```
alaIpArpFilterTable
  alaIpArpFilterIpAddr
  alaIpArpFilterIpMask
  alaIpArpFilterVlan
  alaIpArpFilterMode
  alaIpArpFilterType
```

clear arp filter

Clears the ARP filter database of all entries.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command clears all ARP filters configured on the switch. To remove an individual filter entry, use the **no** form of the [arp filter](#) command.

Examples

```
-> clear arp filter
```

Release History

Release 7.1.1; command introduced

Related Commands

MIB Objects

alaIpClearArpFilter

icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp type *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap*

Syntax Definitions

<i>type</i>	The ICMP packet type. This is conjunction with the ICMP code that determines the type of ICMP message being specified.
<i>code</i>	The ICMP code type. This is conjunction with the ICMP type that determines the type of ICMP message being specified.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable disable	disabled
<i>gap</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages, and set the minimum packet gap between messages of the specified type.
- Enabling **Host unreachable** and **Network unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- While this command can be used to enable or disable all ICMP message, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP messages have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	icmp unreachable
Host unreachable (type 3, code 1)	icmp unreachable
Protocol unreachable (type 3, code 2)	icmp unreachable
Port unreachable (type 3, code 3)	icmp unreachable
Echo reply (type 0, code 0)	icmp echo
Echo request (type 8, code 0)	icmp echo
Timestamp request (type 13, code 0)	icmp timestamp
Timestamp reply (type 14, code 0)	icmp timestamp
Address Mask request (type 17, code 0)	icmp addr-mask
Address Mask reply (type 18, code 0)	icmp addr-mask

Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

Release History

Release 7.1.1; command introduced

Related Commands

[icmp messages](#) Enables or disables all ICMP messages.

[show icmp control](#) Allows the viewing of the ICMP control settings.

MIB Objects

alaIcmpCtrlTable
  alaIcmpCtrlType
alaIcmpCtrlTable
  alaIcmpCtrlCode
  alaIcmpCtrlStatus
  alaIcmpCtrlPktGap
```

icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp unreachable [**net-unreachable** | **host-unreachable** | **protocol-unreachable** | **port-unreachable**]
 {{**enable** | **disable**} | **min-pkt-gap** *gap*}

Syntax Definitions

net-unreachable	Sets the unreachable network ICMP message.
host-unreachable	Sets the unreachable host ICMP message.
protocol-unreachable	Sets the unreachable protocol ICMP message.
port-unreachable	Sets the unreachable port ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable disable	enable
<i>gap</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the unreachable ICMP messages.

Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
```

```
-> icmp unreachable port-unreachable min-pkt-gap 50
```

Release History

icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

```
icmp echo [request | reply] {{enable | disable} | min-pkt-gap gap}
```

Syntax Definitions

request	Specifies the echo request ICMP message.
reply	Specifies the echo reply ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable disable	enable
<i>gap</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the echo ICMP messages.

Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp timestamp [**request** | **reply**] **{{enable | disable}** | **min-pkt-gap** *gap*}

Syntax Definitions

request	Specifies timestamp request messages.
reply	Specifies timestamp reply messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable disable	enable
<i>gap</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the timestamp ICMP messages.

Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

Release History

Release 7.1.1; command introduced

Related Commands

icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp add-mask [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

Syntax Definitions

request	Specifies request address mask messages.
reply	Specifies reply address mask messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable disable	enable
<i>gap</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A gateway receiving an address mask request must return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply enables, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the address mask ICMP messages.

Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

ip dos scan close-port-penalty *penalty_value*

Syntax Definitions

penalty_value

A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
<i>penalty_value</i>	10

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

Examples

```
-> ip dos scan close-port-penalty 25
```

Release History

Release 7.1.1; command introduced

Related Commands

[ip dos scan threshold](#)

Sets the threshold for the port scan value, at which a DoS attack is recorded.

[ip dos trap](#)

Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

alaDoSConfig

alaDoSPortScanClosePortPenalty

ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

ip dos scan tcp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
<i>penalty_value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguish between a legal TCP packet and a port scan packet.

Examples

```
-> ip dos scan tcp open-port-penalty 10
```

Release History

Release 7.1.1; command introduced

Related Commands

- [ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.
- [ip dos trap](#) Sets whether the switch generates SNMP DoS traps when an attack is detected.

ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

ip dos scan udp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
<i>penalty_value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguish between a legal UDP packet and a port scan packet.

Examples

```
-> ip dos scan udp open-port-penalty 15
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold Sets the threshold for the port scan value, at which a DoS attack is recorded.

ip dos trap Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

alaDoSConfig
alaDoSPortScanUdpOpenPortPenalty

ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

ip dos scan threshold *threshold_value*

Syntax Definitions

threshold_value

A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

Defaults

parameter	default
<i>threshold_value</i>	1000

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added. The commands for setting the packet penalty value are the [ip dos scan close-port-penalty](#), [ip dos scan tcp open-port-penalty](#), and [ip dos scan udp open-port-penalty](#) commands.

Examples

```
-> ip dos scan threshold 1200
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan close-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.
ip dos scan tcp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.
ip dos scan udp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

alaDoSConfig
 alaDoSPortScanThreshold

ip dos trap

Sets whether or not the switch generates SNMP DoS traps when an attack is detected.

ip dos trap {enable | disable}

Syntax Definitions

enable	Enables the generation of DoS traps.
disable	Disables the generation of DoS traps.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the [ip dos scan threshold](#) command.

Examples

```
-> ip dos trap enable
-> ip dos trap disable
```

Release History

Release 7.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
  alaDoSTrapCnt1
```

ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

ip dos scan decay *decay_value*

Syntax Definitions

decay_value The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

Defaults

parameter	default
<i>decay_value</i>	2

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

Examples

```
-> ip dos scan decay 10
```

Release History

Release 7.1.1; command introduced

Related Commands

[ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.

[show ip dos config](#) Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

alaDoSConfig
 alaDoSPortScanDecay

ip dos type

Enables or disables detection for the specified type of DoS attack.

ip dos type {port-scan | ping-of-death | land | loopback-src | invalid-ip | invalid-multicast | unicast-ip-mcast-mac | ping-overload | arp-flood | arp-poison} **admin-state** {enable | disable}

Syntax Definitions

port-scan	Detects port scans by monitoring TCP or UDP packets sent to open or closed ports.
ping-of-death	Detects the number of ICMP Ping-of-Death attacks (the switch receives ping packets that exceed the largest IP datagram size of 65535 bytes).
land	Detects the number of Land attacks (the switch receives spoofed packets with the SYN flag set on any open port that is listening).
loopback-src	Detects the number of loopback source attacks (the switch receives packets with 127.0.0.0/8 as the IP source address).
invalid-ip	Detects invalid IP packets (the switch receives packets with an invalid source or destination IP address).
invalid-multicast	Detects invalid Multicast packets (the switch receives packets with an invalid multicast address).
unicast-ip-mcast-mac	Detects a unicast IP and multicast MAC mismatch (the switch receives IP packets with multicast/broadcast source mac-address, non-matching destination IP and mac-address).
ping-overload	Detects a ping overload attack (the switch is flooded with a large number of ICMP packets).
arp-flood	Detects ARP flooding (the switch is flooded with a large number of ARP requests).
arp-poison	Detects ARP poisoning (the switch receives replies to an ARP request generated by the switch for a user-specified restricted address).
enable	Enables DoS attack detection.
disable	Disables DoS attack detection.

Defaults

By default, detection is enabled for all the specified IP DoS attack types, except for ping overload.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When detection is enabled for ping overload, the attack is not detected until the number of ICMP packets received exceeds 100 packets-per-second.
- ARP flooding is rate limited to 500 packets-per-second on the switch. As a result, ARP flooding is not detected until the number of ARP requests exceeds 500 packets-per-second.

- When detection is enabled for unicast IP/multicast MAC mismatches (**unicast-ip-mcast-mac**), ping overload attacks (**ping-overload**), or ARP flooding attacks (**arp-flood**), packets are not dropped when the attack is detected.

Examples

```
-> ip dos type ping-overload admin-state enable
-> ip dos type land admin-state disable
```

Release History

Release 7.1.1; command introduced

Related Commands

show ip dos config	Displays the DoS scan configuration for the switch.
show ip dos statistics	Displays statistics for the detected DoS attacks.

MIB Objects

```
alaDoSTable
  alaDoSType
  alaDoSStatus
```

show ip traffic

Displays IP datagram traffic and errors.

show ip traffic

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command includes statistics regarding the spoofed traffic.
- The presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

Examples

```
-> show ip traffic
```

```
IP statistics
Datagrams received
  Total                = 621883,
  IP header error      = 0,
  Destination IP error = 51752,
  Unknown protocol     = 0,
  Local discards       = 0,
  Delivered to users   = 567330,
  Reassemble needed    = 0,
  Reassembled          = 0,
  Reassemble failed    = 0

Datagrams sent
  Fowarded              = 2801,
  Generated              = 578108,
  Local discards        = 0,
  No route discards    = 9,
```

```

Fragmented          =      2801,
Fragment failed     =          0,
Fragments generated =          0

```

output definitions

Total	Total number of input datagrams received including the datagrams received in the error.
IP header error	Number of IP datagrams discarded due to errors in the IP header (for example, bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
Destination IP error	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (for example, Class E).
Unknown protocol	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Local discards	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. This value must be zero.
Delivered to users	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
Reassemble needed	Number of IP fragments received that needed to be reassembled.
Reassembled	Number of IP datagrams received that were successfully reassembled.
Reassemble failed	Number of IP failures detected by the IP reassembly algorithm for all reasons (for example, timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
Fragmented	Number of successfully fragmented IP datagrams.
Fragment failed	Number of packets received and discarded by IP that were not fragmented. This situation can happen if a large packet has the "Don't Fragment" flag set.
Forwarded	Number of IP datagrams forwarded by the switch.
Generated	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as "Forwarded."
Local discards	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This number includes datagrams counted as "Forwarded" if the packets are discarded for these reasons.
No route discards	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as "Forwarded" if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.

output definitions (continued)

Fragments generated	The of IP datagram fragments generated as a result of fragmentation.
Routing entry discards	Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (for example, discarded because of lack of buffer space).

Release History

Release 7.1.1; command introduced

Related Commands

[show icmp statistics](#) Displays ICMP statistics and errors.

MIB Objects

N/A

show ip interface

Displays the configuration and status of IP interfaces.

show ip interface [*if_name* | **emp** | **vlan** *vlan_id*]

Syntax Definitions

<i>if_name</i>	The name associated with the IP interface.
emp	Displays the configuration and status of the Ethernet Management Port interface.
<i>vlan_id</i>	VLAN ID (displays a list of IP interfaces associated with a VLAN).

Defaults

By default, all IP interfaces are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The basic **show ip interface** command displays information about all configured IP interfaces on the switch.
- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Specify an optional interface *name* to display detailed information about an individual interface.
- Use the optional **emp** parameter to display detailed information about the EMP interface.
- In a virtual chassis environment this command does not accurately reflect the status of the EMP IP interface on other chassis when entered on a Slave chassis.

Examples

```
-> show ip interface
```

```
Total 13 interfaces
```

Name	IP Address	Subnet Mask	Status	Forward	Device
EMP	172.22.16.115	255.255.255.0	UP	NO	EMP
GMRULE	40.1.1.1	255.255.255.0	DOWN	NO	vlan 40
Loopback	127.0.0.1	255.0.0.0	UP	NO	Loopback
client	60.1.1.1	255.255.255.0	DOWN	NO	vlan 60
gbps	5.5.5.5	255.255.255.0	DOWN	NO	vlan 7
if222	30.1.5.1	255.0.0.0	UP	YES	vlan 222
ldap_client1	173.22.16.115	255.255.255.0	UP	YES	vlan 173
ldap_server1	174.22.16.115	255.255.255.0	UP	YES	vlan 174
radius_client3	110.1.1.101	255.255.255.0	UP	YES	vlan 30
vlan-2	0.0.0.0	0.0.0.0	DOWN	NO	unbound
gre-1	24.24.24.1	255.255.255.0	UP	YES	GRE tunnel
ipip-1	25.25.25.1	255.255.255.0	UP	YES	IPIP tunnel
vlan-23	23.23.23.1	255.255.255.0	UP	YES	vlan 23

output definitions

Name	Interface name. This is the name configured for the interface (for example, Accounting). EMP refers to the Ethernet Management Port. Loopback refers to a loopback interface configured for testing.
IP Address	IP address of the interface. Configured through the ip interface command.
Subnet Mask	IP subnet mask for the interface IP address. Configured through the ip interface command.
Status	Interface status: <ul style="list-style-type: none"> • UP—Interface is ready to pass packets. • DOWN—Interface is down.
Forward	Indicates whether the interface is actively forwarding packets (YES or NO).
Device	The type of device bound to the interface: <ul style="list-style-type: none"> • unbound—No device is bound to the interface. • vlan—The VLAN ID that is bound to the interface. • EMP—The Ethernet Management Port is bound to the interface. • Loopback—A loopback interface is configured for testing. • GRE tunnel—GRE tunnel is configured for the interface. • IPIP tunnel—IPIP tunnel is configured for the interface. • vlan<MC>—The multi-chassis virtual IP (VIP) VLAN that is bound to the interface. Configured through the ip interface command. The GRE tunnel and IPIP tunnel devices are supported only on the OmniSwitch 10K switches.

```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the ip interface command.
Subnet Mask	IP subnet mask for the interface. Configured through the ip interface command.
Broadcast Address	Broadcast address for the interface.
Device	<p>The type of device bound to the interface:</p> <ul style="list-style-type: none"> • unbound—No device is bound to the interface. • vlan—The VLAN ID that is bound to the interface. • EMP—The Ethernet Management Port is bound to the interface. • Loopback—A loopback interface is configured for testing. • GRE tunnel—GRE tunnel is configured for the interface. • IPIP tunnel—IPIP tunnel is configured for the interface. <p>Configured through the ip interface command. The GRE tunnel and IPIP tunnel devices are supported only on the OmniSwitch 10K switches.</p>
Encapsulation	Displays the IP router encapsulation (eth2 or snap) that the interface uses when routing packets. Configured through the ip interface command.
Forwarding	Indicates whether IP forwarding is active for the interface (enabled or disabled). Configured through the ip interface command.
Administrative State	Administrative state of the IP interface (enabled or disabled), which is independent of the state of the underlying device. Configured through the ip interface command.
Operational State	Indicates whether the interface is active (up or down).
Operation State Reason	<p>Indicates why the operational state of the interface is down:</p> <ul style="list-style-type: none"> • unbound—No device is bound to the interface. • device-down—Device bound to the interface is down. • admin-down—The admin state of the interface is down. • no-such-device—Device does not exist. • no-router-mac—No MAC address available for the interface. • tunnel-src-invalid—The source IP address of the tunnel is invalid. • tunnel-dst-unreachable—The destination IP address of the tunnel is not reachable. <p>The tunnel-src-invalid and tunnel-dst-unreachable Operational State reasons are supported only on the OmniSwitch 10K switches. These two reasons are only applicable for the GRE tunnel and IPIP tunnel device types. Operational State Reason field is only included in the display output when the operational state of the interface is down.</p>
Router MAC	Switch MAC address assigned to the interface. Each interface assigned to the same VLAN shares the same switch MAC address.

output definitions (continued)

Local Proxy ARP	Indicates whether Local Proxy ARP is active for the interface (enabled or disabled). Configured through the ip interface command.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the vlan mtu-ip command.
Primary (config/actual)	Indicates if the interface is the configured and/or actual primary interface for the device (VLAN, EMP, Loopback). If the actual status is set to yes and the config status is set to no , the interface is the default interface for the VLAN. Configured through the ip interface command.
Designated ARP NI	Displays the chassis and slot number of the dynamically assigned NI for receiving ARP entries.
ARP Count	Displays the number of ARP entries in the NI.

The following are examples of the output display on OmniSwitch 10K switches:

```
-> show ip interface ipip-1
Interface Name = ipip-1
  SNMP Interface Index      = 13600001,
  IP Address                = 25.25.25.1,
  Subnet Mask               = 255.255.255.0,
  Device                   = IPIP Tunnel,
  Tunnel Source Address     = 23.23.23.1
  Tunnel Destination Address = 23.23.23.2,
  Forwarding                = enabled,
  Administrative State      = enabled,
  Operational State         = up,
  Maximum Transfer Unit     = 1480,
```

```
-> show ip interface gre-1
Interface Name = gre-1
  SNMP Interface Index      = 13600002,
  IP Address                = 24.24.24.1,
  Subnet Mask               = 255.255.255.0,
  Device                   = GRE Tunnel,
  Tunnel Source Address     = 23.23.23.1
  Tunnel Destination Address = 23.23.23.2,
  Forwarding                = enabled,
  Administrative State      = enabled,
  Operational State         = down,
  Operational State Reason  = unbound,
  Maximum Transfer Unit     = 1476,
```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the ip interface command.
Subnet Mask	IP subnet mask for the interface. Configured through the ip interface command.

output definitions (continued)

Device	The type of device bound to the interface: <ul style="list-style-type: none"> • unbound—No device is bound to the interface. • vlan—The VLAN ID that is bound to the interface. • EMP—The Ethernet Management Port is bound to the interface. • Loopback—A loopback interface is configured for testing. • GRE tunnel—GRE tunnel is configured for the interface. • IPIP tunnel—IPIP tunnel is configured for the interface. Configured through the ip interface command.
Tunnel Source Address	The source IP address for the tunnel.
Tunnel Destination Address	The destination IP address for the tunnel.
Forwarding	Indicates whether IP forwarding is active for the interface (enabled or disabled). Configured through the ip interface command.
Administrative State	Administrative state of the IP interface (enabled or disabled), which is independent of the state of the underlying device. Configured through the ip interface command.
Operational State	Indicates whether the interface is active (up or down).
Operational State Reason	Indicates why the operational state of the interface is down: <ul style="list-style-type: none"> • interface-up—The admin state of the interface is up. • unbound—No device is bound to the interface. • device-down—Device bound to the interface is down. • admin-down—The administrative state of the interface is down. • no-such-device—Device does not exist. • no-router-mac—No MAC address available for the interface. • tunnel-src-invalid—The source IP address of the tunnel is invalid. • tunnel-dst-unreachable—The destination IP address of the tunnel is not reachable. Operational State Reason field is only included in the display output when the operational state of the interface is down .
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the ip interface command.

Release History

Release 7.1.1; command introduced

Release 7.3.4; output modified to display **Designated NI** and **ARP Count**.

Related Commands

ip interface	Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.
ip interface tunnel	Configures the end points for the GRE and IPIP tunnels.
show icmp statistics	Displays ICMP statistics and errors.
show ip arp utilization	Displays the designated NIs for the interfaces and the NI utilization.

show ip routes

Displays the IP Forwarding table.

[*vrf vrf_name*] **show ip routes** [*summary*]

Syntax Definitions

vrf_name The alphanumeric name (1–20 characters) assigned to the VRF instance.

summary Displays a summary of routing protocols that appear in the IP Forwarding table.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (for example, RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.
- The imported routes are also displayed under the protocol field as **IMPORT** in the show output.

Examples

```
-> show ip routes
```

```
+ = Equal cost multipath routes
Total 4 routes
```

Dest Address	Gateway Addr	Age	Protocol
0.0.0.0/0	10.255.11.254	01:50:33	STATIC
10.255.11.0/24	10.255.11.225	01:50:33	LOCAL
127.0.0.1/32	127.0.0.1	01:51:47	LOCAL
212.109.138.0/24	212.109.138.138	00:33:07	LOCAL
12.0.0.0/8	12.0.0.1	00:20:00	IMPORT

```
-> show ip route summary
```

Protocol	Route Count
Local	3
Static	1
RIP	0
ISIS	0
OSPF	0

BGP	0
Import	1
Other	0
TOTAL =	5

output definitions

Dest Addr	Destination IP address/mask length.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). LOCAL indicates a local interface.
Route Count	The number of routes that appear in the IP Forwarding table for each protocol type listed.

Release History

Release 7.1.1; command introduced
 Release 7.3.1; **vrf** parameter added.

Related Commands

ping	Used to test whether an IP destination can be reached from the local switch.
traceroute	Used to find the path taken by an IP packet from the local switch to a specified destination.
show ip routes	Displays a list of all routes (static and dynamic) that exist in the IP router database.

show ip route-pref

Displays the IPv4 routing preferences of a router.

`[vrf vrf_name] show ip route-pref`

Syntax Definitions

vrf_name The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The imported routes are also displayed under the protocol field as `IMPORT` in the show output.

Examples

```
-> show ip route-pref
  Protocol      Route Preference Value
-----+-----
  Local                1
  Static              2
  OSPF               110
  ISISL1             115
  ISISL2             118
  RIP                120
  EBGP               190
  IBGP               200
  Import             210
```

Release History

Release 7.1.1; command introduced

Release 7.3.1; `vrf` parameter added.

Related Commands

[ip route-pref](#) Configures the route preference of a router.

MIB Objects

```
alaIprmRtPrefTable
  alaIprmRtPrefEntryType
  alaIprmRtPrefEntryValue
```

show ip redistrib

Displays the IPv4 route map redistribution configuration.

[vrf vrf_name] show ipv6 redistrib [rip | ospf | isis | bgp]

Syntax Definitions

<i>vrf_name</i>	The alphanumeric name (1–20 characters) assigned to the VRF instance.
rip	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
ospf	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
isis	Displays route map redistribution configurations that specify ISIS as the destination (into) protocol.
bgp	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

Defaults

By default, all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

Release History

Release 7.1.1; command introduced

Release 7.3.1; **vrf** parameter added.

Examples

```
-> show ip redistrib
```

Source Protocol	Destination Protocol	Status	Route Map
RIP	OSPF	Enabled	ipv4rm
BGP	RIP	Enabled	ipv4rm
IMPORT	RIP	Enabled	ipv4rm

```
-> show ip redistrib rip
```

Source Protocol	Destination Protocol	Status	Route Map
BGP	RIP	Enabled	ipv4rm
IMPORT	RIP	Enabled	ipv4rm

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (Enabled or Disabled) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ip redistrib Controls the conditions for redistributing different IPv6 routes between protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

show ip access-list

Displays the details of the access list.

show ip access-list [*access_list_name*]

Syntax Definitions

access_list_name Name of the access list.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If the *access_list_name* is not specified in this command, all the access lists are displayed.

Examples

-> show ip access-list

Name	Address / Prefix Length	Effect	Redistribution Control
al_3	10.0.0.0/8	permit	all-subnets
al_3	11.0.0.0/8	permit	all-subnets
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

-> show ip access-list al_4

Name	Address / Prefix Length	Effect	Redistribution Control
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

output definitions

Name	Name of the access list.
Address/Prefix Length	IP address that belongs to the access list.
Effect	Indicates whether the IP address is permitted or denied.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 7.1.1; command was introduced

Related Commands

[ip access-list](#)

Creates an access list for adding multiple IPv4 addresses to route maps.

[ip access-list address](#)

Adds multiple IPv4 addresses to the access list.

MIB objects

```
alaRouteMapAccessListIndex  
alaRouteMapAccessListAddressType  
alaRouteMapAccessListAddress

alaRouteMapAccessListAction  
alaRouteMapAccessListRedistControl
```

show ip route-map

Displays the IP route maps configured on the switch.

```
show ip route-map [route_map_name]
```

Syntax Definitions

route_map_name The name of the specific route map.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

If the *route_map_name* is not specified in this command, all the route maps are displayed.

Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redistrib-control all-subnets permit
  set metric 100 effect replace
```

Release History

Release 7.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match ip address	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
ip route-map match ipv6 address	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name.
ip route-map match ip-next-hop	Matches the routes that have a next-hop router address permitted by the specified access list.
ip route-map match ipv6-next-hop	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list.
ip route-map match tag	Permits or denies a route based on the specified next-hop IP address.
ip route-map match tag	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match metric	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match route-type	Matches the specified route type with the one that the routing protocol learned the route on.

  alaRouteMapRedistRouteMapIndex
alaRouteMapTable
  alaRouteMapIndex
  alaRouteMapSequence
  alaRouteMapType
  alaRouteMapValue
  alaRouteMapRowStatus
```

show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed and where duplicate routes are compared to determine the best route for the Forwarding Routing Database. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

```
[vrf vrf_name] show ip router database [protocol type / gateway ip_address / dest {ip_address/  
prefixlen | ip_address}]
```

Syntax Definitions

<i>vrf_name</i>	The alphanumeric name (1–20 characters) assigned to the VRF instance.
<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<i>ip_address</i>	Destination IP address.
<i>ip_address/prefixlen</i>	The destination IP address along with the prefix length of the routes processed for redistribution.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSPF, RIP, then BGP routes. As a result, a route that is known to the switch does not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.
- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip router database
```

```
Legend: + indicates routes in-use
```

```
  b indicates BFD-enabled static route
```

```
  r indicates recursive static route, with following address in brackets
```

```
  i indicates static interface route
```

Destination	Gateway	Interface	Protocol	Metric	Tag	Misc-Info
+ 20.0.0.0/8	20.0.0.1	ip20	LOCAL	1	0	
+b 22.0.0.0/8	20.0.0.22	ip20	STATIC	4	0	
22.0.0.0/8	20.0.0.9	ip20	RIP	22	0	(backup)
+r 33.0.0.0/8	20.0.0.9	ip20	STATIC	33	0	[22.0.0.33]
+i 44.0.0.0/8	20.0.0.1	ip20	STATIC	5	0	
+ 127.0.0.1/32	127.0.0.1	Loopback	LOCAL	1	0	
+ 172.28.4.0/32	172.28.4.1	EMP	LOCAL	1	0	

Inactive Static Routes

Destination	Gateway	Metric	Tag	Misc-Info
1.0.0.0/8	8.4.5.3	1	0	

```
-> show ip router database dest 10.212.62.0/24 protocol ospf
```

Destination	Gateway	Interface	Protocol	Metric	Tag	Misc-Info
10.212.62.0/24	10.212.60.27	I1	OSPF	2	0	
10.212.62.0/24	10.212.61.27	I2	OSPF	2	0	

Inactive Static Routes

Destination	Gateway	Metric	Tag	Misc-Info
1.0.0.0/8	8.4.5.3	1	0	
Destination	Gateway	Metric		

output definitions

Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, /24 indicates the destination IP address has a 24-bit mask (255.255.255.0).
Gateway	IP address of the gateway from which this route was learned.
Interface	The interface associated with the gateway.
Protocol	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

output definitions

Tag	The tag associated with the route.
Misc-Info	Any additional information about the route.

Release History

Release 7.1.1; command introduced
Release 7.3.1; **vrf** parameter added.

Related Commands

[show ip routes](#) Displays the IP Forwarding table.

MIB Objects

show ip emp-routes

Displays the IP routes associated with the Ethernet Management Port (EMP).

show ip emp-routes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.
- There is no dedicated routing table for the EMP interface. All management interfaces use the same routing table with EMP and non-EMP routes.

Examples

```
-> show ip emp-routes
```

Dest Address	Subnet Mask	Gateway Addr	Age	Protocol
127.0.0.1	255.255.255.255	127.0.0.1	2d 4h	LOCAL
172.17.1.10	255.255.255.255	10.255.11.225	1d 5h	LOCAL

output definitions

Dest Addr	Destination IP address.
Subnet Mask	Destination IP address IP subnet mask.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

Release History

Release 7.1.1; command introduced

Related Commands**ping**

Tests whether an IP destination can be reached from the local switch.

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

show ip service

Displays the status of TCP/UDP service ports.

show ip service

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The display output from this command also includes the service port number.

Examples

```
-> show ip service
```

Name	Port	Status
ftp	21	enabled
ssh	22	disabled
telnet	23	disabled
udp-relay	67	disabled
http	80	disabled
network-time	123	disabled
snmp	161	disabled
avlan-telnet	259	disabled
avlan-http	260	disabled
avlan-secure-http	261	disabled
secure_http	443	enabled
proprietary	1024	disabled
proprietary	1025	disabled

output definitions

Name	Name of the TCP/UDP service.
Port	The TCP/UDP well-known port number associated with the service.
Status	The status of the well-known service port: enabled (port is closed) or disabled (port is open).

Release History

Release 7.1.1; command introduced

Related Commands

```

show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

show ip dos arp-poison

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip dos arp-poison
  IP Address                Attacks
-----+-----
192.168.1.1                 0
192.168.1.2                 0
192.168.1.3                 0
```

output definitions

IP Address	The configured ARP Poison restricted-addresses.
Attacks detected	The number of ARP Poison attacks detected for each address.

Release History

Release 7.1.1; command introduced

Related Commands

[ip dos arp-poison restricted-address](#) Adds or deletes an ARP Poison restricted address.

MIB Objects

```
alaDoSArpPoisonTable
  alaDoSArpPoisonIpAddr
  alaDoSArpPoisonDetected
```

show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

show arp [*ip_address* | *mac_address*]

Syntax Definitions

ip_address IP address of the entry you want to view.
mac_address MAC address of the entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

Examples

```
-> show arp
Total 8 arp entries
Flags (P=Proxy, A=Authentication, V=VRRP, R=Remote, B=BFD, H=HAVLAN, I=Interface)
```

IP Addr	Hardware Addr	Type	Flags	Port	Interface
10.255.11.59	00:50:04:b2:c9:ee	DYNAMIC		3/20	vlan 1
10.255.11.48	00:50:04:b2:ca:11	DYNAMIC		3/20	vlan 1
10.255.11.201	00:10:83:03:e7:e4	DYNAMIC		3/20	vlan 1
10.255.11.14	00:10:5a:04:19:a7	DYNAMIC		3/20	vlan 1
10.255.11.64	00:b0:d0:62:fa:f1	DYNAMIC		3/20	vlan 1
10.255.11.25	00:b0:d0:42:80:24	DYNAMIC		3/20	vlan 1
10.255.11.26	00:b0:d0:42:82:59	DYNAMIC		3/20	vlan 1
20.0.0.22	e4:c2:33:00:21:12	STATIC	I	1/20	ip20
10.255.11.254	00:20:da:db:00:47	DYNAMIC		3/20	vlan 1

output definitions

IP Address	Device IP address.
Hardware Addr	MAC address of the device that corresponds to the IP address.
Type	Indicates whether the ARP cache entries are dynamic or static.

output definitions (continued)

Flags	Indicates the type of entry: <ul style="list-style-type: none"> • P = Proxy • A = Authentication (AVLAN) • V = VRRP • R = Remote • B = BFD • H = HAVLAN • I = Interface
Port	The port on the switch attached to the device identified by the IP address.
Interface	The interface to which the entry belongs (for example, VLAN, EMP).

Release History

Release 7.1.1; command introduced

Related Commands

- ip service** Adds a permanent entry to the ARP table.
- ip distributed-arp admin-state** Deletes all dynamic entries from the ARP table.

MIB Objects

```

show ip arp utilization

Displays the designated NIs for the interfaces and the NI utilization.

show ip arp utilization [*slot chassis/slot* / **interfaces**]

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number of the interface. The output is displayed specific to the slot.
<i>interfaces</i>	Displays the ARP utilization of the designated-NI on all the configured interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the basic command (**show ip arp utilization**) to view all of the entries in the table. Enter a specific chassis and slot number to view a specific entry.

Examples

```
-> show ip arp utilization
```

```
Distributed ARPs: Enabled
```

NI	Max	ARP Count	HW Usage	%
1/1	16384	8	11	0%
2/1	16384	12	15	0%

```
-> show ip arp utilization interfaces
```

```
Distributed ARPs: Enabled
```

NI	Max	ARP Count	HW ARPS	%	VRF	Interface
1/1	16384	1	0	0%	0	15
1/1	16384	5	4	0%	0	16
1/1	16384	5	0	0%	0	17
1/1	16384	5	4	0%	0	18
1/1	16384	5	0	0%	0	19
1/1	16384	5	0	0%	0	20
2/1	16384	1	0	0%	0	15
2/1	16384	5	0	0%	0	16
2/1	16384	5	4	0%	0	17
2/1	16384	5	0	0%	0	18
2/1	16384	5	4	0%	0	19
2/1	16384	5	4	0%	0	20

```
-> show ip arp utilization slot 2/1
Distributed ARPs: Enabled
```

NI	Max	ARP Count	HW ARPS	%	VRF	Interface
2/1	16384	1	0	0%	0	15
2/1	16384	5	0	0%	0	16
2/1	16384	5	4	0%	0	17
2/1	16384	5	0	0%	0	18
2/1	16384	5	4	0%	0	19
2/1	16384	5	4	0%	0	20

output definitions

NI	The chassis and slot number of the designated-NI.
Max	The maximum number of ARP entries supported on the NI.
ARP count	ARP count in the NI for the NI or interface.
HW Usage	The amount of table space used up in the ASIC.
HW ARPS	The number of ARPs in the ASIC.
%	The percentage of ARP utilization on that designated-NI.
VRF	The name of the VRF associated to the interface.
Interface	The interface to which the entry belongs.

Release History

Release 7.3.4; command introduced

Related Commands

[ip distributed-arp admin-state](#) Enables or disables the distributed ARP feature.

