## Legal Notice

The use of Alcatel-Lucent switching platforms and software, by all individuals or corporations, to terminate Cisco or Nortel VPN client devices constitutes complete acceptance of liability by that individual or corporation for this action and indemnifies, in full, Alcatel-Lucent from any and all legal actions that might be taken against it with respect to infringement of copyright on behalf of Cisco Systems or Nortel Networks."

[www.alcatel-lucent.com](http://www.alcatel-lucent.com)  
26801 West Agoura Road  
Calabasas, CA 91301

The AOS-W command line interface (CLI) allows you to configure and manage Alcatel-Lucent switches. The CLI is accessible from a local console connected to the serial port on the switches or through a Telnet or Secure Shell (SSH) session from a remote management console or workstation.

Telnet access is disabled by default on Alcatel-Lucent switches. To enable Telnet access, enter the telnet cli command from a serial connection or an SSH session, or in the WebUI navigate to the **Configuration > Management > General** page.

## What's New In AOS-W 3.4

The following commands have been added in the AOS-W 3.4 Command Line Interface.

**Table 1**

Command	Description
<code>ap mesh-ht-ssid-profile</code>	This command configures a mesh high-throughput SSID profile used by mesh nodes.
<code>aaa query-server</code>	Troubleshoot an LDAP authentication failure by verifying that the user exists in the ldap server database.
<code>cellular profile</code>	Configure the cellular interface profile.
<code>controller-ip</code>	This command sets the switch IP to the loopback interface address or a specific VLAN interface address.
<code>cp-bandwidth-contract</code>	This command configures a bandwidth contract traffic rate which can then be associated with a whitelist session ACL.
<code>firewall cp</code>	This command creates whitelist session ACLs. Whitelist ACLs consist of rules that explicitly permit or deny session traffic from being forwarded or not to the switch. This prohibits traffic from being automatically forwarded to the switch if it was not specifically denied in a blacklist. The maximum number of entries allowed in the whitelist is 64.
<code>firewall cp-bandwidth-contract</code>	This command configures bandwidth contract traffic rate limits to prevent denial of service attacks.
<code>guest-access-email</code>	This command configures the SMTP server which is used to send guest email. Guest email is generated when a guest user account is created or when the Guest Provisioning user sends guest user account email a later time.
<code>interface vlan ip igmp proxy</code>	This command enables IGMP and/or IGMP snooping on this interface, or configures a VLAN interface for uninterrupted streaming of multicast traffic.
<code>ip ospf</code>	Configure OSPF on the VLAN interface.

**Table 1**

Command	Description
<code>local-userdb send-to-guest</code>	This command automatically sends email to the guest when the guest user is created.
<code>local-userdb send-to-sponsor</code>	This command automatically sends email to the guest's sponsor when the guest user is created.
<code>mgmt-server</code>	Register a management server with the switch by specifying the IP address of an AirWave Management Server or any other server that should receive messages from the switch using the Application Monitoring (AMON) protocol.
<code>network-printer</code>	This command allows you to configure client and print job for the USB printer connected to a OmniAccess 4306 series switch .
<code>network-storage</code>	This command allows you to configure a file system path for the share (allowing users to access the share from their computer) or remove the share access using the <b>no share</b> command.
<code>papi-security</code>	The papi-security command is used by the Alcatel-Lucent system to enforce advanced security options and provides an enhanced level of security.
<code>pkt-trace</code>	Enable packet tracing in the datapath. Use this feature only under the supervision of Alcatel-Lucent technical support.
<code>pkt-trace-global</code>	Enable global packet tracing in the datapath. Use this feature only under the supervision of Alcatel-Lucent technical support.
<code>process monitor</code>	The process monitor watchdog validates the integrity of processes every 120 seconds. If a process does not respond during three consecutive 120-second timeout intervals, that process is flagged as nonresponsive and the process monitor will create a log message, restart the process or reboot the switch.
<code>router ospf</code>	Define global OSPF configuration for the upstream router.
<code>show cellular profile</code>	Show cellular profiles and profile settings.
<code>show dialer group</code>	Display dialer group information.
<code>show dir</code>	Displays the list of directories in the specified disk and the filesystem path.
<code>show global-user-table</code>	This command displays a count of global user based on the specified criteria.
<code>show network-printer</code>	Displays configuration, job status details, and printer status of USB printers connected to an OmniAccess 4306 switch.
<code>show network-storage</code>	Displays details about the USB storage device connect to an OmniAccess 4306 switch.
<code>show usb</code>	Show USB device information.
<code>show uplink</code>	Displays uplink configuration details on an OmniAccess 4306 series switch.

**Table 1**

Command	Description
<code>uplink</code>	Manage and configure an uplink network connection by defining primary and backup links.
<code>usb-printer</code>	This command allows you to provide an alias to a USB printer connected to an OmniAccess 4306 series switch.
<code>wlan dot11k-profile</code>	Configure a 802.11k radio profile.

## Modified Commands

The following commands were modified in AOS-W 3.4.

**Table 2**

Command	Parameter Change
<code>aaa authentication dot1x</code>	<ul style="list-style-type: none"> <li>The <b>termination enable</b> parameter was added. This enables wired clients to complete an 8.02.1x authentication that terminates on an Alcatel-Lucent switch</li> </ul>
<code>ap mesh-radio-profile</code>	<ul style="list-style-type: none"> <li>The <b>mesh-ht-ssid-profile</b> parameter was introduced.</li> <li>The <b>11a-portal-channel</b>, <b>11a-portal-channel</b>, <b>beacon-period</b> and <b>tx-power</b> parameters were deprecated.</li> </ul>
<code>ids dos-profile</code>	The <b>detect-sequence-anomaly</b> , <b>sequence-diff</b> , <b>sequence-quiet-time</b> , <b>sequence-time-tolerance</b> parameters were deprecated.
<code>interface fastethernet   gigabitethernet</code>	The <b>trusted vlan</b> and <b>ip access-group session vlan</b> parameters were introduced.
<code>interface port-channel</code>	The <b>trusted vlan</b> and <b>ip access-group session vlan</b> parameters were introduced.
<code>interface range</code>	The <b>trusted vlan</b> and <b>ip access-group session vlan</b> parameters were introduced.
<code>interface vlan</code>	The <b>igmp snooping</b> parameter was deprecated.
<code>ip mobile proxy</code>	The default value for <b>no-service-timeout</b> parameter is now set to 180 seconds. The <b>tunnel-heartbeat</b> parameter is now removed from this command.
<code>local-userdb add</code>	The <b>guest</b> , <b>sponsor</b> and <b>optional field</b> parameters were added.
<code>local-userdb modify</code>	The <b>guest</b> , <b>sponsor</b> and <b>optional field</b> parameters were added.
<code>pcap</code>	<ul style="list-style-type: none"> <li>The <b>maxlen</b> parameter was introduced.</li> <li>The <b>pcap start</b> command was deprecated.</li> </ul>

**Table 2**

Command	Parameter Change
<code>provision-ap</code>	AOS-W 3.4 introduced support for the following parameters: <ul style="list-style-type: none"> <li>● installation</li> <li>● mesh-sae</li> <li>● set-ikepsk-by-addr</li> <li>● usb-dev</li> <li>● usb-dial</li> <li>● usb-init</li> <li>● usb-passwd</li> <li>● usb-tty</li> <li>● usb-type</li> <li>● usb-user</li> </ul>
<code>rf dot11a-radio-profile</code>	AOS-W 3.4 introduced support for the following parameters: <ul style="list-style-type: none"> <li>● Spectrum load balancing</li> <li>● Spectrum load balancing domain</li> <li>● RX Sensitivity Tuning Based Channel Reuse</li> <li>● RX Sensitivity Threshold</li> <li>● ARM/WIDS Override</li> </ul>
<code>rf dot11g-radio-profile</code>	AOS-W 3.4 introduced support for the following parameters: <ul style="list-style-type: none"> <li>● Spectrum load balancing</li> <li>● Spectrum load balancing domain</li> <li>● RX Sensitivity Tuning Based Channel Reuse</li> <li>● RX Sensitivity Threshold</li> <li>● ARM/WIDS Override</li> </ul>
<code>rf ht-radio-profile</code>	Introduced the <b>single-chain-legacy</b> parameter.
<code>rf optimization-profile</code>	The following parameters were deprecated: <ul style="list-style-type: none"> <li>● ap-lb-max-retries &lt;number&gt;</li> <li>● ap-lb-user-high-wm &lt;percent&gt;</li> <li>● ap-lb-user-low-wm &lt;percent&gt;</li> <li>● ap-lb-util-high-wm &lt;percent&gt;</li> <li>● ap-lb-util-low-wm &lt;percent&gt;</li> <li>● ap-lb-util-wait-time &lt;seconds&gt;</li> <li>● ap-load-balancing</li> </ul>
<code>vlan</code>	The <b>vlan-ids</b> parameter was introduced.
<code>wlan ssid-profile</code>	<ul style="list-style-type: none"> <li>● The <b>deny-bcast</b> and <b>disable-probe-retry</b> parameters were introduced.</li> <li>● The <b>drop-mcast</b> parameter was deprecated.</li> </ul>
<code>wlan voip-cac-profile</code>	The <b>bandwidth-cac</b> , <b>bandwidth-capacity</b> and <b>call-capacity</b> parameters were introduced.
<code>show wlan voip-cac-profile</code>	<p>The <b>VoIP Vocera Call Capacity</b>, <b>VoIP NOE Call Capacity</b>, <b>Voip SIP Call Capacity</b>, <b>Voip SVP Call Capacity</b>, <b>Voip SCCP Call Capacity</b>, <b>Voip H.323 Call Capacity</b>, <b>Voip T-Spec Call Capacity</b> parameters are now replaced with the new parameter <b>VoIP Call Capacity</b>.</p> <p>The <b>VoIP Active Load Balancing</b>, and <b>VoIP High-capacity Threshold</b> parameters are removed from the output of this command.</p>

## Deprecated Commands

The following CLI commands were removed from AOS-W 3.4.

**Table 3**

Command	Description
<code>ap snmp-profile</code> (deprecated)	This command was previously used to configure an SNMP profile.
<code>ap snmp-user-profile</code> (deprecated)	This command was previously used to configure an SNMPv3 user profile.

## About this Guide

This guide describes the AOS-W command syntax. The commands in this guide are listed alphabetically.

The following information is provided for each command:

- **Command Syntax**—The complete syntax of the command.
- **Description**—A brief description of the command.
- **Syntax**—A description of the command parameters, including license requirements for specific parameters if needed. The applicable ranges and default values, if any, are also included.
- **Usage Guidelines**—Information to help you use the command, including: prerequisites, prohibitions, and related commands.
- **Example**—An example of how to use the command.
- **Command History**—The version of AOS-W in which the command was first introduced. Modifications and changes to the command are also noted.
- **Command Information**—This table describes any licensing requirements, command modes and platforms for which this command is applicable. For more information about available licenses, see the “Managing Software Feature Licenses” chapter in the *AOS-W User Guide*.

This guide does not include **clear**, **no**, or all **show** commands.

## Connecting to the Switch

This section describes how to connect to the switch to use the CLI.

### Serial Port Connection

The serial port is located on the front panel of the switch. Connect a terminal or PC/workstation running a terminal emulation program to the serial port on the switch to use the CLI. Configure your terminal or terminal emulation program to use the following communication settings

Baud Rate	Data Bits	Parity	Stop Bits	Flow Control
9600	8	None	1	None

### Telnet or SSH Connection

Telnet or SSH access requires that you configure an IP address and a default gateway on the switch and connect the switch to your network. This is typically performed when you run the Initial Setup on the switch, as described in the *Alcatel-Lucent Quick Start Guide*. In certain deployments, you can also configure a loopback address for the switch; see the “Deploying a Basic Alcatel-Lucent User-Centric System” chapter in the *AOS-W User Guide* for more information.

## Configuration changes on Master Switches

Some commands can only be issued when connected to a master switch. If you make a configuration change on a master switch, all connected local switches will subsequently update their configurations as well. You can manually synchronize all of the switches at any time by saving the configuration on the master switch.

## CLI Access

When you connect to the switch using the CLI, the system displays its host name followed by the login prompt. Log in using the admin user account and the password you entered during the Initial Setup on the switch (the password displays as asterisks). For example:

```
(host)
User: admin
Password: *****
```

When you are logged in, the *user* mode CLI prompt displays. For example:

```
(host) >
```

User mode provides only limited access for basic operational testing such as running **ping** and **tracert**.

Certain management functions are available in *enable* (also called “privileged”) mode. To move from user mode to enable mode requires you to enter an additional password that you entered during the Initial Setup (the password displays as asterisks). For example:

```
(host) > enable
Password: *****
```

When you are in enable mode, the > prompt changes to a pound sign (#):

```
(host) #
```

Configuration commands are available in *config* mode. Move from enable mode to config mode by entering **configure terminal** at the # prompt:

```
(host) # configure terminal
Enter Configuration commands, one per line. End with CNTL/Z
```

When you are in basic config mode, (config) appears before the # prompt:

```
(host) (config) #
```

NOTE

---

There are several other sub- command modes that allow users to configure individual interfaces, subinterfaces, loopback addresses, GRE tunnels and cellular profiles. For details on the prompts and the available commands for each of these modes, see [Appendix A: Command Modes on page 1032](#).

---

## Command Help

You can use the question mark (?) to view various types of command help.

When typed at the beginning of a line, the question mark lists all the commands available in your current mode or sub-mode. A brief explanation follows each command. For example:

```
(host) > ?

enable          Turn on Privileged commands
logout          Exit this session. Any unsaved changes are lost.
ping            Send ICMP echo packets to a specified IP address.
tracert         Trace route to specified IP address.
```

When typed at the end of a possible command or abbreviation, the question mark lists the commands that match (if any). For example:

```
(host) > c?  
  
clear                Clear configuration  
clock               Configure the system clock  
configure           Configuration Commands  
copy                Copy Files
```

If more than one item is shown, type more of the keyword characters to distinguish your choice. However, if only one item is listed, the keyword or abbreviation is valid and you can press tab or the spacebar to advance to the next keyword.

When typed in place of a parameter, the question mark lists the available options. For example:

```
(host) # write ?  
erase                Erase and start from scratch  
file                 Write to a file in the file system  
memory              Write to memory  
terminal            Write to terminal  
<cr>
```

The <cr> indicates that the command can be entered without additional parameters. Any other parameters are optional.

## Command Completion

To make command input easier, you can usually abbreviate each key word in the command. You need type only enough of each keyword to distinguish it from similar commands. For example:

```
(host) # configure terminal
```

could also be entered as:

```
(host) # con t
```

Three characters (**con**) represent the shortest abbreviation allowed for **configure**. Typing only **c** or **co** would not work because there are other commands (like **copy**) which also begin with those letters. The configure command is the only one that begins with **con**.

As you type, you can press the spacebar or tab to move to the next keyword. The system then attempts to expand the abbreviation for you. If there is only one command keyword that matches the abbreviation, it is filled in for you automatically. If the abbreviation is too vague (too few characters), the cursor does not advance and you must type more characters or use the help feature to list the matching commands.

## Deleting Configuration Settings

Use the **no** command to delete or negate previously-entered configurations or parameters.

- To view a list of no commands, type **no** at the enable or config prompt followed by the question mark. For example:

```
(host) (config) # no?
```

- To delete a configuration, use the no form of a configuration command. For example, the following command removes a configured user role:

```
(host) (config) # no user-role <name>
```

- To negate a specific configured parameter, use the **no** parameter within the command. For example, the following commands delete the DSCP priority map for a priority map configuration:

```
(host) (config) # priority-map <name>  
(host) (config-priority-map) # no dscp priority high
```

## Saving Configuration Changes

Each Alcatel-Lucent switch contains two different types of configuration images.

- The *running config* holds the current switch configuration, including all pending changes which have yet to be saved. To view the running-config, use the following command:

```
(host) # show running-config
```

- The *startup config* holds the configuration which will be used the next time the switch is rebooted. It contains all the options last saved using the **write memory** command. To view the startup-config, use the following command:

```
(host) # show startup-config
```

When you make configuration changes via the CLI, those changes affect the current running configuration only. If the changes are not saved, they will be lost after the switch reboots. To save your configuration changes so they are retained in the startup configuration after the switch reboots, use the following command in enable mode:

```
(host) # write memory
Saving Configuration...
```

Saved Configuration

Both the startup and running configurations can also be saved to a file or sent to a TFTP server for backup or transfer to another system.

## Commands That Reset the Switch or AP

If you use the CLI to modify a currently provisioned and running radio profile, those changes take place immediately; you do not reboot the switch or the AP for the changes to affect the current running configuration. Certain commands, however, automatically force the switch or AP to reboot. You may want to consider current network loads and conditions before issuing these commands, as they may cause a momentary disruption in service as the unit resets.

### Commands that reset an AP

- `ap-regroup`
- `ap-rename`
- `apboot`
- `apflash`
- `provision-ap reprovision`
- `ap wired-ap-profile forward-mode {bridge|split-tunnel|tunnel}`
- `wlan virtual-ap forward-mode {bridge|split-tunnel|tunnel}`
- `ap system-profile master-ip <ipaddr>`

### Commands that reset a switch

- `reload`
- `reload-peer-sc`

## Command Line Editing

The system records your most recently entered commands. You can review the history of your actions, or reissue a recent command easily, without having to retype it.

To view items in the command history, use the *up* arrow to move back through the list and the *down* arrow key to forward. To reissue a specific command, press **Enter** when the command appears in the command history. You can even use the command line editing feature to make changes to the command prior to entering it.

The command line editing feature allows you to make corrections or changes to a command without retyping. [Table 4](#) lists the editing controls: To use key shortcuts, press and hold the **Ctrl** button while you press a letter key.

**Table 4** *Line Editing Keys*

Key	Effect	Description
Ctrl A	Home	Move the cursor to the beginning of the line.
<b>Ctrl B</b> or the left arrow	Back	Move the cursor one character left.
Ctrl D	Delete Right	Delete the character to the right of the cursor.
Ctrl E	End	Move the cursor to the end of the line.
<b>Ctrl F</b> or the right arrow	Forward	Move the cursor one character right.
Ctrl K	Delete Right	Delete all characters to the right of the cursor.
<b>Ctrl N</b> or the down arrow	Next	Display the next command in the command history.
<b>Ctrl P</b> or up arrow	Previous	Display the previous command in the command history.
Ctrl T	Transpose	Swap the character to the left of the cursor with the character to the right of the cursor.
Ctrl U	Clear	Clear the line.
Ctrl W	Delete Word	Delete the characters from the cursor up to and including the first space encountered.
Ctrl X	Delete Left	Delete all characters to the left of the cursor.

## Typographic Conventions

The following conventions are used throughout this manual to emphasize important concepts:

**Table 5** *Text Conventions*

Type Style	Description
Italics	This style is used to emphasize important terms and to mark the titles of books.
Boldface	This style is used to emphasize command names and parameter options when mentioned in the text.

**Table 5** *Text Conventions*

Type Style	Description
Commands	This fixed-width font depicts command syntax and examples of commands and command output.
<angle brackets>	In the command syntax, text within angle brackets represents items that you should replace with information appropriate to your specific situation. For example: ping <ipaddr> In this example, you would type “ping” at the system prompt exactly as shown, followed by the IP address of the system to which ICMP echo packets are to be sent. Do not type the angle brackets.
[square brackets]	In the command syntax, items enclosed in brackets are optional. Do not type the brackets.
{Item_A Item_B}	In the command examples, single items within curled braces and separated by a vertical bar represent the available choices. Enter only one choice. Do not type the braces or bars.
{ap-name <ap-name>} {ipaddr <ip-addr>}	Two items within curled braces indicate that both parameters must be entered together. If two or more sets of curled braces are separated by a vertical bar, like in the example to the left, enter only one choice Do not type the braces or bars.

## Specifying Addresses and Identifiers in Commands

This section describes addresses and other identifiers that you can reference in CLI commands.

**Table 6** *Addresses and Identifiers*

Address/Identifier	Description
IP address	For any command that requires entry of an IP address to specify a network entity, use IPv4 network address format in the conventional dotted decimal notation (for example, 10.4.1.258). For subnetwork addresses, specify a netmask in dotted decimal notation (for example, 255.255.255.0).
Netmask address	For subnetwork addresses, specify a netmask in dotted decimal notation (for example, 255.255.255.0).
Media Access Control (MAC) address	For any command that requires entry of a device’s hardware address, use the hexadecimal format (for example, 00:05:4e:50:14:aa).
Service Set Identifier (SSID)	A unique character string (sometimes referred to as a network name), consisting of no more than 32 characters. The SSID is case-sensitive (for example, WLAN-01).
Basic Service Set Identifier (BSSID)	This entry is the unique hard-wireless MAC address of the AP. A unique BSSID applies to each frequency— 802.11a and 802.11g—used from the AP. Use the same format as for a MAC address.
Extended Service Set Identifier (ESSID)	Typically the unique logical name of an access point.

**Table 6** *Addresses and Identifiers*

Address/Identifier	Description
Fast Ethernet or Gigabit Ethernet interface	<p>Any command that references a Fast Ethernet or Gigabit Ethernet interface requires that you specify the corresponding port on the switch in the format &lt;slot&gt;/&lt;port&gt;: &lt;slot&gt; is always 1, <i>except</i> when referring to interfaces on the OmniAccess 6000 switch. For the OmniAccess 6000 switch, the four slots are allocated as follows:</p> <ul style="list-style-type: none"><li>• <b>Slot 0:</b> contains a supervisor card or OmniAccess Supervisor Card III.</li><li>• <b>Slot 1:</b> can contain either a redundant supervisor card, OmniAccess Supervisor Card III, or a third line card.</li><li>• <b>Slot 2:</b> can contain either a OmniAccess Supervisor Card III or line card (required if slot 0 contains a supervisor card).</li><li>• <b>Slot 3:</b> can contain either a OmniAccess Supervisor Card III or second line card.</li></ul> <p>&lt;port&gt; refers to the network interfaces that are embedded in the front panel of the OmniAccess 4302, OmniAccess 4308T, or OmniAccess 4324 switch, OmniAccess 4504/4604/4704, Multi-Service Switch, OmniAccess Supervisor Card III, or a line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position. Use the <b>show port status</b> command to obtain the interface information currently available from a switch.</p>

## aaa authentication captive-portal

```
aaa authentication
aaa authentication captive-portal <profile>
  clone <source-profile>
  default-role <role>
  enable-welcome-page
  guest-logon
  login-page <url>
  logon-wait {cpu-threshold <percent>}|{maximum-delay <seconds>}|{minimum-delay <secs>}
  logout-popup-window
  max-authentication-failures <number>
  no ...
  protocol-http
  proxy host <ipaddr> port <port>
  redirect-pause <secs>
  server-group <group-name>
  show-fqdn
  single-session
  switch-in-redirection-url
  sygate-on-demand-agent
  use-chap
  user-logon
  welcome-page <url>
```

### Description

This command configures a Captive Portal authentication profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing Captive Portal profile from which parameter values are copied.	—	—
default-role <role>	Role assigned to the Captive Portal user upon login. When both user and guest logon are enabled, the default role applies to the user logon; users logging in using the guest interface are assigned the guest role.	—	guest
enable-welcome-page	Displays the configured welcome page before the user is redirected to their original URL. If this option is disabled, redirection to the web URL happens immediately after the user logs in.	enabled/ disabled	enabled
guest-logon	Enables Captive Portal logon without authentication.	enabled/ disabled	disabled
login-page <url>	URL of the page that appears for the user logon. This can be set to any URL.	—	/auth/index.html
logon-wait	Configure parameters for the logon wait interval	1-100	60%
cpu-threshold <percent>	CPU utilization percentage above which the Logon wait interval is applied when presenting the user with the logon page.	1-100	60%

Parameter	Description	Range	Default
maximum-delay <seconds>	Maximum time, in seconds, the user will have to wait for the logon page to pop up if the CPU load is high. This works in conjunction with the Logon wait CPU utilization threshold parameter.	1-10	10 seconds
minimum-delay <secs>	Minimum time, in seconds, the user will have to wait for the logon page to pop up if the CPU load is high. This works in conjunction with the Logon wait CPU utilization threshold parameter.	1-10	5 seconds
logout-popup-window	Enables a pop-up window with the Logout link for the user to logout after logon. If this is disabled, the user remains logged in until the user timeout period has elapsed or the station reloads.	enabled/ disabled	enabled
max-authentication-failures <number>	Maximum number of authentication failures before the user is blacklisted. <b>NOTE:</b> The Wireless Intrusion Protection license must be installed.	0-10	0
no	Negates any configured parameter.	—	—
protocol-http	Use HTTP protocol on redirection to the Captive Portal page. If you use this option, modify the captive portal policy to allow HTTP traffic.	enabled/ disabled	disabled (HTTPS is used)
proxy host <ip-addr> port <port>	Configures an IP address and port number for a proxy server. <b>NOTE:</b> This option is only available in the base operating system.	—	N/A
redirect-pause <secs>	Time, in seconds, that the system remains in the initial welcome page before redirecting the user to the final web URL. If set to 0, the welcome page displays until the user clicks on the indicated link.	1-60	10 seconds
server-group <group-name>	Name of the group of servers used to authenticate Captive Portal users. See <a href="#">“aaa server-group” on page 54</a> .	—	—
show-fqdn	Allows the user to see and select the fully-qualified domain name (FQDN) on the login page. The FQDNs shown are specified when configuring individual servers for the server group used with captive portal authentication.	enabled/ disabled	disabled
single-session	Allows only one active user session at a time.	—	disabled
switch-in-redirect-url	Sends the switch’s IP address in the redirection URL when external captive portal servers are used. An external captive portal server can determine the switch from which a request originated by parsing the ‘switchip’ variable in the URL.	enabled/ disabled	disabled
sygate-on-demand-agent	Enables client remediation with Sygate-on-demand-agent (SODA). <b>NOTE:</b> The External Services Interface license must be installed.	enabled/ disabled	disabled
use-chap	Use CHAP protocol. You should not use this option unless instructed to do so by an Alcatel-Lucent representative.	enabled/ disabled	disabled (PAP is used)
user-logon	Enables Captive Portal with authentication of user credentials.	enabled/ disabled	enabled

Parameter	Description	Range	Default
welcome-page <url>	URL of the page that appears after logon and before redirection to the web URL. This can be set to any URL.	—	/auth/welcome.html

## Usage Guidelines

You can configure the Captive Portal authentication profile in the base operating system or with the Policy Enforcement Firewall license installed. When you configure the profile in the base operating system, the name of the profile must be entered for the initial role in the AAA profile. Also, when you configure the profile in the base operating system, you cannot define the default-role.

## Example

The following example configures a Captive Portal authentication profile that authenticates users against the switch's internal database. Users who are successfully authenticated are assigned the auth-guest role.

To create the auth-guest user role shown in this example, the Policy Enforcement Firewall license must be installed in the switch.

```
aaa authentication captive-portal guestnet
  default-role auth-guest
  user-logon
  no guest-logon
  server-group internal
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for noted parameters	Config mode on master switches

## aaa authentication dot1x

  xSec-mtu <mtu>
```

### Description

This command configures the 802.1x authentication profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
clear	Clear the Cached PMK, Role and VLAN entries. This command is available in enable mode only.	—	—
countermeasures	Scans for message integrity code (MIC) failures in traffic received from clients. If there are more than 2 MIC failures within 60 seconds, the AP is shut down for 60 seconds. This option is intended to slow down an attacker who is making a large number of forgery attempts in a short time.	—	disabled

Parameter	Description	Range	Default
ca-cert <certificate>	CA certificate for client authentication. The CA certificate needs to be loaded in the switch.	—	—
clone <profile>	Name of an existing 802.1x profile from which parameter values are copied.	—	—
eapol-logoff	Enables handling of EAPOL-LOGOFF messages.	—	disabled
framed-mtu <MTU>	Sets the framed MTU attribute sent to the authentication server.	500-1500	1100
heldstate-bypass-counter <number>	(This parameter is applicable when 802.1x authentication is terminated on the switch, also known as AAA FastConnect.) Number of consecutive authentication failures which, when reached, causes the switch to not respond to authentication requests from a client while the switch is in a held state after the authentication failure. Until this number is reached, the switch responds to authentication requests from the client even while the switch is in its held state.	0-3	0
ignore-eap-id-match	Ignore EAP ID during negotiation.	—	disabled
ignore-eapol-start-afterauthentication	Ignores EAPOL-START messages after authentication.	—	disabled
machine-authentication	(For Windows environments only) These parameters set machine authentication: <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.		
blacklist-on-failure	Blacklists the client if machine authentication fails.	—	disabled
cache-timeout <hours>	The timeout, in hours, for machine authentication.	1-1000	24 hours (1 day)
enable	Select this option to enforce machine authentication before user authentication. If selected, either the machine-default-role or the user-default-role is assigned to the user, depending on which authentication is successful.	—	disabled
machine-default-role <role>	Default role assigned to the user after completing only machine authentication.	—	guest
user-default-role <role>	Default role assigned to the user after 802.1x authentication.	—	guest
max-authentication-failures <number>	Number of times a user can try to login with wrong credentials after which the user is blacklisted as a security threat. Set to 0 to disable blacklisting, otherwise enter a non-zero integer to blacklist the user after the specified number of failures. <b>NOTE:</b> The Wireless Intrusion Protection license must be installed.	0-5	0 (disabled)
max-requests <number>	Maximum number of times ID requests are sent to the client.	1-10	3
multicast-key-rotation	Enables multicast key rotation	—	disabled
no	Negates any configured parameter.	—	—

Parameter	Description	Range	Default
opp-key-caching	Enables a cached pairwise master key (PMK) derived with a client and an associated AP to be used when the client roams to a new AP. This allows clients faster roaming without a full 802.1x authentication. <b>NOTE:</b> Make sure that the wireless client (the 802.1x supplicant) supports this feature. If the client does not support this feature, the client will attempt to renegotiate the key whenever it roams to a new AP. As a result, the key cached on the switch can be out of sync with the key used by the client.	—	enabled
reauth-max <number>	Maximum number of reauthentication attempts.	1-10	3
reauthenticat ion	Select this option to force the client to do a 802.1x reauthentication after the expiration of the default timer for reauthentication. (The default value of the timer is 24 hours.) If the user fails to reauthenticate with valid credentials, the state of the user is cleared.  If derivation rules are used to classify 802.1x-authenticated users, then the reauthentication timer per role overrides this setting.	—	disabled
reload-cert	Reload Certificate for 802.1X termination. This command is available in enable mode only.	—	—
server	Sets options for sending authentication requests to the authentication server group.		
server-retry <number>	Maximum number of authentication requests that are sent to server group.	0-3	2
server-retry- period <seconds>	Server group retry interval, in seconds.	5-65535	30 seconds
server-cert <certificate>	Server certificate used by the switch to authenticate itself to the client.	—	—
termination	Sets options for terminating 802.1x authentication on the switch.		
eap-type <type>	The Extensible Authentication Protocol (EAP) method, either EAP-PEAP or EAP-TLS.	eap-peap/ eap-tls	eap-peap
enable	Enables 802.1x termination on the switch.	—	disabled
enable-token -caching	If you select EAP-GTC as the inner EAP method, you can enable the switch to cache the username and password of each authenticated user. The switch continues to reauthenticate users with the remote authentication server, however, if the authentication server is not available, the switch will inspect its cached credentials to reauthenticate users.	—	disabled
inner-eap-type eap-gtc eap- mschapv2	When EAP-PEAP is the EAP method, one of the following inner EAP types is used: <b>EAP-Generic Token Card (GTC):</b> Described in RFC 2284, this EAP method permits the transfer of unencrypted usernames and passwords from client to server. The main uses for EAP-GTC are one-time token cards such as SecureID and the use of LDAP or RADIUS as the user authentication server. You can also enable caching of user credentials on the switch as a backup to an external authentication server. <b>EAP-Microsoft Challenge Authentication Protocol version 2 (MS-CHAPv2):</b> Described in RFC 2759, this EAP method is widely supported by Microsoft clients.	eap-gtc/ eap- mschapv2	eap-mschap v2

Parameter	Description	Range	Default
token-caching-period <hours>	If you select EAP-GTC as the inner EAP method, you can specify the timeout period, in hours, for the cached information.	(any)	24 hours
timer	Sets timer options for 802.1x authentication:		
idrequest-period <seconds>	Interval, in seconds, between identity request retries.	1-65535	30 seconds
mkey-rotation-period <seconds>	Interval, in seconds, between multicast key rotation.	60-864000	1800 seconds
quiet-period <seconds>	Interval, in seconds, following failed authentication.	1-65535	30 seconds
reauth-period <seconds>	Interval, in seconds, between reauthentication attempts, or specify <b>server</b> to use the server-provided reauthentication period.	60-864000	86400 seconds (1 day)
ukey-rotation-period <seconds>	Interval, in seconds, between unicast key rotation.	60-864000	900 seconds
wpa-groupkey-delay <milliseconds>	Interval, in milliseconds, between unicast and multicast key exchanges.	0-2000	0 ms (no delay)
wpa-key-period <milliseconds>	Interval, in milliseconds, between each WPA key exchange.	1000-5000	3000 ms
wpa2-key-delay <milliseconds>	Set the delay between EAP-Success and unicast key exchange.	1-2000	0 ms (no delay)
tls-guest-access	Enables guest access for EAP-TLS users with valid certificates.	—	disabled
tls-guest-role <role>	User role assigned to EAP-TLS guest. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	—	guest
unicast-keyrotation	Enables unicast key rotation.	—	disabled
use-session-key	Use RADIUS session key as the unicast WEP key.	—	disabled
use-static-key	Use static key as the unicast/multicast WEP key.	—	disabled
validate-pmkid	When <b>opp-key-caching</b> is enabled, this option instructs the switch to check the pairwise master key (PMK) ID sent by the client. When this option is enabled, the client must send a PMKID in the associate or reassociate frame to indicate that it supports OKC; otherwise, full 802.1x authentication takes place. (This feature is optional, since most clients that support OKC do not send the PMKID in their association request.)	—	disabled
voice-aware	Enables rekey and reauthentication for VoWLAN clients. <b>NOTE:</b> The Voice Services Module license must be installed.	—	enabled
wep-key-retries <number>	Number of times WPA/WPA2 key messages are retried.	1-5	3
wep-key-size	Dynamic WEP key size, either 40 or 128 bits.	40 or 128	128 bits
wpa-fast-handover	Enables WPA-fast-handover. This is only applicable for phones that support WPA and fast handover.	—	disabled

Parameter	Description	Range	Default
xSec-mtu <mtu>	Sets the size of the MTU for xSec.	1024-1500	1300 bytes

## Usage Guidelines

The 802.1x authentication profile allows you to enable and configure machine authentication and 802.1x termination on the switch (also called “AAA FastConnect”).

In the AAA profile, you specify the 802.1x authentication profile, the default role for authenticated users, and the server group for the authentication.

## Examples

The following example enables authentication of the user’s client device before user authentication. If machine authentication fails but user authentication succeeds, the user is assigned the restricted “guest” role:

```
aaa authentication dot1x dot1x
  machine-authentication enable
  machine-authentication machine-default-role computer
  machine-authentication user-default-role guest
```

The following example configures an 802.1x profile that terminates authentication on the switch, where the user authentication is performed with the switch’s internal database or to a “backend” non-802.1x server:

```
aaa authentication dot1x dot1x
  termination enable
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system. The voice-aware parameter requires the Voice Services Module license	Config mode on master switches

## aaa authentication mac

```
aaa authentication mac <profile>
  case upper|lower
  clone <profile>
  delimiter {colon|dash|none}
  max-authentication-failures <number>
  no ...
```

### Description

This command configures the MAC authentication profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
case	The case (upper or lower) used in the MAC string sent in the authentication request. If there is no delimiter configured, the MAC address in lower case is sent in the format xxxxxxxxxxxx, while the MAC address in upper case is sent in the format XXXXXXXXXXXX.	upper lower	lower
clone <profile>	Name of an existing MAC profile from which parameter values are copied.	—	—
delimiter	Delimiter (colon, dash, or none) used in the MAC string.	colon dash none	none
max-authentication-failures <number>	Number of times a client can fail to authenticate before it is blacklisted. A value of 0 disables blacklisting.	0-10	0 (disabled)
no	Negates any configured parameter.	—	—

### Usage Guidelines

MAC authentication profile configures authentication of devices based on their physical MAC address. MAC-based authentication is often used to authenticate and allow network access through certain devices while denying access to all other devices. Users may be required to authenticate themselves using other methods, depending upon the network privileges.

### Example

The following example configures a MAC authentication profile to blacklist client devices that fail to authenticate.

```
aaa authentication mac mac-blacklist
  max-authentication-failures 3
```

### Command History:

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.1.8	The max-authentication-failures parameter was allowed in the base operating system. In earlier versions of AOS-W, the max-authentication-failures parameter required the Wireless Intrusion Protection license

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication mgmt

```
aaa authentication mgmt
  default-role {guest-provisioning|location-api|network-operations|no-access|read-
  only|root}
  enable
  no ...
  server-group <group>
```

### Description

This command configures authentication for administrative users.

### Syntax

Parameter	Description	Range	Default
default-role	Select a predefined management role to assign to authenticated administrative users:	—	default
default	Default superuser role		
guest-provisioning	Guest provisioning role		
location-api	Location API role		
network-operations	Network operations role		
no-access	No commands are accessible for this role		
read-only	Read-only role		
enable	Enables authentication for administrative users.	enabled disabled	disabled
no	Negates any configured parameter.	—	—
server-group <group>	Name of the group of servers used to authenticate administrative users. See <a href="#">“aaa server-group” on page 54</a> .	—	default

### Usage Guidelines

If you enable authentication with this command, users configured with the **mgmt-user** command must be authenticated using the specified server-group.

You can configure the management authentication profile in the base operating system or with the Policy Enforcement Firewall license installed.

### Example

The following example configures a management authentication profile that authenticates users against the switch's internal database. Users who are successfully authenticated are assigned the read-only role.

```
aaa authentication mgmt
  default-role read-only
  server-group internal
```

## Command History:

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	The network-operations role was introduced.
AOS-W 3.3	The location-api-mgmt role was introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication stateful-dot1x

```
aaa authentication stateful-dot1x
  default-role <role>
  enable
  no ...
  server-group <group>
  timeout <seconds>
```

### Description

This command configures 802.1x authentication for clients on non-Alcatel-Lucent APs.

### Syntax

Parameter	Description	Range	Default
default-role <role>	Role assigned to the 802.1x user upon login. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	—	guest
enable	Enables 802.1x authentication for clients on non-Alcatel-Lucent APs. Use <b>no enable</b> to disable this authentication.	—	enabled
no	Negates any configured parameter.	—	—
server-group <group>	Name of the group of RADIUS servers used to authenticate the 802.1x users. See <a href="#">“aaa server-group” on page 54</a> .	—	—
timeout <seconds>	Timeout period, in seconds.	1-20	10 seconds

### Usage Guidelines

This command configures 802.1x authentication for clients on non-Alcatel-Lucent APs. The switch maintains user session state information for these clients.

### Example

The following command assigns the employee user role to clients who successfully authenticate with the server group corp-rad:

```
aaa authentication stateful-dot1x
  default-role employee
  server-group corp-rad
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication stateful-dot1x clear

```
aaa authentication stateful-dot1x clear
```

### Description

This command clears automatically-created control path entries for 802.1x users on non-Alcatel-Lucent APs.

### Syntax

No parameters.

### Usage Guidelines

Run this command after changing the configuration of a RADIUS server in the server group configured with the **aaa authentication stateful-dot1x** command. This causes entries for the users to be created in the control path with the updated configuration information.

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa authentication vpn

```
aaa authentication vpn
  default-role <role>
  max-authentication-failures <number>
  no ...
  server-group <group>
```

### Description

This command configures VPN authentication.

### Syntax

Parameter	Description	Default
default-role <role>	Role assigned to the VPN user upon login. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	guest
max- authentication- failures <number>	Maximum number of authentication failures before the user is blacklisted. A value of 0 disables blacklisting. <b>NOTE:</b> The Wireless Intrusion Protection license must be installed.	0 ((disabled)
no	Negates any configured parameter.	—
server-group <group>	Name of the group of servers used to authenticate VPN users. See “ <a href="#">aaa server-group</a> ” on page 54.	internal

### Usage Guidelines

This command configures VPN authentication settings. Use the **vpdn group** command to enable and configure Layer-2 Tunneling Protocol and Internet Protocol Security (L2TP/IPsec) or Point-to-Point Tunneling Protocol (PPTP) VPN connection. (See “[vpdn group l2tp](#)” on page 986.)

### Example

The following command configures VPN authentication settings:

```
aaa authentication vpn
  default-role employee-role-vpn
  max-authentication-failures 0
  server-group vpn-server-group
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for noted parameters	Config mode on master switches

## aaa authentication wired

```
aaa authentication wired
  no ...
  profile <aaa-profile>
```

### Description

This command configures authentication for a client device that is directly connected to a port on the switch.

### Syntax

Parameter	Description
no	Negates any configured parameter.
profile <aaa-profile>	Name of the AAA profile that applies to wired authentication. This profile must be configured for a Layer-2 authentication, either 802.1x or MAC. See <a href="#">“aaa profile” on page 47</a> .

### Usage Guidelines

This command references an AAA profile that is configured for MAC or 802.1x authentication. The port on the switch to which the device is connected must be configured as untrusted.

### Example

The following commands configure an AAA profile for dot1x authentication and a wired profile that references the AAA profile:

```
aaa profile sec-wired
  dot1x-default-role employee
  dot1x-server-group sec-svrs
aaa authentication wired
  profile sec-wired
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication-server internal

```
aaa authentication-server internal use-local-switch
```

### Description

This command specifies that the internal database on a local switch be used for authenticating clients.

### Usage Guidelines

By default, the internal database in the *master* switch is used for authentication. This command directs authentication to the internal database on the *local* switch where you run the command.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master or local switches

## aaa authentication-server ldap

```
aaa authentication-server ldap <server>
  admin-dn <name>
  admin-passwd <string>
  allow-cleartext
  authport <port>
  base-dn <name>
  clone <server>
  enable
  filter
  host <ipaddr>
  key-attribute <string>
  no ...
  timeout <seconds>
```

### Description

This command configures an LDAP server.

### Syntax

Parameter	Description	Range	Default
<server>	Name that identifies the server.	—	—
admin-dn <name>	Distinguished name for the admin user who has read/search privileges across all of the entries in the LDAP database (the user does not need write privileges but should be able to search the database and read attributes of other users in the database).	—	—
admin-passwd <string>	Password for the admin user.	—	—
allow-cleartext	Allows clear-text (unencrypted) communication with the LDAP server.	enabled disabled	disabled
authport <port>	Port number used for authentication. Port 636 will be attempted for LDAP over SSL, while port 389 will be attempted for SSL over LDAP, Start TLS operation and clear text.	1-65535	389
base-dn <name>	Distinguished Name of the node which contains the entire user database to use.	—	—
clone <server>	Name of an existing LDAP server configuration from which parameter values are copied.	—	—
enable	Enables the LDAP server.	—	—
filter	Filter that should be applied to search of the user in the LDAP database (default filter string is: <code>i(objectclass=*)i</code> ).	—	<code>(objectclass=)*</code>
host <ip-addr>	IP address of the LDAP server, in dotted-decimal format.	—	—
key-attribute <string>	Attribute that should be used as a key in search for the LDAP server. For Active Directory, the value is <code>sAMAccountName</code> .	—	<code>sAMAccountName</code>
no	Negates any configured parameter.	—	—
timeout <seconds>	Timeout period of a LDAP request, in seconds.	1-30	20 seconds

### Usage Guidelines

You configure a server before you can add it to one or more server groups. You create a server group for a specific type of authentication (see “[aaa server-group](#)” on page 54).

## Example

The following command configures and enables an LDAP server:

```
aaa authentication-server ldap ldap1
  host 10.1.1.243
  base-dn cn=Users,dc=1m,dc=corp,dc=com
  admin-dn cn=corp,cn=Users,dc=1m,dc=corp,dc=com
  admin-passwd abc10
  key-attribute sAMAccountName
  filter (objectclass=*)
  enable
```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication-server radius

```
aaa authentication-server radius <server>
  acctport <port>
  authport <port>
  clone <server>
  enable
  host <ipaddr>
  key <psk>
  nas-identifier <string>
  nas-ip <ipaddr>
  no ...
  retransmit <number>
  timeout <seconds>
  use-md5
```

### Description

This command configures a RADIUS server.

### Syntax

Parameter	Description	Range	Default
<server>	Name that identifies the server.	—	—
acctport <port>	Accounting port on the server.	1-65535	1813
authport <port>	Authentication port on the server	1-65535	1812
clone <server>	Name of an existing RADIUS server configuration from which parameter values are copied.	—	—
enable	Enables the RADIUS server.		
host <ipaddr>	IP address of the RADIUS server.	—	—
key <psk>	Shared secret between the switch and the authentication server. The maximum length is 48 bytes.	—	—
nas-identifier <string>	Network Access Server (NAS) identifier to use in RADIUS packets.	—	—
nas-ip <ip-addr>	NAS IP address to send in RADIUS packets. You can configure a “global” NAS IP address that the switch uses for communications with all RADIUS servers. If you do not configure a server-specific NAS IP, the global NAS IP is used. To set the global NAS IP, enter the <b>ip radius nas-ip ipaddr</b> command.	—	—
no	Negates any configured parameter.	—	—
retransmit <number>	Maximum number of retries sent to the server by the switch before the server is marked as down.	0-3	3
timeout <seconds>	Maximum time, in seconds, that the switch waits before timing out the request and resending it.	1-30	5 seconds
use-md5	Use MD5 hash of cleartext password.	—	disabled

### Usage Guidelines

You configure a server before you can add it to one or more server groups. You create a server group for a specific type of authentication (see “[aaa server-group](#)” on page 54).

## Example

The following command configures and enables a RADIUS server:

```
aaa authentication-server radius radius1
  host 10.1.1.244
  key qwERtyuIOp
  enable
```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa authentication-server tacacs

```
aaa authentication-server tacacs <server>
  clone <server>
  enable
  host <ipaddr>
  key <psk>
  no ...
  retransmit <number>
  tcp-port <port>
  timeout <seconds>
```

### Description

This command configures a TACACS+ server.

### Syntax

Parameter	Description	Range	Default
<server>	Name that identifies the server.	—	—
clone <server>\	Name of an existing TACACS server configuration from which parameter values are copied.	—	—
enable	Enables the TACACS server.	—	—
host <ip-addr>	IP address of the TACACS server.	—	—
key	Shared secret to authenticate communication between the TACACS+ client and server.	—	—
no	Negates any configured parameter.	—	—
retransmit <number>	Maximum number of times a request is retried.	0-3	3
tcp-port <port>	TCP port used by the server.	1-65535	49
timeout <timeout>	Timeout period of a TACACS request, in seconds.	1-30	20 seconds

### Usage Guidelines

You configure a server before you can add it to one or more server groups. You create a server group for a specific type of authentication (see [“aaa server-group” on page 54](#)).

### Example

The following command configures and enables a TACACS+ server:

```
aaa authentication-server tacacs tacacs1
  clone default
  host 10.1.1.245
  key qwERtyuIOp
  enable
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa bandwidth-contract

```
aaa bandwidth-contract <name> {kbits <kbits>|mbits <mbits>}
```

### Description

This command configures a bandwidth contract.

### Syntax

Parameter	Description	Range
<name>	Name that identifies this bandwidth contract.	—
kbits <bits>	Limit the traffic rate for this bandwidth contract to a specified number of kilobits per second.	256-2000000
mbits <bits>	Limit the traffic rate for this bandwidth contract to a specified number of megabits per second.	1-2000

### Usage Guidelines

You can apply a configured bandwidth contract to a user role or to a VLAN. When you apply a bandwidth contract to a user role (see [“user-role” on page 979](#)), you specify whether the contract applies to upstream traffic (from the client to the switch) or downstream traffic (from the switch to the client). You can also specify whether the contract applies to all users in a specified user role or per-user in a user role.

When you apply a bandwidth contract to a VLAN (see [“interface vlan” on page 213](#)), the contract limits multicast traffic and does not affect other data. This is useful because an AP can only send multicast traffic at the rate of the slowest associated client. Thus excessive multicast traffic will fill the buffers of the AP, causing frame loss and poor voice quality. Generally, every system should have a bandwidth contract of 1 Mbps or even 700 Kbps and it should be applied to all VLANs with which users are associated, especially those VLANs that pass through the upstream router. The exception are VLANs that are used for high speed multicasts, where the SSID is configured without low data rates.

### Example

The following command creates a bandwidth contract that limits the traffic rate to 1 Mbps:

```
aaa bandwidth-contract mbits 1
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa derivation-rules

```
aaa derivation-rules user <name>
  no ...
  set {role|vlan} condition <rule-type> <condition> <value> set-value {<role>|<vlan>}
  [position <number>]
```

### Description

This command configures rules by which the role or VLAN assigned to a client is derived from the client's association with an AP.

The Policy Enforcement Firewall must be installed for a user role to be assigned.

### Syntax

Parameter	Description
<name>	Name that identifies this set of user derivation rules.
no	Negates a configured rule.
set {role vlan}	Specify whether the action of the rule is to set the role or the VLAN.
condition	Condition that should be checked to derive role/VLAN
<rule-type>	Specify one of the following rule types for this user derivation rule. <ul style="list-style-type: none"><li>● <b>bssid</b>: BSSID of access point.</li><li>● <b>dhcp-option-77</b>: Enable DHCP packet processing.</li><li>● <b>encryption-type</b>: Encryption method used by station.</li><li>● <b>ssid</b>: ESSID of access point.</li><li>● <b>location</b>: user location (ap name).</li><li>● <b>macaddr</b>: MAC address of user.</li></ul>
<condition>	Specify one of the following conditions: <ul style="list-style-type: none"><li>● <b>contains</b>: Check if attribute <i>contains</i> the operand value.</li><li>● <b>ends-with</b>: Check if attribute <i>ends with</i> the operand value.</li><li>● <b>equals</b>: Check if attribute <i>equals</i> the operand value.</li><li>● <b>not-equals</b>: Check if attribute <i>is not equal</i> to the operand value.</li><li>● <b>starts-with</b>: Check if attribute <i>starts with</i> the operand value.</li></ul>
set-value <role> <vlan>	Specify the user role or VLAN ID to be assigned to the client if the above condition is met.
position	Position of this rule relative to other configured.

### Usage Guidelines

The user role can be derived from attributes from the client's association with an AP. You configure the user role to be derived by specifying condition rules; when a condition is met, the specified user role is assigned to the client. You can specify more than one condition rule; the order of rules is important as the first matching condition is applied.

User-derivation rules are executed *before* the client is authenticated.

### Example

The following command sets the client's user role to "guest" if the client associates to the "Guest" ESSID.

```
aaa derivation-rules user derive1
  set role condition ssid equals Guest set-value guest
```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system. The Policy Enforcement Firewall must be installed for a user role to be assigned.	Config mode on master switches

## aaa inservice

```
aaa inservice <server-group> <server>
```

### Description

This command designates an “out of service” authentication server to be “in service”.

### Syntax

Parameter	Description
<server-group>	Server group to which this server is assigned.
<server>	Name of the configured authentication server.

### Usage Guidelines

By default, the switch marks an unresponsive authentication server as “out of service” for a period of 10 minutes (you can set a different time limit with the **aaa timers dead-time** command). The **aaa inservice** command is useful when you become aware that an “out of service” authentication server is again available before the dead-time period has elapsed. (You can use the **aaa test-server** command to test the availability and response of a configured authentication server.)

### Example

The following command sets an authentication server to be in service:

```
aaa inservice corp-rad rad1
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa ipv6 user add

```
aaa ipv6 user add <ipv6addr> [authentication-method {dot1x|mac|stateful-  
dot1x|vpn|web}] [mac <macaddr>] [name <username>]  
[profile <aaa-profile>] [role <role>]
```

### Description

This command manually assigns a user role or other values to a specified IPv6 client.

### Syntax

Parameter	Description
<ipv6addr>	IPv6 address of the user to be added.
authentication-method	Authentication method for the user.
dot1x	802.1x authentication.
mac	MAC address of the user.
stateful-dot1x	Stateful 802.1x authentication.
vpn	VPN authentication
web	Captive Portal authentication
mac <macaddr>	Name for the user.
name <username>	Name for the user.
profile <aaa-profile>	AAA profile for the user.
role <role>	Role for the user.

### Usage Guidelines

This command should only be used for troubleshooting issues with a specific IPv6 client. This command allows you to manually assign a client to a role. For example, you can create a role “debugging” that includes a policy to mirror session packets to a specified destination for further examination, then use this command to assign the “debugging” role to a specific client. Use the **aaa ipv6 user delete** command to remove the client or device from the role.

Note that issuing this command does not affect ongoing sessions that the client may already have. For example, if a client is in the “employee” role when you assign them to the “debugging” role, the client continues any sessions allowed with the “employee” role. Use the **aaa ipv6 user clear-sessions** command to clear ongoing sessions.

### Example

The following commands create a role that logs HTTPS traffic, then assign the role to a specific IPv6 client:

```
ipv6 access-list session ipv6-log-https  
  any any svc-https permit log  
user-role ipv6-web-debug  
  session-acl ipv6-log-https  
In enable mode:  
aaa ipv6 user add 2002:d81f:f9f0:1000:e409:9331:1d27:ef44 role ipv6-web-debug
```

### Command History

This command was available in AOS-W 3.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa ipv6 user clear-sessions

```
aaa ipv6 user clear-sessions <ipaddr>
```

### Description

This command clears ongoing sessions for the specified IPv6 client.

### Syntax

Parameter	Description
<ipaddr>	IPv6 address of the user.

### Usage Guidelines

This command clears any ongoing sessions that the client already had before being assigned a role with the **aaa ipv6 user add** command.

### Example

The following command clears ongoing sessions for an IPv6 client:

```
aaa user clear-sessions 2002:d81f:f9f0:1000:e409:9331:1d27:ef44
```

### Command History

This command was available in AOS-W 3.3.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa ipv6 user delete

```
aaa ipv6 user delete {<ipaddr>|all|mac <macaddr>|name <username>|role <role>}
```

### Description

This command deletes IPv6 clients, users, or roles.

### Syntax

Parameter	Description
<ipv6addr>	IPv6 address of the client to be deleted.
all	Deletes all connected IPv6 clients.
mac	MAC address of the IPv6 client to be deleted.
name	Name of the IPv6 client to be deleted.
role	Role of the IPv6 client to be deleted.

### Usage Guidelines

This command allows you to manually delete clients, users, or roles. For example, if you used to the **aaa ipv6 user add** command to assign a user role to an IPv6 client, you can use this command to remove the role assignment.

### Example

The following command a role:

```
aaa ipv6 user delete role web-debug
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa ipv6 user logout

```
aaa ipv6 user logout <ipaddr>
```

### Description

This command logs out an IPv6 client.

### Syntax

Parameter	Description
<ipv6addr>	IPv6 address of the client to be logged out.

### Usage Guidelines

This command logs out an authenticated IPv6 client. The client must reauthenticate.

### Example

The following command logs out an IPv6 client:

```
aaa user logout 2002:d81f:f9f0:1000:e409:9331:1d27:ef44
```

### Command History

This command was available in AOS-W 3.3.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa profile

```
aaa profile <profile>
  authentication-dot1x <dot1x-profile>
  authentication-mac <mac-profile>
  clone <profile>
  dot1x-default-role <role>
  dot1x-server-group <group>
  initial-role <role>
  mac-default-role <role>
  mac-server-group <group>
  no ...
  radius-accounting <group>
  rfc-3576-server <ipaddr>
  sip-authentication-role <role>
  user-derivation-rules <profile>
  wired-to-wireless-roam
  xml-api-server <ipaddr>
```

### Description

This command configures the authentication for a WLAN.

### Syntax

Parameter	Description	Default
<profile>	Name that identifies this instance of the profile. The name must be 1-63 characters.	“default”
authentication-dot1x <dot1x-profile>	Name of the 802.1x authentication profile associated with the WLAN. See <a href="#">“aaa authentication dot1x” on page 18</a> .	—
authentication-mac <mac-profile>	Name of the MAC authentication profile associated with the WLAN. See <a href="#">“aaa authentication mac” on page 23</a> .	—
clone <profile>	Name of an existing AAA profile configuration from which parameter values are copied.	—
dot1x-default-role <role>	Configured role assigned to the client after 802.1x authentication. If derivation rules are present, the role assigned to the client through these rules take precedence over the default role. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	guest
dot1x-server-group <group>	Name of the server group used for 802.1x authentication. See <a href="#">“aaa server-group” on page 54</a> .	—
initial-role <role>	Role for unauthenticated users.	logon
mac-default-role <role>	Configured role assigned to the user when the device is MAC authenticated. If derivation rules are present, the role assigned to the client through these rules take precedence over the default role. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	guest
mac-server- <group> group	Name of the server group used for MAC authentication. See <a href="#">“aaa server-group” on page 54</a> .	—
no	Negates any configured parameter.	—

Parameter	Description	Default
radius-accounting <group>	Name of the server group used for RADIUS accounting. See “aaa server-group” on page 54.	—
rfc-3576-server <ip-addr>	IP address of a RADIUS server that can send user disconnect and change-of-authorization messages, as described in RFC 3576, “Dynamic Authorization Extensions to Remote Dial In User Service (RADIUS)”. See “aaa rfc-3576-server” on page 53. <b>NOTE:</b> The External Services Interface license must be installed.	—
sip-authentication-role <role>	Configured role assigned to a session initiation protocol (SIP) client upon registration. <b>NOTE:</b> The Voice Services Module license must be installed.	guest
user-derivation-rules <profile>	User attribute profile from which the user role or VLAN is derived.	—
wire-to-wireless-roam	Keeps user authenticated when roaming from the wired side of the network.	enabled
xml-api-server <ip-addr>	IP address of a configured XML API server. See “aaa xml-api” on page 69. <b>NOTE:</b> The External Services Interface license must be installed.	—

## Usage Guidelines

The AAA profile defines the user role for unauthenticated users, the default user role for MAC or 802.1x authentication, and user derivation rules. The AAA profile contains the authentication profile and authentication server group.

There are predefined AAA profiles available: default-dot1x, default-mac-auth, and default-open, that have the parameter values shown in the following table.

Parameter	default-dot1x	default-mac-auth	default-open
authentication-dot1x	default	N/A	N/A
authentication-mac	N/A	default	N/A
dot1x-default-role	authenticated	guest	guest
dot1x-server-group	N/A	N/A	N/A
initial-role	logon	logon	logon
mac-default-role	guest	authenticated	guest
mac-server-group	default	default	default
radius-accounting	N/A	N/A	N/A
rfc-3576-server	N/A	N/A	N/A
user-derivation-rules	N/A	N/A	N/A
wired-to-wireless roam	enabled	enabled	enabled

## Example

The following command configures an AAA profile that assigns the “employee” role to clients after they are authenticated using the 802.1x server group “radiusnet”.

```
aaa profile corpnet
  dot1x-default-role employee
  dot1x-server-group radiusnet
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for noted parameters	Config mode on master switches

## aaa query-server

```
aaa query-server <ldap-server-name> <user-name>
```

### Description

Troubleshoot an LDAP authentication failure by verifying that the user exists in the ldap server database.

### Syntax

Parameter	Description
<ldap-server-name>	Name of an LDAP server.
<user-name>	Name of a user whose LDAP record you want to view.

### Usage Guidelines

If the Admin-DN binds successfully but the wireless user fails to authenticate, issue this command to troubleshoot whether the problem is with the wireless network, the switch, or the ldap server. The **aaa query-user <ldap\_server\_name> <username>** command makes the switch send a search query to find the user. If that search fails in spite of the user being in the LDAP database, it is most probable that the base DN where the search was started was not correct. In such case, it is advisable to make the base DN at the root of the ldap tree.

### Example

The example below shows part of the output for an LDAP record for the username JDOE.

```
(host) #aaa query-user eng JDOE

objectClass: top
objectClass: person
objectClass: organizationalPerson
objectClass: user
cn: John Doe
sn: Doe
userCertificate: 0\202\005\2240\202\004|\240\003\002\001\002\002\012H\011\333K

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa radius-attributes

```
aaa radius-attributes add <attribute> <attribute-id> {date|integer|ipaddr|string}
[vendor <name> <vendor-id>]
```

### Description

This command configures RADIUS attributes for use with server derivation rules.

### Syntax

Parameter	Description
add <attribute> <attribute-id>	Adds the specified attribute name (alphanumeric string), associated attribute ID (integer), and type (date, integer, IP address, or string).
date	Adds a date attribute.
integer	Adds a <i>integer</i> attribute.
ipaddr	Adds a IP address attribute.
string	Adds a string attribute.
vendor	(Optional) Display attributes for a specific vendor name and vendor ID.

### Usage Guidelines

Add RADIUS attributes for use in server derivation rules. Use the **show aaa radius-attributes** command to display a list of the current RADIUS attributes recognized by the switch. To add a RADIUS attribute to the list, use the **aaa radius-attributes** command.