MIB Objects

```

show arp filter

Displays a list of ARP filters configured for the switch.

show arp filter [*ip_address*]

Syntax Definitions

ip_address IP address of the filter entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

Examples

```
-> show arp filter
  IP Addr      IP Mask          Vlan  Type      Mode
-----+-----+-----+-----+-----
171.11.1.1    255.255.255.255    0    target    block
172.0.0.0     255.0.0.0          0    target    block
198.0.0.0     255.0.0.0          0    sender    block
198.172.16.1  255.255.255.255   200   target    allow
```

```
-> show arp filter 198.172.16.1
  IP Addr      IP Mask          Vlan  Type      Mode
-----+-----+-----+-----+-----
198.0.0.0     255.0.0.0          0    sender    block
198.172.16.1  255.255.255.255   200   target    allow
```

output definitions

IP Addr	The ARP packet IP address to which the filter is applied.
IP Mask	The IP mask that specifies which part of the IP address to which the filter is applied.
Vlan	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
Type	Indicates which IP address in the ARP packet (sender or target) is used to identify if a filter exists for that address.
Mode	Indicates whether to block or allow a switch response to an ARP packet that matches the filter.

Release History

Release 7.1.1; command introduced

Related Commands

[arp filter](#)

Adds a permanent entry to the ARP table.

[clear arp filter](#)

Deletes all dynamic entries from the ARP table.

show icmp control

Allows the viewing of the ICMP control settings.

show icmp control

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

Examples

```
-> show icmp control
```

Name	Type	Code	Status	min-pkt-gap(us)
echo reply	0	0	enabled	0
network unreachable	3	0	enabled	0
host unreachable	3	1	enabled	0
protocal unreachable	3	2	enabled	0
port unreachable	3	3	enabled	0
frag needed but DF bit set	3	4	enabled	0
source route failed	3	5	enabled	0
destination network unknown	3	6	enabled	0
destination host unknown	3	7	enabled	0
source host isolated	3	8	enabled	0
dest network admin prohibited	3	9	enabled	0
host admin prohibited by filter	3	10	enabled	0
network unreachable for TOS	3	11	enabled	0
host unreachable for TOS	3	12	enabled	0
source quench	4	0	enabled	0
redirect for network	5	0	enabled	0
redirect for host	5	1	enabled	0
redirect for TOS and network	5	2	enabled	0
redirect for TOS and host	5	3	enabled	0
echo request	8	0	enabled	0
router advertisement	9	0	enabled	0
router solicitation	10	0	enabled	0
time exceeded during transmit	11	0	enabled	0
time exceeded during reassembly	11	1	enabled	0
ip header bad	12	0	enabled	0
required option missing	12	1	enabled	0
timestamp request	13	0	enabled	0

timestamp reply	14	0	enabled	0
information request(obsolete)	15	0	enabled	0
information reply(obsolete)	16	0	enabled	0
address mask request	17	0	enabled	0
address mask reply	18	0	enabled	0

output definitions

Name	The name of the ICMP message.
Type	The ICMP message type. This along with the ICMP code specifies the ICMP message.
Code	The ICMP message code. This along with the ICMP type specifies the ICMP message.
Status	Whether this message is Enabled or Disabled .
min-pkt-gap	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

Release History

Release 7.1.1; command introduced

Related Commands

icmp type	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
icmp unreachable	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
icmp echo	Enables or disables ICMP echo messages, and sets the minimum packet gap.
icmp timestamp	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
icmp addr-mask	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
icmp messages	Enables or disables all ICMP messages.

MIB Objects

N/A

output definitions (continued)

Destination unreachable	Number of “destination unreachable” messages that were sent/received by the switch.
Time exceeded	Number of “time exceeded” messages that were sent/received by the switch. These messages occur when a packet is dropped because the TTL counter reaches zero. When a large number of these messages occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
Parameter problem	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending IP software of the host or gateway.
Source quench	Number of messages sent/received that tell a host that it is sending too many packets. A host must attempt to reduce its transmissions upon receiving these messages.
Redirect	Number of ICMP redirect messages sent/received by the switch.
Echo request	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
Echo reply	Number of echo reply messages received by the switch.
Time stamp request	Number of time stamp request messages sent/received by the switch.
Time stamp reply	Number of time stamp reply messages sent/received by the switch.
Address mask request	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
Address mask reply	Number of address mask reply messages that were sent/received by the switch.

Related Commands

[show udp statistics](#) Displays UDP errors and statistics.

MIB Objects

N/A

show tcp statistics

Displays TCP statistics.

show tcp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show tcp statistics
Total segments received = 235080,
Error segments received = 0,
Total segments sent = 363218,
Segments retransmitted = 38,
Reset segments sent = 97,
Connections initiated = 57185,
Connections accepted = 412,
Connections established = 1,
Attempt fails = 24393,
Established resets = 221
```

output definitions

Total segments received	Total number of segments received, including the segments received in the error. This count includes segments received on currently established connections.
Error segments received	Total number of segments received in error (for example, bad TCP checksums).
Total segments sent	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Segments retransmitted	Number of TCP segments transmitted containing one or more previously transmitted octets.
Reset segments sent	Number of TCP segments containing the reset flag.
Connections initiated	Number of connections attempted.
Connections accepted	Number of connections allowed.
Connections established	Number of successful connections.

output definitions (continued)

Attempt fails	Number of times attempted TCP connections have failed.
Established resets	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the "Closed" state.

Release History

10.255.11.223	2522	10.255.11.25	389	TIME-WAIT
10.255.11.223	2525	10.255.11.33	389	TIME-WAIT
10.255.11.223	2526	10.255.11.25	389	TIME-WAIT
10.255.11.223	2529	10.255.11.33	389	TIME-WAIT
10.255.11.223	2530	10.255.11.25	389	TIME-WAIT

output definitions

Local Address	Local IP address for this TCP connection. If a connection is in the LISTEN state it accepts connections for any IP interface associated with the node. The IP address 0.0.0.0 is used.
Local Port	Local port number for this TCP connection. The range is 0–65535.

output definitions (continued)

Remote Address	Remote IP address for this TCP connection.
Remote Port	Remote port number for this TCP connection. The range is 0–65535.
State	<p>State of the TCP connection, as defined in RFC 793. A connection progresses through a series of states during its lifetime:</p> <ul style="list-style-type: none">• Listen—Waiting for a connection request from any remote TCP and port.• Syn Sent—Waiting for a matching connection request after having sent a connection request.• Syn Received—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.• Established—Open connection. Data received can be delivered to the user. This is the normal state for the data transfer phase of the connection.• Fin Wait 1—Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent.• Fin Wait 2—Waiting for a connection termination request from the remote TCP.• Close Wait—Waiting for a connection termination request from the local user.• Closing—Waiting for a connection termination request acknowledgment from the remote TCP.• Last Ack—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request).• Time Wait—Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.• Closed—No connection state.

Release History

Release 7.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show tcp statistics	Displays TCP statistics.

MIB Objects

N/A

show udp statistics

Displays UDP errors and statistics.

show udp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

Examples

```
-> show udp statistics
Total datagrams received = 214937,
Error datagrams received = 0,
No port datagrams received = 32891,
Total datagrams sent = 211884
```

output definitions

Total datagrams received	Total number of UDP datagrams delivered to UDP applications.
Error datagrams received	Number of UDP datagrams that could not be delivered for any reason.
No port datagrams received	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
Total datagrams sent	Total number of UDP datagrams sent from this switch.

Release History

Release 7.1.1; command introduced

Related Commands

[show udp ports](#) Displays the UDP Listener table.

MIB Objects

N/A

show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

show udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

Examples

```
-> show udp port
```

Local Address	Local Port
0.0.0.0	67
0.0.0.0	161
0.0.0.0	520

output definitions

Local Address	Local IP address for this UDP connection.
Local Port	Local port number for this UDP connection.

Release History

Release 7.1.1; command introduced

Related Commands

[show udp statistics](#) Displays UDP errors and statistics.

MIB Objects

N/A

show ip dos config

Displays the DoS scan configuration for the switch.

show ip dos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

Examples

```
-> show ip dos config
```

Dos type	Status
port scan	ENABLED
ping of death	ENABLED
loopback-src	ENABLED
invalid-ip	ENABLED
invalid-multicast	ENABLED
unicast dest-ip/multicast-mac	ENABLED
ping overload	DISABLED
arp flood	ENABLED
arp poison	ENABLED
DoS trap generation	= ENABLED,
DoS port scan threshold	= 1000,
DoS port scan decay	= 2,
DoS port scan close port penalty	= 10,
DoS port scan TCP open port penalty	= 0,
DoS port scan UDP open port penalty	= 0,
Dos MAXimum Ping Rate	= 100
Dos Maximum ARP Request Rate	= 500

output definitions

DoS Type	The type of DoS attack.
Status	Whether or not detection for this type of DoS attack is enabled. Configured through the ip dos type command.
DoS trap generation	Displays the status of DoS trap generation. It is either ENABLED or DISABLED . This is set using the ip dos trap command.
DoS port scan threshold	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the ip dos scan threshold command.
DoS port scan decay	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the ip dos scan decay command.
DoS port scan close port penalty	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the ip dos scan close-port-penalty command.
DoS port scan TCP open port penalty	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the ip dos scan tcp open-port-penalty command.
DoS port scan UDP open port penalty	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the ip dos scan udp open-port-penalty command.

Release History

Release 7.1.1; command introduced

  alaDoSARPRate
  alaDoSPingRate

```

show ip dos statistics

Displays the statistics for detected DoS attacks on the switch.

```
show ip dos statistics
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- If an attack is detected and reported, it does not necessarily mean that an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.
- Statistics for the “unicast dest-ip/multicast-mac” DoS type are not reported for the multicast MAC address attack. In this case, the packet is dropped at a lower level so IP never sees the attack. IP only collects and reports statistics for IP attacks.

Examples

```
-> show ip dos statistics
```

DoS type	Attacks detected
port scan	0
ping of death	0
land	0
loopback-src	0
invalid-ip	0
invalid-multicast	0
unicast dest-ip/multicast-mac	52
ping overload	0
arp flood	0
arp poison	0

output definitions

DoS type	The type of DoS attack.
Attacks detected	The number of attacks detected for each DoS type.

Release History

Release 7.1.1; command introduced

Related Commands

[ip dos type](#)

Enables or disables detection for a specific type of DoS attack.

[show ip dos config](#)

Displays the DoS scan configuration for the switch.

MIB Objects

alaDoSTable

 alaDoSType

 alaDoSDetected

show vrf

Displays the Multiple VRF instance configuration for the switch.

show vrf [*vrf_name* / **default**]

Syntax Definitions

vrf_name The name of an existing VRF instance.
default Selects the default VRF instance.

Defaults

By default, a list of all VRF instances is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the *vrf_name* parameter to display route-map resource information for a specific VRF instance.
- Use the **default** parameter to display route-map resource information for the default VRF instance.
- The type of profile (low or max) assigned to a VRF determines the routing capabilities and the amount of route-map resources available for that specific VRF instance.

Examples

```
-> show vrf
  Virtual Routers      Profile Protocols
-----+-----+-----
default              default BGP PIM VRRP
customer1            max      RIP OSPF
customer2            max      RIP OSPF
customer3            low
```

Total Number of Virtual Routers: 4

output definitions

Virtual Routers	The name of the VRF instance.
Profile	The type of profile applied to this instance (low or max).
Protocols	The protocols loaded within the context of this instance.

```
-> show vrf customer1
Legend:          in use/max
route-maps      :    3/30,
sequences       :    5/60,
tlvs            :    8/100,
access-lists   :    0/20,
address blocks  :    0/40,
match interfaces :    3/100
```

```
-> show vrf customer3
Legend:          in use/max
route-maps      :    0/10,
sequences       :    0/20,
tlvs            :    0/20,
access-lists   :    0/10,
address blocks  :    0/10,
match interfaces :    0/10
```

```
-> show vrf default
Legend:          in use/max
route-maps      :    0/200,
sequences       :    0/400,
tlvs            :    0/1000,
access-lists   :    0/200,
address blocks  :    0/500,
match interfaces :    0/2000
```

output definitions

route-maps	The number of route maps used and the maximum allowed.
sequences	The number of route map sequences used and the maximum allowed.
tlvs	The number of TLV blocks used and the maximum allowed. The TLV blocks contain the route-map match and set clauses.
access-lists	The number of route-map access lists used and the maximum allowed.
address blocks	The number of address blocks used and the maximum allowed. The address blocks hold access list addresses.
match interfaces	The number of route-map interfaces used in match clauses and the maximum allowed.

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **Profile** field added, option to display route-map resources for a specific VRF instance.

show vrf-profiles

Displays the current VRF profile usage and the maximum route-map resources allowed for each profile type (default, low, and max).

show vrf-profiles

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command also provides an estimate of the number of low profile VRFs that can be created.

Examples

```
-> show vrf-profiles
EST: Estimated number of low profile VRFs that can be created
RM: Maximum route-maps
SEQ: Maximum sequences
TLV: Maximum TLVs (used to hold match and set clauses)
AL: Maximum access-lists
AB: Maximum address blocks (used to hold addresses)
ITF: Maximum route-map interfaces used in match clauses
```

Profile	Inuse	EST	RM	SEQ	TLV	AL	AB	ITF
default	1	-	200	400	1000	200	500	2000
low	2	329	10	20	20	10	10	10
max	3	-	30	60	100	20	40	100

20 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch. IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

Expanded Routing and Addressing Capabilities - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

Header Format Simplification - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

Anycast Addressing - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

Improved Support for Options - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

Authentication and Privacy Capabilities - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

Filename: Ipv6.mib
Module: Ipv6-MIB

Filename: AlcatelIND1Ipv6.mib
Module: alcatelIND1IPv6MIB

Filename: AlcatelIND1Iprmv6.mib
Module: alcatelIND1Iprmv6MIB

A summary of the IPv6 commands is listed here:

IPv6	ipv6 interface ipv6 address ipv6 address global-id ipv6 address local-unicast ipv6 dad-check ipv6 hop-limit ipv6 pmtu-lifetime ipv6 neighbor stale-lifetime ipv6 neighbor ipv6 prefix ipv6 static-route ipv6 route-pref ipv6 virtual-source-mac ping6 traceroute6 show ipv6 icmp statistics show ipv6 interface show ipv6 pmtu table show ipv6 neighbors clear ipv6 neighbors show ipv6 prefixes show ipv6 routes show ipv6 route-pref show ipv6 router database show ipv6 tcp listeners show ipv6 tcp connections show ipv6 tunnel configured show ipv6 tunnel 6to4 show ipv6 information
IPv6 Route Map Redistribution	ipv6 redistrib ipv6 access-list ipv6 access-list address show ipv6 redistrib show ipv6 access-list

ipv6 interface

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

```

ipv6 interface if_name [vlan vlan_id | tunnel {tunnel_id | 6to4}] admin-state [enable | disable]
  [base-reachable-time time]
  [ra-send {yes | no}]
  [ra-max-interval interval]
  [ra-managed-config-flag {true | false}]
  [ra-other-config-flag {true | false}]
  [ra-reachable-time time]
  [ra-retrans-timer time]
  [ra-default-lifetime time / no ra-default-lifetime]
  [ra-min-interval interval | no ra-min-interval]
  [ra-clock-skew time]
  [ra-send-mtu] {yes | no}
  [mtu size]
  [retrans-timer time]
  [dad-transmits count]
  [ra-hop-limit count]

no ipv6 interface if_name

```

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<i>vlan_id</i>	VLAN ID number to identify a VLAN interface.
<i>tunnel_id</i>	Tunnel ID number to identify a configured tunnel interface.
6to4	Identifies the 6to4 tunnel interface.
enable	Administratively enable the interface.
disable	Administratively disable the interface.
base-reachable-time <i>time</i>	Base value used to compute the reachable time for neighbors reached through this interface.
ra-send	Specifies whether the router advertisements are sent on this interface.
ra-max-interval <i>interval</i>	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4 - 1,800.
ra-managed-config-flag { true false }	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
ra-other-config-flag { true false }	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
ra-reachable-time <i>time</i>	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0 - 3,600,000. The special value of zero indicates that this time is unspecified by the router.

ra-retrans-timer <i>time</i>	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.
ra-default-lifetime <i>time</i>	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of ra-max-interval and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The no ra-default-lifetime option will calculate the value using the formula ($3 * \text{ra-max-interval}$).
ra-min-interval <i>interval</i>	Value, in seconds, allowed between the transmission of unsolicited multicast router advertisements on this interface. The interval must be a minimum of 3 and not more than .75 times the value of ra-max-interval . The no ra-min-interval option will calculate the value using the formula ($.33 * \text{ra-max-interval}$).
ra-clock-skew <i>time</i>	Value, in seconds. The router advertisement clock skew allows the link propagation delays and poorly synchronized clocks on routers participating in router discover over this interface. The timer differences that fall within the clock skew value are treated as valid times.
ra-send-mtu { yes no }	Specifies whether the MTU option is included in the router advertisements sent on the interface.
mtu <i>size</i>	The maximum transmission unit for a tunnel interface. Use the vlan command's mtu-ip to set for a VLAN.
retrans-timer <i>time</i>	The amount of time, in milliseconds, between retransmission of a neighbor solicitation during neighbor discovery.
dad-transmits <i>count</i>	The number of neighbor solicitations to send during Duplicate Address Detection.
ra-hop-limit <i>count</i>	The value placed in the current hop limit field of router advertisements sent on this interface.

Defaults

parameter	default
base-reachable-time	360
ra-send	yes
ra-max-interval	600
ra-managed-config-flag	false
ra-other-config-flag	false
ra-reachable-time	0
ra-retrans-timer	0
ra-default-lifetime	calculated
ra-min-interval	calculated
ra-clock-skew	600
ra-send-mtu	no
retrans-timer	1000
dad-transmits	1
ra-hop-limit	64

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN and tunnel interfaces must have a name.
- When creating an IPv6 interface you must specify a VLAN ID or Tunnel ID. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- A default **6to4** tunnel named “tunnel_6to4” is automatically created. It can only be enabled/disabled or its configuration modified, it cannot be deleted.
- A 6to4 interface cannot send advertisements (**ra-send**).
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See [Chapter 5, “VLAN Management Commands,”](#) for information on creating VLANs.
- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the [ipv6 interface](#) command.

Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 interface	Displays IPv6 Interface Table.

```

ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

```
ipv6 interface if_name tunnel {source ipv4_source destination ipv4_destination}
```

Syntax Definitions

<i>if_name</i>	Name assigned to the tunnel interface.
<i>ipv4_source</i>	Source IPv4 address for the configured tunnel.
<i>ipv4_destination</i>	Destination IPv4 address for the configured tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the [ipv6 interface](#) command to create an IPv6 tunnel interface.
- A configured tunnel interface cannot be enabled until both its IPv4 source and destination addresses have been specified.

Examples

```
-> ipv6 interface Test tunnel 2 source 192.0.2.1 destination 198.51.100.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 tunnel configured	Displays IPv6 tunnel information.

MIB Objects

  alaIPv6ConfigTunnelv4Source  
  alaIPv6ConfigTunnelv4Dest  
  alaIPv6ConfigTunnelRowStatus
```

ipv6 address

Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel. There are different formats for this command depending on the address type.

```
ipv6 address ipv6_address /prefix_length [anycast] {if_name | loopback}
```

```
no ipv6 address ipv6_address [anycast] {if_name | loopback}
```

```
ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

```
no ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

Syntax Definitions

<i>ipv6_address</i>	IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (3..128).
anycast	Indicates the address is an anycast address.
eui-64	Append an EUI-64 identifier to the prefix.
<i>if_name</i>	Name assigned to the interface.
loopback	Configures the loopback interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.

Examples

```
-> ipv6 address 2001:DB8:4132:86::19A/64 Test_Lab  
-> ipv6 address 2002:C633:6489::35/64 Test_6to4
```

Release History

Release 7.1.1; command was introduced.

ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

```
ipv6 address global-id {generate | globalID}
```

Syntax Definitions

generate	Automatically generates the global ID.
<i>globalID</i>	A 5-byte global ID value specified in the form hh:hhh:hhh

Defaults

By default, the IPv6 global ID is set to all zeros.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added through the [ipv6 address local-unicast](#) command or when the [ipv6 address global-id](#) command is executed.

Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 address local-unicast	Creates a IPv6 local unicast address using the configured global ID.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

alaIPv6GlobalID

ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

```
ipv6 address local-unicast [global-id globalID] [subnet-id subnetID] [interface-id interfaceID | eui-64] [prefix-length prefixLength] [if_name | loopback]
```

```
no ipv6 address local-unicast [global-id globalID] [subnet-id subnetID] [interface-id interfaceID | eui-64] [prefix-length prefixLength] [if_name | loopback]
```

Syntax Definitions

<i>globalID</i>	A 5-byte global ID value specified in the form hh:hhh:hhh.
<i>subnetID</i>	A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.
<i>interfaceID</i>	An interface identifier specified in the form hhhh:hhh:hhh:hhh.
eui-64	Automatically-generated EUI-64 value to be used for interface identifier.
<i>prefixLength</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value must rarely be overridden.
<i>if_name</i>	The name assigned to the interface.
loopback	The loopback for the loopback interface.

Defaults

parameter	default
<i>prefixLength</i>	64

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier, similar to that used for full IPv6 addresses, is allowed.

Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 address global-id	Automatically generates or allows a new global ID to be entered.
show ipv6 information	Displays IPv6 information.

MIB Objects

```

ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

```
ipv6 dad-check ipv6_address if_name
```

Syntax Definitions

<i>ipv6_address</i>	IPv6 address.
<i>if_name</i>	Name assigned to the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The switch performs DAD check when an interface is attached and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

Examples

```
-> ipv6 dad-check 2001:db8::1/32 Test_Lab
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

ipv6 hop-limit *value*

no ipv6 hop-limit

Syntax Definitions

value Hop limit value. The range is 0 - 255.

Defaults

parameter	default
<i>value</i>	64

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

Examples

```
-> ipv6 hop-limit 64
```

Release History

Release 7.1.1; command was introduced.

ipv6 neighbor stale-lifetime

Configures the minimum lifetime for neighbors in the unconfirmed state.

ipv6 neighbor stale-lifetime *stale-lifetime*

Syntax Definitions

stale-lifetime Minimum lifetime for neighbor entries in the stale state (5–2800).

Defaults

parameter	default
<i>stale-lifetime</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

Release History

Release 7.1.1; command was introduced.

ipv6 neighbor

Configures a static entry in IPv6 Neighbor Table.

ipv6 neighbor *ipv6_address hardware_address {if_name} {port chassis/slot/port / linkagg agg_id}*

no ipv6 neighbor *ipv6_address {if_name}*

Syntax Definitions

<i>ipv6_address</i>	IPv6 address that corresponds to the hardware address.
<i>hardware_address</i>	MAC address in hex format (e.g., 00:00:39:59:F1:0C).
<i>if_name</i>	Name assigned to the interface on which the neighbor resides.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number of the port used to reach the neighbor.
<i>agg_id</i>	The link aggregate ID number of the link aggregate used to reach the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test port 1/1
```

Release History

Release 7.1.1; command was introduced.

ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

ipv6 prefix *ipv6_address /prefix_length if_name* [**valid-lifetime** *time*] [**preferred-lifetime** *time*] [**on-link-flag** {**true** | **false**}] [**autonomous-flag** {**true** | **false**}] *if_name*

no ipv6 prefix *ipv6_address /prefix_length if_name*

Syntax Definitions

<i>ipv6_address</i>	IPv6 address of the interface.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (1...127).
valid-lifetime <i>time</i>	Length of time, in seconds, that this prefix will remain valid (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
preferred-lifetime <i>time</i>	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
on-link-flag { true false }	On-link configuration flag. When “true” this prefix can be used for on-link determination.
autonomous-flag { true false }	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
<i>if_name</i>	Name assigned to the interface.

Defaults

parameter	default
valid-lifetime <i>time</i>	2,592,000
preferred-lifetime <i>time</i>	604,800
on-link-flag	true
autonomous-flag	true

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete a prefix.

Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 prefixes Displays IPv6 prefixes used in router advertisements.

  alaIPv6InterfacePrefixOnLinkFlag  
  alaIPv6InterfacePrefixAutonomousFlag  
  alaIPv6InterfacePrefixRowStatus
```

ipv6 static-route

Configures an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* [**tag** *num*] [**name** *string*] [*if_name*] [**metric** *metric*]

no ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* [**tag** *num*] [**name** *string*] [*if_name*]

Syntax Definitions

<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits (0...128) that are significant in the IPv6 address (mask).
gateway <i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>num</i>	Tag to be used for route.
<i>string</i>	Name to be used for route.
<i>if_name</i>	If the next hop is a link-local address, the name of the interface used to reach it.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

Defaults

parameter	default
<i>metric</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove a static route.

Examples

```
-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **tag** and **name** parameters included.

Related Commands

  alaIprmv6StaticRouteIfIndex
  alaIprmv6StaticRouteMetric
  alaIprmv6StaticRouteRowStatus
```

ipv6 route-pref

Configures the route preference of a router.

```
ipv6 route-pref {static | ospf | rip | ebgp | ibgp} value
```

Syntax Definitions

static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF3 routes.
rip	Configures the route preference of RIPng routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
<i>value</i>	Route preference value.

Defaults

parameter	default
static value	2
ospf value	110
rip value	120
ebgp value	190
ibgp value	200

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Route preference of local routes cannot be changed.
- The valid route preference range is 1–255.
- The IPv6 version of BGP is not supported in the current release.

Examples

```
-> ipv6 route-pref ospf 20  
-> ipv6 route-pref rip 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 route-pref

  alaIprmRtPrefRip  
  alaIprmRtPrefEbgp  
  alaIprmRtPrefIbgp
```

ipv6 virtual-source-mac

Configures the source MAC to be used for packets being sent from a VRRP instance.

`ipv6 virtual-source-mac {on | off}`

Syntax Definitions

on	The switch will use the VRRP virtual MAC address for all packets.
off	The switch will use the physical MAC address for all packets except VRRP advertisements.

Defaults

parameter	default
virtual-source-mac	off

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use this command to change which MAC address the switch will use as the source MAC when sending packets from a VRRP instance.
- This command has no affect on VRRP advertisements, the VRRP virtual MAC will always be used.

Examples

```
-> ipv6 virtual-source-mac on
-> ipv6 virtual-source-mac off
```

Release History

Release 7.2.1; command was introduced.

Related Commands

[show ipv6 route-pref](#) Displays the configured route preference of a router.

MIB Objects

N/A

ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

```
ping6 {ipv6_address / hostname} [if_name] [count count] [size data_size] [interval seconds]
```

Syntax Definitions

<i>ipv6_address</i>	The IP address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>count</i>	Number of packets to be transmitted.
<i>size</i>	Size of the data portion of the packet sent for this ping, in bytes.
<i>seconds</i>	Interval, in seconds, at which ping packets are transmitted.

Defaults

parameter	default
<i>count</i>	6
<i>size</i>	8
interval <i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

Examples

```
-> ping6 2001:db8:302::44
-> ping6 fe80::2d0:95ff:fe6a:f458 vlanif-23
```

Release History

Release 7.1.1; command was introduced.

Related Commands**traceroute6**

Finds the path taken by an IPv6 packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute6 { *ipv6_address* | *hostname* } [*if_name*] [**max-hop** *hop_count*] [**dest-port** *port_number*] [**probe-count** *probe*] [**size** *size*] [**host-names** { **yes** / **no** }]

Syntax Definitions

<i>ipv6_address</i>	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>hop_count</i>	Maximum hop count for the trace.
<i>port_number</i>	Specific UDP port destination. By default, the destination port is chosen by traceroute6.
<i>probe</i>	Number of probes to be sent to a single hop.
<i>size</i>	The initial size for the probe packets. During the trace the packet size will be adjusted downward as path MTU information is received. The default and maximum value is 24,000 bytes with a minimum of 1,280 bytes.
host-names { yes / no }	Specify whether each hop must be shown as an IPv6 address or the host name corresponding to the address.

Defaults

parameter	default
<i>hop_count</i>	32
<i>probe</i>	3
host-names	no

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

Examples

```
-> traceroute6 41EA:103::65C3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 interface

Displays IPv6 Interface Table.

show ipv6 interface [*if_name* / **loopback**]

Syntax Definitions

if_name Interface name. Limits the display to a specific interface.
loopback Limits display to loopback interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If you do not specify an interface name, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

Examples

-> show ipv6 interface

Name	IPv6 Address/Prefix Length	Status	Device
smbif-5	fe80::2d0:95ff:fe12:f470/64 212:95:5::35/64 212:95:5::/64	Active	VLAN 955
v6if-to-eagle	fe80::2d0:95ff:fe12:f470/64 195:35::35/64 195:35::/64	Disabled	VLAN 1002
tunnel_6to4	2002:d423:2323::35/64 2002:d423:2323::/64	Active	6to4 Tunnel
v6if-tunnel-137	fe80::2d0:95ff:fe12:f470/64 137:35:35::35/64 137:35:35::/64	Disabled	Tunnel 2
loopback	::1/128	Active	loopback
		Active	Loopback

output definitions

Name	Interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	IPv6 address and prefix length assigned to the interface. If an interface has more than one IPv6 address assigned to it, each address is shown on a separate line.
Status	Interface status (e.g., Active/Inactive).
Device	The device on which the interface is configured (e.g., VLAN 955).

```

-> show ipv6 interface tunnel_6to4
tunnel_6to4
  IPv6 interface index           = 16777216(0x
  Administrative status         = Disabled
  Operational status             = Inactive
  Link-local address(es):
  Global unicast address(es):
  Anycast address(es):
  VRRP address(es):
  Joined group addresses:
    ff02::1
  Maximum Transfer Unit (MTU)   = 1280
  Neighbor reachable time (sec) = 465
  Base reachable time (sec)     = 360
  Retransmit timer (ms)        = 1000
  DAD transmits                 = 1
  Send Router Advertisements    = No
  Maximum RA interval (sec)     = 600
  Minimum RA interval (sec)     = 198
  RA managed config flag       = False
  RA other config flag         = False
  RA reachable time (ms)       = 0
  RA retransmit timer (ms)     = 0
  RA default lifetime (sec)    = 1800
  RA hop limit                  = 64
  RA send MTU option           = No
  RA clock skew (sec)          = 600

```

output definitions

IPv6 interface index	IPv6IfIndex value that must be used in SNMP requests pertaining to this interface.
Administrative status	Administrative status of this interface (Enabled/Disabled).
Operational status	Indicates whether the physical interface is connected to a device (Active/Inactive).
Link-local address	Link-local address assigned to the interface.
Global unicast address(es)	Global unicast address(es) assigned to the interface.
Anycast address(es)	The anycast addresses assigned to the interface.
VRRP address(es)	Addresses assigned to the interface because a VRRP virtual router is active. If (accept) is present, the switch will accept packets destined to the address. If not present, any such packets will be discarded.
Joined group address(es)	Addresses of the multicast groups that this interface has joined.
Maximum Transfer Unit	Interface MTU value.
Neighbor reachable time (sec)	The amount of time that a neighbor reached through this interface will remain in the reachable state.
Base reachable time (sec)	The base reachable time used to calculate the current neighbor reachable time.
Retransmit timer (ms)	The interval at which neighbour solicitations will be retransmitted during the neighbor discovery process.
DAD transmits	The number of neighbour solicitations that will be sent as part of the Duplicate Address Detection process.

output definitions (continued)

Send Router Advertisements	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
Maximum RA interval (sec)	Maximum time between the transmission of unsolicited router advertisements over the interface.
Minimum RA interval (sec)	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).
RA managed config flag	True/False value in the managed address configuration flag field in router advertisements.
RA other config flag	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
RA reachable time (ms)	Value placed in the reachable time field in the router advertisements sent over this interface.
RA retransmit timer (ms)	Value placed in the retransmit timer field in router advertisements sent over this interface.
RA default lifetime (sec)	The value placed in the router lifetime field in the router advertisements sent over this interface.
RA hop limit	The value placed in the current hop limit field in the router advertisements sent over this interface.
RA Send MTU option	Specifies whether the MTU option is included in the router advertisements sent over this interface.
RA clock skew (sec)	The clock skew allowed for router advertisements on this interface.

Release History

Release 7.1.1; command was introduced.

show ipv6 pmtu table

Displays the IPv6 Path MTU Table.

show ipv6 pmtu table

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 pmtu table
```

```
1-PMTU Entry
PMTU entry minimum lifetime = 10m
Destination Address                               MTU      Expires
-----+-----+-----
fe80::02d0:c0ff:fe86:1207                        1280     1h 0m
```

output definitions

Destination Address	IPv6 address of the path's destination.
MTU	Path's MTU.
Expires	Minimum remaining lifetime for the entry.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 pmtu-lifetime](#)

Configures the minimum lifetime for entries in the path MTU Table.

  alaIPv6PMTUexpire
```

show ipv6 neighbors

Displays IPv6 Neighbor Table.

show ipv6 neighbors [*ipv6_prefix/prefix_length* | *if_name* | **hw** *hardware_address* | **static**]

Syntax Definitions

<i>ipv6_prefix/prefix_length</i>	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
<i>if_name</i>	Interface name. Restricts the display to those neighbors reached through the specified interface.
<i>hardware_address</i>	MAC address. Restricts the display to the specified MAC address.
static	Restricts display to statically configured neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If you do not specify an option (e.g., *if_name*), all IPv6 neighbors are displayed.

Examples

```
-> show ipv6 neighbors
Total 2 neighbors
```

```
IPv6 Address           Hardware Address   Reachability Lifetime      Port   Interface
-----+-----+-----+-----+-----+-----+-----
2001:db8:39::11      0a:3f:1e:ac:7b:38 Unconfirmed 39s           1/ 1   vlan-41
fe80::83f:1eff:feac:7b38 0a:3f:1e:ac:7b:38 Confirmed 8m 21s       1/ 1   vlan-41
```

output definitions

IPv6 Address	The neighbor's IPv6 address.
Hardware Address	The MAC address corresponding to the IPv6 address.
Reachability	The neighbor's reachability: <ul style="list-style-type: none"> • Incomplete • Confirmed • Unconfirmed
Lifetime	The time the entry will remain in its current state.
Port	The port used to reach the neighbor.
Interface	The neighbor's interface name (e.g., <i>vlan_1</i>).

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 neighbor Configures a static entry in the IPv6 Neighbor Table.

MIB Objects

```
ipv6IfIndex

```

clear ipv6 neighbors

Removes all entries, except static entries, from IPv6 Neighbor Table.

clear ipv6 neighbors

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This commands only clears dynamic entries. If static entries have been added to the table, they must be removed using the **no** form of the [ipv6 neighbor](#) command.

Examples

```
-> clear ipv6 neighbors
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 neighbor	Configures a static entry in IPv6 Neighbor Table.
show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

```

show ipv6 prefixes

Displays IPv6 prefixes used in router advertisements.

show ipv6 prefixes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

Name	IPv6 Address/Prefix Length	Valid Lifetime	Preferred Lifetime	Flags	Source
vlan 955	212:95:5::/64	2592000	604800	LA	dynamic
vlan 1002	195:35::/64	2592000	604800	LA	dynamic
6to4tunnel	2002:d423:2323::/64	2592000	604800	LA	dynamic
tunnel 2	137:35:35::/64	2592000	604800	LA	dynamic

output definitions

Name	The interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
Valid Lifetime	Length of time, in seconds, that this prefix will remain valid (i.e., time until deprecation). A value of 4,294,967,295 represents infinity.
Preferred Lifetime	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
Flags	L - Prefix can be used for onlink determination. A - Prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
Source	config - Prefix has been configured by management. dynamic - Router Advertisements are using interface prefixes.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 prefix](#)

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

MIB Objects

show ipv6 routes

Displays IPv6 Forwarding Table.

show ipv6 routes [*ipv6_prefix/prefix_length* | **static**]

Syntax Definitions

ipv6_prefix/prefix_length IPv6 prefix. Restricts the display to those routes starting with the specified prefix.

static Restricts display to statically configured routes.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If you do not specify an option (e.g., “static”), all IPv6 interfaces are displayed.

Examples

```
-> show ipv6 routes
```

Legend:Flags:U = Up, G = Gateway, H = Host, S = Static, C = Cloneable, D = Dynamic,
M = Modified, R = Unreachable, X = Externally resolved, B = Discard,
L = Link-layer, 1 = Protocol specific, 2 = Protocol specific

Destination Prefix	Gateway Address	Interface	Age	Protocol	Flags
::/0	2002:d468:8a89::137	v6if-6to4-137	18h 47m 26s	Static	UGS
137:35:35::/64	fe80::2d0:95ff:fe12:f470	v6if-tunnel-137	18h 51m 55s	Local	UC

212:95:5::/64	fe80::2d0:95ff:fe12:f470	smbif-5	18h 51m 55s	Local	UC
2002::/16	2002:d423:2323::35	v6if-6to4-137	18h 51m 55s	Other	U

output definitions

Destination Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Age	Age of the entry. Entries less than 1 day old are displayed in hh:mm:ss format. Entries more than 1 day old are displayed in dd:hh format.
Protocol	Protocol by which the route was learned.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 static-route](#) Configures a static entry in the IPv6 route.

MIB Objects

```

```

show ipv6 route-pref

Displays the IPv6 routing preference of the router.

show ipv6 route-pref

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The IPv6 version of BGP is not supported in the current release.