### Example

The following command adds the VSA “Alcatel-Lucent-User-Role”:

```
aaa radius-attributes add Alcatel-Lucent-User-Role 1 string vendor Alcatel-Lucent 14823
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa rfc-3576-server

```
aaa rfc-3576-server <ipaddr>
  clone <server>
  key <psk>
  no ...
```

### Description

This command configures a RADIUS server that can send user disconnect and change-of-authorization messages, as described in RFC 3576, “Dynamic Authorization Extensions to Remote Dial In User Service (RADIUS)”.

### Syntax

Parameter	Description
<ipaddr>	IP address of the server.
clone <server>	Name of an existing RFC 3576 server configuration from which parameter values are copied.
key <psk>	Shared secret to authenticate communication between the RADIUS client and server.
no	Negates any configured parameter.

### Usage Guidelines

The server configured with this command is referenced in the AAA profile for the WLAN (see [“aaa profile” on page 47](#)).

### Example

The following command configures an RFC 3576 server:

```
aaa rfc-3576-server 10.1.1.245
  clone default
  key asdfjkl;
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa server-group

```
aaa server-group <group> allow-fail-through
  auth-server <name> [match-authstring contains|equals|starts-with <string>] [match-
  fqdn <string>] [position <number>] [trim-fqdn]
  clone <group>
  no ...
  set role|vlan condition <attribute> contains|ends-with|equals|not-equals|starts-with
  <string> set-value <set-value-str> [position <number>]
```

### Description

This command allows you to add a configured authentication server to an ordered list in a server group, and configure server rules to derive a user role, VLAN ID or VLAN name from attributes returned by the server during authentication.

### Syntax

Parameter	Description	Default
<group>	Name that identifies the server group. The name must be 32 characters or less.	—
allow-fail-through	When this option is configured, an authentication failure with the first server in the group causes the switch to attempt authentication with the next server in the list. The switch attempts authentication with each server in the ordered list until either there is a successful authentication or the list of servers in the group is exhausted.	disabled
auth-server <name>	Name of a configured authentication server.	—
match-authstring	This option associates the authentication server with a match rule that the switch can compare with the user/client information in the authentication request. With this option, the user/client information in the authentication request can be in any of the following formats: <domain>\<user> <user>@<domain> host/<pc-name>.<domain> An authentication request is sent to the server only if there is a match between the specified match rule and the user/client information. You can configure multiple match rules for an authentication server.	—
contains	<b>contains:</b> The rule matches if the user/client information contains the specified string.	
equals	The rule matches if the user/client information exactly matches the specified string.	
starts-with	The rule matches if the user/client information starts with the specified string.	
match-fqdn <string>	This option associates the authentication server with a specified domain. An authentication request is sent to the server only if there is an exact match between the specified domain and the <domain> portion of the user information sent in the authentication request. With this option, the user information must be in one of the following formats: <domain>\<user> <user>@<domain>	—
position <number>	Position of the server in the server list. 1 is the top.	(last)

Parameter	Description	Default
trim-fqdn	This option causes the user information in an authentication request to be edited before the request is sent to the server. Specifically, this option: removes the <domain>\ portion for user information in the <domain>\<user> format removes the @<domain> portion for user information in the <user>@<domain> format	—
clone	Name of an existing server group from which parameter values are copied.	—
no	Negates any configured parameter.	—
set role vlan	Assigns the client a user role, VLAN ID or VLAN name based on attributes returned for the client by the authentication server. Rules are ordered: the first rule that matches the configured condition is applied. VLAN IDs and VLAN names cannot be listed together.	—
condition	Attribute returned by the authentication server.	—
contains	The rule is applied if and only if the attribute value contains the specified string.	—
ends-with	The rule is applied if and only if the attribute value ends with the specified string.	—
equals	The rule is applied if and only if the attribute value equals the specified string.	—
not-equals	The rule is applied if and only if the attribute value is not equal to the specified string.	—
starts-with	The rule is applied if and only if the attribute value begins with the specified string.	—
set-value	User role or VLAN applied to the client when the rule is matched.	—
value-of	Sets the user role or VLAN to the value of the attribute returned. The user role or VLAN ID returned as the value of the attribute must already be configured on the switch when the rule is applied.	—

## Usage Guidelines

You create a server group for a specific type of authentication or for accounting. The list of servers in a server group is an ordered list, which means that the first server in the group is always used unless it is unavailable (in which case, the next server in the list is used). You can configure servers of different types in a server group, for example, you can include the internal database as a backup to a RADIUS server. You can add the same server to multiple server groups. There is a predefined server group “internal” that contains the internal database.

## Example

The following command configures a server group “corp-servers” with a RADIUS server as the main authentication server and the internal database as the backup. The command also sets the client’s user role to the value of the returned “Class” attribute.

```
aaa server-group corp-servers
  auth-server radius1 position 1
  auth-server internal position 2
  set role condition Class value-of
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa sygate-on-demand

```
aaa sygate-on-demand remediation-failure-role <role>
```

### Description

This command configures the user role assigned to clients that fail Sygate On-Demand Agent (SODA) remediation.

### Syntax

Parameter	Description	Default
<role>	User role assigned to the client upon failure of client remediation.	guest

### Usage Guidelines

When you enable SODA client remediation in a captive portal profile, you can specify a user role to clients that fail the remediation. The default role for such clients is the guest role.

### Example

The following command assigns the logon role to users who fail remediation:

```
aaa sygate-on-demand remediation-failure-role logon
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Client Integrity license	Config mode on master switches

## aaa tacacs-accounting

```
aaa tacacs-accounting server-group <group> [command {action|all|configuration|show}]  
[mode {enable|disable}]
```

### Description

This command configures reporting of commands issued on the switch to a TACACS+ server group.

### Syntax

Parameter	Description	Range	Default
server-group <group>	The TACACS server group to which the reporting is sent.	—	—
command	The types of commands that are reported to the TACACS server group.	—	—
action	Reports action commands only.	—	—
all	Reports all commands.	—	—
configuration	Reports configuration commands only	—	—
show	Reports show commands only	—	—
mode	Enables accounting for the server group.	enable/ disable	disabled

### Usage Guidelines

You must have previously configured the TACACS+ server and server group (see [aaa authentication-server tacacs on page 36](#) and [aaa server-group on page 54](#)).

### Example

The following command enables accounting and reporting of configuration commands to the server-group “tacacs1”:

```
aaa tacacs-accounting server-group tacacs1 mode enable command configuration
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa test-server

```
aaa test-server {mschapv2|pap} <server> <username> <passwd>
```

### Description

This command tests a configured authentication server.

### Syntax

Parameter	Description
mschapv2	Use MSCHAPv2 authentication protocol.
pap	Use PAP authentication protocol.
<server>	Name of the configured authentication server.
<username>	Username to use to test the authentication server.
<passwd>	Password to use to test the authentication server.

### Usage Guidelines

This command allows you to check a configured RADIUS authentication server or the internal database. You can use this command to check for an “out of service” RADIUS server.

### Example

The following commands adds a user in the internal database and verifies the configuration:

```
local-userdb add kgreen lkjHGfds  
aaa test-server pap internal kgreen lkjHGfds
```

```
Authentication successful
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa timers

```
aaa timers {dead-time <minutes>|idle-timeout <number>|logon-lifetime <0-255>}
```

### Description

This command configures the timers that you can apply to clients and servers.

### Syntax

Parameter	Description	Range	Default
dead-time <minutes>	<p>Maximum period, in minutes, that the switch considers an unresponsive authentication server to be "out of service".</p> <p>This timer is only applicable if there are two or more authentication servers configured on the switch. If there is only one authentication server configured, the server is never considered out of service and all requests are sent to the server.</p> <p>If one or more backup servers are configured and a server is unresponsive, it is marked as out of service for the dead time; subsequent requests are sent to the next server on the priority list for the duration of the dead time. If the server is responsive after the dead time has elapsed, it can take over servicing requests from a lower-priority server; if the server continues to be unresponsive, it is marked as down for the dead time.</p>	0-50	10 minutes
idle-timeout <0-255>	<p>Maximum number of minutes after which a client is considered idle if there is no user traffic from the client.</p> <p>The timeout period is reset if there is a user traffic. After this timeout period has elapsed, the switch sends probe packets to the client; if the client responds to the probe, it is considered active and the User Idle Timeout is reset (an active client that is not initiating new sessions is not removed). If the client does not respond to the probe, it is removed from the system.</p> <p>To prevent clients from timing out, set the value in the field to 0.</p>	0-255	5 minutes
logon-lifetime	<p>Maximum time, in minutes, that unauthenticated clients are allowed to remain logged on.</p>	0-255	5 minutes

### Usage Guidelines

These parameters can be left at their default values for most implementations.

### Example

The following command prevents clients from timing out:

```
aaa timers idle-timeout 0
```

### Command History

This command was available in AOS-W 3.0.

### Related Commands

```
(host) (config) #show aaa timers
```

```
(host) (config) #show datapath user table
```

## Command Information

All platforms	Base operating system	Config mode on master switches

## aaa trusted-ap

```
aaa trusted-ap <macaddr>
```

### Description

This command configures a trusted non-Alcatel-Lucent AP.

### Syntax

Parameter	Description
<macaddr>	MAC address of the AP

### Usage Guidelines

This command configures a non-Alcatel-Lucent AP as a trusted AP.

### Example

The following configures a trusted non-Alcatel-Lucent AP:

```
aaa trusted-ap 00:40:96:4d:07:6e
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa user add

```
aaa user add <ipaddr> [<number>] [authentication-method {dot1x|mac|stateful-dot1x|vpn|web}] [mac <macaddr>] [name <username>] [profile <aaa_profile>] [role <role>]
```

### Description

This command manually assigns a user role or other values to a specified client or device.

### Syntax

Parameter	Description
<ipaddr>	IP address of the user to be added.
<number>	Number of users to create starting with <ipaddr>.
authentication-method	Authentication method for the user.
dot1x	802.1x authentication.
mac	MAC authentication.
stateful-dot1x	Stateful 802.1x authentication.
vpn	VPN authentication.
web	Captive portal authentication.
mac <macaddr>	MAC address of the user.
name <username>	Name for the user.
profile <aaa_profile>	AAA profile for the user.
role <role>	Role for the user.

### Usage Guidelines

This command should only be used for troubleshooting issues with a specific client or device. This command allows you to manually assign a client or device to a role. For example, you can create a role “debugging” that includes a policy to mirror session packets to a specified destination for further examination, then use this command to assign the “debugging” role to a specific client. Use the **aaa user delete** command to remove the client or device from the role.

Note that issuing this command does not affect ongoing sessions that the client may already have. For example, if a client is in the “employee” role when you assign them to the “debugging” role, the client continues any sessions allowed with the “employee” role. Use the **aaa user clear-sessions** command to clear ongoing sessions.

### Example

The following commands create a role that logs HTTPS traffic, then assign the role to a specific client:

```
ip access-list session log-https
  any any svc-https permit log
user-role web-debug
  session-acl log-https
```

In enable mode:

```
aaa user add 10.1.1.236 role web-debug
```

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa user clear-sessions

```
aaa user clear-sessions <ipaddr>
```

### Description

This command clears ongoing sessions for the specified client.

### Syntax

Parameter	Description
<ip-addr>	IP address of the user.

### Usage Guidelines

This command clears any ongoing sessions that the client already had before being assigned a role with the **aaa user add** command.

### Example

The following command clears ongoing sessions for a client:

```
aaa user clear-sessions 10.1.1.236
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa user delete

```
aaa user delete {<ipaddr>|all|mac <macaddr>|name <username>|role <role>}
```

### Description

This command deletes clients, users, or roles.

### Syntax

Parameter	Description
<ipaddr>	IP address of the client to be deleted.
all	Deletes all connected clients.
mac	MAC address of the client to be deleted.
name	Name of the client to be deleted.
role	Role of the client to be deleted.

### Usage Guidelines

This command allows you to manually delete clients, users, or roles. For example, if you used to the **aaa user add** command to assign a user role to a client, you can use this command to remove the role assignment.

### Example

The following command a role:

```
aaa user delete role web-debug
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa user fast-age

```
aaa user fast-age
```

### Description

This command enables fast aging of user table entries.

### Syntax

No parameters.

### Usage Guidelines

When this feature is enabled, the switch actively sends probe packets to all users with the same MAC address but different IP addresses. The users that fail to respond are purged from the system. This command enables quick detection of multiple instances of the same MAC address in the user table and removal of an “old” IP address. This can occur when a client (or an AP connected to an untrusted port on the switch) changes its IP address.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## aaa user logout

```
aaa user logout <ipaddr>
```

### Description

This command logs out a client.

### Syntax

Parameter	Description
<ipaddr>	IP address of the client to be logged out.

### Usage Guidelines

This command logs out an authenticated client. The client must reauthenticate.

### Example

The following command logs out a client:

```
aaa user logout 10.1.1.236
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## aaa xml-api

```
aaa xml-api server <ipaddr>
  clone <server>
  key <key>
  no ...
```

### Description

This command configures an external XML API server.

### Syntax

Parameter	Description
server	IP address of the external XML API server.
clone	Name of an existing XML API server configuration from which parameter values are copied.
key	Preshared key to authenticate communication between the switch and the XML API server.
no	Negates any configured parameter.

### Usage Guidelines

XML API is used for authentication and subscriber management from external agents. This command configures an external XML API server. For example, an XML API server can send a blacklist request for a client to the switch. The server configured with this command is referenced in the AAA profile for the WLAN (see [“aaa profile” on page 47](#)). Contact your Alcatel-Lucent representative for more information about using the XML API.

### Example

The following configures an XML API server:

```
aaa xml-api server 10.210.1.245
  key qwertyuiop
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	External Services Interface license	Config mode on master switches

## adp

```
adp discovery {disable|enable} igmp-join {disable|enable} igmp-vlan <vlan>
```

### Description

This command configures the Alcatel-Lucent Discovery Protocol (ADP).

### Syntax

Parameter	Description	Range	Default
discovery	Enables or disables ADP on the switch.	enabled/ disabled	enabled
igmp-join	Enables or disables sending of Internet Group Management Protocol (IGMP) join requests from the switches.	enabled/ disabled	enabled
igmp-vlan	VLAN to which IGMP reports are sent.	—	0 (default route VLAN used)

### Usage Guidelines

Alcatel-Lucent APs send out periodic multicast and broadcast queries to locate the master switch. If the APs are in the same broadcast domain as the master switch and ADP is enabled on the switch, the switch automatically responds to the APs' queries with its IP address. If the APs are not in the same broadcast domain as the master switch, you need to enable multicast on the network. You also need to make sure that all routers are configured to listen for IGMP join requests from the switch and can route the multicast packets. Use the **show adp config** command to verify that ADP and IGMP join options are enabled on the switch.

### Example

The following example enables ADP and the sending of IGMP join requests on the switch:

```
adp discovery enable igmp-join enable
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## am

```
am scan <ipaddr> <channel> [bssid <bssid>]
am test <ipaddr> {suspect-rap bssid <bssid> match-type <match-type> match-method
<method>|wired-mac {add|remove {bssid <bssid>|enet-mac <enet-mac>} mac <mac>}
```

### Description

These commands enable channel scanning or testing for the specified air monitor.

### Syntax

Parameter	Description	Range
scan	IP address of the air monitor to be scanned.	—
<channel>	Channel to which the scanning is tuned. Set to 0 to enable scanning of all channels.	—
bssid	BSSID of the air monitor.	—
test	IP address of the air monitor to be tested.	—
suspect-rap	Tests suspect-rap feature.	—
match-type	Match type.	eth-wm   ap-wm   eth-gw-wm
match-method	Match method.	equal   plus-one   minus-one
wired-mac	Tests the rogue AP classification feature. Specifies the Wired MAC table.	—
enet-mac	Specifies the Ethernet MAC table.	—
mac	Specifies the MAC entry to add/remove from either the Wired MAC table or the Ethernet MAC table.	—

### Usage Guidelines

These commands are intended to be used with an Alcatel-Lucent AP that is configured as an air monitor. You should not use the **am test** command unless instructed to do so by an Alcatel-Lucent representative.

### Example

The following command sets the air monitor to scan all channels:

```
(host) (config) #am scan 10.1.1.244 0
```

### Command History:

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.1	Support for the <b>wired-mac</b> and <b>associated</b> parameters was introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## ap enet-link-profile

```
ap enet-link-profile <profile>
  clone <profile>
  duplex {auto|full|half}
  no ...
  speed {10|100|1000|auto}
```

### Description

This command configures an AP Ethernet link profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing Ethernet Link profile from which parameter values are copied.	—	—
duplex	The duplex mode of the Ethernet interface, either full, half, or auto-negotiated.	full/half/auto	auto
no	Negates any configured parameter.	—	—
speed	The speed of the Ethernet interface, either 10 Mbps, 100 Mbps, 1000 Mbps (1 Gbps), or auto-negotiated.	10/100/1000/ auto	auto

### Usage Guidelines

This command configures the duplex and speed of the Ethernet port on the AP. The configurable speed is dependent on the port type.

### Example

The following command configures the Ethernet link profile for full-duplex and 100 Mbps:

```
ap enet-link-profile enet
  duplex full
  speed 100
```

### Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3	Support for 1000 Mbps (1 Gbps) Ethernet port speed was introduced.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master switches

## ap mesh-cluster-profile

```
ap mesh-cluster-profile <profile>
  clone <profile>
  cluster <name>
  no ...
  opmode [opensystem | wpa2-psk-aes]
  rf-band {a | g}
  wpa-hexkey <wpa-hexkey>
  wpa-passphrase <wpa-passphrase>
```

### Description

This command configures a mesh cluster profile used by mesh nodes.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing mesh cluster profile from which parameter values are copied.	—	—
cluster	Configures the cluster name, which is used as the mesh service set identifier (MSSID). The cluster name can be up to 32 characters. Each mesh cluster profile should have a unique MSSID.	—	“alcatel-mesh”
no	Negates any configured parameter.	—	—
opmode	Configures data encryption. opensystem—No authentication and encryption. wpa2-psk-aes—WPA2 with AES encryption using a pershared key. Alcatel-Lucent recommends selecting wpa2-psk-aes and entering a passphrase (see wpa-passphrase). Keep the passphrase in a safe place.	opensystem/ wpa2-psk- aes	opensystem
rf-band	Configures the RF band in which multiband mesh nodes should operate: a = 5 GHz g = 2.4 GHz Alcatel-Lucent recommends using 802.11a radios for mesh deployments.	a/g	a
wpa-hexkey	Configures a WPA pre-shared key.	—	—
wpa-passphrase	Sets the WPA password that generates the PSK.	—	—

### Usage Guidelines

Mesh cluster profiles are specific to mesh nodes (APs configured for mesh) and provide the framework of the mesh network. You must define and configure the mesh cluster profile before configuring an AP to operate as a mesh node.

You can configure multiple mesh cluster profiles to be used within a mesh cluster. You must configure different priority levels for each mesh cluster profile. See [“ap-group” on page 97](#) or [“ap-name” on page 100](#) for more information about priorities.

Cluster profiles, including the “default” profile, are not applied until you provision your APs for mesh.

## Related Commands

To view a complete list of mesh cluster profiles and their status, use the following command:

```
show ap mesh-cluster-profile
```

To view the settings of a specific mesh cluster profile, use the following command:

```
show ap mesh-cluster-profile <name>
```

## Example

The following command configures a mesh cluster profile named “cluster1” for the mesh cluster “headquarters:”

```
ap mesh-cluster-profile cluster1  
  cluster headquarters
```

## Command Information

Platforms	Licensing	Command Mode
All platforms	OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	Config mode on master switches

## ap mesh-radio-profile

```
ap mesh-radio-profile <profile>
  a-tx rates [6|9|12|18|24|36|48|54]
  allowed-vlans <vlan-list>
  children <children>
  clone <profile>
  g-tx rates [1|2|5|6|9|11|12|18|24|36|48|54]
  heartbeat-threshold <count>
  hop-count <hop-count>
  link-threshold <count>
  mesh-ht-ssid-profile
  max-retries <max-retries>
  mesh-mcast-opt
  metric-algorithm {best-link-rssi|distributed-tree-rssi}
  mpv <vlan-id>
  no ...
  reselection-mode {reselect-anytime|reselect-never|startup-subthreshold|
  subthreshold-only}
  rts-threshold <rts-threshold>
```

### Description

This command configures a mesh radio profile used by mesh nodes.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
allowed-vlans	Specify a list of VLAN IDs that can be used by a mesh link on APs associated with this mesh radio profile		
<vlan-list>	A comma-separated list of VLAN IDs. You can also specify a range of VLAN IDs using a dash (for example, 1–4095)		
a-tx rates	Indicates the transmit rates for the 802.11a radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.	6, 9, 12, 18, 24, 36, 48, 54 Mbps	6, 9, 12, 18, 24, 36, 48, 54 Mbps
children	Indicates the maximum number of children a mesh node can accept.	1-64	64
clone	Name of an existing mesh radio profile from which parameter values are copied.	—	—
g-tx rates	Indicates the transmit rates for the 802.11b/g radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps
heartbeat-threshold	Indicates the maximum number of heartbeat messages that can be lost between neighboring mesh nodes.	1-255	10
hop-count	Indicates the maximum hop count from the mesh portal.	1-32	8

Parameter	Description	Range	Default
link-threshold	Indicates the minimal RSSI value. If the RSSI value is below this threshold, the link may be considered a sub-threshold link. A sub-threshold link is a link whose average RSSI value falls below the configured threshold. If this occurs, the mesh node may try to find a better link on the same channel and cluster (only neighbors on the same channel are considered). The supported threshold is hardware dependent, with a practical range of 10-90.	hardware dependent	12
mesh-ht-ssid-profile	High-throughput SSID Profile for the mesh feature		default
max-retries	Maximum number of times a mesh node can re-send a packet.	0-15	4 times
mesh-mcast-opt	Enables or disables scanning of all active stations currently associated to a mesh point to select the lowest transmission rate based on the slowest connected mesh child. When enabled, this setting dynamically adjusts the multicast rate to that of the slowest connected mesh child. Multicast frames are not sent if there are no mesh children. Alcatel-Lucent recommends using the default value.		enabled
metric-algorithm	Specifies the algorithm used by a mesh node to select its parent. Alcatel-Lucent recommends using the default value distributed-tree-rssi.	—	distributed-tree-rssi
best-link-rssi	Selects the parent with the strongest RSSI, regardless of the number of children a potential parent has.	—	—
distributed-tree-rssi	Selects the parent based on link-RSSI and node cost based on the number of children. This option evenly distributes the mesh points over high quality uplinks. Low quality uplinks are selected as a last resort.	—	—
mpv	This parameter is experimental and reserved for future use.	0-4094	0 (disabled)
no	Negates any configured parameter.	—	—
reselection-mode	Specifies the method used to find a better mesh link. Alcatel-Lucent recommends using the default value startup-subthreshold.	(see below)	startup-sub threshold
reselect-any time	Connected mesh nodes evaluate alternative mesh links every 30 seconds. If a mesh node finds a better uplink, the mesh node connects to the new parent to create an improved path to the mesh portal.	—	—
reselect-never	Connected mesh nodes do not evaluate other mesh links to create an improved path to the mesh portal.	—	—

Parameter	Description	Range	Default
startup-sub-threshold	When bringing up the mesh network, mesh nodes have 3 minutes to find a better uplink. After that time, each mesh node evaluates alternative links only if the existing uplink falls below the configured threshold level (the link becomes a sub-threshold link). The reselection process is canceled if the average RSSI rises on the existing uplink rises above the configured link threshold.	—	—
subthreshold-only	Connected mesh nodes evaluate alternative links only if the existing uplink becomes a sub-threshold link.	—	—
rts-threshold	Defines the packet size sent by mesh nodes. Mesh nodes transmitting frames larger than this threshold must issue request to send (RTS) and wait for other mesh nodes to respond with clear to send (CTS) to begin transmission. This helps prevent mid-air collisions.	256-2,346	2,333 bytes

## Usage Guidelines

Mesh radio profiles are specific to mesh nodes (APs configured for mesh) and determine the radio frequency/channel used by mesh nodes to establish mesh links and the path to the mesh portal. You can configure multiple radio profiles; however, you select and deploy only one radio profile per mesh cluster.

Radio profiles, including the “default” profile, are not active until you provision your APs for mesh. If you modify a currently provisioned and running radio profile, your changes take place immediately. You do not reboot the switch or the AP.

## Related Commands

To view a complete list of mesh radio profiles and their status, use the following command:

```
(host) (config) #show ap mesh-radio-profile
```

To view the settings of a specific mesh radio profile, use the following command:

```
(host) (config) #show ap mesh-radio-profile <name>
```

## Example

The following command creates a mesh radio profile named “radio2” and associates a mesh high-throughput profile named meshHT1:

```
(host) (config) #ap mesh-radio-profile radio2
mesh-ht-ssid-profile meshHT1
```

## Command History

Release	Modification
AOS-W 3.2	Command introduced.
AOS-W 3.2.0.x, 3.3.1.x	The <b>tx-power</b> default increased from 14 to 30 dBm.
AOS-W 3.3	The <b>heartbeat-threshold</b> default increased from 5 to 10 heartbeat messages.
AOS-W 3.3.2	The <b>mesh-mcast-opt</b> parameter was introduced.

Release	Modification
AOS-W 3.4	The <b>mesh-ht-ssid-profile</b> parameter was introduced The <b>11a-portal-channel</b> , <b>11g-portal-channel</b> , <b>beacon-period</b> and <b>tx-power</b> parameters were deprecated. These settings can now be configured via the <b>rf dot11a-radio-profile</b> and <b>rf dot11g-radio-profile</b> commands.

## Command Information

Platforms	Licensing	Command Mode
All platforms	OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	Config mode on master switches

## ap mesh-ht-ssid-profile

```
ap mesh-ht-ssid-profile <profile-name>
  clone <source>
  40MHz-enable
  high-throughput-enable
  legacy-stations
  max-rx-a-mpdu-size
  max-tx-a-mpdu-size
  min-mpdu-start-spacing
  mpdu-agg
  no
  short-guard-intvl-40Mhz
  supported-mcs-set
```

### Description

This command configures a mesh high-throughput SSID profile used by mesh nodes.

### Syntax

Parameter	Description	Range	Default
<profile-name>	Enter the name of an existing mesh high-throughput SSID profile to modify that profile, or enter a new name or create a new mesh high-throughput profile. The mesh high-throughput profile can have a maximum of 32 characters. To view existing high-throughput SSID radio profiles, use the command <b>show ap mesh-radio-profile</b> .		default
clone <source>	Copy configuration information from a source profile into the currently selected profile		
40MHz-enable	Enable or disable the use of 40 MHz channels. This parameter is enabled by default.		enabled
high-throughput-enable	Enable or disable high-throughput (802.11n) features on this SSID. This parameter is enabled by default.		enabled
legacy-stations	Allow or disallow associations from legacy (non-HT) stations. By default, this parameter is enabled (legacy stations are allowed).		enabled
mpdu-agg	Enable or disable MAC protocol data unit (MPDU) aggregation. High-throughput mesh APs are able to send aggregated MAC protocol data units (MDPUs), which allow an AP to receive a single block acknowledgment instead of multiple ACK signals. This option, which is enabled by default, reduces network traffic overhead by effectively eliminating the need to initiate a new transfer for every MPDU.		enabled
max-tx-a-mpdu-size	Maximum size of a transmitted aggregate MPDU, in bytes.	1576 -65535	65535 bytes
max-rx-a-mpdu-size	Maximum size of a received aggregate MPDU, in bytes.	8191, 16383, 32767, 65535	65535 bytes

Parameter	Description	Range	Default
min-mpdu-start-spacing	Minimum time between the start of adjacent MPDUs within an aggregate MPDU, in microseconds.	0 (No restriction on MDPDU start spacing), .25 μsec, .5 μsec, 1 μsec, 2 μsec, 4 μsec	0 usec
supported-mcs-set	A list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20MHz vs. 40MHz) and the number of spatial streams used by the mesh node.  The default value is 1-15; the complete set of supported values. To specify a smaller range of values, enter a hyphen between the lower and upper values. To specify a series of different values, separate each value with a comma.  Examples: 2-10 1,3,6,9,12 Range: 0-15.	1-15	1-15
short-guard-intvl-40Mhz	Enable or disable use of short (400ns) guard interval in 40 MHz mode.  A guard interval is a period of time between transmissions that allows reflections from the previous data transmission to settle before an AP transmits data again. An AP identifies any signal content received inside this interval as unwanted inter-symbol interference, and rejects that data.  The 802.11n standard specifies two guard intervals: 400ns (short) and 800ns (long). Enabling a short guard interval can decrease network overhead by reducing unnecessary idle time on each AP. Some outdoor deployments, may, however require a longer guard interval. If the short guard interval does not allow enough time for reflections to settle in your mesh deployment, inter-symbol interference values may increase and degrade throughput.  This parameter is enabled by default.		enabled

## Guidelines

The mesh high-throughput profile defines settings unique to 802.11n-capable, high-throughput APs. If none of the APs in your mesh deployment are 802.11n-capable APs, you do not need to configure a high-throughput SSID profile.

If you modify a currently provisioned and running high-throughput SSID profile, your changes take affect immediately. You do not reboot the switch or the AP.

## Related Commands

To view a complete list of mesh high-throughput SSID profiles and their status, use the following command:

```
(host) (config) #show ap mesh-ht-ssid-profile
```

To view the settings of a specific mesh radio profile, use the following command:

```
(host) (config) #show ap mesh-ht-ssid-profile <name>
```

## Example

The following command configures a mesh high-throughput SSID profile named “HT1” and sets some non-default settings for MAC protocol data unit (MPDU) aggregation:

```
(host) (config) #ap mesh-ht-ssid-profile HT1
max-rx-a-mpdu-size 32767
max-tx-a-mpdu-size 32767
min-mpdu-start-spacing .25
```

## Command History

This command was introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms	OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	Config mode on master switches

## ap regulatory-domain-profile

```
ap regulatory-domain-profile <profile>
  clone <profile>
  country-code <code>
  no ...
  valid-11a-40mhz-channel-pair <num+|num->
  valid-11a-channel <num>
  valid-11g-40mhz-channel-pair <num+|num->
  valid-11g-channel <num>
```

### Description

This command configures an AP regulatory domain profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing regulatory domain profile from which parameter values are copied.	—	—
country-code	Code that represents the country in which the APs will operate. The country code determines the 802.11 wireless transmission spectrum. Improper country code assignment can disrupt wireless transmissions. Most countries impose penalties and sanctions for operators of wireless networks with devices set to improper country codes.	—	country code configured on the master switch during initial setup
no	Negates any configured parameter.	—	—
valid-11a-40mhz-channel-pair	Specifies a channel pair valid for 40 MHz operation in the regulatory domain (determined by country code) for the 5 GHz (802.11a) frequency band. num+: Entering a channel number with a plus (+) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by increasing the primary channel number by 4. Example: 157+ represents 157 as the primary channel and 161 as the secondary channel. num-: Entering a channel number with a minus (-) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by decreasing the primary channel number by 4. Example: 157- represents 157 as the primary channel and 153 as the secondary channel.	country code determines supported channel pairs <b>Note:</b> Changing the country code causes the valid channel lists to be reset to the defaults for the country.	
valid-11a-channel	Valid 802.11a channels for the country code. num: Enter a single channel number for 20 MHz mode of operation.	country code determines supported channels <b>Note:</b> Changing the country code causes the valid channel lists to be reset to the defaults for the country.	

Parameter	Description	Range	Default
valid-11g-40mhz-channel-pair	Specifies a channel pair valid for 40 MHz operation in the regulatory domain (determined by country code) for the 2.4 GHz (802.11b/g) frequency band. num+: Entering a channel number with a plus (+) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by increasing the primary channel number by 4. Example: 1+ represents 1 as the primary channel and 5 as the secondary channel. num-: Entering a channel number with a minus (-) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by decreasing the primary channel number by 4. Example: 5- represents 5 as the primary channel and 1 as the secondary channel.	country code determines supported channel pairs	<b>Note:</b> Changing the country code causes the valid channel lists to be reset to the defaults for the country.
valid-11g-channel	Valid 802.11b/g channels for the country code. num: Enter a single channel number for 20 MHz mode of operation.	country code determines supported channels	<b>Note:</b> Changing the country code causes the valid channel lists to be reset to the defaults for the country.

## Usage Guidelines

This profile configures the country code and valid channels for operation of APs. The list of valid channels only affects the channels that may be selected by ARM or by the switch when no channel is configured. Channels that are specifically configured in the AP radio settings profile (see [rf dot11a-radio-profile on page 342](#) or [rf dot11g-radio-profile on page 347](#)) must be valid for the country.

A switch shipped to certain countries, such as the U.S. and Israel, cannot terminate APs with regulatory domain profiles that specify different country codes from the switch. For example, if a switch is designated for the U.S., then only a regulatory domain profile with the “US” country code is valid; setting APs to a regulatory domain profile with a different country code will result in the radios not coming up. For switches in other countries, you can mix regulatory domain profiles on the same switch; for example, one switch can support APs in Japan, Taiwan, China, and Singapore.

In order for an AP to boot correctly, the country code configured in the AP regulatory domain profile must match the country code of the LMS.

## Related Commands

To view the supported channels, use the **show ap allowed-channels** command.

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent’s OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices.

## Examples

The following command configures the regulatory domain profile for APs in Japan:

```
(host) (config) #ap regulatory-domain-profile rd1
country-code JP
```

The following command configures a regulatory domain profile for APs in the United States and specifies that the channel pair of 36 and 40, with 36 being the primary channel, is allowed for 40 MHz mode of operation on the 5 GHz frequency band:

```
(host) (config) #ap regulatory-domain-profile usa1
country-code US
valid-11a-40mhz-channel-pair 36+
```

The following command configures a regulatory domain profile for APs in the United States and specifies that the channel pair of 5 and 1, with 5 being the primary channel, is allowed for 40 MHz mode of operation on the 2.4 GHz frequency band:

```
(host) (config) #ap regulatory-domain-profile usa1
country-code US
valid-11g-40mhz-channel-pair 5-
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3	Support for the IEEE 802.11n draft standard, including channel pairs for 40 MHz mode of operation, was introduced

## Command Information

### Description

This command configures an AP system profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
aeroscout-rtls-server	Enables the AP to send RFID tag information to an AeroScout real-time asset location (RTLS) server.	—	—
ip-addr	IP address of the AeroScout server to which location reports are sent.	—	—
port	Port number on the AeroScout server to which location reports are sent.	—	—

Parameter	Description	Range	Default
bkup-lms-ip	In multi-switch networks, specifies the IP address of a <i>backup</i> to the IP address specified with the lms-ip parameter.	—	—
bootstrap-threshold	Number of consecutive missed heartbeats on a GRE tunnel (heartbeats are sent once per second on each tunnel) before an AP reboots. On the switch, the GRE tunnel timeout is 1.5 x bootstrap-threshold; the tunnel is torn down after this number of seconds of inactivity on the tunnel.	1-65535	8
clone	Name of an existing AP system profile from which parameter values are copied.	—	—
dns-domain	Name of domain that is resolved by corporate DNS servers. Use this parameter when configuring split tunnel.	—	—
double-encrypt	This parameter applies only to remote APs. Use double encryption for traffic to and from a wireless client that is connected to a tunneled SSID. When enabled, all traffic is re-encrypted in the IPsec tunnel. When disabled, the wireless frame is only encapsulated inside the IPsec tunnel. All other types of data traffic between the switch and the AP (wired traffic and traffic from a split-tunneled SSID) are always encrypted in the IPsec tunnel.	—	disabled
dump-server	(For debugging purposes.) Specifies the server to receive a core dump generated when an AP process crashes.	—	—
heartbeat-dscp	DSCP value of AP heartbeats.	0-63	0
keepalive-interval	Time, in seconds, between keepalive messages from the AP.	30-65535	60 seconds
led-mode	The operating mode for the AP LEDs (OAW-AP-120, OAW-AP-121, OAW-AP-124 and OAW-AP-125 only)		normal
normal	Display LEDs in normal mode.		
off	Turn off all LEDs.		
lms-hold-down-period	Time, in seconds, that the primary LMS must be available before an AP returns to that LMS after failover.	1-3600	600 seconds
lms-ip	In multi-switch networks, specifies the IP address of the local management switch (LMS)—the Alcatel-Lucent switch—which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network. This can be the IP address of the local or master switch. When using redundant switches as the LMS, set this parameter to be the VRRP IP address to ensure that APs always have an active IP address with which to terminate sessions.	—	—
lms-preemption	Automatically reverts to the primary LMS IP address when it becomes available.	—	disabled

Parameter	Description	Range	Default
maintenance-mode	Enable or disable AP maintenance mode. This setting is useful when deploying, maintaining, or upgrading the network. If enabled, APs stop flooding unnecessary traps and syslog messages to network management systems or network operations centers when deploying, maintaining, or upgrading the network. The switch still generates debug syslog messages if debug logging is enabled.		disabled
master-ip	In multi-switch networks, specifies the IP address of the master switch. This address must be reachable by the APs.	—	—
max-request-retries	Maximum number of times to retry AP-generated requests, including keepalive messages. After the maximum number of retries, the AP either tries the IP address specified by the bkup-lms-ip (if configured) or reboots.	1-65535	10
mtu	MTU, in bytes, on the wired link for the AP.	1024-1578	—
native-vlan-id	Native VLAN for bridge mode virtual APs (frames on the native VLAN are not tagged with 802.1q tags).	—	1
no	Negates any configured parameter.	—	—
rap-dhcp-default-router	IP address for the default DHCP router. <b>NOTE:</b> The Remote AP license must be installed.		192.168.11.1
rap-dhcp-dns-server	IP address of the DNS server. <b>NOTE:</b> The Remote AP license must be installed.		192.168.11.1
rap-dhcp-lease	The amount of days that the assigned IP address is valid for the client. Specify the lease in <days>. 0 indicates the IP address is always valid; the lease does not expire. <b>NOTE:</b> The Remote AP license must be installed.	0-30	0
rap-dhcp-pool-end	Configures a DHCP pool for remote APs. This is the last IP address of the DHCP pool. <b>NOTE:</b> The Remote AP license must be installed.		192.168.11.254
rap-dhcp-pool-netmask	Configures a DHCP pool for remote APs. This is the netmask used for the DHCP pool. <b>NOTE:</b> The Remote AP license must be installed.		255.255.255.0
rap-dhcp-pool-start	Configures a DHCP pool for remote APs. This is the first IP address of the DHCP pool. <b>NOTE:</b> The Remote AP license must be installed.		192.168.11.2
rap-dhcp-server-id	IP address used as the DHCP server identifier. <b>NOTE:</b> The Remote AP license must be installed.		192.168.11.1
rap-dhcp-server-vlan	VLAN ID of the remote AP DHCP server used if the switch is unavailable. This VLAN enables the DHCP server on the AP (also known as the remote AP DHCP server VLAN). If you enter the native VLAN ID, the DHCP server is unavailable. <b>NOTE:</b> The Remote AP license must be installed.	—	—
request-retry-interval	Interval, in seconds, between the first and second retries of AP-generated requests. If the configured interval is less than 30 seconds, the interval for subsequent retries is increased up to 30 seconds.	1-65535	10 seconds

Parameter	Description	Range	Default
rf-band	For APs that support both a and b/g RF bands, RF band in which the AP should operate: <ul style="list-style-type: none"> <li>g = 2.4 GHz</li> <li>a = 5 GHz</li> </ul>	a/g	g
rfprotect-bkup-server	IP address of the backup Alcatel-Lucent RFprotect server. The AP or AP group to which this profile applies operates as an RFprotect sensor.	—	—
rfprotect-server-ip	IP address of the Alcatel-Lucent RFprotect server. The AP or AP group to which this profile applies operates as an RFprotect sensor.	—	—
rtls-server	Enables the AP to send RFID tag information to an RTLS server.	—	—
ip-addr	IP address of the server to which location reports are sent.	—	—
port	Port number on the server to which location reports are sent.	—	—
key	Shared secret key.	—	—
station-message-frequency	Indicates how often packets are sent to the server.	5-3600	30 seconds
session-acl	Session ACL configured with the ip access-list session command. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	—	—
syscontact	SNMP system contact information.	—	—
telnet	Enable or disable telnet to the AP.	—	disabled

## Usage Guidelines

The AP system profile configures AP administrative operations, such as logging levels.

## Example

The following command sets the LMS IP address in an AP system profile:

```
(host) (config) #ap system-profile local1
    lms-ip 10.1.1.240
```

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Support for additional RTLS servers, remote AP enhancements was introduced
AOS-W 3.3.2	<ul style="list-style-type: none"> <li>Maintenance-mode parameter was introduced.</li> <li>Multiple remote AP DHCP server enhancements were introduced.</li> <li>Support for RFprotect server and backup server configuration was introduced.</li> <li>The mms-rtls-server parameter was deprecated in AOS-W 3.3.2. To configure the OmniVista Mobility Manager server as an RTLS server, see <a href="#">“mobility-manager” on page 296</a>.</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for noted parameters	Config mode on master switches

## ap wipe out flash

```
ap wipe out flash
```

### Description

Overwrite the entire AP compact flash, destroying its contents (including the current image file).

### Syntax

No parameters.

### Usage Guidelines

Use this command only under the supervision of Alcatel-Lucent technical support. If you delete the current image in the AP's flash memory, the AP will not function until you reload another image.

### Command History

This command was introduced in AOS-W 3.2.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms running AOS-W 3.3.2.x-FIPS or later.	Base operating system	Config mode on master switches

## ap wired-ap-profile

```
ap wired-ap-profile <profile>
  clone <profile>
  forward-mode {bridge|split-tunnel|tunnel}
  no ...
  switchport access vlan <vlan>|mode {access|trunk}
    trunk {allowed vlan <list>|add <list>|except <list>|remove <list>}
    native vlan <vlan>}
  trusted
  wired-ap-enable
```

### Description

This command configures a wired AP profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing wired AP profile from which parameter values are copied.	—	—
forward-mode	Controls whether 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the switch, and Internet access remains local). Only 802.1x authentication is supported when configuring bridge or split tunnel mode. <b>NOTE:</b> For split-tunnel mode, the Remote AP license must be installed. Mesh nodes only support tunnel mode.	bridge/split-tunnel/tunnel	tunnel
no	Negates any configured parameter.	—	—
switchport	Configures the switching mode characteristics for the port.		
access	The VLAN to which the port belongs.	—	1
mode	The mode for the port, either access or trunk mode.	access/trunk	access
trunk allowed	Allows multiple VLANs on the port interface.	—	all VLAN IDs or VLAN names VLAN IDs and VLAN names cannot be listed together.
trunk native	The native VLAN for the port (frames on the native VLAN are not tagged with 802.1q tags).	—	1
trusted	Sets port as either trusted or untrusted.	—	untrusted
wired-ap-enable	Enables the wired AP.	—	disabled

### Usage Guidelines

This command is only applicable to Alcatel-Lucent APs that support a second Ethernet port, such as the OAW-AP-70. The wired AP profile configures the second Ethernet port (enet1) on the AP.

For mesh deployments, this command is applicable to all Alcatel-Lucent APs configured as mesh nodes. If you are using mesh to join multiple Ethernet LANs, configure and enable bridging on the mesh point Ethernet port.

Mesh nodes only support bridge mode and tunnel mode on their wired ports (enet0 or enet1). Split tunnel mode is not supported.

Use the bridge mode to configure bridging on the mesh point Ethernet port. Use tunnel mode to configure secure jack operation on the mesh node Ethernet port.

When configuring the Ethernet ports on the OAW-AP-70, note the following requirements:

- If configured as a mesh portal, connect enet0 to the switch to obtain an IP address. The wired AP profile controls enet1. Only enet1 supports secure jack operation.
- If configured as a mesh point, the same wired AP profile will control both enet0 and enet1.

## Example

The following command configures the enet1 port on the OAW-AP-70 as a trunk port:

```
(host) (config) #ap wired-ap-profile wiredapl
    switchport mode trunk
    switchport trunk allowed 4,5
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Support for split tunneling was introduced

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for noted parameters	Config mode on master switches

## ap-group

```
ap-group <group>
  ap-system-profile <profile>
  clone <profile>
  dot11a-radio-profile <profile>
  dot11a-traffic-mgmt-profile <profile>
  dot11g-radio-profile <profile>
  dot11g-traffic-mgmt-profile <profile>
  enet0-profile <profile>
  enet1-profile <profile>
  event-thresholds-profile <profile>
  ids-profile <profile>
  mesh-cluster-profile <profile> priority <priority>
  mesh-radio-profile <profile>
  no ...
  regulatory-domain-profile <profile>
  rf-optimization-profile <profile>
  virtual-ap <profile>
  voip-cac-profile <profile>
  wired-ap-profile <profile>
```

### Description

This command configures an AP group.

### Syntax

Parameter	Description	Range	Default
<group>	Name that identifies the AP group. The name must be 1-63 characters. NOTE: You cannot use quotes (") in the AP group name.	—	“default”
ap-system-profile	Configures AP administrative operations, such as logging levels. See “ <a href="#">ap system-profile</a> ” on page 89.	—	“default”
clone	Name of an existing AP group from which profile names are copied.	—	—
dot11a-radio-profile	Configures 802.11a radio settings and load balancing for the AP group; contains the ARM profile. See “ <a href="#">rf dot11a-radio-profile</a> ” on page 342.	—	“default”
dot11a-traffic-mgmt-profile	Configures bandwidth allocation. See “ <a href="#">wlan traffic-management-profile</a> ” on page 1012.	—	—
dot11g-radio-profile	Configures 802.11g radio settings and load balancing for the AP group; contains the ARM profile. See “ <a href="#">rf dot11a-radio-profile</a> ” on page 342.	—	“default”
dot11g-traffic-mgmt-profile	Configures bandwidth allocation. See “ <a href="#">wlan traffic-management-profile</a> ” on page 1012.	—	—
enet0-profile	Configures the duplex and speed of the Ethernet 0 interface on the AP. See “ <a href="#">ap enet-link-profile</a> ” on page 74.	—	“default”
enet1-profile	Configures the duplex and speed of the Ethernet 1 interface on the AP. See “ <a href="#">ap enet-link-profile</a> ” on page 74.	—	“default”

Parameter	Description	Range	Default
event-thresholds-profile	Configures Received Signal Strength Indication (RSSI) metrics. See <a href="#">“rf event-thresholds-profile” on page 353</a> .	—	“default”
ids-profile	Configures Alcatel-Lucent’s Intrusion Detection System (IDS). See <a href="#">“ids profile” on page 187</a> .	—	“default”
mesh-cluster-profile	Configures the mesh cluster profile for mesh nodes that are members of the AP group. There is a “default” mesh cluster profile; however, it is not applied until you provision the mesh node. See <a href="#">“ap mesh-cluster-profile” on page 75</a> . OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	—	“default”
priority	Configures the priority of the mesh cluster profile. If more than two mesh cluster profiles are configured, mesh points use this number to identify primary and backup profile(s). The lower the number, the higher the priority.	1-16	1
mesh-radio-profile	Configures the 802.11g and 802.11a radio settings for mesh nodes that are members of the AP group. See <a href="#">“ap mesh-radio-profile” on page 77</a> . The Secure Enterprise Mesh license must be installed.	—	“default”
no	Negates any configured parameter.	—	—
regulatory-domain-profile	Configures the country code and valid channels. See <a href="#">“ap regulatory-domain-profile” on page 84</a> .	—	“default”
rf-optimization-profile	Configure coverage hole and interference detection. See <a href="#">“rf optimization-profile” on page 358</a> .	—	“default”
virtual-ap	One or more profiles, each of which configures a specified WLAN. See <a href="#">“wlan virtual-ap” on page 1014</a> .	—	“default”
voip-cac-profile	Configures voice over IP (VoIP) call admission control (CAC) options. See <a href="#">“wlan voip-cac-profile” on page 1018</a> . The Voice Services Module license must be installed.	—	“default”
wired-ap-profile	Configures the second Ethernet port (enet1) on the AP. See <a href="#">“ap wipe out flash” on page 94</a> .	—	“default”

## Usage Guidelines

AP groups are at the top of the configuration hierarchy. An AP group collects virtual AP definitions and configuration profiles, which are applied to APs in the group.

## Example

The following command configures a virtual AP profile to the “default” AP group:

```
(host) (config) #ap-group default
                virtual-ap corpnet
```

## Related Commands

View AP group settings using the command [show ap-group](#).

## Command History:

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Support for the mesh parameters was introduced

## Command Information

  mesh-cluster-profile <profile> priority <priority>
  mesh-radio-profile <profile>
  no ...
  regulatory-domain-profile <profile>
  rf-optimization-profile <profile>
  snmp-profile <profile>
  virtual-ap <profile>
  voip-cac-profile <profile>
  wired-ap-profile <profile>
```

### Description

This command configures a specific AP.

### Syntax

Parameter	Description	Range	Default
<name>	Name that identifies the AP. By default, an AP's name can either be the AP's Ethernet MAC address, or if the AP has been previously provisioned with an earlier version of AOS-W, a name in the format <building>.<floor>.<location>. The name must be 1-63 characters. NOTE: You cannot use quotes (") in the AP name.	—	—
ap-system-profile	Configures AP administrative operations, such as logging levels. See <a href="#">“ap system-profile” on page 89</a> .	—	“default”
clone	Name of an existing AP name from which profile names are copied.	—	—
dot11a-radio-profile	Configures 802.11a radio settings for the AP group; contains the ARM profile. See <a href="#">“rf dot11a-radio-profile” on page 342</a> .	—	“default”
dot11a-traffic-mgmt-profile	Configures bandwidth allocation. See <a href="#">“wlan traffic-management-profile” on page 1012</a> .	—	—
dot11g-radio-profile	Configures 802.11g radio settings for the AP group; contains the ARM profile. See <a href="#">“rf dot11a-radio-profile” on page 342</a> .	—	“default”
dot11g-traffic-mgmt-profile	Configures bandwidth allocation. See <a href="#">“wlan traffic-management-profile” on page 1012</a> .	—	—

Parameter	Description	Range	Default
enet0-profile	Configures the duplex and speed of the Ethernet 0 interface on the AP. See <a href="#">“ap enet-link-profile” on page 74</a> .	—	“default”
enet1-profile	Configures the duplex and speed of the Ethernet 1 interface on the AP. See <a href="#">“ap enet-link-profile” on page 74</a> .	—	“default”
event-thresh-olds-profile	Configures Received Signal Strength Indication (RSSI) metrics. See <a href="#">“rf event-thresholds-profile” on page 353</a> .	—	“default”
exclude-mesh-cluster-profile-ap	Excludes the specified mesh cluster profile from this AP. The Secure Enterprise Mesh license must be installed.	—	—
exclude-virtual-ap	Excludes the specified virtual AP profiles from this AP.		
ids-profile	Configures Alcatel-Lucent’s Intrusion Detection System (IDS). See <a href="#">“ids profile” on page 187</a> .	—	“default”
mesh-cluster-profile	Configures the mesh cluster profile for the AP (mesh node). There is a “default” mesh cluster profile; however, it is not applied until you provision the mesh node. See <a href="#">“ap mesh-cluster-profile” on page 75</a> . The Secure Enterprise Mesh license must be installed.	—	“default”
priority	Configures the priority of the mesh cluster profile. If more than two mesh cluster profiles are configured, mesh points use this number to identify primary and backup profile(s). The lower the number, the higher the priority.	1-16	1
mesh-radio-profile	Configures the 802.11g and 802.11a radio settings for the AP (mesh node). See <a href="#">“ap mesh-radio-profile” on page 77</a> . The Secure Enterprise Mesh license must be installed.	—	“default”
no	Negates any configured parameter.	—	—
regulatory-domain-profile	Configures the country code and valid channels. See <a href="#">“ap regulatory-domain-profile” on page 84</a> .	—	“default”
rf-optimization-profile	Configures load balancing and coverage hole and interference detection. See <a href="#">“rf optimization-profile” on page 358</a> .	—	“default”
snmp-profile	Configures SNMP-related parameters. See <a href="#">“ap snmp-profile (deprecated)” on page 87</a> .	—	“default”
virtual-ap	One or more profiles, each of which configures a specified WLAN. See <a href="#">“wlan virtual-ap” on page 1014</a> .	—	“default”
voip-cac-profile	Configures voice over IP (VoIP) call admission control (CAC) options. See <a href="#">“wlan voip-cac-profile” on page 1018</a> . The Voice Services Module license must be installed.	—	“default”
wired-ap-profile	Configures the ports for APs that are directly attached to the switch. See <a href="#">“ap wipe out flash” on page 94</a> .	—	“default”

## Usage Guidelines

Profiles that are applied to an AP group can be overridden on a per-AP name basis, and virtual APs can be added or excluded on a per-AP name basis. If a particular profile is overridden for an AP, all parameters from the overriding profile are used. There is no merging of individual parameters between the AP and the AP group to which the AP belongs.

## Example

The following command excludes a virtual AP profile from a specific AP:

```
(host) (config) #ap-name 00:0b:86:c0:cf:d8
    exclude-virtual-ap corpnet
```

## Related Commands

View AP settings using the command [show ap-name](#).

## Command History:

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Support for mesh parameters was introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## ap-regroup

```
ap-regroup {ap-name <name>|serial-num <num>|wired-mac <macaddr>} <group>
```

### Description

This command moves a specified AP into a group.

### Syntax

Parameter	Description	Default
ap-name	Name of the AP.	—
serial-num	Serial number of the AP.	—
wired-mac	MAC address of the AP.	—
<group>	Name that identifies the AP group. The name must be 1-63 characters.	“default”

### Usage Guidelines

All APs discovered by the switch are assigned to the “default” AP group. An AP can belong to only one AP group at a time. You can move an AP to an AP group that you created with the **ap-group** command.

---

This command automatically reboots the AP.

---

### Example

The following command moves an AP to the ‘corpnet’ group:

```
(host) (config) #ap-regroup wired-mac 00:0f:1e:11:00:00 corpnet
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## ap-rename

```
ap-rename {ap-name <name>|serial-num <num>|wired-mac <macaddr>} <new-name>
```

### Description

This command changes the name of an AP to the specified new name.

### Syntax

Parameter	Description
ap-name	Current name of the AP.
serial-num	Serial number of the AP.
wired-mac	MAC address of the AP.
<new-name>	New name for the AP. The name must be 1-63 characters. <b>NOTE:</b> You cannot use quotes (") in the AP name.

### Usage Guidelines

An AP name must be unique within your network.

---

This command automatically reboots the AP.

---

### Example

The following command renames an AP:

```
(host) (config) #ap-rename wired-mac 00:0f:1e:11:00:00 building3-lobby
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## apflash

```
apflash {ap-name <name>|ip-addr <ipaddr>|wired-mac <macaddr>} [backup-partition]
[server <ipaddr>]
```

### Description

This command reflashes the specified AP.

### Syntax

Parameter	Description
ap-name	Reflash the AP with the specified name.
ip-addr	Reflash the AP at the specified IP address.
wired-mac	Reflash the AP at the specified MAC address.
backup-partition	(OAW-AP-80M only) Reflash partition two.
server	IP address of the FTP server.

### Usage Guidelines

This command directs an AP to download its image from the switch. You should not normally need to run this command, as Alcatel-Lucent APs automatically download their images from a switch during bootup.

### Example

The following command reflashes a specific AP:

```
(host) (config) #apflash ap-name Building3-Lobby
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes on master switches

## apboot

```
apboot {all [global|local]|ap-group <group> [global|local]|ap-name <name>|ip-addr <ipaddr>|wired-mac <macaddr>}
```

### Description

This command reboots the specified APs.

### Syntax

Parameter	Description	Default
all	Reboot all APs.	all
global	Reboot APs on all switches.	global
local	Reboot only APs registered on this switch. This is the default.	local
ap-group	Reboot APs in a specified group.	ap-group
global	Reboot APs on all switches.	global
local	Reboot only APs registered on this switch. This is the default.	local
ap-name	Reboot the AP with the specified name.	ap-name
ip-addr	Reboot the AP at the specified IP address.	ip-addr
wired-mac	Reboot the AP at the specified MAC address.	wired-mac

### Usage Guidelines

You should not normally need to use this command as APs automatically reboot when you reprovision them. Use this command only when directed to do so by your Alcatel-Lucent representative.

### Example

The following command reboots a specific AP:

```
(host)(config)# apboot ap-name Building3-Lobby
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## apdisconnect

```
apdisconnect {ap-name <name>|bssid <bssid>|ip-addr <ipaddr>}
```

### Description

This command disconnects a mesh point from its parent.

### Syntax

Parameter	Description
ap-name	Specifies the name of the parent AP.
bssid	Specifies the BSSID of the parent AP.
ip-addr	Specifies the IP address of the parent AP.

### Usage Guidelines

Each mesh point learns about the mesh portal from its parent (a mesh node that is part of the path to the mesh portal). This command directs a mesh point to disassociate from its parent. The mesh point will attempt to associate with another neighboring mesh node, if available. The old parent is not eligible for re-association for 60 seconds after disconnection.

### Example

The following command disconnects a specific mesh point from its parent:

```
(host) (config) #apdisconnect ap-name meshpoint1
```

### Command History

This command was introduced in AOS-W 3.2

### Command Information

Platforms	Licensing	Command Mode
All platforms	Secure Enterprise Mesh license	Enable and Config mode on master switches

## arp

```
arp <ipaddr> <macaddr>
```

### Description

This command adds a static Address Resolution Protocol (ARP) entry.

### Syntax

Parameter	Description
<ipaddr>	IP address of the device to be added.
<macaddr>	Hardware address of the device to be added, in the format xx:xx:xx:xx:xx:xx.

### Usage Guidelines

If the IP address does not belong to a valid IP subnetwork, the ARP entry is not added. If the IP interface that defines the subnetwork for the static ARP entry is deleted, you will be unable to use the arp command to overwrite the entry's current values; use the no arp command to negate the entry and then enter a new arp command.

### Example

The following command configures an ARP entry:

```
(host) (config) #arp 10.152.23.237 00:0B:86:01:7A:C0
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## audit-trail

audit-trail [all]

### Description

This command enables an audit trail.

### Syntax

Parameter	Description
all	Enables audit trail for all commands, including enable mode commands. The <b>audit-trail</b> command without this option enables audit trail for all commands in configuration mode.

### Usage Guidelines

By default, audit trail is enabled for all commands in configuration mode. Use the **show audit-trail** command to display the content of the audit trail.

### Example

The following command enables an audit trail:

```
(host) (config) #audit-trail
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## backup

backup {flash|pcmcia}

### Description

This command backs up compressed critical files in flash.

### Syntax

Parameter	Description
flash	Backs up flash directories to flashbackup.tar.gz file.
pcmcia	Backs up flash images to external PCMCIA flash card. This option can only be executed on switches that have a PCMCIA slot.

### Usage Guidelines

Use the **restore flash** command to untar and uncompress the flashbackup.tar.gz file.

### Example

The following command backs up flash directories to the flashbackup.tar.gz file:

```
(host)(config) #backup flash
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes on master switches

## banner motd

```
banner motd <delimiter> <textString>
```

### Description

This command defines a text banner to be displayed at the login prompt when a user accesses the switch.

### Syntax

Parameter	Description	Range
<delimiter>	Indicates the beginning and end of the banner text.	—
<textString>	The text you want displayed.	up to 1023 characters

### Usage Guidelines

The banner you define is displayed at the login prompt to the switch. The banner is specific to the switch on which you configure it. The WebUI displays the configured banner at its login prompt, but you cannot use the WebUI to configure the banner.

The delimiter is a single character that indicates the beginning and the end of the text string in the banner. Select a delimiter that is not used in the text string you define, because the switch ends the banner when it sees the delimiter character repeated.

There are two ways of configuring the banner message:

- Enter a space between the delimiter and the beginning of the text string. The text can include any character except a quotation mark (“). Use quotation marks to enclose your text if you are including spaces (spaces are not recognized unless your text string is enclosed in quotation marks; without quotation marks, the text is truncated at the first space). You can also use the delimiter character within quotation marks.
- Press the **Enter** key after the delimiter to be placed into a mode where you can simply enter the banner text in lines of up to 255 characters, including spaces. Quotation marks are ignored.

### Example

The following example configures a banner by enclosing the text within quotation marks:

```
(host)(config) #banner motd * "Welcome to my switch. This switch is in the production network, so please do not save configuration changes. Maintenance will be performed at 7:30 PM, so please log off before 7:00 PM."*
```

The following example configures a banner by pressing the **Enter** key after the delimiter:

```
(host)(config) #banner motd *  
Enter TEXT message [maximum of 1023 characters].  
Each line in the banner message should not exceed 255 characters.  
End with the character '*'.  
  
Welcome to my switch. This switch is in the production network, so please do not save configuration changes. Maintenance will be performed at 7:30 PM, so please log off before 7:00 PM.*
```

```
Welcome to my switch. This switch is in the production network, so please do not save configuration changes. Maintenance will be performed at 7:30 PM, so please log off before 7:00 PM.*
```

The banner display is as follows:

```
Welcome to my switch. This switch is in the production network, so please do not save configuration changes. Maintenance will be performed at 7:30 PM, so please log off before 7:00 PM.
```

## Command History

This command was introduced in AOS-W 1.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## boot

```
boot
  cf-test [fast | read-only | read-write]
  config-file <filename>
  system partition [0 | 1]
  verbose
```

### Description

This command configures the boot options for the switch.

### Syntax

Parameter	Description
cf-test	Sets the type of compact flash test to run when booting the switch.
fast	Performs a fast test, which does not include media testing.
read-only	Performs a read-only media test.
read-write	Performs a read-write media test.
config-file	Sets the configuration file to use when booting the switch.
<filename>	Specifies the name of the configuration file from which to boot the switch.
system	Specifies the system partition to use when booting the switch.
0   1	Indicates the partition to use as either 0 or 1. One of the partitions is the active partition and the other is the backup.
verbose	Prints extra debugging information at boot.

### Usage Guidelines

Use the following options to control the boot behavior of the switch:

- `cf-test`—Test the flash during boot.
- `config-file`—Set the configuration file to use during boot.
- `system`—Specify the system partition to use during boot.
- `verbose`—Print extra debugging information during boot. The information is sent to the screen at boot time. Printing the extra debugging information is disabled using the `no boot verbose` command.

### Example

The following command uses the configuration file `january-config.cfg` the next time the switch boots:

```
boot config-file january-config.cfg
```

The following command uses system partition 1 the next time the switch boots:

```
boot system partition 1
```

### Command History

This command was introduced in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## cellular profile

```
cellular profile <profile_name>
  dialer <group>
  driver acm|hso|option|sierra
  import <address>
  modeswitch {eject <params>}|rezero
  no
  priority <1-255>
  serial <sernum>
  tty <ttyport>
  user <login> password <password>
  vendor <vend_id> product <prod_id>
```

### Description

Create new profiles to support new USB modems or to customize USB characteristics.

### Syntax

Parameter	Description
<code>cellular profile &lt;profile_name&gt;</code>	Enter the keywords <b>cellular profile</b> followed by your profile name. This command changes the configuration mode and the command line prompt changes to: host (config-cellular <profile_name>)#
<code>dialer &lt;group&gt;</code>	Enter the keyword <b>dialer</b> followed by a group name to specify the dialing parameters for the carrier. The parameters tend to be common between service providers on the same type of network (CDMA vs. GSM) as displayed in the <code>show dialer group</code> command.
<code>driver acm hso option sierra</code>	Enter the keyword <b>driver</b> followed by one of the driver options: <ul style="list-style-type: none"><li>• <b>acm</b>: Linux ACM driver.</li><li>• <b>hso</b>: Option High Speed driver.</li><li>• <b>option</b>: Option USB data card driver (default).</li><li>• <b>sierra</b>: Sierra Wireless driver.</li></ul>
<code>import &lt;address&gt;</code>	Enter the keyword <b>import</b> followed by the USB device address as displayed in the <code>show usb</code> command. Import retrieves the vendor/product serial numbers from the USB device list and populates them into the profile.
<code>modeswitch {eject &lt;params&gt;} rezero</code>	Enter the keyword <b>modeswitch</b> followed by either: <ul style="list-style-type: none"><li>• <b>eject</b> followed by the CDROM device.</li><li>• <b>rezero</b>: Send SCSI CDROM rezero command.</li></ul> Certain cellular devices must be modeswitched before the modem switches to data mode.
<code>no</code>	Enter the keyword <b>no</b> to negate the command and revert back to the defaults.
<code>priority &lt;1-255&gt;</code>	Enter the keyword <b>priority</b> to override the default cellular priority (100). Range: 1 to 255. Default: 100
<code>serial &lt;sernum&gt;</code>	Enter the keyword <b>serial</b> followed by the USB device serial number
<code>tty &lt;ttyport&gt;</code>	Enter the keyword <b>tty</b> followed by the Modem TTY port (i.e. ttyUSB0, ttyACM0)

Parameter	Description
<code>user &lt;login&gt; password &lt;password&gt;</code>	Enter the keyword <b>user</b> followed by your login, and then enter the keyword <b>password</b> followed by your password to establish user name authentication.
<code>vendor &lt;vend_id&gt; product &lt;prod_id&gt; in hex</code>	Enter the keyword <b>vendor</b> followed by the vendor ID in hexadecimal (see <code>show usb</code> ) and then enter the keyword <b>product</b> followed by the product ID listed in the <code>show usb</code> command.

## Usage Guidelines

The cellular modems are plug-and-play and support most native USB modems. Cellular modems are activated only if it is the uplink with the highest priority (see `show uplink`). However, new profiles can be created using this command to support new data cards or to customize card characteristics. New modem profiles are published at [http://www.corpnetworks.com/usb\\_devices](http://www.corpnetworks.com/usb_devices).

## Command History

Introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches (config-cellular <profile_name>)

## cfgm

```
cfgm {mms config {enable|disable}|set config-chunk <kbytes>|set heartbeat <seconds>|set maximum-updates <number>|snapshot-timer <minutes>}
```

### Description

This command configures the configuration module on the master switch.

### Syntax

Parameter	Description	Range	Default
mms config	Permits OmniVista Mobility Manager (OmniVista Mobility Manager) configuration updates on the master switch. When enabled, global configuration changes can only be done from OmniVista Mobility Manager and are not available on the master switch.	enable disable	disabled
config-chunk	Maximum packet size, in Kilobytes, that is sent every second to the local switch whenever the master switch sends a configuration to the local. If the connection between the master and local is slow or uneven, you can lower the size to reduce the amount of data that needs to be retransmitted. If the connection is very fast and stable, you can increase the size to make the transmission more efficient.	1-100	10 Kbytes
heartbeat	Interval, in seconds, at which heartbeats are sent. You can increase the interval to reduce traffic load.	10-300	10 seconds
maximum-updates	Maximum number of local switches that can be updated at the same time with configuration changes. You can decrease this value if you have a busy network. You can increase this value to improve configuration synchronization.	2-25	5
snapshot-timer	Interval, in minutes, that the local switch waits for a configuration download from the master upon bootup or startup before loading the last snapshot configuration.	5-60	5 minutes

### Usage Guidelines

By default, OmniVista Mobility Manager configuration updates on the switch are disabled to prevent any alterations to the switch configuration. You need to explicitly enable OmniVista Mobility Manager configuration updates for the switch to accept configuration changes from OmniVista Mobility Manager. When OmniVista Mobility Manager configuration updates are enabled, global configuration changes can only be done from OmniVista Mobility Manager and are not available on the master switch. You can use the **cfgm mms config disable** command if the switch loses connectivity to the OmniVista Mobility Manager and you must enter a configuration change on the master switch.

### Example

The following command allows configuration updates from the OmniVista Mobility Manager:

```
(host)(config) #cfgm mms config enable
```

### Command History

This command was introduced in AOS-W 3.1.

## Command Information

Platforms	Licensing	Command Mode
All platforms.	Base operating system	Config mode on master switches

## clock set

```
clock  
clock set <year><month><day><time>
```

### Description

This command sets the date and time.

### Syntax

Parameter	Description	Range
year	Sets the year. Requires all 4 digits.	Numeric
month	Sets the month. Requires the first three letters of the month.	Alphabetic
day	Sets the day.	1-31
time	Sets the time. Specify hours, minutes, and seconds separated by spaces.	Numeric

### Usage Guidelines

You can configure the year, month, day, and time. You must configure all four parameters.

Specify the time using a 24-hour clock. You must specify the seconds.

### Example

The following example configures the clock to January 1<sup>st</sup> of 2007, at 1:03:52 AM.

```
(host) (config) #clock set 2007 jan 1 1 3 52
```

### Command History

This command was introduced in AOS-W 1.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## clock summer-time

```
clock summer-time <WORD> [recurring]
  <1-4> <start day> <start month> <hh:mm>
  first <start day> <start month> <hh:mm>
  last <start day> <start month> <hh:mm>
  <1-4> <end day> <end month> <hh:mm>
  first <end day> <end month> <hh:mm>
  last <end day> <end month> <hh:mm>
  [<-23 - 23>]
```

### Description

This command sets daylight savings time.

### Syntax

Parameter	Description	Range
WORD	Name of the time zone.	3-5 characters
1-4	Week of the month when the time change takes effect.	1-4
first	Time change takes effect on the first week of the month.	—
last	Time change takes effect on the last week of the month.	—
start day	Day of the week when the time change takes effect.	Sunday-Saturday
start month	Month when the time change takes effect.	January-December
hh:mm	Time when the time change takes effect.	24 hours
-23 - 23	Hours offset from UTC.	-23 - 23

### Usage Guidelines

This command subtracts exactly 1 hour from the configured time.

The `WORD` can be any alphanumeric string, but cannot start with a colon (:). A `WORD` longer than five characters is not accepted. If you enter a `WORD` containing punctuation, the command is accepted, but the timezone is set to UTC.

You can configure the time to change on a recurring basis. To do so, set the week, day, month, and time when the change takes effect (daylight savings time starts). You must also set the week, day, month, and time when the time changes back (daylight savings time ends).

The `start day` requires the first three letters of the day. The `start month` requires the first three letters of the month.

You also have the option to set the number of hours by which to offset the clock from UTC. This has the same effect as the `clock timezone` command.

### Example

The following example sets daylight savings time to occur starting at 2:00 AM on Sunday in the second week of March, and ending at 2:00 AM on Sunday in the first week of November. The example also sets the name of the time zone to PST with an offset of UTC - 8 hours.

clock summer-time PST recurring 2 Sun Mar 2:00 first Sun Nov 3:00 -8

## Command History

This command was introduced in AOS-W 1.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## clock timezone

```
clock timezone <name> <-23 to 23>
```

### Description

This command sets the timezone on the switch.

### Syntax

Parameter	Description	Range
<name>	Name of the time zone.	3-5 characters
-23 to 23	Hours offset from UTC.	-23 to 23

### Usage Guidelines

The **name** parameter can be any alphanumeric string, but cannot start with a colon (:). A time zone name longer than five characters is not accepted. If you enter a time zone name containing punctuation, the command is accepted, but the timezone is set to UTC.

### Example

The following example configures the timezone to PST with an offset of UTC - 8 hours.

```
clock timezone PST -8
```

### Command History

This command was introduced in AOS-W 1.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## configure terminal

```
configure terminal
```

### Description

This command allows you to enter configuration commands.

### Syntax

No Parameters.

### Usage Guidelines

Upon entering this command, the enable mode prompt changes to:

```
(host) (config) #  
To return to enable mode, enter Ctrl-Z or exit.
```

### Example

The following command allows you to enter configuration commands:

```
(host) # configure terminal
```

### Related Commands

Other commands required to configure a feature or show current settings. This may not be required for all commands.

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## controller-ip

```
controller-ip [loopback|vlan <VLAN ID>]
no ...
```

### Description

This command sets the switch IP to the loopback interface address or a specific VLAN interface address.

### Syntax

Parameter	Description	Default
loopback	Sets the switch IP to the loopback interface.	disabled
vlan	Set the switch IP to a VLAN interface.	—
VLAN ID	Specifies the VLAN interface ID.	—

### Usage Guidelines

This command allows you to set the switch IP to the loopback interface address or a specific VLAN interface address. If the switch IP command is not configured then the switch IP defaults to the loopback interface address. If the loopback interface address is not configured then the first configured VLAN interface address is selected. Generally, VLAN 1 is the factory default setting and thus becomes the switch IP address.

### Example

The following command sets the switch IP address to VLAN interface 6.

```
(host) (config) #controller-ip vlan 6
```

### Related Commands

```
(host) (config) #show controller-ip
```

### Command History

This command was introduced in AOS-W 3.4

### Command Information

Platform	License	Command Mode
Available on all platforms	Base operating system	Config mode on master switches

## copy

```
copy
flash: <srcfilename> {flash: <destfilename> | scp: <scphost> <username>
<destfilename> |
  tftp: <tftphost> <destfilename>} |
ftp: <ftphost> <user> <filename> system: partition {0|1} |
running-config {flash: <filename> | ftp: <ftphost> <user> <password> <filename>
 [<remote-dir>] | startup-config | tftp: <tftphost> <filename>} |
scp: <scphost> <username> <filename> {flash: <destfilename>| system: partition [0|1]}|
startup-config {flash: <filename> | tftp: <tftphost> <filename>} |
system: partition {<srcpartition> 0|1} [<destpartition> 0 | 1] |
tftp: <tftphost> <filename> {flash: <destfilename> | system: partition [0|1]}
```

## Description

This command copies files to and from the switch.

## Syntax

Parameter	Description
flash:	Copy the contents of the switch's flash file system, the system image, to a specified destination.
srcfilename	Full name of the flash file to be copied.
flash:	Copy the file to the flash file system.
destfilename	Specify the new name of the copied file.
tftp:	Copy the file to a TFTP server.
tftphost	Specify the IP address or hostname of the TFTP server.
ftp:	Copy a file from the FTP server.
ftphost	Specify the IP address or hostname of the FTP server.
user	User account name required to access the FTP server.
filename	Full name of the file to be copied.
0   1	Specify the system partition to save the file.
running-config	Copy the active, running configuration to a specified destination.
flash:	Copy the configuration to the flash file system.
filename	Specify the new name of the copied configuration file.
ftp:	Using FTP, copy the configuration to an FTP server.
ftphost	Specify the IP address of the FTP server.
user	User account name required to access the FTP server.
password	Password required to access the FTP server.
remote-dir	Specify a remote directory, if needed.
startup-config	Copy the active, running configuration to the start-up configuration.
tftp:	Using TFTP, copy the configuration to a TFTP server
tftphost	Specify the IP address or hostname of the TFTP server.

Parameter	Description
scp:	Copy an AOS-W image file or file from the flash file system using the Secure Copy protocol. The SCP server or remote host must support SSH version 2 protocol.
scphost	Specify the IP address of the SCP server or remote host.
username	User account name required to access the SCP server or remote host.
filename	Specify the absolute path of the filename to be copied.
flash:	Copy the file to the flash file system.
destfilename	Specify the new name of the copied file.
system:	Copy the file to the system partition.
startup-config	Copy the startup configuration to a specified flash file or to a TFTP server.
flash:	Copy the file to the flash file system.
filename	Specify the new name of the copied startup configuration file.
tftp:	Using TFTP, copy the startup configuration to a TFTP server
tftphost	Specify the IP address or hostname of the TFTP server.
system:	Copy the specified system partition
srcpartition	Disk partition from which to copy the system data, as either 0 or 1.
destpartition	Disk partition to copy the system data to, as either 0 or 1.
tftp:	Copy a file from the specified TFTP server to either the switch or another destination. This command is typically used when performing a system restoration, or to pull a specified file name into the wms database.
tftphost	Specify the IP address or hostname of the TFTP server.
filename	Full name of the file to be copied.
flash:	Copy the file to the flash file system
destfilename	Specify the new name of the copied file.
system	Copy the file to the system partition.

## Usage Guidelines

Use this command to save back-up copies of the configuration file to an FTP or TFTP server, or to load a saved file from an FTP or TFTP server.

Three partitions reside on the file system flash. Totalling 256MB, the three partitions provide space to hold the system image files (in partitions 1 and 2 which are 45MB each) and user files (in partition 3, which is 165MB). System software runs on the system partitions; the database, DHCP, startup configuration, and logs are positioned on the user partition.

To restore a database, copy the database from the network server and import the database.

To restore a configuration file, copy the file from network server to the switch's flash system then copy the file from the flash system to the system configuration. This ensures that you do not accidentally overwrite your system startup configuration file.

## Example

The following commands copy the configuration file named `engineering` from the TFTP server to the switch's flash file system and then uses that file as the startup configuration. This example assumes the startup configuration file is named `default.cfg`:

```
(host) (config) #copy tftp: 192.0.2.0 engineering flash: default.bak
copy flash: default.bak flash: default.cfg
```

## Command History

This command was introduced in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode

## cp-bandwidth-contract

```
cp-bandwidth-contract <name> {mbits <1..2000>}|{kbits <256..2000000>}
```

### Description

This command configures a bandwidth contract traffic rate which can then be associated with a whitelist session ACL.

### Syntax

Parameter	Description
<name>	Name of a bandwidth contract.
mbits <1..2000>	Set a bandwidth rate inn mbits/seconds.
kbits <256..2000000>	Set a bandwidth rate in kbits/seconds.

### Example

The following example configures a bandwidth contract named “cp-rate” with a rate of 10,000Kbps.

```
(host)(config) #cp-bandwidth-contract cp-rate kbits 10000
```

### Related Commands

Command	Description	Mode
<code>show cp-bwcontracts</code>	Display a list of Control Processor (CP) bandwidth contracts for whitelist ACLs.	Enable or Config modes
<code>firewall cp</code>	This command creates a new whitelist ACL and can associate a bandwidth contract with that ACL.	Enable or Config modes

### Command History

This command was introduced in AOS-W 3.4

### Command Information

All platforms	This command requires the PEF license.	Config mode on master switches

## crypto dynamic-map

```
crypto dynamic-map <name> <priority>
  no ...
  set puffs {group1|group2}
  set security-association lifetime seconds <seconds>
  set transform-set <name1> [<name2>] [<name3>] [<name4>]
```

### Description

This command configures an existing dynamic map.

### Syntax

Parameter	Description	Range	Default
<name>	Name of the map.	—	—
<priority>	Priority of the map.	1-10000	10000
no	Negates a configured parameter.	—	—
pfs	Enables Perfect Forward Secrecy (PFS) mode. Use one of the following: group1: 768-bit Diffie Hellman prime modulus group group2: 1024-bit Diffie Hellman prime modulus group	group1/ group2	disabled
seconds	Configures the lifetime, in seconds, for the security association (SA).	300-86400	no limit
transform-set	Name of the transform set for this dynamic map. You can specify up to four transform sets. You configure transform sets with the <code>crypto ipsec transform-set</code> command.	—	default-transform

### Usage Guidelines

Dynamic maps enable IPsec SA negotiations from dynamically addressed IPsec peers. Once you have defined a dynamic map, you can associate that map with the default global map using the command `crypto map global-map`.

### Example

The following command configures a dynamic map:

```
(host) (config)# crypto dynamic-map dmap1 100
set pfs group2
set security-association lifetime seconds 300
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN Server and/or Remote AP license	Config mode on master switches

## crypto ipsec

```
crypto ipsec {mtu <max-mtu>}|{transform-set <transform-set-mtu> esp-3des|esp-  
aes128|esp-aes192|esp-aes256|esp-des esp-md5-hmac|esp-sha-hmac}
```

### Description

This command configures IPsec parameters.

### Syntax

Parameter	Description	Range	Default
mtu	Configure IPsec Maximum Transmission Unit (MTU) parameters.	—	—
<max-mtu>	Configure IPsec MTU.	1024-1500	1500
transform-set	Create or modify a transform set.	—	—
<transform-set-mtu>	Name of the transform set to create or modify.	—	—
esp-3des	Use ESP with 168-bit 3DES encryption.	—	—
esp-aes128	Use ESP with 128-bit AES encryption.	—	—
esp-aes192	Use ESP with 192-bit AES encryption.	—	—
esp-aes256	Use ESP with 256-bit AES encryption.	—	—
esp-des	Use ESP with 56-bit DES encryption.	—	—
esp-md5-hmac	Use ESP with the MD5 (HMAC variant) authentication algorithm		
esp-sha-hmac	Use ESP with the SHA (HMAC variant) authentication algorithm		

### Usage Guidelines

Define the Maximum Transmission Unit (MTU) size allowed for network transmissions using IPsec security, and create or edit transform sets that define a specific encryption and authentication type.

### Example

The following command configures 3DES encryption and MD5 authentication for a transform set named set1:

```
(host) (config)# crypto ipsec transform-set set1 esp-3des esp-md5-hmac
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## crypto isakmp

```
crypto isakmp {address <peer-address> netmask <mask>}|enable|disable|{groupname <name>}  
|{key <keystring> address <peer-address> netmask <mask>}|{policy <priority>}|{psk-  
caching days <interval-days>}|{psk-caching disable}|{psk-caching hours <interval-  
hours>}| {udpencap-behind-natdevice enable|disable}|packet-dump
```

### Description

This command configures Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

### Syntax

Parameter	Description
address	Configure the IP address for the global group key.
<peer-address>	IP address for the group key, in dotted-decimal format.
netmask	Configure the IP netmask for the group key.
<mask>	Subnet mask for the group key.
enable	Enable IKE processing.
disable	Disable IKE processing.
groupname	Configure the IKE Aggressive group name. Aggressive-mode IKE is a 3-packet IKE exchange that does not provide identity-protection, but is faster, because fewer messages are exchanged.
<name>	Name of the IKE aggressive group.
key	Configure the IKE preshared key.
<keystring>	Configure the value of the IKE PRE-SHARED key. The key must be between 6-64 characters long.
address	Configure the IP address for the group key.
<peer-address>	An IP for the group key, in dotted-decimal format.
netmask	Configure the netmask for the group key IP address.
<mask>	A subnet mask, in dotted-decimal format
policy	Configure an IKE policy
<priority>	Specify a number from 1 to 10,000 to define a priority level for the policy. The higher the number, the higher the priority level.
psk-caching	Configure IKE RAP PSK caching by specifying the interval of time for which the previous PSK is valid. If this feature is enabled, and the administrator changes the Global PSK, the switch will accept connections from an AP using the previous PSK for the configured time interval.
days	Configure the PSK caching interval in days.
<interval-days>	Caching interval.
disable	Disable PSK caching. (This feature is disabled by default)
hours	Configure the PSK caching interval in hours.
<interval-hours>	Caching interval.

Parameter	Description
udpencap-behind-natdevice	Configure NAT-T if switch is behind NAT device. Only for Windows VPN Dialer
enable	Enable Nat-T. (This is the recommended setting if the switch is behind a NAT device.)
disable	Disable Nat-T.
packet-dump	Enable the packet dump feature to troubleshoot an IPsec tunnel establishment by looking at the packet exchanges between the switch and the remote AP or the other IPsec peer. The packet dump output is saved to a file named ike.pcap. <b>NOTE:</b> This is a testing feature only, and should not be enabled on a production network. To disable this feature, use the command <b>no crypto isakmp packet-dump</b> .

## Usage Guidelines

Preshared key (PSK)-refresh allows you to refresh the IKE PSK used by remote APs. By default, PSK-refresh is disabled. With PSK-refresh enabled, the switch accepts connections from remote APs using the previously configured PSK for the specified interval. After the interval elapses, that PSK expires and the switch uses the new PSK to authenticate remote APs. If you enable and then disable PSK-refresh, the remote AP attempts to authenticate with the currently configured global PSK only.

To enable PSK-refresh, you must:

1. Configure the amount of time in days or hours (known as the interval), to remember the previously configured PSK used in your remote AP deployment.  
**NOTE:** Alcatel-Lucent recommends configuring a large interval to prevent remote APs from being unable to authenticate and connect to the network. Consider your existing PSK interval when configuring this feature.
2. Configure the global PSK using the command **crypto isakmp key**. The IP address must be 0.0.0.0, and the netmask must be 0.0.0.0.

## Example

The following command configures an ISAKMP peer IP address and subnet mask. After configuring an ISAKMP address and netmask, you will be prompted to enter the IKE preshared key.

```
(host) (config) #crypto isakmp address 10.3.14.21 netmask 255.255.255.0
Key:*****
Re-Type Key:*****
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## crypto map global-map

```
crypto map global-map <map-number> ipsec-isakmp {dynamic <dynamic-map-name>}|{ipsec <ipsec-map-name>}
```

### Description

This command configures the default global map.

### Syntax

Parameter	Description
<map-number>	Priority of the map.
dynamic	Use a dynamic map.
<dynamic-map-name>}	Name of the dynamic map.
ipsec	Use a IPsec map.
<ipsec-map-name>	Name of an IPsec map.

### Usage Guidelines

This command identifies the dynamic or ipsec map used as the default global map. If you have not yet defined a dynamic or ipsec map, issue the command **crypto map global-map** or **crypto-local ipsec-map** to define map parameters.

### Example

The following command configures the global map with the dynamic map named *dynamic\_map\_2*.

```
(host)(config) #crypto map global-map 2 ipsec-isakmp dynamic dynamic_map_2
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## crypto pki

```
crypto pki csr key <key_val> common_name <common_val> country <country_val>  
state_or_province <state> city <city_val> organization <organization_val> unit  
<unit_val> email <email_val>
```

### Description

Generate a certificate signing request (CSR) for the captive portal feature.

### Syntax

Parameter	Description
key <key_val>	Specify the CSR key length: <b>1024, 2048, or 4096</b> .
common_name <common_val>	Specify a common name, e.g., www.yourcompany.com.
country <country_val>	Specify a country name, e.g., US or CA.
state_or_province <state>	Specify the name of a state or province.
city <city_val>	Specify the name of a city.
organization <organization_val>	Specify the name of an organization unit, e.g., sales.
unit <unit_val>	Specify a unit value, e.g. EMEA.
email <email_val>	Specify an email address, in the format name@mycompany.com.

### Usage Guidelines

Use this command to generate a CSR for the Captive Portal feature. Display the CSR output by entering the command **show crypto pki csr**. Note that this command will only generate CSR on a switch running AOS-W 3.x or later. Earlier versions require that you generate the certificate externally.

### Example

The following command configures a CSR for a user with the email address *jdoe@example.com*.

```
(host)(config) #crypto pki csr key 1024 common_name www.example.lcom country US state_or_province ca cit  
organization engineering unit pubs email jdoe@example.com
```

### Command History

This command was introduced in AOS-W 3.1

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## crypto pki-import

```
crypto pki-import {der|pem|pfx|pkcs12|pkcs7} {PublicCert|ServerCert|TrustedCA} <name>
```

### Description

Import certificates for the captive portal feature.

### Syntax

Parameter	Description
der	Import a certificate in DER format.
pem	Import a certificate in x509 PEM format.
pfx	Import a certificate in PFX format.
pkcs12	Import a certificate in PKCS12 format.
pkcs7	Import a certificate in PKCS7 format.
PublicCert	Import a public certificate.
ServerCert	Import a server certificate.
TrustedCA	Import a trusted CA certificate.
<name>	Name of a certificate.

### Usage Guidelines

Use this command to install a CSR for the Captive Portal feature.

### Example

The following command installs a server certificate in DER format.

```
(host)(config) #crypto pki-import der ServerCert cert_20
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## crypto-local ipsec-map

```
crypto-local
crypto-local ipsec-map <map> <priority>
  dst-net <ipaddr> <mask>
  force-natt
  no ...
  local-fqdn <local_id_fqdn>
  peer-ip <ipaddr>
  pre-connect {disable|enable}
  set ca-certificate <cacert-name>
  set pfs {group1|group2}
  set security-association lifetime seconds <seconds>
  set server-certificate <cert-name>
  set transform-set <name1> [<name2>] [<name3>] [<name4>]
  src-net <ipaddr> <mask>
  trusted {disable|enable}
  vlan <vlan>
```

### Description

This command configures IPsec mapping for site-to-site VPN.

### Syntax

Parameter	Description	Range	Default
<map>	Name of the IPsec map.	—	—
<priority>	Priority of the entry.	1-9998	—
dst-net	IP address and netmask for the destination network.	—	—
force-natt	Include this parameter to always enforce UDP 4500 for IKE and IPSEC. This option is disabled by default.	—	—
no	Negates a configured parameter.	—	—
local-fqdn <local_id_fqdn>	If the local switch has a dynamic IP address, you must specify the fully qualified domain name (FQDN) of the switch to configure it as a initiator of IKE aggressive-mode.		
peer-ip <ipaddr>	IP address of the peer gateway. <b>NOTE:</b> If you are configuring an IPsec map for a static-ip switch with a dynamically addressed remote peer, you must leave the peer gateway set to its default value of 0.0.0.0.	—	—
pre-connect	Enables or disables pre-connection.	enable/ disable	disabled
set ca-certificate <cacert-name>	User-defined name of a trusted CA certificate installed in the switch. Use the <b>show crypto-local pki TrustedCA</b> command to display the CA certificates that have been imported into the switch.	—	—

Parameter	Description	Range	Default
set pfs	If you enable Perfect Forward Secrecy (PFS) mode, new session keys are not derived from previously used session keys. Therefore, if a key is compromised, that compromised key will not affect any previous session keys. To enable this feature, specify one of the following Perfect Forward Secrecy modes: <ul style="list-style-type: none"> <li><b>group1:</b> 768-bit Diffie Hellman prime modulus group</li> <li><b>group2:</b> 1024-bit Diffie Hellman prime modulus group</li> </ul>	group1/ group2	disabled
set security-association lifetime seconds <seconds>	Configures the lifetime, in seconds, for the security association (SA).	300-86400	7200 seconds
set server-certificate <cert-name>	User-defined name of a server certificate installed in the switch. Use the <b>show crypto-local pki ServerCert</b> command to display the server certificates that have been imported into the switch.	—	—
set transform-set <name1>	Name of the transform set for this IPsec map. One transform set name is required, but you can specify up to four transform sets. Configure transform sets with the <b>crypto ipsec transform-set</b> command.	—	default-transform
src-net <ipaddr> <mask>	IP address and netmask for the source network.	—	—
trusted	Enables or disables a trusted tunnel.	enable/ disable	disabled
vlan <vlan>	VLAN ID. Enter 0 for the loopback.	1-4094	—

## Usage Guidelines

You can use switches instead of VPN concentrators to connect sites at different physical locations. For site-to-site VPN between two switches, you must purchase and install VPN Server licenses on both switches.

You can configure separate CA and server certificates for each site-to-site VPN. You can also configure the same CA and server certificates for site-to-site VPN and client VPN. Use the **show crypto-local ipsec-map** command to display the certificates associated with all configured site-to-site VPN maps; use the **tag <map>** option to display certificates associated with a specific site-to-site VPN map.

AOS-W supports site-to-site VPNs with two statically addressed switches, or with one static and one dynamically addressed switch. By default, site-to-site VPN uses IKE Main-mode with Pre-Shared-Keys to authenticate the IKE SA. This method uses the IP address of the peer, and therefore will not work for dynamically addressed peers.

To support site-site VPN with dynamically addressed devices, you must enable IKE Aggressive-Mode with Authentication based on a Pre-Shared-Key. The Alcatel-Lucent switch with a dynamic IP address must be configured to be the initiator of IKE Aggressive-mode for Site-Site VPN, while the switch with a static IP address must be configured as the responder of IKE Aggressive-mode.

## Example

The following commands configures site-to-site VPN between two switches:

```
(host) (config) #crypto-local ipsec-map sf-chi-vpn 100
src-net 101.1.1.0 255.255.255.0
dst-net 100.1.1.0 255.255.255.0
peer-ip 172.16.0.254
```

```
vlan 1
trusted

(host) (config) #crypto-local ipsec-map chi-sf-vpn 100
src-net 100.1.1.0 255.255.255.0
dst-net 101.1.1.0 255.255.255.0
peer-ip 172.16.100.254
vlan 1
trusted
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	VPN and server license	Config mode on master switches

## crypto-local isakmp ca-certificate

```
crypto-local isakmp ca-certificate <cacert-name>
```

### Description

This command assigns the Certificate Authority (CA) certificate used to authenticate VPN clients.

### Syntax

Parameter	Description
ca-certificate	User-defined name of a trusted CA certificate installed in the switch. Use the <b>show crypto-local pki TrustedCA</b> command to display the CA certificates that have been imported into the switch.

### Usage Guidelines

You can assign multiple CA certificates. Use the **show crypto-local isakmp ca-certificate** command to view the CA certificates associated with VPN clients.

### Example

This command configures a CA certificate:

```
crypto-local isakmp ca-certificate TrustedCA1
```

### Command History

This command was introduced in AOS-W 3.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN server license is required	Config mode on master switches

## crypto-local isakmp dpd

```
crypto-local isakmp dpd idle-timeout <seconds> retry-timeout <seconds> retry-attempts <number>
```

### Description

This command configures IKE Dead Peer Detection (DPD) on the local switch.

### Syntax

Parameter	Description	Range	Default
idle-timeout	Idle timeout, in seconds.	10-3600	22 seconds
retry-timeout	Retry interval, in seconds.	2-60	2 seconds
retry-attempts	Number of retry attempts.	3-10	3

### Usage Guidelines

DPD is enabled by default on the switch for site-to-site VPN.

### Example

This command configures DPD parameters:

```
crypto-local isakmp dpd idle-timeout 60 retry-timeout 3 retry-attempts 5
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN and/or Remote AP license	Config mode on master and local switches

## crypto-local isakmp key

```
crypto-local isakmp key <key> {address <peer-ipaddr> netmask <mask>}|{fqdn <ike-id-fqdn>}|fqdn-any
```

### Description

This command configures the IKE preshared key on the local switch for site-to-site VPN.

### Syntax

Parameter	Description
key <key>	IKE preshared key value, between 6-64 characters.
address <peer-ipaddr>	IP address for the preshared key.
netmask <mask>	Netmask for the preshared key.
fqdn <ike-id-fqdn>	Configure the PSK for the specified FQDN
fqdn-any	Configure the PSK for any FQDN

### Usage Guidelines

This command configures the IKE preshared key.

### Example

The following command configures an IKE preshared key for site-to-site VPN:

```
crypto-local isakmp key R8nD0mK3y address 172.16.100.1 netmask 255.255.255.255
```

### Command History

Version	Modification
AOS-W 3.0	Command introduced.
AOS-W 3.4	The <b>fqdn</b> and <b>fqdn-any</b> parameters were introduced.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN and/or Remote AP license	Config mode on master and local switches

## crypto-local isakmp permit-invalid-cert

```
crypto-local isakmp permit-invalid-cert
```

### Description

This command allows invalid or expired certificates to be used for site-to-site VPN.

### Syntax

No parameters.

### Usage Guidelines

This command allows invalid or expired certificates to be used for site-to-site VPN.

### Command History

This command was introduced in AOS-W 3.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN and/or Remote AP license	Config mode on master and local switches

## crypto-local isakmp server-certificate

```
crypto-local isakmp server-certificate <cert-name>
```

### Description

This command assigns the server certificate used to authenticate the switch for VPN clients.

### Syntax

Parameter	Description
server-certifi cate	User-defined name of a server certificate installed in the switch. Use the <b>show crypto-local pki ServerCert</b> command to display the server certificates that have been imported into the switch.

### Usage Guidelines

This certificate is only for VPN clients and not for site-to-site VPN clients. You can assign only one server certificate for use with VPN clients. Use the **show crypto-local isakmp server-certificate** command to view the server certificate associated with VPN clients. You must import and configure server certificates separately on master and local switches.

NOTE

There is a default server certificate installed in the switch, however this certificate does not guarantee security for production networks. Alcatel-Lucent strongly recommends that you replace the default certificate with a custom certificate issued for your site or domain by a trusted CA. You can use the WebUI to generate a Certificate Signing Request (CSR) to submit to a CA and then import the signed certificate received from the CA into the switch. For more information, see “Managing Certificates” in the AOS-W User Guide.

### Example

This command configures a server certificate:

```
crypto-local isakmp server-certificate ServerCert1
```

### Command History

This command was introduced in AOS-W 3.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN server license is required.	Config mode on master and local switches

## crypto-local isakmp xauth

```
crypto-local isakmp xauth
```

### Description

This command enables IKE XAuth for VPN clients.

### Syntax

No parameters.

### Usage Guidelines

The **no crypto-local isakmp xauth** command disables IKE XAuth for VPN clients. This command only applies to VPN clients that use certificates for IKE authentication. If you disable XAuth, then a VPN client that uses certificates will not be authenticated using username/password. You must disable XAuth for Cisco VPN clients using CAC Smart Cards.

### Example

This command disables IKE XAuth for Cisco VPN clients using CAC Smart Cards:

```
no crypto-local isakmp xauth
```

### Command History

This command was introduced in AOS-W 3.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN server license is required.	Config mode on master and local switches

## crypto-local pki

```
crypto-local pki {PublicCert|ServerCert|TrustedCA} <name> <filename>
```

### Description

This command is saved in the configuration file when you import a certificate.

### Syntax

Parameter	Description
PublicCert	Public key of a certificate. This allows an application to identify an exact certificate.
ServerCert	Server certificate. This certificate must contain both a public and a private key (the public and private keys must match). You can import a server certificate in either PKCS12 or x509 PEM format; the certificate is stored in x509 PEM DES encrypted format on the switch.
TrustedCA	Trusted CA certificate. This can be either a root CA or intermediate CA. Alcatel-Lucent encourages (but does not require) an intermediate CA's signing CA to be the switch itself.
<name>	Name of the certificate.
<filename>	Internal directory structure in the switch in which the imported certificate is stored.

### Usage Guidelines

This command in the configuration file verifies the presence of the certificate in the switch's internal directory structure.

### Command History

This command was introduced in AOS-W 3.1.

### Command Information

Platforms	Licensing	Command Mode
All platforms	VPN server license is required.	This command appears in the configuration file after you import a certificate

## database synchronize

```
database synchronize {[period <minutes>][rf-plan-data]}
```

### Description

This command manually synchronizes the database between a pair of redundant master switches and includes RF Plan data when synchronizing with standby.

### Syntax

Parameter	Description
period	Configures the interval for automatic database synchronization.
<minutes>	Interval in minutes. Range is 1 — 25200 minutes.
rf-plan-data	Includes the RF Plan data when synchronizing with standby mode.

### Usage Guidelines

This command takes effect immediately. If a peer is not configured, the switch displays an error message.

Use the **database synchronize period** command in config mode to configure the interval for automatic database synchronization. Use the **database synchronize rf-plan-data** command to include RF plan data when synchronizing in standby mode.

### Example

The following commands cause the database on the active master switch to synchronize with the standby in 25 minute intervals. The synchronization includes RF plan data.

```
(host) (config) #database synchronize period 25
(host) (config) #database synchronize rf-plan-data
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes on master switches

## delete

```
delete {filename <filename>|ssh-host-addr <ipaddr>|ssh-known-hosts}
```

### Description

This command deletes a file or RSA signature entry from flash.

### Syntax

Parameter	Description
filename	Name of the file to be deleted.
ssh-host-addr	Deletes the entry stored in flash for the RSA host signature created when you run the <b>copy scp</b> command.
ssh-known -hosts	Deletes all entries stored in flash for the RSA host signatures created when you run the <b>copy scp</b> command.

### Usage Guidelines

To prevent running out of flash file space, you should delete files that you no longer need.

The **copy scp** command creates RSA signatures whenever it connects to a new host. These host signatures are stored in the flash file system.

### Example

The following command deletes a file:

```
(host) #delete filename december-config-backup.cfg
```

The following command deletes an RSA signature entry from flash:

```
(host) #delete ssh-host-addr 10.100.102.101
```

The following command deletes all RSA signature entries from flash:

```
(host) #delete ssh-known-hosts
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## destination

```
destination <STRING> <A.B.C.D> [invert]
```

### Description

This command configures the destination name and address.

### Syntax

Parameter	Description	Range
STRING	Destination name.	Alphanumeric
A.B.C.D	Destination IP address or subnet.	—
invert	Specifies all destinations except this one.	—

### Usage Guidelines

You can configure the name and IP address of the destination. You can optionally configure the subnet, or invert the selection.

### Example

The following example configures a destination called “Home” with an IP address of 10.10.10.10.

```
(host) (config) #destination Home 10.10.10.10
```

### Command History

Release	Modification
AOS-W 1.0	Command introduced
AOS-W 3.0	Replaced with <b>netdestination</b> command.

### Command Information

Availability	License	Command Mode
Can be used only on the master switch.	Requires Policy Enforcement Firewall license	Config mode on master switches

# dir

dir

## Description

This command displays a list of files stored in the flash file system.

## Syntax

No parameters.

## Usage Guidelines

Use this command to view the system files associated with the switch.

Output from this command includes the following:

- The first column contains ten place holders that display the file permissions.
  - First place holder: Displays `-` for a file or `d` for directory.
  - Next three place holders: Display file owner permissions: `r` for read access, `w` for write access permissions, `x` for executable.
  - Following three place holders: Display member permissions: `r` for read access or `x` for executable.
  - Last three place holders: Display non-member permissions: `r` for read access or `x` for executable.
- The second column displays the number of links the file has to other files or directories.
- The third column displays the file owner.
- The fourth column displays group/member information.
- The remaining columns display the file size, date and time the file was either created or last modified, and the file name.

## Example

The following command displays the files currently residing on the system flash:

```
(host) #dir
```

The following is sample output from this command:

```
-rw-r--r--    1 root    root          9338 Nov 20 10:33 class_ap.csv
-rw-r--r--    1 root    root          1457 Nov 20 10:33 class_sta.csv
-rw-r--r--    1 root    root        16182 Nov 14 09:39 config-backup.cfg
-rw-r--r--    1 root    root        14174 Nov  9  2005 default-backup-11-8-05.cfg
-rw-r--r--    1 root    root        16283 Nov  9 12:25 default.cfg
-rw-r--r--    1 root    root       22927 Oct 25 12:21 default.cfg.2006-10-25_20-21-38
-rw-r--r--    2 root    root       19869 Nov  9 12:20 default.cfg.2006-11-09_12-20-22
```

## Command History

Introduced in AOS-W 1.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable and Config modes on local or master switches

## dynamic-ip

dynamic-ip restart

### Description

This command restarts the PPPoE or DHCP process.

### Syntax

No parameters.

### Usage Guidelines

This command can be used to renegotiate DHCP or PPPoE parameters. This can cause new addresses to be assigned on a VLAN where the DHCP or PPPoE client is configured.

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches

# enable

enable

## Description

This user mode command switches the switch into enable mode.

## Usage Guidelines

To enter enable mode, you are prompted for the password configured during the switch's initial setup. Passwords display as asterisks (\*) when you enter them. To change the password, use the config mode <z\_blue>"enable secret" command. If you lose or forget the enable mode password, resetting the default admin user password also resets the enable mode password to "enable". See the *AOS-W User Guide* for more information about resetting the admin and enable mode passwords.

When you are in enable mode, the CLI prompt ends with the hash (#) character.

## Example

The following example allows you to enter enable mode on the switch.

```
(host) >enable
Password: *****
(host) #
```

## Command History

Command introduced in AOS-W 1.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in base operating system	User mode on master or local switches

## enable secret

enable secret

### Description

This config mode command allows you to change the password for enable mode.

### Usage Guidelines

Use this command to change the password for enable mode. To reset the password to the factory default of “enable”, use the `no enable` command.

---

The password must not contain the space and ‘?’ special characters.

---

### Example

The following example allows you to change the password for enable mode.

```
(host) #configure terminal
Enter Configuration commands, one per line. End with CNTL/Z

(host) (config) #enable secret
Password:*****
Re-Type password: *****
(host) (config) #
```

### Command History

Version	Modification
AOS-W1.0	Command introduced
AOS-W 3.3.2	Updated with restriction of the secret phase

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master or local switches

## encrypt

```
encrypt {disable|enable}
```

### Description

This command allows passwords and keys to be displayed in plain text or encrypted.

### Syntax

Parameter	Description	Default
disable	Passwords and keys are displayed in plain text	—
enable	Passwords and keys are displayed encrypted	enabled

### Usage Guidelines

Certain commands, such as `show crypto isakmp key`, display configured key information. Use the `encrypt` command to display the key information in plain text or encrypted.

### Example

The following command allows passwords and keys to be displayed in plain text:

```
(host) #encrypt disable
```

### Command History

Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master or local switches

## esi group

```
esi group <name>
esi
  [no] |
  [ping <attributes>] |
  [server <server>]
```

### Description

This command configures an ESI group.

### Syntax

Parameter	Description
no	Negates any configured parameter.
ping	Specify the name of a set of ping checking attributes defined via the command <code>esi ping</code> . Only one set is allowed.
server	Specify the name of a server to be added or removed from the ESI group. You define ESI servers via the command <code>esi server</code> .

### Usage Guidelines

Use the `show esi group` command to show ESI group information.

### Example

The following command sets up the ESI group named “fortinet.”

```
(host) (config) #esi group fortinet
  ping default
  server forti_1
```

### Command History

Introduced in AOS-W 2.5

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master or local switches

## esi parser domain

```
esi parser domain <name>
  [no] |
  [peer <peer-ip>] |
  [server <ipaddr>]
```

### Description

This command configures an ESI syslog parser domain.

### Syntax

Parameter	Description
no	Negates any configured parameter
peer	(Optional.) Specify the IP address of an another switch in this domain. These switches are notified when the user cannot be found locally. This command is needed only when multiple switches share a single ESI server
server	Specify the IP address of the ESI server to which the switch listens.

### Usage Guidelines

The ESI parser is a generic syslog parser on the switch that accepts syslog messages from external third-party appliances such as anti-virus gateways, content filters, and intrusion detection systems. It processes syslog messages according to user-defined rules and takes configurable actions on the corresponding system users.

ESI servers (see [“esi server” on page 163](#)) are configured into domains to which ESI syslog parser rules (see [“esi parser rule” on page 157](#)) are applied.

Use the `show esi parser domains` command to show ESI parser domain information.

### Example

The following commands configure a virus syslog parser domain named “fortinet” which contains the ESI server “forti\_1” with the trusted IP address configured using the command [“esi server” on page 163](#).

```
(host) (config) #esi parser domain fortinet
server 10.168.172.3
```

### Command History

Introduced in AOS-W 3.1.

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master or local switches

## esi parser rule

```
esi parser rule <rule_name>
  [condition <expression>] |
  [domain <name>] |
  [enable]
  [match {ipaddr <expression> | mac <expression> | user <expression> }] |
  [no] |
  [position <position>] |
  [set {blacklist | role <role>} |
  [test {msg <msg> | file <filename>}]
```

### Description

This command creates or changes an ESI syslog parser rule.

### Syntax

Parameter	Description	Range	Default
condition	Specifies the REGEX (regular expression) pattern that uniquely identifies the syslog.	—	—
domain	(Optional.) Specify the ESI syslog parser domain to which this rule applies. If not specified, the rule matches with all configured ESI servers.	—	—
enables	Enables this rule. <b>Note:</b> The condition, user match, and set action parameters must be configured before the rule can be enabled.	—	Not enabled
match	Specifies the user identifier to match, where ipaddr, mac, and user take a REGEX pattern that uniquely identifies the user.	—	—
no	Negates any configured parameter.	—	—
position	Specifies the rule's priority position.	1–32; 1 highest	—
set	Specifies the action to take: blacklist the user or change the user role. <b>Note:</b> The role entity should be configured before it is accepted by the ESI rule.	—	—
test	Test the regular expression output configured in the esi parser rules command. You can test the expressions against a specified syslog message, or test the expression against a sequence of syslog messages contained in a file.	—	—

### Usage Guidelines

The user creates an ESI rule by using characters and special operators to specify a pattern that uniquely identifies a syslog message. This “condition” defines the type of message and the ESI domain to which this message pertains. The rule contains three major fields:

- Condition: The pattern that uniquely identifies the syslog message type.
- User: The username identifier. It can be in the form of a name, MAC address, or IP address.
- Action: The action to take when a rule match occurs.

Once a condition match occurs, no further rule-matching will be made. For the matching rule, only one action can be defined.

For more details on the character-matching operators, repetition operators, and expression anchors used to define the search or match target, see the External Services Interface chapter in the *AOS-W User Guide*.

Use the `show esi parser rules` command to show ESI parser rule information. Use the `show esi parser stats` command to show ESI parser rule statistical information

## Examples

The following command sets up the Fortigate virus rule named “forti\_rule.” This rule parses the virus detection syslog scanning for a condition match on the log\_id value (log\_id=) and a match on the IP address (src=).

```
(host) (config) #esi parser rule forti_rule
  condition "log_id=[0-9]{10}[ ]"
  match ipaddr "src=(.*)" [ ]"
  set blacklist
  domain fortinet
  enable
```

In this example, the corresponding ESI expression is:

```
< Sep 26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4 >
```

The following example of the test command tests a rule against a specified single syslog message.

```
test msg "26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4"

< 26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4 >
=====
Condition:      Matched with rule "forti_rule"
User:          ipaddr = 1.2.3.4
=====
```

The following example of the test command tests a rule against a file named test.log, which contains several syslog messages.

```
test file test.log

< Sep 26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4 >
=====
Condition:      Matched with rule "forti_rule"
User:          ipaddr = 1.2.3.4
=====

< Oct 18 10:43:40 cli[627]: PAPI_Send: To: 7f000001:8372 Type:0x4 Timed out. >
=====
Condition:      No matching rule condition found
=====

< Oct 18 10:05:32 mobileip[499]: <500300> <DEBUG> |mobileip| Station 00:40:96:a6:a1:
a4,
10.0.100.103: DHCP FSM received event: RECEIVE_BOOTP_REPLY current: PROXY_DHCP_NO_PROXY
Y, next: PROXY_DHCP_NO_PROXY >
=====
Condition:      No matching rule condition found
=====
```

## Command History

Introduced in AOS-W 3.1

## Command Information

Platform	License	Command Mode
Available on all platforms.	Requires the Policy Enforcement Firewall license	Config mode on master and local switches

## esi parser rule-test

```
esi parser rule-test
  [file <filename>] |
  [msg <msg>]
```

### Description

This command allows you to test all of the enabled parser rules.

### Syntax

Parameter	Description
file	Tests against a specified file containing more than one syslog message.
msg	Tests against a syslog message, where <msg> is the message text.

### Usage Guidelines

You can test the enabled parser rules against a syslog message input, or run the expression through a file system composed of syslog messages. The command shows the match result as well as the user name parsed for each message.

### Example

The following command tests against a specified single syslog message.

```
(host) (config) #esi parser rule-test msg
"26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4"

< 26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4 >
=====
Condition:      Matched with rule "forti_rule"
User:          ipaddr = 1.2.3.4
=====
```

The following command tests against a file named test.log, which contains several syslog messages.

```
esi parser rule-test file test.log

< Sep 26 18:30:02 log_id=0100030101 type=virus subtype=infected src=1.2.3.4 >
=====
Condition:      Matched with rule "forti_rule"
User:          ipaddr = 1.2.3.4
=====

< Oct 18 10:43:40 cli[627]: PAPI_Send: To: 7f000001:8372 Type:0x4 Timed out. >
=====
Condition:      No matching rule condition found
=====

< Oct 18 10:05:32 mobileip[499]: <500300> <DEBUG> |mobileip| Station 00:40:96:a6:a1:
a4,
10.0.100.103: DHCP FSM received event: RECEIVE_BOOTP_REPLY current: PROXY_DHCP_NO_PROX
Y, next: PROXY_DHCP_NO_PROXY >
=====
Condition:      No matching rule condition found
=====
```

## Command History

Introduced in AOS-W 3.1

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master and local switches

## esi ping

```
esi ping <ping-name>
  [frequency <seconds>] |
  [no] |
  [retry-count <count>] |
  [timeout <seconds>] |
```

### Description

This command specifies the ESI ping health check configuration.

### Syntax

Parameter	Description	Range	Default
frequency	Specifies the ping frequency in seconds.	1-65536	
no	Negates any configured parameter	—	—
retry-count	Specifies the ping retry count	1-65536	2
timeout	Specifies the ping timeout in seconds.	1-65536	2

### Usage Guidelines

Use the `show esi ping` command to show ESI ping information.

### Example

The following command specifies the ping health check attributes.

```
(host) (config) #esi ping default
  frequency 5
  retry-count 2
  timeout 2
```

### Command History

Introduced in AOS-W 2.5

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master and local switches

## esi server

```
esi server <name>
  [dport <tcp-udp-port>] |
  [mode {bridge | nat | route}] |
  [no] |
  [trusted-ip-addr <ip-addr> [health-check]] |
  [trusted-port <slot/port>] |
  [untrusted-ip-port <ip-addr> [health-check]] |
  [untrusted-port <slot/port>]
```

### Description

This command configures an ESI server.

### Syntax

Parameter	Description
dport	Specifies the NAT destination TCP/UDP port.
mode	Specifies the ESI server mode of operation: bridge, nat, or route
no	Negates any configured parameter.
trusted-ip-addr	Specifies the server IP address on the trusted network. As an option, you can also enable a health check on the specified address
trusted-port	Specifies the port connected to the trusted side of the ESI server; slot/port format.
untrusted-ip-addr	Specifies the server IP address on the untrusted network. As an option, you can also enable a health check on the specified address
untrusted-port	Specifies the port connected to the untrusted side of the ESI server.

### Usage Guidelines

Use the `show esi server` command to show ESI server information.

### Example

The following command specifies the ESI server attributes.

```
(host) (config) #esi server forti_1
  mode route
  trusted-ip-addr 10.168.172.3
  untrusted-ip-addr 10.168.171.3
```

### Command History

Introduced in AOS-W 2.5.

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master and local switches

# exit

exit

## Description

This command exits the current CLI mode.

## Syntax

No parameters.

## Usage Guidelines

Upon entering this command in a configuration sub-mode, you are returned to the configuration mode. Upon entering this command in configuration mode, you are returned to the enable mode. Upon entering this command in enable mode, you are returned to the user mode. Upon entering this command in user mode, you are returned to the user login.

## Example

The following sequence of `exit` commands return the user from the interface configuration sub-mode to the user login:

```
(host) (config-if) #exit
(host) (config) #exit
(host) #exit
(host) >exit
User:
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Available in the following command modes: <ul style="list-style-type: none"><li>• User</li><li>• Enable</li><li>• Config</li><li>• Config sub-modes</li></ul>

## export

```
export gap-db <filename>
```

### Description

This command exports the global AP database to the specified file.

### Syntax

Parameter	Description
<filename>	Name of the file to which the global AP database is exported.

### Usage Guidelines

This command is intended for system troubleshooting. You should run this command only when directed to do so by an Alcatel-Lucent support representative.

The global AP database resides on a master switch and contains information about known APs on all switches in the system. You can view the contents of the global AP database with the **show ap database** command.

### Example

The following command exports the global AP database to a file:

```
(host) #export gap-db global-ap-db
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## firewall

firewall

```
{allow-tri-session |attack-rate {cp <rate>|ping <number>|session
<number>}|broadcast-filter-arp |cp | cp-bandwidth-contract|tcp-syn <number> |deny-
inter-user-bridging |disable-ftp-server |disable-ftp-server| disable-stateful-
h323|disable-stateful-sip |drop-ip-fragments
|enable-per-packet-logging |enforce-tcp-handshake |gre-call-id-processing
|local-valid-users|log-icmp-error|prohibit-arp-spoofing|prohibit-ip-spoofing
|prohibit-rst-replay
|session-idle-timeout <seconds> |session-mirror-destination {ip-address <ipaddr>
|port <slot>/<port>} |broadcast-filter-arp |voip-wmm-content-enforcement}
```

### Description

This command configures firewall options on the switch.

### Syntax

Parameter	Description	Range	Default
allow-tri-session	Allows three-way session when performing destination NAT. This option should be enabled when the switch is not the default gateway for wireless clients and the default gateway is behind the switch. This option is typically used for captive portal configuration.	—	disabled
attack-rate	Sets rates which, if exceeded, can indicate a denial of service attack.	—	—
cp	Rate of misbehaving user's inbound traffic, which if exceeded, can indicate a denial of service attack. Recommended value is 100.	1-255	100 frames per second
ping	Number of ICMP pings per second, which if exceeded, can indicate a denial of service attack. Recommended value is 4	1-255	—
session	Number of TCP or UDP connection requests per second, which if exceeded, can indicate a denial of service attack. Recommended value is 32.	1-255	—
broadcast-filter-arp	Reduces the number of broadcast packets sent to VoIP clients, thereby improving the battery life of voice handsets. You can enable this option for voice handsets in conjunction with increasing the DTIM interval on clients.		
cp	See <a href="#">firewall cp on page 170</a>		
cp-bandwidth-contract	See <a href="#">firewall cp-bandwidth-contract on page 172</a>		
tcp-syn	Number of TCP SYN messages per second, which if exceeded, can indicate a denial of service attack. Recommended value is 32.	1-255	—
deny-inter-user-bridging	Prevents the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic. This option can be used to prevent traffic, such as Appletalk or IPX, from being forwarded.	—	disabled

Parameter	Description	Range	Default
disable-ftp-server	Disables the FTP server on the switch. Enabling this option prevents FTP transfers. Enabling this option could cause APs to not boot up. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
disable-stateful-h323-processing	Disables stateful H.323 processing.	—	enabled
disable-stateful-sip	Disables monitoring of exchanges between a voice over IP or voice over WLAN device and a SIP server. This option should be enabled only when there is no VoIP or VoWLAN traffic on the network.	—	disabled
drop-ip-fragments	When enabled, all IP fragments are dropped. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
enable-per-packet-logging	Enables logging of every packet if logging is enabled for the corresponding session rule. Normally, one event is logged per session. If you enable this option, each packet in the session is logged. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative, as doing so may create unnecessary overhead on the switch.	—	disabled
enforce-tcp-handshake	Prevents data from passing between two clients until the three-way TCP handshake has been performed. This option should be disabled when you have mobile clients on the network as enabling this option will cause mobility to fail. You can enable this option if there are no mobile clients on the network.	—	disabled
gre-call-id-processing	Creates a unique state for each PPTP tunnel. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
local-valid-users	Adds only IP addresses, which belong to a local subnet, to the user-table.	—	disabled
log-icmp-error	Logs received ICMP errors. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
prohibit-arp-spoofing	Detects and prohibits arp spoofing. When this option is enabled, possible arp spoofing attacks are logged and an SNMP trap is sent.	—	disabled
prohibit-ip-spoofing	Detects IP spoofing (where an intruder sends messages using the IP address of a trusted client). When this option is enabled, IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.	—	disabled
prohibit-rst-replay	Closes a TCP connection in both directions if a TCP RST is received from either direction. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
session-idle-timeout	Time, in seconds, that a non-TCP session can be idle before it is removed from the session table. You should not modify this option unless instructed to do so by an Alcatel-Lucent representative.	16-259	15 seconds

Parameter	Description	Range	Default
<code>session-mirror-destination</code>	Destination to which mirrored packets are sent. This option is used only for troubleshooting or debugging. Packets can be mirrored in multiple ACLs, so only a single copy is mirrored if there is a match within more than one ACL. You can configure the following: Ethertype to be mirrored with the Ether type ACL mirror option. See <a href="#">ip access-list eth on page 217</a> . IP flows to be mirrored with the session ACL mirror option. See <a href="#">ip access-list session on page 223</a> . MAC flows to be mirrored with the MAC ACL mirror option. See <a href="#">ip access-list mac on page 221</a> . If you configure both an IP address and a port to receive mirrored packets, the IP address takes precedence.	—	—
<code>ip-address</code>	Configures the IP address of the mirrored destination. Packets are encapsulated in GRE and sent to the destination IP address.	—	—
<code>port</code>	Configures the port of the mirrored destination. Packets are forwarded to the destination port.	—	—
<code>&lt;slot&gt;</code>	<code>&lt;slot&gt;</code> is always 1 except for the OmniAccess 6000 switch, where the slots can be 0, 1, 2, or 3.	—	—
<code>&lt;port&gt;</code>	Number assigned to the network interface embedded in the switch or in the line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position.	—	—
<code>session-mirror-ipsec</code>	Configures session mirroring of all frames that are processed by IPsec. Frames are sent to IP address specified by the <code>session-mirror-destination</code> option. This option is used only for troubleshooting or debugging.	—	disabled
<code>session-voip-timeout</code>	Idle session timeout, in seconds, for sessions that are marked as voice sessions. If no voice packet exchange occurs over a voice session for the specified time, the voice session is removed.	16-300	300 seconds
<code>broadcast-filter-arp</code>	If enabled, all broadcast ARP requests are converted to unicast and sent directly to the client. You can check the status of this option using the <code>show ap active</code> and the <code>show datapath tunnel</code> command. If enabled, the output will display the letter a in the flags column.	—	disabled
<code>wmm-voip-content-enforcement</code>	If traffic to or from the user is inconsistent with the associated QoS policy for voice, the traffic is reclassified to best effort and data path counters incremented. This parameter requires the Voice Services Module license in the switch.	—	disabled

## Usage Guidelines

This command configures global firewall options on the switch.

## Example

The following command disallows forwarding of non-IP frames between users:

```
firewall deny-inter-user-bridging
```

## Related Commands

```
(host) (config) #show firewall
```

## History

Version	Modification
AOS-W 3.0	Introduced for the first time.
AOS-W 3.2	The <b>wmm-voip-content-enforcement</b> parameter was introduced.
AOS-W 3.3	The <b>session-mirror-destination</b> parameter was modified.
AOS-W 3.3.2	The <b>local-valid-users</b> parameter was added.
AOS-W 3.4	The <b>voip-proxy-arp</b> parameter was renamed to <b>broadcast-filter-arp</b> and it does not require a Voice license. The <b>prohibit-arp-spoofing</b> parameter was added.

## Command Information

Platform	License	Command Mode
Available on all platforms	PEF license	Config mode on master switches

## firewall cp

```
firewall cp {deny|permit} proto <IP protocol number> ports <start port number>
<last port number> [bandwidth-contract <name>]
no ...
```

### Description

This command creates whitelist session ACLs. Whitelist ACLs consist of rules that explicitly permit or deny session traffic from being forwarded or not to the switch. This prohibits traffic from being automatically forwarded to the switch if it was not specifically denied in a blacklist. The maximum number of entries allowed in the whitelist is 64.

### Syntax

Parameter	Description	Range	Default
deny	Specifies the entry to reject on the session ACL whitelist	—	disabled
proto	Indicates the protocol.	—	—
IP protocol number	Specifies the IP protocol number that is rejected.	1-255	—
ports	Port that the session traffic is using	—	
start port	Specifies the start port	1-65535	
last port	Specifies the last port	1-65535	
permit	Specifies an entry that is allowed on the session ACL whitelist	—	
proto	Protocol that the session traffic is using	—	—
IP protocol number	Specifies the IP protocol number that is allowed	1-255	—
ports	Indicates the port on which session traffic is running	—	
start port	Specifies the starting port, in the port range, on which session traffic is running.	1-65535	
last port	Specifies the last port, in the port range, on which session traffic is running.	1-65535	
bandwidth-contract <name>	Specify the name of a bandwidth contract defined via the <a href="#">cp-bandwidth-contract</a> command.	—	

### Usage Guidelines

This command turns the session ACL from a blacklist to a whitelist. A rule must exist that explicitly permits the session before it is forwarded to the switch and the last rule in the list denies everything else.

### Example

The following command creates a whitelist ACL that allows traffic using protocol 6 on ports 5000 through 6000 to be forwarded to the switch.