Examples

```
-> show ipv6 route-pref
  Protocol      Route Preference Value
-----+-----
  Local         1
  Static        2
  OSPF          110
  RIP           120
  EBGP          190
  IBGP          200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 route-pref](#) Configures the IPv6 route preference of a router.

MIB Objects

N/A

show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

show ipv6 router database [**protocol** *type* / **gateway** *ipv6_address* / **dest** *ipv6_prefix/prefix_length*]

Syntax Definitions

<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (0...128).

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSPF, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

Examples

-> show ipv6 router database
 Legend: + indicates routes in use

Total IPRM IPv6 routes: 5

Destination/Prefix	Gateway Address	Interface	Protocol	Metric
::/0	2002:d468:8a89::137	v6if-6to4-137	Static	1
137:35:35::/64	fe80::2d0:95ff:fe12:f470	v6if-tunnel-137	OSPF	2
195:35::/64	fe80::2d0:95ff:fe12:f470	v6if-to-eagle	OSPF	2
212:95:5::/64	fe80::2d0:95ff:fe12:f470	smbif-5	Local	1
2002::/16	2002:d423:2323::35	v6if-6to4-137	Local	1

Inactive Static Routes:

VLAN	Destination/Prefix	Gateway Address	Metric
1510	212:95:5::/64	fe80::2d0:95ff:fe6a:f458	1

output definitions

Destination/Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Protocol	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
VLAN	The VLAN on which the route was <i>learned</i> , not forwarded. Note that N/A appears in this field for static routes as they are not learned on a VLAN.

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 routes](#) Displays the IPv6 Forwarding Table.

MIB Objects

N/A

show ipv6 tcp connections

Displays the TCP connections over the IPV6 table.

show ipv6 tcp connections

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

-> show ipv6 tcp connections

Local Address	Port	Remote Address	Port	State
2001:0000:0200::23	23	2001:0000:0400::143	1867	established
2001:0000:0200::23	8734	2001:0000:0200::19	8735	timeWait

output definitions

Local Address	The local IPV6 address for the TCP connection .
Port	The local port number of the TCP connection.
Remote Address	The remote IPV6 address for the TCP connection.
Port	The remote port number of the TCP connection.
State	The state of the TCP connection.

Release History

Release 7.1.1; command was introduced.

Related Commands

```

show ipv6 tcp listeners

Displays the TCP connections over the IPV6 listeners (endpoints awaiting a connection request).

show ipv6 tcp listeners

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 tcp listeners
```

Local Address	Port
:::0	21
:::0	23
:::0	80

output definitions

Local Address	The local IPV6 address for this TCP listener. A value of ::0 indicates that the listener will accept a connection request sent to any of the switch's addresses.
Port	The local port number on which the listener is awaiting connection requests.

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 tcp connections](#) Displays the TCP connections over the IPV6 table.

MIB Objects

```

  alaRipngJitter
  alaRipngTriggeredSends
```

show ipv6 traffic

Displays IPv6 traffic statistics.

show ipv6 traffic [*if_name*]

Syntax Definitions

if_name Interface name. Restricts the display to the specified interface instead of global statistics.

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The statistics show the cumulative totals since the last time the switch was powered on, the last reset of the switch was executed or the traffic statistics were cleared using the command.

Examples

```
-> show ipv6 traffic
```

Message	Current	Previous	Change
-----+-----+-----+-----			
Packets received			
Total	66193	0	66193
Header errors	0	0	0
Too big	0	0	0
No route	0	0	0
Address errors	0	0	0
Unknown protocol	0	0	0
Truncated packets	0	0	0
Local discards	0	0	0
Delivered to users	969	0	969
Reassembly needed	0	0	0
Reassembly failed	0	0	0
Multicast packets	66191	0	66191
Packets sent			
Forwarded	0	0	0
Generated	23	0	23
Local discards	5	0	5
Fragmented	0	0	0
Fragmentation failed	0	0	0
Fragments generated	0	0	0
Multicast packets	34	0	34

output definitions

Total	Total number of input packets received, including those received in error.
Header errors	Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
Too big	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
No route	Number of input packets discarded because no route could be found to transmit them to their destination.
Address errors	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).
Unknown protocol	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
Truncated packets	Number of input packets discarded because the packet frame did not carry enough data.
Local discards	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
Delivered to users	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
Reassembly needed	Number of IPv6 fragments received that needed to be reassembled.
Reassembly failed	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).
Multicast packets	Number of multicast packets received.
Forwarded	Number of output packets that this entity received and forwarded to their final destinations.
Generated	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
Local discards	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
Fragmented	Number of IPv6 packets successfully fragmented.
Fragmentation failed	Number of IPv6 packets discarded because they needed to be fragmented but could not be.
Fragments generated	Number of output packet fragments generated as a result of fragmentation.
Multicast packets	Number of multicast packets transmitted.

Release History

Release 7.1.1; command was introduced.

show ipv6 tunnel configured

Displays IPv6 tunnel information and whether the 6to4 tunnel is enabled.

show ipv6 tunnel configured

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipv6 tunnel configured
```

```
IPv6 6to4 tunnel: Enabled
```

```
Configured Tunnels:
```

Tunnel	IPv6 Address/Prefix Length	Source IPv4	Destination IPv4
1	2001:0000:0200::101/48	192.16.10.101	192.28.5.254
23	2001:0000:0200::102/48	192.15.10.102	10.27.105.25
v6if-tunnel-137	fe80::2d0:95ff:fe12:f470/64	212.35.35.35	212.104.138.137

output definitions

IPv6 6to4 tunnel	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
Tunnel	Tunnel ID.
IPv6 Address/Prefix Length	IPv6 address associated with the tunnel.
Source IPv4	Source IPv4 address for the tunnel.
Destination IPv4	Destination IPv4 address for the tunnel.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

show ipv6 udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

Examples

```
-> show ipv6 udp ports
```

```
Local Address                               Port  Interface
-----+-----+-----
::                                           521
```

output definitions

Local Address	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
Port	Local Port number for the UDP connection.
Interface	Name of the interface the listener is using or “unknown.”

Release History

Usage Guidelines

N/A

Examples

```
-> show ipv6 information
Default hop limit           = 64
Path MTU entry minimum lifetime (min) = 10
Neighbor stale lifetime (min) = 10
Local Unicast Global ID    = 70:3302:a472
```

output definitions

Default hop limit	The value placed in the hop limit field in router advertisements
Path MTU entry minimum lifetime	Minimum lifetime for entries in the path MTU.
Neighbor stale lifetime	Minimum lifetime for neighbor entries in the stale state.
Local Unicast Global ID	The default global ID value used in unique local unicast addresses. "none" if a global ID has not been configured.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.
ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.
ipv6 hop-limit	Configures the value placed in the hop limit field in the header of all IPv6 packet.
ipv6 address global-id	Configures the default global ID for unique local unicast addresses

ipv6 redistrib

Controls the conditions for redistributing IPv6 routes between different protocols.

ipv6 redistrib {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} {all-routes | route-map route_map_name} [admin-state {enable | disable}]

no ipv6 redistrib {local | static | ospf | isis | bgp} into {rip | ospf | isis | bgp} [all-routes | route-map route_map_name]

Syntax Definitions

local	Redistributes local IPv6 routes.
static	Redistributes static IPv6 routes.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
bgp	This parameter is currently not supported.
isis	This parameter is currently not supported.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
<i>route_map_name</i>	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported in the current release.
- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ipv6 redistrib rip into ospf route-map rip-to-ospf1
-> ipv6 redistrib rip into ospf route-map rip-to-ospf2
-> no ipv6 redistrib rip into ospf route-map rip-to-ospf2
-> ipv6 redistrib local into rip route-map local-to-rip
-> ipv6 redistrib local into rip route-map local-to-rip disable
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **all-routes** parameter added.

Related Commands

[show ipv6 redistrib](#) Displays the route map redistribution configuration.

MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

ipv6 access-list *access_list_name*

no ipv6 access-list *access_list_name*

Syntax Definitions

access_list_name Name of the IPv6 access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ipv6 access-list access1  
-> no ipv6 access-list access1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 access-list address](#) Adds IPv6 addresses to an existing IPv6 access list.

[show ipv6 access-list](#) Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

ipv6 access-list *access_list_name* **address** *address/prefixLen* [**action** {**permit** | **deny**}] [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}]

no ipv6 access-list *access_list_name* **address** *address/prefixLen*

Syntax Definitions

<i>access_list_name</i>	Name of the IPv6 access list (up to 20 characters).
<i>address/prefixLen</i>	IPv6 address along with the prefix length to be added to the access list.
permit	Permits the IPv6 address for redistribution.
deny	Denies the IPv6 address for redistribution.
all-subnets	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Redistributes or denies only those routes that exactly match the IP address and the mask length.
aggregate	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit deny	permit
all-subnets no-subnets aggregate	all-subnets

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access_list_name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 access-list	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
show ipv6 access-list	Displays the contents of an IPv6 access list.

  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
```

show ipv6 redist

Displays the IPv6 route map redistribution configuration.

```
show ipv6 redist [rip | ospf | bgp]
```

Syntax Definitions

rip	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
ospf	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
bgp	This parameter is not supported.

Defaults

By default all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported in the current release.

Release History

Release 7.1.1; command was introduced.

Examples

```
-> show ipv6 redist
```

Source Protocol	Destination Protocol	Status	Route Map
localIPv6	RIPng	Enabled	ipv6rm
RIPng	OSPFv3	Enabled	ipv6rm

```
-> show ipv6 redist ospf
```

Source Protocol	Destination Protocol	Status	Route Map
RIPng	OSPFv3	Enabled	ipv6rm

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (Enabled or Disabled) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ipv6 redistrib Controls the conditions for redistributing IPv6 routes between different protocols.

MIB Objects

```
alaRouteMapRedistProtoTable  
  alaRouteMapRedistSrcProtoId  
  alaRouteMapRedistDestProtoId  
  alaRouteMapRedistRouteMapIndex  
  alaRouteMapRedistStatus  
  alaRouteMapRedistAddressType  
  alaRouteMapRedistRowStatus
```

show ipv6 access-list

Displays the contents of the specified IPv6 access list.

show ip access-list [*access_list_name*]

Syntax Definitions

access_list_name Name of the IPv6 access list.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If the *access_list_name* is not specified in this command, all the access lists will be displayed.

Examples

```
-> show ipv6 access-list
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_3	128::/64	permit	all-subnets
al_4	124::/64	permit	no-subnets

```
-> show ipv6 access-list 4
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_4	124::/64	permit	no-subnets

output definitions

Name	Name of the IPv6 access list.
Address/Prefix Length	IPv6 address that belongs to the access list.
Effect	Indicates whether the IPv6 address is permitted or denied for redistribution.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 7.1.1; command was introduced

Related Commands

```

21 IPsec Commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as Encrypting traffic, Integrity validation, Authenticating the peers, and Anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

There are two modes of IPsec operation: transport mode and tunnel mode. In transport mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two intermediate systems are processed with IPsec. In tunnel mode, the entire IPv6 packet with both the data and the message headers is encrypted and/or authenticated. In tunnel mode, all the IPv6 packets that pass through the endpoints are processed by IPsec. The current implementation of IPsec supports only the transport mode.

Note. The current implementation of IPsec supports only IPv6.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations can be manually configured or negotiated through IKE. The current implementation of IPsec does not support the negotiation of SA through IKE and SAs need to be configured manually.

A summary of the available commands is listed here:

- [ipsec key](#)
- [ipsec security-key](#)
- [ipsec policy](#)
- [ipsec policy rule](#)
- [ipsec sa](#)
- [show ipsec policy](#)
- [show ipsec sa](#)
- [show ipsec key](#)
- [show ipsec ipv6 statistics](#)

ipsec key

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

ipsec key *name* {**sa-authentication** | **sa-encryption**} [**encrypted**] *key*

no ipsec key *name* {**sa-authentication** | **sa-encryption**}

Syntax Definitions

<i>name</i>	The name of this key (maximum 20 characters).
sa-authentication	Indicates that the key value is used for Authentication Header.
sa-encryption	Indicates that the key value is used for Encapsulated Security Payload.
encrypted	Not user configured, used only by switch in config file.
<i>key</i>	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The *name* parameter must be same as the name of the manually configured SA that uses this SA authentication and encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that uses the key. The required key length for the supported algorithm are as follows:

algorithm	key length
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128

- The combination of the key's name and type must be unique.
- The **encrypted** option is used when the key commands are written to the boot.cfg or other snapshot file. This option can not be specified by the user when entering CLI commands.

Examples

```
-> ipsec key sa_md5_in sa-authentication takd03c9@skL68L%
```

Release History

Release 7.1.1; command introduced.

Related Commands

| show ipsec key | Displays the keys for the manually configured IPsec SA. |

MIB Objects

AlaIPsecKeyTable
 alaIPsecKeyName
 alaIPsecKeyType
 alaIPsecKeyEncrypted
 alaIPsecKey

ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys.

```
ipsec security-key [old_key] new_key
```

Syntax Definitions

<i>old_key</i>	The current master security key. The key can be specified either in the hexadecimal format or as a string.
<i>new_key</i>	The new key value. The key can be specified either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The *old_key* parameter must always be specified when you modify an existing key. Setting the key for first time does not require the *old_key*.
- If the value of the *old_key* is incorrect, the attempt to set a new key fails.
- While the SA keys can be configured without a master security key; the configured SA keys are written to the configuration file unencrypted, and a warning is logged.
- The security key must be 16 characters or 16 bytes if in hex form (32 hex digits).
- If the master security key is reset using **debug clear ipsec security key** command, the currently configured SA keys are deleted.

Examples

```
-> ipsec security-key "old key value ab" 0xa38d901bde77af091a2485ce0a14a8cc
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ipsec key](#)

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecSecurityKeyTable  
  alaIPsecSecurityKeyCurrent  
  alaIPsecSecurityKeyNew
```

ipsec policy

Adds, modifies, or removes a security policy.

ipsec policy *name* [**priority** *priority*] [**source** {*ipv6_address*[/*prefix_length*]} [**port** *port*]] [**destination** {*ipv6_address*[/*prefix_length*]} [**port** *port*]] [**protocol** {**any** | **icmp6** [**type** *type*]} | **tcp** | **udp** | **ospf** | **vrrp** | **number** *protocol*}] [**in** | **out**] [**discard** | **ipsec** | **none**] [**description** *description*] [**admin-state** {**enable** | **disable**}]

no ipsec policy *name*

Syntax Definitions

<i>name</i>	The name for the policy.
<i>priority</i>	The priority for the policy. Values may range from 1 to 1000. The lower the value, the higher the priority.
source <i>ipv6_address</i>	Specifies the source address of the IPv6 traffic that is covered by the policy.
source / <i>prefix_length</i>	Specifies the prefix length of the source address of the IPv6 traffic that is covered by the policy.
source <i>port</i>	Specifies the source port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets originated from any port.
destination <i>ipv6_address</i>	Specifies the destination address of the IPv6 traffic that is covered by the policy.
destination / <i>prefix-length</i>	Specifies the prefix length of the destination address of the IPv6 traffic that is covered by the policy.
destination <i>port</i>	Specifies the destination port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets destined to any port.
protocol	Specifies that the particular protocol specific traffic to be covered by the policy (Refer to the table in the “Usage Guidelines“ section below for various protocol options).
in	Specifies that the policy is applied to the inbound IPv6 traffic.
out	Specifies that the policy is applied to the outbound IPv6 traffic.
discard	Specifies the policy to discard the IPv6 packet, if it matches the criteria.
ipsec	Specifies the policy to send the IPv6 packet for IPsec processing, if it matches the criteria.
none	Specifies IPsec should not process the packet.
<i>description</i>	The detailed description of the policy.
enable	Administratively enables the policy.
disable	Administratively disables the policy.

Defaults

parameter	default
priority	100
<i>port</i>	0
any icmp6 tcp udp ospf vrrp number	any
icmp6 <i>type</i>	not present
discard ipsec none	ipsec
admin-state	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If two policies can cover the same traffic, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options in this command:

protocol
any
icmp6 [<i>type type</i>]
tcp
udp
ospf
vrrp
number <i>protocol</i>

The **any** option must be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.

- If the **ipsec** option is specified this policy cannot be enabled until at least one rule has been defined. The policy rules specify that IPsec algorithms be applied to the traffic that matches the policy.

Examples

```
-> ipsec policy tcp_out source 2001:db8:3::12 destination 201:db8:4::a3e protocol
tcp out ipsec description "Outbound TCP traffic" admin-state disable
-> no ipsec policy tcp_out
```

Release History

Release 7.1.1; command introduced.

Related Commands

ipsec policy rule	Adds, modifies, or removes an IPsec rule for a security policy.
show ipsec policy	Displays information about the security policies.

```

ipsec policy rule

Adds, modifies, or removes an IPsec rule for a security policy.

ipsec policy *name* **rule** *index* [**ah** | **esp**]

no ipsec policy *name*

Syntax Definitions

<i>name</i>	The name of the security policy created by using the ipsec policy command.
<i>index</i>	The index of this rule. Values may range from 1 to 10.
ah	Specifies that the rule requires the presence of an Authentication Header (AH).
esp	Specifies that the rule requires the presence of an Encrypted Security Payload header (ESP).

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the *index* parameter to specify the order in which the multiple rules for the same security policy are applied to the original payload.

Examples

```
-> ipsec policy alucent rule 1 ah
-> no ipsec policy alucent
```

Release History

Release 7.1.1; command introduced.

Related Commands

```

ipsec sa

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

ipsec sa *name* {**esp** | **ah**} [**source** *ipv6_address*] [**destination** *ipv6_address*] [**spi** *spi*] [**encryption** {**null** | **3des-cbc** | **aes-cbc** [**key-size** *key_length*]}] [**authentication** {**none** | **hmac-md5** | **hmac-sha1** | **aes-xcbc-mac**}] [**description** *description*] [**admin-state** {**enable** | **disable**}]

no ipsec sa *name*

Syntax Definitions

<i>name</i>	The name assigned to this IPsec SA.
esp	Specifies the type of security association as ESP.
ah	Specifies the type of security association as AH.
source <i>ipv6_address</i>	Specifies the source address of the IPv6 traffic that is covered by the SA.
destination <i>ipv6_address</i>	Specifies the destination address of the IPv6 traffic that is covered by the SA.
<i>spi</i>	The Security Parameters Index (SPI) for the SA.
encryption	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter must be used only when the SA type is ESP.
<i>key_length</i>	Key length for the specified encryption algorithm.
authentication	Specifies the authentication algorithm to be used for traffic covered by the SA.
<i>description</i>	The detailed description of the SA.
enable	Administratively enables the SA.
disable	Administratively disables the SA.

Defaults

parameter	Defaults
encryption	none
authentication	none
admin-state	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The **encryption** parameter must be specified with the **none** option, if **ESP** is being used to verify integrity only.

- If **null** is specified as the option for **encryption**, an integrity algorithm must be specified using the **authentication** parameter.
- To override a default key length in an **encryption** algorithm, the key length must be specified after the protocol name. The key length supported for various algorithm are as follows:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256

- For AH SAs, one of the authentication algorithms such as aes-xcbc-mac, hmac-md5 or hmac-sha1 must be specified.

Examples

```
-> ipsec sa esp_in_1 esp source 2001:db8:3::13d destination 2001:db8:1::24 spi
10392 encryption aes-cbc authentication hmac-sha1
-> no ipsec sa esp_in_1
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ipsec sa](#) Displays information about manually configured IPsec Security Associations.

show ipsec key

Displays the keys for the manually configured IPsec SA.

show ipsec key [sa-encryption | sa-authentication]

Syntax Definitions

sa-encryption Displays the encryption keys.
sa-authentication Displays the authentication keys.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The key values are not be displayed due to security reasons.

Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                               Length (bits)
-----+-----
sa_1                               192
sa_2                               160
sa_3                               64

-> show ipsec key sa-authentication
Authentication Keys
Name                               Length (bits)
-----+-----
sa_1                               128
sa_5                               160
```

output definitions

Name	The name of the SA for which the key is used.
Length	The length of the key in bits.

Release History

Release 7.1.1; command introduced.

Related Commands

show ipsec ipv6 statistics

Displays IPsec statistics.

```
show ipsec ipv6 statistics
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ipsec ipv6 statistics
```

```
Inbound:
  Discarded                = 2787
  Policy violation         = 0
  Authentication Failure   = 0
  No SA found              = 0
Outbound:
  Discarded                = 5135
  No SA found              = 19
```

output definitions

Discarded	The number of incoming packets discarded because they matched a discard policy.
Policy violation	The number of incoming packets that don't have the IPsec protection required by a security policy.
Authentication Failure	Authentication of a packet failed.
No SA found	No SA found matching the information present in a packet.

Release History

Release 7.1.1; command introduced.

alaIPsecStatisticsOutNoSA
```

22 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIP next generation (RIPng). It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, RFC1724, and RFC2080.

MIB information for the RIP commands is as follows:

Filename: RIPv2.mib

Module: rip2

Filename: AlcatelIND1Rip.mib

Module: alcatelIND1RIPMIB

Filename: AlcatelIND1Ripng.mib

Module: alcatelIND1RipngMIB

A summary of the available commands is listed here:

ip load rip	ipv6 load rip
ip rip admin-state	ipv6 rip admin-state
ip rip interface	ipv6 rip invalid-timer
ip rip interface admin-state	ipv6 rip garbage-timer
ip rip interface metric	ipv6 rip holddown-timer
ip rip interface send-version	ipv6 rip jitter
ip rip interface recv-version	ipv6 rip route-tag
ip rip interface ingress-filter	ipv6 rip update-interval
ip rip interface egress-filter	ipv6 rip triggered-sends
ip rip force-holddowntimer	ipv6 rip interface
ip rip host-route	ipv6 rip interface metric
ip rip route-tag	ipv6 rip interface recv-status
ip rip interface auth-type	ipv6 rip interface send-status
ip rip interface auth-key	ipv6 rip interface horizon
ip rip update-interval	show ipv6 rip
ip rip invalid-timer	show ipv6 rip interface
ip rip garbage-timer	show ipv6 rip peer
ip rip holddown-timer	show ipv6 rip routes
show ip rip	
show ip rip routes	
show ip rip interface	
show ip rip peer	

ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

ip load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **boot.cfg** file. The **boot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the **ip rip admin-state** command to enable RIP on the switch.

Examples

```
-> ip load rip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPRipStatus
```

ip rip admin-state

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

ip rip admin-state {enable | disable}

Syntax Definitions

enable Enables RIP routing on the switch.
disable Disables RIP routing on the switch.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- RIP must be loaded on the switch ([ip load rip](#)) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

Examples

```
-> ip rip admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip load rip](#) Loads RIP into the switch memory.
[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip  
  alaRipProtoStatus
```

ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

```
ip rip interface {interface_name}
```

```
no ip rip interface {interface_name}
```

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the **ip rip interface admin-state** command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 5, "VLAN Management Commands"](#).

Examples

```
-> ip rip interface rip-1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface admin-state	Enables/disables a RIP interface.

MIB Objects

```
rip2IfConfTable  
    rip2IfConfAddress  
    rip2IfConfStatus
```

ip rip interface admin-state

Enables and disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

```
ip rip interface {interface_name} admin-state {enable | disable}
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
enable	Administratively enables RIP on the interface.
disable	Administratively disables RIP on the interface.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- You must first create a RIP interface by using the [ip rip interface](#) command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 5, “VLAN Management Commands”](#).

Examples

```
-> ip rip interface rip-1 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface	Creates/deletes a RIP interface.

MIB Objects

```
rip2IfConfTable
```

```
    rip2IfConfAddress
```

```
    rip2IfConfStatus
```

ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

ip rip interface {*interface_name*} **metric** *value*

Syntax Definitions

interface_name The name of the interface.
value Metric value. Valid range is 1–15.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ip rip interface rip-1 metric 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip interface](#) Enables/disables RIP on a specific interface.
[show ip rip peer](#) Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

MIB Objects

rip2IfConfTable
 rip2IfConfAddress
 rip2IfConfDefaultMetric

ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

ip rip interface {*interface_name*} **send-version** {**none** | **v1** | **v1compatible** | **v2**}

Syntax Definitions

<i>interface_name</i>	The name of the interface.
none	RIP packets will not be sent by the interface.
v1	Only RIPv1 packets will be sent by the interface.
v1compatible	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
v2	Only RIPv2 packets will be sent by the interface.

Defaults

parameter	default
none v1 v2 v1compatible	v2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 send-version v1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip interface recv-version](#) Configures the receive option for a RIP interface.

MIB Objects

```
rip2IfConfTable
  rip2IfConfAddress
  rip2IfConfSend
```

ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

```
ip rip interface {interface_name} recv-version {v1 | v2 | both | none}
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
v1	Only RIPv1 packets will be received by the interface.
v2	Only RIPv2 packets will be received by the interface.
both	Both RIPv1 and RIPv2 packets will be received by the interface.
none	Interface ignores any RIP packets received.

Defaults

parameter	default
v1 v2 both none	both

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 recv-version both
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip interface send-version](#) Configures the send option for a RIP interface.

MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfReceive
```

ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

```
ip rip interface {interface_name} ingress-filter {filter_name}
```

Syntax Definitions

<i>interface_name</i>	The name of an existing RIP interface.
<i>filter_name</i>	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 Ingress-filter RipFilter1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface egress-filter	Assigns an egress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip interface egress-filter

Assigns an egress route map filter to the specified RIP interface. Outbound route advertisements are compared against egress filters. When a prefix matches the corresponding filter, that prefix is sent on the interface. When a prefix does not match the filter, the prefix is dropped as if it did not exist in the RIP RIB.

```
ip rip interface {interface_name} egress-filter {filter_name}
```

Syntax Definitions

<i>interface_name</i>	The name of an existing RIP interface.
<i>filter_name</i>	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 egress-filter RipFilter1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

iip rip interface egress-filter	Assigns an ingress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

Related Commands

`show ip rip`

Displays the RIP status and general configuration parameters (for example, forced hold-down timer).

MIB Objects

```
alaProtocolRip  
  alaRipForceHolddownTimer
```

ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

ip rip host-route

no ip rip host-route

Syntax Definitions

N/A

Defaults

The default is to enable a default host route.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

Examples

```
-> ip rip host-route
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip routes](#) Displays the RIP Routing Database.

MIB Objects

```
alaProtocolRip  
  alaRipHostRouteSupport
```

ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ip rip route-tag *value*

Syntax Definitions

value Route tag value. Valid range is 0–2147483647.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Only RIPv2 supports route tags.

Examples

```
-> ip rip route-tag 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

alaRipRedistRouteTag

ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

```
ip rip interface {interface_name} auth-type {none | simple | md5}
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
none	No authentication will be used.
simple	Simple authentication will be used.
md5	MD5 authentication will be used.

Defaults

parameter	default
none simple md5	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-type none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip interface auth-key](#) Configures the text string that will be used as the password for the RIP interface.

MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthType
```

ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

```
ip rip interface {interface_name} auth-key string
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>string</i>	16-byte text string.

Defaults

The default authentication string is a null string.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-key nms
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip interface auth-type	Configures the type of authentication that will be used for the RIP interface.
--	--

MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthKey
```

ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

ip rip update-interval *seconds*

Syntax Definitions

seconds The RIP routing update interval, in seconds. The valid range is 1–120.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

Examples

```
-> ip rip update-interval 45
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip  
  alaRipUpdateInterval
```

ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

ip rip invalid-timer *seconds*

Syntax Definition

seconds The RIP invalid timer value, in seconds. The valid range is 3–360.

Defaults

parameter	default
<i>seconds</i>	180

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The invalid time interval value must be three times the update interval value.

Examples

```
-> ip rip invalid-timer 270
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip  
  alaRipInvalidTimer
```

ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

ip rip garbage-timer *seconds*

Syntax Definition

seconds The RIP garbage timer value, in seconds. The valid range is 0–180.

Defaults

parameter	default
<i>seconds</i>	120

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

Examples

```
-> ip rip garbage-timer 180
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip  
  alaRipGarbageTimer
```

show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

show ip rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip rip
```

```
Status = Enabled
Number of routes = 9
Host Route Support = Enabled
Route Tag = 42
Update interval = 30
Invalid interval = 180
Garbage interval = 120
Holddown interval = 0
Forced Hold-Down Timer = 0
```

output definitions

Status	RIP status (Enabled or Disabled).
Number of routes	Number of network routes in the RIP routing table.
Host Route Support	Host route status (Enabled or Disabled). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
Route Tag	Route tag value for RIP routes generated by the switch. Valid values are 0–2147483647.
Update interval	The RIP routing update interval, in seconds.
Invalid interval	The RIP invalid timer value, in seconds.
Garbage interval	The RIP garbage timer value, in seconds.
Holddown interval	The hold-down time interval, in seconds.
Forced Hold-Down Timer	The forced hold-down time interval, in seconds.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip force-holddowntimer	Configures the interval during which a RIP route remains in the forced hold-down state.
ip rip update-interval	Configures the time interval during which RIP routing updates are sent out.
ip rip invalid-timer	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
ip rip garbage-timer	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.
ip rip holddown-timer	Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold down state.

MIB Objects

  alaRipForceHolddownTimer
```

show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

show ip rip routes [*ip_address ip_mask*]

Syntax Definitions

ip_address 32-bit IP address.
ip_mask The mask corresponding to the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

Examples

-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
2.0.0.0/8	+5.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
4.0.0.0/8	+5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
5.0.0.0/8	+2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
10.0.0.0/8	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
22.0.0.0/8	+5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
128.251.40.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
150.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
152.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip

output definitions

Destination	Destination network IP address.
Gateway	The Gateway IP address (switch from which the destination address was learned).
State	The associated state of the route, which can be A (Active) , H (Holddown) , or G (Garbage) .
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Proto	The type of route (Local , Rip , or Redist).

```
-> show ip rip routes 2.0.0.0 255.0.0.0
```

```

Destination          = 2.0.0.0,
Mask length          = 8,
Gateway(1)           = 5.0.0.14,
  Protocol            = Rip,
  Out Interface       = intf5,
  Metric              = 2,
  Status              = Installed,
  State               = Active,
  Age                 = 19s,
  Tag                 = 0,
Gateway(2)           = 4.0.0.7,
  Protocol            = Rip,
  Out Interface       = intf4,
  Metric              = 3,
  Status              = Not Installed,
  State               = Active,
  Age                 = 12s,
  Tag                 = 0,

```

output definitions

Destination	Destination network IP address.
Mask length	Length of the destination network IP subnet mask.
Gateway	The Gateway IP address (switch from which the destination address was learned).
Protocol	The type of the route (Local , Rip , or Redist).
Out Interface	The RIP interface through which the next hop is reached.
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Status	The RIP interface status (Installed or Not Installed).
State	The associated state of the route (Active , Holddown , or Garbage).
Age	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
Tag	The associated route tag.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip host-route](#)

Enables/disables a host route to an individual host on a network.

MIB Objects

```

  alaRipEcmpRouteState
  alaRipEcmpRouteStatus
```

show ip rip interface

Displays RIP interface status and configuration.

show ip rip interface [*interface_name*]

Syntax Definitions

interface_name The interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

Examples

```
-> show ip rip interface rip-1
```

```
Interface IP Name           = rip-1,
Interface IP Address        = 11.11.11.1
IP Interface Number (VLANId) = 4,
Interface Admin status     = enabled,
IP Interface Status        = enabled,
Interface Config AuthType  = None,
Interface Config AuthKey Length = 0,
Interface Config Send-Version = v2,
Interface Config Receive-Version = both,
Interface Config Default Metric = 1,
Received Packets           = 154,
Received Bad Packets       = 0,
Received Bad Routes        = 0,
Sent Updates                = 8
```

output definitions

Interface IP Name	The IP Interface name.
Interface IP Address	Interface IP address.
IP Interface Number	Interface VLAN ID number.
Interface Admin Status	The RIP administrative status (enabled/disabled).
IP Interface Status	Interface status (enabled /disabled).
Interface Config AuthType	The type of authentication that will be used for the RIP interface (None or Simple).

output definitions (continued)

Interface Config AuthKey Length	The authentication key length used for the RIP interface.
Interface Config Send-Version	Interface send option (none, v1, v2, and v1 compatible).
Interface Config Receive-Version	Interface receive option (none, v1, v2, and both).
Interface Config Default Metric	Default redistribution metric.
Received Packets	Number of packets received on the interface.
Received Bad Packets	Number of bad packets received and discarded. Normally this value is zero (0).
Received Bad Routes	Number of bad routes received and discarded. Normally this value is zero (0).
Sent Updates	Number of RIP routing table updates sent.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip interface](#) Enables/disables RIP for a specific interface.

show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

show ip rip peer [*ip_address*]

Syntax Definitions

ip_address 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

-> show ip rip peer

```

      Total   Bad      Bad      Secs since
      IP Address  Recvd  Packets  Routes  Version  last update
-----+-----+-----+-----+-----+-----
      100.10.10.1      1      0        0        2        3

```

output definitions

IP Address	Peer IP address.
Total recvd	Total number of RIP packets received from the peer.
Bad Packets	Number of bad packets received from peer.
Bad Routes	Number of bad routes received from peer.
Version	Peer's RIP version as seen on the last packet received.
Secs since last update	Number of seconds since the last packet was received from the peer.

Release History

ipv6 load rip

Lloads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the [ipv6 rip admin-state](#) command to enable RIPng on the switch.

Examples

```
-> ipv6 load rip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip admin-state	Enables/disables RIPng routing on the switch.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPRipngStatus
```

ipv6 rip admin-state

Enables or disables RIPng on the switch.

```
ipv6 rip admin-state {enable | disable}
```

Syntax Definitions

enable	Enables RIPng.
disable	Disables RIPng.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

RIPng must be loaded on the switch ([ip load rip](#)) to enable RIP on the switch.

Examples

```
-> ipv6 rip admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip load rip	Loads RIPng into memory.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaProtocolripng  
  alaRipngProtoStatus
```

ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

ipv6 rip invalid-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in an "Active" state. Valid range is 1 - 300.

Defaults

parameter	default
<i>seconds</i>	180

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This timer is reset each time a routing update is received.

Examples

```
-> ipv6 rip invalid-timer 300
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.
[ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

MIB Objects

alaProtocolripng
alaRipngInvalidTimer

ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

parameter	default
<i>seconds</i>	120

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the [ipv6 rip invalid-timer](#) command to set the Invalid Timer Value.

Examples

```
-> ipv6 rip garbage-timer 180
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
- [ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

MIB Objects

alaProtocolripng
alaRipngGarbageTimer

ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

ipv6 rip holddown-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

Defaults

parameter	default
<i>seconds</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

Examples

```
-> ipv6 rip holddown-timer 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.

MIB Objects

alaProtocolripng
alaRipngHolddownTimer

ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

ipv6 rip jitter *value*

Syntax Definitions

value Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

Defaults

parameter	default
<i>value</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

Examples

```
-> ipv6 rip jitter 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip update-interval](#) Configures the RIPng update interval.
[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaProtocolripng
alaRipngJitter

ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ipv6 rip route-tag *value*

Syntax Definitions

value Route tag value. Valid range is 0 – 65535.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

Examples

```
-> ipv6 rip route-tag 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaProtocolripng
alaRipngRouteTag

ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

ipv6 rip update-interval *seconds*

Syntax Definitions

seconds Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

Defaults

parameter	default
<i>seconds</i>	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use this command, along with the [ipv6 rip jitter](#) command to configure RIPng updates.

Examples

```
-> ipv6 rip update-interval 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip jitter](#) Configures an offset value for RIPng updates.
[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaRipng
alaRipngUpdateInterval

ipv6 rip triggered-sends

Configures the behavior of triggered updates.

```
ipv6 rip triggered-sends {all | updated-only | none}
```

Syntax Definitions

all	All RIPng routes are added to any triggered updates.
updated-only	Only route changes that are causing the triggered update are included in the update packets.
none	RIPng routes are not added to triggered updates.