```
(host) (config-fw-cp) #firewall cp permit proto 6 ports 5000 6000
```

The following command creates a a whitelist ACL entry that denies traffic using protocol 2 on port 5000 from being forwarded to the switch:

```
(host) (config-fw-cp) #firewall cp deny proto 2 ports 5000 5000
```

## Related Commands

Command	Description	Mode
<code>show firewall-cp</code>	Show Control Processor (CP) whitelist ACL info.	Enable or Config modes
<code>cp-bandwidth-contract</code>	This command configures a bandwidth contract traffic rate which can then be associated with a whitelist session ACL.	Enable or Config modes

## Command History

Introduced in AOS-W 3.4

## Command Information

Platform	License	Command Mode
Available on all platforms	PEF license	Config mode on master switches

## firewall cp-bandwidth-contract

```
firewall cp-bandwidth-contract {auth|route|sessmirr|trusted-mcast|trusted-ucast|untrusted-mcast|untrusted-ucast} <Rate>
```

### Description

This command configures bandwidth contract traffic rate limits to prevent denial of service attacks.

### Syntax

Parameter	Description	Range	Default
auth	Specifies the traffic rate limit that is forwarded to the authentication process.	1-200 Mbps	1
route	Specifies the traffic rate limit that needs ARP requests.	1-200 Mbps	1
sessmirr	Specifies the session mirrored traffic forwarded to the switch.	1-200 Mbps	1
trusted-mcast	Specifies the trusted multicast traffic rate limit.	1-200 Mbps	2
trusted-ucast	Specifies the trusted unicast traffic rate limit.	1-200 Mbps	80
untrusted-mcast	Specifies the untrusted multicast traffic rate limit.	1-200 Mbps	2
untrusted-ucast	Specifies the untrusted unicast traffic rate limit.	1-200 Mbps	10

### Usage Guidelines

This command configures firewall bandwidth contract options on the switch.

### Example

The following command disallows forwarding of non-IP frames between users:

```
(host) (config) #firewall deny-inter-user-bridging
```

### Related Commands

```
(host) (config) #show firewall
```

### Command History

Introduced in AOS-W 3.4

### Command Information

Platform	License	Command Mode
Available on all platforms	PEF license	Config mode on master switches

# gateway health-check disable

gateway health-check disable

## Description

Disable the gateway health check.

## Usage Guidelines

The gateway health check feature can only be enabled by Alcatel-Lucent Technical Support. This command disables the gateway health check, and should only be issued under the guidance of the support staff.

## Related Commands

Command	Description	Mode
<code>show gateway health-check</code>	Display the current status of the gateway health-check feature	This command is available in Config and Enable mode on master and local switches

```
(host) (config) #show gateway health-check
```

## History

Introduced in AOS-W 3.4

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master or local switches.

## guest-access-email

```
guest-access-email
  smtp-port
  smtp-server
  no...
```

### Description

This command configures the SMTP server which is used to send guest email. Guest email is generated when a guest user account is created or when the Guest Provisioning user sends guest user account email a later time.

### Syntax

Parameter	Description	Range	Default
smtp-port	Identifies the SMTP port through which the guest-access email is sent.	—	—
<Port number>	The SMTP port number.	1–65535	25
smtp-server	The SMTP server to which the switch sends the guest-access email.	—	—
<IP-Address>	The SMTP server's IP address.	—	—
no	Deletes the command configuration	—	—

### Usage Guidelines

As part of the guest provisioning feature, the **guest-access-email** command allows you to set up the SMTP port and server that process guest provisioning email. This email process sends email to either the guest or the sponsor whenever a guest user account is created or when the Guest Provisioning user manually sends email from the Guest Provisioning page.

### Example

The following command creates a guest-access email profile and sends guest user email through SMTP server IP address 1.1.1.1 on port 25.

```
(host) (config) #guest-access-email
(host) (Guest-access Email Profile) #
(host) (Guest-access Email Profile) #smtp-port 25
(host) (Guest-access Email Profile) #smtp-server 1.1.1.1
```

### Related Commands

```
(host) #show guest-access-email
(host) #local-userdb-guest add
(host) #local-userdb-guest modify
(host) #show local-userdb-guest
```

### Command History

Version	Modification
AOS-W 3.4	Introduced for the first time.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master switches.

# halt

halt

## Description

This command halts all processes on the switch.

## Syntax

No parameters.

## Usage Guidelines

This command gracefully stops all processes on the switch. You should issue this command before rebooting or shutting down to avoid interrupting processes.

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Enable mode on master and local switches.

## help

help

### Description

This command displays help for the CLI.

### Syntax

No parameters.

### Usage Guidelines

This command displays keyboard editing commands that allow you to make corrections or changes to the a command without retyping.

You can also enter the question mark (?) to get various types of command help:

- When typed at the beginning of a line, the question mark lists all commands available in the current mode.
- When typed at the end of a command or abbreviation, the question mark lists possible commands that match.
- When typed in place of a parameter, the question mark lists available options.

### Example

The following command displays help:

```
(host) #help
```

### Command History

Available in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Available in the following command modes: <ul style="list-style-type: none"><li>• User</li><li>• Enable</li><li>• Config</li></ul>

# hostname

hostname <hostname>

## Description

This command changes the hostname of the switch.

## Syntax

Parameter	Description	Range	Default
hostname	The hostname of the switch	1-63	See below

## Usage Guidelines

The hostname is used as the default prompt.

You can use any alphanumeric character, punctuation, or symbol character. To use spaces, plus symbols (+), question marks (?), or asterisks (\*), enclose the text in quotes.

The default names for the following switches are:

- OmniAccess 4302 WLAN Switch: Alcatel-Lucent200
- OmniAccess 4308T WLAN Switch: Alcatel-Lucent800
- OmniAccess 4324 WLAN Switch: Alcatel-Lucent2400
- OmniAccess 6000 WLAN Switch: Alcatel-Lucent6000
- OmniAccess 4504 Multi-Service Switch: Alcatel-Lucent3200
- OmniAccess 4604 MMulti-Service Switch: Alcatel-Lucent3400
- OmniAccess 4704 Multi-Service Switch: Alcatel-Lucent3600

## Example

The following example configures the switch hostname to “Switch 1”.

```
(host) (config)# hostname "Switch 1"
```

## Command History

Introduced in AOS-W 1.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master and local switches

## ids dos-profile

```
ids
ids dos-profile <profile>
  ap-flood-inc-time <seconds>
  ap-flood-quiet-time <seconds>
  ap-flood-threshold <number>
  assoc-rate-thresholds <number>
  auth-rate-thresholds <number>
  client-ht-40mhz-intol-quiet-time <seconds>
  clone <profile>
  deauth-rate-thresholds <number>
  detect-ap-flood
  detect-eap-rate-anomaly
  detect-ht-40mhz-intolerance
  detect-rate-anomalies
  disassoc-rate-thresholds <number>
  eap-rate-quiet-time <seconds>
  eap-rate-threshold <number>
  eap-rate-time-interval <seconds>
  no ...
  probe-request-rate-thresholds <number>
  probe-response-rate-thresholds <number>
  spoofed-deauth-blacklist
```

### Description

This command configures traffic anomalies for denial of service (DoS) attacks.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
ap-flood-inc-time	Time, in seconds, during which a configured number of fake AP beacons must be received to trigger an alarm.	any	3600 seconds
ap-flood-quiet-time	After an alarm has been triggered by a fake AP flood, the time, in seconds, that must elapse before an identical alarm may be triggered.	60-360000	900 seconds
ap-flood-threshold	Number of fake AP beacons that must be received within the flood increase time to trigger an alarm.	any	50
assoc-rate-thresholds	Rate threshold for associate request frames.		
auth-rate-thresholds	Rate threshold for authenticate frames.		
client-ht-40mhz-intol-quiet-time	Controls the quiet time (when to stop reporting intolerant STAs if they have not been detected), in seconds, for detection of 802.11n 40 MHz intolerance setting.	60-360000	900 seconds
clone	Name of an existing IDS DoS profile from which parameter values are copied.	—	—
deauth-rate-thresholds	Rate threshold for deauthenticate frames.		

Parameter	Description	Range	Default
detect-ap-flood	Enables detection of flooding with fake AP beacons to confuse legitimate users and to increase the amount of processing needed on client operating systems.	true false	false
detect-eap-rate-anomaly	Enables Extensible Authentication Protocol (EAP) handshake analysis to detect an abnormal number of authentication procedures on a channel and generate an alarm when this condition is detected.	true false	false
detect-ht-40mhz-intolerance	Enables or disables detection of 802.11n 40 MHz intolerance setting, which controls whether stations and APs advertising 40 MHz intolerance will be reported.	true false	true
detect-rate-anomalies	Enables detection of rate anomalies.	true false	false
disassoc-rate-thresholds	Rate threshold for disassociate frames.		
eap-rate-quiet-time	After an EAP rate anomaly alarm has been triggered, the time, in seconds, that must elapse before another identical alarm may be triggered.	60-360000	900 seconds
eap-rate-threshold	Number of EAP handshakes that must be received within the EAP rate time interval to trigger an alarm.	any	60
eap-rate-time-interval	Time, in seconds, during which the configured number of EAP handshakes must be received to trigger an alarm.	1-120	3 seconds
no	Negates any configured parameter.	—	—
probe-request-rate-thresholds	Rate threshold for probe request frames.		
probe-response-rate-thresholds	Rate threshold for probe response frames.		
spoofed-death-blacklist	Enables detection of a death attack initiated against a client associated to an Alcatel-Lucent AP. When such an attack is detected, the client is quarantined from the network to prevent a man-in-the-middle attack from being successful.	true false	false

## Usage Guidelines

DoS attacks are designed to prevent or inhibit legitimate clients from accessing the network. This includes blocking network access completely, degrading network service, and increasing processing load on clients and network equipment.

---

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices

---

There are four predefined DoS profiles, each of which provides different levels of detection and containment. The following describes the settings for each of the predefined profiles:

Parameter	ids-dos-disable	ids-dos-low-setting	ids-dos-medium-setting	ids-dos-high-setting
Spoofed Deauth Blacklist	false	false	false	false
Detect AP Flood Attack	false	false	false	false
AP Flood Threshold	50	50	50	50
AP Flood Increase Time	3 seconds	3 seconds	3 seconds	3 seconds
AP Flood Detection Quiet Time	900 seconds	900 seconds	900 seconds	900 seconds
Detect EAP Rate Anomaly	false	false	true	true
EAP Rate Threshold	60	60	30	60
EAP Rate Time Interval	3 seconds	3 seconds	3 seconds	3 seconds
EAP Rate Quiet Time	900 seconds	900 seconds	900 seconds	900 seconds
Detect Rate Anomalies	false	false	false	true
Detect 802.11n 40 MHz Intolerance Setting	false	true	true	true
Client 40 MHz Intolerance Detection Quiet Time	900 seconds	900 seconds	900 seconds	900 seconds
Rate Thresholds for Assoc Frames	default	default	default	default
Rate Thresholds for Disassoc Frames	default	default	default	default
Rate Thresholds for Deauth Frames	default	default	default	default
Rate Thresholds for Probe Request Frames	default	probe-request-response-thresholds	probe-request-response-thresholds	probe-request-response-thresholds
Rate Thresholds for Probe Response Frames	default	probe-request-response-thresholds	probe-request-response-thresholds	probe-request-response-thresholds
Rate Thresholds for Auth Frames	default	default	default	default

## Example

The following command enables detections in the DoS profile:

```
(host) (config) #ids dos-profile dos1
detect-ap-flood
detect-eap-rate-anomalies
detect-rate-anomalies
spoofed-deauth-blacklist
```

## Command History

Release	Modification
AOS-W 3.0	Command Introduced.
AOS-W 3.3	Updated with support for high-throughput IEEE 902.11n draft standard.
AOS-W 3.4	detect-disconnect-sta and disconnect-sta-quiet-time parameters deprecated.

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches

## ids general-profile

```
ids general-profile <name>
  ap-inactivity-timeout <seconds>
  clone <profile>
  min-pot-ap-beacon-rate <percent>
  min-pot-ap-monitor-time <seconds>
  no ...
  signature-quiet-time <seconds>
  sta-inactivity-timeout <seconds>
  stats-update-interval <seconds>
  wired-containment
  wireless-containment
  wireless-containment-debug
```

### Description

This command configures AP attributes.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
ap-inactivity-timeout	Time, in seconds, after which an AP is aged out.	5-36000	5 seconds
clone	Name of an existing IDS general profile from which parameter values are copied.	—	—
min-pot-ap-beacon-rate	Minimum beacon rate acceptable from a potential AP, in percentage of the advertised beacon interval.	0-100	25%
min-pot-ap-monitor-time	Minimum time, in seconds, a potential AP has to be up before it is classified as a real AP.	any	2 seconds
no	Negates any configured parameter.	—	—
signature-quiet-time	After a signature match is detected, the time to wait, in seconds, to resume checking.	60-360000	900 seconds
sta-inactivity-timeout	Time, in seconds, after which a station is aged out.	30-360000	60 seconds
stats-update-interval	Interval, in seconds, for the AP to update the switch with statistics. This setting takes effect only if the Alcatel-Lucent Mobility Manager is configured. Otherwise, statistics update to the switch is disabled.	60-360000	60 seconds
wired-containment	Enable containment from the wired side.	—	false
wireless-containment	Enable containment from the wireless side.	—	false
wireless-containment-debug	Enable debugging of containment from the wireless side.	—	false

### Usage Guidelines

This command configures general IDS attributes. There are two predefined general IDS profiles, each of which provides different levels of containment. The following describes the settings for each of the predefined profiles:

Parameter	ids-general-disabled	ids-general-high-setting
Stats Update Interval	60 seconds	60 seconds
AP Inactivity Timeout	5 seconds	5 seconds
STA Inactivity Timeout	60 seconds	60 seconds
Min Potential AP Beacon Rate	25%	25%
Min Potential AP Monitor Time	2 seconds	2 seconds
Signature Quiet Time	900 seconds	900 seconds
Wireless Containment	false	true
Debug Wireless Containment	false	false
Wired Containment	false	true

## Example

The following command enables containments in the general IDS profile:

```
(host) (config) #ids general-profile general1
    wired-containment
    wireless-containment
    wireless-containment-debug
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Most parameters of this command are available in the base operating system. However, the <b>signature-quiet-time parameter</b> requires the Wireless Intrusion Protection license.	Config mode on master switches

## ids impersonation-profile

```
ids impersonation-profile <name>
  beacon-diff-threshold <percent>
  beacon-inc-wait-time <seconds>
  clone <profile>
  detect-ap-impersonation
  no ...
  protect-ap-impersonation
```

### Description

This command configures anomalies for impersonation attacks.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
beacon-diff-threshold	Percentage increase in beacon rates that triggers an AP impersonation event.	0-100	50%
beacon-inc-wait-time	Time, in seconds, after the beacon difference threshold is crossed before an AP impersonation event is generated.	any	3 seconds
clone	Name of an existing IDS impersonation profile from which parameter values are copied.	—	—
detect-ap-impersonation	Enables detection of AP impersonation. In AP impersonation attacks, the attacker sets up an AP that assumes the BSSID and ESSID of a valid AP. AP impersonation attacks can be done for man-in-the-middle attacks, a rogue AP attempting to bypass detection, or a honeypot attack.	—	true
no	Negates any configured parameter.	—	—
protect-ap-impersonation	When AP impersonation is detected, both the legitimate and impersonating AP are disabled using a denial of service attack.	—	false

### Usage Guidelines

A successful man-in-the-middle attack will insert an attacker into the data path between the client and the AP. In such a position, the attacker can delete, add, or modify data, provided he has access to the encryption keys. Such an attack also enables other attacks that can learn a client’s authentication credentials. Man-in-the-middle attacks often rely on a number of different vulnerabilities.

There are two predefined IDS impersonation profiles, each of which provides different levels of detection. The following describes the settings for each of the predefined profiles:

Parameter	ids-impersonation-disabled	ids-impersonation-high-setting
Detect AP Impersonation	false	true
Protect from AP Impersonation	false	true
Beacon Diff Threshold	50%	50%
Beacon Increase Wait Time	3 seconds	3 seconds

## Example

The following command enables detections in the impersonation profile:

```
ids impersonation-profile mitml
  detect-ap-impersonation
```

## Command History0

Version	Modification
AOS-W 3.0	Command Introduced
AOS-W 3.4	detect-sequence-anomaly , sequence-diff, sequence-quiet-time, sequence-time-tolerance parameters deprecated.

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches

## ids profile

```
ids profile <name>
  clone <profile>
  dos-profile <profile>
  general-profile <profile>
  impersonation-profile <profile>
  no ...
  signature-matching-profile <profile>
  unauthorized-device-profile <profile>
```

### Description

This command defines a set of IDS profiles.

### Syntax

Parameter	Description	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	“default”
clone	Name of an existing IDS profile from which parameter values are copied.	—
dos-profile	Name of a IDS denial of service profile to be applied to the AP group/name. See <a href="#">ids dos-profile on page 179</a> .	“default”
general-profile	Name of an IDS general profile to be applied to the AP group/name. See <a href="#">ids general-profile on page 183</a> .	“default”
impersonation-profile	Name of an IDS impersonation profile to be applied to the AP group/name. See <a href="#">ids impersonation-profile on page 185</a> .	“default”
no	Negates any configured parameter.	—
signature-matching-profile	Name of an IDS signature matching profile to be applied to the AP group/name. See <a href="#">ids signature-matching-profile on page 191</a>	“default”
unauthorized-device-profile	Name of an IDS unauthorized device profile to be applied to the AP group/name. See <a href="#">ids unauthorized-device-profile on page 195</a> .	“default”

### Usage Guidelines

This command defines a set of IDS profiles that you can then apply to an AP group (with the **ap-group** command) or to a specific AP (with the **ap-name** command).

There are four predefined IDS profiles, each of which defines different sets of IDS profile. The following describes the settings for each of the predefined profiles:

Parameter	ids-disabled	ids-low-setting	ids-medium-setting	ids-high-setting
IDS General profile	ids-general-disabled	default	default	ids-general-high-setting
IDS Signature Matching profile	default	factory-default-signatures	factory-default-signatures	factory-default-signatures
IDS DoS profile	ids-dos-disabled	ids-dos-low-setting	ids-dos-medium-setting	ids-dos-high-setting

Parameter	ids-disabled	ids-low-setting	ids-medium-setting	ids-high-setting
IDS Impersonation profile	ids-impersonation-disabled	default	default	ids-impersonation-high-setting
IDS Unauthorized Device profile	ids-unauthorized-device-disabled	default	ids-unauthorized-device-medium-setting	ids-unauthorized-device-high-setting

## Example

The following command defines a set of IDS profiles:

```
(host) (config) #ids profile ids1
dos-profile dos1
general-profile general1
impersonation-profile mitm1
signature-matching-profile sig1
unauthorized-device-profile unauth1
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches.

## ids rate-thresholds-profile

```
ids rate-thresholds-profile <name>
  channel-inc-time <seconds>
  channel-quiet-time <seconds>
  clone <profile>
  no ...
  node-quiet-time <seconds>
  node-threshold <number>
  node-time-interval <seconds>
```

### Description

This command configures thresholds that are assigned to the different frame types for rate anomaly checking.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
channel-inc-time	Time, in seconds, in which the threshold must be exceeded in order to trigger an alarm.	0 - 360000 seconds	15 seconds
channel-quiet-time	After a channel rate anomaly alarm has been triggered, the time that must elapse before another identical alarm may be triggered. This option prevents excessive messages in the log file.	60-360000	900 seconds
channel-threshold	Number of a specific type of frame that must be exceeded within a specific interval in an entire channel to trigger an alarm.	any	300
clone	Name of an existing IDS rate thresholds profile from which parameter values are copied.	—	—
no	Negates any configured parameter.	—	—
node-quiet-time	After a node rate anomaly alarm has been triggered, the time, in seconds, that must elapse before another identical alarm may be triggered. This option prevents excessive messages in the log file.	60-360000	900 seconds
node-threshold	Number of a specific type of frame that must be exceeded within a specific interval for a particular client MAC address to trigger an alarm.	0 -100000 frames	200
node-time-interval	Time, in seconds, in which the threshold must be exceeded in order to trigger an alarm.	1-120	15 seconds

### Usage Guidelines

A profile of this type is attached to each of the following 802.11 frame types in the IDS denial of service profile:

- Association frames
- Disassociation frames
- Deauthentication frames
- Probe Request frames
- Probe Response frames

- Authentication frames

There is a predefined IDS rate thresholds profile. The following describes the settings for the predefined profile:

Parameter	probe-request-response-thresholds
Channel Increase Time	30 seconds
Channel Quiet Time	900 seconds
Channel Threshold	350
Node Time Interval	10 seconds
Node Quiet Time	900 seconds
Node Threshold	250 seconds

## Example

The following command configures frame thresholds:

```
(host) (config) #ids rate-thresholds-profile ratel
    channel-threshold 250
    node-threshold 150
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches

## ids signature-matching-profile

```
ids signature-matching-profile <name>
  clone <profile>
  no ...
  signature <profile>
```

### Description

This command contains defined signature profiles.

### Syntax

Parameter	Description	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	“default”
clone	Name of an existing IDS signature matching profile from which parameter values are copied.	—
no	Negates any configured parameter.	—
signature	Name of a signature profile. See <z_blue>“ids signature-profile” on page 193.	—

### Usage Guidelines

You can include one or more predefined signature profiles or a user-defined signature profile in a signature matching profile. The following are predefined signature profiles that are included in the signature matching profile called “factory-default-signatures”:

Signature	Description
AirJack	Originally a suite of device drivers for 802.11(a/b/g) raw frame injection and reception. It was intended to be used as a development tool for all 802.11 applications that need to access the raw protocol, however one of the tools included allowed users to force off all users on an Access Point.
ASLEAP	A tool created for Linux systems that has been used to attack Cisco LEAP authentication protocol.
Deauth-Broadcast	A deauth broadcast attempts to disconnect all stations in range – rather than sending a spoofed deauth to a specific MAC address, this attack sends the frame to a broadcast address.
NetStumbler Generic	NetStumbler is a popular wardriving application used to locate 802.11 networks. When used with certain NICs (such as Orinoco), NetStumbler generates a characteristic frame that can be detected.
NetStumbler Version 3.3.0x	Version 3.3.0 of NetStumbler changed the characteristic frame slightly. This signature detects the updated frame.
Null-Probe-Response	An attack with the potential to crash or lock up the firmware of many 802.11 NICs. In this attack, a client probe-request frame will be answered by a probe response containing a null SSID. A number of popular NIC cards will lock up upon receiving such a probe response.

### Example

The following command configures a signature matching profile:

```
(host) (config) #ids signature-matching-profile sig1
  signature Null-Probe-Response
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches

## ids signature-profile

```
ids signature-profile <name>
  bssid <macaddr>
  clone <profile>
  dst-mac <macaddr>
  frame-type {assoc|auth|beacon|control|data|deauth|disassoc|mgmt|probe-request|
  probe-response} [ssid <ssid>] [ssid-length <bytes>]
  no ...
  payload <pattern> [offset <number>]
  seq-num <number>
  src-mac <macaddr>
```

### Description

This command configures signatures for wireless intrusion detection.

### Syntax

Parameter	Description	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	“default”
bssid	BSSID field in the 802.11 frame header.	—
clone	Name of an existing IDS signature profile from which parameter values are copied.	—
dst-mac	Destination MAC address in the 802.11 frame header.	—
frame-type	Type of 802.11 frame. For each type of frame, further parameters can be specified to filter and detect only the required frames.	—
assoc	Association frame type	
auth	Authentication frame type	
beacon	Beacon frame type	
control	All control frames	
data	All data frames	
deauth	Deauthentication frame type	
disassoc	Disassociation frame type	
mgmt	Management frame type	
probe-request	Probe request frame type	
probe-response	Probe response frame type	
ssid	For beacon, probe-request, and probe-response frame types, specify the SSID as either a string or hex pattern.	—
ssid-length	For beacon, probe-request, and probe-response frame types, specify the length, in bytes, of the SSID. Maximum length is 32 bytes.	—
no	Negates any configured parameter.	—

Parameter	Description	Default
payload	Pattern at a fixed offset in the payload of an 802.11 frame. Specify the pattern to be matched as a string or hex pattern. Maximum length is 32 bytes.	—
offset	When a payload pattern is configured, specify the offset in the payload where the pattern is expected to be found in the frame.	—
seq-num	Sequence number of the frame.	—
src-mac	Source MAC address in the 802.11 frame header.	—

## Usage Guidelines

The following describes the configuration for the predefined signature profiles:

Signature Profile	Parameter	Value
AirJack	frame-type	beacon ssid = AirJack
ASLEAP	frame-type	beacon ssid = asleep
Deauth-Broadcast	frame-type	deauth
	dst-mac	ff:ff:ff:ff:ff:ff
Netstumbler Generic	payload	offset=3 pattern=0x00601d
	payload	offset=6 pattern=0x0001
Netstumbler Version 3.3.0x	payload	offset=3 pattern=0x00601d
	payload	offset=12 pattern=0x000102
Null-Probe-Response	frame-type	probe-response ssid length = 0

## Example

The following command configures a signature profile:

```
(host) (config) #ids signature-profile mysig
    frame-type assoc
    src-mac 00:00:00:00:00:00
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Wireless Intrusion Protection license	Config mode on master switches

## ids unauthorized-device-profile

```
ids unauthorized-device-profile <name>
  adhoc-quiet-time <seconds>

### Description

This command configures detection of unauthorized devices, as well as rogue AP detection and containment.

### Syntax

Parameter	Description	Range	Default
<profile>	Name that identifies an instance of the profile. The name must be 1-63 characters.	—	“default”
adhoc-quiet-time	Time, in seconds, that must elapse after an adhoc network detection alarm has been triggered before another identical alarm may be triggered.	60-3600 00	900 seconds

Parameter	Description	Range	Default
allow-well-known-mac	<p>Allows devices with known MAC addresses to classify rogues APs. Depending on your network, configure one or more of the following options for classifying rogue APs:</p> <ul style="list-style-type: none"> <li>hsrp—Routers configured for HSRP, a Cisco-proprietary redundancy protocol, with the HSRP MAC OUI 00:00:0c.</li> <li>iana—Routers using the IANA MAC OUI 00:00:5e.</li> <li>local-mac—Devices with locally administered MAC addresses starting with 02.</li> <li>vmware—Devices with any of the following VMWare OUIs: 00:0c:29, 00:05:69, or 00:50:56</li> <li>vmware1—Devices with VMWare OUI 00:0c:29.</li> <li>vmware2—Devices with VMWare OUI 00:05:69.</li> <li>vmware3—Devices with VMWare OUI 00:50:56.</li> </ul> <p>If you modify an existing configuration, the new configuration overrides the original configuration. For example, if you configure <code>allow-well-known-mac hsrp</code> and then configure <code>allow-well-known-mac iana</code>, the original configuration is lost. To add more options to the original configuration, include all of the required options, for example: <code>allow-well-known-mac hsrp iana</code>.</p> <p>Use caution when configuring this command. If the neighboring network uses similar routers, those APs might be classified as rogues. If containment is enabled, clients attempting to associate to an AP classified as a rogue are disconnected through a denial of service attack.</p> <p>To clear the well known MACs in the system, use the following commands on all switches:</p> <pre>clear wms wired-mac</pre> <p>This clears all of the learned wired MAC information on the switch.</p> <pre>reload</pre> <p>This reboots the switch.</p>	—	—
cfg-valid-11a-channel	List of valid 802.11a channels that third-party APs are allowed to use.	34-165	N/A
cfg-valid-11g-channel	List of valid 802.11b/g channels that third-party APs are allowed to use.	1-14	N/A
classification	Enable/disable rogue AP classification. A rogue AP is one that is unauthorized and plugged into the wired side of the network. Any other AP seen in the RF environment that is not part of the valid enterprise network is considered to be interfering — it has the potential to cause RF interference but it is not connected to the wired network and thus does not represent a direct threat.	—	true
clone	Name of an existing IDS rate thresholds profile from which parameter values are copied.	—	—
detect-adhoc-network	Enable detection of adhoc networks.	—	true
detect-bad-wep	Enables detection of WEP initialization vectors that are known to be weak and/or repeating. A primary means of cracking WEP keys is to capture 802.11 frames over an extended period of time and search for implementations that are still used by many legacy devices.	—	false
detect-ht-greenfield	Enables or disables detection of high-throughput devices advertising greenfield preamble capability.	—	true
detect-invalid-mac-oui	Enables checking of the first three bytes of a MAC address, known as the organizationally unique identifier (OUI), assigned by the IEEE to known manufacturers. Often clients using a spoofed MAC address do not use a valid OUI and instead use a randomly generated MAC address. Enabling MAC OUI checking causes an alarm to be triggered if an unrecognized MAC address is in use.	—	false

Parameter	Description	Range	Default
detect-misconfigured-ap	Enables detection of misconfigured APs. An AP is classified as misconfigured if it is classified as valid and does not meet any of the following configurable parameters: - valid channels - encryption type - list of valid AP MAC OUIs - valid SSID list	—	false
detect-windows-bridge	Enables detection of Windows station bridging.	—	true
detect-wireless-bridge	Enables detection of wireless bridging.	—	true
mac-oui-quiet-time	Time, in seconds, that must elapse after an invalid MAC OUI alarm has been triggered before another identical alarm may be triggered.		900 seconds
no	Negates any configured parameter.	—	—
overlay-classification	This option is useful when Alcatel-Lucent APs are used for monitoring a non-Alcatel-Lucent wireless network, as it allows APs that are plugged into the wired side of the network to be classified as “suspected rogue” instead of “rogue”. Suspected rogue APs are not subject to the rogue containment settings; however, if configured, they are subject to the suspected rogue AP containment settings (see suspect-rogue-containment).	—	true
privacy	Enables encryption as a valid AP configuration.	—	false
protect-adhoc-network	Enables protection from adhoc networks. When adhoc networks are detected, they are disabled using a denial of service attack.	—	false
protect-high-throughput	Enables or disables protection of high-throughput (802.11n) devices.	—	false
protect-ht-40mhz	Enables or disables protection of high-throughput (802.11n) devices operating in 40 MHz mode.	—	false
protect-misconfigured-ap	Enables protection of misconfigured APs.	—	false
protect-ssid	Enables use of SSID by valid APs only.	—	false
protect-valid-sta	When enabled (true), does not allow valid stations to connect to a non-valid AP.	—	false
require-wpa	When enabled (true), any valid AP that is not using WPA encryption is flagged as misconfigured.	—	false
rogue-containment	Rogue APs can be detected (see classification) but are not automatically disabled. This option automatically shuts down rogue APs. When this option is enabled (true), clients attempting to associate to an AP classified as a rogue are disconnected through a denial of service attack.	—	false
suspect-rogue-conf-level	Confidence level of suspected Rogue AP to trigger containment. When an AP is classified as a suspected rogue AP, it is assigned a 50% confidence level. If multiple APs trigger the same events that classify the AP as a suspected rogue, the confidence level increases by 5% up to 95%. In combination with suspected rogue containment, this option configures the threshold by which containment should occur. Suspected rogue containment occurs only when the configured confidence level is met.	50-100	60%

Parameter	Description	Range	Default
suspect-rogue-containment	Suspected rogue APs are treated as interfering APs, thereby the switch attempts to reclassify them as rogue APs. Suspected rogue APs are not automatically contained. In combination with the configured confidence level (see suspect-rogue-conf-level), this option contains the suspected rogue APs.	—	false
valid-and-protected-ssid	List of valid and protected SSIDs.	—	—
valid-oui	List of valid MAC OUIs.	—	—
valid-wired-mac	List of MAC addresses of wired devices in the network, typically gateways or servers.	—	—
wireless-bridge-quiet-time	Time, in seconds, that must elapse after a wireless bridge alarm has been triggered before another identical alarm may be triggered.	60-3600 00	900 seconds

## Usage Guidelines

Unauthorized device detection includes the ability to detect and disable rogue APs and other devices that can potentially disrupt network operations.

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices.

There are three predefined unauthorized device profiles, each of which provides different levels of detection and containment. The following describes the settings for each of the predefined profiles:

Parameter	ids-unauthorized-device-disabled	ids-unauthorized-device-medium-setting	ids-unauthorized-high-setting
Detect adhoc networks	false	true	true
Protect from adhoc networks	false	false	true
Detect windows bridge	false	true	true
Detect wireless bridge	false	true	true
Detect devices with invalid MAC OUI	false	false	true
MAC OUI detection quiet time	900 seconds	900 seconds	900 seconds
Adhoc network detection quiet time	900 seconds	900 seconds	900 seconds
Wireless bridge detection quiet time	900 seconds	900 seconds	900 seconds
Rogue AP classification	false	true	true
Overlay rogue AP classification	true	true	true
Valid wired MACs	—	—	—
Rogue containment	false	false	true
Allow well known MAC	—	—	—
Suspected rogue containment	false	false	false

Parameter	ids-unauthorized-device-disabled	ids-unauthorized-device-medium-setting	ids-unauthorized-high-setting
Suspected rogue containment confidence level	60	60	60
Protect valid stations	false	false	true
Detect bad WEP	false	true	true
Detect misconfigured AP	false	true	true
Protect misconfigured AP	false	false	true
Protect SSID	false	false	true
Privacy	false	false	true
Require WPA	false	true	false
Valid 802.11g channel for policy enforcement	—	—	—
Valid 802.11a channel for policy enforcement	—	—	—
Valid MAC OUIs	—	—	—
Valid and protected SSIDs	—	—	—
Protect 802.11n High-throughput Devices	false	false	true
Protect 40 MHz 802.11n High-throughput Devices	false	false	true
Detect Active 802.11n Greenfield Mode	false	true	true

## Example

The following command copies the settings from the `ids-unauthorized-device-disabled` profile and then enables detection and protection from adhoc networks:

```
ids unauthorized-device-profile unauth1
  clone ids-unauthorized-device-disabled
  detect-adhoc-network
  protect-adhoc-network
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3	Update with support for the high-throughput IEEE 802.11n draft standard. Also, introduced <code>allow-well-known-mac</code> , <code>suspect-rogue-conf-level</code> , and <code>suspect-rogue-containment</code> parameters.

## interface fastethernet | gigabitethernet

```
interface
interface {fastethernet|gigabitethernet} <slot>/<port>
  description <string>
  duplex {auto|full|half}
  ip access-group <acl> {in|out|session {vlan <vlanId>}}
  no ...
  poe [cisco]
  port monitor {fastethernet|gigabitethernet} <slot>/<port>
  priority-map <name>
  shutdown
  spanning-tree [cost <value>] [port-priority <value>] [portfast]
  speed {10|100|auto}
  switchport {access vlan <vlan>|mode {access|trunk}|
  trunk {allowed vlan {<vlans>|add <vlans>|all|except <vlans>|remove <vlans>}}|
  native vlan <vlan>}}
  trusted {vlan <vlanID>}
  xsec {point-to-point <macaddr> <key> allowed vlan <vlans> [<mtu>]|vlan <vlan>}
```

### Description

This command configures a FastEthernet or GigabitEthernet interface on the switch.

### Syntax

Parameter	Description	Range	Default
<slot>	<slot> is always 1 except for the OmniAccess 6000 WLAN Switch, where the slots can be 0, 1, 2, or 3.	—	—
<port>	Number assigned to the network interface embedded in the switch, or for the OmniAccess 6000 WLAN Switch, in a line card or the OmniAccess Supervisor Card III. Port numbers start at 0 from the left-most position.	—	—
description	String that describes this interface.	—	—
duplex	Transmission mode on the interface: full- or half-duplex or auto to automatically adjust transmission.	auto/full/half	auto
ip access-group	Applies the specified access control list (ACL) to the interface. Use the <b>ip access-list</b> command to configure an ACL. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	—	—
in	Applies ACL to interface's inbound traffic.	—	—
out	Applies ACL to interface's outbound traffic.	—	—
session	Applies session ACL to interface and optionally to a selected VLAN associated with this port.	—	—
no	Negates any configured parameter.	—	—
poe	Enables Power-over-Ethernet (PoE) on the interface.	—	enabled
cisco	Enables Cisco-style PoE on the interface.	—	disabled
port monitor	Monitors another interface on the switch.	—	—

Parameter	Description	Range	Default
priority-map	Applies a priority map to the interface. Use the <b>priority-map</b> command to configure a priority map which allows you to map ToS and CoS values into high priority traffic queues.	—	—
shutdown	Causes a hard shutdown of the interface.	—	—
spanning-tree	Enables spanning tree.	—	enabled
cost	Administrative cost associated with the spanning tree.	1-65535	19 (Fast Ethernet) 4 (Gigabit Ethernet)
port-priority	Spanning tree priority of the interface. A lower setting brings the port closer to root port position (favorable for forwarding traffic) than does a higher setting. This is useful if ports may contend for root position if they are connected to an identical bridge.	0-255	128
portfast	Enables forwarding of traffic from the interface.	—	disabled
speed	Sets the interface speed: 10 Mbps, 100 Mbps, or auto configuration.	10 100 auto	auto
switchport	Sets switching mode parameters for the interface.	—	—
access vlan	Sets the interface as an access port for the specified VLAN. The interface carries traffic only for the specified VLAN.	—	1
mode	Sets the mode of the interface to access or trunk mode only.	access trunk	access
trunk	Sets the interface as a trunk port for the specified VLANs. A trunk port carries traffic for multiple VLANs using 802.1q tagging to mark frames for specific VLANs. You can include all VLANs configured on the switch, or add or remove specified VLANs. Specify <b>native</b> to identify the native VLAN for the trunk mode interface. Frames on the native VLAN are not 802.1q tagged.	—	—
trusted	Set this interface and associated VLANs to be trusted. Trusted ports and VLANs are typically connected to internal controlled networks, while untrusted ports connect to third-party APs, public areas, or other networks to which access controls should be applied. When Alcatel-Lucent APs are attached directly to the switch, set the port to be trusted.  You can set individual VLANs that are associated with this port to be untrusted by using the <b>no trusted vlan</b> command.	—	enabled
xsec	Enables and configures the Extreme Security (xSec) protocol. <b>NOTE:</b> You must purchase and install the xSec software module license in the switch.	—	—
point-to-point	MAC address of the switch that is the xSec tunnel termination point, and the 16-byte shared key used to authenticate the switches to each other. The key must be the same on both switches.	—	—
allowed vlan	VLANs that are allowed on the xSec tunnel.	—	—
mtu	(Optional) MTU size for the xSec tunnel.	—	—

Parameter	Description	Range	Default
vlan	xSec VLAN ID. For switch-to-switch communications, both switches must belong to the same VLAN.	1-4094	—

## Usage Guidelines

Use the **show port status** command to obtain information about the interfaces available on the switch.

## Example

The following commands configure an interface as a trunk port for a set of VLANs:

```
(host) (config) # interface fastethernet 1/2
(host) (config-range)# switchport mode trunk
(host) (config-range)# switchport trunk native vlan 10
(host) (config-range)# switchport trunk allowed vlan 1,10,100
```

The following commands configure trunk port 1/2 with test-acl session for VLAN 2.

```
(host) (config) # interface range fastethernet 1/2
(host) (config-range)# switchport mode trunk
(host) (config-range)# ip access-group
(host) (config-range) # ip access-group test session vlan 2
```

## Related Commands

```
(host) #show interface {fastethernet|gigabitethernet} <slot>/<port>
```

```
(host) #show datapath port vlan-table <slot>/<port>
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.4	The <b>trusted VLAN</b> and <b>ip access-group session vlan</b> parameters were introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command is available in the base operating system. The <b>ip access-group</b> parameter requires the <b>PEF</b> license. The <b>xsec</b> parameter requires the <b>xSec</b> license.	Config mode on master and local switches

## interface loopback

```
interface loopback
  ip address <ipaddr>
  no ...
```

### Description

This command configures the loopback address on the switch.

### Syntax

Parameter	Description
ip address	Host IP address in dotted-decimal format. This address should be routable from all external networks.
no	Negates any configured parameter.

### Usage Guidelines

If configured, the loopback address is used as the switch's IP address. If you do not configure a loopback address for the switch, the IP address assigned to VLAN 1 is used as the switch's IP address. After you configure or modify a loopback address, you need to reboot the switch.

### Example

The following command configures a loopback address:

```
(host) (config) #interface loopback
  ip address 10.2.22.220
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	This command is available in the base operating system	Config mode on master and local switches

## interface mgmt

```
interface mgmt
  dhcp
  ip address <ipaddr> <netmask>
  no ...
  shutdown
```

### Description

This command configures the out-of-band Ethernet management port on an OmniAccess 6000 WLAN Switch.

### Syntax

Parameter	Description
dhcp	Enables DHCP on the interface.
ip address	Configures an IP address and netmask on the interface.
no	Negates any configured parameter.
shutdown	Causes a hard shutdown of the interface.

### Usage Guidelines

This command applies to Alcatel-Lucent Supervisor Card (SC) and OmniAccess Supervisor Card III (OmniAccess Supervisor Card III).

Use the **show interface mgmt** command to view the current status of the management port.

### Example

The following command configures an IP address on the management interface:

```
(host) (config) #interface mgmt
  ip address 10.1.1.1 255.255.255.0
```

### Platform Availability

This command is only available on the OmniAccess 6000 WLAN Switch.

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 6000 WLAN Switches	Base operating system	Config mode on master and local switches

## interface port-channel

```
interface port-channel <id>
  add {fastethernet|gigabitethernet} <slot>/<port>
  del {fastethernet|gigabitethernet} <slot>/<port>
  ip access-group <acl> {in|out|session {vlan <vlanId>}}
  no ...
  shutdown
  spanning-tree [portfast]
  switchport {access vlan <vlan>|mode {access|trunk}}
  trunk {allowed vlan {<vlans>|add <vlans>|all|except <vlans>|remove <vlans>}
  native vlan <vlan>}
  trusted {vlan <vlanId>}
  xsec {point-to-point <macaddr> <key> allowed vlan <vlans> [<mtu>]|vlan
<vlan>}
```

### Description

This command configures an Ethernet port channel.

### Syntax

Parameter	Description	Range	Default
port-channel	ID number for this port channel.	0-7	—
add	Adds the specified FastEthernet or GigabitEthernet interface to the port channel. You cannot specify both FastEthernet and GigabitEthernet interfaces for the same port channel.	—	—
del	Deletes the specified Fastethernet or Gigabitethernet interface to the port channel.	—	—
ip access-group	Applies the specified access control list (ACL) to the interface. Use the <b>ip access-list</b> command to configure an ACL. <b>NOTE:</b> The Policy Enforcement Firewall license must be installed.	—	—
in	Applies ACL to interface's inbound traffic.	—	—
out	Applies ACL to interface's outbound traffic.	—	—
session	Applies session ACL to interface and optionally to a selected VLAN associated with this port.	—	—
no	Negates any configured parameter.	—	—
shutdown	Causes a hard shutdown of the interface.	—	—
spanning-tree	Enables spanning tree.	—	—
portfast	Enables forwarding of traffic from the interface.	—	—
switchport	Sets switching mode parameters for the interface.	—	—
access vlan	Sets the interface as an access port for the specified VLAN. The interface carries traffic only for the specified VLAN.	—	—
mode	Sets the mode of the interface to access or trunk mode only.	—	—
trunk	Sets the interface as a trunk port for the specified VLANs. A trunk port carries traffic for multiple VLANs using 802.1q tagging to mark frames for specific VLANs. You can include all VLANs configured on the switch, or add or remove specified VLANs.	—	—

Parameter	Description	Range	Default
native	Specifies the native VLAN for the trunk mode interface. Frames on the native VLAN are not 802.1q tagged.	—	—
trusted	Set this interface and associated VLANs to be trusted. Trusted ports and VLANs are typically connected to internal controlled networks, while untrusted ports connect to third-party APs, public areas, or other networks to which access controls should be applied. When Alcatel-Lucent APs are attached directly to the switch, set the port to be trusted. You can set individual VLANs that are associated with this port to be untrusted by using the <b>no trusted vlan</b> command.	—	disabled
xsec	Enables and configures the Extreme Security (xSec) protocol. <b>NOTE:</b> You must purchase and install the xSec software module license in the switch.	—	—
point-to-point	MAC address of the switch that is the xSec tunnel termination point, and the 16-byte shared key used to authenticate the switches to each other. The key must be the same on both switches.	—	—
allowed vlan	VLANs that are allowed on the xSec tunnel.	—	—
mtu	(Optional) MTU size for the xSec tunnel.	—	—
vlan	xSec VLAN ID. For switch-to-switch communications, both switches must belong to the same VLAN.	1-4094	—

## Usage Guidelines

A port channel allows you to aggregate ports on a switch. You can configure a maximum of 8 port channels per supported switch with a maximum of 8 interfaces per port channel. A port channel does not use the Link Aggregation Control Protocol (LACP), which is part of the IEEE 802.3ad specification.

Note the following when setting up a port channel between a switch and a Cisco switch (such as a Catalyst 6500 Series Switch):

- There must be no negotiation of the link parameters.
- The configuration on the Cisco switch must not include LACP.
- The port-channel mode on the Cisco switch must be “on”.

## Example

The following command configures a port channel:

```
(host) (config) #interface port channel 7
    add fastethernet 1/1
    add fastethernet 1/2
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.4	The <b>trusted VLAN</b> and <b>ip access-group session vlan</b> parameters were introduced.

## Command Information

Platforms	Licensing	Command Mode
OmniAccess 4324 and OmniAccess 6000 WLAN Switches, and OmniAccess 4504/4604/4704 Multi-Service Switch	This command is available in the base operating system. The ip <b>access-group</b> parameter requires the <b>PEF</b> license. The <b>xsec</b> parameter requires the <b>xSec</b> license.	Config mode on master and local switches

## interface range

```
interface range {fastethernet|gigabitethernet} <slot>/<port>-<port>
  duplex {auto|full|half}
  ip access-group <acl> {in|out|session {vlan <vlanId>}}
  no ...
  poe [cisco]
  shutdown
  spanning-tree [cost <value>] [port-priority <value>] [portfast]
  speed {10|100|auto}
  switchport {access vlan <vlan>|mode {access|trunk}|
  trunk {allowed vlan {<vlans>|add <vlans>|all|except <vlans>|remove
<vlans>}}|
  native vlan <vlan>}}
  trusted {vlan <vlanID>}
```

### Description

This command configures a range of FastEthernet or GigabitEthernet interfaces on the switch.

### Syntax

Parameter	Description	Range	Default
range	Range of Ethernet ports in the format <slot>/<port>-<port>.	—	—
duplex	Transmission mode on the interface: full- or half-duplex or auto to automatically adjust transmission.	auto/full/half	auto
ip access-group	Applies the specified access control list (ACL) to the interface. Use the ip access-list command to configure an ACL.	—	—
in	Applies ACL to interface's inbound traffic.	—	—
out	Applies ACL to interface's outbound traffic.	—	—
session	Applies session ACL to interface and optionally to a selected VLAN associated with this port.	—	—
no	Negates any configured parameter.	—	—
poe	Enables Power-over-Ethernet (PoE) on the interface.	—	—
cisco	Enables Cisco-style PoE on the interface.	—	—
shutdown	Causes a hard shutdown of the interface.	—	—
spanning-tree	Enables spanning tree.	—	—
cost	Administrative cost associated with the spanning tree.	1-65535	—
port-priority	Spanning tree priority of the interface. A lower setting brings the port closer to root port position (favorable for forwarding traffic) than does a higher setting. This is useful if ports may contend for root position if they are connected to an identical bridge.	0-255	—
portfast	Enables forwarding of traffic from the interface.	—	—
speed	Sets the interface speed: 10 Mbps, 100 Mbps, or auto configuration.	10 100 auto	auto
switchport	Sets switching mode parameters for the interface.	—	—

Parameter	Description	Range	Default
access vlan	Sets the interface as an access port for the specified VLAN. The interface carries traffic only for the specified VLAN.	—	—
mode	Sets the mode of the interface to access or trunk mode only.	—	—
trunk	Sets the interface as a trunk port for the specified VLANs. A trunk port carries traffic for multiple VLANs using 802.1q tagging to mark frames for specific VLANs. You can include all VLANs configured on the switch, or add or remove specified VLANs. Specify <b>native</b> to identify the native VLAN for the trunk mode interface. Frames on the native VLAN are not 802.1q tagged.	—	—
trusted	Set this interface and associated VLANs to be trusted. Trusted ports and VLANs are typically connected to internal controlled networks, while untrusted ports connect to third-party APs, public areas, or other networks to which access controls should be applied. When Alcatel-Lucent APs are attached directly to the switch, set the port to be trusted. You can set individual VLANs that are associated with this port to be untrusted by using the <b>no trusted vlan</b> command.	—	enabled

## Usage Guidelines

Use the show port status command to obtain information about the interfaces available on the switch.

## Example

The following command configures a range of interface as a trunk port for a set of VLANs:

```
interface range fastethernet 1/12-15
  switchport mode trunk
  switchport trunk native vlan 10
  switchport trunk allowed vlan 1,10,100
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.4	The <b>trusted VLAN</b> and <b>ip access-group session vlan</b> parameters were introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master and local switches

## interface tunnel

```
interface tunnel <number>
  description <string>
  inter-tunnel-flooding
  ip address <ipaddr> <netmask>
  mtu <mtu>
  no ...
  shutdown
  trusted
  tunnel checksum|destination <ipaddr>|keepalive [<interval> <retries>]|key
<key>|mode gre {<protocol>|ip}|source {<ipaddr>|loopback|vlan <vlan>}|vlan
<vlans>
```

### Description

This command configures a tunnel interface.

### Syntax

Parameter	Description	Range	Default
tunnel	Identification number for the tunnel.	1-2147483647	—
description	String that describes this interface.	—	Tunnel Interface
inter-tunnel-flooding	Enables inter-tunnel flooding.	—	enabled
ip address	IP address of the tunnel. This represents the entrance to the tunnel.	—	—
mtu	MTU size for the interface.	—	1500
no	Negates any configured parameter.	—	—
shutdown	Causes a hard shutdown of the interface.	—	—
trusted	Set this interface to be a trusted interface. Trusted ports and VLANs are typically connected to internal controlled networks, while untrusted ports connect to third-party APs, public areas, or other networks to which access controls should be applied. When Alcatel-Lucent APs are attached directly to the switch, set the port to be trusted.	—	disabled
tunnel	Configures tunneling.	—	mode gre ip
checksum	Enables end-to-end checksum of packets that pass through the tunnel.	—	disabled
destination	Destination IP address for the tunnel endpoint.	—	—
keepalive	Enables sending of periodic keepalive frames on the tunnel to determine the tunnel status (up or down). You can optionally set the interval at which keepalive frames are sent, and the number of times the frames are resent before a tunnel is considered to be down.	—	disabled
<interval>	(Optional) Number of seconds at which keepalive frames are sent.	1-86400	10 seconds
<retries>	(Optional) Number of consecutive times that the keepalives fail before the tunnel is considered to be down.	0-1024	3

Parameter	Description	Range	Default
key	Key used to authenticate packets on the tunnel.	0-4294967295	—
mode gre	Specifies generic route encapsulation (GRE) type. You configure either a 16-bit protocol number (for Layer-2 tunnels) or <b>ip</b> (for a Layer-3 tunnel). The 16-bit protocol number uniquely identifies a Layer-2 tunnel. The switches at both endpoints of the tunnel must be configured with the same protocol number.	—	—
source	The local endpoint of the tunnel on the switch. This can be one of the following: <ul style="list-style-type: none"> <li>specified IP address</li> <li>the loopback interface configured on the switch</li> <li>specified VLAN</li> </ul>	—	—
vlan	VLANs to be included in this tunnel.	—	—

## Usage Guidelines

You can configure a GRE tunnel between an Alcatel-Lucent switch and another GRE-capable device. Layer-3 GRE tunnel type is the default (**tunnel mode gre ip**). You can direct traffic into the tunnel using a static route (specify the tunnel as the next hop for a static route) or a session-based access control list (ACL).

## Example

The following command configures a tunnel interface:

```
(host) (config) #interface tunnel 200
ip address 10.1.1.1 255.255.2550
tunnel source loopback
tunnel destination 20.1.1.242
tunnel mode gre ip
```

## Command History

Release	Modification
AOS-W 3.0	Command available
AOS-W 3.2	The <b>keepalive</b> parameter was introduced

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master and local switches

## interface vlan

```
interface vlan <vlan>
  bandwidth-contract <name>
  description <string>
  ip address {<ipaddr> <netmask>|dhcp-client|pppoe}|helper-address
  <ipaddr>|igmp|local-proxy-arp|nat inside|{ospf area <id>}routing}
  ipv6 mld [snooping]
  mtu
  no ...
  operstate up
  shutdown
```

### Description

This command configures a VLAN interface.

### Syntax

Parameter	Description	Range	Default
vlan	VLAN ID number.	1-4094	—
bandwidth-contract	Name of the bandwidth contract to be applied to this VLAN interface. When applied to a VLAN, the contract only limits multicast traffic and does not affect other data. Use the <code>aaa bandwidth-contract</code> command to configure a bandwidth contract.	—	—
description	String that describes this interface.	—	802.1Q VLAN
ip	Configures IPv4 for this interface.		
address	Configures the IP address for this interface, which can be one of the following: <ipaddr> <netmask> dhcp-client: use DHCP to obtain the IP address pppoe: use PPPoE to obtain the IP address	—	—
helper-address	IP address of the DHCP server for relaying DHCP requests for this interface. If the DHCP server is on the same subnetwork as this VLAN interface, you do not need to configure this parameter.	—	—
igmp	Enables IGMP and/or IGMP snooping on this interface.	—	—
local-proxy-arp	Enables local proxy ARP.	—	—
nat inside	Enables source network address translation (NAT) for all traffic routed from this VLAN.	—	—
ospf	Define an OSPF area. See <a href="#">ip ospf</a> for complete details on this command.	—	—
routing	Enables layer-3 forwarding on the VLAN interface. To disable layer-3 forwarding, you must configure the IP address for the interface and specify <b>no ip routing</b> .	—	(enabled)
ipv6	Configures IPv6 for this interface.		
mld	Enables Multicast Listener Discovery (MLD) on this interface.	—	—
snooping	Enables MLD snooping on this interface.	—	—

Parameter	Description	Range	Default
no	Negates any configured parameter.	—	—
mtu	MTU setting for the VLAN.	1024-1500	—
operstate up	Set the state of the interface to be up.	—	—
shutdown	Causes a hard shutdown of the interface.	—	—

## Usage Guidelines

All ports on the switch are assigned to VLAN 1 by default. Use the `interface fastethernet|gigabitethernet` command to assign a port to a configured VLAN.

## Example

The following command configures a VLAN interface:

```
(host) (config) #interface vlan 16
ip address 10.26.1.1 255.255.255.0
ip helper-address 10.4.1.22
```

## Command History

This command was introduced in AOS-W 3.0

Release	Modification
AOS-W 3.0	Command available
AOS-W 3.3	The <b>ipv6</b> parameters were introduced
AOS-W 3.4	The <b>igmp snooping</b> parameter was deprecated. For information on configuring IGMP snooping in AOS-W 3.4 or later, see <a href="#">interface vlan ip igmp proxy on page 215</a>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master and local switches

## interface vlan ip igmp proxy

```
interface vlan <vlan>  
  ip igmp snooping[{proxy fastethernet|gigabitethernet <slot>/<port>}]
```

### Description

This command enables IGMP and/or IGMP snooping on this interface, or configures a VLAN interface for uninterrupted streaming of multicast traffic.

### Syntax

Parameter	Description
snooping	Enable IGMP snooping. The IGMP protocol enables an router to discover the presence of multicast listeners on directly-attached links. Enable IGMP snooping to limit the sending of multicast frames to only those nodes that need to receive them.
proxy	Enable IGMP on this interface.
fastethernet	Enable IGMP proxy on the FastEthernet (IEEE 802.3) interface.
gigabitethernet	Enable IGMP proxy on the GigabitEthernet (IEEE 802.3) interface.
<slot>/<port>	Any command that references a Fast Ethernet or Gigabit Ethernet interface requires that you specify the corresponding port on the switch in the format <slot>/<port>. The <b>&lt;slot&gt;</b> parameter is always 1 except when referring to interfaces on the OmniAccess 6000 switch. For the OmniAccess 6000 switch, the four slots are allocated as follows: <ul style="list-style-type: none"><li>• <b>0</b>: This slot contains a supervisor card or a OmniAccess Supervisor Card III.</li><li>• <b>1</b>: This slot can contain either a redundant supervisor card, OmniAccess Supervisor Card III, or a third line card.</li><li>• <b>2</b>: This slot can contain either a OmniAccess Supervisor Card III or line card (required if slot 0 contains a supervisor card).</li><li>• <b>3</b>: This slot can contain either a OmniAccess Supervisor Card III or second line card.</li></ul> The <b>&lt;port&gt;</b> parameter refers to the network interfaces that are embedded in the front panel of the OmniAccess 4302, OmniAccess 4308T or OmniAccess 4324 switch, OmniAccess 4504/4604/4704 Multi-Service Switch, OmniAccess Supervisor Card III, or a line card installed in the OmniAccess 6000 switch. Port numbers start at 0, from the left-most position.

### Usage Guidelines

The newer IGMP proxy feature and the older IGMP snooping feature cannot be enabled at the same time, as both features add membership information to multicast group table. For most multicast deployments, you should enable the IGMP Proxy feature on all VLAN interfaces to manage all the multicast membership requirements on the switch. If IGMP snooping is configured on some of the interfaces, there is a greater chance that multicast information transfers may be interrupted.

### Example

The following example configures IGMP proxy for vlan 2. IGMP reports from the switch would be sent to the upstream router on fastethernet port 1/3.

```
(host) (conf)# interface vlan 2  
  (conf-subif)# ip igmp proxy fastethernet 1/3
```

### Related Commands

This release of AOS-W supports version 1 of the Multicast Listener Discovery (MLD) protocol (MLDv1). MLDv1, defined in RFC 2710, is derived from version 2 of the IPv4 Internet Group Management Protocol (IGMPv2)

Issue the command **interface vlan <vlan> ipv6 mld** to enable the MLD protocol and allow an IPv6 router to discover the presence of multicast listeners on directly-attached links. Use the CLI command **interface vlan <vlan> ipv6 mld snooping**, and the IPv6 router will send multicast frames to only those nodes that need to receive them.

## Command History

This command was introduced in AOS-W 3.4

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## ip access-list eth

```
ip
ip access-list eth {<number>|<name>}
  deny {<ethtype> [<bits>]|any} [mirror]
  no ...
  permit {<ethtype> [<bits>]|any} [mirror]
```

### Description

This command configures an Ethertype access control list (ACL).

### Syntax

Parameter	Description	Range
eth	Enter a name, or a number in the specified range.	200-299
deny	Reject the specified packets, which can be one of the following: Ethertype in decimal or hexadecimal (0-65535) and optional wildcard (0-65535) any: match any Ethertype Optionally, you can configure the mirror parameter, which mirrors packets to a datapath or remote destination.	—
no	Negates any configured parameter.	—
permit	Allow the specified packets, which can be one of the following: Ethertype in decimal or hexadecimal (0-65535) and optional wildcard (0-65535) any: match any Ethertype Optionally, you can configure the mirror parameter, which mirrors packets to a datapath or remote destination.	—

### Usage Guidelines

The Ethertype field in an Ethernet frame indicates the protocol being transported in the frame. This type of ACL filters on the Ethertype field in the Ethernet frame header, and is useful when filtering non-IP traffic on a physical port. This ACL can be used to permit IP frames while blocking other non-IP protocols such as IPX or Appletalk.

If you configure the mirror option, define the destination to which mirrored packets are sent in the firewall policy. For more information, see [“firewall” on page 166](#).

### Example

The following command configures an Ethertype ACL:

```
(host) (config) #ip access-list eth 200
  deny 809b
```

### Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3	The <b>mirror</b> parameter was introduced.

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master switches

## ip access-list extended

```
ip access-list extended {<number>|<name>}
  deny <protocol> <source> <dest>
  no ...
  permit <protocol> <source> <dest>
```

### Description

This command configures an extended access control list (ACL).

### Syntax

Parameter	Description	Range
extended	Enter a name, or a number in the specified range.	100-199, 2000-2699
deny	Reject the specified packets.	
<protocol>	Protocol, which can be one of the following: <ul style="list-style-type: none"><li>● Protocol number between 0-255</li><li>● any: any protocol</li><li>● icmp: Internet Control Message Protocol</li><li>● igmp: Internet Gateway Message Protocol</li><li>● tcp: Transmission Control Protocol</li><li>● udp: User Datagram Protocol</li></ul>	—
<source>	Source, which can be one of the following: <ul style="list-style-type: none"><li>● Source address and wildcard</li><li>● any: any source</li><li>● host: specify a single host IP address</li></ul>	—
<dest>	Destination, which can be one of the following: <ul style="list-style-type: none"><li>● Destination address and wildcard</li><li>● any: any destination</li><li>● host: specify a single host IP address</li></ul>	—
no	Negates any configured parameter.	—
permit	Allow the specified packets.	
<protocol>	Protocol, which can be one of the following: <ul style="list-style-type: none"><li>● Protocol number between 0-255</li><li>● any: any protocol</li><li>● icmp: Internet Control Message Protocol</li><li>● igmp: Internet Gateway Message Protocol</li><li>● tcp: Transmission Control Protocol</li><li>● udp: User Datagram Protocol</li></ul>	—
<source>	Source, which can be one of the following: Source address and wildcard any: any source host: specify a single host IP address	—
<dest>	Destination, which can be one of the following: Destination address and wildcard any: any destination host: specify a single host IP address	—

### Usage Guidelines

Extended ACLs are supported for compatibility with router software from other vendors. This ACL permits or denies traffic based on the source or destination IP address or IP protocol.

## Example

The following command configures an extended ACL:

```
(host) (config) #ip access-list extended 100
deny any host 1.1.21.245 any
```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master switches

## ip access-list mac

```
ip access-list mac {<number>|<name>}
  deny {<macaddr>[<wildcard>]|any|host <macaddr>} [mirror]
  no ...
  permit {<macaddr>[<wildcard>]|any|host <macaddr>} [mirror]
```

### Description

This command configures a MAC access control list (ACL).

### Syntax

Parameter	Description	Range
mac	Configures a MAC access list. Enter a name, or a number in the specified range.	700-799, 1200-1299
deny	Reject the specified packets, which can be the following: MAC address and optional wildcard any: any packets host: specify a MAC address Optionally, you can configure the mirror parameter, which mirrors packets to a datapath or remote destination.	—
no	Negates any configured parameter.	—
permit	Allow the specified packets, which can be the following: MAC address and optional wildcard any: any packets host: specify a MAC address Optionally, you can configure the mirror parameter, which mirrors packets to a datapath or remote destination.	—

### Usage Guidelines

MAC ACLs allow filtering of non-IP traffic. This ACL filters on a specific source MAC address or range of MAC addresses.

If you configure the mirror option, define the destination to which mirrored packets are sent in the firewall policy. For more information, see [“firewall” on page 166](#).

### Example

The following command configures a MAC ACL:

```
(host) (config) #ip access-list mac 700
  deny 11:11:11:00:00:00
```

### Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3	The <b>mirror</b> parameter was introduced.

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Policy Enforcement Firewall license	Config

## ip access-list session

```
ip access-list session <name>
  <source> <dest> <service> <action> [<extended action>]
  no ...
```

### Description

This command configures a session access control list (ACL).

### Syntax

Parameter	Description
session	Enter a name for this ACL
<source>	The traffic source, which can be one of the following: <b>alias</b> : specify the network resource (use the <b>netdestination</b> command to configure aliases; use the <b>show netdestination</b> command to see configured aliases) <b>any</b> : match any traffic <b>host</b> : specify a single host IP address <b>network</b> : specify the IP address and netmask <b>user</b> : represents the IP address of the user
<dest>	The traffic destination, which can be one of the following: <b>alias</b> : specify the network resource (use the <b>netdestination</b> command to configure aliases; use the <b>show netdestination</b> command to see configured aliases) <b>any</b> : match any traffic <b>host</b> : specify a single host IP address <b>network</b> : specify the IP address and netmask <b>user</b> : represents the IP address of the user
<service>	Network service, which can be one of the following: IP protocol number (0-255) name of a network service (use the show netservice command to see configured services) <b>any</b> : match any traffic <b>tcp</b> : specify the TCP port number (0-65535) <b>udp</b> : specify the UDP port number (0-65535)
<action>	Action if rule is applied, which can be one of the following: <b>deny</b> : reject packets <b>dst-nat</b> : perform destination NAT on packets <b>dual-nat</b> : perform both source and destination NAT on packets <b>permit</b> : forward packets <b>redirect</b> : specify the location to which packets are redirected, which can be one of the following: <ul style="list-style-type: none"><li>• datapath destination ID (<b>0-65535</b>)</li><li>• <b>esi-group</b>: specify the ESI server group configured with the esi group command</li><li>• <b>opcode</b>: specify the datapath destination ID (0x33, 0x34, or 0x82). Do not use this parameter without proper guidance from Alcatel-Lucent, Inc.</li></ul> <b>tunnel</b> : specify the ID of the tunnel configured with the interface tunnel command <b>src-nat</b> : perform source NAT on packets

Parameter	Description
<extended action>	Optional action if rule is applied, which can be one of the following: <b>blacklist:</b> blacklist user <b>disable-scanning:</b> pause ARM scanning while traffic is present. Note that you must enable “Voice Aware Scanning” in the ARM profile for this feature to work. <b>dot1p-priority:</b> specify 802.1p priority (0-7) <b>log:</b> generate a log message <b>mirror:</b> mirror all session packets to datapath or remote destination If you configure the mirror option, define the destination to which mirrored packets are sent in the firewall policy. For more information, see “ <a href="#">firewall</a> ” on page 166. <b>position:</b> specify the position of the rule (1 is first, default is last) <b>queue:</b> assign flow to priority queue (high/low) <b>send-deny-response:</b> if <action> is deny, send an ICMP notification to the source <b>time-range:</b> specify time range for this rule (configured with time-range command) <b>tos:</b> specify ToS value (0-63)
no	Negates any configured parameter.

## Usage Guidelines

Session ACLs define traffic and firewall policies on the switch. You can configure multiple rules for each policy, with rules evaluated from top (1 is first) to bottom. The first match terminates further evaluation. Generally, you should order more specific rules at the top of the list and place less specific rules at the bottom of the list. The ACL ends with an implicit deny all.

## Example

The following command configures a session ACL that drops any traffic from 10.0.0.0 subnetwork:

```
ip access-list session drop-from10
    network 10.0.0.0 255.0.0.0 any any
```

## Command History

Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Policy Enforcement Firewall license	Config mode on master switches

## ip access-list standard

```
ip access-list standard {<number>|<name>}
  deny {<ipaddr> <wildcard>|any|host <ipaddr>}
  no ...
  permit {<ipaddr> <wildcard>|any|host <ipaddr>}
```

### Description

This command configures a standard access control list (ACL).

### Syntax

Parameter	Description	Range
standard	Enter a name, or a number in the specified range.	1-99, 1300-1399
deny	Reject the specified packets, which can be the following: IP address and optional wildcard any: any packets host: specify a host IP address	—
no	Negates any configured parameter.	—
permit	Allow the specified packets, which can be the following: IP address and optional wildcard any: any packets host: specify a host IP address	—

### Usage Guidelines

Standard ACLs are supported for compatibility with router software from other vendors. This ACL permits or denies traffic based on the source address of the packet.

### Example

The following command configures a standard ACL:

```
(host) (config) #ip access-list standard 1
  permit host 10.1.1.244
```

### Command History

#### Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Requires Policy Enforcement Firewall license	Config mode on master switches

## ip cp-redirect-address

ip cp-redirect-address <ipaddr> | disable

### Description

This command configures a redirect address for captive portal.

### Syntax

Parameter	Description
<ipaddr>	Host address with a 32-bit netmask. This address should be routable from all external networks.
disable	Disables automatic DNS resolution for captive portal.

### Usage Guidelines

This command redirects wireless clients that are on different VLANs (from the switch's IP address) to the captive portal on the switch.

If you have the Policy Enforcement Firewall license installed in the switch, modify the captive portal session ACL to permit HTTP/S traffic to the destination **cp-redirect-address <ipaddr>** instead of **mswitch**. If you do not have the Policy Enforcement Firewall license installed in the switch, the implicit captive-portal-profile ACL is automatically modified when you issue this command.

### Example

The following command configures a captive portal redirect address:

```
(host) (config) #ip cp-redirect-address
```

### Command History

#### Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip default-gateway

```
ip default-gateway <ipaddr>[{import cell|dhcp|pppoe}|{ipsec <name>} <cost>
```

### Description

This command configures the default gateway for the switch.

### Syntax

Parameter	Description
<ipaddr>	IP address of the default gateway.
import	Use a gateway IP address obtained through the cell interface, DHCP or PPPoE. The default gateway is imported into the routing table and removed when the uplink is no longer active.
cell	Use Cell interface when available to obtain default gateway.
dhcp	Use DHCP when available to obtain default gateway.
pppoe	Use PPPOE when available to obtain default gateway.
ipsec <name>	Define a static route using an ipsec map.
<cost>	Distance metric for this route.

### Usage Guidelines

You can use this command to set the default gateway to the IP address of the interface on the upstream router or switch to which you connect the switch. If you define more than one dynamic gateway type, you must also define a cost for the route to each gateway. The switch will first attempt to obtain a gateway IP address using the option with the lowest cost. If the switch is unable to obtain a gateway IP address, it will then attempt to obtain a gateway IP address using the option with the next-lowest path cost.

### Example

The following command configures the default gateway for the switch:

```
(host) (config) #ip default-gateway 10.1.1.1
```

### Command History

#### Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip dhcp excluded-address

```
ip dhcp excluded-address <low-ipaddr> [<high-ipaddr>]
```

### Description

This command configures an excluded address range for the DHCP server on the switch.

### Syntax

Parameter	Description
<low-ipaddr>	Low end of range of IP addresses. For example, you can enter the IP address of the switch so that this address is not assigned.
<high-ipaddr>	High end of the range of IP addresses.

### Usage Guidelines

Use this command to specifically exclude certain addresses from being assigned by the DHCP server. It is good practice to exclude any statically assigned addresses.

### Example

The following command configures an excluded address range:

```
ip dhcp excluded-address 192.168.1.1 192.168.1.255
```

### Command History

#### Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in base operating system	Config mode on master switches

## ip dhcp pool

```
ip dhcp pool <name>
  default-router <ipaddr> ...
  dns-server {<ipaddr> ... |import}
  domain-name <name>
  lease <days> <hours> <minutes>
  netbios-name-server {<ipaddr> ... |import}
  network <ipaddr> {<netmask>|<prefix>}
  no ...
  option <code> ip <ipaddr>
```

### Description

This command configures a DHCP pool on the switch.

### Syntax

Parameter	Description
default-router	IP address of the default router for the DHCP client. The client should be on the same subnetwork as the default router. You can specify up to eight IP addresses.
dns-server	IP address of the DNS server, which can be one of the following:
<address>	IP address of the DNS server. You can specify up to eight IP addresses.
import	Use the DNS server address obtained through PPPoE or DHCP.
domain-name	Domain name to which the client belongs.
lease	The amount of time that the assigned IP address is valid for the client. Specify the lease in <days> <hours> <minutes>.
netbios-name-server	IP address of the NetBIOS Windows Internet Naming Service (WINS) server, which can be one of the following:
<address>	IP address of the WINS server. You can specify up to eight IP addresses.
import	Use the NetBIOS name server address obtained through PPPoE or DHCP.
network	Range of addresses that the DHCP server may assign to clients, in the form of <ipaddr> and <netmask> or <ipaddr> and <prefix> (/n).
no	Negates any configured parameter.
option	Client-specific option code and IP address. See RFC 2132, "DHCP Options and BOOTP Vendor Extensions".

### Usage Guidelines

A DHCP pool should be created for each IP subnetwork for which DHCP services should be provided. DHCP pools are not specifically tied to VLANs, as the DHCP server exists on every VLAN. When the switch receives a DHCP request from a client, it examines the origin of the request to determine if it should respond. If the IP address of the VLAN matches a configured DHCP pool, the switch answers the request.

### Example

The following command configures a DHCP pool:

```
(host) (config) #ip dhcp pool floor1
  default-router 10.26.1.1
  dns-server 192.168.1.10
  domain-name floor1.test.com
```

```
lease 0 8 0
network 10.26.1.0 255.255.255.0
```

## Command History

### Introduced in AOS-W 3.0

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip domain lookup

ip domain lookup

### Description

This command enables Domain Name System (DNS) hostname to address translation.

### Syntax

There are no parameters for this command.

### Usage Guidelines

This command is enabled by default. Use the **no** form of this command to disable.

### Example

The following command enables DNS hostname translation:

```
(host) (config) #ip domain lookup
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip domain-name

```
ip domain-name <name>
```

### Description

This command configures the default domain name.

### Syntax

Parameter	Description
domain-name	Name used to complete unqualified host names. Do not specify the leading dot (.).

### Usage Guidelines

The switch uses the default domain name to complete hostnames that do not contain domain names. You must have at least one domain name server configured on the switch (see [“ip name-server” on page 246](#)).

### Example

The following command configures the default domain name:

```
(host) (config) #ip domain-name yourdomain.com
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip igmp

```
ip igmp
  last-member-query-count <number>
  last-member-query-interval <seconds>
  query-interval <seconds>
  query-response-interval <.1 seconds>
  robustness-variable <2-10>
  startup-query-count <number>
  startup-query-interval <seconds>
  version-1-router-present-timeout <seconds>
```

### Description

This command configures Internet Group Management Protocol (IGMP) timers and counters.

### Syntax

Parameter	Description	Range	Default
last-member-query-count	Number of group-specific queries that the switch sends before assuming that there are no local group members.	—	2
last-member-query-interval	Maximum time, in seconds, that can elapse between group-specific query messages.	—	10 seconds
query-interval	Interval, in seconds, at which the switch sends host-query messages to the multicast group address 224.0.0.1 to solicit group membership information.	1-1024	125 seconds
query-response-interval	Maximum time, in .1 seconds, that can elapse between when the switch sends a host-query message and when it receives a response. This must be less than the query-interval.	1-1024	100 (10 seconds)
robustness-variable	Increase this value to allow for expected packet loss on a subnetwork.	2-10	2
startup-query-count	Number of queries that the switch sends out on startup, separated by startup-query-interval. The default is the robustness-variable value.	—	2
startup-query-interval	Interval, in seconds, at which the switch sends general queries on startup. The default is 1/4 of the query-interval.	—	31 seconds
version-1-router-present-timeout	Timeout, in seconds, if a version 1 IGM router is detected.	—	400 seconds

### Usage Guidelines

IGMP is used to establish and manage IP multicast group membership. See RFC 3376, “Internet Group Management Protocol, version 3” for more information.

### Example

The following command configures IGMP:

```
(host) (config) #ip igmp
  query-interval 130
```

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip local

```
ip local pool <name> <start-ipaddr> [<end-ipaddr>]
```

### Description

This command configures a local IP pool for Layer-2 Tunnel Protocol (L2TP).

### Syntax

Parameter	Description
pool	Name for the address pool.
<start-ipaddr>	Starting IP address for the pool.
<end-ipaddr>	(Optional) Ending IP address for the pool.

### Usage Guidelines

VPN clients can be assigned IP addresses from the L2TP pool.

### Example

The following command configures an L2TP pool:

```
(host) (config) #ip local pool 10.1.1.1 10.1.1.99
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	This command requires the VPN Server and/or Remote AP license.	Config mode on master switches

## ip mobile active-domain

```
ip mobile
ip mobile active-domain <name>
```

### Description

This command configures the mobility domain that is active on the switch.

### Syntax

Parameter	Description
active-domain	Name of the mobility domain.

### Usage Guidelines

All switches are initially part of the “default” mobility domain. If you use the “default” mobility domain, you do not need to specify this domain as the active domain on the switch. However, once you assign a switch to a user-defined domain, the “default” mobility domain is no longer an active domain on the switch.

### Example

The following command assigns the switch to a user-defined mobility domain:

```
(host) (config) #ip mobile active-domain campus1
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip mobile domain

```
ip mobile domain <name>
  hat <subnetwork> <mask> <vlan> <ha-ipaddr>
  no ...
```

### Description

This command configures the mobility domain on the switch.

### Syntax

Parameter	Description	Range
domain	Name of the mobility domain.	—
hat	Configures a home agent table (HAT) entry.	—
<subnetwork>	Subnet that requires mobility service.	—
<mask>	Netmask for the IP address.	—
<vlan>	VLAN ID. The VLAN ID must be the VLAN number on the home agent switch.	1-4094
<ha-ipaddr>	IP address of the home agent.	—
no	Negates any configured parameter.	—

### Usage Guidelines

You configure the HAT on a master switch; the mobility domain information is pushed to all local switches that are managed by the same master.

HAT entries map subnetworks or VLANs and the home agents. The home agent is typically the switch's IP address. The home agent's IP address must be routable; that is, all switches that belong to the same mobility domain must be able to reach the home agent's IP address.

The switch looks up information in the HAT to obtain the IP address of the home agent for a mobile client. Because there can be multiple home agents on a subnetwork, the HAT can contain more than one entry for the same subnetwork.

### Example

The following command configures HAT entries:

```
(host) (config) #ip mobile domain default
  hat 10.1.1.0 255.255.255.0 1 10.1.1.245
  hat 10.1.1.0 255.255.255.0 1 10.2.1.245
  hat 10.1.2.0 255.255.255.0 2 10.1.1.245
  hat 10.1.3.0 255.255.255.0 3 10.1.1.245
  hat 10.2.1.0 255.255.255.0 4 10.2.1.245
  hat 10.2.2.0 255.255.255.0 5 10.2.1.245
  hat 10.2.3.0 255.255.255.0 6 10.2.1.245
  hat 10.3.1.0 255.255.255.0 7 10.3.1.245
  hat 10.3.2.0 255.255.255.0 8 10.3.1.245
  hat 10.3.3.0 255.255.255.0 9 10.3.1.245
```

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip mobile foreign-agent

```
ip mobile foreign-agent {lifetime <seconds> | max-visitors <number> |  
registrations {interval <msecs> | retransmits <number>}}
```

### Description

This command configures the foreign agent for IP mobility.

### Syntax

Parameter	Description	Range	Default
lifetime	Requested lifetime, in seconds, as per RFC 3344, "IP Mobility Support for IPv4".	10-65534	180 seconds
max-visitors	Maximum number of active visitors.	0-5000	5000
registrations	Frequency at which re-registration messages are sent to the home agent:		
interval	Retransmission interval, in milliseconds	100-10000	1000 milliseconds
retransmits	Maximum number of times the foreign agent attempts mobile IP registration message exchanges before giving up.	0-5	3

### Usage Guidelines

A foreign agent is the switch which handles all mobile IP communication with a home agent on behalf of a roaming client.

### Example

The following command configures the foreign agent:

```
(host) (config) #ip mobile foreign-agent registration interval 10000
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip mobile home-agent

```
ip mobile home-agent {max-bindings <number>|replay <seconds>}
```

### Description

This command configures the home agent for IP mobility.

### Syntax

Parameter	Description	Range	Default
max-bindings	Maximum number of mobile IP bindings. Note that there is a license-based limit on the number of users and a one user per binding limit in addition to unrelated users. This option is an additional limitation to control the maximum number of roaming users. When the limit is reached, registration requests from the foreign agent fail which causes a mobile client to set a new session on the visited switch, which will become its home switch.	0-5000	5000
replay	Time difference, in seconds, for timestamp-based replay protection, as described by RFC 3344, "IP Mobility Support for IPv4". 0 disables replay.	0-300	7 seconds

### Usage Guidelines

A home agent for a mobile client is the switch where the client first appears when it joins the mobility domain. The home agent is the single point of contact for the client when it roams.

### Example

The following command configures the home agent:

```
(host) (config) #ip mobile home-agent replay 100
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## ip mobile proxy

```
ip mobile proxy auth-sta-roam-only | block-dhcp-release | dhcp {max-requests <number>|
transaction-hold <seconds>|transaction-timeout <seconds>}| event-threshold <number> |
log-trail | no-service-timeout <seconds> | on-association |re-home |
stale-timeout <seconds> | stand-alone-AP | trail-length <number> |trail-timeout
<seconds>
```

### Description

This command configures the proxy mobile IP module in a mobility-enabled switch.

### Syntax

Parameter	Description	Range	Default
auth-sta-roam-only	Allows a client to roam only if has been authenticated. If a client has not been authenticated, no mobility service is offered if it roams to a different VLAN or switch.	—	enabled
block-dhcp-release	Determines whether DHCP release packets generated from the client should be dropped or forwarded to the DHCP server. Blocking the packets prevents the DHCP server from assigning the same IP address to another client until the lease has expired.		disabled
dhcp	Configures proxy DHCP		
aggressive-transaction	Terminate Proxy DHCP on aggressive Transaction ID change. <b>NOTE:</b> Alcatel-Lucent recommends keeping this parameter at the default setting:	0-65534	25
max-requests	Maximum number of BOOTP packets that are allowed to be handled during one DHCP session.	0-65534	25
transaction-hold	Hold time, in seconds, on proxy DHCP state after completion of DHCP transaction (DHCP ACK) was forwarded to the client. This option ensures that late BOOTP replies reach the station and that a retransmitted BOOTP request does not trigger a new proxy DHCP session.	1-600	5 seconds
transaction-timeout	Maximum time allowed for a proxy DHCP session to complete.	10-600	60 seconds
event-threshold	Maximum number of mobility events (events that can trigger mobility) handled per second. Mobility events above this threshold are ignored. This helps to control frequent mobility state changes when the client bounces back and forth on APs before settling down.	1-65535	25
log-trail	Enables logging at the notification level for mobile client moves.	—	enabled
no-service-timeout	Time, in seconds, after which mobility service expires. If nothing has changed from the previous state, the client is given another bridge entry but it will have limited connectivity.	30-60000	180 seconds
on-association	Mobility move detection is performed when the client associates with the switch instead of when the client sends packets. Enabled by default. Mobility on association can speed up roaming and improve connectivity for devices that do not send many uplink packets out that can trigger mobility. Downside is security; an association is all it takes to trigger mobility. This is irrelevant unless layer-2 security is enforced.	—	enabled

re-home	Allows on-hook phones to be assigned a new home agent. This is to load balance voice client home agents across switches in a mobility domain. This parameter requires that you install the Voice Services Module license in the switch.	—	disabled
stale-timeout	Number of seconds the mobility state is retained after the loss of connectivity. This allows authentication state and mobility information to be preserved on the home agent switch. The default is 60 seconds but can be safely increased. Note that in many case a station state is deleted without waiting for the stale timeout; user delete from management, foreign agent to foreign agent handoff, etc. (This is different from the no-service-timeout; no-service-timeout occurs up front while the stale-timeout begins when mobility service is provided but the connection is disrupted for some reason.)	30-3600	60 seconds
stand-alone-AP	Enables support for third party or standalone APs. When this is enabled, broadcast packets are not used to trigger mobility and packets from untrusted interfaces are accepted. If mobility is enabled, you must also enable standalone AP for the client to connect to the switch's untrusted port. If the switch learns wired users via the following methods, enable standalone AP: <ul style="list-style-type: none"> <li>• Third party AP connected to the switch through the untrusted port.</li> <li>• Clients connected to ENET1 on the OAW-AP70.</li> <li>• Wired user connected directly to the switch's untrusted port.</li> </ul>	—	disabled
trail-length	Specifies the maximum number of entries (client moves) stored in the user mobility trail.	1-100	30
trail-timeout	Specifies the maximum interval, in seconds, an inactive mobility trail is held.	120-86400	3600 seconds

## Usage Guidelines

The *proxy mobile IP module* in a mobility-enabled switch detects when a mobile client has moved to a foreign network and determines the home agent for a roaming client. The proxy mobile IP module performs the following functions:

- Derives the address of the home agent for a mobile client from the HAT using the mobile client's IP address. If there is more than one possible home agent for a mobile client in the HAT, the proxy mobile IP module uses a discovery mechanism to find the current home agent for the client.
- Detects when a mobile client has moved. Client moves are detected based on ingress port and VLAN changes and mobility is triggered accordingly. For faster roaming convergence between AP(s) on the same switch, it is recommended that you keep the "on-association" option enabled. This helps trigger mobility as soon as 802.11 association packets are received from the mobile client.

## Example

The following command enables re-home for voice clients:

```
(host) (config) #ip mobile proxy re-home
```

---

The re-home parameter requires the Voice Services Module

---

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system. The re-home parameter requires the Voice Services Module.	Config mode on master switches

## ip mobile revocation

```
ip mobile revocation {interval <msec>|retransmits <number>
```

### Description

This command configures the frequency at which registration revocation messages are sent.

### Syntax

Parameter	Description	Range	Default
interval	Retransmission interval, in milliseconds.	100-10000 ms	1000 ms
retransmits	Maximum number of times the home agent or foreign agent attempts mobile IP registration/revocation message exchanges before giving up.	0-5	3

### Usage Guidelines

A home agent or foreign agent can send a registration revocation message, which revokes registration service for the mobile client. For example, when a mobile client roams from one foreign agent to another, the home agent can send a registration revocation message to the first foreign agent so that the foreign agent can free any resources held for the client.

### Example

The following command configures registration revocation messages:

```
(host) (config) #ip mobile revocation interval 2000
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master switches

## ip mobile trail

```
ip mobile trail {host IP address | host MAC address}
```

### Description

This command configures the capture of association trail for all devices.

### Syntax

Parameter	Description	Default
Host IP address	The IP address of the client for which the association trail is captured.	disabled
Host MAC address	The MAC address of the client for which the association trail is captured.	disabled

### Usage Guidelines

A device can move from one home agent to another or between home agents. When the client makes an association, the agent can store information about the client and registration time. The association trail can be captured for devices even when mobility is disabled.

### Example

The following command configures trail capture for a client using its IP address:

```
(host) (config) #ip mobile trail 1.2.3.4
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master switches

## ip name-server

```
ip name-server <ipaddr>
```

### Description

This command configures servers for name and address resolution.

### Syntax

Parameter	Description
<ip-addr>	IP address of the server.

### Usage Guidelines

You can configure up to six servers using separate commands. Specify one or more servers when you configure a default domain name (see “[ip domain-name](#)” on page 232).

### Example

The following command configures a name server:

```
ip name-server 10.1.1.245
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master switches

## ip nat

```
ip nat pool <name> <start-ipaddr> <end-ipaddr> [<dest-ipaddr>]
```

### Description

This command configures a pool of IP addresses for network address translation (NAT).

### Syntax

Parameter	Description
pool	Name of the NAT pool.
<start-ipaddr>	IP address that defines the beginning of the range of source NAT addresses in the pool.
<end-ipaddr>	IP address that defines the end of the range of source NAT addresses in the pool.
<dest-ipaddr>	Destination NAT IP address.

### Usage Guidelines

This command configures a NAT pool which you can reference in a session ACL rule (see [“ip access-list session” on page 223](#)).

### Example

The following command configures a NAT pool:

```
(host) (config) #ip nat pool 2net 2.1.1.1 2.1.1.125
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	This command requires the Policy Enforcement Firewall license.	Config mode on master and local switches

## ip ospf

```
ip ospf area|{authentication message-digest | cost <cost> | dead-interval <seconds> |  
hello-interval <seconds> | message-digest-key <keyid> <passwd> | priority <number> |  
retransmit-interval <seconds> |transmit-delay <seconds>
```

### Description

Configure OSPF on the VLAN interface.

### Syntax

Parameter	Description	Range	Default
area	Enable OSPF on a specific interface by entering the IP address of the router that will use OSPF.		
authentication message-digest	Enable OSPF message digest authentication.		disabled
cost <cost>	Change the cost associated with the OSPF traffic on an interface.	1 to 65535	1
dead-interval <seconds>	Set the elapse interval (seconds) since the last hello-packet was received from the router. After the interval elapses, the neighboring routers declare the router dead.	1 to 65535 seconds	40
hello-interval <seconds>	Set the elapse interval (seconds) between hello packets sent on the interface.	1 to 65535 seconds	10
message-digest-key <keyid> <passwd>	Enable OSPF MD5 authentication and set the key identification and a character string password.	<keyid> = 1 to 256	No default
priority <number>	Set the priority number of the interface to determine the DR.	0 to 255	1
retransmit-interval <seconds>	Set the retransmission time between link state advertisements for adjacencies belonging to the interface. <b>NOTE:</b> Set the time interval long enough to prevent unnecessary retransmissions.	1 to 65535 seconds	5
transmit-delay <seconds>	Set the elapse time before retransmitting link state update packets on the interface.	1 to 65535 seconds	1

### Usage Guidelines

When configuring OSPF over multiple vendors, use this **ip ospf cost** command to ensure that all routers use the same cost. Otherwise, OSPF may route improperly.

### Related Commands

Command	Description
<b>show ip ospf</b>	View OSPF process on the router
show ip ospf interface	View the configure OSPF interface.

## Command History

AOS-W 3.4	Command introduced

## Command Information

Platforms	Licensing	Command Mode
All Platforms	Base operating system	Configuration Mode (config)

## ip pppoe-max-segment-size

ip pppoe-max-segment-size <bytes>

### Description

This command configures the maximum TCP segment size, in bytes, for Point-to-Point Protocol over Ethernet (PPPoE) data.

### Syntax

Parameter	Description	Range	Default
pppoe-max-segment-size	Size, in bytes, of the maximum TCP segment.	128-1452	1452

### Usage Guidelines

The maximum segment size for PPPoE is smaller than the normal Ethernet encapsulation size because of the PPPoE overhead.

### Example

The following command configures the PPPoE maximum TCP segment size:

```
(host) (config) #ip pppoe-max-segment-size 1412
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master switches

## ip pppoe-password

ip pppoe-password <string>

### Description

This command configures the PPP over Ethernet (PPPoE) password.

### Syntax

Parameter	Description
pppoe-password	PAP password configured on the PPPoE access concentrator.

### Usage Guidelines

Note the following about enabling the PPPoE client on the switch:

- You cannot enable both the DHCP and PPPoE client on the switch at the same time.
- You can enable the PPPoE client on only one VLAN on the switch (the VLAN cannot be VLAN 1).
- You can connect only one port in the VLAN to the uplink switch.
- At least one interface in the VLAN must be in the up state before the PPPoE client requests an IP address from the server.

### Example

The following commands configure the PPPoE client on the switch:

```
(host) (config) #ip pppoe-service-name ppp2056
ip pppoe-username rudolph123
ip pppoe-password 1234567890
vlan 22
interface vlan 22
    ip address pppoe
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master or local switches

## ip pppoe-service-name

ip pppoe-service-name <string>

### Description

This command configures the PPP over Ethernet (PPPoE) service name.

### Syntax

Parameter	Description
pppoe-service-name	PPPoE service name.

### Usage Guidelines

Note the following about enabling the PPPoE client on the switch:

- You cannot enable both the DHCP and PPPoE client on the switch at the same time.
- You can enable the PPPoE client on only one VLAN on the switch (the VLAN cannot be VLAN 1).
- You can connect only one port in the VLAN to the uplink switch.
- At least one interface in the VLAN must be in the up state before the PPPoE client requests an IP address from the server.

### Example

The following commands configure the PPPoE client on the switch:

```
(host) (config) #ip pppoe-service-name ppp2056
ip pppoe-username rudolph123
ip pppoe-password 1234567890
vlan 22
interface vlan 22
    ip address pppoe
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master and local switches

## ip pppoe-username

ip pppoe-username <string>

### Description

This command configures the PPP over Ethernet (PPPoE) username.

### Syntax

Parameter	Description
<string>	PAP username configured on the PPPoE access concentrator.

### Usage Guidelines

Note the following about enabling the PPPoE client on the switch:

- You cannot enable both the DHCP and PPPoE client on the switch at the same time.
- You can enable the PPPoE client on only one VLAN on the switch (the VLAN cannot be VLAN 1).
- You can connect only one port in the VLAN to the uplink switch.
- At least one interface in the VLAN must be in the up state before the PPPoE client requests an IP address from the server.

### Example

The following commands configure the PPPoE client on the switch:

```
(host) (config) #ip pppoe-service-name ppp2056
ip pppoe-username rudolph123
ip pppoe-password 1234567890
vlan 22
interface vlan 22
    ip address pppoe
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system.	Config mode on master and local switches

## ip radius

```
ip radius {nas-ip <ipaddr>|rfc-3576-server udp-port <port>|source-interface  
{loopback|vlan <vlan>}}
```

### Description

This command configures global parameters for configured RADIUS servers.

### Syntax

Parameter	Description	Range	Default
nas-ip	NAS IP address to send in RADIUS packets. A server-specific NAS IP configured with the <b>aaa authentication-server radius</b> command supersedes this configuration.	—	—
rfc-3576-server	Configures the UDP port to receive requests from a RADIUS server that can send user disconnect and change-of-authorization messages, as described in RFC 3576, “Dynamic Authorization Extensions to Remote Dial In User Service (RADIUS)”. See the <b>aaa rfc-3576-server</b> command to configure the server. <b>NOTE:</b> This parameter can only be used on the master switch.		
udp-port	UDP port to receive server requests.	0-65535	3799
source-inter face	Interface for all outgoing RADIUS packets. The IP address of the specified interface is included in the IP header of RADIUS packets. The interface can be one of the following:		
loopback	The loopback interface.	—	—
vlan	The specified VLAN.	—	—

### Usage Guidelines

This command configures global RADIUS server parameters. If the **aaa authentication-server radius** command configures a server-specific NAS IP, the server-specific IP address is used instead.

### Example

The following command configures a global NAS IP address sent in RADIUS packets:

```
(host) (config) #ip radius nas-ip 192.168.1.245
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	The <b>ip radius rfc-3576-server udp-port</b> command requires the ESI license. Other commands are available in the base operating system.	Config mode on master and local switches

## ip route

```
ip route <dest-ipaddr> <netmask> {<nexthop> [<cost>]|ipsec <map>}
```

### Description

This command configures a static route on the switch.

### Syntax

Parameter	Description
route	IP address and netmask of the destination network.
<nexthop>	IP address of the forwarding router.
<cost>	(Optional) Cost associated with this route. You can specify a cost to prioritize routes to the same destination. The lower the cost, the higher the priority.
ipsec	Name of the IPsec map for this route.

### Usage Guidelines

This command configures a static route on the switch other than the default gateway. Use the **ip default-gateway** command to set the default gateway to the IP address of the interface on the upstream router or switch to which you connect the switch.

### Example

The following command configures a static route:

```
(host) (config) #ip route 172.16.0.0 255.255.0.0 10.1.1.1
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	The <b>ipsec</b> parameter requires the VPN server license. Other commands are available in the base operating system.	Config mode on master and local switches

## ipv6 access-list session

```
ipv6
ipv6 access-list session <name>
  <source> <dest> <service> <action> [<extended action>]
  no ...
```

### Description

This command configures a session access control list (ACL) for use with IPv6 clients.

### Syntax

Parameter	Description
session	Enter a name for this ACL
<source>	The traffic source, which can be one of the following: <ul style="list-style-type: none"><li>● <b>alias</b>: specify the network resource</li></ul> <b>NOTE:</b> This release does not support IPv6 aliases. You cannot configure an alias for an IPv6 host or network. <ul style="list-style-type: none"><li>● <b>any</b>: match any traffic</li><li>● <b>host</b>: specify a single host IPv6 address (for example, 2002:d81f:f9f0:1000:c7e:5d61:585c:3ab)</li><li>● <b>network</b>: specify an IPv6 address and netmask (for example, 2002:ac10:fe::ffff:ffff:.)</li><li>● <b>user</b>: represents the IPv6 address of the user</li></ul>
<dest>	The traffic destination, which can be one of the following: <ul style="list-style-type: none"><li>● <b>alias</b>: specify the network resource (use the show netdestination command to see configured aliases)</li></ul> <b>NOTE:</b> This release does not support IPv6 aliases. You cannot configure an alias for an IPv6 host or network. <ul style="list-style-type: none"><li>● <b>any</b>: match any traffic</li><li>● <b>host</b>: specify a single host IPv6 address (for example, 2002:d81f:f9f0:1000:c7e:5d61:585c:3ab)</li><li>● <b>network</b>: specify an IPv6 address and netmask (for example, 2002:ac10:fe::ffff:ffff:.)</li><li>● <b>user</b>: represents the IPv6 address of the user</li></ul>
<service>	Network service, which can be one of the following: <ul style="list-style-type: none"><li>● IP protocol number (0-255)</li><li>● name of a network service (use the show netservice command to see configured services)</li></ul> <b>NOTE:</b> Not all network services supported with IPv4 sessions ACLs are supported for IPv6. For example, you cannot use voice-related services (such as SIP or H323) for IPv6 session ACLs. <ul style="list-style-type: none"><li>● <b>any</b>: match any traffic</li><li>● <b>tcp</b>: specify the TCP port number (0-65535)</li><li>● <b>udp</b>: specify the UDP port number (0-65535)</li></ul>
<action>	Action if rule is applied, which can be one of the following: <ul style="list-style-type: none"><li>● <b>deny</b>: reject packets</li><li>● <b>permit</b>: forward packets</li></ul>

<extended action>	<p>Optional action if rule is applied, which can be one of the following:</p> <ul style="list-style-type: none"> <li>● <b>blacklist</b>: blacklist user</li> <li>● <b>disable-scanning</b>: pause ARM scanning while traffic is present</li> <li>● <b>dot1p-priority</b>: specify 802.1p priority (0-7)</li> <li>● <b>log</b>: generate a log message</li> <li>● <b>mirror</b>: mirror all session packets to datapath or remote destination</li> <li>● <b>position</b>: specify the position of the rule (1 is first, default is last)</li> <li>● <b>queue</b>: assign flow to priority queue (high/low)</li> <li>● <b>send-deny-response</b>: if &lt;action&gt; is deny, send an ICMP notification to the source</li> <li>● <b>time-range</b>: specify time range for this rule (configured with time-range command)</li> <li>● <b>tos</b>: specify ToS value (0-63)</li> </ul>
no	Negates any configured parameter.

## Usage Guidelines

Session ACLs define traffic and firewall policies on the switch. You can configure multiple rules for each policy, with rules evaluated from top (1 is first) to bottom. The first match terminates further evaluation. Generally, you should order more specific rules at the top of the list and place less specific rules at the bottom of the list. The ACL ends with an implicit deny all.

Do not use VLAN pooling if you enable IPv6 forwarding on the switch, as VLAN pooling will flood IPv6 multicast packets for all VLANs that are part of the VLAN pool. This can cause autoconfigured clients to acquire multiple IPv6 addresses (one for each vlan in the pool) making those clients behave unpredictably. If you need to work around this limitation, you can unicast BC/MC traffic to every station. To enable this workaround, you must enable the wlan ssid-profile battery-boost option, and install a wlan voice license.

## Example

The following command configures a session ACL that permits traffic from an IPv6 subnetwork:

```
(host) (config) #ipv6 access-list session allow-ipv6-clients
network 2002:ac10:fe:: ffff:ffff:ffff:: any any permit
```

## Command History

Introduced in AOS-W 3.3

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires Policy Enforcement Firewall license	Config mode on master switches

## ipv6 firewall

### ipv6 firewall

```
attack-rate {ping <number>|session <number>|tcp-syn <number>}
deny-inter-user-bridging |
drop-ip-fragments |
enable-per-packet-logging |
enforce-tcp-handshake |
prohibit-ip-spoofing |
prohibit-rst-replay |
session-idle-timeout <seconds> |
session-mirror-destination {ip-address <ipaddr>}|{port <slot/<port>}
```

### Description

This command configures firewall options on the switch for IPv6 traffic.

### Syntax

Parameter	Description	Range	Default
attack-rate	Sets rates which, if exceeded, can indicate a denial of service attack.		
ping	Number of ICMP pings per second, which if exceeded, can indicate a denial of service attack. Recommended value is 4	1-255	—
session	Number of TCP or UDP connection requests per second, which if exceeded, can indicate a denial of service attack. Recommended value is 32.	1-255	—
tcp-syn	Number of TCP SYN messages per second, which if exceeded, can indicate a denial of service attack. Recommended value is 32.	1-255	—
deny-inter-user-bridging	Prevents the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic. This option can be used to prevent Appletalk or IPX traffic from being forwarded.	—	disabled
drop-ip-fragments	When enabled, all IP fragments are dropped. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled
enable-per-packet-logging	Enables logging of every packet if logging is enabled for the corresponding session rule. Normally, one event is logged per session. If you enable this option, each packet in the session is logged. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative, as doing so may create unnecessary overhead on the switch.	—	disabled
enforce-tcp-handshake	Prevents data from passing between two clients until the three-way TCP handshake has been performed. This option should be disabled when you have mobile clients on the network as enabling this option will cause mobility to fail. You can enable this option if there are no mobile clients on the network.	—	disabled
prohibit-ip-spoofing	Detects IP spoofing (where an intruder sends messages using the IP address of a trusted client). When this option is enabled, IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.	—	disabled
prohibit-rst-replay	Closes a TCP connection in both directions if a TCP RST is received from either direction. You should not enable this option unless instructed to do so by an Alcatel-Lucent representative.	—	disabled

Parameter	Description	Range	Default
session-idle-timeout	Time, in seconds, that a non-TCP session can be idle before it is removed from the session table. You should not modify this option unless instructed to do so by an Alcatel-Lucent representative.	16-259	15 seconds
session-mirror-destination	Destination to which mirrored session packets are sent. The destination can be either an IPv4 address or a switch port. You configure IPv6 flows to be mirrored with the <b>mirror</b> option of the <b>ipv6 access-list session</b> command. Use this option only for troubleshooting or debugging.	—	—
ip-address <ipaddr>	Send mirrored session packets to the specified IP address		
port <slot>/ <port>	Send mirrored session packets to the specified switch port.		

## Usage Guidelines

This command configures global firewall options on the switch for IPv6 traffic.

## Example

The following command disallows forwarding of non-IP frames between IPv6 clients:

```
(host) (config) #ipv6 firewall deny-inter-user-bridging
```

## Command History

Introduced in AOS-W 3.3

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system, except for noted parameters	Config mode on master switches

## license

```
license {add <key>|del <key>|export <filename>|import <filename>|report <filename>}
```

### Description

This command allows you to install, delete, and manage software licenses on the switch.

### Syntax

Parameter	Description
add	Installs the software license key in the switch. The key is normally sent to you via email.
del	Removes the software license key from the switch. The key is normally sent to you via email.
export	Exports the license database on the switch to the specified file in flash.
import	Replaces the license database on the switch with the specified file in flash. The system serial numbers referenced in the imported file must match the numbers on the switch.
report	Saves a license report to the specified file in flash.

### Usage Guidelines

Obtain an Alcatel-Lucent software license certificate from your Alcatel-Lucent sales representative or authorized reseller. Use the certificate ID and the system serial number to obtain a software license key which you install in the switch.

---

Users that are not very familiar with this procedure may wish to use the License Management page in the WebUI to install and manage licenses on the switch.

---

### Example

The following command adds a license key on the switch:

```
license add 890BobXs-cVPCb3aJ-7FbCijhZ-BuQPtuI4-RjLJW6Pl-n5K
```

### Command History

Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master and local switches

## localip

```
localip <ipaddr> ipsec <key>
```

### Description

This command configures the IP address and preshared key for the local switch on a master switch.

### Syntax

Parameter	Description
<ipaddr>	IP address of the local switch. Use the 0.0.0.0 address to configure a global preshared key for all inter-switch communications.
ipsec	Preshared key, which must be between 6-64 characters.

### Usage Guidelines

Use this command on a master switch to configure the IP address and preshared key for communication with a local switch. On the local switch, use the **masterip** command to configure the IP address and preshared key for the master switch.

### Example

The following command configures the local switch on a master switch:

```
(host) (config) #localip 0.0.0.0 ipsec gw1234xyz
```

### Command History

Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## local-userdb add

localuserdb

```
local-userdb add {generate-username|username <name>} {generate-password|password <passwd>} [comment <g_comments>][email <email>] [expiry {duration <minutes>|time <hh/mm/yyyy> <hh:mm>}] [guest-company <g_company>][guest-fullname <g_fullname>][guest-phone <g-phone>][mode disable][opt-field-1 <opt1>][opt-field-2 <opt2>][opt-field-3 <opt3>][opt-field-4 <opt4>][role <role>][sponsor-dept <sp_dept>][sponsor-mail <sp_email>][sponsor-fullname <sp_fullname>][sponsor-name <sp_name>][start-time <mm/dd/yyyy> <hh.mm>]
```

### Description

This command creates a user account entry in the switch's internal database.

### Syntax

Parameter	Description	Range	Default
generate-username	Automatically generate and add a username.	—	—
username	Add the specified username.	1 – 64 characters	—
generate-password	Automatically generate a password for the username.	—	—
password	Add the specified password for the username.	6 – 128 characters	—
comments	Comments added to the user account.	—	—
email	Email address for the user account.	—	—
expiry	Expiration for the user account. If this is not set, the account does not expire.	—	no expiration
duration	Duration, in minutes, for the user account.	1-2147483647	—
time	Date and time, in mm/dd/yyyy and hh:mm format, that the user account expires.	—	—
guest-company	Name of the guest's company. <b>NOTE:</b> A guest is the person who needs guest access to the company's Alcatel-Lucent wireless network.		
guest-fullname	The guest's full name.		
guest-phone	The guest's phone number.		
mode	Enables or disables the user account,	—	Disable
opt-field-1	This category can be used for some other purpose. For example, the optional category fields can be used for another person, such as a "Supervisor." You can enter username, full name, department and Email information into the optional fields.	—	—
opt-field-2	Same as opt-field-1.	—	—
opt-field-3	Same as opt-field-1.	—	—
opt-field-4	Same as opt-field-1.	—	—

Parameter	Description	Range	Default
role	Role for the user. This role takes effect when the internal database is specified in a server group profile with a server derivation rule. If there is no server derivation rule configured, then the user is assigned the default role for the authentication method.	—	guest
sponsor-dept	The guest sponsor's department name <b>NOTE:</b> A sponsor is the guest's primary contact for the visit.	—	—
sponsor-email	The sponsor's email address.	—	—
sponsor-fullname	The sponsor's full name.	—	—
sponsor-name	The sponsor's name.	—	—
start-time	Date and time, in mm/dd/yyyy and hh:mm format, the guest account begins.	—	—

## Usage Guidelines

When you specify the internal database as an authentication server, client information is checked against the user accounts in the internal database. You can modify an existing user account in the internal database with the `local-userdb modify` command, or delete an account with the `local-userdb del` command.

By default, the internal database in the master switch is used for authentication. Issue the `aaa authentication-server internal use-local-switch` command to use the internal database in a local switch; you then need to add user accounts to the internal database in the local switch.

## Example

The following command adds a user account in the internal database with an automatically-generated username and password:

```
(host) #local-userdb add generate-username generate-password expiry duration 480
```

The following information is displayed when you enter the command:

```
GuestConnect
Username: guest4157
Password: cDFD1675
Expiration: 480 minutes
```

## Related Commands

## Command History

Version	Modification
AOS-W 3.0	Introduced for the first time.
AOS-W 3.4	The <b>guest, sponsor and optional field</b> parameters were added.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system. The <b>role</b> parameter requires the PEF license.	Enable mode on master switches.

## local-userdb del

```
local-userdb {del username <name>|del-all}
```

### Description

This command deletes entries in the switch's internal database.

### Syntax

Parameter	Description
del username	Deletes the user account for the specified username.
del-all	Deletes all entries in the internal database.

### Usage Guidelines

User account entries created with expirations are automatically deleted from the internal database at the specified expiration. Use this command to delete an entry before its expiration or to delete an entry that was created without an expiration.

### Example

The following command deletes a specific user account entry:

```
(host)#local-userdb del username guest4157
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## local-userdb export

local-userdb export <filename>

### Description

This command exports the internal database to a file.

---

Use this command with caution. It replaces the existing users with user entries from the imported file.

---

### Syntax

Parameter	Description
export	Saves the internal database to the specified file in flash.

### Usage Guidelines

After using this command, you can use the **copy** command to transfer the file from flash to another location.

### Example

The following command saves the internal database to a file:

```
(host)#local-userdb export jan-userdb
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## local-userdb fix-database

local-userdb fix-database

### Description

This command deletes and reinitializes the internal database.

### Syntax

No parameters.

### Usage Guidelines

Before using this command, you can save the internal database with the **local-userdb export** command.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## local-userdb import

```
local-userdb import <filename>
```

### Description

This command replaces the internal database with the specified file from flash.

### Syntax

Parameter	Description
import	Replaces the internal database with the specified file.

### Usage Guidelines

This command replaces the contents of the internal database with the contents in the specified file. The file must be a valid internal database file saved with the `local-userdb export` command.

### Example

The following command imports the specified file into the internal database:

```
(host)#local-userdb import jan-userdb
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## local-userdb maximum-expiration

local-userdb maximum-expiration <minutes>

### Description

This command configures the maximum time, in minutes, that a guest account in the internal database can remain valid.

### Syntax

Parameter	Description	Range
maximum-expiration	Maximum time, in minutes, that a guest account in the internal database can remain valid.	1-2147483647

### Usage Guidelines

The user in the guest-provisioning role cannot create guest accounts that expire beyond the configured maximum time. This command is not available to the user in the guest-provisioning role.

### Example

The following command sets the maximum time for guest accounts in the internal database to 8 hours (480 minutes):

```
(host)#local-userdb maximum-expiration 480
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Configuration mode on master switches.

## local-userdb modify

```
local-userdb modify username <name> [comments <g_comments>][email <email>] [expiry {duration <minutes>|time <hh/mm/yyyy> <hh:mm>}] [guest-company <g_company>][guest-fullname <g_fullname>][guest-phone <g-phone>][mode disable][opt-field-1 <opt1>][opt-field-2 <opt2>][opt-field-3 <opt3>][opt-field-4 <opt4>][role <role>][sponsor-dept <sp_dept>][sponsor-mail <sp_email>][sponsor-fullname <sp_fullname>][sponsor-name <sp_name>][start-time <mm/dd/yyyy> <hh.mm>]
```

### Description

This command modifies an existing user account entry in the switch's internal database.

### Syntax

Parameter	Description	Range	Default
username	Name of the existing user account entry.	1 – 64 characters	—
comments	Comments added to the user account.	—	—
email	Email address for the use account.	—	—
expiry	Expiration for the user account. If this is not set, the account does not expire.	—	no expiration
duration	Duration, in minutes, for the user account.	1-2147483647	—
time	Date and time, in mm/dd/yyyy and hh:mm format, that the user account expires.	—	—
guest-company	Name of the guest's company. <b>NOTE:</b> A guest is the person who needs guest access to the company's Alcatel-Lucent wireless network.		
guest-fullname	The guest's full name.		
guest-phone	The guest's phone number.		
mode	Enables or disables the user account,	—	Disable
opt-field-1	This category can be used for some other purpose. For example, the optional category fields can be used for another person, such as a "Supervisor." You can enter username, full name, department and Email information into the optional fields.	—	—
opt-field-2	Same as opt-field-1.	—	—
opt-field-3	Same as opt-field-1.	—	—
opt-field-4	Same as opt-field-1.	—	—
role	Role for the user. The Policy Enforcement Firewall license must be installed	—	guest
sponsor-dept	The guest sponsor's department name <b>NOTE:</b> A sponsor is the guest's primary contact for the visit.	—	—
sponsor-email	The sponsor's email address.	—	—
sponsor-fullname	The sponsor's full name.	—	—
sponsor-name	The sponsor's name.	—	—

Parameter	Description	Range	Default
start-time	Date and time, in mm/dd/yyyy and hh:mm format, the guest account begins.	—	—

## Usage Guidelines

Use the **show local-userdb** command to view the current user account entries in the internal database.

## Example

The following command disables an existing user account in the internal database:

```
(host)# local-userdb modify username guest4157 mode disable
```

## Command History

Version	Modification
AOS-W 3.0	Introduced for the first time.
AOS-W 3.4	The guest, sponsor and optional parameters were added.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches.

## local-userdb send-to-guest

local-userdb send-to-guest

### Description

This command automatically sends email to the guest when the guest user is created.

### Syntax

No parameters.

### Usage Guidelines

A guest is the person who needs guest access to the company's Alcatel-Lucent wireless network. Email is sent directly to the guest after the guest user is created. When configuring the guest provisioning feature, the guest user is generally created by Guest Provisioning user. This is the person who is responsible for signing in guests at your company.

### Example

```
(host) (config) #local-userdb send-to-guest
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Configuration mode on master switches.

## local-userdb send-to-sponsor

local-userdb send-to-sponsor

### Description

This command automatically sends email to the guest's sponsor when the guest user is created.

### Syntax

No parameters.

### Usage Guidelines

The sponsor is the guest's primary contact. Email is sent directly to the guest's sponsor after the guest user is created. When configuring the guest provisioning feature, the sponsor is generally created by the Guest Provisioning user. This is the person who responsible for signing in guests at your company.

### Example

```
(host) (config) #local-userdb send-to-sponsor
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Configuration mode on master switches.

## local-userdb-guest add

local-userdb-guest

```
local-userdb-guest add {generate-username|username <name>} {generate-password|password
<passwd>} [comment <g_comments>][email <email>] [expiry {duration <minutes>|time <hh/
mm/yyy> <hh:mm>}] [guest-company <g_company>][guest-fullname <g_fullname>][guest-phone
<g-phone>][mode disable][opt-field-1 <opt1>][opt-field-2 <opt2>][opt-field-3
<opt3>][opt-field-4 <opt4>][sponsor-dept <sp_dept>][sponsor-mail <sp_email>][sponsor-
fullname <sp_fullname>][sponsor-name <sp_name>]
[start-time <mm/dd/yyyy> <hh.mm>]
```

### Description

This command creates a guest user in a local user database.

### Syntax

Parameter	Description	Range	Default
generate-username	Automatically generate and add a guest username.	—	—
username	Add the specified guest username.	1 – 64 characters	—
generate-password	Automatically generate a password for the username.	—	—
password	Add the specified password for the username.	6 – 128 characters	—
comments	Comments added to the guest user account.	—	—
email	Email address for the guest user account.	—	—
expiry	Expiration for the user account. If this is not set, the account does not expire.	—	no expiration
duration	Duration, in minutes, for the user account.	1-2147483647	—
time	Date and time, in mm/dd/yyy and hh:mm format, that the user account expires.	—	—
guest-company	Name of the guest's company. <b>NOTE:</b> A guest is the person who needs guest access to the company's Alcatel-Lucent wireless network.		
guest-fullname	The guest's full name.		
guest-phone	The guest's phone number.		
mode	Enables or disables the user account,	—	Disable
opt-field-1	This category can be used for some other purpose. For example, the optional category fields can be used for another person, such as a "Supervisor." You can enter username, full name, department and Email information into the optional fields.	—	—
opt-field-2	Same as opt-field-1.	—	—
opt-field-3	Same as opt-field-1.	—	—
opt-field-4	Same as opt-field-1.	—	—
sponsor-dept	The guest sponsor's department name. <b>NOTE:</b> A sponsor is the guest's primary contact for the visit.	—	—

Parameter	Description	Range	Default
sponsor-email	The sponsor's email address.	—	—
sponsor-fullname	The sponsor's full name.	—	—
sponsor-name	The sponsor's name.	—	—
start-time	Date and time, in mm/dd/yyyy and hh:mm format, the guest account begins.	—	—

## Usage Guidelines

When you specify the internal database as an authentication server, client information is checked against the user accounts in the internal database. You can modify an existing user account in the internal database with the **local-userdb-guest modify** command, or delete an account with the **local-userdb-guest del** command.

By default, the internal database in the master switch is used for authentication. Issue the **aaa authentication-server internal use-local-switch** command to use the internal database in a local switch; you then need to add user accounts to the internal database in the local switch.

## Example

The following command adds a guest user in the internal database with an automatically-generated username and password:

```
(host) #local-userdb-guest add generate-username generate-password expiry none
```

The following information is displayed when you enter the command:

```
GuestConnect
Username: guest-5433352
Password: mBgJ6764
Expiration: none
```

## Related Commands

Introduced in AOS-W 3.4.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system. The <b>role</b> parameter requires the PEF license.	Enable and config modes on master switches.

## local-userdb-guest del

```
local-userdb-guest {del username <name>|del-all}
```

### Description

This command deletes entries in the switch's internal database.

### Syntax

Parameter	Description
del username	Deletes the user account for the specified username.
del-all	Deletes all entries in the internal database.

### Usage Guidelines

User account entries created with expirations are automatically deleted from the internal database at the specified expiration. Use this command to delete an entry before its expiration or to delete an entry that was created without an expiration.

### Example

The following command deletes a specific user account entry:

```
(host) #local-userdb-guest del username guest4157
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable and config modes on master switches.

## local-userdb-guest modify

```
local-userdb-guest modify username <name> [comments <g_comments>][email <email>] [expiry {duration <minutes>|time <hh/mm/yyyy> <hh:mm>}] [guest-company <g_company>][guest-fullname <g_fullname>][guest-phone <g-phone>][mode disable][opt-field-1 <opt1>][opt-field-2 <opt2>][opt-field-3 <opt3>][opt-field-4 <opt4>][password <passwd>][sponsor-dept <sp_dept>][sponsor-mail <sp_email>][sponsor-fullname <sp_fullname>][sponsor-name <sp_name>][start-time <mm/dd/yyyy> <hh.mm>]
```

### Description

This command modifies an existing guest user entry in the switch's internal database.

### Syntax

Parameter	Description	Range	Default
username	Name of the existing user account entry.	1 – 64 characters	—
comments	Comments added to the user account.	—	—
email	Email address for the use account.	—	—
expiry	Expiration for the user account. If this is not set, the account does not expire.	—	no expiration
duration	Duration, in minutes, for the user account.	1-2147483647	—
time	Date and time, in mm/dd/yyyy and hh:mm format, that the user account expires.	—	—
guest-company	Name of the guest's company. <b>NOTE:</b> A guest is the person who needs guest access to the company's Alcatel-Lucent wireless network.		
guest-fullname	The guest's full name.		
guest-phone	The guest's phone number.		
mode	Enables or disables the user account,	—	Disable
opt-field-1	This category can be used for some other purpose. For example, the optional category fields can be used for another person, such as a "Supervisor." You can enter username, full name, department and Email information into the optional fields.	—	—
opt-field-2	Same as opt-field-1.	—	—
opt-field-3	Same as opt-field-1.	—	—
opt-field-4	Same as opt-field-1.	—	—
password	User's password	1– 6 characters	—
sponsor-dept	The guest sponsor's department name <b>NOTE:</b> A sponsor is the guest's primary contact for the visit.	—	—
sponsor-email	The sponsor's email address.	—	—
sponsor-fullname	The sponsor's full name.	—	—
sponsor-name	The sponsor's name.	—	—

Parameter	Description	Range	Default
start-time	Date and time, in mm/dd/yyyy and hh:mm format, the guest account begins.	—	—

## Usage Guidelines

Use the **show local-userdb-guest** command to view the current user account entries in the internal database.

## Example

The following command disables an guest user account in the internal database:

```
(host) local-userdb-guest modify username guest4157 mode disable
```

## Command History

Introduced in AOS-W 3.4.

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable and config modes on master switches.

## local-userdb-guest send-email

```
local-userdb-guest send-email <username> [to-guest][to-sponsor]
```

### Description

This command causes the switch to send email to the guest and/or sponsor any time a guest user is created.

Syntax

Parameter	Description	Range	Default
<username>	Name of the guest	1 – 64 characters	—
to-guest	Allows you to send email to the guest user's address.	—	—
to-sponsor	Allows you to send email to the sponsor's email address.	—	—

### Usage Guidelines

This command allows the guest provisioning user or network administrator to causes the switch to send email to the guest and/or sponsor any time a guest user is created.

### Example

The following command causes the switch to send an email to the sponsor alerting them that the guest user “Laura” was just created.

```
(host)# local-userdb-guest send-email Laura to-sponsor
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Enable mode on master switches

## location

location <string>

### Description

This command configures the location of the switch.

### Syntax

Parameter	Description
location	A text string that specifies the system location.

### Usage Guidelines

Use this command to indicate the location of the switch. You can use a combination of numbers, letters, characters, and spaces to create the name. To include a space in the name, use quotation marks to enclose the text string.

To change the existing name, enter the command with a different string. To unconfigure the location, enter "" at the prompt.

### Example

The following command configures the location:

```
(host) (config) #location "Building 10, second floor, room 21E"
```

### Command History

Introduced in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## logging

```
logging <ipaddr>
  [ap-debug <facility>] |
  [bssid-debug <facility>] |
  [essid-debug <facility>] |
  [network <facility>] |
  [security <facility>] |
  [system <facility>] |
  [user <facility>] |
  [user-debug <facility>] |
  [wireless <facility>] |
```

### Description

Use this command to specify the IP address of the remote logging server, as well as facility log types and their associated facility levels.

### Syntax

Parameter	Description	Range	Default
ap-debug <facility>	AP debug logs.	local0 to local7	local1
bssid-debug <facility>	Bssid debug logs.	local0 to local7	local1
essid-debug <facility>	Essid debug logs.	local0 to local7	local1
network <facility>	Network logs.	local0 to local7	local1
security <facility>	Security logs.	local0 to local7	local1
system <facility>	System logs.	local0 to local7	local1
user <facility>	User logs.	local0 to local7	local1
user-debug <facility>	User debug logs.	local0 to local7	local1
wireless <facility>	Wireless logs.	local0 to local7	local1

### Usage Guidelines

The local use facilities (local0, local1, local2, local3, local4, local5, local6, and local7) are not reserved for specific message-generating sources, and can be used for sending syslog messages. Use the `show logging` command to verify that the device sends logging messages.

### Example

The following command adds the remote logging server with the IP address 10.1.2.3 with a user log type using local4.

```
(host) (config) #logging 10.1.2.3 user local4
```

### Command History

Introduced in AOS-W 2.5

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## logging facility

logging facility <facility>

### Description

Use this command to set the facility to use when logging to the remote syslog server.

### Syntax

Parameter	Description	Range
<facility>	The facility to use when logging to a remote syslog server.	local0 to local7

### Usage Guidelines

The local use facilities (local0, local1, local2, local3, local4, local5, local6, and local7) are not reserved for specific message-generating sources, and can be used for sending syslog messages.

### Example

The following command sets the facility to local4.

```
(host) (config) #logging facility local4
```

### Command History

Introduced in AOS-W 2.5

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master switches

## logging level

```
logging level <level> <category> [process <process>] [subcat <subcategory>]
```

### Description

Use this command to set the categories or subcategories and the severity levels of messages that are logged.