Defaults

parameter	default
all updated-only none	updated-only

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

Examples

```
-> ipv6 rip triggered-sends none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng  
alaRipngTriggeredSends
```

ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface *if_name*

no ipv6 rip interface *if_name*

Syntax Definitions

if_name IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see [Chapter 5, "VLAN Management Commands"](#).
- RIPng will support a maximum of 20 interfaces.

Examples

```
-> ipv6 rip interface Test_Lab
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables or disables RIPng on the switch.
ipv6 rip interface rcv-status	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

alaRipngInterfaceTable
 alaRipngInterfaceStatus

ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

ipv6 rip interface *if_name* **metric** *value*

Syntax Definitions

if_name IPv6 interface name.
value Metric value. Valid range is 1 - 15.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ipv6 rip Test_Lab metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip interface](#) Creates or deletes a RIPng interface.
[show ipv6 rip interface](#) Displays information for all or specified RIPng interfaces.

MIB Objects

alaRipngInterfaceTable
 alaRipngInterfaceMetric

ipv6 rip interface rcv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

```
ipv6 rip interface if_name rcv-status {enable | disable}
```

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
enable	Enables the “Receive” status for the specified interface.
disable	Disables the “Receive” status for the specified interface.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

RIPng must be loaded ([ip load rip](#)) and enabled ([ipv6 rip admin-state](#)) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab rcv-status disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status.

MIB Objects

```
alaRipngInterfaceTable  
  alaRipngInterfaceRecvStatus
```

ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is enabled, packets can be sent from this interface. When it is disabled, packets will not be sent from this interface.

ipv6 rip interface *if_name* send-status {enable | disable}

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
enable	Enables the “Send” status for the specified interface.
disable	Disables the “Send” status for the specified interface.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

RIPng must be loaded ([ip load rip](#)) and enabled ([ipv6 rip admin-state](#)) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface rcv-status	Configures IPv6 RIPng interface “Receive” status.

MIB Objects

```
alaRipngInterfaceTable
  alaRipngInterfaceSendStatus
```

ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

```
ipv6 rip interface if_name horizon {none | split-only | poison}
```

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
none	Disables loop prevention mechanisms.
split-only	Enables split-horizon, without poison-reverse.
poison	Enables split-horizon with poison-reverse.

Defaults

parameter	default
none split-only poison	poison

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

Examples

```
-> ipv6 rip interface Test_Lab none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip interface	Displays information for all or specified RIPng interfaces.
show ipv6 rip routes	Displays all or a specific set of routes in the RIPng Routing Table.

MIB Objects

```
alaRipngInterfaceTable
  alaRipngInterfaceHorizon
```

show ipv6 rip

Displays the RIPng status and general configuration parameters.

show ipv6 rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

-> show ipv6 rip

```
Status                = Enabled,
Number of routes      = 10,
Route tag              = 0,
Update interval       = 30,
Invalid interval      = 180,
Garbage interval      = 120,
Holddown interval     = 0,
Jitter interval       = 5,
Triggered Updates    = All Routes,
```

output definitions

Status	RIPng protocol status (enabled or disabled).
Number of routes	Number of RIPng routes in Forwarding Information Base (FIB).
Route tag	Route tag value for RIP routes generated by the switch. Default is 0.
Invalid interval	Invalid Timer setting, in seconds.
Garbage interval	Garbage Timer setting, in seconds.
Holddown interval	Holddown Timer setting, in seconds.
Jitter interval	Jitter setting.
Triggered updates	Triggered Updates setting (All Routes, Updated Routes, and None).

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip route-tag	Configures the route tag value for RIP routes generated by the switch.
ipv6 rip update-interval	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
ipv6 rip invalid-timer	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.
ipv6 rip jitter	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
ipv6 rip triggered-sends	Configures the behavior of triggered updates.

MIB Objects

```
alaRipngInterfaceTable
  alaRipngInterfaceStatus
  alaRipngRouteTag
  laRipngInvalidTimer
  alaRipngGarbageTimer
  alaRipngHolddownTimer
  alaRipngJitter
  alaRipngTriggeredSends
```

show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

show ipv6 rip interface [*if_name*]

Syntax Definitions

if_name IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If an interface name is not specified, all IPv6 RIP interfaces are displayed.

Examples

```
-> show ipv6 rip interface
```

Interface Name	Status	Packets		Metric
		Recvd	Sent	
Test_Lab	Active	12986	12544	1
Test_Lab_2	Active	12556	12552	1

```
-> show ipv6 rip interface if3
```

```
Name = Test_Lab,
IPv6 interface index = 3,
Interface status = Active,
Next Update = 27 secs,
Horizon Mode = Split and Poison-reverse,
MTU size = 1500,
Metric = 1,
Send status = Enabled,
Receive status = Enabled,
Packets received = 12986,
Packets sent = 12544,
```

output definitions

Interface name	Interface name.
IPv6 interface index	IPv6 index of this interface.
Status	Interface status (Active/Inactive).
Packets Recvd	Number of packets received by the interface.

output definitions (continued)

Packets Sent	Number of packets sent by the interface.
Metric	RIPng metric (cost) configured for the interface.
IPv6 interface index	IPv6 interface index number.
Interface status	Interface status (Active/Inactive).
Next update	Seconds remaining until the next update on this interface.
Horizon mode	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
MTU size	Maximum transmission size for RIPng packets on the interface.
Send status	Interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
Receive status	Interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
Packets received	Number of packets received by the interface.
Packets sent	Number of packets sent by the interface.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 rip interface	IPv6 interface name.
ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip interface rcv-status	Configures the interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
ipv6 rip interface send-status	Configures the interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
ipv6 rip interface metric	Configures the RIPng metric (cost) for the interface.
ipv6 rip interface horizon	Configures the interface Horizon Mode (routing loop prevention mechanisms).
show ipv6 rip	Displays RIPng status and general configuration parameters (e.g., force holddown timer).

MIB Objects

```
alaRipngInterfaceTable

  alaRipngInterfaceNextUpdate  
  alaRipngInterfaceHorizon  
  alaRipngInterfaceMTU  
  alaRipngInterfaceSendStatus  
  alaRipngInterfaceRecvStatus
```

show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

show ipv6 rip peer [*ipv6_address*]

Syntax Definitions

ipv6_address IPv6 address of the peer.

Defaults

N/A.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

Examples

```
-> show ipv6 peer
```

Address	Seen on Interface	Packets Recv	Last Update
fe80::200:39ff:fe1f:710c	vlan172	23	20
fe80::2d0:95ff:fe12:da40	bkbone20	33	2
fe80::2d0:95ff:fe12:da40	vlan150	26	25
fe80::2d0:95ff:fe6a:5d41	nssa23	20	25

```
-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40
```

```
Peer#1 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = bkbone20,
Last Update         = 8 secs,
Received packets    = 33,
Received bad packets = 0
Received routes     = 5,
Received bad routes = 0
```

```
Peer#2 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = vlan150,
Last Update         = 1 secs,
Received packets    = 27,
Received bad packets = 0
Received routes     = 2,
Received bad routes = 0
```

output definitions

Address	IPv6 address of the peer.
Seen on Interface	Interface used to reach the peer.
Packets Recvd	Number of packets received from the peer.
Last Update	Number of seconds since the last update was received from the peer.
Peer address	Peer IPv6 address.
Received packets	Number of packets received from the peer.
Received bad packets	Number of bad packets received from the peer.
Received routes	Number of RIPng routes received from the peer.
Received bad routes	Number of bad RIPng routes received from the peer.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip interface	Displays all or specified RIPng interface status.
show ipv6 rip routes	Displays all or a specific set of routes in RIPng Routing Table.

MIB Objects

```
alaRipngPeerTable
  alaRipngPeerEntry
  alaRipngPeerAddress
  alaRipngPeerIndex
  alaRipngPeerLastUpdate
  alaRipngPeerNumUpdates
  alaRipngPeerBadPackets
  alaRipngPeerNumRoutes
  alaRipngPeerBadRoutes
```

show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

show ipv6 rip routes [**dest** *ipv6_prefix/prefix_length* | **gateway** *ipv6_addr* | **detail** *ipv6_prefix/prefix_length*]

Syntax Definitions

dest	Displays all routes whose destination matches the IPv6 prefix/prefix length.
gateway	Displays all routes whose gateway matches the specified IPv6 address.
detail	Displays detailed information about a single route matching the specified destination.
<i>ipv6_prefix/prefix length</i>	IPv6 address and prefix/prefix length.
<i>ipv6_addr</i>	IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If none of the optional parameters are entered with this command, all IPv6 RIP routes are displayed.

Examples

-> show ipv6 rip routes

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
100::1/128	+fe80::200:39ff:fe1f:710c	A	2	Rip

23 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, OSPF, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

BFD can be operated in two different modes: Asynchronous mode with Echo enabled and Echo-Only mode. Demand mode is not supported.

In Asynchronous mode, the systems continuously send BFD control packets between each other as part of a BFD session. If there are no packets received for a minimum time interval negotiated between the systems, then the neighbor system is considered down.

In Echo mode, a stream of BFD echo packets are transmitted in a forwarding path for which the neighboring system would loop the packets and send them back. If the number of packets transmitted is not echoed back, then the system is declared down. Echo mode can be operated along with Asynchronous mode.

MIB information for the BFD commands is as follows:

Filename: ALCATEL-IND1-BFD-MIB
Module: ALCATEL-IND-BFD-MIB

A summary of the available commands is listed here:

Global BFD commands	ip bfd admin-state ip bfd transmit ip bfd receive ip bfd multiplier ip bfd echo-interval ip bfd interface show ip bfd show ip bfd sessions show ip bfd sessions statistics
----------------------------	---

BFD Interface commands

ip bfd interface
ip bfd interface admin-state
ip bfd interface transmit
ip bfd interface receive
ip bfd interface multiplier
ip ospf bfd-state
ip bfd interface echo-interval
show ip bfd interfaces

Commands to configure BFD supported protocols

ip ospf bfd-state
ip ospf bfd-state all-interfaces
ip ospf interface bfd-state
ip ospf interface bfd-state drs-only
ip ospf interface bfd-state all-neighbors
ip bgp bfd-state
ip bgp bfd-state all-neighbors
ip bgp neighbor bfd-state
vrrp bfd-state
vrrp track address bfd-state
ip static-route all bfd-state
ip static-route bfd-state

ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

```
ip bfd admin-state {enable | disable}
```

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

```
-> ip bfd admin-state enable  
-> ip bfd admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bfd](#) Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalAdminStatus
```

ip bfd transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

ip bfd transmit *transmit_interval*

Syntax Definitions

transmit_interval The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>transmit_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd transmit** command does not override the value set for the interface using the **ip bfd interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd transmit 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|---|--|
| ip bfd interface transmit | Configures the transmit time interval for a specific BFD interface. |
| show ip bfd | Displays the BFD global status and general configuration parameters. |

MIB Objects

alaBfdGlobalTxInterval

ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

ip bfd receive *receive_interval*

Syntax Definitions

receive_interval The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>receive_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd receive** command does not override the value set for the interface using the **ip bfd interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd receive 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bfd interface receive** Configures the receive time interval for a specific BFD interface.
- show ip bfd** Displays the BFD global status and general configuration parameters.

MIB Objects

alaBfdGlobalRxInterval

ip bfd echo-interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd echo-interval *echo_interval*

Syntax Definitions

echo_interval The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>echo_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd echo-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bfd interface echo-interval** Configures the echo packet time interval for a BFD interface.
- show ip bfd** Displays the BFD global status and general configuration parameters.

MIB Objects

alaBfdGlobalEchoRxInterval

ip bfd interface admin-state

Enables or disables the administrative status of a BFD interface.

```
ip bfd interface if_name admin-state {enable | disable}
```

Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
enable	Enables the BFD interface.
disable	Disables the BFD interface.

Defaults

By default, a BFD interface is disabled when it is created.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

Examples

```
-> ip bfd interface bfd-vlan-101 admin-state enable
-> ip bfd interface bfd-vlan-101 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
show ip bfd interfaces	Displays the status and statistics of a BFD interface.
show ip bfd sessions	Displays the status and statistics of BFD sessions.

MIB Objects

```
alaBfdIntfTable
  alaBfdIntfAdminStatus
```

ip bfd interface transmit

Configures the transmit time interval for the BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

ip bfd interface *if_name* **transmit** *transmit_interval*

Syntax Definitions

if_name The name of an existing BFD interface.
transmit_interval The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>transmit_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface transmit** command does not change the global value configured with the **ip bfd transmit** command.

Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
ip bfd transmit	Configures a global BFD transmit time interval.
show ip bfd interfaces	Displays the status and statistics of a BFD interface.
show ip bfd sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

alaBfdIntfTable
 alaBfdIntfDesiredMinTxInterval

ip bfd interface receive

Configures the receive time interval for the BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

ip bfd interface *if_name* **receive** *receive_interval*

Syntax Definitions

if_name The name of an existing BFD interface.

receive_interval The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>receive_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface receive** command does not change the global value configured with the **ip bfd receive** command.

Examples

```
-> ip bfd interface bfd-vlan-101 receive 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bfd interface](#) Creates a BFD interface.

[ip bfd receive](#) Configures a global BFD receive time interval.

[show ip bfd interfaces](#) Displays the BFD interface configuration table.

[show ip bfd sessions](#) Displays the BFD interface configuration table.

MIB Objects

alaBfdIntfTable
alaBfdReqMinRxInterval

ip bfd interface multiplier

Configures the BFD interface detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

ip bfd interface *if_name* **multiplier** *num*

Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
<i>num</i>	The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

Examples

```
-> ip bfd interface bfd-vlan-101 multiplier 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
show ip bfd interfaces	Displays the BFD interface configuration table.
show ip bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable  
  alaBfdIntfDetectMult
```

ip bfd interface echo-interval

Configures the echo time interval for the BFD interface. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd interface *if_name* **echo-interval** *echo_interval*

Syntax Definitions

if_name The name of an existing IP interface.
echo_interval The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
<i>echo_interval</i>	300 milliseconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd interface echo-interval** command does not change the global value configured with the **ip bfd echo-interval** command.

Examples

```
-> ip bfd interface bfd-vlan-101 echo-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
ip bfd echo-interval	Configures a global BFD echo time interval.
show ip bfd interfaces	Displays the BFD interface configuration table.
show ip bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable  
  alaBfdIntfReqMinEchoRxInterval
```

ip ospf bfd-state

Enables or disables the BFD status for the OSPF protocol.

```
ip ospf bfd-state {enable | disable}
```

Syntax Definitions

enable	Enables BFD Status.
disable	Disables BFD Status.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip ospf bfd-state enable  
-> ip ospf bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip ospf bfd-state all-interfaces** Enables or disables BFD for all OSPF interfaces configured.
- ip ospf interface bfd-state** Enables or disables BFD for a specific OSPF interface.
- ip ospf interface bfd-state drs-only** Establishes BFD sessions only on neighbors in full state.
- ip ospf interface bfd-state all-neighbors** Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

alaProtocolospf
alaOspfBfdStatus

ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

```
ip ospf bfd-state all-interfaces {enable | disable}
```

Syntax Definitions

enable	Enables BFD for all the OSPF interfaces.
disable	Disables BFD for all the OSPF interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf bfd-state all-interfaces enable  
-> ip ospf bfd-state all-interfaces disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaProtocolospf  
  alaOspfBfdAllInterfaces
```

ip ospf interface bfd-state

Enables or disables BFD for a specific OSPF interface.

ip ospf interface *if_name* **bfd-state** {**enable** | **disable**}

Syntax Definitions

<i>if_name</i>	The name of an existing OSPF interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state enable
-> ip ospf interface int2 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaOspfIfAugEntry
  ospfIfIpAddress
  alaOspfIfBfdStatus
```

ip ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ip ospf interface *if_name* bfd-state all-neighbors {enable | disable}

Syntax Definitions

<i>if_name</i>	The name of an existing OSPF interface.
enable	Enables BFD sessions with all neighbors.
disable	Disables BFD sessions with all neighbors.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state all-neighbors enable
-> ip ospf interface int1 bfd-state all-neighbors disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bfd interface admin-state** Enables or disables the BFD status for OSPF protocol.
- ip ospf bfd-state all-interfaces** Enables or disables BFD for all OSPF interfaces configured.
- ip ospf interface bfd-state** Enables or disables BFD for a specific OSPF interface.
- ip ospf interface bfd-state drs-only** Establishes BFD sessions only on neighbors in full state.

MIB Objects

```
alaOspfIfAugEntry  
  ospfIfIpAddress  
  alaOspfIfBfdDrsOnly
```

ip bgp bfd-state

Enables or disables BFD for the BGP protocol.

```
ip bgp bfd-state {enable | disable}
```

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip bgp bfd-state enable  
-> ip bgp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip bgp bfd-state all-neighbors](#) Enables or disables BFD for all BGP neighbors.
- [ip bgp neighbor bfd-state](#) Enables or disables BFD for a specific neighbor.

MIB Objects

```
alaBgpGlobal  
alaBgpBfdStatus
```

ip bgp bfd-state all-neighbors

Enables or disables BFD for all BGP neighbors.

ip bgp bfd-state all-neighbors {enable | disable}

Syntax Definitions

enable	Enables BFD for all the BGP neighbors.
disable	Disables BFD for all the BGP neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp bfd-state all-neighbors enable
-> ip bgp bfd-state all-neighbors disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bfd-state	Enables or disables BGP with BFD protocol.
ip bgp neighbor bfd-state	Enables or disables the BFD for a specific BGP neighbor.

MIB Objects

```
alaBgpGlobal
  alaBgpBfdAllNeighbors
```

ip bgp neighbor bfd-state

Enables or disables BFD for a specific BGP neighbor.

```
ip bgp neighbor ipv4_address bfd-state {enable | disable}
```

Syntax Definitions

<i>ipv4_address</i>	The IP address of the BGP neighbor.
enable	Enables BGP neighbor.
disable	Disables BGP neighbor.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp neighbor 135.10.10.2 bfd-state enable
-> ip bgp neighbor 135.10.10.2 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip bgp bfd-state](#) Enables or disables BGP with BFD protocol.
- [ip bgp bfd-state all-neighbors](#) Enables or disables BFD for all BGP neighbors.

MIB Objects

```

```

vrrp bfd-state

Enables or disables VRRP with the BFD protocol.

```
vrrp bfd-state {enable | disable}
```

Syntax Definitions

enable	Enables BFD for VRRP.
disable	Disables BFD for VRRP.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> vrrp bfd-state enable  
-> vrrp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[vrrp track address bfd-state](#) Enables or disable BFD for a specific tracking policy.

vrrp track address bfd-state

Enables or disable BFD for a specific track policy.

```
vrrp track track_id address ipv4_address bfd-state {enable| disable}
```

Syntax Definitions

<i>track_id</i>	The VRRP track number.
<i>ipv4_address</i>	The remote IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> vrrp track 2 address 10.1.1.1 bfd-state enable  
-> vrrp track 3 address 10.1.1.2 bfd-state disable
```

Multiplier                   = 3,
Applications Registered:     = STATIC-ROUTING
```

output definitions

Local discriminator	The local discriminator.
Neighbor IP address	The IP address of the BFD neighbor.
Requested Session Type	The bit map of the session type that is requested. .
Interface IP address	The IP address of the outgoing BFD interface for this session.
Source UDP Port	The unique source UDP port used to send BFD packets for this session.
State	The state of the BFD session.
Session Operating Mode	The current operating mode of the BFD session.
Remote discriminator	The remote discriminator.
Negotiated Tx interval	The negotiated transmit interval.
Negotiated Rx interval	The negotiated receive interval.
Echo Rx interval	The Echo packet receive interval.
Detection Time Multiplier	The BFD Detection Time multiplier number.
Applications Registered	The bit map object of applications that are registered with this BFD session.

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ip static-route all bfd-state

Enables BFD for all static routes.

ip static-route all bfd-state {enable| disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When there are static route configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

Examples

```
-> ip static-route all bfd-state enable  
-> ip static-route all bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```

ip static-route bfd-state

Enables or disables BFD for a specific static route.

```
ip static-route ipv4_prefix/pfx_length gateway ipv4_host_address bfd-state {enable| disable}
```

Syntax Definitions

<i>ipv4_prefix</i>	The destination IP address.
<i>pfx_length</i>	The prefix length for the destination IP address.
<i>ipv4_host_address</i>	The gateway IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

BFD is enabled to track the gateway of static routes.

Examples

```
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state enable
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state disable
```

```

24 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

Filename: AlcatelIND1UDPRelay.MIB
Module: ALCATEL-IND1-UDP-RELAY-MIB

A summary of the available commands is listed here.

IP Helper	ip helper address ip helper vlan address ip helper standard ip helper per-vlan-only ip helper forward-delay ip helper maximum-hops ip helper agent-information ip helper agent-information policy ip helper pxe-support ip helper boot-up ip helper boot-up enable show ip helper show ip helper statistics no ip helper statistics
UDP	ip udp relay port ip udp relay service ip udp relay service vlan show ip udp relay show ip udp relay statistics ip udp relay no statistics
IPv6 DHCP	ipv6 dhcp relay admin-state ipv6 dhcp relay interface admin-state ipv6 dhcp relay destination show ipv6 dhcp relay

DHCP Server Commands

dhcp-server
dhcp-server restart
show dhcp-server leases
show dhcp-server statistics
clear dhcp-server statistics
dhcpv6-server
dhcpv6-server restart
show dhcpv6-server leases
clear dhcpv6-server statistics
show dhcpv6-server statistics
dhcp-message-service
dhcp-message-service restart
show message-service status
active-lease-service
active-lease-service restart
show active-lease-service status

DHCP Snooping

dhcp-snooping admin-state
dhcp-snooping mac-address-verification
dhcp-snooping option-82-data-insertion
dhcp-snooping bypass option-82-check
dhcp-snooping option-82 format
dhcp-snooping vlan
dhcp-snooping port
dhcp-snooping linkagg
dhcp-snooping ip-source-filter
dhcp-snooping binding admin-state
dhcp-snooping binding timeout
dhcp-snooping binding action
dhcp-snooping binding persistency
dhcp-snooping binding
show dhcp-snooping ip-source-filter
show dhcp-snooping vlan
show dhcp-snooping port
show dhcp-snooping binding

ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

ip helper address *ip_address*

no ip helper address [*ip_address*]

Syntax Definitions

ip_address DHCP server IP address (for example 21.0.0.10).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

Examples

```
-> ip helper address 75.0.0.10  
-> no ip helper address 31.0.0.20
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper vlan address	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
ip helper forward-delay	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
ip helper maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable  
    iphelperService  
    iphelperForwAddr
```

ip helper vlan address

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

ip helper vlan *vlan_id*[-*vlan_id2*] **address** *ip_address*

no ip helper vlan *vlan_id*[-*vlan_id2*] **address** *ip_address*

Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i>]	VLAN ID number of the DHCP server VLAN. Use a hyphen to specify a range of VLAN IDs (3-5).
<i>ip_address</i>	IP address (for example 21.0.0.10) of the DHCP server VLAN.

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The **ip helper vlan address** command works only if the **per-vlan-only** forwarding option is active. Use the **ip helper per-vlan-only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.

Examples

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ip helper per-vlan-only](#)

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperTable

 iphelperService

 iphelperVlan

ip helper standard

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

ip helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the [ip helper per-vlan-only](#) command.

Examples

```
-> ip helper standard
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable  
  iphelperForwOption
```

ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

ip helper per-vlan-only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the forwarding option is set to **per-vlan-only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.
- Using the **per-vlan-only** forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The **ip helper vlan address** command performs this function and at the same time enables relay for the specified VLAN.

Examples

```
-> ip helper per-vlan-only
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper vlan address	Configures a DHCP Relay service for the specified VLAN.
ip helper standard	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperStatTable
iphelperForwOption

ip helper forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

ip helper forward-delay *seconds*

Syntax Definitions

seconds Forward delay time value in seconds.

Defaults

By default, the forward delay time is set to three seconds.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

Examples

```
-> ip helper forward-delay 300
-> ip helper forward-delay 120
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper address	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
ip helper maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperStatTable
iphelperForwDelay

MIB Objects

iphelperStatTable
iphelperMaxHops

ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

ip helper agent-information {enable | disable}

Syntax Definitions

enable	Enables the relay agent Option-82 feature for the switch.
disable	Disables the relay agent Option-82 feature for the switch.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

Examples

```
-> ip helper agent-information enable
-> ip helper agent-information disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper agent-information policy	Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperAgentInformation

ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

ip helper agent-information policy {drop | keep | replace}

Syntax Definitions

drop	Drop DHCP packets that already contain an Option-82 field.
keep	Keep the existing Option-82 field information and continue to relay the DHCP packet.
replace	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper agent-information	Enables the insertion of relay agent information Option-82 into DHCP packets.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

`iphelperAgentInformationPolicy`

ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

ip helper pxe-support {enable | disable}

Syntax Definitions

enable	Enables PXE support.
disable	Disables PXE support.

Defaults

By default, PXE support is disabled for the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

PXE support is disabled by default and it is a user-configurable option using the **ip helper pxe-support** command.

Examples

```
-> ip helper pxe-support enable
-> ip helper pxe-support disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper](#) Displays current DHCP Relay configuration information.

MIB Objects

iphelperPXESupport

ip helper boot-up

Enables or disables automatic IP address configuration for default VLAN 1 when an unconfigured switch boots up. If enabled, the switch broadcasts a BootP or a DHCP request packet at boot time. When the switch receives an IP address from a BootP/DHCP server, the address is assigned to default VLAN 1.

Note. Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up {enable | disable}

Syntax Definitions

enable	Enables automatic IP address configuration for default VLAN 1.
disable	Disables automatic IP address configuration for default VLAN 1.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **ip helper boot-up enable** command to specify BootP or DHCP for the request packet type.
- If an IP router port already exists for VLAN 1, a request packet is not broadcast even if automatic IP address configuration is enabled for the switch.

Examples

```
-> ip helper boot-up enable
-> ip helper boot-up disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip helper boot-up enable	Specifies BootP or DHCP as the type of request packet the switch broadcasts at boot time.
---------------------------------	---

MIB Objects

```
iphelperStatTable
  iphelperBootupOption
```

ip helper boot-up enable

Specifies the type of packet to broadcast (BootP or DHCP) when automatic IP address configuration is enabled for the switch.

Note. Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up enable {BOOTP | DHCP}

Syntax Definitions

BOOTP Broadcasts a BOOTP formatted request packet.
DHCP Broadcasts a DHCP formatted request packet.

Defaults

parameter	default
BOOTP DHCP	BOOTP

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

This command is only valid if automatic IP address configuration is already enabled for the switch.

Examples

```
-> ip helper boot-up enable DHCP
-> ip helper boot-up enable BOOTP
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ip helper boot-up](#) Enables or disables automatic IP configuration for the switch.

MIB Objects

```
iphelperStatTable
iphelperBootupPacketOption
```

MIB Objects

```
iphelperxServicePortAssociationTable
  iphelperxServicePortAssociationService
  iphelperxServicePortAssociationPort
  iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
  iphelperxPortServiceAssociationService
  iphelperxPortServiceAssociationPort
  iphelperxPortServiceAssociationName
```

ip udp relay service

Enables or disables UDP port relay for generic UDP service ports (NBNS, NBDD, or other well-known UDP ports).

```
ip udp relay service {TFTP | TACACS | NTP | NBNS | NBDD | DNS} [description description]
```

```
ip udp relay no service {TFTP | TACACS | NTP | NBNS | NBDD | DNS}
```

Syntax Definitions

TFTP	TFTP well-known port 69.
TACACS	TACACS well-known port 65.
NTP	NTP well-known port 123.
NBNS	NBNS well-known ports 137.
NBDD	NBDD well-known port 138.
DNS	DNS well-known port 53.
<i>description</i>	A description of the UDP service.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is only used with any of the **service** keywords and provides a user-defined description to identify the port service.
- When UDP Relay is disabled for BOOTP/DHCP, the **ip helper** configuration is *not* retained and all dependent functionality (automatic IP configuration for VLAN 1, Telnet and HTTP client authentication, and so on) is disrupted.
- Up to three types of UDP Relay services are supported at any one time and in any combination.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ip udp relay service DNS
-> ip udp relay service DNS description DNS_1
-> ip udp relay no service DNS
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip udp relay service vlan Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

MIB Objects

```
iphelperxServicePortAssociationTable
  iphelperxServicePortAssociationService
  iphelperxServicePortAssociationPort
  iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
  iphelperxPortServiceAssociationService
  iphelperxPortServiceAssociationPort
  iphelperxPortServiceAssociationName
```

ip udp relay service vlan

Specifies a VLAN on which traffic destined for a UDP port is forwarded.

ip udp relay service {TFTP | TACACS | NTP | NBNS | NBDD | DNS} | **port** *port_num* [**description** *description*] **vlan** *vlan_id*[-*vlan_id2*]

ip udp relay service {TFTP | TACACS | NTP | NBNS | NBDD | DNS} | **port** *port_num* **no vlan** *vlan_id*[-*vlan_id2*]

Syntax Definitions

TFTP	TFTP well-known port 69.
TACACS	TACACS well-known port 65.
NTP	NTP well-known port 123.
NBNS	NBNS well-known ports 137.
NBDD	NBDD well-known port 138.
DNS	DNS well-known port 53.
<i>port_num</i>	A user-defined port number.
<i>description</i>	A description of the UDP service.
<i>vlan_id</i> [- <i>vlan_id2</i>]	VLAN ID number. Use a hyphen to specify a range of VLAN IDs (3-5).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to define a well-known UDP port. Use the **port** keyword to specify a user-defined port.
- Only specify service port numbers that are *not* well known when using the *port* parameter with this command. For example, do not specify port 53 as it is the well-known port number for the DNS UDP service. Instead, use the **DNS** parameter to enable relay for port 53.
- Specifying a VLAN for the BOOTP/DHCP service does not work if the **per-vlan-only** forwarding option is not active. Use the **ip helper per-vlan-only** command to enable this option.

Examples

```
-> ip udp relay service DNS vlan 10
-> ip udp relay service DNS vlan 500-550
-> ip udp relay service DNS no vlan 10
```

```
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20
```

Release History

Release 7.1.1; command introduced.

Related Commands

ip udp relay port	Enables or disables UDP port relay for user-defined service ports that are not well-known.
ip udp relay service	Enables or disables relay for UDP service ports.

```

show ip helper

Displays the current DHCP Relay and Relay Agent Information.

show ip helper

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Displays information for all IP addresses configured.

Examples

The following example shows the show ip helper command output:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds)           = 300,
  Max number of hops                = 5,
  Relay Agent Information           = Enabled,
  Relay Agent Information Policy     = Keep,
  PXE support                       = Enabled,
  Forward option                   = standard mode,
  Bootup Option                     = Disable,
  Bootup Packet Option              = DHCP
  Forwarding address list (Standard mode):
    128.100.16.1
```

output definitions

Forward Delay	The current forward delay time (default is three seconds). Use the ip helper forward-delay command to change this value.
Max number of hops	The current maximum number of hops allowed (default is four hops). Use the ip helper maximum-hops command to change this value.
Relay Agent Information	Indicates the status (Enabled or Disabled) of the DHCP relay agent information option feature. Configured through the ip helper agent-information command.
Relay Agent Information Policy	The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

output definitions

PXE support	Specifies the status (Enabled or Disabled) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the ip helper pxe-support command.
Forward option	The current forwarding option setting: standard mode .
Bootup Option	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (Enabled or Disabled). Configured through the ip helper boot-up command.
Bootup Packet Option	Indicates if the Bootup Option broadcasts a DHCP or BOOTP packet to obtain an IP address for default VLAN 1. Configured through the ip helper boot-up enable command. Note that this field does not appear if the Bootup Option is disabled.
Forwarding Addresses	IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the ip helper address command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

Release History

Release 7.1.1; command introduced.

Related Commands**show ip helper statistics**

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperForwDelay
iphelperMaxHops

iphelperAgentInformation

iphelperAgentInformationPolicy

iphelperStatTable

iphelperBootupOption
iphelperBootupPacketOption

show ip helper statistics

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

show ip helper statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to clear all DHCP Relay statistics.

Examples

```
-> show ip helper statistics
```

```
Global Statistics :
  Reception From Client :
    Total Count =      12, Delta =      12,
  Forw Delay Violation :
    Total Count =       3, Delta =       3,
  Max Hops Violation :
    Total Count =       0, Delta =       0,
  Agent Info Violation :
    Total Count =       0, Delta =       0,
  Invalid Gateway IP :
    Total Count =       0, Delta =       0,
  Invalid Agent Info From Server :
    Total Count =       0, Delta =       0,
Server Specific Statistics :
  Server 5.5.5.5
    Tx Server :
      Total Count =       9, Delta =       9
```

output definitions

Reception From Client	Number of packets DHCP Relay has received from the DHCP client.
Forw Delay Violation	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.

output definitions (continued)

Max Hops Violation	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to Drop or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
Invalid Agent Info From Server	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
Delta	Total number of packets processed since the last time the ip helper statistics were checked during any user session.
Server	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the ip helper address command to add or remove DHCP server IP addresses from DHCP Relay configuration.
Tx Server	Number of packets DHCP Relay has transmitted to the DHCP server.
Delta	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

Release History

show ip udp relay

Displays the VLAN assignments to which the traffic received on the UDP service ports is forwarded. Displays the current configuration for UDP services by service name or by service port number.

show ip udp relay [**service** {**TFTP** | **TACACS** | **NTP** | **NBNS** | **NBDD** | **DNS**} | **port** *port_num*]

Syntax Definitions

TFTP	TFTP well-known port 69.
TACACS	TACACS well-known port 65.
NTP	NTP well-known port 123.
NBNS	NBNS well-known ports 137.
NBDD	NBDD well-known port 138.
DNS	DNS well-known port 53.
<i>port_num</i>	A user-specified port that is not a well-known port.

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **show ip udp relay** command without the additional parameters to display information related to all the ports.
- Enter a service name with this command along with the **service** parameter to display information about an individual service.
- Enter a port number along with the **port** parameter, to get the UDP relay information for the specific user defined or well-known port.