### Syntax

Parameter	Description
<level>	The message severity level, which can be one of the following (in order of severity level):
emergencies	(0) Panic conditions that occur when the system becomes unstable.
alerts	(1) Any condition requiring immediate attention and correction.
critical	(2) Any critical conditions, such as hard drive errors.
errors	(3) Error conditions.
warnings	(4) Warning messages.
notifications	(5) Significant events of a non-critical and normal nature.
informational	(6) Messages of general interest to system users.
debugging	(7) Messages containing information for debugging purposes.
<category>	Message category, which can be one of the following:
ap-debug	AP troubleshooting messages. You must specify a debug value.
network	Network messages.
security	Security messages.
system	System messages.
user	User messages.
user-debug	User troubleshooting messages. You must specify a MAC address.
wireless	Wireless messages.
process	Switch process, which can be one of the following:
aaa	AAA logging
ads	Anomaly detection
approc	AP processes
authmgr	User authentication
cfgm	Configuration Manager
crypto	VPN (IKE/IPsec)
cts	Transport service
dbsync	Database synchronization
dhcpd	DHCP packets
esi	External Services Interface
fpapps	Layer 2 and 3 control

Parameter	Description
httpd	Apache
l2tp	L2TP
licensemgr	License manager
localdb	Local database
mobileip	Mobile IP
packetfilter	Packet filtering of messaging and control frames
phonehome	PhoneHome
pim	Protocol Independent Multicast
pppoed	PPPoE
pptp	PPTP
processes	Run-time processes
profmgr	Profile Manager
publisher	Publish subscribe service
rfm	RF Troubleshooting Manager
snmp	SNMP
stm	Station management
syslogdwrap	Syslogd wrap
traffic	Traffic
vrrpd	VRRP
wms	Wireless management (master switch only)
subcat	<p>Message subcategory, which depends upon the message category specified. The following lists the subcategories available for each message category:</p> <ul style="list-style-type: none"> <li>● ap-debug: all</li> <li>● network: all, dhcp, mobility, packet-dump</li> <li>● security: aaa, all, dot1x, firewall, ike, mobility, packet-trace, vpn, webserver</li> <li>● system: all, configuration, messages, snmp, webserver</li> <li>● user: all, captive-portal, dot1x, radius, vpn</li> <li>● user-debug: all, configuration</li> <li>● wireless: all</li> </ul>

## Usage Guidelines

There are eight logging severity levels, each with its associated types of messages. Each level also includes the levels below it. For example, if you set the logging level to informational (6), all messages from level 0 through level 5 (from emergencies through notifications) are also logged. The warnings severity level is set by default for all message categories and subcategories.

## Example

The following command logs critical system messages.

```
logging level critical system
```

## Command History

Introduced in AOS-W 2.5

## Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master and local switches

# login session

login session timeout <minutes>

## Description

This command configures the time a management session (via Telnet or SSH) remains active without user activity.

## Syntax

Parameter	Description	Range	Default
timeout	Number of minutes that a management session remains active without any user activity.	5-60, 0 to disable	15 minutes

## Usage Guidelines

The management user must re-login to the switch after a Telnet or SSH session times out. If you set the timeout value to 0, sessions do not time out.

The TCP session timeout for wireless and wired user sessions through the switch is 15 minutes; this timeout for user sessions is not configurable.

## Example

The following command configures management sessions on the switch to not time out:

```
(host) (config) #login session timeout 0
```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platform	License	Command Mode
Available on all platforms	Requires the Policy Enforcement Firewall license	Config mode on master switches

# logout

logout

## Description

This command exits the current CLI session.

## Syntax

No parameters.

## Usage Guidelines

Use this command to leave the current CLI session and return to the user login.

## Example

The following command exits the CLI session:

```
(host) >logout  
User:
```

## Command History

**This command was available in AOS-W 3.0.**

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	User mode on local or master switches

## mac-address-table

```
mac-address-table static <macaddr> {fastethernet|gigabitethernet} <slot>/<port> vlan <vlan>
```

### Description

This command adds a static entry to the MAC address table.

### Syntax

Parameter	Description	Range
<macaddr>	Media Access Control (MAC) address, in the format xx:xx:xx:xx:xx:xx.	—
<slot>	<slot> is always 1 except for the OmniAccess 6000 Switch, where the slots can be 1, 2, or 3.	—
<port>	Number assigned to the network interface embedded in the switch or in the line card installed in the OmniAccess 6000 Switch. Port numbers start at 0 from the left-most position.	
vlan	ID number of the VLAN.	1-4094

### Usage Guidelines

The MAC address table is used to forward traffic between ports on the switch. The table includes addresses learned by the switch. This command allows you to manually enter static addresses that are bound to specific ports and VLANs.

### Example

The following command configures a MAC address table entry:

```
(host) (config) #mac-address-table static 00:0b:86:f0:05:60 fastethernet 1/12 vlan 22
```

### Command History

Available in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Config mode on master and local switches

## masterip

```
masterip <ipaddr> ipsec <key> [fqdn <fqdn>] [uplink] [vlan <id>]
```

### Description

This command configures the IP address and preshared key for the master switch on a local switch.

### Syntax

Parameter	Description
<ipaddr>	IP address of the master switch.
ipsec <key>	Preshared key, which must be between 6-64 characters.
fqdn <fqdn>	The local switch's Fully Qualified Domain Name (FQDN) used in IKE.
uplink	Use the current active uplink to initiate IKE.
vlan <id>	Vlan interface to initiate IKE. The switch IP address will be used if the VLAN is not specified.

### Usage Guidelines

Use this command on a local switch to configure the IP address and preshared key for communication with the master switch. On the master switch, use the **localip** command to configure the IP address and preshared key for a local switch.

---

Changing the IP address of the master on a local switch requires a reboot of the local switch

---

### Example

The following command configures the master switch on a local switch:

```
(host) (config) #masterip 10.1.1.250 ipsec gw1234567
```

### Command History

Available in AOS-W 3.0

### Command Information

Platform	License	Command Mode
Available on all platforms	Available in the base operating system	Available in Config mode on master and local switches

## master-redundancy

```
master-redundancy
  master-vrrp <id>
  no ...
  peer-ip-address <ipaddr> ipsec <key>
```

### Description

This command associates a VRRP instance with master switch redundancy.

### Syntax

Parameter	Description	Range
master-vrrp	The virtual router ID for the VRRP instance configured with the <b>vrrp</b> command.	1-255
no	Negates any configured parameter.	—
peer-ip-address	IP address of the peer switch for master redundancy.	—
ipsec	Preshared key used to secure communications between the master switches. Specify a key of up to 64 bytes in length.	—

### Usage Guidelines

To maintain a highly redundant network, you can use a switch as a standby for the master switch. The underlying protocol used is VRRP which you configure using the **vrrp** command.

### Example

The following command configures VRRP for the initially preferred master switch:

```
(host) (config) #vrrp 22
  vlan 22
  ip address 10.200.22.254
  priority 110
  preempt
  description Preferred-Master
  tracking master-up-time 30 add 20
  no shutdown
master-redundancy
  master-vrrp 22
  peer-ip-address 192.168.2.1 ipsec qwerTY012
```

The following shows the corresponding VRRP configuration for the peer switch.

```
(host) (config) #vrrp 22
  vlan 22
  ip address 10.200.22.254
  priority 100
  preempt
  description Backup-Master
  tracking master-up-time 30 add 20
  no shutdown
master-redundancy
  master-vrrp 22
  peer-ip-address 192.168.22.1 ipsec qwerTY012
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## mgmt-server

wlan

```
mgmt-server type {amp|other} primary-server <ip-addr> secondary-server <ip-addr>
```

### Description

Register a management server with the switch by specifying the IP address of an AirWave Management Server or any other server that should receive messages from the switch using the Application Monitoring (AMON) protocol.

### Syntax

Parameter	Description
amp	Define an AirWave Management Server.
other	Define any other type of management server.
primary-server <ip-addr>	IP address of the primary management server.
secondary-server <ip-addr>	IP address of the secondary management server.

### Example

The following command defines a primary and secondary Airwave Management server.

```
(host) (config) #mgmt-server type amp primary-server 192.168.6.2 secondary-server 192.168.14.38
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on master switches

## mgmt-user

```
mgmt-user <username> <role> <password>
mgmt-user localauth-disable
mgmt-user ssh-pubkey client-cert <certificate> <username> <role>
mgmt-user webui-cacert <certificate_name> serial <number> <username> <role>
```

### Description

This command configures an administrative user.

### Syntax

Parameter	Description	Default
<username>	Name of the user. You can create a maximum of 10 management users. <b>NOTE:</b> If you configure a root management user, you can use special characters except for double-byte characters.	—
<role>	Role assigned to the user. Predefined roles include: <ul style="list-style-type: none"><li>• guest-provisioning: Allows the user to create guest accounts on a special WebUI page.</li><li>• location-api-mgmt: Permits access to location API information. You can log into the CLI; however, you cannot use any CLI commands.</li><li>• network-operations: Permits access to Monitoring, Reports, and Events pages in the WebUI. You can log into the CLI; however, you can only use a subset of CLI commands to monitor the switch.</li><li>• read-only: Permits access to CLI show commands or WebUI monitoring pages only.</li><li>• root: Permits access to all management functions on the switch.</li></ul>	—
<password>	<b>NOTE:</b> You are prompted for the <password> for this user after you type in <role> and press Enter. The password must have a minimum of six characters. You can use special characters in the management user password. The restrictions are as follows: <ul style="list-style-type: none"><li>• You cannot use double-byte characters</li><li>• You cannot use the question mark (?)</li><li>• You cannot use white space &lt;space &gt;</li></ul>	—
localauth-disable	Disables authentication of management users based on the results returned by the authentication server. To cancel this setting, use the no form of the command: <b>no mgmt-user localauth-disable</b> To verify if authentication of local management user accounts is enabled or disabled, use the following command: show mgmt-user local-authentication-mode	Enabled
ssh-pubkey	Configures certificate authentication of administrative users using the CLI through SSH.	—
client-cert	Name of the X.509 client certificate for authenticating administrative users using SSH.	—
<username>	Name of the user.	—
<role>	Role assigned to the authenticated user.	—
webui-cacert	The client certificate for authenticating administrative users using the WebUI.	—

Parameter	Description	Default
<certificate_name>	The CA certificate. If configured, certificate authentication and authorization are automatically completed using an authentication server.	—
serial	Serial number of the client certificate.	—
<username>	Name of the user.	—
<role>	Role assigned to the authenticated user.	—

## Usage Guidelines

You can configure client certificate authentication of WebUI or SSH management users (by default, only username/password is used). To configure certificate authentication for the WebUI or SSH, use the web-server `mgmt-auth certificate` or `ssh mgmt-auth public-key` commands, respectively.

Use **`webui-cacert <certificate name>`** command if you want an external authentication server to derive the management user role. This is helpful if there are a large number of users who need to be authenticated.

Or, use the if the **`mgmt-user webui-cacert <certificate_name> serial <number> <username> <role>`** if you want the authentication process to use previously configured certificate name and serial number to derive the user role.

## Example

See the web-server and ssh command descriptions for examples of certificate and public key authentication. The following command configures a management user and role:

```
(host) (config) #mgmt-user kgreen root
Password: *****
Re-Type password: *****
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.1	The <b><code>ssh-pubkey</code></b> and <b><code>webui-cacert</code></b> parameters were introduced.
AOS-W 3.2	The <b><code>network-operations</code></b> role was introduced.
AOS-W 3.3	The <b><code>location-api-mgmt</code></b> role and <b><code>localauth-disable</code></b> parameters were introduced.
AOS-W 3.4	The <b><code>webui-cacert &lt;certificate name&gt;</code></b> parameter had additional functionality introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## mobility-manager

```
mobility-manager <ipaddr> user <username> <password> [interval <secs>]  
[retrycount <number>] [udp-port <port>] [rtls <rtls-udp-port>] trap-version {1|2c|3}
```

### Description

This command allows the switch to communicate with an OmniVista Mobility Manager server.

### Syntax

Parameter	Description	Range	Default
<ipaddr>	IP address of the OmniVista Mobility Manager server.	—	—
user	Name and SNMP password for the OmniVista Mobility Manager server user.	—	—
interval	Round-trip time, in seconds, to trap server.	1-65535	60 seconds
retrycount	Number of retries to the OmniVista Mobility Manager server before giving up.	1-65535	3
udp-port	UDP port number for trap server.	0-65535	162
rtls	UDP port number on which RSSI location data should be received from APs.	0-65535	8000
trap-version	Allows the you to specify the SNMP trap version by the remote trap reciever.	1, 2c, or 3	3

### Usage Guidelines

This command needs to be configured before the switch can communicate with the OmniVista Mobility Manager server. This command performs three tasks:

- Configures the IP address of the OmniVista Mobility Manager server. In previous AOS-W releases, this was done with the `mobility-server` command.
- Creates an SNMP version 3 user profile with the configured <username> and <password>. This allows SNMP SETs from the OmniVista Mobility Manager server to be received by the switch. The authentication protocol is Secure Hash Algorithm (SHA) and Data Encryption Standard (DES) is used for encryption. If <username> and <password> match an existing SNMP v3 user profile, the existing one is used. Otherwise, a new profile is created.

This username and password must be used when adding this switch to the OmniVista Mobility Manager server in the OmniVista Mobility Manager Dashboard.

- Allows SNMP traps and notifications to be sent to the OmniVista Mobility Manager server IP address, by adding this OmniVista Mobility Manager server as a trap receiver.
- Optionally enables the OmniVista Mobility Manager server to function as a Real Time Location System (RTLS) server to receive location information via APs from RTLS tags or other devices.

Use the **show mobility-manager** command to check the current status of the configured OmniVista Mobility Manager servers.

### Example

The following command configures the IP address and SNMP user profile for the OmniVista Mobility Manager server:

```
(host) (config)# mobility-manager 10.2.1.245 user mms-user my-password.
```

## Command History

This command was introduced in AOS-W 3.1.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## netdestination

```
netdestination <name>
host <ipaddr> [position <number>] |
invert |
network <ipaddr> <netmask> [position <number>] |
no ... |
range <start-ipaddr> <end-ipaddr> [position <number>]
```

### Description

This command configures an alias for a network host, subnetwork, or range of addresses.

### Syntax

Parameter	Description	Default
<name>	Name for this alias.	—
host	Configure a single host	—
invert	Specifies that the inverse of the network addresses configured are used. For example, if a network of 172.16.0.0 255.255.0.0 is configured, this parameter specifies that the alias matches everything except this subnetwork.	—
network	An IP subnetwork consisting of an IP address and netmask.	—
no	Negates any configured parameter.	—
position	Specifies the position of this network specification relative to other specifications (1 is first, default is the last position). To view current position settings for network destinations, use the command <b>show netdestination network</b> .	(last)
range	A range of IP addresses consisting of sequential addresses between a lower and an upper value. The maximum number of addresses in the range is 16. If larger ranges are needed, convert the range into a subnetwork and use the <b>network</b> parameter.	—

### Usage Guidelines

Aliases can simplify configuration of session ACLs, as you can use an alias when specifying the traffic source and/or destination. Once you configure an alias, you can use it in multiple session ACLs.

### Example

The following command configures an alias for an internal network:

```
(host) (config) #netdestination Internal
network 10.1.0.0 255.255.0.0
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Requires the Policy Enforcement Firewall license.	Config mode on master switches

## netSERVICE

```
netSERVICE <name> {<protocol> | tcp <port> [<port>] | udp <port> [<port>]}  
[ALG <service>]
```

### Description

This command configures an alias for network protocols.

### Syntax

Parameter	Description	Range
netSERVICE	Name for this alias.	—
<protocol>	IP protocol number.	0-255
tcp	Configure an alias for a TCP protocol	
<port>	TCP port number. You can specify a single port number, or define a port range by specifying both the lower and upper port numbers.	0-65535
UDP	Configure an alias for a UDP protocol	
<port>	UDP port number. You can specify a single port number, or define a port range by specifying both the lower and upper port numbers.	0-65535
ALG	Application-level gateway (ALG) for this alias.	—
<service>	Specify one of the following service types: <ul style="list-style-type: none"><li>● <b>dhcp</b>: Service is DHCP</li><li>● <b>dns</b>: Service is DNS</li><li>● <b>ftp</b>: Service is FTP</li><li>● <b>h323</b>: Service is H323</li><li>● <b>noe</b>: Service is Alcatel NOE</li><li>● <b>rtsp</b>: Service is RTSP</li><li>● <b>sccp</b>: Service is SCCP</li><li>● <b>sip</b>: Service is SIP</li><li>● <b>sips</b>: Service is Secure SIP</li><li>● <b>svp</b>: Service is SVP</li><li>● <b>tftp</b>: Service is TFTP</li><li>● <b>vocera</b>: Service is VOCERA</li></ul>	

### Usage Guidelines

Aliases can simplify configuration of session ACLs, as you can use an alias when specifying the network service. Once you configure an alias, you can use it in multiple session ACLs.

### Example

The following command configures an alias for a network service:

```
(host) (config) #netSERVICE HTTP tcp 80
```

### Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## network-printer

```
network-printer [ max-clients <2-20> |  
  max-clients-per-host <1-20> |  
  max-jobs <1-1000> ]
```

### Description

This command allows you to configure client and print job for the USB printer connected to a OmniAccess 4306 series switch.

### Syntax

Parameter	Description
max-clients	Specify the maximum number of clients that can use the printer. Currently, the OmniAccess 4306 series supports a maximum of 20 concurrent clients.
max-clients-per-host	Specify the maximum number of concurrent clients for a single host. Currently, the OmniAccess 4306 series supports a maximum of 20 concurrent clients.
max-jobs	Specify the maximum number of jobs that can be saved in the memory. Currently, the OmniAccess 4306 series switch will support a storage of 1000 jobs.

### Usage Guidelines

Use this command in the config mode.

In the enable mode, you can use the `network-printer delete <printer-name> job <job-id>` command to delete print jobs in specific printer.

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 series	Base operating system	Config or enable mode.

## network-storage

```
network-storage [share <share-name> ]
  share [usb: disk <disk-name> <filesystem-path> mode {read-only | read-write}
  no share
```

### Description

This command allows you to perform the following operation on a network share:

- Configure a file system path for the share—This allows users to access the share from their computer.
- Remove the share access using the `no share` command.

### Syntax

Parameter	Description
share	Enter a name for the share on the switch. After you enter this command, the CLI mode will shift to operations on that share.

### Usage Guidelines

To access the share, you must create a filesystem path to the share. enter:

```
(host) (config-network-storage share)# share usb: disk <disk name> <filesystem path>
mode
```

Where,

*disk name* is the name of the disk. You can also specify the disk alias instead of the disk name.

*filesystem path* is the path to access the share. This path contains the partition name and the shared folder name.

*mode* is the permission settings. You can either specify `read-only` or `read-write` modes.

### Example

The following command associates a share to a file system path and configures the access mode.

```
(host) (config-network-storage share)#share usb: disk Maxtor1TB Maxtor-Basics_Desktop-2HBADMJ4_p1,
documents mode read-write
(host) (config-network-storage share)#show network-storage shares
NAS Shares
-----
Disk Name  Partition Name  Folder Name  Share Name  Share Path
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 series	Base operating system	Enable mode.

## ntp server

```
ntp server <ipaddr> [iburst]
```

### Description

This command configures a Network Time Protocol (NTP) server.

### Syntax

Parameter	Description	Default
<ipaddr>	IP address of the NTP server, in dotted-decimal format.	—
iburst	(Optional) This parameter causes the switch to send up to ten queries within the first minute to the NTP server. This option is considered “aggressive” by some public NTP servers.	disabled

### Usage Guidelines

You can configure the switch to set its system clock using NTP by specifying one or more NTP servers.

### Example

The following command configures an NTP server:

```
(host) (config) #ntp server 10.1.1.245
```

### Command History

Release	Modification
AOS-W 1.0	Command introduced
AOS-W 3.0	The <b>iburst</b> parameter was introduced

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## packet-capture

```
packet-capture [other {disable | enable}] [sysmsg {all | disable | <opcodes>]
[tcp {all | disable | <ports>}] [udp {all | disable | <ports>}]
```

### Description

Use this command to enable or disable packet capturing and set packet capturing options for a single packet capture session.

### Syntax

Parameter	Description	Default
other	Enable or disable all other types of packets. Specify up to ten comma-separated opcodes to capture; use <code>all</code> to sniff all opcodes; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Enabled
sysmsg	Enable or disable internal messaging packets.	Disabled
tcp ports	Enable or disable TCP packet capturing. Specify up to ten comma-separated ports to capture; use <code>all</code> to sniff all TCP ports; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Disabled
udp ports	Enable or disable UDP packet capturing. Specify up to ten comma-separated ports to capture; use <code>all</code> to sniff all UDP ports; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Disabled

### Usage Guidelines

This command applies to control path packets; not datapath packets. Packets can be retrieved through the `tar log` command; look for the `filter.pcap` file. This command activates packet capture options on the current switch. They are not saved and applied across switches.

If you do want to enable a packet capture session without setting values that can be saved and used for another session, use the command `packet-capture`. The related command `packet-capture-defaults` lets you define a set of packet capture options that will run every time you enable the packet capture feature.

### Example

The following command enables packet capturing for debugging a wireless WEP station doing VPN. This example uses the following parameters and values:

- Station up/down: sysmsg opcode 30
- WEP key plumbing: sysmsg opcode 29
- DHCP: sysmsg opcode 90
- IKE: UDP port 500 and 4500
- Layer 2 Tunneling Protocol (L2TP): UDP port 1701

```
(host) #packet-capture sysmsg 30,29,90 udp 500,4500,1701,1812,1645
```

### Command History

This command was introduced in AOS-W 2.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## packet-capture-defaults

```
packet-capture-defaults [other {disable | enable}]  
[sysmsg {all | disable | <opcodes>}] [tcp {all | disable | <ports>}]  
[udp {all | disable | <ports>}]
```

### Description

Use this command to enable or disable packet capturing and define a set of default packet capturing options on the control path for debugging purposes.

### Syntax

Parameter	Description	Default
other	Enable or disable all other types of packets. Specify up to ten comma-separated opcodes to capture; use <code>all</code> to sniff all opcodes; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Enabled
sysmsg	Enable or disable internal messaging packets.	Disabled
tcp ports	Enable or disable TCP packet capturing. Specify up to ten comma-separated ports to capture; use <code>all</code> to sniff all TCP ports; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Disabled
udp ports	Enable or disable UDP packet capturing. Specify up to ten comma-separated ports to capture; use <code>all</code> to sniff all UDP ports; use <code>disable</code> to bypass the <code>all</code> setting. All CLI ports are always skipped.	Disabled

### Usage Guidelines

This command applies to control path packets; not datapath packets. Packets can be retrieved through the `tar log` command; look for the `filter.pcap` file. This command activates packet capture options on the current switch. They are not saved and applied across switches.

### Example

The following command sets the default packet capture values to debug a wireless WEP station doing VPN. Once these default settings are defined, you can use the `packet-capture` command to enable packet capturing with these values. This example uses the following parameters and values:

- Station up/down: sysmsg opcode 30
- WEP key plumbing: sysmsg opcode 29
- DHCP: sysmsg opcode 90
- IKE: UDP port 500 and 4500
- Layer 2 Tunneling Protocol (L2TP): UDP port 1701

```
packet-capture-defaults sysmsg 30,29,90 udp 500,4500,1701,1812,1645
```

Use the `show packet-capture` command to show the current action and the default values.

```
show packet-capture
```

```
Current Active Packet Capture Actions(current switch)
```

```
=====
```

```
Packet filtering TCP with 2 port(s) enabled:
```

```
  2
```

```
  1
```

```
Packet filtering UDP with 1 port(s) enabled:
```

```
  1
```

```
Packet filtering for internal messaging opcodes disabled.
```

```
Packet filtering for all other packets disabled.
```

```
Packet Capture Defaults(across switches and reboots if saved)
```

```
=====
```

```
Packet filtering TCP with 2 port(s) enabled:
```

```
  2
```

## Command History

This command was introduced in AOS-W 2.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## page

page <length>

### Description

This command sets the number of lines of text the terminal will display when paging is enabled.

### Syntax

Parameter	Description	Range
length	Specifies the number of lines of text displayed.	24 - 100

### Usage Guidelines

Use this command in conjunction with the **paging** command to specify the number of lines of text to display. For more information on the pause mechanism that stops the command output from printing continuously to the terminal, refer to the command [“paging” on page 309](#).

If you need to adjust the screen size, use your terminal application to do so.

### Example

The following command sets 80 as the number of lines of text displayed:

```
(host) (config) #page 80
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config and Enable mode on master switches

# paging

paging

## Description

This command stops the command output from printing continuously to the terminal.

## Syntax

### No parameters

## Usage Guidelines

By default, paging is enabled.

With paging enabled, there is a pause mechanism that stops the command output from printing continuously to the terminal. If paging is disabled, the output prints continuously to the terminal. To disable paging, use the **no paging** command. You must be in enable mode to disable paging.

The paging setting is active on a per-user session. For example, if you disable paging from the CLI, it only affects that session. For new or existing sessions, paging is enabled by default.

You can also configure the number of lines of text displayed when paging is enabled. For more information, refer to the command [“page” on page 308](#).

If you need to adjust the screen size, use your terminal application to do so.

## Example

The following command enables paging:

```
(host) (config) #paging
```

## Command History

This command was introduced in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config and Enable mode on master switches

# panic

```
panic {clear | info {file <filename> <symbolfile>|nvram <symbolfile>} | list {file <filename>|nvram} | save <filename>}
```

## Description

This command manages information created during a system crash.

## Syntax

Parameter	Description
clear	Removes panic information from non-volatile random access memory (NVRAM).
info	Displays the content of specified panic files.
list	Lists panic information in the specified file in flash or in NVRAM.
save	Saves panic information from NVRAM into the specified file in flash.

## Usage Guidelines

To troubleshoot system crashes, use the **panic save** command to save information from NVRAM into the specified file, then use the **panic clear** command to clear the information from NVRAM.

## Example

The following command lists panic information in NVRAM:

```
(host) #panic list nvram
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## papi-security

```
papi-security
  key <key>
  [enhanced-security]
  no...
```

### Description

The papi-security command is used by the Alcatel-Lucent system to enforce advanced security options and provides an enhanced level of security.

---

Alcatel-Lucent recommends that customers work closely with the Alcatel-Lucent TAC department before modifying default settings.

---

### Syntax

Parameter	Description	Default
key	The key authenticates the messages between systems.	—
key	The key string.	Range: 10–64 characters
enhanced-security	Allows you to use the enhanced security mode. This mode causes the system to reject messages when an incorrect key is used.	disabled
no key	Reverts to the default key.	—

### Usage Guidelines

This command allows you to use advanced options which regulate the switch and AP communication. One way PAPI messages are authenticated is through a shared secret key. The papi-security command lets you configure a key on the master switch which then distributes it to other switches and APs, thus allowing each site to have a unique key. If no key is configured, then the switch uses the default key.

When enhanced-security mode is disabled, any AP can obtain the current shared secret key.

When enhanced-security mode is enabled, an AP is not updated with the new shared secret key unless the AP knows the previous key and the AP is updated with the new key within one hour of the key creation.

---

Make sure that the enhanced-security mode is disabled before installing new APs.

---

If an AP cannot be authenticated because it has the wrong key, the show ap database command displays a “Bad key” status.

### Example

This example sets a unique shared secret key called “testkey123” on the master switch.

```
(host) (config) #papi-security
(host) (PAPI Security Profile) #
(host) (PAPI Security Profile) #key testkey123
(host) (PAPI Security Profile) #exit
```

### Related Commands

```
(host) (config) #show papi-security
(host) (config) #show ap database
```

## Command History

This command was introduced in AOS-W 3.4

## Command Information

Platform	License	Command Mode
Available on all platforms	Base operating system	Config mode on master switches

## pcap

```
pcap {raw-start <ipaddr> <target-ipaddr> <target-port> <format> [bssid <bssid>]
[channel <number>] [maxlen <maxlen>]}|{interactive <am-ip> <filter> <target-ipaddr>
<target-port> [bssid <bssid>] [channel <number>]}|{clear|pause|resume|stop <am-ip> <id>
[bssid <bssid>]}
```

### Description

These commands manage packet capture (PCAP) on Alcatel-Lucent air monitors.

### Syntax

Parameter	Description
raw-start	Stream raw packets to an external viewer.
<ipaddr>	IP address of the air monitor collecting packets.
<target-ipaddr>	IP address of the client station running Wildpacket's AiroPeek monitoring application.
<target-port>	UDP port number on the client station where the captured packets are sent.
<format>	Specify a number to indicate one of the following formats for captured packets: <ul style="list-style-type: none"><li>● 0 : pcap</li><li>● 1 : peek</li><li>● 2 : airmagnet</li><li>● 3 : pcap+radio header</li><li>● 4 : ppi</li></ul>
bssid	(Optional) BSSID of the Air Monitor interface for the PCAP session.
<bssid>	BSSID of the Air Monitor Interface, which is usually its MAC address.
channel	(Optional) Number of a radio channel to tune into to capture packets
maxlen	(Optional) Limit the length of 802.11 frames to include in the capture to a specified maximum.
<maxlen>	(Optional) Maximum number of packets to be captured.
interactive	Start an interactive packet capture session.
<am-ip>	IP address of the air monitor collecting packets.
<filter-spec>	Packet Capture filter specification.
<target-ipaddr>	IP Address of host to which the frames should be sent
<target-port>	UDP Port Number to which the frames should be sent
bssid	(Optional) Specify the BSSID of the Air Monitor interface for the PCAP session.
<bssid>	BSSID of the Air Monitor Interface, which is usually its MAC address.
channel	(Optional) Number of a radio channel to tune into to capture packets
clear	Clears the packet capture session.
pause	Pause a packet capture session.
resume	Resume a packet capture session.
start	Start a new packet capture session.
stop	Stop a packet capture session.
<am-ip>	IP address of the air monitor collecting packets.

Parameter	Description
<id>	ID of the PCAP session.
bssid	(Optional) Specify the BSSID of the Air Monitor interface for the PCAP session.
<bssid>	BSSID of the Air Monitor Interface, which is usually its MAC address.

## Usage Guidelines

These commands direct an Alcatel-Lucent air monitor to send packet captures to the Wildpacket's AiroPeek monitoring application on a remote client. The AiroPeek application listens for packets sent by the air monitor.

The following pcap commands are available:

Command	Description
clear	Clears the packet capture session.
pause	Pause a packet capture session.
resume	Resume a packet capture session.
start	Start a new packet capture session.
stop	Stop a packet capture session.

Before using these commands, you need to start the AiroPeek application on the client and open a capture window for the air monitor. The AiroPeek application cannot be used to control the flow or type of packets sent from Alcatel-Lucent air monitors.

The AiroPeek application processes all packets, however, you can apply display filters on the capture window to control the number and type of packets being displayed. In the capture window, the time stamp displayed corresponds to the time that the packet is received by the client and is not synchronized with the time on the Alcatel-Lucent air monitor.

## Example

The following command starts a raw packet capture session for the air monitor at 10.100.100.1 and sends the packets to the client at 192.168.22.44 on port 604 with pcap format:

```
(host) (config) #pcap raw-start 10.100.100.1 192.168.22.44 604 0
```

## Command History

Version	Change
AOS-W3.0	Command Introduced
AOS-W3.4	The <b>maxlen</b> parameter was introduced, and the <b>pcap start</b> command deprecated.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## ping

ping <ipaddress>

### Description

This command sends five ICMP echo packets to the specified ip address.

### Syntax<

Parameter	Description
<ipaddress>	Destination IP Address

### Usage Guidelines

You can send five ICMP echo packets to a specified IP address. The switch times out after two seconds.

### Example

The following example pings 10.10.10.5.

```
(host) >ping 10.10.10.5
```

The sample switch output is:

```
Press 'q' to abort.
```

```
Sending 5, 100-byte ICMP Echos to 10.10.10.5, timeout is 2 seconds:!!!!!
```

```
Success rate is 100 percent (5/5), round-trip min/avg/max = 0.408/0.5434/1.073 ms
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	User, Enable, and Config modes on master switches

## pkt-trace

```
pkt-trace acl <acl-name> {enable|disable} [trace {cptrace|pktrace} [trace-mask <tmask>]] ]
```

### Description

Enable packet tracing in the datapath. Use this feature only under the supervision of Alcatel-Lucent technical support.

### Syntax

Parameter	Description
<acl-name>	Enable packet tracing for the specified access-control list.
enable	Enable packet tracing for the ACL.
disable	Disable packet tracing for the ACL.
cptrace	Send packet trace data into the Control Processor.
pktrace	Write packet trace data in the packet.
tracemask <tmask>	Specify a the trace mask. This value will be provided by Alcatel-Lucent technical support.

### Example

The following example enables packet tracing for the traffic matching the acl **stateful-dot1x**.

```
(host) #pkt-trace acl stateful-dot1x enable trace cptrace trace-mask <val>
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## pkt-trace-global

```
pkt-trace-global {enable|disable} [trace-mask <tmask>]
```

### Description

Enable global packet tracing in the datapath. Use this feature only under the supervision of Alcatel-Lucent technical support.

### Syntax

Parameter	Description
<acl-name>	Enable packet tracing for the specified access-control list.
enable	Enable global packet tracing for the ACL.
disable	Disable global packet tracing for the ACL.
tracemask <tmask>	Specify a trace mask. Use this feature only under the supervision of Alcatel-Lucent technical support.

### Example

The following command enables the global packet tracing for all traffic.

```
(host) (config) #pkt-trace-global enable
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## pptp ip local pool

```
pptp ip local pool <pool> <ipaddr> [<end-ipaddr>]
```

### Description

This command configures an IP address pool for VPN users using Point-to-Point Tunneling Protocol (PPTP).

### Syntax

Parameter	Description
<pool>	User-defined name for the address pool.
<ipaddr>	Starting IP address for the pool.
<end-ipaddr>	Ending IP address for the pool.

### Usage Guidelines

If VPN is used as an access method, you specify the pool from which the user's IP address is assigned when the user negotiates a PPTP session. Use the **show vpdn pptp local** command to see the used and free addresses in the pool.

PPTP is an alternative to IPsec that is supported by various hardware platforms. PPTP is considered to be less secure than IPsec but also requires less configuration. You configure PPTP with the **vpdn** command.

### Example

The following command configures an IP address pool for PPTP VPN users:

```
(host) (config) #pptp ip local pool pptp-pool1 172.16.18.1 172.16.18.24
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Requires a VPN server license	Config mode on master switches

## priority-map

```
priority-map <name>
  dot1p <priority> high
  dscp <priority> high
  no ...
```

### Description

This command configures the Type of Service (ToS) and Class of Service (CoS) values used to map traffic into high priority queues.

### Syntax

Parameter	Description	Range
<name>	User-defined name of the priority map.	—
dot1p	IEEE 802.1p priority value, or a range of values separated by a dash (-).	0-7
dscp	Differentiated Services Code Point (DSCP) priority value, or a range of values separated by a dash (-).	0-63
no	Negates any configured parameter.	—

### Usage Guidelines

This command allows you to prioritize inbound traffic that is already tagged with 802.1p and/or IP ToS in hardware queues. You apply configured priority maps to ports on the switch (using the **interface fastethernet** or **interface gigabitethernet** command). This causes the switch to inspect inbound traffic on the port; when a matching QoS tag is found, the packet or flow is mapped to the specified queue.

### Example

The following commands configure a priority map and apply it to a port:

```
(host) (config) #priority-map pri1
  dscp 4-20 high
  dscp 60 high
  dot1p 4-7 high
interface gigabitethernet 1/24
  priority-map pri1
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## process monitor

```
process monitor log|restart|
```

### Description

The process monitor watchdog validates the integrity of processes every 120 seconds. If a process does not respond during three consecutive 120-second timeout intervals, that process is flagged as nonresponsive and the process monitor will create a log message, restart the process or reboot the switch

### Syntax

Parameter	Description
log	The process monitor watchdog creates a log message when a process fails to responding properly. This is the default behavior for the process monitor
restart	This parameter enables strict behavior for runtime processes. When you enable this option, the process monitor watchdog will restart processes that fail to responding properly.

### Usage Guidelines

The CLI command **process monitor log** enables logging for process monitoring. By default, whenever a process does not update a required file or send a heartbeat pulse within the required time limit, the process monitor records a critical log message, but does not restart any process. If you want the configure watchdog to restart a process once it fails to respond, use the CLI **command process monitor restart**.

### Example

The following changes the default process monitor behavior, so the process monitor restarts nonresponsive processes.

```
(host) #process monitor restart
```

### Related Commands

The show **process monitor statistics** command displays the current status of all the processes running under the process monitor watchdog. A partial example of the output of this command is show below:

```
show process monitor statistics
```

```

## prompt

prompt <prompt>

### Description

This command changes the prompt text.

### Syntax.

Parameter	Description	Range	Default
prompt	The prompt text displayed by the switch.	1–64	<hostname>

### Usage Guidelines

You can use any alphanumeric character, punctuation, or symbol character. To use spaces, plus symbols (+), question marks (?), or asterisks (\*), enclose the text in quotes.

You cannot alter the parentheses that surround the prompt text, or the greater-than (>) or hash (#) symbols that indicate user or enable CLI mode.

### Example

The following example changes the prompt text to “It’s a new day!”.

```
(host) (config) #prompt "It's a new day!"  
(It's a new day!) (config) #
```

### Command History

```

### Description

This command provisions or reprovisions an AP.

## Syntax

Parameter	Description	Range	Default
a-ant-bearing	Determines the horizontal coverage distance of the 802.11a (5GHz) antenna from True North. From a planning perspective, the horizontal coverage pattern does not consider the elevation or vertical antenna pattern. <b>NOTE:</b> This parameter is supported on outdoor APs only. If you use this parameter to configure an indoor AP, an error message is displayed.	0-360 Decimal Degrees	—
a-ant-gain	Antenna gain for 802.11a (5GHz) antenna.	—	—
a-ant-tilt-angle	Directs the angle of the 802.11a (5GHz) antenna for optimum coverage. Use a - (negative) value for downtilt and a + (positive) value for uptilt. <b>NOTE:</b> This parameter is supported on outdoor APs only. If you use this parameter to configure an indoor AP, an error message is displayed.	-90 to +90 Decimal Degrees	—
a-antenna	Antenna use for 5 GHz (802.11a) frequency band. <ul style="list-style-type: none"> <li>1: Use antenna 1</li> <li>2: Use antenna 2</li> <li>both: Use both antennas</li> </ul>	1, 2, both	both
altitude	Altitude, in meters, of the AP. <b>NOTE:</b> This parameter is supported on outdoor APs only. If you use this parameter to configure an indoor AP, an error message is displayed.	—	—
ap-group	Name of the AP group to which the AP belongs.	—	“default”
ap-name	Name for this AP.	—	—
copy-provisioning-params	Initializes the provisioning-params workspace with the current provisioning parameters of the specified AP. The provisioning parameters of the AP must have previously been retrieved with the <b>read-bootinfo</b> option. <b>NOTE:</b> This parameter can only be used on the master switch.	—	—
dns-server-ip	IP address of the DNS server for the AP.	—	—
domain-name	Domain name for the AP.	—	—
external-antenna	Use an external antenna with the AP.	—	—
fqln	Fully-qualified location name (FQLN) for the AP, in the format <APname.floor.building.campus>.	—	—
g-ant-bearing	Determines the horizontal coverage distance of the 802.11g (2.4GHz) antenna from True North. From a planning perspective, the horizontal coverage pattern does not consider the elevation or vertical antenna pattern. <b>NOTE:</b> This parameter is supported on outdoor APs only. If you use this parameter to configure an indoor AP, an error message is displayed.	0-360 decimal degrees	—
g-ant-gain	Antenna gain for 802.11g (2.4GHz) antenna.	—	—

Parameter	Description	Range	Default
g-ant-tilt-angle	Directs the angle of the 802.11g (2.4GHz) antenna for optimum coverage. Use a - (negative) value for downtilt and a + (positive) value for uptilt. <b>NOTE:</b> This parameter is supported on outdoor APs only. If you use this parameter to configure an indoor AP, an error message is displayed.	-90 to +90 Decimal Degrees	—
g-antenna	Antenna use for 2.4 GHz (802.11g) frequency band. <ul style="list-style-type: none"> <li>1: Use antenna 1</li> <li>2: Use antenna 2</li> <li>both: Use both antennas</li> </ul>	1, 2, both	both
gateway	IP address of the default gateway for the AP.	—	—
ikepsk	IKE preshared key for the AP. <b>NOTE:</b> The Remote AP license must be installed.	—	—
installation	Specify the type of installation (indoor or outdoor). The default parameter automatically selects an installation mode based upon the AP model type.	default indoor outdoor	default
ipaddr	Static IP address for the AP.	—	—
latitude	Latitude coordinates of the AP. Use the format: Degrees, Minutes, Seconds (DMS). For example: 37 22 00 N	—	—
longitude	Longitude coordinates of the AP. Use the DMS format. For example: 122 02 00 W	—	—
master	Name or IP address for the master switch.	—	—
mesh-role	Configure the AP to operate as a mesh node. You assign one of three roles: <b>mesh portal</b> , <b>mesh point</b> or <b>remote mesh point</b> . If you select “none,” the AP operates as a thin AP. <b>NOTE:</b> OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	mesh-portal mesh-point remote-mesh-portal none	—
mesh-sae	Enable or disable Secure Attribute Exchange (SAE) on a mesh network. The default setting disables SAE. If used, this feature needs to be enabled on all the Mesh nodes (points and portals) in the network, else there could be mesh link connectivity issues. This is a Beta feature and recommended to be kept “disabled” for this 3.4 release. <b>NOTE:</b> OAW-AP80M and OAW-AP85 models require the Outdoor Mesh Access Points license.	sae-default sae-disable sae-enable	sae-default
netmask	Netmask for the IP address.	—	—
no	Negates any configured parameter.	—	—
pap-passwd	Password Authentication Protocol (PAP) password for the AP. You can use special characters in the PAP password. Following are the restrictions: <ul style="list-style-type: none"> <li>You cannot use double-byte characters</li> <li>You cannot use a tilde (~)</li> <li>You cannot use a tick (')</li> <li>If you use quotes (single or double), you must use the backslash (\) before and after the password</li> </ul> <b>NOTE:</b> The Remote AP license must be installed.	—	—

Parameter	Description	Range	Default
pap-user	PAP username for the AP. <b>NOTE:</b> The Remote AP license must be installed.	—	—
pppoe-passwd	Point-to-Point Protocol over Ethernet (PPPoE) password for the AP. <b>NOTE:</b> The Remote AP license must be installed.	—	—
pppoe-service-name	PPPoE service name for the AP. <b>NOTE:</b> The Remote AP license must be installed.	—	—
pppoe-user	PPPoE username for the AP. <b>NOTE:</b> The Remote AP license must be installed.	—	—
read-bootinfo	Retrieves current provisioning parameters of the specified AP. <b>NOTE:</b> This parameter can only be used on the master switch.	—	—
reprovision	Provisions one or more APs with the values in the provisioning-params workspace. To use <b>reprovision</b> , you must use <b>read-bootinfo</b> to retrieve the current values of the APs into the provisioning-ap-list. <b>NOTE:</b> This parameter can only be used on the master switch.	—	—
reset-bootinfo	Restores factory default provisioning parameters to the specified AP. <b>NOTE:</b> This parameter can only be used on the master switch.	—	—
server-ip	IP address of the switch from which the AP boots.	—	—
server-name	DNS name of the switch from which the AP boots.	—	—
set-ikepsk-by-addr	Set a IKE preshared key to correspond to a specific IP address.		
syslocation	User-defined description of the location of the AP.	—	—
usb-dev	The USB device identifier.		
usb-dial	The dial string for the USB modem. This parameter only needs to be specified if the default string is not correct.		
usb-init	The initialization string for the USB modem. This parameter only needs to be specified if the default string is not correct.		
usb-passwd	A PPP password, if provided by the cellular service provider		
usb-tty	The TTY device path for the USB modem. This parameter only needs to be specified if the default path is not correct.		
usb-type	The USB driver type.		
usb-user	The PPP username provided by the cellular service provider		

## Usage Guidelines

You do not need to provision APs before installing and using them.

The exceptions are:

- The OAW-AP-80M and OAW-AP-60, which have antenna gains that you must provision before they can be used.
- APs configured for mesh. You must provision the AP before you install it as a mesh node in a mesh deployment.

---

Users less familiar with this process may prefer to use the **Provisioning** page in the WebUI to provision an AP.

---

Provisioned or reprovisioned values do not take effect until the AP is rebooted. APs reboot automatically after they are successfully reprovisioned.

## Provisioning a Single AP

To provision a single AP:

1. Use the **read-bootinfo** option to read the current information from the deployed AP you wish to reprovision.
2. Use the **show provisioning-ap-list** command to see the AP to be provisioned.
3. Use the **copy-provisioning-params** option to copy the AP's parameter values to the provisioning-params workspace.
4. Use the provision-ap options to set new values. Use the **show provisioning-params** command to display parameters and values in the provisioning-params workspace. Use the **clear provisioning-params** command to reset the workspace to default values.
5. Use the **reprovision** option to provision the AP with the values in provisioning-params workspace. The AP automatically reboots.

## Provisioning Multiple APs at a Time

You can change parameter values for multiple APs at a time, however, note the following:

- You cannot provision the following AP-specific options on multiple APs:
  - ap-name
  - ipaddr
  - pap-user
  - pap-passwd
  - ikepsk

If any of these options are already provisioned on the AP, their values are retained when the AP is reprovisioned.
- The values of the server-name, a-ant-gain, or g-ant-gain options are retained if they are not reprovisioned.
- All other values in the provisioning-params workspace are copied to the APs.

To provision multiple APs at the same time:

1. Use the **read-bootinfo** to read the current information from each deployed AP that you wish to provision.

---

The AP parameter values are written to the provisioning-ap-list. To reprovision multiple APs, the APs must be present in the provisioning-ap-list. Use the **show provisioning-ap-list** command to see the APs that will be provisioned. Use the **clear provisioning-ap-list** command to clear the provisioning-ap-list.

---

2. Use the **copy-provisioning-params** option to copy an AP's parameter values to the provisioning-params workspace.

3. Use the provision-ap options to set new values. Use the **show provisioning-params** command to display parameters and values in the provisioning-params workspace. Use the **clear provisioning-params** command to reset the workspace to default values.
4. Use the **reprovision all** option to provision the APs in the provisioning-ap-list with the values in provisioning-params workspace. All APs in the provisioning-ap-list automatically reboot.

The following are useful commands when provisioning one or more APs:

- **showclear provisioning-ap-list** displays or clears the APs that will be provisioned.
- **showclear provisioning-params** displays or resets values in the provisioning-params workspace.
- **show ap provisioning** shows the provisioning parameters an AP is currently using.

## Example

The following commands change the IP address of the master switch on the AP:

```
(host) (config) #provision-ap
  read-bootinfo ap-name lab103
  show provisioning-ap-list
  copy-provisioning-params ap-name lab103
  master 10.100.102.210
  reprovision ap-name lab103
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Introduced support for the mesh parameters, additional antenna parameters, and AP location parameters.
AOS-W 3.4	Introduced support for the following parameters: <ul style="list-style-type: none"> <li>• installation</li> <li>• mesh-sae</li> <li>• set-ikepsk-by-addr</li> <li>• usb-dev</li> <li>• usb-dial</li> <li>• usb-init</li> <li>• usb-passwd</li> <li>• usb-tty</li> <li>• usb-type</li> <li>• usb-user</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms, except for the parameters noted in the Syntax table.	Base operating system, except for the parameters noted in the Syntax table.	Config mode on master switches

## rap-wml

```
rap-wml <server-name> [ageout <period>] [cache {disable|enable}] [db-name <name>]
[ip-addr <ipaddr>] [password <password>] [type {mssql|mysql}] [user <name>]
```

### Description

Use this command to specify the name and attributes of a MySQL or an MSSQL server.

### Syntax

Parameter	Description	Default
ageout	(Optional) Specifies the cache ageout period, in seconds.	0
cache	(Optional) Enables the cache, or disables the cache.	Disabled
db-name	(Optional) Specifies the name of the MySQL or MSSQL database.	—
ip-addr	(Optional) Specifies the IP address of the named MSSQL server.	0.0.0.0
no	Negates any configured parameter.	—
password	(Optional) Specifies the password required for database login.	—
type	(Optional) Specifies the server type.	—
user	(Optional) Specifies the user name required for database login.	—

### Usage Guidelines

Use the **show rap-wml cache** command to show the cache of all lookups for a database server. Use the **show rap-wml servers** command to show the database server state. Use the **show rap-wml wired-mac** command to show wired MAC discovered on traffic through the AP.

### Example

This example configures a MySQL server and sets up associated rap-wml table attributes.

```
(host) (config) #rap-wml mysqlserver type mysql ip-addr 10.4.11.10 db-name
automatedtestdatabase user sa password sa
rap-wml table mysqlserver mactest_undelimited mac timestamp-column time 600
rap-wml table mysqlserver mactest_delimited mac delimiter : timestamp-column time 600
```

This example configures an MSSQL server and sets up associated rap-wml table attributes.

```
(host) (config) #rap-wml mssqlserver type mssql ip-addr 10.4.11.11 db-name
automatedtestdatabase user sa password sa
rap-wml table mssqlserver mactest_undelimited mac timestamp-column time 600
rap-wml table mssqlserver mactest_delimited mac delimiter : timestamp-column time 600
```

### Command History

This command was introduced in AOS-W 2.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Requires the Wireless Intrusion Protection license.	Config mode on master switches

## rap-wml table

```
rap-wml table <server-name> <table-name> <column-name> [[delimiter <char>] |  
[timestamp-column <timestamp-column-name> <lookup-time>]]
```

### Description

Use this command to specify the name and attributes of the database table to be used for lookup.

### Syntax

Parameter	Description	Default
server-name	Specifies the database server name (created using the <b>rap-wml &lt;server-name&gt;</b> command.	—
table-name	Specifies the database table name.	—
column-name	Specifies the database column name with the MAC address.	—
delimiter	Specifies the optional delimiter character for the MAC address in the database.	No delimiter
no	Negates the rap-wml table for the named server.	—
timestamp-column	Specify the database column name with the timestamp last seen.	—
timestamp-column-name	Specify the database column name with the timestamp last seen.	—
lookup-time	Specifies how far back—in seconds—to look for the MAC address. Use 0 seconds to lookup everything.	0

### Usage Guidelines

Use the **rap-wml <servername>** command to configure a MySQL or an MSSQL server, then use the **rap-wml table** command to configure the associated database table for the server.

### Example

This example configures a MySQL server and sets up associated rap-wml table attributes for that server.

```
(host) (config) #rap-wml mysqlserver type mysql ip-addr 10.4.11.10 db-name  
automatedtestdatabase user sa password sa  
rap-wml table mysqlserver mactest_undelimited mac timestamp-column time 600  
rap-wml table mysqlserver mactest_delimited mac delimiter : timestamp-column time 600
```

This example configures an MSSQL server and sets up associated rap-wml table attributes for that server.

```
(host) (config) # rap-wml mssqlserver type mssql ip-addr 10.4.11.11 db-name  
automatedtestdatabase user sa password sa  
rap-wml table mssqlserver mactest_undelimited mac timestamp-column time 600  
rap-wml table mssqlserver mactest_delimited mac delimiter : timestamp-column time 600
```

### Command History

This commands was introduced in AOS-W 2.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Requires the Wireless Intrusion Protection license.	Config mode on master switches

## reload

reload

### Description

This command performs a reboot of the switch.

### Syntax

No parameters.

### Usage Guidelines

Use this command to reboot the switch if required after making configuration changes or under the guidance of Alcatel-Lucent Networks customer support. The **reload** command powers down the switch, making it unavailable for configuration. After the switch reboots, you can access it via a local console connected to the serial port, or through an SSH, Telnet, or WebUI session. If you need to troubleshoot the switch during a reboot, use a local console connection.

After you use the **reload** command, the switch prompts you for confirmation of this action. If you have not saved your configuration, the switch returns the following message:

```
Do you want to save the configuration (y/n):
```

- Enter **y** to save the configuration.
- Enter **n** to not save the configuration.
- Press [Enter] to exit the command without saving changes or rebooting the switch.

If your configuration has already been saved, the switch returns the following message:

```
Do you really want to reset the system(y/n):
```

- Enter **y** to reboot the switch.
- Enter **n** to cancel this action.

The command will timeout if you do not enter y or n.

### Example

The following command assumes you have already saved your configuration and you must reboot the switch:

```
(host) (config) #reload
```

The switch returns the following messages:

```
Do you really want to reset the system(y/n): y
System will now restart!
...
Restarting system.
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes on master switches

## reload-peer-sc

reload-peer-sc

### Description

This command performs a reboot of the Supervisor Card in OmniAccess 6000 Mobility switches.

### Syntax

**No parameters.**

### Usage Guidelines

This command is supported only on switches that require the Supervisor Card (SC). The SC processes all traffic from the line cards (LCs) and performs all management functions.

---

This command is not applicable to the OmniAccess Supervisor Card III

---

The **reload-peer-sc** command allows one SC to reset the other SC in a dual SC configuration. This does not affect the SC on which the command is executed and the LCs which it controls.

After you use the **reload-peer-sc** command, the switch prompts you for confirmation of this action and returns the following message:

```
Do you really want to reset the peer Supervisor Card(y/n):
```

- Enter **y** to reboot the peer SC.
- Enter **n** to cancel this action.

The command will timeout if you do not enter y or n.

### Example

The following command reboots the peer SC:

```
reload-peer-sc
```

The switch returns the following messages:

```
Do you really want to reset the peer Supervisor Card(y/n):  
Peer Supervisor Card will now restart.
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
Available only on the OmniAccess 6000 Mobility Switch	Base operating system	Enable and Config modes on master switches

## rename

```
rename <filename> <newfilename>
```

### Description

This command renames an existing system file.

### Syntax

Parameter	Description
filename	An alphanumeric string that specifies the current name of the file on the system.
newfilename	An alphanumeric string that specifies the new name of the file on the system.

### Usage Guidelines

Use this command to rename an existing system file on the switch. You can use a combination of numbers, letters, and punctuation (periods, underscores, and dashes) to rename a file. The new name takes affect immediately.

Make sure the renamed file uses the same file extension as the original file. If you change the file extension, the file may be unrecognized by the system. For example, if you have an existing file named `upgrade.log`, the new file must include the `.log` file extension.

You cannot rename the active configuration currently selected to boot the switch. If you attempt to rename the active configuration file, the switch returns the following message:

```
Cannot rename active configuration file
```

To view a list of system files, and for more information about the directory contents, see [“dir” on page 149](#).

### Example

The following command changes the file named **test\_configuration** to **deployed\_configuration**:

```
(host) (config) #rename test_configuration deployed_configuration
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Eanble and Config modes on master switches

## restore

```
restore flash
```

### Description

This command restores flash directories backed up to the flashbackup.tar.gz file.

### Syntax

Parameter	Description
flash	Restores flash directories from the flashbackup.tar.gz file.

### Usage Guidelines

Use the **backup flash** command to tar and compress flash directories to the flashbackup.tar.gz file.

### Example

The following command restores flash directories from the flashbackup.tar.gz file:

```
(host) #restore flash
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## rf arm-profile

```
rf
rf arm-profile <profile>
  40MHz-allowed-bands {All|None|a-only|g-only}
  acceptable-coverage-index <number>
  active-scan (not intended for use)
  assignment {disable|maintain|multi-band|single-band}
  backoff-time <seconds>
  client-aware
  clone <profile>
  error-rate-threshold <percent>
  error-rate-wait-time <seconds>
  free-channel-index <number>
  ideal-coverage-index <number>
  load-aware-scan-threshold
  max-tx-power <dBm>
  min-scan-time <# of scans>
  min-tx-power <dBm>
  mode-aware
  multi-band-scan
  no ...
  noise-threshold <number>
  noise-wait-time <seconds>
  ps-aware-scan
  rogue-ap-aware
  scan-interval <seconds>
  scan-time <milliseconds>
  scanning
  voip-aware-scan
```

### Description

This command configures the Adaptive Radio Management (ARM) profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
40MHz-allowed-bands	The specified setting allows ARM to determine if 40 MHz mode of operation is allowed on the 5 GHz or 2.4 GHz frequency band only, on both frequency bands, or on neither frequency band.	All/None/a-only/g-only	a-only
All	Allows 40 MHz channels on both the 5 GHz (802.11a) and 2.4 GHz (802.11b/g) frequency bands.		
None	Disallows use of 40 MHz channels.		
a-only	Allows use of 40 MHz channels on the 5 GHz (802.11a) frequency band only.		
g-only	Allows use of 40 MHz channels on the 2.4 GHz (802.11b/g) frequency band only.		

Parameter	Description	Range	Default
acceptable-coverage-index	The minimal coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be. This setting applies to multi-band implementations only.	1-6	4
active-scan	When the <b>Active Scan</b> checkbox is selected, an AP initiates active scanning via probe request. This option elicits more information from nearby APs, but also creates additional management traffic on the network. <b>Active Scan</b> is disabled by default, and should <i>not be enabled</i> except under the direct supervision of Alcatel-Lucent Support. Default: disabled		disabled
assignment	Activates one of four ARM channel/power assignment modes.	—	single-band (new installations only)
disable	Disables ARM channel/power assignments.		
maintain	Maintains existing channel assignments.		
multi-band	Computes ARM assignments for both 5 GHZ (802.11a) and 2.4 GHZ (802.11b/g) frequency bands.		
single-band	Computes ARM assignments for a single band.		
backoff-time	Time, in seconds, an AP backs off after requesting a new channel or power.	120-3600	240 seconds
client-aware	If the Client Aware option is enabled, the AP does not change channels if there is active client traffic on that AP. If Client Aware is disabled, the AP may change to a more optimal channel, but this change may also disrupt current client traffic.	—	enabled
clone	Name of an existing ARM profile from which parameter values are copied.	—	—
error-rate-threshold	The percentage of errors in the channel that triggers a channel change. Recommended value is 50%.	0-100	50%
error-rate-wait-time	Time, in seconds, that the error rate has to be at least the error rate threshold to trigger a channel change.	1-2,147,483,647 Recommended Values: 1-100	30 seconds
free-channel-index	The difference in the interference index between the new channel and current channel must exceed this value for the AP to move to a new channel. The higher this value, the lower the chance an AP will move to the new channel. Recommended value is 25.	10-40	25
ideal-coverage-index	The coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be. Recommended value is 10.	2-20	10

Parameter	Description	Range	Default
load-aware-scan-threshold	Load aware ARM preserves network resources during periods of high traffic by temporarily halting ARM scanning if the load for the AP gets too high. The Load Aware Scan Threshold is the traffic throughput level an AP must reach before it stops scanning. The supported range for this setting is 0-20000000 bytes/second. (Specify 0 to disable this feature.)		1250000 bytes/second
max-tx-power	Maximum effective isotropic radiated power (EIRP) from 0 to 51 dBm in 3 dBm increments. You may also specify a special value of 127 dBm for regulatory maximum. This value takes into account both radio transmit power and antenna gain. Higher power level settings may be constrained by local regulatory requirements and AP capabilities.	0, 3, 6, 9, 12, 15, 18, 21, 24, 27, 30, 33, 36, 39, 42, 45, 48, 51, 127	30 dBm
min-scan-time	Minimum number of times a channel must be scanned before it is considered for assignment. The supported range for this setting is 0-2,147,483,647 scans. Alcatel-Lucent recommends a Minimum Scan Time between 1-20 scans. Default: 8 scans	1-2,147,483,647 Recommended Values: 1-20	8 scans
min-tx-power	Minimum effective isotropic radiated power (EIRP) from 0 to 127 dBm in 3 dBm increments. This value takes into account both radio transmit power and antenna gain. Higher power level settings may be constrained by local regulatory requirements and AP capabilities.	0, 3, 6, 9, 12, 15, 18, 21, 24, 27, 30, 33, 36, 39, 42, 45, 48, 51, 127	9 dBm
mode-aware	If enabled, ARM will turn APs into Air Monitors (AMs) if it detects higher coverage levels than necessary. This helps avoid higher levels of interference on the WLAN. Although this setting is disabled by default, you may want to enable this feature if your APs are deployed in close proximity (e.g. less than 60 feet apart).	—	disabled
multi-band-scan	When enabled, single-radio APs try to scan across bands for rogue AP detection.	—	enabled
no	Negates any configured parameter.	—	—
noise-threshold	Maximum level of noise in a channel that triggers a channel change (-dBm).	0-2,147,483,647 Recommended Values: 0-80 -dBm	75 -dBm
noise-wait-time	Minimum time in seconds the noise level has to exceed the Noise Threshold before it triggers a channel change.	120-3600	120 seconds
ps-aware-scan	When enabled, the AP will not scan if Power Save is active.	—	enabled
rogue-ap-aware	When enabled, the AP will try to contain off-channel rogue APs.	—	disabled

Parameter	Description	Range	Default
scan-interval	If Scanning is enabled, the Scan Interval defines how often the AP will leave its current channel to scan other channels in the band. Off-channel scanning can impact client performance. Typically, the shorter the scan interval, the higher the impact on performance. If you are deploying a large number of new APs on the network, you may want to lower the Scan Interval to help those APs find their optimal settings more quickly. Raise the Scan Interval back to its default setting after the APs are functioning as desired.	0-2,147,483,647 Recommended Values: 0-30	10 seconds
scan-time	The amount of time, in milliseconds, an AP will drift out of the current channel to scan another channel.	50-2,147,483,647 Recommended Values: 50-200	110 milliseconds
scanning	The Scanning checkbox enables or disables AP scanning across multiple channels. Disabling this option also disables the following scanning features: <ul style="list-style-type: none"> <li>• Multi Band Scan</li> <li>• Rogue AP Aware</li> <li>• Voip Aware Scan</li> <li>• Power Save Scan</li> </ul> Do not disable Scanning unless you want to disable ARM and manually configure AP channel and transmission power.	—	enabled
voip-aware-scan	When enabled, the AP will not scan if a VoIP call is in progress.	—	disabled

## Usage Guidelines

Adaptive Radio Management (ARM) is a radio frequency (RF) resource allocation algorithm that allows each AP to determine the optimum channel selection and transmit power setting to minimize interference and maximize coverage and throughput. This command configures an ARM profile that you apply to a radio profile for the 5 GHz or 2.4 GHz frequency band (see [“rf dot11a-radio-profile” on page 342](#) or [“rf dot11g-radio-profile” on page 347](#)).

If you were running an earlier version of AOS-W with ARM disabled, ARM remains disabled when you upgrade to the current release.

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent’s OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices.

## Using Adaptive Radio Management (ARM) in a Mesh Network

When a mesh portal operates on a mesh network, the mesh portal determines the channel used by the mesh feature. When a mesh point locates an upstream mesh portal, it will scan the regulatory domain channels list to determine the channel assigned to it, for a mesh point always uses the channel selected by its mesh portal. However, if a mesh portal uses an ARM profile enabled with a single-band or multi-band channel/power assignment and the scanning feature, the mesh portal will scan the configured channel lists and the ARM algorithm will assign the proper channel to the mesh portal.

If you are using ARM in your network, is important to note that mesh points, unlike mesh portals, do not scan channels. This means that once a mesh point has selected a mesh portal or an upstream mesh point, it will tune to this channel, form the link, and will not scan again unless the mesh link gets broken. This provides good mesh link stability, but may adversely affect system throughput in networks with mesh portals and mesh points. When ARM assigns optimal channels to mesh portals, those portals use different

channels, and once the mesh network has formed and all the mesh points have selected a portal (or upstream mesh point), those mesh points will not be able to detect other portals on other channels that could offer better throughput. This type of suboptimal mesh network may form if, for example, two or three mesh points select the same mesh portal after booting, form the mesh network, and leave a nearby mesh portal without any mesh points. Again, this will not affect mesh functionality, but may affect total system throughput.

## Example

The following command configures VoIP-aware scanning for the arm-profile named “voice-arm:”

```
(config) (host) #rf arm-profile voice-arm  
    voip-aware-scan
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.	Support for the high-throughput IEEE 802.11n draft standard was introduced
AOS-W 3.3.2	Support for the <b>wait-time</b> parameter was removed.

### Description

This command configures AP radio settings for the 5 GHz frequency band, including the Adaptive Radio Management (ARM) profile and the high-throughput (802.11n) radio profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
arm-profile	Configures Adaptive Radio Management (ARM) feature. See <a href="#">“rf arm-profile” on page 337</a> .	—	“default”
beacon-period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.	60 (minimum)	100 milliseconds

Parameter	Description	Range	Default
channel	<p>Channel number for the AP 802.11a/802.11n physical layer. The available channels depend on the regulatory domain (country). Channel number configuration options for 20 MHz and 40 MHz modes:</p> <ul style="list-style-type: none"> <li>• <b>num</b>: Entering a channel number disables 40 MHz mode and activates 20 MHz mode for the entered channel.</li> <li>• <b>num+</b>: Entering a channel number with a plus (+) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by increasing the primary channel number by 4. Example: 157+ represents 157 as the primary channel and 161 as the secondary channel.</li> <li>• <b>num-</b>: Entering a channel number with a minus (-) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by decreasing the primary channel number by 4. Example: 157- represents 157 as the primary channel and 153 as the secondary channel.</li> </ul> <p><b>NOTE:</b> 20 MHz clients are allowed to associate when a primary and secondary channel are configured; however, the client will only use the primary channel.</p>	Depends on regulatory domain	—
channel-reuse	<p>When you enable the channel reuse feature, it can operate in either of the following three modes; static, dynamic or disable. (This feature is disabled by default.)</p> <ul style="list-style-type: none"> <li>• <b>Static mode</b>: This mode of operation is a coverage-based adaptation of the Clear Channel Assessment (CCA) thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa.</li> <li>• <b>Dynamic mode</b>: In this mode, the Clear Channel Assessment (CCA) thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client.</li> <li>• <b>Disable mode</b>: This mode does not support the tuning of the CCA Detect Threshold.</li> </ul>	enabled disabled	enabled

Parameter	Description	Range	Default
channel-reuse-threshold	RX Sensitivity Tuning Based Channel Reuse Threshold, in - dBm. If the Rx Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold ( in -dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBm to -64 dBm. If the value is set to zero, the feature will automatically determine an appropriate threshold.	Depends on regulatory domain	—
clone	Name of an existing radio profile from which parameter values are copied.	—	—
csa	Channel Switch Announcement (CSA), as defined by IEEE 802.11h, allows an AP to announce that it is switching to a new channel before it begins transmitting on that channel. Clients must support CSA in order to track the channel change without experiencing disruption.	—	disabled
csa-count	Number of CSA announcements that are sent before the AP begins transmitting on the new channel.	1-16	4
disable-arm-wids-function	Disables Adaptive Radio Management (ARM) and Wireless IDS functions. These can be disabled if a small increase in packet processing performance is desired. If a radio is configured to operate in Air Monitor mode, then these functions are always enabled irrespective of this option. CAUTION: Use carefully, since this effectively disables ARM and WIDS	1-16	4
dot11h	Enable advertisement of 802.11d (Country Information) and 802.11h (TPC or Transmit Power Control) capabilities This parameter is enabled by default.	—	enabled
high-throughput-enable	Enables high-throughput (802.11n) features on a radio using the 5 GHz frequency band.	—	enabled
ht-radio-profile	Name of high-throughput radio profile to use for configuring high-throughput support on the 5 GHz frequency band. See <a href="#">“rf ht-radio-profile” on page 356</a> .	—	“default-a”
mgmt-frame-throttle-interval	Averaging interval for rate limiting management frames in seconds. Zero disables rate limiting. Note: This parameter only applies to AUTH and ASSOC/RE-ASSOC management frames.	0-60	1 second interval
mgmt-frame-throttle-limit	Maximum number of management frames allowed in each throttle interval. <b>NOTE:</b> This parameter only applies to AUTH and ASSOC/RE-ASSOC management frames.	0-999999	20 frames per interval
mode	One of the operating modes for the AP.	ap-mode   am-mode   sensor-mode	ap-mode
ap-mode	Device provides transparent, secure, high-speed data communications between wireless network devices and the wired LAN.		

Parameter	Description	Range	Default
am-mode	Device behaves as an air monitor to collect statistics, monitor traffic, detect intrusions, enforce security policies, balance traffic load, self-heal coverage gaps, etc.		
apm-mode	AP monitor mode.		
sensor-mode	Device operates as an RFprotect managed sensor. Changing the mode of a radio from ap-mode or am-mode to sensor-mode or from sensor-mode to ap-mode or am-mode causes the AP to reboot. For a dual-radio AP, setting one radio in sensor-mode causes both radios to behave as sensors.		
no	Negates any configured parameter.	—	—
radio-enable	Enables or disables radio configuration.	—	enabled
spectrum-load-bal-domain	Define a spectrum load balancing domain to manually create RF neighborhoods. Use this option to create RF neighborhood information for networks that have disabled Adaptive Radio Management (ARM) scanning and channel assignment. <ul style="list-style-type: none"> <li>If spectrum load balancing is enabled in a 802.11a radio profile but the spectrum load balancing domain is <i>not</i> defined, AOS-W uses the ARM feature to calculate RF neighborhoods.</li> <li>If spectrum load balancing is enabled in a 802.11a radio profile and a spectrum load balancing domain <i>is also</i> defined, AP radios belonging to the same spectrum load balancing domain will be considered part of the same RF neighborhood for load balancing, and will not recognize RF neighborhoods defined by the ARM feature.</li> </ul>	—	—
spectrum-load-balancing	The Spectrum Load Balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the switch is responding to the wireless clients' probe requests. If enabled, the switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.	—	disabled
tx-power	Sets the initial transmit power (dBm) on which the AP operates, unless a better choice is available through either calibration or from RF Plan. This parameter can be set from 0 to 51 in .5 dBm increments, or set to the regulatory maximum value of 127 dBm. Transmission power may be further limited by regulatory domain constraints and AP capabilities.	0-51 dBm, 127 dBm	14 dBm

## Usage Guidelines

This command configures radios that operate in the 5 GHz frequency band, which includes radios utilizing the IEEE 802.11a or IEEE 802.11n draft standard. Channels must be valid for the country configured in the AP regulatory domain profile (see “[ap regulatory-domain-profile](#)” on page 84).

To view the supported channels, use the **show ap allowed-channels** command.

## Examples

The following command configures APs to operate in AM mode for the selected dot11a-radio-profile named “samplea:”

```
(host) (config) #rf dot11a-radio-profile samplea mode am-mode
```

The following command configures APs to operate in high-throughput (802.11n) mode on the 5 GHz frequency band for the selected dot11a-radio profile named “samplea” and assigns a high-throughput radio profile named “default-a:”

```
(host) (config) #rf dot11a-radio-profile samplea
  high-throughput-enable
  ht-radio-profile default-a
```

The following command configures a primary channel number of 157 and a secondary channel number of 161 for 40 MHz mode of operation for the selected dot11a-radio profile named “samplea:”

```
(host) (config) #rf dot11a-radio-profile samplea
  channel <157+>
```

## Command History

### Description

This command configures AP radio settings for the 2.4 GHz frequency band, including the Adaptive Radio Management (ARM) profile and the high-throughput (802.11n) radio profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
arm-profile	Configures Adaptive Radio Management (ARM) feature. See <a href="#">“rf arm-profile” on page 337</a> .	—	“default”
beacon-period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.	60 (minimum)	100 milliseconds
clone	Name of an existing radio profile from which parameter values are copied.	—	—
csa	Channel Switch Announcement (CSA), as defined by IEEE 802.11h, allows an AP to announce that it is switching to a new channel before it begins transmitting on that channel. Clients must support CSA in order to track the channel change without experiencing disruption.	—	disabled
csa-count	Number of CSA announcements that are sent before the AP begins transmitting on the new channel.	1-16	4

Parameter	Description	Range	Default
channel	<p>Channel number for the AP 802.11 a/802.11 n physical layer. The available channels depend on the regulatory domain (country). Channel number configuration options for 20 MHz and 40 MHz modes:</p> <ul style="list-style-type: none"> <li>• <b>num:</b> Entering a channel number disables 40 MHz mode and activates 20 MHz mode for the entered channel.</li> <li>• <b>num+:</b> Entering a channel number with a plus (+) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by increasing the primary channel number by 4. Example: 157+ represents 157 as the primary channel and 161 as the secondary channel.</li> <li>• <b>num-:</b> Entering a channel number with a minus (-) sign selects a primary and secondary channel for 40 MHz mode. The number entered becomes the primary channel and the secondary channel is determined by decreasing the primary channel number by 4. Example: 157- represents 157 as the primary channel and 153 as the secondary channel.</li> </ul> <p><b>NOTE:</b> 20 MHz clients are allowed to associate when a primary and secondary channel are configured; however, the client will only use the primary channel.</p>	Depends on regulatory domain	—
channel-reuse	<p>When you enable the channel reuse feature, it can operate in either of the following three modes; static, dynamic or disable. (This feature is disabled by default.)</p> <ul style="list-style-type: none"> <li>• <b>Static mode:</b> This mode of operation is a coverage-based adaptation of the Clear Channel Assessment (CCA) thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa.</li> <li>• <b>Dynamic mode:</b> In this mode, the Clear Channel Assessment (CCA) thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client.</li> <li>• <b>Disable mode:</b> This mode does not support the tuning of the CCA Detect Threshold.</li> </ul>	enabled disabled	enabled
channel-reuse-threshold	<p>RX Sensitivity Tuning Based Channel Reuse Threshold, in - dBm.</p> <p>If the Rx Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold ( in -dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBm to -64 dBm.</p> <p>If the value is set to zero, the feature will automatically determine an appropriate threshold.</p>	Depends on regulatory domain	—

Parameter	Description	Range	Default
disable-arm-wids-function	Disables Adaptive Radio Management (ARM) and Wireless IDS functions. These can be disabled if a small increase in packet processing performance is desired. If a radio is configured to operate in Air Monitor mode, then these functions are always enabled irrespective of this option. CAUTION: Use carefully, since this effectively disables ARM and WIDS	1-16	4
dot11b-protection	Enable or disable protection for 802.11b clients. This parameter is enabled by default. Disabling this feature may improve performance if there are no 802.11b clients on the WLAN. WARNING: Disabling protection violates the 802.11 standard and may cause interoperability issues. If this feature is disabled on a WLAN with 802.11b clients, the 802.11b clients will not detect an 802.11g client talking and can potentially transmit at the same time, thus garbling both frames.	—	enabled
dot11h	Enable advertisement of 802.11d (Country Information) and 802.11h (TPC or Transmit Power Control) capabilities This parameter is enabled by default.	—	enabled
high-throughput-enable	Enables high-throughput (802.11n) features on a radio using the 2.4 GHz frequency band.	—	enabled
ht-radio-profile	Name of high-throughput radio profile to use for configuring high-throughput support on the 5 GHz frequency band. See <a href="#">“rf ht-radio-profile” on page 356</a> .	—	“default-a”
interference-immunity	Set a value for 802.11 Interference Immunity. This parameter sets the interference immunity on the 2.4 Ghz band. The default setting for this parameter is level 2. When performance drops due to interference from non-802.11 interferers (such as DECT or Bluetooth devices), the level can be increased up to level 5 for improved performance. However, increasing the level makes the AP slightly “deaf” to its surroundings, causing the AP to lose a small amount of range. The levels for this parameter are: <ul style="list-style-type: none"> <li>Level-0: no ANI adaptation.</li> <li>Level-1: noise immunity only.</li> <li>Level-2: noise and spur immunity. This is the default setting</li> <li>Level-3: level 2 and weak OFDM immunity.</li> <li>Level-4: level 3 and FIR immunity.</li> <li>Level-5: disable PHY reporting.</li> </ul> <b>NOTE:</b> Do not raise the noise immunity feature’s default setting if the <a href="#">channel-reuse-threshold</a> feature is also enabled. A level-3 to level-5 Noise Immunity setting is not compatible with the Channel Reuse feature.	Level-0 - Level-5	Level-2
mgmt-frame-throttle-interval	Averaging interval for rate limiting management frames in seconds. Zero disables rate limiting. Note: This parameter only applies to AUTH and ASSOC/RE-ASSOC management frames.	0-60	1 second interval

Parameter	Description	Range	Default
mgmt-frame-throttle-limit	Maximum number of management frames allowed in each throttle interval. <b>NOTE:</b> This parameter only applies to AUTH and ASSOC/RE-ASSOC management frames.	0-999999	20 frames per interval
mode	One of the operating modes for the AP.	ap-mode   am-mode   sensor-mode	ap-mode
ap-mode	Device provides transparent, secure, high-speed data communications between wireless network devices and the wired LAN.		
am-mode	Device behaves as an air monitor to collect statistics, monitor traffic, detect intrusions, enforce security policies, balance traffic load, self-heal coverage gaps, etc.		
apm-mode	AP monitor mode.		
sensor-mode	Device operates as an RFprotect managed sensor. Changing the mode of a radio from ap-mode or am-mode to sensor-mode or from sensor-mode to ap-mode or am-mode causes the AP to reboot. For a dual-radio AP, setting one radio in sensor-mode causes both radios to behave as sensors.		
no	Negates any configured parameter.	—	—
radio-enable	Enables or disables radio configuration.	—	enabled
spectrum-load-bal-domain	Define a spectrum load balancing domain to manually create RF neighborhoods. Use this option to create RF neighborhood information for networks that have disabled Adaptive Radio Management (ARM) scanning and channel assignment. <ul style="list-style-type: none"> <li>If spectrum load balancing is enabled in a 802.11g radio profile but the spectrum load balancing domain is <i>not</i> defined, AOS-W uses the ARM feature to calculate RF neighborhoods.</li> <li>If spectrum load balancing is enabled in a 802.11g radio profile and a spectrum load balancing domain <i>is also</i> defined, AP radios belonging to the same spectrum load balancing domain will be considered part of the same RF neighborhood for load balancing, and will not recognize RF neighborhoods defined by the ARM feature.</li> </ul>	—	—
spectrum-load-balancing	The Spectrum Load Balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the switch is responding to the wireless clients' probe requests. If enabled, the switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.	—	disabled

Parameter	Description	Range	Default
tx-power	<p>Sets the initial transmit power (dBm) on which the AP operates, unless a better choice is available through either calibration or from RF Plan.</p> <p>This parameter can be set from 0 to 51 in .5 dBm increments, or set to the regulatory maximum value of 127 dBm.</p> <p>Transmission power may be further limited by regulatory domain constraints and AP capabilities.</p>	0-51 dBm, 127 dBm	14 dBm

## Usage Guidelines

This command configures radios that operate in the 2.4 GHz frequency band, which includes radios utilizing the IEEE 802.11b/g or IEEE 802.11n draft standard. Channels must be valid for the country configured in the AP regulatory domain profile (see [“ap regulatory-domain-profile”](#) on page 84).

To view the supported channels, use the **show ap allowed-channels** command.

## Examples

The following command configures APs to operate in AM mode for the selected dot11g-radio-profile named “sampleg:”

```
rf dot11g-radio-profile sampleg
  mode am-mode
```

The following command configures APs to operate in high-throughput (802.11n) mode on the 2.4 GHz frequency band for the selected dot11g-radio profile named “sampleg” and assigns a high-throughput radio profile named “default-g:”

```
rf dot11g-radio-profile sampleg
  high-throughput-enable
  ht-radio-profile default-g
```

The following command configures a primary channel number of 1 and a secondary channel number of 5 for 40 MHz mode of operation for the selected dot11g-radio profile named “sampleg:”

```
rf dot11g-radio-profile sampleg
  channel <1+>
```

## Command History

Release	Modification

```

### Description

This command configures the event thresholds profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
bwr-high-wm	If bandwidth in an AP exceeds this value, a bandwidth exceeded condition exists. The value represents the percentage of maximum for a given radio. (For 802.11b, the maximum bandwidth is 7 Mbps. For 802.11 a and g, the maximum is 30 Mbps.) The recommended value is 85%.	0-100	0%
bwr-low-wm	After a bandwidth exceeded condition exists, the condition persists until bandwidth drops below this value. The recommended value is 70%.	0-100	0%
clone	Name of an existing radio profile from which parameter values are copied.	—	—
detect-frame-rate-anomalies	Enable or disables detection of frame rate anomalies.	—	disabled
fer-high-wm	If the frame error rate (as a percentage of total frames in an AP) exceeds this value, a frame error rate exceeded condition exists. The recommended value is 16%.	0-100	0%
fer-low-wm	After a frame error rate exceeded condition exists, the condition persists until the frame error rate drops below this value. The recommended value is 8%.	0-100	0%
ffr-high-wm	If the frame fragmentation rate (as a percentage of total frames in an AP) exceeds this value, a frame fragmentation rate exceeded condition exists. The recommended value is 16%.	0-100	16%

Parameter	Description	Range	Default
ffr-low-wm	After a frame fragmentation rate exceeded condition exists, the condition persists until the frame fragmentation rate drops below this value. The recommended value is 8%.	0-100	8%
flsr-high-wm	If the rate of low-speed frames (as a percentage of total frames in an AP) exceeds this value, a low-speed rate exceeded condition exists. This could indicate a coverage hole. The recommended value is 16%.	0-100	16%
flsr-low-wm	After a low-speed rate exceeded condition exists, the condition persists until the percentage of low-speed frames drops below this value. The recommended value is 8%.	0-100	8%
fnur-high-wm	If the non-unicast rate (as a percentage of total frames in an AP) exceeds this value, a non-unicast rate exceeded condition exists. This value depends upon the applications used on the network.	0-100	0%
fnur-low-wm	After a non-unicast rate exceeded condition exists, the condition persists until the non-unicast rate drops below this value.	0-100	0%
frer-high-wm	If the frame receive error rate (as a percentage of total frames in an AP) exceeds this value, a frame receive error rate exceeded condition exists. The recommended value is 16%.	0-100	16%
frer-low-wm	After a frame receive error rate exceeded condition exists, the condition persists until the frame receive error rate drops below this value. The recommended value is 8%.	0-100	8%
frr-high-wm	If the frame retry rate (as a percentage of total frames in an AP) exceeds this value, a frame retry rate exceeded condition exists. The recommended value is 16%.	0-100	16%
frr-low-wm	After a frame retry rate exceeded condition exists, the condition persists until the frame retry rate drops below this value. The recommended value is 8%.	0-100	8%
no	Negates any configured parameter.	—	—

## Usage Guidelines

The event threshold profile configures Received Signal Strength Indication (RSSI) metrics. When certain RF parameters are exceeded, these events can signal excessive load on the network, excessive interference, or faulty equipment. This profile and many of the detection parameters are disabled (value is 0) by default.

## Example

The following command configures an event threshold profile:

```
(host) (config) #rf event-thresholds-profile et1
detect-frame-rate-anomalies
```

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master controllers

## rf ht-radio-profile

```
rf ht-radio-profile <profile>
  40MHz-intolerance
  clone <profile>
  honor-40MHz-intolerance
  no
  single-chain-legacy
```

### Description

This command configures high-throughput AP radio settings. High-throughput features use the IEEE 802.11n draft standard.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters. Default Options: <ul style="list-style-type: none"><li>“Default-a” is generally used in association with high-throughput devices running on the 5 GHz frequency band, see <a href="#">“rf dot11a-radio-profile” on page 342</a>.</li><li>“Default-g” is generally used in association with high-throughput devices running on the 2.4 GHz frequency band, see <a href="#">“rf dot11g-radio-profile” on page 347</a>.</li><li>“Default” is generally used when the same ht-radio-profile is desired for use with both frequency bands.</li></ul>	—	default-a default-g default
40MHz-intolerance	Controls whether or not APs using this radio profile will advertise intolerance of 40 MHz operation. By default, 40 MHz operation is allowed.	—	disabled
clone	Name of an existing high-throughput radio profile from which parameter values are copied.	—	—
honor-40MHz-intolerance	When enabled, the radio will stop using the 40 MHz channels if the 40 MHz intolerance indication is received from another AP or station.	—	enabled
no	Negates any configured parameter.	—	—
single-chain-legacy	Interoperability for misbehaving legacy stations (keep disabled unless necessary)		disabled

### Usage Guidelines

The ht-radio-profile configures high-throughput settings for networks utilizing the IEEE 802.11n draft standard, which supports 40 MHz channels and operates in both the 2.4 GHz and 5 GHz frequency bands.

The ht-radio-profile you wish to use must be assigned to a dot11a and/or dot11g-radio-profile. You can assign the same profile or different profiles to the 2.4 GHz and 5 GHz frequency bands. See [“rf dot11a-radio-profile” on page 342](#) and [“rf dot11g-radio-profile” on page 347](#).

### Example

The following command configures an ht-radio-profile named “default-g” and enables 40MHz-intolerance:

```
(host) (config) #rf ht-radio-profile default-g
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.2	Support for the dsss-cck-40mhz parameter removed
AOS-W 3.4	Introduced the <b>single-chain-legacy</b> parameter.

## Command Information

Platforms	Licensing	Command Mode
All platforms, but operates with IEEE 802.11n compliant devices only	Base operating system	Config mode on master controllers

## rf optimization-profile

```
rf optimization-profile <profile>
  clone <profile>
  coverage-hole-detection
  detect-association-failure
  detect-interference
  handoff-assist
  hole-detection-interval <seconds>
  hole-good-rssi-threshold <number>
  hole-good-sta-ageout <seconds>
  hole-idle-sta-ageout <seconds>
  hole-poor-rssi-threshold <number>
  interference-baseline <seconds>
  interference-exceed-threshold <seconds>
  interference-threshold <percent>
  low-rssi-threshold <number>
  no ...
  rssi-check-frequency <number>
  rssi-falloff-wait-time <seconds>
```

### Description

This command configures the RF optimization profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
clone	Name of an existing optimization profile from which parameter values are copied.	—	—
coverage-hole-detection	Enables or disables coverage hole detection. The Wireless Intrusion Protection license must be installed.	—	disabled
detect-association-failure	Enables or disables STA association failure detection.	—	disabled
detect-interference	Enables or disables interference detection.	—	disabled
handoff-assist	Allows the switch to force a client off an AP when the RSSI drops below a defined minimum threshold.	—	disabled
hole-detection-interval	Time, in seconds, after a coverage hole is detected until a coverage hole event notification is generated. The Wireless Intrusion Protection license must be installed.		180 seconds
hole-good-rssi-threshold	Stations with signal strength above this value are considered to have good coverage. The Wireless Intrusion Protection license must be installed.		20
hole-good-sta-ageout	Time, in seconds, after which a station with good coverage is aged out. The Wireless Intrusion Protection license must be installed.		30 seconds

Parameter	Description	Range	Default
hole-idle-sta-ageout	Time, in seconds, after which a station in a poor coverage area is aged out. The Wireless Intrusion Protection license must be installed.		90 seconds
hole-poor-rssi-threshold	Stations with signal strength below this value will trigger detection of a coverage hole. The Wireless Intrusion Protection license must be installed.		10
interference-baseline	Time, in seconds, the air monitor should learn the state of the link between the AP and client to create frame retry rate (FRR) and frame receive error rate (FRER) baselines.		30 seconds
interference-exceed-time	Time, in seconds, the FRR or FRER exceeds the threshold before interference is reported.		30 seconds
interference-threshold	Percentage increase in the frame retry rate (FRR) or frame receive error rate (FRER) before interference monitoring begins on a given channel.	0-100	100%
low-rssi-threshold	Minimum RSSI, above which deauth should never be sent.		0
no	Negates any configured parameter.	—	—
rssi-check-frequency	Interval, in seconds, to sample RSSI.		0 seconds
rssi-falloff-wait-time	Time, in seconds, to wait with decreasing RSSI before deauth is sent to the client. The maximum value is 8 seconds.	0-8	0 seconds

## Usage Guidelines

The RF optimization includes parameters for the following features:

- Coverage hole detection looks for clients unable to associate to any AP or clients that are associating at very low data rates or with low signal strength. These symptoms indicate areas where holes in radio coverage exist. When the system detects such coverage holes, you are notified of the condition via the event log.
- Detection of interference near a wireless client station or AP based on an increase in the frame retry rate or frame receive error rate.

## Example

The following command configures an RF optimization profile:

```
(host) (config) #rf optimization-profile opt1
  coverage-hole-detection
  detect-association-failure
  detect-interference
```

## Command History

Version	Modification
AOS-W 3.0	Command introduced

Version	Modification
AOS-W 3.4	<p>The following parameters were deprecated:</p> <ul style="list-style-type: none"> <li>• ap-lb-max-retries &lt;number&gt;</li> <li>• ap-lb-user-high-wm &lt;percent&gt;</li> <li>• ap-lb-user-low-wm &lt;percent&gt;</li> <li>• ap-lb-util-high-wm &lt;percent&gt;</li> <li>• ap-lb-util-low-wm &lt;percent&gt;</li> <li>• ap-lb-util-wait-time &lt;seconds&gt;</li> <li>• ap-load-balancing</li> </ul> <p>Use the command <b>rf dot11a-radio-profile spectrum-load-balancing</b> and <b>rf dot11g-radio-profile spectrum-load-balancing</b> to enable the spectrum load balancing feature.</p>

## rft

```
rft test profile antenna-connectivity ap-name <name> [dest-mac <macaddr> [phy {a|g}| radio {0|1}]]
```

```
rft test profile link-quality {ap-name <name> dest-mac <macaddr> [phy {a|g}| radio {0|1}]} | bssid <bssid> dest-mac <macaddr> | ip-addr <ipaddr> dest-mac <macaddr> [phy {a|g}|radio {0|1}]}
```

```
rft test profile raw {ap-name <name> dest-mac <macaddr> [phy {a|g}|radio {0|1}]} | bssid <bssid> dest-mac <macaddr> | ip-addr <ipaddr> dest-mac <macaddr> [phy {a|g}|radio {0|1}]}
```

### Description

This command is used for RF troubleshooting.

### Syntax

Parameter	Description	Range
ap-name	Name of the AP that performs the test.	—
dest-mac	MAC address of the client to be tested.	—
phy	802.11 type, either a or g.	a   g
radio	Radio ID, either 0 or 1.	0   1
bssid	BSSID of the AP that performs the test.	—
ip-addr	IP address of the AP that performs the test.	

### Usage Guidelines

This command can run predefined test profiles for antenna connectivity, link quality, or raw testing. You should only run these commands when directed to do so by an Alcatel-Lucent support representative.

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## router mobile

router mobile

### Description

This command enables Layer-3 (IP) mobility.

### Syntax

No parameters.

### Usage Guidelines

IP mobility is disabled by default on the switch. You need to use this command to enable IP mobility. This command must be executed on all switches (master and local) that need to provide support for layer-3 roaming in a mobility domain.

You can disable IP mobility in a virtual AP profile with the **wlan virtual-ap** command (IP mobility is enabled by default in a virtual AP profile).

### Example

This command enables IP mobility:

```
(host) (config) #router mobile
```

### Command History

Release	Modification
AOS-W 3.0	Command introduced

### Command Information

All platforms	Base operating system	Config mode on master switches

## router ospf

```
router ospf {area <area-id> stub [no-summary] | router-id <rtr-id> | subnet exclude <addr> <mask>
```

### Description

Global OSPF configuration for the upstream router.

### Syntax

Parameter	Description
area <area-id> stub [no-summary]	Set an area as a Total Stub Area. Enter the area ID in dotted decimal format (A.B.C.D.)
router-id <rtr-id>	Enter the router ID in IP address format.
subnet exclude <addr> <mask>	Specify the subnet that OSPF will <i>not</i> advertise. Enter the subnet and mask address in dotted decimal format (A.B.C.D).

### Usage Guidelines

OSPFv2 is a dynamic Interior Gateway routing Protocol (IGP) based on IETF RFC 2328. The AOS-W implementation of OSPF allows switches to deploy effectively in a Layer 3 topology. For more detailed information, refer to the OSPF Chapter in the AOS-W User Guide.

### Example

By default OSPF will advertise all the user VLAN subnet addresses in the router LSA (Link-State Advertisement). To control the OSPF advertisement, execute the following command:

```
(host) (config) # router ospf subnet exclude 75.1.1.0 255.255.0.0
```

With the above command, any user VLAN subnet matching 75.1/16 will not be advertised in the router LSA. To return to the default advertisement, execute the command:

```
(host) (config) # no router ospf subnet exclude 75.1.1.0 255.255.0.0
```

### Related Commands

Command	Description
<a href="#">show ip ospf</a>	View OSPF process on the router.
<a href="#">show ip ospf interface</a>	View the configure OSPF interface.

### Command History

Release	Modification

All Platforms	Base operating system	Configuration Mode (config)

## service

```
service [dhcp] [network-storage] [print-server]
```

### Description

This command enables the DHCP server on the switch.

### Syntax

Parameter	Description	Default
dhcp	Enables the DHCP server	disabled
network-storage	Enables the NAS service	disabled
print-server	Enables the printer service	disabled

### Usage Guidelines

You can enable and configure DHCP, network-storage or print server in the switch to provide the following:

- DHCP: IP addresses to wireless clients if an external DHCP server is not available.
- Network-storage: To provide access to the storage devices attached to the switch.
- Printer-server: To provide access to printers attached to the switch.

### Example

The following command enables the DHCP server in the switch:

```
(host) (config) #service dhcp
```

The following command enables the NAS services in the switch:

```
(host) (config) #service network-storage
```

The following command enables the printer services in the switch:

```
(host) (config) #service print-server
```

### Command History

The DHCP command was introduced in AOS-W 3.0.

The network-storage and print-server options was introduced in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show ap active

```
show ap active [ap-name <ap-name>|{arm-edge dot11a|dot11g|voip-
only}|dot11a|dot11g|ssid <ssid>|ip-addr <ip-addr>|{type access-point|air-
monitor|(sensor dot11a|dot11g|voip-only)}|voip-only
```

### Description

Show all active APs registered to a switch.

### Syntax

Parameter	Description
ap-name <ap-name>	View data for an AP with a specified name.
arm-edge	Show the state of ARM edge APs.
dot11a	Show 802.11a radio information.
dot11g	Show 802.11g radio information.
voip-only	Show AP information filtered by associated/active VoIP clients.
ssid <ssid>	View data for a specific ESSID (Extended Service Set Identifier). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	View data for an AP with a specified IP address by entering an IP address in dotted-decimal format.
type	Show AP information filtered by type of AP.
access-point	Show information for Access Points only.
air-monitor	Show information for Air Monitors only.
sensor	Show only RFprotect Sensor information.
voip-only	Show AP information filtered by associated/active VoIP clients.

### Example

Issue this command to displays details for all active APs.

```
(host)# show ap active
```

```
Active AP Table
```

```
-----
Name      Group      IP Address      11g      11g Ch/EIRP/MaxEIRP      11a 11a Ch/EIRP/MaxEIRP      AP
Type      Flags      Uptime
-----
-----
-----
-----
AL31      corp1344    10.6.1.202      0         AP:HT:1/8.5/33      0         AP:HT:149+/19/36      125
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP
Group	The AP is associated with this AP group.

Column	Description
IP address	IP address of the AP, in dotted decimal format.
11g Clients	Number of 802.11g clients using the AP.
11g Ch/EIRP/MaxEIRP	802.11g radio channel used by the AP/current effective Isotropic Radiated Power (EIRP) /maximum EIRP.
11a Clients	Number of 802.11a clients using the AP.
11a Ch/EIRP/MaxEIRP	802.11a radio channel used by the AP/current EIRP/maximum EIRP.
AP Type	AP model type.
Flags	This column displays any flags for this AP. The list of flag abbreviations is included in the output of the <b>show ap active</b> command.
Uptime	Number of hours, minutes and seconds since the last switch reboot or bootstrap, in the format <i>hours:minutes:seconds</i> .

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap allowed-channels

```
show ap allowed-channels [<ap-name>|<country-code>|<ip-addr>]
```

### Description

This command shows configuration information for Captive portal authentication profiles.

### Syntax

Parameter	Description
<ap-name>	Name of an AP.
<country-code>	Specify a country code to display allowed channels for that country.
<ip-addr>	IP address of an AP, in dotted-decimal format.

### Usage Guidelines

Specify the country code for your switch during initial setup. Changing the country code causes the valid channel lists to be reset to the defaults for that country.

### Examples

The output of this example shows all allowed channels for the country code **US**.

```
(host)# show ap allowed-channels US

Allowed Channels for Country Code "US"
-----
PHY Type                Allowed Channels
-----
802.11g (indoor)        1 2 3 4 5 6 7 8 9 10 11
802.11a (indoor)        36 40 44 48 149 153 157 161 165
802.11g (outdoor)       1 2 3 4 5 6 7 8 9 10 11
802.11a (outdoor)       149 153 157 161 165
802.11g 40MHz (indoor)  1-5 2-6 3-7 4-8 5-9 6-10 7-11
802.11a 40MHz (indoor)  36-40 44-48 149-153 157-161
802.11g 40MHz (outdoor) 1-5 2-6 3-7 4-8 5-9 6-10 7-11
802.11a 40MHz (outdoor) 149-153 157-161
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap ap-group

```
show ap ap-group {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show the AP group settings for an individual AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID). An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Usage Guidelines

Use this command to display the contents of an AP's group profile. If you know the name of the group whose profile settings you want to view, use the command **show ap-group <profile-name>**. To view a list of all configured AP groups on your switch, use the command **show ap-group**.

### Examples

In the example below, the output of this command lists the profiles associated with the AP group **Corp13**.

```
(host) #show ap ap-group AP2
AP group "corp13"
-----
Parameter                               Value
-----
Virtual AP                               corp13-guest
Virtual AP                               corp13-ether-wpa2
Virtual AP                               corp13-ether-voip
Virtual AP                               corp13-ether-comm
802.11a radio profile                    default
802.11g radio profile                    default
Wired AP profile                         default
Ethernet interface 0 link profile        default
Ethernet interface 1 link profile        default
AP system profile                        corp13
VoIP Call Admission Control profile      default
802.11a Traffic Management profile       N/A
802.11g Traffic Management profile       N/A
Regulatory Domain profile                corp13-channel-profile
SNMP profile                             default
RF Optimization profile                  handoff-aggressive
RF Event Thresholds profile              default
IDS profile                              ids-low-setting
Mesh Radio profile                       default
    Mesh Cluster profile                  N/A
```

### Related Commands

## show ap arm neighbors

```
show ap arm neighbors {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show the ARM settings for an AP's neighbors.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID). An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Examples

The output of this command shows ARM neighbor information for both the **wifi1** and **wifi0** interfaces on AP **ap70\_1**.

```
(host)# show ap arm neighbors ap70_1

Interface:wifi1
00:1b:2f:e6:1c:d0:known-interfering/SNR-1/CH-1
00:19:e3:31:55:f2:known-interfering/SNR-7/CH-1

## show ap arm rf-summary

```
show ap arm rf-summary {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show the state and statistics for all channels being monitored by an individual AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show channel data for an AP with a specific name.
bssid <bssid>	Show channel data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show channel data for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Examples

The output of this command shows detailed information for the individual channels being monitored and statistics for each AP interface. Use this command verify an AP's RF health, or to determine why multiple APs in the same area are on the same channel.

```
(host)# show ap arm rf-summary ap-name ap21
Channel Summary
-----
channel  retry  low-speed  non-unicast  frag  bwidth  phy-err  mac-err  noise  cov-idx  intf_idx
-----

```

The output of this command includes the following information:

Parameter	Description
channel	Number of a radio channel used by the AP.

Parameter	Description
retry	Number of 802.11 retry frames sent because a client failed to send an ACK.
low-speed	Number of frames sent at a data rate of 18 Mbps or slower.
non-unicast	The number of non-unicast frames sent on the channel.
frag	Number of fragmented packets
bwidth	Current bandwidth, in kbps.
phy-err	Number of PHY errors on the channel.
mac-err	Number of MAC errors on the channel.
noise	Current noise level, in -dBm.
cov-idx	The AP uses this metric to measure RF coverage. The coverage index is calculated as $x/y$ , where "x" is the AP's weighted calculation of the Signal-to-Noise Ratio (SNR) on all valid APs on a specified 802.11 channel, and "y" is the weighted calculation of the Alcatel-Lucent APs SNR the neighboring APs see on that channel.
intf_idx	The AP uses this metric to measure co-channel and adjacent channel interference. The Interference Index is calculated as $a/b/c/d$ , where: <ul style="list-style-type: none"> <li>Metric value "a" is the channel interference the AP sees on its selected channel.</li> <li>Metric value "b" is the interference the AP sees on the adjacent channel.</li> <li>Metric value "c" is the channel interference the AP's neighbors see on the selected channel.</li> <li>Metric value "d" is the interference the AP's neighbors see on the adjacent channel</li> </ul>
Interface Name	Name of the fastethernet or gigabit ethernet interface
Current ARM Assignment	Current channels assigned by the AP's ARM profile.
Target Coverage Index	Ideal value of coverage index an AP tries to achieve on its channel.
Covered channels a/g	Number of channels that are currently being used by an AP's BSSIDs.
Free channels a/g	Number of channels that are available to an AP because that channel has a lower interference index.
ARM Edge State	If enabled, ARM-enabled APs on the network edge will not become Air Monitors.
Last check channel/ pwr	Time elapsed since the AP checked its channel and power settings, in <i>hour:minute:second</i> format.
Last change channel/ pwr	Time elapsed since the AP changed its channel and power settings, in <i>hour:minute:second</i> format.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap arm scan-times

```
show ap arm scan-times {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show AM channel scan times for an individual AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show channel scan data for an AP with a specific name.
bssid <bssid>	Show channel scan data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show channel scan data for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Examples

The output of this command shows scan times for every channel on an AP with the IP address 10.15.10.37.

```
(host)# show ap arm scan-times ip-addr 10.15.10.37
```

```
Channel Scan Time
```

```
-----  
channel  assign-time  scans-attempted  scans-rejected  dos-scans  flags  timer-tick

1       4194             97               0               0          DVACT  50594  
2       0                97               0               0          DAC    50604  
3       0                97               0               0          DAC    50615  
4       0                97               0               0          DAC    50627  
5       0                97               0               0          DC     50638  
6       4076             97               0               0          DVACT  50656  
7       0                96               0               0          DAC    50538  
8       0                97               0               0          DC     50549  
9       0                97               0               0          DC     50561  
10      0                97               0               0          DAC    50572  
11      3710             97               0               0          DVACT  50583
```

The output of this command includes the following parameters:

Parameter	Description
channel	A radio channel on the specified AP.
Assign-time	The amount of time that an AP has been on a channel.
scans-attempted	The number of times an AP has attempted to scan another channel
scans-rejected	The number of times an AP attempted to scan a channel, but was unable to scan because the scan was halted by the power save, voice aware or load aware ARM features.
dos-scans	The number of times an AP enabled with the rogue aware scanning feature had to contain a rogue device on a channel.
flags	The flags column displays additional relevant information about the channel. The flags key appears at the bottom of the Channel Scan Time table.
timer tick	Timer tick at which the last scan was attempted.
last-scan-channel	The last channel scanned by the AP
current-scan-channel	The AP's current channel.
last-dos-channel	The last channel that had to be contained because a rogue device was detected on that channel.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap arm state

```
show ap arm state [ap-name <ap-name>|dot11a|dot11g|ip-addr <ip-addr>]
```

### Description

Display Adaptive Radio Management (ARM) information for an individual AP's neighbors, or show all available data for any neighboring AP using an 802.11a or 802.11g radio type.

### Syntax

Parameter	Description
ap-name <ap-name>	Show aggregate ARM Neighbor Information for a specific AP.
dot11a	Show aggregate ARM Neighbor Information for all APs using an 802.11a radio.
dot11g	Show aggregate ARM Neighbor Information for all APs using an 802.11g radio.
ip-addr <ip-addr>	Show aggregate ARM Neighbor Information for a AP with a specific IP address by entering its IP address in dotted-decimal format.

### Usage Guidelines

The output of the **show ap arm state** command shows 802.11a and 802.11g information for all APs. Include an AP name or IP address to show data for just a single AP, or use the **dot11a** or **dot11g** keywords to show data for all APs using that radio type.

### Examples

The output of this command shows 802.11a information for all neighboring APs.

```
(host)# show ap arm state

AP-AL39:10.6.1.206:48:19:23-Edge:enable
Neighbor Data
-----
Name   IP Address  SNR  Assignment
----   -
AL33   10.6.1.205  32   48/10

AP-AL33:10.6.1.205:48:10:23-Edge:disable
Neighbor Data
-----
Name   IP Address  SNR  Assignment
----   -
AL39   10.6.1.206  42   48/19
AL19   10.6.1.212  29   161/19
AL31   10.6.1.202  25   153/16
AL25   10.6.1.196  13   153/16
AL29   10.6.1.204  26   153/19
```

The output of this command includes the following information

Column	Description
Name	Name of an AP.
IP address	IP address of an AP.

Column	Description
SNR	Signal-to-noise (SNR) ratio. SNR is the power ratio between an information signal and the level of background noise.
Assignment	The AP's current channel assignment.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode

## show ap association

```
show ap association [ap-name <ap-name>|ap-group <ap-group>|bssid <bssid>|channel <channel>|client-mac <client-mac>|essid <essid>|ip-addr <ip-addr>|phy {a|b|g}|voip-only]
```

### Description

Show the association table for an AP group or for an individual AP.

### Syntax

Parameter	Description
ap-group <ap-group>	Show AP associations for a specific AP group. You can also include the <b>channel</b> , <b>essid</b> or <b>voip-only</b> keywords to further filter the output of this command.
ap-name <ap-name>	Show AP associations for a specific AP. You can also include the <b>essid</b> , <b>phy</b> or <b>voip-only</b> keywords to further filter the output of this command.
bssid <bssid>	Show the AP associations for an specific AP Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
channel <channel>	Show AP associations for an individual channel by specifying the channel for which you want to view information.
client-mac <client-mac>	Show the AP associations for a specific MAC address by entering the MAC address of a client for which you want to view association information.
essid <essid>	Show AP associations for an Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	Show AP associations for a specific AP by entering an IP address in dotted-decimal format. You can also include the <b>essid</b> , <b>phy</b> or <b>voip-only</b> keywords to further filter the output of this command.
phy	Include the <b>phy</b> <b>[a b g]</b> keywords to show associations for a specific 802.11 radio type, either 802.11a, 802.11b or 802.11g.
voip-only	Show VoIP client information only.

### Usage Guidelines

Use this command to check if user is connected to an AP. This command validates whether the client is associated and indicates the last AP to which it was connected. If the flags column shows an 'A', the client is currently associated with that AP. Alternately, if the client is not currently associated, the AP with the smallest value of association time is the last AP used by the client.

### Example

Use the **show ap association client-mac** command to verify that a user has associated with an AP, or to determine last AP to which the client was connected. The output of this command in the example below shows the association table for the client with the MAC address 00:13:fd:5c:7c:59. If the flags column in the output of this command shows an 'A', the client associated last to that AP. Alternately, the AP with the smallest value of association time is the last AP to which the client had associated.

In the example below, the output of this command has been broken into two separate tables to better fit this page. In the actual output of the command, this information is shown in a single, wide table.

```
(host) #show ap association client-mac 00:13:fd:5c:7c:59
```

```
Flags: W: WMM client, A: Active, R: RRM client  
PHY Details: HT: High throughput; 20: 20MHz; 40: 40MHz  
             ss: spatial streams
```

```
Association Table
```

```
Association Table
```

```
-----  
-----  
Name  bssid          mac              auth  assoc  aid  l-int  essid  
----  -
```

Name	bssid	mac	auth	assoc	aid	l-int	ssid
AL12	00:1a:1e:11:5f:11	00:21:5c:50:b1:ed	y	y	12	10	ethersphere-wpa2
AL5	00:1a:1e:88:88:31	00:19:7d:d6:74:93	y	y	6	10	ethersphere-wpa2

```
vlan-id tunnel-id phy          assoc. time num assoc  Flags
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP
bssid	The AP Basic Service Set Identifier (BSSID)
mac	MAC address of the AP
auth	This column displays a <b>y</b> if the AP has been configured for 802.11 authorization frame types. Otherwise, it displays an <b>n</b> .
assoc	This column displays a <b>y</b> if the AP has been configured for 802.11 association frame types. Otherwise, it displays an <b>n</b> .
aid	802.11 association ID. A client receives a unique 802.11 association ID when it associates to an AP.
l-int	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.
ssid	Name that uniquely identifies the AP's Extended Service Set Identifier (ESSID).
vlan-id	Identification number of the AP's VLAN.
tunnel-id	Identification number of the AP's tunnel.
assoc. time	Amount of time the client has associated with the AP, in the format <i>hours:minutes:seconds</i> .
num assoc	Number of clients associated with the AP.
flags	This column displays any flags for this AP. The list of flag abbreviations is included in the output of the <b>show ap association</b> command.

## Related Commands

Command	Description	Mode
<b>show ap debug association-failure</b>	If the output of this show command indicates that a client is not associating with an AP, use <b>show ap debug association-failure</b> to determine why a client is not associated with an AP.	Config mode

## show ap association remote

```
show ap association remote [ap-name <ap-name>|ap-group <ap-group>|bssid <bssid>|channel <channel>|ssid <ssid>
```

### Description

Display the association table for an individual AP or group of APs in bridge mode.

### Syntax

Parameter	Description
ap-name <ap-name>	Show AP associations for a specific remote AP.
ap-group <ap-group>	Show AP associations for a specific group of remote APs.
bssid <bssid>	Show the AP associations for an specific AP Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
channel <channel>	Show remote AP associations for a specific channel.
ssid <ssid>	Show remote AP associations for an Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).

### Examples

The output of the command below shows the association table for clients in the AP group **group1**.

```
show ap association remote ap-group group1
```

```
Flags: W: WMM client, A: Active, R: RRM client  
PHY Details: HT: High throughput; 20: 20MHz; 40: 40MHz  
ss: spatial streams
```

Association Table

```
-----

assoc.time num assoc  Flags  
---- -  
-----
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP
bssid	The AP Basic Service Set Identifier (BSSID)
mac	MAC address of the AP
auth	This column displays a <b>y</b> if the AP has been configured for 802.11 authorization frame types. Otherwise, it displays an <b>n</b> .
assoc	This column displays a <b>y</b> if the AP has been configured for 802.11 association frame types. Otherwise, it displays an <b>n</b> .
aid	802.11 association ID. A client receives a unique 802.11 association ID when it associates to an AP.
l-int	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.

Column	Description
ssid	Name that uniquely identifies the AP's Extended Service Set Identifier (ESSID).
vlan-id	Identification number of the AP's VLAN.
tunnel-id	Identification number of the AP's tunnel.
phy	The RF band in which the AP should operate: <b>g</b> = 2.4 GHz <b>a</b> = 5 GHz
assoc. time	Amount of time the client has associated with the AP, in the format <i>hours:minutes:seconds</i> .
num assoc	Number of clients associated with the AP.
flags	This column displays any flags for this AP. The list of flag abbreviations is included in the output of the <b>show ap association remote</b> command.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap blacklist-clients

```
show ap blacklist-clients
```

### Description

Show a list of clients that have been denied access.

### Usage Guidelines

Use the **stm** CLI command to add or remove users from a blacklist. Additionally, the **dot1x authentication**, **VPN authentication** and **MAC authentication** profiles allow you to automatically blacklist a client if machine authentication fails.

### Examples

The output of this command shows that the switch has a single user-defined blacklisted client.

```
(host)# show ap blacklist-clients

Blacklisted Clients
-----
STA              reason          block-time(sec)  remaining time(sec)
---            -
00:1E:37:CB:D4:52  user-defined    2480             Permanent
```

The output of this command includes the following information:

Column	Description
STA	MAC address of the blacklisted client.
reason	The reason that the user was blacklisted. <ul style="list-style-type: none"><li>● <b>user-defined</b>: User was blacklisted due to blacklist criteria were defined by the network administrator</li><li>● <b>mitm-attack</b>: Blacklisted for a man in the middle (MITM) attack; impersonating a valid enterprise AP.</li><li>● <b>ping-flood</b>: Blacklisted for a ping flood attack.</li><li>● <b>session-flood</b>: Blacklisted for a session flood attack.</li><li>● <b>syn-flood</b>: Blacklisted for a syn flood attack.</li><li>● <b>session-blacklist</b>: User session was blacklisted</li><li>● <b>IP spoofing</b>: Blacklisted for sending messages using the IP address of a trusted client.</li><li>● <b>ESI-blacklist</b>: An external virus detection or intrusion detection application or appliance blacklisted the client.</li><li>● <b>CP-flood</b>: Blacklisting for flooding with fake AP beacons.</li><li>● <b>UNKNOWN</b>: Blacklist reason unknown.</li></ul>
block-time (sec)	Amount of time the client has been blocked, in seconds.
remaining time(sec)	Amount of time remaining before the client will be allowed access to the network again.

## show ap bss-table

```
show ap bss-table [ap-name <ap-name>|bssid <bssid>|essid <essid>|ip-addr <ip-addr>|port <port>\<slot>]
```

### Description

Show an AP's Basic Service Set (BSS).

### Syntax

Parameter	Description
ap-name <ap-name>	Show the BSS table for a specific AP.
bssid <bssid>	Show the BSS table for an specific AP Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
essid <essid>	Show the BSS table for an Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	Show the BSS table for a specific AP by entering an IP address in dotted-decimal format.
port <port>/<slot>	Show the BSS table for a specific port and slot on an AP. The slot and port numbers should be separated by a forward slash (/).

### Usage Guidelines

The output of the **show ap bss-table** command shows the Alcatel-Lucent AP BSS table for all APs. To filter this information and view BSS table data for an individual AP or a specific port and slot number, include the **ap-name**, **bssid**, **essid**, **ip-addr** or **port** keywords.

### Example

The output of this command shows the BSS table for the seven active APs using the switch.

```
show ap bss-table
```

```
Alcatel-Lucent AP BSS Table
```

```

```

The output of this command includes the following information:

Column	Description
bss	The AP Basic Service Set Identifier (BSSID). This is usually the MAC address of the AP
ess	The AP Extended Service Set Identifier (ESSID).

Column	Description
s/p	<p>The switch port used by the AP, in the format &lt;slot&gt;/&lt;port&gt;.</p> <p>The <b>&lt;slot&gt;</b> number is always 1 except when referring to interfaces on the OmniAccess 6000 switch. For the OmniAccess 6000 switch, the four slots are allocated as follows:</p> <ul style="list-style-type: none"> <li>Slot 0: contains a supervisor card or an OmniAccess Supervisor Card III.</li> <li>Slot 1: can contain either a redundant supervisor card, OmniAccess Supervisor Card III, or a third line card.</li> <li>Slot 2: can contain either a OmniAccess Supervisor Card III or line card (required if slot 0 contains a supervisor card).</li> <li>Slot 3: can contain either a OmniAccess Supervisor Card III or second line card.</li> </ul> <p>The <b>&lt;port&gt;</b> number refers to the network interfaces that are embedded in the front panel of the OmniAccess 4302, OmniAccess 4308T, or OmniAccess 4324 switch, OmniAccess 4504/4604/4704 Multi-Service Switch, OmniAccess Supervisor Card III, or a line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position.</p>
ip	IP address of an AP.
phy	<p>An AP radio type. Possible values are:</p> <ul style="list-style-type: none"> <li>a—802.11a</li> <li>a-HT—802.11a high throughput</li> <li>g—802.11g</li> <li>g-HT—802.11g high throughput</li> </ul>
type	Shows whether the AP is working as an access point (AP) or air monitor (AM).
ch/EIRP/max-EIRP	Radio channel used by the AP/current effective Isotropic Radiated Power (EIRP) / maximum EIRP.
cur-cl	Current number of clients on the AP.
ap name	Name of the AP.
in-t(s)	Number of seconds that an AP has been inactive.
tot-t	An AP's total active time, in seconds.
mtu	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
acl-state	<p>An access control list (ACL) can enable or disable an AP during specific time ranges.</p> <ul style="list-style-type: none"> <li><b>Disabled:</b> An ACL with time restrictions is currently <b>disabled</b> (so the AP is enabled).</li> <li><b>Enabled:</b> An ACL with time restrictions is currently <b>enabled</b> (so the AP is disabled).</li> <li>This data column will display a dash (-) if no ACLs are currently configured for the AP.</li> </ul>

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap bw-report

```
show ap bw-report {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show the bandwidth reporting table for a specific AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show bandwidth data for an AP with a specific name.
bssid <bssid>	Show bandwidth data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show bandwidth data for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Examples

The output of the following command shows the Alcatel-Lucent AP bandwidth table for an AP with the IP address 192.0.2.170.

```
show ap bw-report ip-addr 192.0.2.170
```

```
Bandwidth report for AP "AL16" radio 0
```

```
-----  
Virtual AP           Allocated Share  Actual Share  Offered Load  Delivered Load  
-----  
corp1344-guest      0%                0%            0 kbps        0 kbps  
corp1344-ethersphere-wpa2 0%                0%            0 kbps        0 kbps  
Average Throughput:0 kbps
```

```
Bandwidth report for AP "AL16" radio 1
```

```
-----  
Virtual AP           Allocated Share  Actual Share  Offered Load  Delivered Load  
-----  
corp1344-guest      0%                0%            0 kbps        0 kbps  
corp1344-ethersphere-voip 0%                0%            0 kbps        0 kbps  
corp1344-ethersphere-vocera 0%                0%            0 kbps        0 kbps  
Average Throughput:0 kbps
```

The output of this command includes the following information for all radios on the AP:

Column	Description
Virtual AP	Name of a Virtual AP
Allocated Share	Maximum percentage of total bandwidth available to that Virtual AP.
Actual Share	Actual percentage of total bandwidth used by a Virtual AP.
Offered Load	Attempted throughput for the Virtual AP, in kbps.
Delivered Load	Actual throughput for the Virtual AP, in kbps. This value may be less than the offered load if the Virtual AP has used all its allocated bandwidth.
Average Throughput	Average throughput for the virtual AP, in kbps.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap client status

```
show ap client status <client-mac>
```

### Description

Show the current status of a specific client.

### Syntax

Parameter	Description
<client-mac>	MAC address of a client

### Examples

The output of the command shows the status of an individual client in the STA (station) table.

```
(host) #show ap client status 00:13:fd:42:32:38

STA Table
-----
bssid          auth  assoc  aid  l-int  essid      vlan-id  tunnel-id
-----
00:1a:1e:a3:02:c9  y    y      7    10    corp-wpa2  65      0x10c0
State Hash Table
-----
bssid          state      reason
-----
00:1a:1e:a3:02:c9  auth-assoc  0
```

The output of this command includes the following information:

Column	Description
bssid	Basic Service Set ID (BSSID) of the client.
auth	This column displays a <b>y</b> if the AP has been configured for 802.11 authorization frame types. Otherwise, it displays an <b>n</b> .
assoc	This column displays a <b>y</b> if the AP has been configured for 802.11 association frame types. Otherwise, it displays an <b>n</b> .
aid	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.
l-int	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.
ssid	Extended Service Set ID (ESSID) of the client.
vlan-id	VLAN ID of the VLAN used by the client
tunnel-id	Identification number for the tunnel
state	If the client has been both authorized and associated, this data column will display <b>auth-assoc</b> . If the client has only been authorized, this data column will display <b>auth</b> .
Reason	If the client failed to authenticate, this data column lists the reason code for 802.11 authentication failure

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap config

```
show ap config {ap-group <ap-group>}|{ap-name <ap-name>}|{essid <essid>}
```

### Description

Show a large list of configuration settings for an ap-group or an individual AP.

### Syntax

Parameter	Description
ap-group <ap-group>	Display configuration settings for an AP group.
ap-name <ap-name>	Display configuration settings for an AP with a specific name.
essid <essid>	Display configuration settings for an AP with a specific Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).

### Examples

The example output below shows just some of the configuration settings displayed in the output of this command.

```
show ap config ap-group apgroup14
-----
Parameter                               802.11g      802.11a      Source
-----

Dump Server                                N/A          N/A          ap system-profile
"default"
Telnet                                     Disabled     Disabled     ap system-profile
```

The output of this command includes the following parameters.

Parameter	Description
LMS IP	The IP address of the local management switch (LMS)—the Alcatel-Lucent switch which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network.
Backup LMS IP	For multi-switch networks, this parameter displays the IP address of a backup to the IP address specified with the lms-ip parameter.
LMS Preemption	When this parameter is enabled, the local management switch automatically reverts to the primary LMS IP address when it becomes available.
LMS Hold-down Period	Time, in seconds, that the primary LMS must be available before an AP returns to that LMS after failover.
Master switch IP address	For multi-switch networks, this parameter displays the IP address of the master switch.
RF Band	For dual-band radios, this parameter displays the RF band in which the AP should operate: <ul style="list-style-type: none"> <li>● <b>g</b> = 2.4 GHz</li> <li>● <b>a</b> = 5 GHz</li> </ul>
Double Encrypt	This parameter applies only to remote APs. Double encryption is used for traffic to and from a wireless client that is connected to a tunneled SSID. When enabled, all traffic is re-encrypted in the IPsec tunnel. When disabled, the wireless frame is only encapsulated inside the IPsec tunnel.
Native VLAN ID	Native VLAN for bridge mode virtual APs (frames on the native VLAN are not tagged with 802.1q tags).
SAP MTU	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
Bootstrap threshold	Number of consecutive missed heartbeats on a GRE tunnel (heartbeats are sent once per second on each tunnel) before an AP reboots. On the switch, the GRE tunnel timeout is 1.5 x bootstrap-threshold; the tunnel is torn down after this number of seconds of inactivity on the tunnel.
Request Retry Interval	Interval, in seconds, between the first and second retries of AP-generated requests. If the configured interval is less than 30 seconds, the interval for subsequent retries is increased up to 30 seconds.
Maximum Request Retries	Maximum number of times to retry AP-generated requests, including keepalive messages. After the maximum number of retries, the AP either reboots or tries the IP address specified by the backup LMS IP address (if configured).
Keepalive Interval	Time, in seconds, between keepalive messages from the AP
Dump Server	(For debugging purposes.) Displays the server to receive the core dump generated if an AP process crashes.
Telnet	Reports whether telnet access the AP is enabled or disabled.
SNMP sysContact	SNMP system contact information.
RFprotect Server IP	The IP address of the RFprotect server for this AP or group
RFprotect Backup Server IP	The IP address of the RFprotect backup server for this AP or group
AeroScout RTLS Server	Displays whether or not the AP will send RFID tag information to an AeroScout real-time asset location (RTLS) server.
RTLS Server configuration	Displays whether or not the AP will send RFID tag information to an RTLS server.