Examples

```
-> show ip udp relay
Service      Port      VLANs
-----+-----+-----
DNS          53        2  4
TACACS       65        3
```

output definitions

Service	The active UDP service name.
Port	The UDP service port number.
VLANs	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Use the ip udp relay service vlan command to configure this value.

```
-> show ip udp relay service DNS
```

```
Service      Port(s)  Description
-----+-----+-----
  4          53      DNS
```

```
-> show ip udp relay port
```

```
Service      Port(s)  Description
-----+-----+-----
  4          54      Generic_Service
  5          66      Tservice
```

```
-> show ip udp relay port 54
```

```
Service      Port(s)  Description
-----+-----+-----
  4          54      Generic_Service
```

output definitions

Service	The UDP service number. (1 through 7 for well-known service ports and 8 and above for user-defined service ports).
Port(s)	The UDP service port number.
Description	A description of the UDP service.

Release History

Release 7.1.1; command introduced.

Related Commands

show ip udp relay statistics	Displays the current statistics for each UDP port relay service.
no ip helper statistics	Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

```

show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLAN(s) configured for that service, and the number of packets the service has sent and received.

```
show ip udp relay statistics [service {TFTP | TACACS | NTP | NBNS | NBDD | DNS}] [port
[port_num]]
```

Syntax Definitions

TFTP	TFTP well-known port 69.
TACACS	TACACS well-known port 65.
NTP	NTP well-known port 123.
NBNS	NBNS well-known ports 137.
NBDD	NBDD well-known port 138.
DNS	DNS well-known port 53.
<i>port_num</i>	A user-specified port that is not a well-known port.

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Enter a service name with the **service** parameter to display information about an individual service.
- Enter a port number with the **port** parameter to display information about an individual service.

Examples

```
-> show ip udp relay statistics
Service      Vlan      Pkts Sent   Pkts Recvd
-----+-----+-----+-----
145          0         0           0
DNS          2         10          10
             4         15          15
TACACS       3         0           0

-> show ip udp relay statistics service tacacs
Service      Vlan      Pkts Sent   Pkts Recvd
-----+-----+-----+-----
TACACS       3         0           0
```

```
-> show ip udp relay statistics port 1776
Service          Vlan    Pkts Sent  Pkts Recvd
-----+-----+-----+-----
A UDP Protocol   18      2          2
```

output definitions

Service	The active UDP service name.
VLAN	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Use the ip udp relay service vlan command to configure this value.
Pkts Sent	The number of packets sent from this service port to the server.
Pkts Recvd	The number of packets received by this service port from a client.

Release History

Release 7.1.1; command introduced.

Related Commands

```

no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

no ip helper statistics [**global-only** | **server-only** | **address** *ip_address* / **vlan** *vlan_id* {**address** *ip_address*}]

Syntax Definitions

global-only	Specifies that only the global IP helper statistics must be reset.
server-only	Specifies that only the IP helper statistics related to the server must be reset.
<i>ip_address</i>	Specifies the IP address for the flat mode instance.
<i>vlan_id</i>	Specifies the VLAN ID for the per-VLAN mode instance.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the **address** keyword
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the **vlan** keyword and the related IP address with the **address** keyword.

Examples

```
-> no ip helper statistics
-> no ip helper statistics global-only
-> no ip helper statistics server-only
-> no ip helper statistics address 172.6.5.1
-> no ip helper statistics vlan 20 address 172.6.5.1
```

Release History

Release 7.1.1; command introduced.

Related Commands

  genericUdpRelayStatReset
```

ipv6 dhcp relay admin-state

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.

ipv6 dhcp relay admin-state {enable | disable}

Syntax Definitions

enable	Enables the DHCPv6 Relay feature.
disable	Disables the DHCPv6 Relay feature.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

DHCPv6 Relay must be explicitly enabled on the interfaces from which received DHCP client messages are to be relayed.

Examples

```
-> ipv6 dhcp relay admin-state enable
-> ipv6 dhcp relay admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[ipv6 dhcp relay interface admin-state](#) Enables or disables the relay of DHCPv6 client messages received on an interface.

[show ipv6 dhcp relay](#) Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

alaDHCPv6Config
alaDHCPv6RelayAdminStatus

ipv6 dhcp relay interface admin-state

Enables or disables the relay of DHCPv6 client messages received on an interface.

```
ipv6 dhcp relay if_name admin-state {enable | disable}
```

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
enable	Enables the relay of DHCPv6 client messages on an interface.
disable	Disables the relay of DHCPv6 client messages on an interface.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

At least one relay destination must be configured before enabling the DHCPv6 relay on an interface.

Examples

```
-> ipv6 dhcp relay int1 admin-state enable
-> ipv6 dhcp relay int1 admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

ipv6 dhcp relay destination	Configures the DHCPv6 relay destination.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayInterfaceTable
    alaDHCPv6RelayInterfaceAdminStatus
```

ipv6 dhcp relay destination

Configures the DHCPv6 relay destination.

ipv6 dhcp relay *if_name* **destination** *ip6_address* *scope_if_name*

no ipv6 dhcp relay *if_name* **destination** *ip6_address* *scope_if_name*

Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<i>ip6_address</i>	The IPv6 address of the relay destination.
<i>scope_if_name</i>	Name of the interface for the local-link. This must be specified if the relay destination is a local-link.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Maximum five relay destinations can be configured for an interface.
- If the relay destination is a local-link, then the interface-ID of the local-link must be specified.
- Use the **no** form of the command to remove the configured DHCPv6 relay destination for an interface.

Examples

```
-> ipv6 dhcp relay int1 destination 3001::3
-> ipv6 dhcp relay int1 destination fe80::64 int1
-> no ipv6 dhcp relay int1 destination 3001::3
```

Release History

Release 7.3.4; command introduced.

Related Commands

show ipv6 dhcp relay Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayDestinationTable  
  alaDHCPv6RelayDestinationAddressType  
  alaDHCPv6RelayDestinationAddress  
  alaDHCPv6RelayDestinationRowStatus
```

show ipv6 dhcp relay

Displays all the interfaces on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

show ipv6 dhcp relay

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The interface for which the DHCPv6 relay is disabled for the VRF and which do not have relay destination configured will not be displayed in the output.

Examples

```
-> show ipv6 dhcp relay
```

```
DHCPv6 Relay: Enabled
```

Interface	Relay Destination(s)	Status
vlan-41	ff02::1:2	Enabled
vlan-103	2001:dbc8:8003::17 2001:dbc8:8004::99	Disabled
vlan-200	fe80::cd0:deff:fe28:1ca5 vlan-201	Enabled
tunnel-2	2001:dbc8:a23::ea77	Enabled

output definitions

DHCPv6 Relay	Specifies if the DHCPv6 Relay feature is enabled in the current VRF.
Interface	Displays the interface on which DHCPv6 Relay is enabled.
Relay Destination(s)	Displays the configured DHCPv6 Relay destination(s) for the interface.
Status	Displays the status of DHCPv6 Relay on the interface.

Release History

Release 7.3.4; command introduced.

Related Commands

- ipv6 dhcp relay admin-state** Enables or disables the DHCPv6 Relay feature on a per-VRF basis.
- ipv6 dhcp relay interface admin-state** Enables or disables the relay of DHCPv6 client messages received on an interface.
- ipv6 dhcp relay destination** Configures the DHCPv6 relay destination.

MIB Objects

alaDHCPv6RelayAdminStatus
alaDHCPv6RelayInterfaceEntry
alaDHCPv6RelayDestinationAddress
alaDHCPv6RelayInterfaceAdminStatus

dhcp-server

Enables or disables the DHCP server operation.

dhcp-server {enable | disable}

Syntax Definitions

enable	Enables the DHCP server.
disable	Disables the DHCP server.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When DHCP server is enabled on the switch, DHCP relay and DHCP snooping will not be supported on the default VRF of the switch.
- DHCP server must be restarted when changes are made to the `dhcpd.conf` or `dhcpd.pcy` file. Use the [dhcp-server restart](#) command to restart the DHCP server.

Examples

```
-> dhcp-server enable
-> dhcp-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcp-server leases	Displays the leases offered by the DHCP server.
dhcp-server restart	Allows to restart the DHCP server when the <code>dhcpd.conf</code> or <code>dhcpd.pcy</code> file is modified.
clear dhcp-server statistics	Clears the statistics of the DHCP server.

MIB Objects

alaDhcpSrvGlobalConfigStatus

show dhcp-server leases

Displays the leases offered by the DHCP server.

show dhcp-server leases [**ip-address** *ip_address* | **mac-address** *mac_address*] [**type** {**static** | **dynamic**}] [**count**]

Syntax Definitions

<i>ip_address</i>	Specifies IP address of the interface configured with DHCP server.
<i>mac_address</i>	Specifies MAC address of the interface configured with DHCP server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCP messages recorded.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

```
-> show dhcp-server leases
```

```
Total leases: 8
```

show dhcp-server statistics

Displays the statistics of the DHCP server.

show dhcp-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCP server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

DHCP server should be enabled before using this command.

output definitions

General stats	Denotes general DHCP Server statistics.
Name	Specifies the name assigned to the DHCP server.
Status	Specifies up or down status of the DHCP server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCP server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCP Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCP server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.

output definitions (continued)

Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCP request grants provided by the server to the clients.
Total DHCP Request Renewals	Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.
Total DHCP Declines	Specifies the total number of DHCP requests declined by the DHCP server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.
Total DHCP Nacks	Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCP server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.
Leases stats	Denotes statistical information about leases provided by the DHCP server.
Hosts Managed	Specifies the total number of clients managed by the DHCP server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCP server.
Hosts unused	Specifies the total number of clients managed by the DHCP server which are not being used.
Hosts Pending	Specifies the total number of DHCP IP address requests which are pending by the DHCP server.
Hosts unavailable	Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.
Static DHCP	Denotes statistical information about the hosts configured with Static DHCP.
Automatic DHCP	Denotes statistical information about the hosts configured with Automatic DHCP.

output definitions (continued)

Static BootP	Denotes statistical information about the hosts configured under Static BootP. Note: BootP Relay is disabled when DHCP server is enabled on the switch.
Automatic BootP	Denotes statistical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCP related statistical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.
Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 7.3.4; command introduced.

Related Commands

[clear dhcp-server statistics](#) Clears the DHCP Server lease statistics.

N/A

dhcpv6-server

Enables or disables the DHCPv6 server operation.

dhcpv6-server {enable | disable}

Syntax Definitions

enable Enables the DHCPv6 server.
disable Disables the DHCPv6 server.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The dhcpdv6.conf and dhcpdv6.pcy files will be parsed when the DHCPv6 status is enabled for the first time.
- There will be one instance of DHCPv6 for the default VRF.

Examples

```
-> dhcpv6-server enable  
-> dhcpv6-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcpv6-server leases Displays the leases offered by the DHCPv6 server.
dhcpv6-server restart Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.
clear dhcpv6-server statistics Displays the statistics of the DHCPv6 server.

MIB Objects

alaDhcpv6SrvGlobalConfigStatus

dhcpv6-server restart

Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.

dhcpv6-server restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> dhcpv6-server restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[dhcpv6-server](#) Enables or disables the DHCPv6 server operation.

MIB Objects

```
alaDhcpv6SrvGlobalRestart
```

show dhcpv6-server leases

Displays the leases offered by the DHCPv6 server.

show dhcpv6-server leases [**ip- address** *ipv6_address* | **type** {**static** | **dynamic**}] [**count**]

Syntax Definitions

<i>ipv6_address</i>	Specifies IPv6 address of the interface configured with DHCPv6 server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCPv6 messages recorded.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-server leases
```

```
Total leases: 8
```

IP Address	Lease Granted	Pref Lease Expiry	Valid Lease Expiry	Type
2001:100::2	DEC 15 14:10:59 2009	DEC 19 01:30:59 2009	DEC 19 05:30:59 2009	STATIC
2001:100::3	DEC 15 14:11:05 2009	DEC 19 01:31:05 2009	DEC 19 05:31:05 2009	DYNAMIC
2001:200::2	DEC 15 14:11:48 2009	DEC 19 01:31:48 2009	DEC 19 05:31:48 2009	DYNAMIC

```
-> show dhcpv6-server leases ip-address 2001:100::3
```

IP Address	Lease Granted	Pref Lease Expiry	Valid Lease Expiry	Type
2001:100::3	DEC 15 14:11:05 2009	DEC 19 01:31:05 2009	DEC 19 05:31:05 2009	DYNAMIC

```
-> show dhcpv6-server leases type static
```

```
Total leases: 1
```

IP Address	Lease Granted	Pref Lease Expiry	Valid Lease Expiry	Type
2001:100::2	DEC 15 14:10:59 2009	DEC 19 01:30:59 2009	DEC 19 05:30:59 2009	STATIC

output definitions

IP address	The IP address allocated to the client.
Lease Granted	The date and time at which lease is granted.

output definitions (continued)

Pref Lease Expiry	The date and time at which lease expires.
Type	The type of lease offered.

Release History

Release 7.3.4; command introduced.

Related Commands

[clear dhcpv6-server statistics](#) Clears the DHCPv6 server lease statistics.

MIB Objects

```
alaDhcpv6SrvLeaseTable
  alaDhcpv6SrvLeaseIpAddress
  alaDhcpv6SrvLeaseLeaseGrant
  alaDhcpv6SrvLeaseLeaseExpiry
  alaDhcpv6SrvLeaseType
```

show dhcpv6-server statistics

Displays the statistics of the DHCPv6 server.

show dhcpv6-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCPv6 server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCPv6 server.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

DHCPv6 server should be enabled before using this command.

Examples

```
-> show dhcpv6-server statistics
```

```

output definitions

General	Denotes general DHCPv6 Server statistics.
DHCPv6 Server Name	Specifies the name assigned to the DHCPv6 server.
DHCPv6 Server Status	Specifies up or down status of the DHCPv6 server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCPv6 server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCPv6 Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCPv6 server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.
Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCPv6 server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCPv6 request grants provided by the server to the clients.

output definitions (continued)

Total DHCP Request Renews	Specifies the total number of DHCPv6 lease renew requests sent by the clients to the DHCPv6 server.
Total DHCP Declines	Specifies the total number of DHCPv6 requests declined by the DHCPv6 server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCPv6 server to the clients.
Total DHCP Nacks	Specifies the total number of DHCPv6 Negative acknowledgements sent from the DHCPv6 server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCPv6 server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCPv6 options from the DHCPv6 server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCPv6 server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCPv6 server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCPv6 packets received by the DHCPv6 server.
Leases stats	Denotes statistical information about leases provided by the DHCPv6 server.
Hosts Managed	Specifies the total number of clients managed by the DHCPv6 server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCPv6 server.
Hosts unused	Specifies the total number of clients managed by the DHCPv6 server which are not being used.
Hosts Pending	Specifies the total number of DHCPv6 IP address requests which are pending by the DHCPv6 server.
Hosts unavailable	Specifies the total number of DHCPv6 hosts which are unavailable (for example, hosts whose lease period has expired).
Static DHCP	Denotes statistical information about the hosts configured with Static DHCPv6.
Automatic DHCP	Denotes statistical information about the hosts configured with Automatic DHCPv6.
Static BootP	Denotes statistical information about the hosts configured under Static BootP. Note: BootP Relay is disabled when DHCPv6 server is enabled on the switch.
Automatic BootP	Denotes statistical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCPv6 related statistical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.

output definitions (continued)

Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 7.3.4; command introduced.

Related Commands

[clear dhcpv6-server statistics](#) Clears the DHCPv6 Server lease statistics.

MIB Objects

N/A

clear dhcpv6-server statistics

Clears the packet counters of DHCPv6 server statistics.

```
clear dhcpv6-server statistics
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use this command to clear the packet counters of DHCPv6 server statistics.

Examples

```
-> clear dhcpv6-server statistics
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show dhcpv6-server statistics](#) Displays the DHCPv6 Server lease statistics.

MIB Objects

N/A

dhcp-message-service

Enable or disable the message service operation.

dhcp-message-service {enable | disable}

Syntax Definitions

enable	Enables the operational status of the message service.
disable	Disables the operational status of the message service.

Defaults

By default, the operational status of the message service is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The **conf** and **pcy** files are parsed when message service is enabled.
- There is one instance of the message service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> dhcp-message-service enable  
-> dhcp-message-service disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-message-service restart Restarts the message service after the msgd.conf file is modified.

MIB Objects

alaMsgSrvGlobalConfigStatus

dhcp-message-service restart

Restarts the message service after the `msgd.conf` file or `dhcpcd.pcy` is modified.

`dhcp-message-service restart`

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Before using this command, enable the message service status using the [dhcp-message-service](#) command.

Examples

```
-> message-service restart
```

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service

Enable or disable the Active Lease Service operation.

active-lease-service {enable | disable}

Syntax Definitions

enable	Enables the operational status of the Active Lease Service.
disable	Disables the operational status of the Active Lease Service.

Defaults

By default, the operational status of Active Lease Service is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

There is one instance of Active Lease Service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> active-lease-service enable  
-> active-lease-service disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service restart	Restarts the Active Lease Service after the netd.pcy file is modified.
show active-lease-service status	Displays the status and statistical information related to Active Lease Service running on the switch.

MIB Objects

MIB Objects

N/A

dhcp-snooping admin-state

Enables or disables DHCP Snooping for the switch.

dhcp-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping for the switch.
disable	Disables DHCP Snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A.

Examples

```
-> dhcp-snooping admin-state enable  
-> dhcp-snooping admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping vlan	.Enables or disables DHCP Snooping on a per VLAN basis.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
dhcpSnoopingTable  
  dhcpSnoopingMode
```

dhcp-snooping mac-address-verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

dhcp-snooping mac-address-verification admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP MAC address verification for the switch.
disable	Disables DHCP MAC address verification for the switch.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping mac-address-verification admin-state enable
-> dhcp-snooping mac-address-verification admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip udp relay no statistics	.Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping option-82-data-insertion	Globally enables or disables DHCP Option-82 data insertion for DHCP packets.

MIB Objects

```
dhcpSnoopingTable
  dhcpSnoopingMacAddrVerificationStatus
```

dhcp-snooping option-82-data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

dhcp-snooping option-82-data-insertion admin-state {enable | disable}

Syntax Definitions

enable	Enables inserting the DHCP Option-82 field into DHCP packets.
disable	Disables inserting the DHCP Option-82 field into DHCP packets.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, Option-82-data-insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> dhcp-snooping option-82-data-insertion admin-state enable
-> dhcp-snooping option-82-data-insertion admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping option-82 format	Configures the type of information that is inserted in both the Circuit ID and Remote ID sub option of the Option-82 field.
ip udp relay no statistics	.Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping ip-source-filter	Enables or disables the DHCP Snooping binding table functionality
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

dhcpSnoopingTable
dhcpSnoopingOpt82InsertionStatus

dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

dhcp-snooping bypass option-82-check admin-state {enable | disable}

Syntax Definitions

enable	Bypasses the Option-82 field check.
disable	Checks DHCP packets for the Option-82 field.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

Examples

```
-> dhcp-snooping bypass option-82-check admin-state enable
-> dhcp-snooping bypass option-82-check admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip udp relay no statistics	Globally enables or disables DHCP Snooping for the switch.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
dhcpSnoopingTable
  dhcpSnoopingBypassOpt82CheckStatus
```

dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.

dhcp-snooping option-82 format [**base-mac** | **system-name** | **user-string** *string* / **interface-alias** | **auto-interface-alias** | **ascii** [{ **remote-id** | **circuit-id** } {**base-mac** | **cvlan** | **interface** | **interface-alias** | **system-name** | **user-string** *string* | **vlan** } {**delimiter** *string*}]]

no dhcp-snooping option-82 format [**base-mac** | **system-name** | **user-string** *string* / **interface-alias** | **auto-interface-alias** | **ascii** [{**remote-id** | **circuit-id** } {**base-mac** | **cvlan** | **interface** | **interface-alias** | **system-name** | **user-string** *string* | **vlan** } {**delimiter** *string*}]]

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
<i>string</i>	A user defined text string. Supports up to 64 characters.
interface-alias	The alias configured for the interface.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: SystemName_slot_port. ascii ASCII format.
ascii	ASCII format. remote-id circuit-id : Select the sub-id fields of option-82 to configure ascii. base-mac : The base MAC address of the switch. cvlan : The Customer VLAN ID. interface : The interface name. interface-alias : The alias configured for the interface. system-name : The system name of the switch. user-string : A user defined text string. vlan : The VLAN ID of which the client is a member. <i>string</i> : A user-defined text string. delimiter : The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

Defaults

parameter	default
user-string <i>string</i> system-name interface-alias base-mac auto-interface-alias ascii	base-mac
ascii	base-mac

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a string for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the string “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the interfaces alias command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the interface-alias and auto-interface-alias commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID sub option. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID or Remote ID sub option in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- Use the no form of this command to remove the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.s option-82-check admin-state disable.

Examples

```
-> dhcp-snooping option-82 format user-string "Building B Server"  
-> dhcp-snooping option-82 format system-name  
-> dhcp-snooping option-82 format base-mac  
-> dhcp-snooping option-82 format interface-alias  
-> dhcp-snooping option-82 format auto-interface-alias  
-> no dhcp-snooping option-82 format user-string "Building B Server"
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

dhcp-snooping vlan *vlan_id* [**mac-address-verification** {**enable** | **disable**}] [**option-82-data-insertion** {**enable** | **disable**}] [**admin-state**]

no dhcp-snooping vlan *vlan_id*

Syntax Definitions

<i>vlan_id</i>	The VLAN identification number (1–4094).
mac-address verification	Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
option-82 data-insertion	Enables or disables inserting Option-82 information into DHCP packets.
admin-state	Enables or disables DHCP snooping feature for specified VLAN.

Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

parameter	default
mac-address verification	Enabled
option-82 data-insertion	Enabled

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable DHCP Snooping for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- Note that disabling the Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

```
-> dhcp-snooping vlan 100 admin-state enable
-> dhcp-snooping vlan 100 admin-state disable
-> dhcp-snooping vlan 100 admin-state enable mac-address-verification enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[ip udp relay no statistics](#) Globally enables or disables DHCP Snooping for the switch.
[dhcp-snooping ip-source-filter](#) Enables or disables the DHCP Snooping binding table functionality

MIB Objects

```
dhcpSnoopingVlanTable
  dhcpSnoopingVlanNumber
  dhcpSnoopingVlanMacVerificationStatus
  dhcpSnoopingVlanOpt82DataInsertionStatus
```

dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping port chassis/slot1/port[-port2] {block | client-only | trust}
```

Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot1/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
block	Blocks all DHCP traffic on the port.
client-only	Allows only DHCP client traffic on the port.
trust	Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the [show dhcp-snooping port](#) command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping port 1/1/24 trust
-> dhcp-snooping port 1/1/1-10 block
-> dhcp-snooping port 1/1/8 client-only
```

Release History

Release 7.3.4; command introduced.

Related Commands**ip udp relay no statistics**

Globally enables or disables DHCP Snooping for the switch.

dhcp-snooping vlan

Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects

dhcpSnoopingPortTable

dhcpSnoopingPortIfIndex

 dhcpSnoopingPortTrustMode

dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping linkagg agg_id {block | client-only | trust}
```

Syntax Definitions

<i>agg_id</i>	The link aggregate ID number.
block	Blocks all DHCP traffic on the link aggregate.
client-only	Allows only DHCP client traffic on the link aggregate.
trust	Allows all DHCP traffic on the link aggregate. The link aggregate behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the [show dhcp-snooping port](#) command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping linkagg 1 trust
-> dhcp-snooping linkagg 2 block
-> dhcp-snooping linkagg 3 client-only
```

Release History

Release 7.3.4; command introduced.

Related Commands

ip udp relay no statistics	Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects`dhcpSnoopingPortTable``dhcpSnoopingPortIfIndex``dhcpSnoopingPortTrustMode`

dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability at a port, link aggregation, or VLAN level. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

dhcp-snooping ip-source-filter {**vlan** *vlan_id* | **port** *chassis/slot/port[-port2]* | **linkagg** *agg_id*} {**enable** | **disable**}

Syntax Definitions

<i>vlan_id</i>	The VLAN identification number (1–4094).
<i>chassis</i>	The chassis identifier.
<i>slot1/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i>	The link aggregate ID number.
enable	Enables IP source filtering for the specified port, link aggregation, or VLAN.
disable	Disables IP source filtering for the specified port, link aggregation, or VLAN level.

Defaults

By default, IP source filtering is disabled for a port or link aggregate, or VLAN.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled as follows:
 - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
 - on all the ports when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping ip-source-filter port 1/1/1 enable
-> dhcp-snooping ip-source-filter linkagg 2 enable
-> dhcp-snooping ip-source-filter vlan 10 enable
-> dhcp-snooping ip-source-filter vlan 20 disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show ip udp relay](#)

Displays the ports or VLANs on which IP source filtering is enabled.

```

dhcp-snooping binding admin-state

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

dhcp-snooping binding admin-state {enable | disable}

Syntax Definitions

enable	Enables the creation of binding table entries.
disable	Disables the creation of binding table entries.

Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.

Examples

```
-> dhcp-snooping binding admin-state disable
-> dhcp-snooping binding admin-state enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding timeout Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

dhcp-snooping binding action Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable
  dhcpSnoopingBindingStatus
```

dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

dhcp-snooping binding timeout *seconds*

Syntax Definitions

seconds The number of seconds to wait before the next save. The valid range is 60–600.

Defaults

By default, the timeout value is set to 300 seconds.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the **dhcpBinding.db** file in the **/flash/switch** directory.
- The **dhcpBinding.db** file is time stamped when a save of the binding table contents is successfully completed.

Examples

```
-> dhcp-snooping binding timeout 600
-> dhcp-snooping binding timeout 250
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping ip-source-filter .Enables or disables the DHCP Snooping binding table functionality.

dhcp-snooping binding action Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

dhcpSnoopingBindingTable
ipHelperDhcpSnoopingBindingDatabaseSyncTimeout

dhcp-snooping binding action

Triggers a purge or renew action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file.

dhcp-snooping binding action {purge | renew}

Syntax Definitions

purge	Clears all binding table entries that are maintained in switch memory.
renew	Populates the binding table with entries saved in the dhcpBinding.db file located in the /flash/switch directory on the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **purge** and **renew** options available with this command to sync the binding table contents with the contents of the **dhcpBinding.db** file.

Examples

```
-> dhcp-snooping binding action purge
-> dhcp-snooping binding action renew
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping ip-source-filter .Enables or disables the DHCP Snooping binding table functionality.

dhcp-snooping binding timeout Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

dhcpSnoopingBindingDatabaseAction

dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

dhcp-snooping binding persistency admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping binding persistency.
disable	Disables DHCP Snooping binding persistency.

Defaults

By default, DHCP Snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the [show ip helper](#) command to display the current status.

Examples

```
-> dhcp-snooping binding persistency admin-state enable
-> dhcp-snooping binding persistency admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[dhcp-snooping ip-source-filter](#) Enables or disables the DHCP Snooping binding table functionality.

[dhcp-snooping binding timeout](#) Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

dhcpSnoopingBindingPersistencyStatus

dhcp-snooping binding

Creates a static entry in the binding table.

dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

no dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

Syntax Definitions

<i>mac_address</i>	The client MAC address.
<i>chassis</i>	The chassis identifier.
<i>slot1/port[-port2]</i>	The slot and port number (3/1).
<i>ip_address</i>	The IP address that the DHCP server offered to the client.
<i>vlan_id</i>	The VLAN identification number (1–4094).

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.
- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.

Examples

```
-> dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
-> no dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan
200
```

show dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show dhcp-snooping ip-source-filter {vlan | port}

Syntax Definitions

vlan	Displays the VLANs on which IP source filtering is enabled.
port	Displays the ports on which IP source filtering is enabled.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

Examples

```
-> show dhcp-snooping ip-source-filter port
Slot   IP Src
Port   Filtering
-----+-----
1/7     Enabled
1/12    Enabled
```

output definitions

Slot/Port	Specifies the slot and port number.
IP Src Filtering	Specifies if IP source filtering status. Enabled or Disabled .

```
-> show dhcp-snooping ip-source-filter vlan
Vlan ID IP Src Filtering
-----+-----
10      Enabled
11      Enabled
12      Enabled
13      Enabled
```

output definitions

Vlan ID	VLAN number.
IP Src Filtering	Specifies if IP source filtering status. Enabled or Disabled .

Release History

Release 7.3.4; command introduced.

show dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

show dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show ip helper** command to determine the status of DHCP Snooping at the switch level.

Examples

```
-> show dhcp-snooping vlan
VLAN      Opt82      MAC Addr
ID        Insertion  Verification
-----+-----+-----
50         Enabled    Enabled
60         Enabled    Enabled
100        Disabled   Enabled
200        Enabled    Disabled
1500       Disabled   Disabled
```

output definitions

VLAN ID	The VLAN identification number for the DHCP Snooping VLAN.
MAC Address Verification	Indicates whether or not MAC address verification is enabled for the VLAN (Enabled or Disabled). Configured through the dhcp-snooping vlan command.
Opt-82 Data Insertion	Indicates whether or not Option-82 data insertion is enabled for the VLAN (Enabled or Disabled). Configured through the dhcp-snooping vlan command.

Release History

Release 7.3.4; command introduced.

Related Commands

show dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

show dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

Examples

```
-> show dhcp-snooping port
Slot      Trust      IP Src      Opt82      MAC      Server      Relay      Binding
Port      Mode       Filtering  Violation  Violation Violation  Violation Violation
-----+-----+-----+-----+-----+-----+-----+-----
1/1       Blocked   Disabled    0          0          0          0          0
1/2       Client-Only Enabled     0          0          0          0          0
1/3       Client-Only Enabled     0          0          0          0          0
1/4       Client-Only Enabled     0          0          0          0          0
1/5       Client-Only Enabled     0          0          0          0          0
1/6       Blocked   Disabled    0          0          0          0          0
1/7       Client-Only Enabled     0          0          0          0          0
1/8       Client-Only Enabled     0          0          0          0          0
1/9       Client-Only Enabled     0          0          0          0          0
1/10      Trusted   Disabled    0          0          0          0          0
1/11      Trusted   Disabled    0          0          0          0          0
1/12      Trusted   Disabled    0          0          0          0          0
```

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
Trust Mode	The DHCP Snooping trust mode for the port (Blocked , Client-Only , or Trusted). Configured through the dhcp-snooping port command.
IP Src Filtering	Indicates whether or not IP source filtering is enabled for the port (Enabled or Disabled). Configured through the dhcp-snooping ip-source-filter command.
Opt82 Violation	The number of DHCP packets dropped due to a DHCP Snooping Option-82 violation.
MAC Violation	The number of DHCP packets dropped due to a mismatch between the packet source MAC address and the client hardware address contained within the packet.
Server Violation	The number of DHCP server packets dropped because they originated from outside the network or firewall.
Relay Violation	The number of DHCP packets dropped because the packet included a relay agent IP address that was not 0.0.0.0.
Binding Violation	The number of DHCP packets dropped due to a mismatch between packets received and binding table information.

Release History

Release 7.3.4; command introduced.

show dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

show dhcp-snooping binding

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the [dhcp-snooping ip-source-filter](#) command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> show dhcp-snooping binding
      MAC          Slot      IP          Lease   VLAN   Binding
      Address      Port      Address     Time    ID     Type
-----+-----+-----+-----+-----+-----
00:ae:22:e4:00:08  1/4     10.255.11.23  2000    5     Dynamic
10:fe:a2:e4:32:08  2/15    10.255.91.53  2000    2     Dynamic
```

output definitions

MAC Address	The MAC address of the client.
Slot/Port	The slot/port designation for the switch port that received the DHCP request
IP Address	The IP address offered by the DHCP server.
Lease Time	The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.
VLAN ID	The VLAN ID of the VLAN to which the client belongs.
Binding Type	Indicates whether the binding table entry is dynamic or static . Static entries are created using the dhcp-snooping binding command.

25 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP/VRRP3 routers on the LAN. The VRRP/VRRP3 router, which controls the IP/IPv6 address associated with a virtual router is called the master router, and forwards packets to that IP/IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The Alcatel-Lucent implementation of VRRP also supports the collective management of virtual routers on a switch.

Note. VRRP3 does not support the collective management functionality in this release.

The VRRP and VRRP3 commands comply with RFC 2787 and RFC 3768, respectively.

MIB information is as follows:

Filename: IETF-VRRP.MIB
Module: VRRP-MIB

Filename: AlcatelIND1VRRP.MIB
Module: ALCATEL-IND1-VRRP-MIB

Filename: AlcatelIND1VRRP3.MIB
Module: ALCATEL-IND1-VRRP3-MIB

A summary of the available VRRP commands is listed here:

vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp *vrid* *vlan_id* **admin-state** [**enable** | **disable**] [**priority** *priority*] [**preempt** | **no preempt**]
[[**advertising**] **interval** *seconds*] [**authenticate** *password* | **no authenticate**]

no vrrp *vrid* *vlan_id*

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router. A virtual router may only be enabled if an IP address is configured for the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
<i>seconds</i>	The interval in seconds after which the master router will send VRRP advertisements. The advertising interval must be same for all VRRP routers configured with the same VRID. The valid range is 1–255 seconds.
<i>password</i>	A 16-character password to be used for simple text authentication of VRRP packets. The password must be same for all VRRP routers configured for this VRID.
no authenticate	Specifies that VRRP packets should not be authenticated. If authentication is enabled for this virtual router, it must be enabled for all VRRP routers configured with this VRID.

Defaults

parameter	default
enable disable	disable
<i>priority</i>	100
preempt no preempt	preempt
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp address** command to configure an IP address for the virtual router. This must be done before the virtual router can be enabled.
- To disable the virtual router, rather than to remove it, use the **disable**. Note that **disable** cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The **advertising** parameter is optional. When used before the **interval** parameter, it displays the same information as **vrrp vrid vlan_id interval**.
- A value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.

Examples

```
-> vrrp 23 1 priority 75
-> vrrp 23 1 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[vrrp address](#)

Configures an IP address for a virtual router.

vrrp address

Configures an IP address for a virtual router.

```
vrrp vrid vlan_id address ip_address
```

```
vrrp vrid vlan_id no address ip_address
```

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>ip_address</i>	The virtual IPv4 address associated with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A virtual router IP address must be configured before the virtual router can be enabled.
- **IP** is an optional command parameter. It displays the same information as **vrrp address**.

Examples

```
-> vrrp 1 3 address 10.10.3.2  
-> vrrp 1 3 no address 10.10.3.2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp statistics	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable  
  alaVrrp3AssoIpAddrRowStatus
```

vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

vrrp track *track_id* **admin-state** [**enable** | **disable**] [**priority** *value*] [**ipv4-interface** *if_name* / **ipv6-interface** *if_name* | **port** *chassis/slot/port* | **address** *ip_address*]

no vrrp track *track_id*

Syntax Definitions

<i>track_id</i>	The ID of the tracking policy; the range is 1 to 255.
enable	Enables the tracking policy.
disable	Disables the tracking policy.
<i>value</i>	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. The valid range is 0–255.
<i>if_name</i>	The name of the IPv4 or IPv6 interface that this policy will track.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot/port number that this policy will track.
<i>ip_address</i>	The remote IPv4 or IPv6 address that this policy will track.

Defaults

parameter	default
enable disable	enable
<i>value</i>	25

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **disable** option to disable the tracking policy, rather than removing it from the switch.

Examples

```
-> vrrp track 2 admin-state enable priority 50 ipv4-interface Marketing
-> vrrp track 3 admin-state enable priority 60 ipv6-interface Sales
-> vrrp track 3 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp track-association

Associates a VRRP tracking policy with a virtual router.

```
vrrp vrid vlan_id track-association track_id
```

```
vrrp vrid vlan_id no track-association track_id
```

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove a tracking policy from a virtual router.

Examples

```
-> vrrp 2 4 track-association 1  
-> vrrp 2 4 no track-association 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp track-association	Displays the tracking policies associated with virtual routers.

MIB Objects

```
alaVrrpAssoTrackTable  
  alaVrrpAssoTrackId  
  alaVrrpTrackRowStatus
```

vrrp trap

Enables or disables SNMP traps for VRRP.

vrrp trap

no vrrp trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP are enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP traps to actually be sent.

Examples

```
-> vrrp trap
-> no vrrp trap
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[snmp-trap filter-ip](#) Enables or disables SNMP trap filtering.

MIB Objects

```
vrrpOperGroup
  vrrpNotificationCntl
```

vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

vrrp delay *seconds*

Syntax Definitions

seconds The amount of time after a reboot that virtual routers will wait before they go active; the range is 0–180 seconds.

Defaults

parameter	default
<i>seconds</i>	45 seconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

Examples

```
-> vrrp delay 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

show vrrp Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVRRPStartDelay

vrrp interval

Modifies the default advertising interval value assigned to the virtual routers on the switch.

vrrp interval *seconds*

Syntax Definitions

seconds The default advertising interval for the virtual routers. The valid range is 1–255 seconds.

Defaults

parameter	default
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config  
  alaVrrpDefaultPriority
```

vrrp preempt

Modifies the default preempt mode assigned to the virtual routers on the switch.

vrrp [preempt | no preempt]

Syntax Definitions

preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
preempt no preempt	preempt

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp preempt
-> vrrp no preempt
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVrrpv2Config
alaVrrpDefaultPreemptMode

vrrp all

Changes the administrative status of all the virtual routers on the switch.

vrrp admin-state [disable | enable | enable-all]

Syntax Definitions

disable	Disables all the virtual routers on the switch.
enable	Enables the virtual routers that have not previously been disabled individually or collectively through the vrrp group all command.
enable-all	Enables all the virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the vrrp group all command.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command changes the administrative status of all the virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp admin-state disable
-> vrrp admin-state enable
-> vrrp admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVrrpv2Config
alaVrrpAdminState

vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

```
vrrp set [interval | priority | preempt | all | none] [override]
```

Syntax Definitions

interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters value to the new default value.
none	Resets all the parameter values to their default values.
override	Overrides the specified parameters configured value with the new default value.

Defaults

parameter	default
interval priority preempt all	all

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp set priority
-> vrrp set priority override
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp all	Changes the administrative status of all the virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config  
  alaVrrpSetParam  
  alaVrrpOverride
```

vrrp group

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

vrrp group *vrgid* [*interval seconds*] [*priority priority*] [**preempt** | **no preempt**]

no vrrp group *vrgid*

Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<i>seconds</i>	The default advertising interval for the virtual router group. The valid range is 1–255 seconds.
<i>priority</i>	The default priority value for the virtual router group. The valid range is 1–255.
preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
<i>seconds</i>	1
<i>priority</i>	100
preempt no preempt	preempt

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default value to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

```
-> vrrp group 25 interval 50 priority 50 no preempt  
-> no vrrp group 25
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
vrrp group-association	Adds a virtual router to a virtual router group.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable  
  alaVrrpGroupInterval  
  alaVrrpGroupPriority  
  alaVrrpGroupPreemptMode  
  alaVrrpGroupRowStatus
```

vrrp group all

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

vrrp group *vrgid* admin-state [disable | enable | enable-all]

Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
disable	Disables all the virtual routers in the group.
enable	Enables those virtual routers that have not previously been disabled individually in the group.
enable-all	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If a virtual router in a group is disabled on an individual basis, it can only be reenabled by using the **enable-all** option in this command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp group 25 admin-state disable
-> vrrp group 25 admin-state enable
-> vrrp group 25 admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

alaVrrpGroupTable
 alaVrrpGroupAdminState

vrrp group set

Sets the new modified default value to all the virtual routers in a virtual router group.

vrrp group *vrgid* set [interval | priority | preempt | all] [override]

Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters' value to the new default value.
override	Overrides the parameter's configured value with the group default value.

Defaults

parameter	default
interval priority preempt all	all

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, you must disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.

Examples

```
->vrrp group 10 set priority
->vrrp group 10 set priority override
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable  
  alaVrrpGroupSetParam  
  alaVrrpGroupOverride
```

vrrp group-association

Adds a virtual router to a virtual router group.

```
vrrp vrid vlan_id group-association vrgid
```

```
vrrp vrid vlan_id no group-association vrgid
```

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<i>vrgid</i>	The virtual router group ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the virtual router from the virtual router group.
- A virtual router need not be disabled in order to be added to a virtual router group. However, the virtual router will not adopt the group's default parameter values until it is reenabled.
- A virtual router need not be disabled to be removed from a group.

Examples

```
-> vrrp 25 1 group-association 10  
-> vrrp 25 1 no group-association 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show vrrp group-association](#) Displays the virtual routers that are associated with a group.

MIB Objects

```
alaVrrpAssoGroupTable  
alaVrrpAssoGroupRowStatus
```

vrrp3

Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp3 *vrid* *vlan_id* **admin-state** [**enable** | **disable**] [**priority** *priority*] [**preempt** | **no preempt**][**accept** | **no accept**] [[**advertising**] **interval** *centiseconds*] [**authenticate** *password* | **no authenticate**]

no vrrp3 *vrid* *vlan_id*

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
accept	Specifies that the master router, which is not the IPv6 address owner, will accept the packets addressed to the IPv6 address owner as its own.
no accept	Specifies that the master router, which is not the IPv6 address owner will not accept the packets addressed to the IPv6 address owner as its own.
<i>centiseconds</i>	The interval in centiseconds after which the master router will send VRRP3 advertisements. The advertising interval must be the same for all VRRP3 routers configured with the same VRID. The valid range is 1–4096 centiseconds.
<i>password</i>	A 16-character password to be used for simple text authentication of VRRP packets. The password must be same for all VRRP routers configured for this VRID.
no authenticate	Specifies that VRRP packets should not be authenticated. If authentication is enabled for this virtual router, it must be enabled for all VRRP routers configured with this VRID.

Defaults

parameter	default
enable disable	disable
<i>priority</i>	100
preempt no preempt	preempt
accept / no accept	accept
<i>centiseconds</i>	100

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp3 address** command to configure an IPv6 address for the virtual router.
- To disable the virtual router, rather than to remove it, use the **disable** option. Note that the **disable** option cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The maximum number of virtual routers supported is based on the 100 centisecond interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval cannot be less than 10 centiseconds.
- **Advertising** is an optional command parameter. When prefaced before **interval**, it displays the same information as **vrrp3 vrid vlan_id interval**.

Examples

```
-> vrrp3 23 1 priority 75
-> vrrp3 23 1 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[vrrp3 address](#)

Configures an IPv6 address for a virtual router.

[show vrrp3](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVrrp3OperTable

- alaVrrp3OperAdminState
- alaVrrp3OperPriority

- alaVrrp3OperRowStatus

vrrp3 address

Configures an IPv6 address for a virtual router.

```
vrrp3 vrid vlan_id address ip_address
```

```
vrrp3 vrid vlan_id no address ip_address
```

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>ip_address</i>	The virtual IPv6 address to associate with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

IP is an optional command parameter. It displays the same information as **vrrp3 address**.

Examples

```
-> vrrp3 1 3 address 213:100:1::56  
-> vrrp3 1 3 no address 213:100:1::56
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable  
  alaVrrp3AssoIpAddrRowStatus
```

vrrp3 trap

Enables or disables SNMP traps for VRRP3.

vrrp3 trap

no vrrp3 trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP3 are enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP3 traps to actually be sent.

Examples

```
-> vrrp3 trap  
-> no vrrp3 trap
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[snmp-trap filter-ip](#) SNMP traps must be enabled with this command.

MIB Objects

```
alaVrrp3OperGroup  
alaVrrp3NotificationCntl
```

vrrp3 track-association

Associates a VRRP3 tracking policy with a virtual router.

```
vrrp3 vrid vlan_id track-association track_id
```

```
vrrp3 vrid vlan_id no track-association track_id
```

Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- Use the **vrrp track** command to create a tracking policy for an IPv6 interface.

Examples

```
-> vrrp3 2 4 track-association 1  
-> vrrp3 2 4 no track-association 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 track-association	Displays the tracking policies associated with VRRP3 virtual routers.

MIB Objects

```
alaVrrp3AssoTrackTable  
  alaVrrp3AssoTrackId  
  alaVrrp3TrackRowStatus
```

output definitions

VRRP default advertisement interval	The default advertising interval for all virtual routers on the switch.
VRRP default priority	The default priority value for all virtual routers on the switch.
VRRP default preempt	The default preempt mode for all virtual routers on the switch.
VRRP trap generation	Indicates whether or not the VRRP trap generation is enabled or disabled; configured through the vrrp track command.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the vrrp delay command.
VRID	Virtual router identifier. Configured through the vrrp command.
VLAN	The VLAN associated with the VRRP instance. Configured through the vrrp command.
IP Address(es)	The assigned IP addresses. Configured through the vrrp address command.
Admin Status	The administrative status of this virtual router instance; enabled allows the virtual router instance to operate; disabled disables the virtual router instance without deleting it.
Priority	Indicates the VRRP router's priority for the virtual router. For more information about priority, see the vrrp command description on page 25-3 .
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master router: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.
Virtual MAC	Displays the virtual MAC address for the virtual router. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the backup or initialize state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp address	Configures an IP address for a virtual router.
vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
show vrrp statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

  alaVrrp3OperAdminState  
  alaVrrp3OperPriority  
  alaVrrp3OperPreemptMode  
  alaVrrp3OperAcceptMode
```

output definitions (continued)

State	The operational state of the VRRP router instance; initialize specifies that the interface or VLAN is either disabled or down, or if the startup delay timer has not expired; backup specifies that this instance is monitoring the availability of the master router; master specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become Master	The total number of times this virtual router's state has transitioned from backup to master.
Adv. Rcvd	The total number of VRRP advertisements received by this instance.

```
-> show vrrp 1 statistics
Virtual Router VRID = 1 on VLAN = 1
  State = master
  UpTime (1/100th second) = 378890
  Become master = 1
  Advertisements received = 0
  Type errors = 0
  Advertisement interval errors = 0
  Authentication errors = 0
  IP TTL errors = 0
  IP address list errors = 0
  Packet length errors = 0
  Zero priority advertisements sent = 0
  Zero priority advertisements received = 0
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance.
State	The operational state of this VRRP router instance; initialize specifies that the interface or VLAN is either disabled or down, or the startup delay timer has not expired; backup specifies that this instance is monitoring the availability of the master router; master specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become master	The total number of times this virtual router's state has transitioned from backup to master.
Advertisements received	The total number of VRRP advertisements received by this instance.
Type errors	The total number of VRRP packets received with an invalid value in the VRRP type field.
Advertisement interval errors	The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.
Authentication errors	The total number of VRRP packets received with an unknown or invalid authentication type.
IP TTL errors	The total number of VRRP packets received with a TTL value other than 255.

output definitions (continued)

IP address list errors	The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.
Packet length errors	The total number of VRRP packets received with a length less than the length of the VRRP header.
Zero priority advertisements sent	The total number of VRRP advertisements with a priority of 0 sent by the virtual router.
Zero priority advertisements received	The total number of VRRP advertisements with a priority of 0 received by the virtual router.

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaVrrpTrackEntityIpAddress
  alaVrrpTrackEntityIpv6Interface
  alaVrrpTrackEntityInterface
```

show vrrp track-association

Displays the tracking policies associated with virtual routers.

show vrrp [*vrid*] **track-association** [*track_id*]

Syntax Definitions

vrid The virtual router ID, in the range from 1–255.
track_id The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp 2 track-association
```

VRID	VLAN	Conf Pri	Cur Pri	Track ID	Policy	Admin State	Oper State	Track Pri
2	1	100	100	1	VLAN 1	Enabled	Up	25
				2	10.255.11.101	Enabled	Up	25

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the vrrp command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IP address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy configured through the vrrp track command.

output definitions (continued)

Oper State	Whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.

output definitions

VRRP trap generation	Whether or not VRRP trap generation is enabled or disabled.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize.
VRID	Virtual router identifier. Configured through the vrrp3 command.
VLAN	The VLAN associated with the VRRP3 instance. Configured through the vrrp3 command.
IPv6 Address(es)	The assigned IPv6 addresses. Configured through the vrrp3 address command.
Admin Status	The administrative status of this virtual router instance; enabled allows the virtual router instance to operate; disabled disables the virtual router instance without deleting it.
Priority	Indicates the VRRP3 router's priority for the virtual router. For more information about priority, see the vrrp3 command description on page 25-29 .
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case the IP address owner will always take over it if is available.
Accept	Displays whether the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
Virtual MAC	Displays the virtual MAC address for the virtual router when the router is in the master state. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the backup or initialize state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 7.1.1; command was introduced.

Related Commands

show vrrp3 track-association

Displays the tracking policies associated with VRRP3 virtual routers.

show vrrp3 [*vrid*] **track-association** [*track_id*]

Syntax Definitions

vrid The virtual router ID, in the range from 1–255.
track_id The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp3 track-association
      Conf  Cur  Track
VRID VLAN Pri  Pri  ID          Policy      Admin  Oper  Track
-----+-----+-----+-----+-----+-----+-----+-----+-----+
      1  101  200  200  1  PORT 1/37      Enabled  Up    25
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the vrrp3 command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IPv6 address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy.

output definitions (continued)

Oper State	Indicates whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

26 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf.mib
Module: ALCATEL-IND1-OSPF-MIB

Filename: IETF_OSPF.MIB
Module: OSPF-MIB

The following is a list of the commands for configuring OSPF:

Global OSPF Commands	<code>ip ospf admin-state</code> <code>ip load ospf</code> <code>ip ospf asbr</code> <code>ip ospf exit-overflow-interval</code> <code>ip ospf extlsdb-limit</code> <code>ip ospf host</code> <code>ip ospf mtu-checking</code> <code>ip ospf default-originate</code> <code>ip ospf route-tag</code> <code>ip ospf spf-timer</code> <code>ip ospf virtual-link</code> <code>ip ospf neighbor</code> <code>show ip ospf</code> <code>show ip ospf border-routers</code> <code>show ip ospf ext-lsdb</code> <code>show ip ospf host</code> <code>show ip ospf lsdb</code> <code>show ip ospf neighbor</code> <code>show ip ospf routes</code> <code>show ip ospf virtual-link</code> <code>show ip ospf virtual-neighbor</code>
OSPF Area Commands	<code>ip ospf area</code> <code>ip ospf area default-metric</code> <code>ip ospf area range</code> <code>show ip ospf area</code> <code>show ip ospf area range</code> <code>show ip ospf area stub</code>
OSPF Interface Commands	<code>ip ospf interface</code> <code>ip ospf interface admin-state</code> <code>ip ospf interface area</code> <code>ip ospf interface auth-key</code> <code>ip ospf interface auth-type</code> <code>ip ospf interface dead-interval</code> <code>ip ospf interface hello-interval</code> <code>ip ospf interface md5</code> <code>ip ospf interface md5 key</code> <code>ip ospf interface type</code> <code>ip ospf interface cost</code> <code>ip ospf interface poll-interval</code> <code>ip ospf interface priority</code> <code>ip ospf interface retrans-interval</code> <code>ip ospf interface transit-delay</code> <code>show ip ospf interface</code>

ip ospf admin-state

Enables or disables the administration status of OSPF on the router.

```
ip ospf admin-state {enable | disable}
```

Syntax Definitions

enable	Enables OSPF.
disable	Disables OSPF.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

Examples

```
-> ip ospf admin-state enable  
-> ip ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup  
  ospfAdminStat
```

ip load ospf

Loads the OSPF software on the router.

ip load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

N/A

Example

```
-> ip load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

ALADRCTMCONFIG
alaDrcTmIPOspfStatus

ip ospf asbr

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR.

ip ospf asbr

no ip ospf asbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The **no** variant of this command removes the ASBR classification of the selected router.

Examples

```
-> ip ospf asbr  
-> no ip ospf asbr
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfAsBdRtr
```

ip ospf exit-overflow-interval

This command sets the overflow interval value.

ip ospf exit-overflow-interval *seconds*

Syntax Definitions

seconds The number of seconds the router waits before attempting to leave the overflow state.

Defaults

parameter	default
<i>seconds</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router's arrival into this state.
- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

Example

```
-> ip ospf exit-overflow-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays the OSPF status and general configuration parameters.

MIB Objects

ospfGeneralGroup
ospfExitOverflowInterval

ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

ip ospf extlsdb-limit *limit*

Syntax Definitions

limit The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

Defaults

parameter	default
<i>limit</i>	-1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

Example

```
-> ip ospf extlsdb-limit 25
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

ospfGeneralGroup
ospfExtLsdbLimit

ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

ip ospf host *ip_address* **tos** *tos* [**metric** *metric*]

no ip ospf host *ip_address* **tos** *tos*

Syntax Definitions

<i>ip_address</i>	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
<i>tos</i>	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0 and up.

Defaults

parameter	default
<i>metric</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.

Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10
-> no ip ospf host 172.22.2.115 tos 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf host](#)

MIB Objects

ospfHostTable

ospfHostStatus

ospfHostIpAddress

ospfHostTOS

ospfHostMetric

ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking

no ip ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ip ospf mtu-checking  
-> no ip ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfMTUcheck
```

ip ospf default-originate

Configures a default external route into the OSPF routing domain.

```
ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric value]
```

```
no ip ospf default-originate
```

Syntax Definitions

only	Advertises only when there is a default route in the routing table.
always	Advertises the default route regardless of whether the routing table has a default route.
type1	Sets the external route as type1.
type2	Sets the external route as type2.
<i>value</i>	The metric value. The valid range is 1-65535.

Defaults

parameter	default
type1 type2	type2
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf

Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfDefaultOriginate  
  alaOspfDefaultOriginateMetricType  
  alaOspfDefaultOriginateMetric
```

ip ospf route-tag

Configures a tag value that is applied to internal routes for potential redistribution.

ip ospf route-tag *tag*

Syntax Definitions

tag The set tag value. The valid range is 0–2,147,483,647.

Defaults

parameter	default
<i>tag</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- A 32-bit value tagged to each OSPF internal route that is redistributed into other routing protocol domains. The lower 16-bits typically indicate the autonomous system number.

Example

```
-> ip ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfRedistRouteTag
```

ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ip ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

Syntax Definitions

<i>delay_seconds</i>	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
<i>hold_seconds</i>	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Example

```
-> ip ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ip ospf**

Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
  alaOspfTimerSpfDelay
  alaOspfTimerSpfHold
```

ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

ip ospf virtual-link *area_id* *router_id* [**auth-type** {**none** | **simple** | **md5**}] [**auth-key** *key_string*] [**dead-interval** *seconds*] [**hello-interval** *seconds*] [**retrans-interval** *seconds*] [**transit-delay** *seconds*]

no ip ospf virtual-link *area_id* *router_id*

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
none	Sets the virtual link authorization type to no authentication.
simple	Sets the virtual link authorization type to simple authentication. If simple is selected, a key must be specified as well.
md5	Sets the virtual link authorization type to MD5 authentication.
<i>key_string</i>	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
dead-interval <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
none simple md5	none
<i>key_string</i>	null string
dead-interval <i>seconds</i>	40
hello-interval <i>seconds</i>	10
retrans-interval <i>seconds</i>	5
transit-delay <i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

  ospfVirtIfRetransInterval
  ospfVirtIfTransitDelay
```

ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

ip ospf neighbor *neighbor_id* {**eligible** | **non-eligible**}

no ip ospf neighbor *neighbor_id*

Syntax Definitions

<i>neighbor_id</i>	A unique 32-bit IP address identical to the neighbor's interface address.
eligible	Sets this router as eligible to be the DR.
non-eligible	Sets this router as not eligible to be the DR.

Defaults

parameter	default
eligible non-eligible	eligible

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

Examples

```
-> ip ospf neighbor 1.1.1.1 non-eligible
-> no ip ospf neighbor 1.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

Configures the OSPF interface type.

[show ip ospf neighbor](#)

Displays information on OSPF non-virtual neighbor routers.

MIB Objects

ospfNbrTable

ospfNbrPriority

ospfNbmaNbrStatus

ip ospf area

Assigns an OSPF interface to a specified area.

```
ip ospf area area_id [summary {enable | disable}] | [type {normal | stub | nssa}]
```

```
no ip ospf area area_id
```

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
enable	Enables summarization.
disable	Disables summarization.
normal	Sets the area as a regular OSPF area.
stub	Configures an OSPF area as a stub area.
nssa	Configures an OSPF area as a Not So Stubby Area (NSSA).

Defaults

parameter	default
enable disable	enable
normal stub nssa	normal

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.

Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area default-metric	Creates or deletes an OSPF default metric.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfAreaTable  
  ospfImportAsExtern  
  ospfAreaSummary  
  ospfAreaId
```

ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

ip ospf area *area_id* **default-metric** *tos* [[**cost** *cost*] | [**type** {**ospf** | **type 1** | **type 2**}]

no ip ospf area *area_id* **default-metric** *tos*

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>tos</i>	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>cost</i>	The numerical cost of this area and ToS. Only 0 is supported in the current release.
ospf	Advertises external routes as OSPF autonomous system external (ASE) routes.
type1	Advertises external routes as a Type 1 (non-OSPF) metric.
type2	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

Defaults

parameter	default
<i>tos</i>	0
ospf type 1 type 2	ospf

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS. To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfStubAreaTable  
  ospfStubAreaId  
  ospfStubTOS  
  ospfStubStatus  
  ospfStubMetric  
  ospfStubMetricType
```

ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```
ip ospf area area_id range {summary | nssa} ip_address subnet_mask [effect {admatching | noMatching}]
```

```
no ip ospf area area_id range {summary | nssa} ip_address subnet_mask
```

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
summary	Advertises the address range as a summary link state advertisement (LSA).
nssa	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement.
<i>ip_address</i>	A 32-bit IP address for the range's area.
<i>subnet_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
admatching	Determines that routes specified falling within the specified range will be advertised.
noMatching	Determines that any route falling within the specified range will not be advertised.

Defaults

parameter	default
summary nssa	summary
admatching noMatching	admatching

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.
- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.

- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area default-metric	Creates or deletes an OSPF default metric.
show ip ospf area range	Displays all or specified route summaries in a given area.

MIB Objects

  ospfAreaAggregateAreaId
  ospfAreaAggregateLsdbType
  ospfAreaAggregateNet
  ospfAreaAggregateMask
  ospfAreaAggregateEffect
  ospfAreaAggregateStatus
```

ip ospf interface

Creates and deletes an OSPF interface.

ip ospf interface {*interface_name*}

no ip ospf interface {*interface_name*}

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ip ospf interface admin-state

Enables or disables the administrative status on an OSPF interface.

```
ip ospf interface {interface_name} admin-state {enable | disable}
```

```
no ip ospf interface {interface_name} admin-state {enable | disable}
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

Examples

```
-> ip ospf interface vlan-101 admin-state enable
-> ip ospf interface vlan-101 admin-state disable
-> no ip ospf interface vlan-101 admin-state enable
-> no ip ospf interface vlan-101 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfAdminStat

ip ospf interface area

Configures an OSPF area identifier for this interface.

```
ip ospf interface {interface_name} area area_id
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf area	Displays either all the OSPF areas, or a specified OSPF area.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfAreaId
```

ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

```
ip ospf interface {interface_name} auth-key key_string
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_string</i>	An authentication key (8 characters maximum).

Defaults

The default for the authentication key string is a null string.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on [page 26-30](#), set to **simple**.

Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the authentication type.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfAuthKey
```

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

ip ospf interface {*interface_name*} **auth-type** [**none** | **simple** | **md5**]

Syntax Definitions

<i>interface_name</i>	The name of the interface.
none	No authentication.
simple	Simple, clear text authentication.
md5	MD5 encrypted authentication.

Defaults

parameter	default
none simple md5	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on [page 26-29](#).
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conjunction with the commands described on [page 26-34](#) and [page 26-36](#). One command enables MD5 and the other sets the key identification number.

Examples

```
-> ip ospf interface vlan-101 auth-type-simple
```

Release History

Release 7.1.1; command was introduced.

Related Commands**ip ospf interface auth-key**

Sets the password for simple authentication.

show ip ospf interface

Displays the status and statistics of an OSPF interface.

MIB Objects`ospfIfTable`
`ospfIfAuthType`

ip ospf interface dead-interval

Configures the OSPF interface dead interval.

```
ip ospf interface {interface_name} dead-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multipoint)	120

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf interface hello-interval](#) Configures the OSPF interface hello interval.

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfRtrDeadInterval
```

ip ospf interface hello-interval

Configures the OSPF interface hello interval.

```
ip ospf interface {interface_name} hello-interval seconds
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>seconds</i>	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multipoint)	30

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfHelloInterval
```

ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

ip ospf interface {*interface_name*} **md5** *key_id* [**enable** | **disable**]

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
enable	Enables the interface key.
disable	Disables the interface key.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on [page 26-30](#) and [page 26-36](#).
- The **no** variant deletes the key ID number.

Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5 key	Configures the OSPF key ID and key.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId
```

ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

```
ip ospf interface {interface_name} md5 key_id key key_string
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	The key ID. The valid range is 1–255.
<i>key_string</i>	A key string.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command is used in conjunction with the commands described above on [page 26-30](#) and [page 26-34](#).
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId  
  alaOspfIfMd5Key
```

ip ospf interface type

Configures the OSPF interface type.

ip ospf interface {*interface_name*} **type** {**point-to-point** | **point-to-multipoint** | **broadcast** | **non-broadcast**}

Syntax Definitions

<i>interface_name</i>	The name of the interface.
point-to-point	Sets the interface to be a point-to-point OSPF interface.
point-to-multipoint	Sets the interface to be a point-to-multipoint OSPF interface.
broadcast	Sets the interface to be a broadcast OSPF interface.
non-broadcast	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

Defaults

parameter	default
broadcast non-broadcast point-to-point point-to-multipoint	broadcast

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfType

ip ospf interface cost

Configures the OSPF interface cost.

```
ip ospf interface {interface_name} cost cost
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>cost</i>	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
<i>cost</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

```
-> ip ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfMetricTable  
  ospfIfMetricIpAddress  
  ospfIfMetricValue
```

ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

```
ip ospf interface {interface_name} poll-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The poll interval, in seconds. The valid range is 1–2147483647.

Defaults

parameter	default
<i>seconds</i>	120

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfPollInterval

ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface {interface_name} priority priority
```

Syntax Definitions

interface_name The name of the interface.
priority The interface priority. The valid range is 0–255.

Defaults

parameter	default
<i>priority</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ip ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfRtrPriority

ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

```
ip ospf interface {interface_name} retrans-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfRetransInterval

ip ospf interface transit-delay

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

Syntax Definitions

interface_name The name of the interface.
seconds The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfTransitDelay

ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

ip ospf restart-support {planned-unplanned | planned-only}

no ip ospf restart-support

Syntax Definitions

planned-unplanned	Specifies support for planned and unplanned restarts.
planned-only	This parameter is currently not supported.

Defaults

Graceful restart is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
  alaOspfRestartSupport
```

ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

ip ospf restart-helper [admin-state {enable | disable}]

Syntax Definitions

enable Enables the capability of an OSPF router to operate in helper mode.
disable Disables the capability of an OSPF router to operate in helper mode.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> ip ospf restart-helper admin-state disable  
-> ip ospf restart-helper admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support Administratively enables and disables support for the graceful restart feature on an OSPF router.

ip ospf restart-helper strict-lsa-checking admin-state Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

show ip ospf restart Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf  
  alaOspfRestartHelperSupport
```

ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}

Syntax Definitions

enable	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
disable	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable  
-> ip ospf restart-helper strict-lsa-checking admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf restart-support](#)

Administratively enables and disables support for the graceful restart feature on an OSPF router.

  alaOspfRestartHelperSupport
```

ip ospf restart initiate

Initiates a planned graceful restart.

ip ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Example

```
-> ip ospf restart initiate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

MIB Objects

# of attached areas      = 1,
# of Active areas        = 0,
# of Transit areas       = 0,
# of attached NSSAs      = 0

```

output definitions

Router Id	The unique identification for the router.
OSPF Version Number	The version of OSPF the router is running.
Admin Status	Whether OSPF is currently enabled or disabled on the router.
Area Border Router?	Whether the router status is an area router or not.
AS Border Router Status	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
Route Redistribution Status	Whether route redistribution is enabled or disabled on the router. This is set using the ip ospf default-originate command.
Route Tag	Shows the route tag for this router.
SPF Hold Time	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
SPF Delay Time	Shows the time in seconds between consecutive SPF calculations.
MTU Checking	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the ip ospf mtu-checking command.
# of routes	The total number of OSPF routes known to this router.
# of AS-External LSAs	The number of external routes learned from outside the router's Autonomous System (AS).
# of self-originated LSAs	The number of times a new Link State Advertisement has been sent from this router.
# of LSAs received	The number of times a new Link State Advertisement has been received by this router.
External LSDB Limit	The maximum number of entries allowed in the external Link State Database.
Exit Overflow Interval	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the ip ospf exit-overflow-interval command.
# of SPF calculations done	The number of SPF calculations that have occurred.
# of Incr SPF calculations done	The number of incremental SPF calculations done.
# of Init State Nbrs	The number of neighbors in the initialization state.
# of 2-Way State Nbrs	The number of OSPF 2-way state neighbors on this router.
# of Exchange State Nbrs	The number of neighbors in the exchange state.
# of Full State Nbrs	The number of neighbors in the full state.
# of attached areas	The number of areas that are configured on the router.
# of Active areas	The number of areas that are active.
# of Transit areas	The number of transit areas that are configured on the router.
# of attached NSSAs	The number of Not So Stubby Areas that are configured on the router.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf admin-state	Enables or disables the administration of OSPF on the router.
ip ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ip ospf spf-timer	Configures timers for SPF calculation.
ip ospf default-originate	Enables or disables OSPF redistribution
ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
ip ospf exit-overflow-interval	This command sets the overflow interval value.
ip ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

show ip ospf border-routers

Displays information regarding all or specified border routers.

show ip ospf border-routers [*area_id*] [*router_id*] [*tos*] [*gateway*]

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<i>tos</i>	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>gateway</i>	The 32-bit IP address of the gateway for the border router being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

Examples

```
-> show ip ospf border-routers 10.0.0.0
```

Router Id	Area Id	Gateway	TOS	Metric
10.0.0.0	1.0.0.1	143.209.92.71	1	1

output definitions

Router ID	The unique identification for the router.
Area ID	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Gateway	The next hop interface on which the border router has been learned.
ToS	The Type of Service. Only ToS value 0 is supported at this time.
Metric	The cost to the border router.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf ext-lsdb
```

LS Id	Orig Router-Id	SeqNo	Age	Protocol
198.168.100.100	198.168.100.100	10	100	STATIC

output definitions

LS Id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.
SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
Protocol	The type of protocol, if any.

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

Examples

```
-> show ip ospf lsdb
  Area Id      Type      LS Id      Orig Router-Id  SeqNo  Age
-----+-----+-----+-----+-----+-----
0.0.0.1      OSPF      198.168.100.100  198.168.100.100  1      100
```

output definitions

Area Id	The area identification for the area to which the record belongs.
Type	The protocol type from where the route was learned.
LS Id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.

output definitions (continued)

SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 7.1.1; command was introduced.

# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

output definitions

Neighbor's IP Address	The IP address of the neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
Neighbor's DR Address	The address of the neighbors Designated Router.
Neighbor's BDR Address	The address of the neighbors Backup Designated Router.
Neighbor's Priority	The priority value for this neighbor becoming the DR.
Neighbor's State	The condition of the OSPF neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this neighbor is suppressed.
Neighbor's type	What type of neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as No . Otherwise, if configured as Eligible (the default), it shows up as Yes .
# of State Events	The number of state events restricted for this neighbor and the local router.
Mode	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of Outstanding LS Requests	The number of Link State requests to this neighbor that have not received a response from this neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

output definitions (continued)

# of Outstanding LS Retransmissions	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

Release History

Release 7.1.1; command was introduced.

show ip ospf routes

Displays the OSPF routes known to the router.

show ip ospf routes [*ip_address mask tos gateway*]

Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the route destination in dotted decimal format.
<i>mask</i>	The IP subnet mask of the route destination.
<i>tos</i>	The Type of Service of the route.
<i>gateway</i>	The next hop IP address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

-> show ip ospf routes

Destination/Mask	Gateway	Metric	Vlan	Type
198.168.100.100	195.5.2.8	0	5	AS-Ext

output definitions

Destination/Mask	The destination address of the route. This can also display the destination IP address mask if it is known.
Gateway	The gateway address of the route.
Metric	The cost of the route.
Vlan	The VLAN number on which the gateway can be routed.
Type	The type of OSPF route.

Release History

Release 7.1.1; command was introduced.

show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

show ip ospf virtual-neighbor *area_id* *router_id*

Syntax Definitions

area_id A unique 32-bit value in IP address format.
router_id The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1
```

AreaId	RouterId	Priority	Events	RxmtQlen	LastHello	State
0.0.0.0	10.0.0.0	1	10	100	323	INIT

output definitions

AreaId	The area identification for the area of which the virtual neighbor is a part.
RouterId	The router identification of the virtual neighbor.
Priority	The number used to determine whether the virtual neighbor will become the designated router for its area.
Events	The number of OSPF control message sent by the neighbor to the router.
RxmtQlen	The length (in number of packets) of the retransmit queue.
LastHello	The last Hello message sent by the neighbor
State	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

```

-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254

Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

output definitions

Neighbor's IP Address	The IP address of the virtual neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
Neighbor's DR Address	The address of the virtual neighbor's Designated Router.
Neighbor's BDR Address	The address of the virtual neighbor's Backup Designated Router.
Neighbor's Priority	The priority value for this virtual neighbor becoming the DR.
Neighbor's State	The condition of the OSPF virtual neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this virtual neighbor is suppressed.
Neighbor's type	What type of virtual neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as No . Otherwise, if configured as Eligible (the default), it shows up as Yes .
# of State Events	The number of state events restricted for this virtual neighbor and the local router.
Mode	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
Last DD I_M_MS	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

output definitions (continued)

# of Outstanding LS Requests	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
# of Outstanding LS Retransmissions	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

Admin Status	Whether the area is enabled or disabled.
Operational Status	Whether the area is active.
Area Type	The area type. This field will be normal , stub , or NSSA .
Area Summary	Whether Area Summary is enabled or disabled.
Time since last SPF Run	The last time the Shortest Path First calculation was performed.
# of Area Border Routers known	The number of Area Border Routers in the area.
# of AS Border Routers known	The number of Autonomous System Border Routers in the area.
# of LSAs	The total number of Link State Advertisements for the Area.
# of SPF Calculations	The number of times the area has calculated the Shortest Path.
# of Incremental SPF Calculations	The number of incremental Shortest Path First calculations that have been performed in the area.
# of Neighbors in Init State	The number of OSPF neighbors that are in initialization.
# of Neighbors in 2-Way State	The number of OSPF 2-way state neighbors in this area.
# of Neighbors in Exchange State	The number of OSPF neighbors that are currently establishing their status.
# of Neighbors in Full State	The number of OSPF neighbors.
# of Interfaces attached	The number of OSPF interfaces.
Attached Interfaces	The names of the OSPF interfaces attached to this area.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area, assigning default metric, cost, and type.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf interface	Displays OSPF interface information.

show ip ospf area range

Displays all or specified route summaries in a given area.

```
show ip ospf area area_id range [{summary | nssa} ip_address ip_mask]
```

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
summary	Specifies that routes are summarized.
nssa	Specifies the Not So Stubby Area (NSSA) routers are summarized.
<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area 0.0.0.0 range
```

AreaId	Type	Destination	Advertise
0.0.0.0	Summary	192.168.12.1/24	Matching
0.0.0.0	NSSA	143.209.92.71/24	noMatching

output definitions

AreaId	The area identification for the area range.
Type	The type of area the range is associated with.
Destination	The destination address of the range.
Advertise	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf area range](#)

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

  ospfAreaRangeNet  
  ospfAreaRangeMask  
  ospfAreaRangeStatus  
  ospfAreaRangeEffect
```

show ip ospf area stub

Displays stub default area metrics, if configured.

show ip ospf area *area_id* stub

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

N/A

Examples

```
-> show ip ospf area 0.0.0.1 stub
```

Area Id	TOS	Metric	MetricType
0.0.0.1	1	1	ospf

output definitions

Area Id	The identification number of the stub area.
TOS	The Type of Service assignment.
Metric	The metric assignment of the default router in the stub area.
MetricType	The metric type of the stub area. It will be either ospf , type1 , or type2 .

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf area](#) Creates or deletes an OSPF area.

show ip ospf interface

Displays OSPF interface information.

show ip ospf interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

Examples

No interface name is specified:

```
-> show ip ospf interface
```

Interface Name	DR Address	Backup DR Address	Admin Status	Oper Status	State
vlan-213	213.10.10.1	213.10.10.254	enabled	up	DR
vlan-215	215.10.10.254	215.10.10.1	enabled	up	BDR

output definitions

Interface Name	The name of the interface.
DR Address	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, “VLAN Management Commands,” for more information.)
Backup DR Address	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either enabled or disabled .
Oper Status	Whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be down , up , dp , dr , or other .

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                    = 3,
Interface IP Address       = 100.10.10.2,
Interface IP Mask          = 255.255.255.0,
Admin Status               = Enabled,
Operational Status         = Up,
OSPF Interface State       = BDR,
Interface Type              = Broadcast,
Area Id                    = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId  = 100.10.10.88,
Backup Designated Router IP Address = 100.10.10.2,
Backup Designated Router RouterId  = 192.169.1.2,
MTU (bytes)                = 1500,
Metric Cost                 = 1,
Priority                    = 1,
Hello Interval (seconds)   = 10,
Transit Delay (seconds)    = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)    = 40,
Poll Interval (seconds)    = 120,
Link Type                   = Broadcast,
Authentication Type         = md5,
#   Id   Key   Status   StartAccept   StopAccept   StartGen   StopGen
-----+-----+-----+-----+-----+-----+-----+-----
1  1     Set  Enabled     0             0             0           0
# of Events                  = 2,
# of Init State Neighbors    = 0,
# of 2-Way State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors    = 1
BFD status                   = Disabled,
DR-Only Option for BFD      = Disabled
```

Note. See the table of the following page for output definitions.

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                    = 3,
Interface IP Address       = 100.10.10.2,
Interface IP Mask         = 255.255.255.0,
Admin Status              = Enabled,
Operational Status        = Up,
OSPF Interface State      = DR,
Interface Type            = Broadcast,
Area Id                   = 0.0.0.2,
Designated Router IP Address = 100.10.10.2,
Designated Router RouterId = 192.169.1.2,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes)               = 1500,
Metric Cost                = 1,
Priority                   = 1,
Hello Interval (seconds)  = 10,
Transit Delay (seconds)   = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)   = 40,
Poll Interval (seconds)   = 120,
Link Type                  = Broadcast,
Authentication Type       = simple,
Authentication Key        = Set,
# of Events                = 3,
# of Init State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Full State Neighbors = 0,
BFD Status                = Disabled,
DR-Only Option for BFD    = Disabled
```

Output fields when an interface name is specified are described below:

output definitions

Interface IP Name	The name of the VLAN to which the interface is assigned.
VLAN Id	The VLAN to which the interface is assigned.
Interface IP Address	The IP address assigned to the interface.
Interface IP Mask	The IP mask associated with the IP address assigned to the interface.
Admin Status	The current administration status of the interface, either enabled or disabled .
Operational Status	Whether the interface is an active OSPF interface.
OSPF Interface State	The current state of the OSPF interface. It will be down , up , dp , dr , or other .
Interface Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Area Id	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Designated Router IP Address	The designated router IP address.

output definitions (continued)

Designated Router RouterId	The identification number of the designated router.
Backup Designated Router IP Address	The IP address of the backup designated router.
Backup Designated Router RouterId	The identification number of the backup designated router.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
Metric Cost	The cost added to routes learned on this interface.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Retrans Interval	The number of seconds the interface waits before resending hello messages.
Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Poll Interval	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
Link Type	The IP interface type, either broadcast or non broadcast .
Authentication Type	The type of authentication used by this interface, either none , simple , or md5 .
#	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
Id	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
Key	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
Status	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
StartAccept	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StopAccept	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StartGen	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
StopGen	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
Authentication Key	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
# of Events	The number of interface state machine events.

output definitions (continued)

# of Init State Neighbors	The number of OSPF neighbors in the initialization state.
# of 2-Way State Neighbors	The number of OSPF 2-way state neighbors on this interface.
# of Exchange State Neighbors	The number of OSPF neighbors in the exchange state.
# of Full State Neighbors	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.
BFD Status	The status of BFD on this interface.
DR-Only Option for BFD	The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf interface	Creates and deletes an OSPF interface.
ip ospf interface auth-key	Configures an OSPF authentication key for simple authentication on an interface.
ip ospf interface dead-interval	Configures the OSPF interface dead interval.
ip ospf interface hello-interval	Configures the OSPF interface hello interval.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
ip ospf interface md5 key	Configures the OSPF key string.
ip ospf interface cost	Configures the OSPF interface cost.
ip ospf interface poll-interval	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
ip ospf interface priority	Configures the OSPF interface priority.
ip ospf interface retrans-interval	Configures the OSPF interface retransmit interval.
ip ospf interface transit-delay	Configures the OSPF interface transit delay.
ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface area	Configures an OSPF interface area.
ip ospf interface type	Configures the OSPF interface type.
ip ospf interface admin-state	Enables or disables the administration status on an OSPF interface.

show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

show ip ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6850, 6865

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> show ip ospf restart
Restart Support                = Enabled,
Restart Interval (in seconds) = 120,
Restart Status                 = Not Restarting,
Restart Age (in seconds)       = 0,
Last Restart Exit Reason       = None,
Restart Helper Support         = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode            = NotHelping
```

output definitions

Restart Support	The administrative status of OSPF graceful restart, which can be Enabled or Disabled .
Restart Interval	The configured OSPF hitless restart timeout interval, in seconds. Use the ip ospf restart-interval command to modify this parameter.
Restart Status	The current status of OSPF graceful restart, which can be Not Restarting , Unplanned Restart (after a CMM takeover), or Planned Restart (before CMM takeover).
Restart Age	The remaining time, in seconds, for the current OSPF graceful restart interval.
Last Restart Exit Reason	The outcome of the last attempt at a graceful restart. If the value is None , then no restart has yet been attempted. If the value is In Progress , then a restart attempt is currently underway. Other possible values include Completed (successfully completed), Timed Out (timed out), and Topology Changed (aborted due to topology change).

output definitions (continued)

Restart Helper Support	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be Enabled or Disabled . Use the ip ospf restart-helper admin-state command to modify this parameter.
Restart Helper Strict Checking	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be Enabled or Disabled . Use the ip ospf restart-helper strict-lsa-checking admin-state command to modify this parameter.
Restart Helper Mode	Whether this OSPF router is operating as a helper to a restarting router.

Release History

Release 7.1.1; command was introduced.

Related Commands

ip ospf restart-support	Configures support for the graceful restart feature on an OSPF router.
ip ospf restart initiate	Initiates a planned graceful restart.

MIB Objects

N/A

27 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf3.mib
Module: ALCATEL-IND1-OSPF3-MIB

Filename: IETF-OSPF-OSPFv3.MIB
Module: OSPF-OSPFv3-MIB

The following is a list of the commands for configuring OSPFv3:

Global OSPFv3 Commands	<code>ipv6 ospf admin-state</code> <code>ipv6 load ospf</code> <code>ipv6 ospf host</code> <code>ipv6 ospf mtu-checking</code> <code>ipv6 ospf route-tag</code> <code>ipv6 ospf spf-timer</code> <code>ipv6 ospf virtual-link</code> <code>show ipv6 ospf</code> <code>show ipv6 ospf border-routers</code> <code>show ipv6 ospf host</code> <code>show ipv6 ospf lsdb</code> <code>show ipv6 ospf neighbor</code> <code>show ipv6 ospf routes</code> <code>show ipv6 ospf virtual-link</code>
OSPFv3 Area Commands	<code>ipv6 ospf area</code> <code>show ipv6 ospf area</code>
OSPFv3 Interface Commands	<code>ipv6 ospf interface</code> <code>ipv6 ospf interface admin-state</code> <code>ipv6 ospf interface area</code> <code>ipv6 ospf interface dead-interval</code> <code>ipv6 ospf interface hello-interval</code> <code>ipv6 ospf interface cost</code> <code>ipv6 ospf interface priority</code> <code>ipv6 ospf interface retrans-interval</code> <code>ipv6 ospf interface transit-delay</code> <code>show ipv6 ospf interface</code>

ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

ipv6 ospf admin-state {enable | disable}

Syntax Definitions

enable	Enables OSPFv3.
disable	Disables OSPFv3.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3GeneralGroup
  ospfv3AdminStat
```

ipv6 load ospf

Loads the OSPFv3 software on the router.

ipv6 load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Example

```
-> ipv6 load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

ALADRCTMCONFIG
alaDrcTmIPOspf3Status

ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

```
ipv6 ospf host ipv6_address [area area_id] [metric metric]
```

```
no ipv6 ospf host ipv6_address area area_id
```

Syntax Definitions

<i>ipv6_address</i>	The 128-bit IP address of the OSPF host.
<i>area_id</i>	Area to which the host route belongs.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0–65535.

Defaults

parameter	default
<i>metric</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

Examples

```
-> ipv6 ospf host 2001::1/64 metric 10  
-> no ipv6 ospf host 2001::1/64 metric 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf host](#) Displays information on the configured OSPFv3 hosts.

MIB Objects

ospfv3HostTable

- ospfv3HostStatus
- ospfv3HostAreaID
- ospfv3HostAddress
- ospfv3HostMetric

ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ipv6 ospf mtu-checking

no ipv6 ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ipv6 ospf mtu-checking  
-> no ipv6 ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf](#) Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3  
  alaOspf3MTUCheck
```

ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag *tag*

Syntax Definitions

tag The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

parameter	default
<i>tag</i>	0

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

```
-> ipv6 ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3  
alaOspf3RedistRouteTag
```

ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

Syntax Definitions

<i>delay_seconds</i>	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
<i>hold_seconds</i>	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3  
  alaOspf3TimerSpfDelay  
  alaOspf3TimerSpfHold
```

ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

ipv6 ospf virtual-link area *area_id* **router** *router_id* [**dead-interval** *seconds*] [**hello-interval** *seconds*] [**retrans-interval** *seconds*] [**transit-delay** *seconds*]

no ipv6 ospf virtual-link area *area_id* **router** *router_id*

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
dead-interval <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
dead-interval <i>seconds</i>	40
hello-interval <i>seconds</i>	10
retrans-interval <i>seconds</i>	5
transit-delay <i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a

virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.

- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

ipv6 ospf area *area_id* [**type** {**normal** | **stub** [**default-metric** *metric*]}]

no ipv6 ospf area *area_id*

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
normal	Sets the area as a regular OSPFv3 area.
stub	Configures an OSPFv3 area as a stub area.
<i>metric</i>	Defines the metric to be used for default routes injected into the stub.

Defaults

parameter	default
normal stub	normal

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub area.

Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub
-> ipv6 ospf area 0.0.0.1 type normal
-> no ipv6 ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ospfv3AreaSummary

ospfv3StubMetric

ospfv3AreaId

ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface *interface_name*

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

```
-> ipv6 ospf interface vlan-101  
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```

  ospfv3IfIndex
```

ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

ipv6 ospf interface *interface_name* **admin-state** {enable | disable}

no ipv6 ospf interface *interface_name*

Syntax Definitions

<i>interface_name</i>	The name of the interface.
enable	Enables the OSPFv3 interface.
disable	Disables the OSPFv3 interface.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfAreaId
```

ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

```
ipv6 ospf interface interface_name dead-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multipoint)	120

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

ipv6 ospf interface *interface_name* **hello-interval** *seconds*

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>seconds</i>	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multipoint)	30

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfHelloInterval
```

ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>cost</i>	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
<i>cost</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfMetricValue
```

ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name The name of the interface.
priority The interface priority. The valid range is 0–255.

Defaults

parameter	default
<i>priority</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

```
ipv6 ospf interface interface_name retrans-interval interval
```

Syntax Definitions

interface_name The name of the interface.

seconds The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
<i>interval</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```

```

ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

Syntax Definitions

interface_name The name of the interface.
delay The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
<i>seconds</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

show ipv6 ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

Examples

```
-> show ipv6 ospf
```

```
Status = Enabled,
Router ID = 5.5.5.5,
# Areas = 2,
# Interfaces = 4,
Area Border Router = Yes,
AS Border Router = No,
External Route Tag = 0,
SPF Hold (seconds) = 10,
SPF Delay (seconds) = 5,
MTU checking = Enabled,
# SPF calculations performed = 3,
Last SPF run (seconds ago) = N/A,
# of neighbors that are in:
  Full state = 3,
  Loading state = 0,
  Exchange state = 0,
  Exstart state = 0,
  2way state = 0,
  Init state = 0,
  Attempt state = 0,
  Down state = 0,
```

output definitions

Status	Displays whether OSPFv3 is currently enabled or disabled on the router.
Router Id	The unique identification for the router.
# Areas	Number of areas to which the router belongs.
# Interface	Number of interfaces participating in OSPF
Area Border Router	Displays whether the router status is an area router or not.
AS Border Router	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
External Route Tag	Displays the route tag for this router.
SPF Hold (seconds)	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
SPF Delay (seconds)	Displays the time in seconds between consecutive SPF calculations.
MTU Checking	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the ipv6 ospf mtu-checking command.
# SPF calculations performed	Displays the number of SPF calculation performed.
Last SPF run (seconds ago)	N/A
Full state	Displays the number of neighbor routers that are in Full state.
Loading state	Displays the number of neighbor routers that are in Loading state.
Exchange state	Displays the number of neighbor routers that are in Exchange state.
Exstart state	Displays the number of neighbor routers that are in Exstart state.
2way state	Displays the number of neighbor routers that are in 2way state.
Init state	Displays the number of neighbor routers that are in Init state.
Attempt state	Displays the number of neighbor routers that are in Attempt state.
Down state	Displays the number of neighbor routers that are in Down state.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf admin-state	Enables or disables the administration of OSPFv3 on the router.
ipv6 ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ipv6 ospf spf-timer	Configures timers for SPF calculation.
ipv6 ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [**area** *area_id*] [**router** *router_id*]

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

Examples

```
-> show ipv6 ospf border-routers
```

```
Router ID          Area          Metric  Type
-----+-----+-----+-----
6.6.6.6           0.0.0.0       2       INTRA
6.6.6.6           0.0.0.1       2       INTRA
    fe80::2d0:95ff:fee2:6bda -> pseudo1
    fe80::2d0:95ff:fee2:6bda -> pseudo2
```

output definitions

Router ID	The unique identification for the router.
Area	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Metric	The metric used by the routes.
Type	The type of routes specified (intra or inter).

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf](#)

Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

show ipv6 ospf host [*ipv6_address*]

Syntax Definitions

ipv6_address A 128-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf host
```

```
Area           Metric   Address
-----+-----+-----
0.0.0.1        1       2001::1/64
```

output definitions

Area	A 32-bit IP address for a directly attached host. This can be set using the ipv6 ospf host command.
Metric	The metric assigned to the host. Metric is set using the ipv6 ospf host command.
Address	IPV6 address of the host.

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 ospf host](#)

Creates or deletes an OSPFv3 entry for directly attached hosts.

MIB Objects

```
ospfv3HostTable  
  ospfv3HostIpAddress  
  ospfv3HostMetric  
  ospfHostStatus  
  ospfv3HostAreaID
```

show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used to display the LSDB of the OSPF router. It can be used for OSPF debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

Examples

```
-> show ipv6 ospf lsdb
```

Area	Type	Link ID	Advertising Rtr	Sequence #	Age
0.0.0.0	Router	0	1.1.1.1	8000020f	1117
0.0.0.0	Router	0	3.3.3.3	80000208	1121
0.0.0.0	Router	0	5.5.5.5	800001f1	1117
0.0.0.0	Router	0	30.30.30.30	800000da	1115

output definitions

Area	The identification of the area to which the router belongs.
Type	The protocol type from where the route was learned.

output definitions (continued)

Link Id	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
Advertising Rtr	The ID of the router that advertises the routes.
Sequence #	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 7.1.1; command was introduced.

Related Commands

```

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [**router** *ipv4_address*][**interface** *interface_name*]

Syntax Definitions

ipv4_address A 32-bit router ID of the neighboring router.
interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf neighbor
```

Router ID	Area/Transit Area	State	Interface
1.1.1.1	0.0.0.0	FULL	vlan-2071
3.3.3.3	0.0.0.0	FULL	vlan-2071
5.5.5.5	0.0.0.0	FULL	vlan-2071
23.23.23.23	0.0.0.1	FULL	vlan-2055
23.23.23.23	0.0.0.1	FULL	vlan-2056
24.24.24.24	0.0.0.1	FULL	vlan-2065
24.24.24.24	0.0.0.1	FULL	vlan-2066

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 24.24.24.24
```

Router ID	Area/Transit Area	State	Interface
24.24.24.24	0.0.0.1	FULL	vlan-2070
24.24.24.24	0.0.0.1	FULL	vlan-2073

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf](#) Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3NbrTable
  ospfNbrAddress
  ospfv3NbrRtrId

```

show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

show ipv6 ospf routes [**prefix** *ipv6_address_prefix*][**gateway** *gateway*]

Syntax Definitions

ipv6_address_prefix The 128-bit IPv6 address of the route destination in hexadecimal format.
gateway The next hop IPv6 address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ipv6 ospf routes
```

Prefix	Path Type	Metric
		1 : 2
::/ 0	INTER	2 : -
fe80::2d0:95ff:fee0:710c -> vlan-2071		
2051::/64	INTRA	2 : -
fe80::2d0:95ff:feac:a59f -> vlan-2055		
fe80::2d0:95ff:feac:a59f -> vlan-2056		
fe80::2d0:95ff:fed7:747e -> vlan-2065		
fe80::2d0:95ff:fed7:747e -> vlan-2066		

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
Path Type	The type of routes specified (intra or inter).
Metric	The cost of the route.

Release History

Release 7.1.1; command was introduced.

show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

show ipv6 ospf area [*area_id*]

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPF area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ipv6 ospf area
```

Area ID	Type	Stub Metric	Number of Interfaces
0.0.0.0	Normal	NA	2
0.0.0.1	Normal	NA	2

```
-> show ipv6 ospf area 0.0.0.0
```

```
Area Type = Normal,
Area Stub Metric = 0,
# of SPF calculations = 52,
# Interfaces = 3,
# Router LSAs = 2,
# Network LSAs = 3,
# Intra-area-prefix LSAs = 4,
# Inter-area-prefix LSAs = 15,
# Inter-area-router LSAs = 0,
# hosts = 0,
```

output definitions

Area Type	The area type. This field will be normal or stub .
Area Stub Metric	Indicates whether the area is enabled or disabled.
# Router LSAs	The total number of Link State Advertisements for the Area.

output definitions (continued)

# Network LSAs	The total number of inter-area Link State Advertisements.
# of SPF calculations	The number of times the area has calculated the Shortest Path.
# Interfaces	The number of OSPF interfaces.
# Intra-area-prefix LSAs	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
# Inter-area-prefix LSAs	The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPF.
# Inter-area-router LSAs	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPF.
# hosts	The number of directly attached hosts.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf area	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
show ipv6 ospf interface	Displays OSPFv3 interface information.

MIB Objects

```

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

-> show ipv6 ospf interface

Name	DR Router ID	BDR Router ID	Admin Status	Oper Status	State
vlan-2071	5.5.5.5	0.0.0.0	Enabled	Up	DR
vlan-2055	7.7.7.7	5.5.5.5	Enabled	Up	BDR
vlan-2056	7.7.7.7	5.5.5.5	Enabled	Up	BDR

output definitions

Name	The name of the interface.
DR Router ID	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, “VLAN Management Commands,” for more information.)
BDR Router ID	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either enabled or disabled .
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be DR, BDR, other .

```

-> show ipv6 ospf interface vlan-2071
Type                               = BROADCAST,
Admin Status                        = Enabled,
IPv6 Interface Status              = Up,
Oper Status                         = Up,
State                               = DR,
Area                               = 0.0.0.0,
Priority                            = 100,
Cost                               = 1,
Designated Router                  = 3.3.3.3,
Backup Designated Router           = 0.0.0.0,
Hello Interval                     = 1,
Router Dead Interval               = 4,
Retransmit Interval                = 5,
Transit Delay                      = 1,
Ifindex                            = 17,
IPv6 'ifindex'                    = 2071,
MTU                                 = 1500,
# of attached neighbors            = 0,
Globally reachable prefix #0       = 2071::2/64

```

Output fields when an IP address or interface name is specified are described below:

output definitions

Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Admin Status	The current administrative status of the interface, either enabled or disabled .
IPv6 Interface Status	The current administrative status of the IPv6 interface, either up or down .
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be down , up , dp , dr , or other .
Area	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Cost	The cost added to routes learned on this interface.
Designated Router	The identification number of the designated router.
Backup Designated Router	The identification number of the backup designated router.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Router Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Retransmit Interval	The number of seconds the interface waits before resending hello messages.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.

output definitions (continued)

Ifindex	The unique value assigned to an interface.
IPv6 'ifindex'	The unique value assigned to an IPv6 interface.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
# of attached neighbors	The number of OSPFv3 neighbors in the initialization state.
Globally reachable prefix #0	A globally unique IPv6 address.

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf interface	Creates and deletes an OSPFv3 interface.
ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
ipv6 ospf interface cost	Configures the OSPFv3 interface cost.
ipv6 ospf interface priority	Configures the OSPFv3 interface priority.
ipv6 ospf interface retrans-interval	Configures the OSPFv3 interface retransmit interval.
ipv6 ospf interface transit-delay	Configures the OSPFv3 interface transit delay.
ipv6 ospf interface area	Configures an OSPFv3 interface area.
ipv6 ospf interface admin-state	Enables or disables the administration status on an OSPFv3 interface.

28 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

Alcatel-Lucent's version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

Filename: AlcatelIND1Isis.mib
Module: ALCATEL-IND1-ISIS-MIB

Filename: IETF_ISIS.MIB
Module: ISIS-MIB

A summary of the available commands is listed here:

Global IS-IS Commands

ip load isis
ip isis admin-state
ip isis area-id
ip isis level-capability
ip isis auth-check
ip isis auth-type
ip isis csnp-auth
ip isis hello-auth
ip isis psnp-auth
ip isis lsp-lifetime
ip isis lsp-wait
ip isis spf-wait
ip isis summary-address
ip isis overload
ip isis overload-on-boot
ip isis graceful-restart
ip isis graceful-restart helper
ip isis strict-adjacency-check
ip isis level auth-type
ip isis level hello-auth
ip isis level csnp-auth
ip isis level psnp-auth
ip isis level wide-metrics-only

IPv4 and IPv6 Commands

ip isis activate-ipv6|ipv4
ip isis vlan
ip isis vlan admin-state
ip isis vlan interface-type
ip isis vlan csnp-interval
ip isis vlan hello-auth-type
ip isis vlan level-capability
ip isis vlan lsp-pacing-interval
ip isis vlan passive
ip isis vlan retransmit-interval
ip isis vlan default-type
ip isis vlan level hello-auth-type
ip isis vlan level hello-interval
ip isis vlan level hello-multiplier
ip isis vlan level metric
ip isis vlan level passive
ip isis vlan level priority
ip isis summary-address6

Show Commands

```
show ip isis adjacency
show ip isis database
show ip isis hostname
show ip isis routes
show ip isis routes6
show ip isis spf
show ip isis spf-log
show ip isis statistics
show ip isis status
show ip isis summary-address
show ip isis vlan
show ip isis summary-address6
```

Clear Commands

```
clear ip isis adjacency
clear ip isis lsp-database
clear ip isis spf-log
clear ip isis statistics
```

**M-ISIS (Multi Topology)
Commands**

```
ip isis multi-topology
```

ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

Examples

```
-> ip load isis
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip protocols](#) Displays switch routing protocol information and status.

MIB Objects

```
alaDrcTmIPISISStatus
```

ip isis admin-state

Enables or disables the administrative status of IS-IS on the switch.

```
ip isis admin-state {enable | disable}
```

Syntax Definitions

enable	Enables IS-IS.
disable	Disables IS-IS.

Defaults

parameter	default
enable / disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis admin-state enable  
-> ip isis admin-state disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
isisSysTable  
  isisSysAdminState
```

ip isis level-capability

Configures the router level of the IS-IS protocol globally.

```
ip isis level-capability {level-1 | level-2 | level-1/2}
```

Syntax Definitions

level-1	Specifies that the router can operate at Level-1 only.
level-2	Specifies that the router can operate at Level-2 only.
level-1/2	Specifies that the router can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 / level-2 / level-1/2	level-1/2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- Configuring the level capability at the IS-IS circuit level is also possible.

Examples

```
-> ip isis level-capability level-1  
-> ip isis level-capability level-2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan level-capability	Configures the IS-IS level on the specified circuit.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable  
  isisSysType
```

ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

enable	Enables authentication check for IS-IS PDUs.
disable	Disables authentication check for IS-IS PDUs.

Defaults

By default, authentication check is enabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

Release History

Release 7.3.3; command was introduced;

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
vRtrIsisAuthCheck
```

ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

ip isis auth-type {**simple** {**key** *key* | **encrypt-key** *encrypt_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt_key*} | **none**}

Syntax Definitions

simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple / md5 / none	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt-key*. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt-key*.

- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis auth-type simple key rachel  
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable  
  vRtrIsisAuthType  
  vRtrIsisAuthKey
```

ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

ip isis csnp-auth

no ip isis csnp-auth

Syntax Definitions

N/A

Defaults

CSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

Examples

```
-> ip isis csnp-auth
-> no ip isis csnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level csnp-auth	Configures CSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
  vRtrIsisCsnpAuthentication
```

ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

ip isis hello-auth

no ip isis hello-auth

Syntax Definitions

N/A

Defaults

Authentication check of Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

Examples

```
-> ip isis hello-auth
-> no ip isis hello-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis level hello-auth](#) Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
  vRtrIsisHelloAuthentication
```

ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

ip isis psnp-auth

no ip isis psnp-auth

Syntax Definitions

N/A

Defaults

PSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

Examples

```
-> ip isis psnp-auth
-> no ip isis psnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis level psnp-auth](#)

Configures the PSNP authentication for specific IS-IS levels.

[show ip isis status](#)

Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
  vRtrIsisPsnpAuthentication
```

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

ip isis lsp-wait {**max-wait** | **initial-wait** | **second-wait**} *seconds*

no ip isis lsp-wait {**max-wait** | **initial-wait** | **second-wait**}

Syntax Definitions

max-wait	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
initial-wait	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
second-wait	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
<i>seconds</i>	Specifies the time interval.

Defaults

parameter	default
<i>seconds</i> (max-wait)	5
<i>seconds</i> (initial-wait)	0
<i>seconds</i> (second-wait)	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan lsp-pacing-interval Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

show ip isis status Displays the IS-IS status.

MIB Objects

vRtrIisisTable

 vRtrIisisLspInitialWait

 vRtrIisisLspSecondWait

 vRtrIisisLspMaxWait

ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

ip isis spf-wait {**max-wait** *seconds* | **initial-wait** *milliseconds*| **second-wait** *milliseconds*}

no ip isis spf-wait {**max-wait** | **initial-wait** | **second-wait**}

Syntax Definitions

max-wait <i>seconds</i>	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.
initial-wait <i>milliseconds</i>	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
second-wait <i>milliseconds</i>	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

Defaults

parameter	default
max-wait <i>seconds</i>	10
initial-wait <i>milliseconds</i>	1000
second-wait <i>milliseconds</i>	1000

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects`vRtrIisisTable``vRtrIisisSpfWait``vRtrIisisSpfInitialWait``vRtrIisisSpfSecondWait`

ip isis summary-address

Adds or deletes the summary address.

ip isis summary-address {*ip_prefix/mask* | *ip_prefix* [*/netmask*]} {**level-1** | **level-2** | **level-1/2**}

no ip isis summary-address {*ip_prefix/mask* | *ip_prefix* [*/netmask*]}

Syntax Definitions

<i>ip_prefix/mask</i>	Specifies the IP prefix in dotted decimal notation and the mask length.
<i>ip_prefix</i>	Specifies the IP prefix in dotted decimal notation.
<i>/netmask</i>	Specifies the subnet mask in dotted decimal notation.
level-1	Specifies the IS-IS level as Level-1.
level-2	Specifies the IS-IS level as Level-2.
level-1/2	Specifies the IS-IS level as Level-1/2.

Defaults

parameter	default
level-1 level-2 level-1/2	level-1/2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis summary-address Displays the IS-IS summary address database.

MIB Objects

vRtrIsisSummaryTable
vRtrIsisSummRowStatus

ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

ip isis overload [*timeout seconds*]

no ip isis overload [*timeout*]

Syntax Definitions

timeout *seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state during bootup for a specified time period.

show ip isis status

Displays the IS-IS status.

MIB Objects

isisSysTable

 isisSysSetOverload

vRtrIsisTable

 vRtrIsisOverloadTimeout

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

ip isis overload-on-boot [*timeout seconds*]

no ip isis overload-on-boot [*timeout seconds*]

Syntax Definitions

timeout seconds Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
<i>timeout seconds</i>	60

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis overload](#)

Sets the IS-IS router to operate in the overload state.

[show ip isis status](#)

Displays the IS-IS status.

MIB Objects

vRtrIisisTable

 vRtrIisisOverloadOnBootTimeout

ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

ip isis graceful-restart

no ip isis graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is disabled on the router by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

Examples

```
-> ip isis graceful-restart  
-> no ip isis graceful-restart
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis graceful-restart helper](#) Configures the helper mode of routers for graceful restart.

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
vRtrIisisTable  
vRtrIisisGracefulRestart
```

ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the router.
disable	Disables the helper mode on the router.

Defaults

parameter	default
enable disable	enable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```
-> ip isis graceful-restart helper disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis graceful-restart	Configures graceful restart on the router.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIisisTable  
vRtrIisisGRHelperMode
```

ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

ip isis strict-adjacency-check {enable | disable}

Syntax Definitions

enable	Enables the adjacency check configuration on the router.
disable	Disables the adjacency check configuration on the router.

Defaults

By default, the adjacency check configuration is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

Examples

```
-> ip isis strict-adjacency-check enable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

ip isis level {1 | 2} auth-type {simple {key *key* | encrypt-key *encrypt_key*} | md5 {key *key* | encrypt-key *encrypt_key*} | none}

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple / md5 / none	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis level 2 auth-type simple key rachel  
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type for the IS-IS protocol globally.

ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

ip isis level {1 | 2} hello-auth

no ip isis level {1 | 2} hello-auth

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

Authentication check of Level Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

Examples

```
-> ip isis level 1 hello-auth  
-> no ip isis level 1 hello-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} csnp-auth

no ip isis level {1 | 2} csnp-auth

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

Release History

Release 7.3.3; command was introduced.

```

ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} psnp-auth

no ip isis level {1 | 2} psnp-auth

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

Examples

```
-> ip isis level 1 psnp-auth  
-> no ip isis level 1 psnp-auth
```

Release History

Release 7.3.3; command was introduced.

ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

ip isis level {1 | 2} wide-metrics-only

no ip isis level {1 | 2} wide-metrics-only

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

By default, wide metrics is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

Examples

```
-> ip isis level 1 wide-metrics-only  
-> no ip isis level 1 wide-metrics-only
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis activate-ipv6|ipv4

Configures the IPv6 or IPv4 routing in IS-IS.

```
ip isis {activate-ipv6 | activate-ipv4}
```

```
no ip isis {activate-ipv6 | activate-ipv4}
```

Syntax Definitions

activate-ipv6 Enables IPv6 routing in IS-IS.

activate-ipv4 Enables IPv4 routing in IS-IS.

Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The **no** form of this command disables the IPv4/IPv6 routing in IS-IS.

Examples

```
-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

```
ip isis vlan vlan_id [address-family {v4 | v6 | v4v6}]
```

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN on which IS-IS is to be enabled.
v4 v6 v4v6	The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension.

Defaults

By default, both address families (IPv4 and IPv6) are disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The **no** form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

Examples

```
-> ip isis vlan 10
-> ip isis vlan 10 address-family v6
-> no ip isis vlan 10 address-family v6
```

Release History

Release 7.3.3; command was introduced.

```

ip isis vlan admin-state

Enables or disables IS-IS on an circuit.

```
ip isis vlan vlan_id admin-state {enable / disable}
```

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
enable	Administratively enables IS-IS on the VLAN.
disable	Administratively disables IS-IS on the VLAN.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis vlan 10 admin-state enable
-> ip isis vlan 10 admin-state disable
```

Release History

Release 7.3.3; command was introduced.

```

ip isis vlan interface-type

Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

```
ip isis vlan vlan_id interface-type {broadcast | point-to-point}
```

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
broadcast	Sets the interface (circuit) type as a broadcast IS-IS interface.
point-to-point	Sets the interface (circuit) type as a point-to-point IS-IS interface.

Defaults

parameter	default
broadcast point-to-point	broadcast

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 interface-type broadcast
-> ip isis vlan 10 interface-type point-to-point
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan default-type	Sets the interface type to default, that is, broadcast.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```

  isisCircType
```

ip isis vlan csnp-interval

Configures the time interval in seconds to send Complete Sequence Number PDUs (CSNP) PDUs from the specified VLAN circuit.

ip isis vlan *vlan_id* **csnp-interval** *seconds*

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>seconds</i>	The time interval in seconds between successive CSNP PDUs sent on an interface after which IS-IS must generate a CSNP PDU on the specified circuit. The valid range is 1–65535.

Defaults

parameter	default
<i>seconds</i>	Broadcast interface: 10 seconds Point-to-Point interface: 5 seconds

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The **no** form of this command reverts the time interval to the default value.

Examples

```
-> ip isis vlan 10 csnp-interval 10  
-> no ip isis vlan 10 csnp-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

vRtrIisisIfCsnpInterval

ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

```
ip isis vlan vlan_id hello-auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key |
encrypt-key encrypt_key} | none}
```

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple / md5 / none	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt_key*. The Configuration snapshot always displays the password in the encrypted form. You must use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt_key*.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno  
-> ip isis vlan 10 hello-auth-type simple key sdsdff
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan level hello-auth-type Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

show ip isis vlan Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfHelloAuthKey  
vRtrIisisIfHelloAuthType
```

ip isis vlan level-capability

Configures the IS-IS level on the specified circuit.

ip isis vlan *vlan_id* **level-capability** [**level-1** | **level-2** | **level-1/2**]

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
level-1	Specifies that the interface can operate at Level-1 only.
level-2	Specifies that the interface can operate at Level-2 only.
level-1/2	Specifies that the interface can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 level-2 level-1/2	level-1/2

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

Examples

```
-> ip isis vlan 10 level-capability level-1
-> ip isis vlan 10 level-capability level-1/2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis level-capability	Configures the router level of the IS-IS protocol globally.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
  isisCircLevel
```

ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

ip isis vlan *vlan_id* **lsp-pacing-interval** *milliseconds*

no ip isis vlan *vlan_id* **lsp-pacing-interval**

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>milliseconds</i>	The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

Defaults

parameter	default
<i>milliseconds</i>	100

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

```
-> ip isis vlan 10 lsp-pacing-interval 1000  
-> no ip isis vlan 10 lsp-pacing-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis lsp-lifetime	Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.
ip isis lsp-wait	Configures the time interval between successively generated LSPs.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfTable  
vRtrIisisIfLspPacingInterval
```

ip isis vlan retransmit-interval

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

ip isis vlan *vlan_id* **retransmit-interval** *seconds*

no ip isis vlan *vlan_id* **retransmit-interval**

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>seconds</i>	The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

Defaults

parameter	default
<i>seconds</i>	5

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

Examples

```
-> ip isis vlan 10 retransmit-interval 130
-> no ip isis vlan 10 retransmit-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

MIB Objects

```
vRtrIisisIfTbale
vRtrIisisIfRetransmitInterval
```

ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

```
ip isis vlan vlan_id level {1 | 2} hello-auth-type {simple {key key / encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | none}
```

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple / md5 / none	none

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123  
-> ip isis vlan 10 level 2 hello-auth-type none
```

Release History

Release 7.3.3; command was introduced.

ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

ip isis vlan *vlan_id* level {1 | 2} **hello-interval** *seconds*

no ip isis vlan *vlan_id* level {1 | 2} **hello-interval**

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
<i>seconds</i>	The hello interval, in seconds. The valid range is 1–20000.

Defaults

parameter	default
<i>seconds</i> (designated routers)	3
<i>seconds</i> (non-designated routers)	9

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-interval 50
-> no isis vlan 10 level 2 hello-interval
```

Release History

Release 7.3.3; command was introduced.

ip isis vlan level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

ip isis vlan *vlan_id* level {1 | 2} **hello-multiplier** *number*

no ip isis vlan *vlan_id* level {1 | 2} **hello-multiplier**

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
<i>number</i>	The multiplier (2–100) of the hello interval.

Defaults

parameter	default
<i>number</i>	3

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircLevelTable
  isisCircLevelHelloMultiplier
```

ip isis vlan level metric

Configures the metric value of the specified IS-IS level of the circuit.

ip isis vlan *vlan_id* level {**1** | **2**} metric *number*

no ip isis vlan *vlan_id* level {**1** | **2**} metric

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
<i>number</i>	The metric value (1–16777215) assigned for the specified level of the circuit.

Defaults

parameter	default
<i>number</i>	10

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

Examples

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```

  vRtrIisisIfLevelAdminMetric
```

ip isis vlan level passive

Configures the IS-IS circuit as passive at the specified IS-IS level.

ip isis vlan *vlan_id* level {1 | 2} passive

no ip isis vlan *vlan_id* level {1 | 2} passive

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, the interface level passive configuration is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 level 1 passive
-> no ip isis vlan 10 level 1 passive
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis vlan passive](#)

Configures the IS-IS circuit as passive.

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfLevelTable  
  vRtrIisisIfLevelPassive
```

ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

ip isis vlan *vlan_id* level [1 | 2] priority *number*

no ip isis vlan *vlan_id* level [1 | 2] priority

Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
<i>number</i>	The priority value of the IS-IS circuit at this level. The valid range is 0–127.

Defaults

parameter	default
<i>number</i>	64

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSAs to this network and also to the routers that are attached to it.

Examples

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

ip isis summary-address6

Configures the IPv6 summary address.

```
ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

```
no ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

Syntax Definitions

<i>ipv6_prefix/prefix_length</i>	IPv6 prefix and prefix length.
<i>ipv6_address</i>	IPv6 address.
level-1	Specifies that the routes can be summarized at Level-1 only.
level-2	Specifies that the routes can be summarized at Level-2 only.
level-1/2	Specifies that the routes can be summarized at both Level-1 and Level-2.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to remove an already configured summary address.

Examples

```
-> ip isis summary-address6 4001::/16 level-1  
-> no ip isis summary-address6 4001::/16
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis summary-address6](#) Displays the IS-IS IPv6 summary address database.

MIB Objects

```

show ip isis adjacency

Displays information about IS-IS adjacent routers.

show ip isis adjacency [{system-id *nbr_sys_id* | vlan *vlan_id*] [detail]

Syntax Definitions

nbr_sys_id The system ID of the neighbor router.
vlan_id The VLAN ID of a given VLAN.

Defaults

By default adjacency information for all the neighbor routers are displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use *the nbr_sys_id* or *vlan_id* parameter with this command to view the adjacency information for a specific neighbor.

Examples

```
-> show ip isis adjacency
=====
ISIS Adjacency
=====
System ID           Type      State    Hold    VlanID  MT IDs  Hostname
-----
0000.0000.0001     L1       UP       25      20      0, 2   Router-A
0000.0000.0002     L2       UP       21      30      None   Router-B
-----
Adjacency : 2
=====
```

output definitions

System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Type	The level (L1 , L2 , or L1/L2) of the adjacent router.
State	The state of the adjacent router (Up or Down).
Hold	The Hold time of the adjacent router.
VlanID	The VLAN ID of the adjacent router.
MT IDs	MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour.

output definitions

Hostname	The host name of the adjacent router.
Adjacencies	The total number of adjacent routers.

output definitions

SystemID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
VLAN	The Vlan ID in which the adjacency is present.
MT IDs	MT IDs sent by MT enabled ISIS neighbor. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbor.
NLPIDs	The IP address families supported by IS-IS neighbor: IPv4 or IPv6
State	The state of the adjacent router (Up or Down).
Adj Level	The adjacency level (L1 or L2) of the router.
Nbr Sys Type	The type of the neighboring router(L1 , L2 or L1L2)
Hold Time	The Hold time of the adjacent router.

output definitions

IPv4 Neighbor	The 32-bit IP address of the neighbor.
IPv6 Neighbor	The 32-bit IPv6 address of the neighbor
Restart Support	Indicates if graceful restart is enabled or disabled .
Restart Status	Indicates whether the router is currently helping an adjacent router to restart.
Restart Suppressed	Indicates whether the advertisement of LSPs are suppressed (enabled) or not (disabled) as per the request of adjacent router.
SNPA	The SNPA address of the adjacent router.
Up Time	Indicates the time period in seconds, during which the router was in the adjacency.
Priority	The priority of the adjacent router.
Host-name	The host name of the adjacent router.
L. CircType	Indicates the level circuit type (L1 , L2 or L1L2) of the adjacent router.
Max Hold	Indicates the maximum Hold time of the adjacent router.

show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

show ip isis database [{*system_id system_id* | *lsp_id lsp_id*}] [**detail**] [**level** {**1** | **2**}]

Syntax Definitions

<i>system_id</i>	The system ID of the router.
<i>lsp_id</i>	The LSP ID.
detail	Indicates that the output is displayed in a detailed manner.
level	Indicates the IS-IS level, either 1 or 2 .

Defaults

By default, the entire LSP database is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- Use *system_id* or *lsp_id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

Examples

```
-> show ip isis database
Legends : P           = The Partition repair bit is set
OV          = The overload bit is set
ATT        = The Attach bit is set

```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Attributes	The level capability of the router.
LSP Count	The number of LSPs in the Link State Database.

=====

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Version	The version of the IS-IS protocol that has generated the LSP.
Pkt Type	The IS-IS PDU type number derived from the PDU header, which can be 18 or 20 . The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
Pkt Ver	The version of the IS-IS protocol that has generated the packet.
Attributes	The level capability of the router.
Max Area	The Maximum number of areas supported by the originating router of the LSP.
SysID Len	The length of the system-id as used by the originating router.
Used Len	The length used by the LSP.
Alloc Len	The length allocated for the LSP to be stored.
Area Address	The area ID of the router.
Supp protocols	The network layer protocols that are supported.
IS-Host Name	The host name of the router.
System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
IS Neighbors	The list of reachable IS-IS neighbors.
IPv4 Internal Reach	The list of IS-IS internal routes.
IPv6 Reach	The list of IS-IS IPv6 internal routes.
IP Prefix	The IP address and subnet mask of the destination.
Metrics	The metric value to reach the destination.
IPv4 External Reach	The list of external IS-IS routes.
IPv6 Reach	The list of external IS-IS IPv6 routes.
level-1 LSP Count	The number of Level-1 LSPs.
level-2 LSP Count	The number of Level-2 LSPs.

Release History

Release 7.3.3; command was introduced.

show ip isis routes6

Displays the IS-IS IPv6 route information from the routing table.

show ip isis routes6

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

N/A

Examples

```
-> show ip isis routes6
```

```
=====
ISISv6 Routes
=====
```

Prefix	Metric	Lvl/Type	Vlan-Id	Nexthop	System ID
2001:1::/64	10	1/Int	6	::	0300.0100.1001
3001:1::/64	10	1/Int	11	::	0300.0100.1001
4001:1::/64	10	1/Int	6	::	0300.0100.1001
5001:1::/64	20	1/Int	6	fe80::213:c3ff:fe9a:2761	0000.0000.0001

```
-----
Routes : 4
=====
```

output definitions

Prefix	The IP prefix and mask of the IPv6 destination routes.
Metric	The cost to reach the destination route.
Lvl/Type	The level and route type of the routes.
SPF-num	The version of the SPF calculation used to select the route.
Nexthop	The Next Hop address to reach the destination.
System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis adjacency](#)

Displays information about IS-IS adjacent routers.

[show ip isis database](#)

Displays IS-IS LSP database information of the adjacent routers.

MIB Objects

N/A

show ip isis spf

Displays the IS-IS SPF calculation information.

show ip isis spf [detail]

Syntax Definitions

detail Indicates that the output is displayed in a detailed manner.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

The SPF path table is common for both IPv4 and IPv6.

Examples

```
-> show ip isis spf
=====
ISIS Path Table
=====
Node                VlanId            Nexthop

```

output definitions

ISIS Instance	The number of IS-IS instances.
SPF Runs	The number of SPF calculations that have been performed.
Purge Initiated	The number of purges that the system initiated. A purge is initiated if the router decides that a link-state PDU must be removed from the database.
LSP Regens	The number of LSPs that have been regenerated. An LSP is regenerated when it nears the end of its lifetime and has not changed.
Requests	The number of CSNP requests received.

output definitions (continued)

Request Drops	The number of CSNP requests that are dropped.
Paths Found	The number of paths found.
Paths Not Found	The number of paths not found.
PDU Type	The type of PDU.
Received	The number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	The number of PDUs that are processed (number of PDUs received less the number dropped).
Dropped	The number of PDUs that are dropped.
Sent	The number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Retransmitted	The number of PDUs that are retransmitted.

output definitions

System Id	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Admin State	The state of the router (Up or Down).
Protocols Enabled	The protocol enabled on the router: IPv4 or IPv6
Last Enabled	The date and time when the router is enabled.
Level Capability	The level capability of the router (L1 , L2 , or L1L2).
Authentication Check	Indicates the status of the authentication (true or false).
Authentication Type	The type of authentication (password or md5).
Graceful Restart	Indicates if graceful restart is Enabled or Disabled .
GR helper-mode	Indicates if the helper mode of graceful restart is Enabled or Disabled .
LSP Lifetime	The Lifetime of the LSP (in seconds).
LSP Wait	The Wait time of the LSP (in seconds).
Adjacency Check	The adjacency check configuration on the router
L1 Auth Type	The authentication type (password or md5) for Level-1 adjacency.
L2 Auth Type	The authentication type (password or md5) for Level-2 adjacency.
L1 Wide Metrics-only	Indicates whether wide metrics is Enabled or Disabled for Level-1 adjacency.
L2 Wide Metrics-only	Indicates whether wide metrics is Enabled or Disabled for Level-2 adjacency.
L1 LSDB Overload	Indicates whether LSDB Overload is Enabled or Disabled for Level-1 adjacency.
L2 LSDB Overload	Indicates whether LSDB Overload is Enabled or Disabled for Level-2 adjacency.
L1 LSPs	The number of LSPs for Level-1 adjacency.
L2 LSPs	The number of LSPs for Level-2 adjacency.
Last SPF	The date and duration of the last SPF calculation.
SPF Wait	The Wait time for the SPF calculation.
Hello-Auth Check	Indicates the status of global Hello authentication check (Enabled or Disabled).
Csnp-Auth Check	Indicates the status of global CSNP authentication check (Enabled or Disabled).
Psnp-Auth Check	Indicates the status of global PSNP authentication check (Enabled or Disabled).

output definitions (continued)

L1 Hello-Auth Check	Indicates the status of L1 Hello authentication check (Enabled or Disabled).
L1 Csnp-Auth Check	Indicates the status of L1 CSNP authentication check (Enabled or Disabled).
L1 Psnp-Auth Check	Indicates the status of L1 PSNP authentication check (Enabled or Disabled).
L2 Hello-Auth Check	Indicates the status of L2 Hello authentication check (Enabled or Disabled).
L2 Csnp-Auth Check	Indicates the status of L2 CSNP authentication check (Enabled or Disabled).
L2 Psnp-Auth Check	Indicates the status of L2 PSNP authentication check (Enabled or Disabled).
Auto-Configuration	Indicates the status of auto-configuration for ISIS. (Enabled or Disabled)
Area Address	The area address of the router.

Release History

Release 7.3.3; command introduced.

Release 7.3.4; added **auto-configuration** to the output definition.

Related Commands

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [*ip_address* [/i>mask]]

Syntax Definitions

ip_address The 32-bit IP address.
/mask The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Use the *ip_address* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address
=====
ISIS Summary Address
=====
Address                               Level
-----
1.0.0.0/8                             L1

output definitions

VlanId	The VLAN ID.
Level Capability	The level capability of the interface.
Oper State	The operational state of the interface (up or down).
Admin State	The administrative state of the interface (up or down).
Auth Type	Indicates the authentication type (simple , MD5 , or none) of the interface.
Address Families	The address family extension: IPv4 or IPv6
Circuit Id	The circuit ID of the interface.
RetransmitInt	Specifies the minimal interval of time, in seconds between retransmission of an LSP on the point-to-point interface.
Type	The type of interface: Broadcast or Pt-to-Pt (point to point).
LSP Pacing Int	The LSP Pacing interval.
Mesh Group	The status of the mesh group (Active or Inactive).
CSNP Int	The CSNP interval.

output definitions (continued)

Level	Indicates the IS-IS level of the neighbor (L1 , L2 , or L1L2).
Adjacencies	The number of adjacencies formed.
Desg IS	The ID of the LAN Designated Intermediate System on this circuit at this level.
Auth Type	Indicates the authentication type (simple , MD5 , or none) for the specified level.
Metric	The metric value of this circuit for a specific level.
Hello Timer	Indicates the Hello timer value.
Hello Mult	Indicates the Hello multiplier value.
Priority	The priority value of the interface.
Passive	Indicates whether the interface is configured as a passive interface (Yes or No).
Vlans	The total number of VLANs.

Release History

Release 7.3.3; command was introduced.

ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

ip isis multi-topology

no ip isis multi-topology

Syntax Definitions

N/A

Defaults

By default, multi-topology is disabled.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of the IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

Examples

```
-> ip isis multi-topology
-> no ip isis multi-topology
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.
show ip isis adjacency	Displays information about IS-IS adjacent routers.

vRtrIisisMTEnabled
```

29 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The Alcatel-Lucent implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545.

Note. In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

Filename: AlcatelIND1Bgp.MIB
Module: ALCATEL-IND1-BGP-MIB

Filename: IETF_BGP4.MIB
Module: BGP4-MIB

The following table summarizes the available commands:

Global BGP Commands	<code>ip load bgp</code> <code>ip bgp admin-state</code> <code>ip bgp autonomous-system</code> <code>ip bgp bestpath as-path ignore</code> <code>ip bgp cluster-id</code> <code>ip bgp default local-preference</code> <code>ip bgp fast-external-failover</code> <code>ip bgp always-compare-med</code> <code>ip bgp bestpath med missing-as-worst</code> <code>ip bgp client-to-client reflection</code> <code>ip bgp as-origin-interval</code> <code>ip bgp synchronization</code> <code>ip bgp confederation identifier</code> <code>ip bgp maximum-paths</code> <code>ip bgp log-neighbor-changes</code> <code>ip bgp dampening</code> <code>ip bgp dampening clear</code> <code>ip bgp asn-format</code> <code>ip bgp unicast</code> <code>show ip bgp</code> <code>show ip bgp statistics</code> <code>show ip bgp dampening</code> <code>show ip bgp dampening-stats</code> <code>show ip bgp path</code> <code>show ip bgp routes</code>

ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the [ip bgp admin-state](#) to start the BGP protocol.

Examples

```
-> ip load bgp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|--|--|
| ip bgp autonomous-system | Configures the Autonomous system number for this BGP router. |
| ip bgp admin-state | Administratively enables or disables BGP. |

MIB Objects

alaDrcTmIPBgpStatus

ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

ip bgp admin-state {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You must first load the BGP software into running memory using the [ip load bgp](#) command before initiating this command.
- Many BGP commands require that the protocol be disabled ([ip bgp admin-state](#)) before issuing them.

Examples

```
-> ip bgp admin-state enable  
-> ip bgp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip load bgp](#) Loads the BGP software.

|---|--|
| ip bgp admin-state | Enables and disables the BGP protocol. |
| ip bgp neighbor remote-as | Assigns an AS number to this BGP peer. |

MIB Objects

alaBgpGlobal
 alaBgpAutonomousSystemNumber

ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore

no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

Examples

```
-> ip bgp bestpath as-path ignore  
-> no ip bgp bestpath as-path ignore
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address as-set Specifies whether AS path aggregation is to be performed or not.

ip bgp policy aspath-list Creates or removes an AS path list.

ip bgp default local-preference Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

alaBgpGlobal

alaBgpASPathCompare

ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

ip bgp cluster-id *ip_address*

Syntax Definitions

ip_address 32-bit IP address that is the Cluster ID of the router acting as a route reflector.

Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

Examples

```
-> ip bgp cluster-id 1.2.3.4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state Enables and disables BGP.

ip bgp client-to-client reflection Enables route reflection and sets this speaker as the route reflector.

MIB Objects

alaBgpGlobal
 alaBgpClusterId

ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

ip bgp default local-preference *value*

Syntax Definitions

value The default local preference value for this router. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	100

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp default local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address local-preference Sets the local preference for a BGP aggregate.

ip bgp network local-preference Sets the local preference for a BGP network.

MIB Objects

alaBgpGlobal
alaBgpDefaultLocalPref

ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

ip bgp fast-external-failover

no ip bgp fast-external-failover

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp fast-external-failover  
-> no ip bgp fast-external-failover
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor clear](#)

Restarts a BGP peer.

[ip bgp neighbor auto-restart](#)

Enables or disables BGP peer automatic restart.

[ip bgp neighbor timers](#)

Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

MIB Objects

alaBgpFastExternalFailOver

ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

ip bgp always-compare-med

no ip bgp always-compare-med

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

Examples

```
-> ip bgp always-compare-med  
-> no ip bgp always-compare-med
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp bestpath med missing-as-worst](#) Configures the MED parameter when it is missing in a BGP path.

MIB Objects

```
alaBgpGlobal  
alaBgpMedAlways
```

ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst

no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst ($2^{32}-1$) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp always-compare-med Forces BGP to consider MED values from external routes.

MIB Objects

```
alaBgpGlobal
  alaBgpMissingMed
```

ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state Administratively disables BGP in this router.

ip bgp neighbor route-reflector-client Configures a BGP peer to be a client to the this route reflector.

MIB Objects

alaBgpGlobal
alaBgpRouteReflection

ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

ip bgp synchronization

no ip bgp synchronization

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ip bgp**

Displays the current global settings for the local BGP speaker.

MIB Objects

alaBgpGlobal

alaBgpIgpSynchStatus

Related Commands

- ip bgp autonomous-system** Sets the AS number for this router.
- ip bgp confederation neighbor** Specifies peers that are members of a confederation.

MIB Objects

alaBgpGlobal
 alaBgpConfedId

ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
  alaBgpMultiPath
```

ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

ip bgp log-neighbor-changes

no ip bgp log-neighbor-changes

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp admin-state](#) Disables BGP within the router.

MIB Objects

```
alaBgpGlobal
  alaBgpPeerChanges
```

ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

ip bgp dampening [**half-life** *half_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max_suppress_time*]

no ip bgp dampening

Syntax Definitions

<i>half_life</i>	The half-life duration, in seconds. The valid range is 0–65535.
<i>reuse</i>	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
<i>suppress</i>	The dampening cutoff value. The valid range is 1–9999.
<i>max_suppress_time</i>	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

Defaults

parameter	value
<i>half_life</i>	300
<i>reuse</i>	200
<i>suppress</i>	300
<i>max_suppress_time</i>	1800

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening clear	Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

ip bgp dampening clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

Examples

```
-> ip bgp dampening clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp dampening](#) Enables or disables route dampening.

MIB Objects

```
alaBgpGlobal  
alaBgpDampeningClear
```

ip bgp asn-format

Configures the display format to be used when displaying 4-octet ASNs.

```
ip bgp asn-format {asdot | asplain}
```

Syntax Definitions

asdot	A mixture of asplain and asdot+.
asplain	Simple decimal notation.

Defaults

The default is **asplain**.

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

Examples

```
-> ip bgp asn-format asdot
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous System (AS) number for this router.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal  
alaBgpAsnFormat
```

ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

ip bgp aggregate-address *ip_address ip_mask*

[**admin-state** {**enable** | **disable**}]

[**as-set**]

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**summary-only**]

no ip bgp aggregate-address *ip_address ip_mask*

Syntax Definitions

<i>ip_address</i>	32-bit IP address to be used as the aggregate address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0  
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp aggregate-address
summary-only](#)

Enables or disables aggregate summarization, which suppresses more-specific routes.

alaBgpAggrMetric  
alaBgpAggrSummarize  
alaBgpAggrMask
```

ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

ip bgp aggregate-address *ip_address ip_mask* **admin-state** {enable | disable}

Syntax Definitions

<i>ip_address</i>	32-bit IP address for this aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
enable	Enables this aggregate route.
disable	Disables this aggregate route.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the [ip bgp asn-format](#) command to configure individual aggregate parameters.
- The [show ip bgp path](#) command displays every aggregate currently defined.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format	Creates an aggregate route.
show ip bgp path	Displays aggregate routes.

MIB Objects

```
alaBgpAggrTable  
  alaBgpAggrAddr  
  alaBgpAggrMask
```

ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

ip bgp aggregate-address *ip_address ip_mask as-set*

no ip bgp aggregate-address *ip_address ip_mask as-set*

Syntax Definitions

ip_address 32-bit IP address.

ip_mask 32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format Creates and deletes a BGP aggregate route.

MIB Objects

  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrSet
```

ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

ip bgp aggregate-address *ip_address ip_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none no-export no-advertise no-export-subconfed <i>num:num</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the aggregate community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

ip bgp aggregate-address *ip_address ip_mask local-preference value*

no ip bgp aggregate-address *ip_address ip_mask local-preference value*

Syntax Definitions

<i>ip_address</i>	An IP address for the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the [ip bgp default local-preference](#) command).

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp default local-preference](#) Sets the default local preference value for this AS.

MIB Objects

ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

ip bgp aggregate-address *ip_address ip_mask metric value*

no ip bgp aggregate-address *ip_address ip_mask metric value*

Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The MED attribute. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst Configures the MED for paths that do not contain a MED value.

ip bgp always-compare-med Forces BGP to use the MED for comparison of external routes.

MIB Objects

ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

ip bgp aggregate-address *ip_address ip_mask* **summary-only**

no ip bgp aggregate-address *ip_address ip_mask* **summary-only**

Syntax Definitions

<i>ip_address</i>	IP address for the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

Release History

Release 7.1.1; command was introduced.

ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
ip bgp network ip_address ip_mask  
    [community string]  
    [local-preference value]  
    [metric metric]  
    [admin-state {enable | disable}]
```

```
no ip bgp network ip_address ip_mask
```

Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0  
-> no ip bgp network 172.22.2.115 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

ip bgp network admin-state

Enables or disables a BGP network.

ip bgp network *ip_address ip_mask* **admin-state** {**enable** | **disable**}

Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
enable	Enables this network.
disable	Disables this network.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up to 200 network entries. The **show ip bgp path** command displays every network currently defined.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

Release History

ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

ip bgp network *ip_address ip_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the network.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

Defaults

parameter	default
none no-export no-advertise no-export-subconfed <i>num:num</i>	none

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the network community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ip bgp network *ip_address ip_mask local-preference value*

no ip bgp network *ip_address ip_mask local-preference value*

Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the [ip bgp default local-preference](#) command).

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bgp network** Creates or deletes a BGP network.
- ip bgp default local-preference** Sets the default local preference for this AS.

MIB Objects

alaBgpNetworkTable
 alaBgpNetworkAddr

 alaBgpNetworkLocalPref

ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

ip bgp network *ip_address ip_mask metric value*

no ip bgp network *ip_address ip_mask metric value*

Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	A MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
<i>value</i>	0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

Release History

Release 7.1.1; command was introduced.

ip bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

ip bgp neighbor *ip_address* [**activate-ipv4**]

no ip bgp neighbor *ip_address* [**activate-ipv4**]

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
activate-ipv4	Enable the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv4 BGP peer.

Examples

```
-> ip bgp neighbor 172.22.2.115 activate-ipv4
-> no ip bgp neighbor 172.22.2.115 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerActivateIpv4
```

ip bgp neighbor admin-state

Enables or disables a BGP peer.

```
ip bgp neighbor ip_address admin-state {enable | disable}
```

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
enable	Enables this peer.
disable	Disables this peer.

Defaults

parameter	default
enable disable	disable

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates a BGP peer.
show ip bgp neighbors	Displays peer parameters.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
```

ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

ip bgp neighbor *ip_address* **advertisement-interval** *value*

Syntax Definitions

ip_address 32-bit IP address of the neighbor.
value An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

parameter	default
<i>value</i>	30

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

Release History

Release 7.1.1; command was introduced.

ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

ip bgp neighbor *ip_address* **clear**

Syntax Definitions

ip_address 32-bit IP address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
 - **ip bgp neighbor remote-as**
 - **ip bgp neighbor md5 key**
 - **ip bgp neighbor passive**
 - **ip bgp neighbor ebgp-multihop**
 - **ip bgp neighbor maximum-prefix**
 - **ip bgp neighbor update-source**
 - **ip bgp neighbor next-hop-self**
 - **ip bgp neighbor soft-reconfiguration**
 - **ip bgp neighbor route-reflector-client**
 - **ip bgp confederation neighbor**
 - **ip bgp neighbor remove-private-as**
 - **ip bgp neighbor update-source.**
- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

 alaBgpPeerRestart

ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

ip bgp neighbor *ip_address* **timers** *keepalive holdtime*

Syntax Definitions

<i>ip_address</i>	32-bit IP address for the BGP peer.
<i>keepalive</i>	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
<i>holdtime</i>	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

Defaults

parameter	default
<i>keepalive</i>	30
<i>holdtime</i>	90

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the [ip bgp neighbor clear](#) command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor conn-retry-interval](#) The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

MIB Objects

```

  bgpPeerKeepAliveConfigured
```

ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

ip bgp neighbor *ip_address* **conn-retry-interval** *seconds*

Syntax Definitions

<i>ip_address</i>	32-bit IP address for the neighbor.
<i>seconds</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
<i>seconds</i>	120

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the [ip bgp neighbor auto-restart](#) command).
- You must restart the peer (using the [ip bgp neighbor clear](#) command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

ip bgp neighbor *ip_address* **maximum-prefix** *maximum* [**warning-only**]

Syntax Definitions

ip_address 32-bit IP address for the BGP peer.
maximum The maximum number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
<i>threshold</i>	5000

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000  
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear Restarts the BGP peer.

MIB Objects

ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

ip bgp neighbor *ip_address* **md5 key** {*string* | **none**}

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	The MD5 public key. Maximum character length is 200.
none	Removes the MD5 public key.

Defaults

parameter	default
<i>string</i>	no password

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

ip bgp neighbor *ip_address* **md5 key-encrypt** *encrypted_string*

However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

Release History

Release 7.1.1; command was introduced.

 alaBgpPeerMD5Key

ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

ip bgp neighbor *ip_address* **ebgp-multihop** [*tth*]

no ip bgp neighbor *ip_address* **ebgp-multihop**

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>tth</i>	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

parameter	default
<i>tth</i>	255

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250  
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor

Creates or deletes a BGP peer.

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior.

MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerMultiHop

ip bgp neighbor description

Configures the BGP peer name.

```
ip bgp neighbor ip_address description string
```

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Peer name (1–20 characters).

Defaults

parameter	default
<i>string</i>	peer(ip_address)

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#) Sets the IP address for the peer.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerName
```

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

ip bgp neighbor *ip_address* next-hop-self

no ip bgp neighbor *ip_address* next-hop-self

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self  
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands**ip bgp neighbor**

Creates or deletes a BGP peer.

MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

 alaBgpPeerNextHopSelf

ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

ip bgp neighbor *ip_address* **remote-as** *value*

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.
value Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 6900, 6860, 6865

Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
 - asplain (simple decimal notation)
 - asdot+ (two 16-bit values as low-order and high-order)
 - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100
```

The following examples show how to configure the BGP neighbor ASN as 65535 in the three different formats:

```
-> ip bgp neighbor 2.2.2.2 remote-as 65535                    (asplain format)
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535                (asdot+ format)
-> ip bgp neighbor 2.2.2.2 remote-as 65535                (asdot format)
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.3; support for 4-octet ASN was added.

ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

```
ip bgp neighbor ip_address update-source [interface_name]
```

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.
interface_name The name of the interface.

Defaults

parameter	default
<i>interface_address</i>	0.0.0.0

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the [ip bgp neighbor](#) command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117  
-> ip bgp neighbor 172.22.5.115 update-source vlan-22  
-> ip bgp neighbor 172.22.5.115 update-source
```

Release History

Release 7.1.1; command was introduced.

ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

ip bgp neighbor *ip_address* **in-aspathlist** {*string* / **none**}

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
none	Removes this AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

Release History

Release 7.1.1; command was introduced.

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “**none**”.

Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefix6list OutboundPrefix6  
-> ip bgp neighbor 172.22.2.115 out-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefix6ListOut
```

ip bgp neighbor route-map

Assigns a policy map (inbound or outbound) to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
```

```
no ip bgp neighbor ip_address route-map {in | out}
```

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the peer.
<i>string</i>	Policy map name (0 to 70 characters). This name is case sensitive.
none	Deletes the route map if entered rather than a text string.
in	Designates this route map policy as an inbound policy.
out	Designates this route map policy as an outbound policy.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to deassign an inbound or an outbound policy.
- The policy route map name (**InboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- The policy route map name (**OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any outbound routes for the BGP peer must match this route map filter before being advertised or passed to outbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerRouteMapOut
  alaBgpPeerRouteMapIn
```

ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

ip bgp neighbor *ip_address* **clear soft** {**in** | **out**}

Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
in	Applies reconfiguration to the inbound policies.
out	Applies reconfiguration to the outbound policies.

Defaults

N/A

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor soft-reconfiguration](#) Enables or disables BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerReconfigureInBound
  alaBgpPeerReconfigureOutBound
```

ip bgp policy aspath-list

Creates or removes an AS path list.

ip bgp policy aspath-list *name* “*regular_expression*”

no ip bgp policy aspath-list *name* “*regular_expression*”

Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, for example, “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

Defaults

No IP BGP peer policy AS path-list exists.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.
	Separates AS numbers in an alternation sequence.

Symbol	Description
)	Ends an alternation sequence of AS numbers
[Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
\$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-*aspathlist***, **ip bgp neighbor out-*aspathlist***, **ipv6 bgp neighbor in-*aspathlist***, and **ipv6 bgp neighbor out-*aspathlist*** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-ashpathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-ashpathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.
ipv6 bgp neighbor in-ashpathlist	Assigns an inbound AS path list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-ashpathlist	Assigns an outbound AS path filter list to an IPv6 BGP peer.

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListRowStatus

ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

ip bgp policy aspath-list *name* "*regular_expression*" **action** {**permit** | **deny**}

Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-102 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" action permit
-> ip bgp policy aspath-list OutboundAspath "^300 400$" action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-ashpathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-ashpathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.
ipv6 bgp neighbor in-ashpathlist	Assigns an inbound AS path list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-ashpathlist	Assigns an outbound AS path filter list to an IPv6 BGP peer.

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListAction

ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

ip bgp policy aspath-list *name* "*regular_expression*" **priority** *value*

Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<i>value</i>	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

Defaults

parameter	default
<i>value</i>	1

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-102 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListPriority

ip bgp policy community-list

Creates or deletes a community list.

ip bgp policy community-list *name* {*num:num* / *num.num:num* / *num*}

no ip bgp policy community-list *name* {*num:num* / *num.num:num* / *num*}

Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<i>num:num</i>	The community number, given in the form of the AS number in the asplain format and the community number, separated by a colon.
<i>num.num:num</i>	The community number, given in the form of the AS number in the asdot or asdot+ format and the community number, separated by a colon.

Defaults

No IP BGP peer policy community-list exists.

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist**, **ip bgp neighbor out-communitylist**, **ipv6 bgp neighbor in-communitylist** and **ipv6 bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp policy community-list** command.

Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> no ip bgp policy community-list CommListAIn 40:40
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.
ipv6 bgp neighbor in-communitylist	Assigns an inbound community list filter to an IPv6 BGP peer.
ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListRowStatus

ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
action {**permit** | **deny**}

Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit deny	permit

Platforms Supported

OmniSwitch 10K, 9900, 6900, 6860, 6865

Usage Guidelines

- By default, this command allows routes that match the criteria specified in the community list to pass.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.

ipv6 bgp neighbor out-communitylist	Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListAction

ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
match-type {**exact** | **occur**}

Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
exact	Checks for an exact match of the community string and the community attribute.
occur	Checks for an occurrence of the community string anywhere in the community attribute.

Defaults

parameter	default
exact occur	exact

Platforms Supported