Parameter	Description
Remote-AP DHCP Server VLAN	Shows the VLAN ID of the remote-AP DHCP server used when switch is unreachable.
Remote-AP DHCP Server Id	Shows the IP Address of the DHCP DNS Server.
Remote-AP DHCP Default Router	Shows the IP Address of the DHCP Default Router.
Remote-AP DHCP Pool Start	Shows the IP Address used as start of DHCP Pool.
Remote-AP DHCP Pool End	Shows the IP Address used as end of DHCP Pool.
Remote-AP DHCP Pool Netmask	Shows the netmask of DHCP Pool.
Remote-AP DHCP Lease Time	Shows the length of leases, in days (0 means infinite).
Heartbeat DSCP	DSCP value of AP heartbeats (0-63).
Session ACL	Shows the access control list (ACL) applied on the uplink of a remote AP.
Maintenance Mode	Shows if Maintenance mode is enabled or disabled. If enabled, APs stop flooding unnecessary traps and syslog messages to network management systems or network operations centers when deploying, maintaining, or upgrading the network. The switch still generates debug syslog messages if debug logging is enabled.
Radio enable	Shows if the AP's radio is enabled or disabled.
Mode	Shows the operating modes for the AP. <ul style="list-style-type: none"> <li>● <b>ap-mode:</b> Device provides transparent, secure, high-speed data communications between wireless network devices and the wired LAN.</li> <li>● <b>am-mode:</b> Device behaves as an air monitor to collect statistics, monitor traffic, detect intrusions, enforce security policies, balance traffic load, self-heal coverage gaps, etc.</li> </ul>
High throughput enable (radio)	Shows if high-throughput (802.11n) features on the 2.4 GHz frequency band are enabled or disabled.
Channel	Shows the channel number for the AP's 802.11a/802.11n physical layer.
Beacon Period	Shows the time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.
Transmit Power	Shows the current transmission power level.
Advertise 802.11d and 802.11h Capabilities	This column reports whether or not the AP will advertise its 802.11d (Country Information) and 802.11h (TPC or Transmit Power Control) capabilities
Enable CSA	Displays whether or not the AP has enabled channel switch announcements (CSAs) for 802.11h.
CSA Count	Number of channel switch announcements that must be sent before the AP will switch to a new channel.
Management Frame Throttle interval	Average interval that rate limiting management frames are sent from this radio, in seconds. If this column displays a zero (0) rate limiting is disabled for this AP.
Management Frame Throttle Limit	Maximum number of management frames that can come from this radio in each throttle interval.
ARM/WIDS Override	Shows if Adaptive Radio Management (ARM) and Wireless IDS functions are enabled or disabled. If a radio is configured to operate in Air Monitor mode, then these functions are always enabled, regardless of this option.

Parameter	Description
Protection for 802.11b Clients	Displays whether or not protection for 802.11b clients is enabled or disabled.
Assignment	Displays whether or not ARM channel and power assignment has been enabled or disabled.
Allowed bands for 40MHz channels	Forty MHz channels may be used on the specified radio bands (802.11a or 802.11g).
Client Aware	Shows if the client aware feature has been enabled or disabled for this AP. If enabled, AP will not change channels when there are active clients.
Max Tx Power	Maximum transmission power for this AP, in dBm.
Min Tx Power	Minimum transmission power for this AP, in dBm.
Multi Band Scan	Shows if the multi-band scan feature has been enabled or disabled on this AP. If enabled, single-radio APs will try to scan across bands for Rogue AP detection
Rogue AP Aware	Shows if the rogue AP awareness feature has been enabled or disabled on this AP. If enabled, the AP will try to contain off-channel Rogue APs
Scan Interval	This column indicates, in seconds, how often the AP will leave its current channel to scan other channels in the band if scanning is enabled
Active Scan	Displays whether or not the active scan feature is enabled. <b>NOTE:</b> This option elicits more information from nearby APs, but also creates additional management traffic on the network. <b>Active Scan</b> is disabled by default, and should <i>not be enabled</i> except under the direct supervision of Alcatel-Lucent Support.
Scanning	Shows if scanning is enabled or disabled for this AP. If this option is disabled, the following other options will also be disabled: <ul style="list-style-type: none"> <li>• Multi Band Scan</li> <li>• Rogue AP Aware</li> <li>• Voip Aware Scan</li> <li>• Power Save Scan</li> </ul>
Scan Time	The amount of time, in milliseconds, an AP will drift out of the current channel to scan another channel. The supported range for this setting is 0-2,147,483,647 seconds. Alcatel-Lucent recommends a scan time between 50-200 msec.
VoIP Aware Scan	Shows if VoIP aware scanning is enabled or disabled. If you use voice handsets in the WLAN, <b>VoIP Aware Scan</b> should be enabled in the ARM profile so the AP will not attempt to scan a different channel if one of its clients has an active VoIP call. This option requires that <b>Scanning</b> is also enabled.
Power Save Aware Scan	Shows if the power save aware scan is enabled or disabled. If enabled, the AP will not scan a different channel if it has one or more clients and is in power save mode. Default: enabled
Ideal Coverage Index	The Alcatel-Lucent coverage index metric is a weighted calculation based on the RF coverage for all Alcatel-Lucent APs and neighboring APs on a specified channel. The <b>Ideal Coverage Index</b> specifies the ideal coverage that an AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be.
Acceptable Coverage Index	For multi-band implementations, the <b>Acceptable Coverage Index</b> specifies the minimal coverage an AP it should achieve on its channel. The denser the AP deployment, the lower this value should be.

Parameter	Description
Free Channel Index	The current free channel index value. The Alcatel-Lucent Interference index metric measures interference for a specified channel and its surrounding channels. This value is calculated and weighted for all APs on those channels (including 3rd-party APs). An AP will only move to a new channel if the new channel has a lower interference index value than the current channel. <b>Free Channel Index</b> specifies the required difference between the two interference index values before the AP moves to the new channel. The lower this value, the more likely it is that the AP will move to the new channel.
Backoff Time	After an AP changes channel or power settings, it waits for this backoff time interval before it asks for a new channel/power setting.
Error Rate Threshold	The minimum percentage of PHY errors and MAC errors in the channel that will trigger a channel change.
Error Rate Wait Time	Minimum time in seconds the error rate on the AP has to exceed its defined error rate threshold before it triggers a channel change.
Noise Threshold	Maximum level of noise in a channel that triggers a channel change.
Noise Wait Time	Minimum time in seconds the noise level has to exceed the Noise Threshold before it triggers a channel change on the AP.
Minimum Scan Time	Minimum number of times a channel must be scanned before it is considered for assignment. Alcatel-Lucent recommends a <b>Minimum Scan Time</b> between 1-20 scans.
Load aware Scan Threshold	The <b>Load Aware Scan Threshold</b> is the traffic throughput level an AP must reach before it stops scanning. Load aware ARM preserves network resources during periods of high traffic by temporarily halting ARM scanning if the load for the AP gets too high.
Mode Aware Arm	Shows if the mode-aware ARM feature has been enabled or disabled for this AP. If enabled, ARM will turn the AP into an Air Monitors (AMs) if it detects higher coverage levels than necessary. This helps avoid higher levels of interference on the WLAN. Although this setting is disabled by default, you may want to enable this feature if your APs are deployed in close proximity (e.g. less than 60 feet apart).
40 MHz intolerance	The specified setting allows ARM to determine if 40 MHz mode of operation is allowed on the 5 GHz or 2.4 GHz frequency band only, on both frequency bands, or on neither frequency band.
Honor 40 MHz intolerance	Shows if 40 MHz intolerance is enabled or disabled. If enabled, the radio will stop using the 40 MHz channels if the 40 MHz intolerance indication is received from another AP or station.
Legacy station workaround	Shows if interoperability for misbehaving legacy stations is enabled or disabled.
ESSID	Name that uniquely identifies the Extended Service Set Identifier (SSID).
Encryption	Encryption type used on this AP.
DTIM Interval	Shows the interval, in milliseconds, between the sending of Delivery Traffic Indication Messages (DTIMs) in the beacon. This is the maximum number of beacon cycles before unacknowledged network broadcasts are flushed.
Basic Rates	Lists supported 802.11a rates, in Mbps, that are advertised in beacon frames and probe responses from this AP.
Transmit Rates	Lists 802.11a rates at which the AP is allowed to send data. The actual transmit rate depends on what the client is able to handle, based on information sent at the time of association and on the current error/loss rate of the client.
Station Ageout Time	Time, in seconds, that a client is allowed to remain idle before being aged out.
Max Transmit Attempts	Maximum number of retries allowed for the AP to send a frame

Parameter	Description
RTS Threshold	Wireless clients transmitting frames larger than this threshold must issue Request to Send (RTS) and wait for the AP to respond with Clear to Send (CTS). This helps prevent mid-air collisions for wireless clients that are not within wireless peer range and cannot detect when other wireless clients are transmitting.
Short Preamble	Shows if a short preamble for 802.11b/g radios is enabled or disabled for this AP. Network performance may be higher when short preamble is enabled. In mixed radio environments, some 802.11b wireless client stations may experience difficulty associating with the AP using short preamble. To use only long preamble, disable short preamble. Legacy client devices that use only long preamble generally can be updated to support short preamble.
Max Associations	Maximum number of wireless clients allowed to associate to the AP
Wireless Multimedia (WMM)	Shows if Wireless Multimedia (WMM) is enabled or disabled for this AP. WMM provides prioritization of specific traffic relative to other traffic in the network
WMM TSPEC Min Inactivity Interval	Displays the minimum inactivity time-out threshold of WMM traffic for this AP.
DSCP mapping for WMM voice AC	Displays the DSCP value used to map WMM video traffic.
DSCP mapping for WMM video AC	Displays the DSCP value used to map WMM voice traffic.
DSCP mapping for WMM best-effort AC	Displays the DSCP value used to map WMM best-effort traffic
DSCP mapping for WMM background AC	Displays the DSCP value used to map WMM background traffic.
902il Compatibility Mode	Shows if 902 il compatibility mode is enabled or disabled. (This parameter only needs to be enabled for APs with associated clients using NTT DoCoMo 902iL phones.)
Hide SSID	Shows if the feature to hide a SSID name in beacon frames is enabled or disabled.
Deny_Broadcast Probes	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID.
Local Probe Response	Shows if local probe response is enabled or disabled on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients' probe requests. If this option is disabled, then the switch sends the 802.11 probe responses
Disable Probe Retry	If disabled, the AP will not resend probes if it does not get a response.
Battery Boost	Shows if the battery boost feature is enabled or disabled for the AP. If enabled, this feature converts multicast traffic to unicast before delivery to the client, thus allowing you to set a longer DTIM interval. The longer interval keeps associated wireless clients from activating their radios for multicast indication and delivery, leaving them in power-save mode longer and thus lengthening battery life
Drop Broadcast and Multicast	If this feature is enabled on an AP, it drops all downstream broadcast or multicast traffic to increase battery life.
WEP Key 1	Displays the static WEP key (1 of 4).
WEP Key 2	Displays the static WEP key (2 of 4).
WEP Key 3	Displays the static WEP key (3 of 4).

Parameter	Description
WEP Key 4	Displays the static WEP key (4 of 4).
WEP Transmit Key Index	Displays the key index that specifies which static WEP key is to be used.
WPA Hexkey	Displays the WPA pre-shared key (PSK).
WPA Passphrase	Displays the WPA passphrase with which the AP generates a pre-shared key (PSK).
Maximum Transmit Failures	Display the maximum number of transmission failures allowed before the client gives up.
BC/MC Rate Optimization	Shows if the AP has enabled or disabled scanning of all active stations currently associated to that AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate.
High throughput enable (SSID)	Shows if the AP has enabled or disabled the use of its high-throughput SSID in 40 MHz mode.
40 MHz channel usage	Determines if this high-throughput SSID allows high-throughput (802.11n) stations to associate.
MPDU Aggregation	Shows if the AP has enabled or disabled MAC protocol data unit (MPDU) aggregation.
Max transmitted A-MPDU size	Shows the maximum size, in bytes, of an A-MPDU that can be sent on the AP's high-throughput SSID.
Max received A-MPDU size	Shows the maximum size, in bytes, of an Aggregated-MAC Packet Data Unit (A-MPDU) that can be received on the AP's high-throughput SSID.
Min MPDU start spacing	Displays the minimum time between the start of adjacent MDPUs within an aggregate MPDU, in microseconds.
Supported MCS set	Comma-separated list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this high-throughput SSID.
Short guard interval in 40 MHz mode	Shows if the AP has enabled or disabled use of short guard interval in 40 MHz mode of operation.
Legacy stations	Shows if the AP has enabled or disabled the legacy stations option, which controls whether or not legacy (non-HT) stations are allowed to associate with the AP's SSID. By default, legacy stations are allowed to associate. <b>NOTE:</b> This setting has no effect on a BSS in which HT support is not available.
Allow weak encryption	Shows if the AP has enabled or disabled the weak encryption option. The use of TKIP or WEP for unicast traffic forces the use of legacy transmissions rates. Disabling this mode prevents the association of stations using TKIP or WEP for unicast traffic. This mode is disabled by default.
Virtual AP enable	Wireless LAN profiles configure WLANs in the form of virtual AP profiles. This parameter shows if the AP has enabled or disabled virtual APs.
Allowed band	Shows the band(s) on which to use the virtual AP: <ul style="list-style-type: none"> <li>● a—802.11a band only (5 GHz)</li> <li>● g—802.11b/g band only (2.4 GHz)</li> <li>● all—both 802.11a and 802.11b/g bands (5 GHz and 2.4 GHz)</li> </ul>
VLAN	Shows the VLAN(s) into which users are placed in order to obtain an IP address.

Parameter	Description
Forward mode	Shows the current forward mode (bridge, split-tunnel, or tunnel) for the virtual AP. This parameter controls whether 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the switch, and Internet access remains local). Only 802.1x authentication is supported when configuring bridge or split tunnel mode.
Deny time range	Shows the time range for which the AP will deny access for a virtual AP.
Mobile IP	Shows if IP mobility has been enabled or disabled for the virtual AP.
HA Discovery on-association	If enabled, all clients of a virtual-ap will received mobility service on association.
DoS Prevention	Shows the status of the Dos Prevention option. If enabled, virtual APs ignore deauthentication frames from clients. This prevents a successful death attack from being carried out against the AP. This does not affect third-party APs.
Station Blacklisting	Shows if the virtual AP has enabled or disabled detection of denial of service (DoS) attacks, such as ping or SYN floods, that are not spoofed death attacks.
Blacklist Time	Shows the number of seconds that a client will be quarantined from the network after being blacklisted.
Authentication Failure Blacklist Time	Shows the time, in seconds, a client is blocked if it fails repeated authentication. If the virtual AP shows a value of 0, a blacklisted client is blocked indefinitely.
Fast Roaming	Shows if the AP has enabled or disabled fast roaming.
Strict Compliance	If enabled, the virtual AP denies client association requests if the AP and client station have no common rates defined. Some legacy client stations which are not fully 802.11-compliant may not include their configured rates in their association requests. Such non-compliant stations may have difficulty associating with APs unless strict compliance is disabled.
VLAN Mobility	Shows if a virtual AP has enabled or disabled VLAN (Layer-2) mobility
Remote-AP Operation	Shows when the virtual AP operates on a remote AP: <ul style="list-style-type: none"> <li>● <b>always</b>—Permanently enables the virtual AP.</li> <li>● <b>backup</b>—Enables the virtual AP if the remote AP cannot connect to the switch.</li> <li>● <b>persistent</b>—Permanently enables the virtual AP after the remote AP initially <b>connects</b> to the switch.</li> <li>● <b>standard</b>—Enables the virtual AP when the remote AP connects to the switch.</li> </ul> A remote AP should use <b>always</b> and <b>backup</b> for bridge SSIDs, and use <b>persistent</b> and <b>standard</b> for 802.1x, tunneled, and split-tunneled SSIDs.
Convert Broadcast ARP requests to unicast	If this option is enabled, all broadcast ARP requests are converted to unicast and sent directly to the client. You can check the status of this option using the <b>show ap active</b> and the <b>show datapath</b> tunnel command. If enabled, the output will display the letter <b>a</b> in the flags column.
Band Steering	Shows if band-steering has been enabled or disabled for a virtual AP. ARM's band steering feature encourages dual-band capable clients to stay on the 5GHz band on dual-band APs. This frees up resources on the 2.4GHz band for single band clients like VoIP phones. Band steering reduces co-channel interference and increases available bandwidth for dual-band clients, because there are more channels on the 5GHz band than on the 2.4GHz band. Dual-band 802.11n-capable clients may see even greater bandwidth improvements, because the band steering feature will automatically select between 40MHz or 20MHz channels in 802.11n networks. This feature is disabled by default, and must be enabled in a Virtual AP profile.

Parameter	Description
VoIP Call Admission Control	Shows if WiFi VoIP Call Admission Control features are enabled or disabled.
VoIP Bandwidth based CAC	Shows the maximum bandwidth that can be handled by one radio, in kbps.
VoIP Call Capacity	Show the number of simultaneous calls that can be handled by one radio.
VoIP Bandwidth Capacity (kbps)	Shows the maximum bandwidth that can be handled by one radio, in kbps.
VoIP Call Handoff Reservation	Shows the percentage of call capacity reserved for mobile VoIP clients on call.
VoIP Send SIP 100 Trying	If enabled, the AP sends SIP 100 - trying messages to a call originator to indicate that the call is proceeding. This is useful when the SIP invite may be redirected through a number of servers before reaching the switch.
VoIP Disconnect Extra Call	If enabled, the AP disconnects calls that exceed the high capacity threshold by sending a deauthentication frame.
VOIP TSPEC Enforcement	Shows if validation of TSPEC requests for call admission controls is enabled or disabled.
VOIP TSPEC Enforcement Period	Displays the maximum time for the station to start a call after the TSPEC request.
VoIP Drop SIP Invite and send status code (client)	Displays the status code sent to the client when a SIP Invite is dropped. <ul style="list-style-type: none"> <li>● <b>480</b>: Temporary Unavailable</li> <li>● <b>486</b>: Busy Here</li> <li>● <b>503</b>: Service Unavailable</li> <li>● <b>none</b>: Don't send SIP status code</li> </ul>
VoIP Drop SIP Invite and send status code (server)	Displays the status code sent to the server when a SIP Invite is dropped. <ul style="list-style-type: none"> <li>● <b>480</b>: Temporary Unavailable</li> <li>● <b>486</b>: Busy Here</li> <li>● <b>503</b>: Service Unavailable</li> <li>● <b>none</b>: Don't send SIP status code</li> </ul>

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap coverage-holes

```
show ap coverage holes
```

### Description

Show information for APs that have detected coverage holes in the wireless network.

### Usage Guidelines

This command will only display coverage hole information if you have enabled coverage hole detection using the command **rf optimization-profile <profile> coverage-hole-detection**. The coverage hole detection feature requires the Wireless Intrusion Protection license.

### Examples

The output of this command

```
(host) #show ap coverage-holes
Coverage Holes Detected
-----
Name      BSSID                Radio  STA                RSSI
-----  -
ap12     00:1a:1e:c0:7f:fc    a      00:0b:86:c7:49:94  15
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP that detected a coverage hole.
BSSID	Basic Service Set Identifier (BSSID) of an AP that detected a coverage hole.
Radio	The coverage hole is for this radio PHY type ( <b>a</b> or <b>g</b> ).
STA	MAC address of the station.
RSSI	The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.

### Command History

Introduced in AOS-W 2.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Wireless Intrusion Protection license	Enable or Config mode on master switches

## show ap database

```
show ap database {group <group>|inactive|indoor|local|long|outdoor|page <page>|sensors
[disconnected]|sort-by [ap-group|ap-ip|ap-type|fqln|provisioned|status
{up|down}|switch-ip]|sort-direction[ascending|descending]|start <start> |status
{up|down}|switch <switch-ip-addr>|unprovisioned}
```

### Description

Show the list of access points in the switch's database.

### Syntax

Parameter	Description
group <group>	Show data for a specified AP group.
inactive	Show only local APs with no active BSSIDs or wired AP interfaces.
indoor	Show only APs that have an installation mode set to "indoor."
local	Show only APs on this switch.
long	Display the following additional data columns: <ul style="list-style-type: none"><li>• Wired MAC Address,</li><li>• Serial #</li><li>• Slot/Port</li><li>• FQLN</li></ul>
outdoor	Show only APs that have an installation mode set to "outdoor."
page <page>	Display a limited number of APs by entering the number of APs to be displayed in the output of this command.
sensors	Show only RFprotect sensors.
disconnected	Show only disconnected RFprotect sensors.
sort-by	Sort the output of this command by a specific data column.
ap-group	Sort by AP group name.
ap-ip	Sort by AP group name.
ap-type	Sort by AP model.
fqln	Sort by Fully Qualified Location Name (FQLN).
provisioned	Sort by provisioning statistics.
status up down	If used with the <b>sort-by</b> keyword, <b>status</b> sorts the output of the command by status type ( <b>up</b> or <b>down</b> .) Otherwise, use the <b>status</b> keyword to display APs with the specified status.
switch-ip	Sort by switch IP address.
sort-direction	Choose sort direction of AP list:.
ascending	Sort AP list in ascending order by name.
descending	Sort AP list in descending order by name.
start <start>	Start showing the AP index at the specified index number.
status	Show only APS with a given status as active or inactive.
down	Show only APs that are inactive.

Parameter	Description
up	Show only APs that are active.
switch <switch-ip-addr>	Show only APs registered with a specified switch by entering a switch IP address.
unprovisioned	Show only unprovisioned APs (using modifiers).

## Usage Guidelines

Many of the parameters in this command can be used together to filter a large database of information down to just the AP data you want to see. For example, you can issue the **command show ap database group <group> local status up** to view a list of local APs within a specific AP group that are reporting an **up** status. Include the **sort-by** and **sort-direction** keywords to specify how the data is sorted in the output of this command.

## Examples

The output of the command **show ap database** shows the switch's database of information for APs in the group **default**. The output also includes a description of the flag types that may appear in the **Flags** column.

```
show ap database group default
AP Database
-----
Name           Group   AP Type  IP Address  Status           Flags  Switch IP
-----

## Related Commands

Command	Description	Mode
<a href="#">show ap database-summary</a>	To display a more general summary overview of the AP registered to a switch, use the command <a href="#">show ap database-summary</a> .	Enable and Config modes

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap database-summary

```
show ap database-summary
```

### Description

Show a general summary of access point information for this switch.

### Usage Guidelines

Use this command to show the current number of active APs and Air Monitors. This command is also useful for determining how many unprovisioned APs or duplicate APs are on the network. For full details on each AP registered to a switch, use the command `show ap database`.

### Examples

The output of this command shows that this switch can detect a total of five APs, four up, and one down.

```
show ap database-summary
```

```
(host) #show ap database-summary
```

```
AP Database Summary
```

AP Mode	Total Up	Total Down	Total Upgrading*	Total Rebooting*	RAP Up	RAP Down	RAP	RAP
	Upgrading*	Rebooting*						
Access Points	0	0	0	0	0	0	0	0
Air Monitors	0	0	0	0	0	0	0	0
Wired Access Points	0	0	0	0	0	0	0	0
Mesh Portals	0	0	0	0	0	0	0	0
Mesh Points	0	0	0	0	0	0	0	0
RFprotect Sensors	0	0	0	0	0	0	0	0

\*Upgrading and Rebooting counts only reflect APs registered on this controller.

```
Unprovisioned Access Points:0
```

```
Duplicated AP Name:0
```

The output of this command includes the following information:

Column	Description
Total Up	Total number of APs with an <i>up</i> status.
Total Down	Total number of APs with a <i>down</i> status.
IPSEC Up	Total number of APs with an active (up) IPSEC tunnel.
IPSEC Down	Total number of APs with an inactive (down) IPSEC tunnel.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug association-failure

```
show ap debug association-failure [{ap-name <ap-name>}|{bssid <bssid>}|{client-mac <client-mac>}|{essid <essid>}|{ip-addr <ip-addr>}]
```

### Description

Display association failure information that can be used to troubleshoot problems on an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Filter the Association Failure Table by AP name.
bssid <bssid>	Filter the Association Failure Table by BSSID. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
client-mac <client-mac>	Filter the Association Failure Table to show an individual client MAC address by entering the MAC address of a client.
essid <essid>	Filter the Association Failure Table by ESSID. An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	Filter the Association Failure Table by IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

Use this command to determine whether the client is associated, and identify the last AP to which it was connected.

### Example

The output of the command `show ap debug association-failure` displays the Association Failure Table show below. If the **Idle time** column in the output of this command is a low value, **reason** column will describe why association failed.

```
(host)#show ap debug association-failure
Association Failure Table
-----
MAC Address      AP Name  BSSID           ESSID  State  Radio  Idle Time  Reason
-----
00:16:6f:09:54:3e AL29     00:1a:1e:11:6f:00 guest   802.11g 20h:39m:33s Denied; AP Going Down
00:16:6f:09:54:3e AL33     00:1a:1e:11:6e:60 guest   auth  802.11g 20h:39m:33s Unspecified Failure
00:16:6f:09:54:3e AL40     00:1a:1e:8d:5b:20 guest   802.11g 20h:39m:33s Denied; Ageout
Num Association Failures:3
```

The output of this command includes the following data columns:

Column	Description
MAC address	MAC address of the client that failed to associate with an AP.
AP Name	Name of an AP to which the client attempted to associate.
BSSID	Basic Service Set Identifier of an AP.
ESSID	Extended Service Set Identifier of an AP.
State	This data column shows if the client is currently authorized or both authorized and associated with an AP.

Column	Description
Radio	The AP radio type.
Idle Time	Amount of time that the client has been idle, in the format <i>hours:minutes:seconds</i> .
Reason	A brief description of the reason why the client failed to associate.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug bss-config

```
show ap debug bss-config [ap-name <ap-name>|bssid <bssid>||essid <essid>|ip-addr <ip-addr>|port <port>/<slot>]
```

### Description

Show the configuration for each BSSID of an AP. This information can be used to troubleshoot problems on an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Filter the AP Config Table by AP name.
bssid <bssid>	Filter the AP Config Table by BSSID. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
essid <essid>	Filter the AP Config Table by ESSID. An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	Filter the AP Config Table by IP address by entering an IP address in dotted-decimal format.
port <port>/<slot>	Filter the AP Config Table by port and slot numbers. The slot and port numbers should be separated by a forward slash (/).

### Examples

The output of this command shows the AP configuration table for a specific BSSID.

```
(host) #show ap debug bss-config
Alcatel-Lucent AP Config Table
-----
bss      ess      vlan  ip          phy  type  fw-mode  max-cl  rates tx-rates  preamble
mtu  status  wmm
---      ---      ---      --          ---  ---  ---      ---      ---  ---      ---
00:1a:1e:11:24:c2  cera2  66     10.6.1.203  g-HT ap    tunnel  64      0x3   0xffff  enable
0      enable  enable
```

The output of this command includes the following information:

Column	Description
bss	Basic Service Set (BSS) identifier, which is usually the AP's MAC address.
ess	Extended Service Set (ESS) identifier; a user-defined name for a wireless network.
vlan	The BSSID's VLAN number.
IP	The AP's IP address.
phy	One of the following 802.11 types <ul style="list-style-type: none"><li>• a</li><li>• a-HT (high-throughput)</li><li>• g</li><li>• g-HT (high-throughput)</li></ul>
type	This column shows if the BSSID is for an access point ( <b>ap</b> ) or an air monitor ( <b>am</b> ).

Column	Description
fw-mode	The configured forward mode for the AP's virtual AP profile. <ul style="list-style-type: none"> <li>● <b>bridge</b>: Bridge locally</li> <li>● <b>split-tunnel</b>: Tunnel to switch or NAT locally</li> <li>● <b>tunnel</b>: Tunnel to switch</li> </ul>
max-cl	The maximum number of clients allowed for this BSSID.
preamble	Shows if short preambles are enabled for 802.11b/g radios. Network performance may be higher when short preamble is enabled. In mixed radio environments, some 802.11b wireless client stations may experience difficulty associating with the AP using a short preamble.
MTU	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
status	Shows if this BSSID is enabled or disabled.
wmm	Shows if the BSSID has enabled or disabled WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function (EDCF) WMM provides prioritization of specific traffic relative to other traffic in the network.

## Command History

Introduced in AOS-W 3.0.

## show ap debug bss-stats

```
show ap debug bss-stats [bssid <bssid>]
```

### Description

Show debug and troubleshooting statistics from a specific BSSID of an AP.

### Syntax

Parameter	Description
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.

### Examples

The example below shows part of the output of the command **show ap debug bss-stats bssid <bssid>**.

```
(host) #show ap debug bss-stats bssid 00:1a:1e:11:5f:11
BSSID Stats
-----
Parameter          Value
-----
-----
General Per-radio Statistics
-----
Transmit specific Statistics
Frames Rcvd For TX  4263
Tx Frames Dropped   613
Frames Transmitted  3650

Short Preamble      0
Tx EAPOL Frames     0
Tx 6 Mbps           3650
Tx WMM [VO]         4263
```

The output of this command includes the following information:

Parameter	Description
Frames Rcvd For TX	Number of frames received for transmission.
Tx Frames Dropped	Number of transmission frames that were dropped.
Frames Transmitted	Number of frames successfully transmitted.
Success With Retry	Number of frames that were transmitted after being retried.
Tx Mgmt Frames	Number of management frames transmitted.
Beacons Transmitted	Number of beacons transmitted.

Parameter	Description
Tx Probe Responses	Number of transmitted probe responses.
Tx Data Frames	Number of transmitted data frames.
Multicast Data	Number of multicast and broadcast frames transmitted.
Tx CTS Frames	Number of clear-to-sent (CTS) frames transmitted.
Dropped After Retry	Number of frames dropped after an attempted retry.
Dropped No Buffer	Number of frames dropped because the AP's buffer was full.
Missed ACKs	Number of missed acknowledgements (ACKs).
Long Preamble	Number of frames sent with a long preamble.
Short Preamble	Number of frames sent with a short preamble.
Tx EAPOL Frames	Number of Extensible Authentication Protocol over LAN (EAPOL) frames transmitted.
Tx 6 Mbps	Number of frames transmitted at 6 Mbps.
Tx 9 Mbps	Number of frames transmitted at 9 Mbps.
Tx 12 Mbps	Number of frames transmitted at 12 Mbps.
Tx 18 Mbps	Number of frames transmitted at 18 Mbps.
Tx 24 Mbps	Number of frames transmitted at 24 Mbps.
Tx 36 Mbps	Number of frames transmitted at 36 Mbps.
Tx 48 Mbps	Number of frames transmitted at 48 Mbps.
Tx 54 Mbps	Number of frames transmitted at 54 Mbps.
Tx HT 108 Mbps	Number of frames transmitted at 108 Mbps.
Tx HT 120 Mbps	Number of frames transmitted at 120 Mbps.
Tx HT 162 Mbps	Number of frames transmitted at 162 Mbps.
Tx HT 180 Mbps	Number of frames transmitted at 180 Mbps.
Tx HT 216 Mbps	Number of frames transmitted at 216 Mbps.
Tx HT 240 Mbps	Number of frames transmitted at 240 Mbps.
Tx HT 243 Mbps	Number of frames transmitted at 243 Mbps.
Tx HT 270 Mbps	Number of frames transmitted at 270 Mbps.
Tx HT 300 Mbps	Number of frames transmitted at 300 Mbps.
Tx WMM	<p>Number of Wifi Multimedia (WMM) packets transmitted for the following access categories. If the AP has not transmitted packets in a category type, this data row will not appear in the output of the command.</p> <p><b>Tx WMM [BE]:</b> Best Effort  <b>Tx WMM [BK]:</b> Background  <b>Tx WMM [VO]:</b> VoIP  <b>Tx WMM [VI]:</b> Video</p>
	Number of Wifi Multimedia (WMM) VoIP packets transmitted.
UAPSD OverflowDrop	Number of packets dropped due to Unscheduled Automatic Power Save Delivery (U-APSD) overflow.
Last SNR	The last recorded signal-to-noise ratio.

Parameter	Description
Last SNR CTL0	The signal-to-noise ratio for the last received data packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL1	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL2	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR	Signal-to-noise ratio for the last received ACK packet.
Last ACK SNR CTL0	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL1	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL2	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT0	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT1	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT2	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Frames Received	Number of frames received.
Rx Data Frames	Number of data frames received.
Null Data Frames	Number of null data frames received.
Rx Mgmt Frames	Number of management frames received.
Control Frames	Number of control frames received.
Frames To Me	Number of wireless frames received that are addressed to the specified BSSID.
Probe Requests	Number of probe requests.
PS Poll Frames	Number of Power Save poll frames
Rx 6 Mbps	Number of frames received at 6 Mbps.
Rx 9 Mbps	Number of frames received at 9 Mbps.
Rx 12 Mbps	Number of frames received at 12 Mbps.
Rx 18 Mbps	Number of frames received at 18 Mbps.
Rx 24 Mbps	Number of frames received at 24 Mbps.
Rx 36 Mbps	Number of frames received at 36 Mbps.
Rx 48 Mbps	Number of frames received at 48 Mbps.
Rx 54 Mbps	Number of frames received at 54 Mbps.

## Command History

Introduced in AOS-W 3.0.

## Command Information

## show ap debug client-mgmt-counters

```
show ap debug client-mgmt-counters
```

### Description

Show the numbers of each type of message from an AP's clients. This information can be used to troubleshoot problems on an AP.

### Examples

The output of the command

```
(host)#show ap debug client-mgmt-counters
Counters
-----
Name                               Value
----                               -
Validate Client                    512
AP Stats Update Message            557750
3087                                6
Tunnel VLAN Membership             4493
Update STA Tunnel Request          229
Update STA Tunnel Response         229
ARM Update                         808921
ARM Propagate                      590567
ARM Neighbor Assigned              55396
STM SAP Down                       19
AP Message                         192
STA On Call Message               12164
STA Message                       19750
STA SIP authenticate Message      10919
STA Deauthenticate                707
Stat Update V3                    441447
VoIP CAC State Announcement        37185
Remote AP State                   371330
AP Message Response               164
```

The output of this command includes the following information:

Parameter	Description
Validate Client	Number of times a client was validated.
AP Stats Update Message	Number of times an AP updated its statistics with the switch.
3087	(For internal use only)
Tunnel VLAN Membership	(For internal use only)
Update STA Tunnel Request	(For internal use only)
Update STA Tunnel Response	(For internal use only)
ARM Update	Number of times an AP has changed its adaptive radio management (ARM) settings.
ARM Propagate	(For internal use only)
ARM Neighbor Assigned	(For internal use only)

Parameter	Description
STM SAP Down	(For internal use only)
AP Message	(For internal use only)
STA On Call Message	Number of counters indicating that a station has an active phone call
STA Message	(For internal use only)
STA SIP authenticate Message	Number of messages indicating that a telephone has completed SIP registration and authentication.
STA Deauthenticate	Number of times a station sent a message to an AP to deauthenticate a client.
Stat Update V3	(For internal use only)
VoIP CAC State Announcement	Number of times a switch announces a call admission control (CAC) state change to the AP. Changes in CAC state could include the ability of call admission controls to accept more or fewer calls than previously configured.
Remote AP State	(For internal use only)
AP Message Response	(For internal use only)
assoc-req	Number of 802.11 association request management frames from the switch.
assoc-resp	Number of 802.11 association responses to the switch.
reassoc-req	Number of 802.11 reassociation requests to the switch.
reassoc-resp	Number of 802.11 reassociation responses from the switch.
disassoc	Number of 802.11 disassociation messages to the switch.
deauth	Number of 802.11 deauthorization messages from the switch.
sapcp	(For internal use only)

## show ap debug client-stats

```
show ap debug client-stats <client-mac>
```

### Description

Show detailed statistics about a client.

### Example

The command below displays statistics for packets both received from and transmitted to the specified client.

```
(host) #show ap debug client-stats 00:19:7e:89:fa:e7

Station Stats

Last ACK SNR CTL1   28
Last ACK SNR CTL2   21
Last ACK SNR EXT0   5
Last ACK SNR EXT1   4
Frames Received     2932
```

The output of this command includes the following information:

Parameter	Description
Frames Rcvd For TX	Number of frames received for transmission.
Tx Frames Dropped	Number of transmission frames that were dropped.

Parameter	Description
Frames Transmitted	Number of frames successfully transmitted.
Success With Retry	Number of frames that were transmitted after being retried.
Tx Mgmt Frames	Number of management frames transmitted.
Tx Probe Responses	Number of transmitted probe responses.
Tx Data Frames	Number of transmitted data frames.
Tx CTS Frames	Number of clear-to-send (CTS) frames transmitted.
Dropped After Retry	Number of frames dropped after an attempted retry.
Dropped No Buffer	Number of frames dropped because the AP's buffer was full.
Missed ACKs	Number of missed acknowledgements (ACKs)
Long Preamble	Number of frames sent with a long preamble.
Short Preamble	Number of frames sent with a short preamble.
Tx EAPOL Frames	Number of Extensible Authentication Protocol over LAN (EAPOL) frames transmitted.
Tx <n> Mbps	Number of frames transmitted at <n> Mbps, where <n> is a value between 6 and 300.
Tx WMM	Number of Wifi Multimedia (WMM) packets transmitted for the following access categories. If the AP has not transmitted packets in a category type, this data row will not appear in the output of the command. <b>Tx WMM [BE]:</b> Best Effort <b>Tx WMM [BK]:</b> Background <b>Tx WMM [VO]:</b> VoIP <b>Tx WMM [VI]:</b> Video
UAPSD OverflowDrop	Number of packets dropped due to Unscheduled Automatic Power Save Delivery (U-APSD) overflow.
Last SNR	The last recorded signal-to-noise ratio.
Last SNR CTL0	The signal-to-noise ratio for the last received data packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL1	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL2	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR	Signal-to-noise ratio for the last received ACK packet.
Last ACK SNR CTL0	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL1	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL2	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT0	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT1	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Frames Received	Number of frames received.

Parameter	Description
Rx Data Frames	Number of data frames received.
Null Data Frames	Number of null data frames received.
Rx Mgmt Frames	Number of management frames received.
PS Poll Frames	Number of power save poll frames received.
Rx <n> Mbps	Number of frames received at <n> Mbps, where <n> is a value between 6 and 300.
Tx WMM	<p>Number of Wifi Multimedia (WMM) packets transmitted for the following access categories. If the AP has not transmitted packets in a category type, this data row will not appear in the output of the command.</p> <p><b>Tx WMM [BE]:</b> Best Effort  <b>Tx WMM [BK]:</b> Background  <b>Tx WMM [VO]:</b> VoIP  <b>Tx WMM [VI]:</b> Video</p>

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug client-table

```
show ap debug client-table [ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>]
```

### Description

Show clients associated to an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Filter the AP Config Table by AP name.
bssid <bssid>	Filter the AP Config Table by BSSID. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Filter the AP Config Table by IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

The **Tx\_Rate**, **Rx\_Rate**, **Last\_ACK\_SNR**, and **Last\_Rx\_SNR** columns shown in the output of this command display valuable troubleshooting information for clients trying to connect to a specific AP. Use this command to verify that the transmit (**Tx\_Rate**) and receive (**Rx\_Rate**) rates are not too low, and that the signal-to-noise (SNR) ratio is acceptable.

### Examples

The example below shows part of the AP configuration table for a specific BSSID. Additional parameters not displayed are described in the table below.

```
(host) #show ap debug client-table ap-name AP12
MAC          ESSID BSSID          Assoc_State HT_State AID PS_State UAPSD          Tx_Pkts
Rx_Pkts PS_Qlen Tx_Repr
---
-----
00:17:f2:4d:01:e2 wpa2 00:1a:1e:11:5f:11 Associated None 0x1 Awake (0,0,0,0,N/A,0) 31463
22821 0 4289
00:14:a4:25:72:6d wpa2 00:1a:1e:11:5f:11 Associated None 0x2 Awake (0,0,0,0,N/A,0) 24691
45215 0 944
00:19:7e:66:89:38 wpa2 00:1a:1e:11:5f:11 Associated None 0x4 Awake (0,0,0,0,N/A,0) 7031
```

The output of this command includes the following information:

Parameter	Description
MAC	MAC address of a client.
ESSID	Extended Service Set identifier (ESSID) used by the client. An ESSID is a user-defined name for a wireless network.
BSSID	Basic Service Set identifier for the client.
Assoc_State	Shows whether or not the client is currently authorized and/or associated with the AP.
HT_State	Shows the client's high-throughput (802.11n) transmission type: <ul style="list-style-type: none"><li>● <b>none</b>: AP is a legacy AP that does not support the 802.11n standard.</li><li>● <b>20Mhz</b>: A high-throughput APs using a single 20 Mhz channel.</li><li>● <b>40Mhz</b>: A high-throughput APs using two 20 Mhz channels.</li></ul>

Parameter	Description
AID	802.11 association ID. A client receives a unique 802.11 association ID when it associates to an AP.
UAPSD	<p>This parameter shows the following values for Unscheduled Automatic Power Save Delivery (UAPSD) in comma-separated format: VO, VI, BK, BE, Max SP, Q Len.</p> <ul style="list-style-type: none"> <li>VO: If <b>1</b>, UAPSD is enabled for the VoIP access category. If UAPSD is disabled for this access category, this value is <b>0</b>.</li> <li>VI: If <b>1</b>, UAPSD is enabled for the Video access category. If UAPSD is disabled for this access category, this value is <b>0</b>.</li> <li>BK: If <b>1</b>, UAPSD is enabled for the Background access category. If UAPSD is disabled for this access category, this value is <b>0</b>.</li> <li>BE: If <b>1</b>, UAPSD is enabled for the Best Effort access category. If UAPSD is disabled for this access category, this value is <b>0</b>.</li> <li>Max SP: The maximum service period is the number of frame sent per trigger packet. This value is value can be 0, 2, 4 or 8.</li> <li>Q Len: The number of frames currently queued for the client, from 0 to 16 frames.</li> </ul>
Tx_Pkts	Number of packets transmitted by the client.
Rx_Pkts	Number of packets received by the client.
PS-Qlen	Power save queue length, in bytes.
Tx_Retries	Number of packets that the client had to resend due to an initial transmission failure.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug counters

```
show ap debug counters {ap-name <ap-name>|bssid <bssid>|group <group>|ip-addr <ip-addr>}
```

### Description

Show AP message and reboot/bootstrap counters for an individual AP or AP group.

### Syntax

Parameter	Description
ap-name <ap-name>	Show debug counters for an AP with a specified name.
bssid <bssid>	Show debug counters for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
group <group>	Show debug counters for an AP group.
ip-addr <ip-addr>	Show debug counters for an AP with a specified IP address by entering an IP address in dotted-decimal format.

### Example

The output of this command can you how many times each AP has rebooted (a hard boot) or bootstrapped (a soft boot), the number of times configuration changes were sent from the switch, and the number of configuration changes acknowledged by that AP.

```
(host) #show ap debug counters group corp1
AP Counters
-----
Name  Group  IP Address  Configs  Configs  AP Boots  AP Boots  Bootstraps  Reboots
      -----  -----  Sent    Acked    Sent     Acked
-----  -----  -----  -----  -----  -----  -----  -----
AL1   corp1  10.6.1.209  1597    1597    0         0         1           0
AL10  corp1  10.6.1.198  165     165     0         0         2           1
AL12  corp1  10.6.1.200  195     195     0         0         1           0
AL15  corp1  10.6.1.197  1580    1580    0         0         1           0
AL16  corp1  10.6.1.199  73      73      0         0         1           0
AL19  corp1  10.6.1.212  8       8       0         0         1           0
Total APs :6
```

The output of this command includes the following information:

Column	Description
Name	Name of the AP.
Group	Name of the AP's group.
IP Address	IP address of the AP.
Configs sent	Number of times configuration changes have been sent to the AP.
Configs Acked	Number of times that the AP has acknowledged receiving a configuration change.
Bootstraps	Number of times the AP restarted. Bootstraps are also known as "soft" restarts.
Reboots	Number of times power to the AP cycled off and then on again. Reboots also known as "hard" restarts.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug datapath

```
show ap debug datapath {ap-group <ap-group>|ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show datapath tunnel parameters of an AP or AP group.

### Syntax

Parameter	Description
ap-group <ap-group>	Show data path information for a specific AP group.
ap-name <ap-name>	Show data path information for an AP with a specific name.
bssid <bssid>	Show data path information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data path information for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Example

The output of the following command shows datapath tunnel parameters for an AP with the IP address 192.0.2.32.

```
(host) #show ap debug datapath 192.0.2.32
```

```
Datapath Parameters Table
```

```
-----  
essid      encr-alg      client-vlan-id  tunnel-id  gre-type  deny-bcast  num-clients  
-----  
guest      Open          63              0x10f6    0x8300    disable     0  
voip       WPA2 8021X AES 66              0x1103    0x8310    disable     7  
corpWPA2   PSK AES       66              0x10f1    0x8320    disable     0  
guest      Open          63              0x10f7    0x8200    disable     1  
wpa2       WPA2 8021X AES 65              0x10be    0x8210    enable      15
```

The output of this command includes the following information:

Column	Description
ESSID	The Extended Service Set Identifier is a unique name that identifies a wireless network
encr-alg	Encryption algorithm used by the network
client-vlan-id	ID of the network VLAN
tunnel-id	Identification number of the AP's tunnel.
gre-type	GRE tunnel type.
deny-bcast	If <b>enabled</b> , the AP will respond to broadcast probe requests. If <b>disabled</b> , the AP will not respond to these requests.
num-clients	Number of clients currently using the network.

### Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug driver-log

```
show ap debug driver-log {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show an AP's driver logs.

### Syntax

Parameter	Description
ap-name <ap-name>	Show log information for an AP with a specific name.
bssid <bssid>	Show log information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show log information for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

Use this command to review configuration changes made since the AP was last reset.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug log

```
show ap debug log {ap-group <ap-group>|ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show an AP's debug log.

### Syntax

Parameter	Description
ap-name <ap-name>	Show log information for an AP with a specific name.
bssid <bssid>	Show log information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show log information for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

An AP's log files show configuration changes since the AP was last reset.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug mgmt-frames

```
show ap mgmt-frames {bssid <bssid>}|{client-mac <client-mac>}|{count <count>}
```

### Description

Show traced 802.11 management frames.

### Syntax

Parameter	Description
bssid <bssid>	Show management frame information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
client-mac <client-mac>	Show management frame information for a specific MAC address by entering the MAC address of a client.
count <count>	Limit the amount of management frame information displayed by specifying number of frames to appear in the output of this command.

### Usage Guidelines

Use this command to determine if the client is completing an authorization/association exchange with the client. If the client does not appear in the output of this CLI command, the client might be configured with wrong SSID, so it cannot complete its probe-request/probe-response sequence. It is also possible that client may be configured with shared-key authentication, which would cause 802.11 authorization to fail.

### Example

The output of the command lists traced management frames for a client with the MAC address 00:23:6c:2f:9a:8, starting with the most current frame. This example shows that client attempted to associate with an AP, was authenticated, and later logged off the network and was deauthenticated.

```
Host) #show ap debug mgmt-frames client-mac 00:23:6c:2f:9a:85
```

```
Traced 802.11 Management Frames
```

```
-----  
Timestamp      stype      SA          DA          BSS          signal  Misc  
-----      -  
Oct 30 11:20:19  deauth    00:23:6c:2f:9a:85  00:1a:1e:11:56:40  00:1a:1e:11:56:40  0      STA has  
left and is deauthenticated
```

The output of this command includes the following information:

Column	Description
Timestamp	The time the management frame was sent
stype	One of the following 802.11 frame types: auth: Authorization frame deauth: Deauthorization frame assoc-resp: Association response assoc-req: Association request
SA	Source MAC address.
DA	Destination MAC address.
BSS	Basic Service Set Identifier (BSSID) of the AP

Column	Description
signal	Signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
Misc	Additional information describing the client's action.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug radio-stats

```
show ap debug radio-stats {ap-name <ap-name>|ip-addr <ip-addr>} radio {0|1} [advanced]
```

### Description

Show aggregate radio debug statistics of an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show log information for an AP with a specific name.
ip-addr <ip-addr>	Show log information for an AP with a specific IP address by entering its IP address in dotted-decimal format.
radio {0 1}	Specify the ID number of the radio for which you want to view statistics.
advanced	Include this parameter to display additional radio statistics.

### Example

The output of this command displays general statistics for the radio, as well as statistics for transmitted and received frames.

```
(host) #show ap debug radio-stats ap-name AP12 radio 1
RADIO Stats
-----
Parameter                Value
-----
-----
----- General Per-radio Statistics
Total Radio Resets       0
Resets Beacon Fail      0
TX Power Changes         5
Channel Changes          2
Radio Band Changes       0
Current Noise Floor     95
11g Protection           0
----- Transmit specific Statistics
Frames Rcvd For TX      2452151
Tx Frames Dropped      1736429
Frames Transmitted     4247212
...
  Success With Retry    0
  Tx Mgmt Frames       24174109
```

If you include the **advanced** option at the end of the **show ap debug radio-stats** command, the output of this command will include all the following parameters. If you omit the advanced option, the output will include less information, and the data will be displayed in a different order.

Parameter	Description
Total Radio Resets	Total number of times the radio reset.
Resets Beacon Fail	Number of times the radio reset due to beacon failure.
Resets BeacQ Stuck	An AP's radio typically sends a beacon every 100 milliseconds. If beacons are not sent at a regular interval or the radio experiences excessive noise, the beacon queue will reset. This parameter indicates the number of queue resets.
Resets Fatal Intr	Number of time the radio was reset because the AP hardware was unresponsive.
Resets RX Overrun	The number of radio resets due to Receive FIFO overruns.

Parameter	Description
Resets RF Gain	Number of radio resets due to gain changes.
Resets MTU Change	Number of times the radio reset due to a change in the Maximum Transmission Unit (MTU) value.
Resets TX Timeouts	Number of radio resets due to transmission timeouts (the radio doesn't transmit a signal within the required time frame.)
POE-Related Resets	If the radio power profile drops, an OAW-AP-125 may not be able to support three transmit chains, and may drop to two chains only. This parameter displays the number of resets due to this type of power change.
External Reset	Number of times the AP has been reset because it was unplugged or its reset button was pressed.
TX Power Changes	Number of times the radio's transmission power changed.
Channel Changes	Number of times the radio's channel changed.
Radio Band Changes	Number of time the radio's band changed.
Current Noise Floor	The residual background noise detected by an AP. <b>NOTE:</b> Noise seen by an AP is reported as -dBm. Therefore, a noise floor of -100 dBm is smaller (lower) than a noise floor of -50 dBm. For most environments, the noise floor should be no greater than -80 dBm. Anything larger may indicate an interference problem which is drowning out good signals (data) in background noise.
Avail TX Buffers	An AP has a set number of buffers which it can use to buffer frames for nonresponsive power save clients. The total number of buffer frames depends upon the AP model type.
11g Protection	This parameter shows whether 802.11g protection has been enabled or disabled.
Last TX Antenna	This parameter indicates whether the last frame transmitted was sent on antenna 1 or antenna 0. This parameter can be useful for troubleshooting external antennas.
Last RX Antenna	This parameter indicates whether the last frame received was via antenna 1 or antenna 0. This parameter can be useful for troubleshooting external antennas.
Scan Requests	Total number of scan requests received by the AP.
Scan Rejects	Total number of scan rejected by the AP.
Load aware Scan Rejects	Load aware ARM preserves network resources during periods of high traffic by temporarily halting scanning if the load for the AP gets too high. The <b>load aware Scan Rejects</b> parameter shows the number of times the AP has rejected a scan because of the load aware scan feature.
PS aware Scan Rejects	If the ARM power-save aware scan feature is enabled, the AP will not scan a different channel if it has one or more clients and is in power save mode. The <b>ps aware Scan Rejects</b> parameter shows the number of times the AP has rejected a scan because of the power-save aware scan feature.
Voice aware Scan Rejects	If you enable the VoIP Aware Scan feature in the AP's ARM profile, the AP will not attempt to scan a different channel if one of its clients has an active VoIP call. This <b>Voice aware scan Rejects</b> parameter shows the number of times the AP has rejected a scan because of the Voip aware scan feature.
Scan Success	Number of successful scans. To view scan details, use the command <b>show ap arm scan-times</b> .
EIRP	The value of this parameter is the transmission power level (in dBm) + the antenna gain value.
MAX EIRP	The max EIRP depends on AP capability and the regulatory domain constraint for the channel of operation. For example, in the US, Channels 36-48 have max EIRP of 23dBm

Parameter	Description
UAPSD Flush STA Wake	Number of times a client wakes from power-save mode and flushes the UAPSD queue.
UAPSD SP Set	The number of unique UAPSD Scheduled Period is started in response to UAPSD trigger frames.
UAPSD Dup Trig	The number of times duplicate UAPSD trigger frames are received (i.e., retried UAPSD triggers that were received by the AP more than once).
UAPSD Recv frame for TX	The number of frames received for transmission over the air interface using UAPSD
UAPSD Ageout Drain	The number of time UAPSD queue is drained (i.e. frames are dropped) due to ageout.
UAPSD TX proc comp	The number of UAPSD frames that were successfully transmitted
UAPSD SP In prog	The number of times a trigger frame was received while a Scheduled Period (SP) was already in progress based on an earlier trigger frame.
UAPSD QOS NULL TX	The number of times the AP had to respond with a QoS Null Data frame in response to a UAPSD trigger because AP did not have Data frame queued for that client
UAPSD TX HW Queued	The number of frames (Data and Null Data) that were transferred to the radio HW for transmission, in response to UAPSD triggers.
UAPSD SP Reset	The number of times the UAPSD Scheduled Period (SP) in progress is reset or cancelled.
Frames Rcvd For TX	Number of frames received for transmission.
Tx Frames Dropped	Number of transmission frames that were dropped.
Frames Transmitted	Number of frames successfully transmitted.
PS Unicast	Number of power save unicast frames
DTIM Broadcast	Number of broadcast frames with DTIM values.
Success With Retry	Number of frames that were transmitted after being retried.
Tx Mgmt Frames	Number of management frames transmitted.
Beacons Transmitted	Number of beacons transmitted.
Tx Probe Responses	Number of transmitted probe responses.
Tx Data Frames	Number of transmitted data frames.
Multicast Data	Number of multicast and broadcast frames transmitted.
Tx CTS Frames	Number of clear-to-sent (CTS) frames transmitted.
DTIM Timeouts	Number of broadcast frames with DTIM data that were not answered by a client.
Dropped After Retry	Number of frames dropped after an attempted retry.
Dropped No Buffer	Number of frames dropped because the AP's buffer was full.
Dropped UAPSD	Number of dropped Unscheduled Automatic Power Save Delivery (UAPSD) frames.
Missed ACKs	Number of missed acknowledgement frames.
Failed Beacons	Number of times a radio failed to transmit a beacon at the scheduled interval (100ms).
Multi-Beacon Fail	Number of times multiple consecutive beacons failed to transmit.
Long Preamble	Number of frames sent with a long preamble.

Parameter	Description
Short Preamble	Number of frames sent with a short preamble.
Beacon Interrupts	Number of broadcast beacons that were interrupted.
TX Interrupts	Number of transmission interrupts.
FIFO Underrun	The number of Receive FIFO overruns.
Allocated Desc	Number of allocated transmit descriptors.
Freed Desc	Number of freed transmit descriptors.
Tx EAPOL Frames	Number of Extensible Authentication Protocol over LAN (EAPOL) frames transmitted
Tx AGGR Good	Number of aggregated frames successfully transmitted.
Tx AGGR Unaggr	Number of non-aggregate frames transmitted due to unavailability of additional frames for aggregation at the time of transmission.
Tx 1 Mbps	Number of frames transmitted at 1 Mbps.
Tx 2 Mbps [Long]	Number of frames transmitted at 2 Mbps with a long preamble.
Tx 2 Mbps [Short]	Number of frames transmitted at 2 Mbps with a short preamble.
Tx 5.5 Mbps [Long]	Number of frames transmitted at 5.5 Mbps with a long preamble.
Tx 5.5 Mbps [Short]	Number of frames transmitted at 5.5 Mbps with a short preamble.
Tx 11 Mbps [Short]	Number of frames transmitted at 11 Mbps with a short preamble.
Tx 12 Mbps	Number of frames transmitted at 12 Mbps.
Tx 18 Mbps	Number of frames transmitted at 18 Mbps.
Tx 24 Mbps	Number of frames transmitted at 24 Mbps.
Tx 36 Mbps	Number of frames transmitted at 36 Mbps.
Tx 48 Mbps	Number of frames transmitted at 48 Mbps.
Tx WMM	Number of Wifi Multimedia (WMM) packets transmitted for the following access categories. If the AP has not transmitted packets in a category type, this data row will not appear in the output of the command. <b>Tx WMM [BE]:</b> Best Effort <b>Tx WMM [BK]:</b> Background <b>Tx WMM [VO]:</b> VoIP <b>Tx WMM [VI]:</b> Video
UAPSD OverflowDrop	Number of packets dropped due to Unscheduled Automatic Power Save Delivery (U-APSD) overflow.
TX Timeouts	Number of transmission timeouts
Lost Carrier Events	Number of carrier sense timeouts.
Last SNR	The last recorded signal-to-noise ratio.
Last SNR CTL0	The signal-to-noise ratio for the last received data packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL1	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR CTL2	The signal-to-noise ratio for the last received data packet on the secondary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.

Parameter	Description
Last SNR EXT0	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR EXT1	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last SNR EXT2	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR	Signal-to-noise ratio for the last received ACK packet.
Last ACK SNR CTL0	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL1	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR CTL2	Signal-to-noise ratio for the last received ACK packet on the primary (control) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT0	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 0. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT1	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 1. This parameter is only displayed for APs operating in 40 Mhz mode.
Last ACK SNR EXT2	Signal-to-noise ratio for the last received ACK packet on the secondary (extension) channel 2. This parameter is only displayed for APs operating in 40 Mhz mode.
Frames Received	Number of frames received.
Good Frames	Number of frames received with no errors.
Bad Frames	Number of bad or error frames received.
Rx Clear 1s	The percentage of time no activity was seen on the air in the last 1 second.
Rx Clear 4s	The percentage of time no activity was seen on the air in the last 4 seconds.
Rx Clear 64s	The percentage of time no activity was seen on the air in the last 64 seconds.
Discarded Events	Number of non-802.11 events that were detected and discarded during normal operation.
ARM Scan Frames	Number of scan frames sent for the adaptive radio management (ARM) feature.
Rx Data Frames	Data frames received
Null Data Frames	Null data frames received
Rx Mgmt Frames	Management frames received
Control Frames	Control frames received.
Frames To Me	Number of wireless frames received that are addressed to the specified BSSID.
Broadcast Frames	Number of broadcast frames received.
Beacons Received	Number of beacons received
Probe Requests	Number of Probe requests received.
Rx Probe Responses	Number of Probe responses received.
Rx RTS Frames	Ready To Send (RTS) frames received. These frames are sent when a computer has data to transmit.
Rx CTS Frames	Clear To Send (CTS) frames received. This type of frame are used to verify that a client is ready to receive information.

Parameter	Description
ACK Frames	Number of acknowledgement frames received.
PS Poll Frames	Power-Save Poll (PS-Poll) frames received. When a client exits a power-saving mode, it transmits a PS-Poll frame to the AP to retrieve any frames buffered while it was in power-saving mode.
CRC Errors	Cyclic Redundancy Check (CRC) is a data sequence that is sent with a frame to help verify if all the data received correctly. Possible CRC error causes include: <ul style="list-style-type: none"> <li>• Hardware malfunction</li> <li>• Loose or unconnected cables</li> <li>• RF interference, such as overlapping access point coverage on a channel or interfering 2.4-GHz signals from devices like microwave ovens</li> <li>• and wireless handset phones</li> </ul>
PLCP Errors	Physical Layer Convergence Protocol (PLCP) errors.
Rx Frames Dropped	Number of received frames that were dropped.
PHY Events	The number of Physical Layer Events, that are not 802.11 packets, detected by radio as part of its normal receive operation.
RADAR Events	Number of times an AP detects a radar signature. Alcatel-Lucent APs are DFS-compliant detects a radar signature, it will change its channel.
RX Interrupts	The number of receive interrupts received by the CPU from the radio.
RX Overrun	The number of Receive FIFO overruns.
Rx 1 Mbps	Packets received at the rate of 1 Mbps
Rx 2 Mbps (Long)	Packets received at the rate of 2 Mbps with a long preamble.
Rx 2 Mbps (Short)	Packets received at the rate of 2 Mbps with a short preamble.
Rx 5.5 Mbps (Long)	Packets received at the rate of 5.5 Mbps with a long preamble.
Rx 5.5 Mbps (Short)	Packets received at the rate of 5.5 Mbps.
Rx 11 Mbps (Long)	Packets received at the rate of 11 Mbps with a long preamble.
Rx 11 Mbps (Short)	Packets received at the rate of 11 Mbps with a short preamble.
Rx 6 Mbps	Packets received at the rate of 6 Mbps.
Rx 9 Mbps	Packets received at the rate of 9 Mbps.
Rx 12 Mbps	Packets received at the rate of 12 Mbps.
Rx 18 Mbps	Packets received at the rate of 18 Mbps.
Rx 24 Mbps	Packets received at the rate of 24 Mbps.
Rx 36 Mbps	Packets received at the rate of 36 Mbps.
Rx 48 Mbps	Packets received at the rate of 48 Mbps.
Rx 54 Mbps	Packets received at the rate of 54 Mbps.
Rx WMM [BE]	Number of Wifi Multimedia (WMM) packets received for the following access categories. If the AP has not transmitted packets in a category type, this data row will not appear in the output of the command. <b>Rx WMM [BE]:</b> Best Effort <b>Rx WMM [BK]:</b> Background <b>Rx WMM [VO]:</b> VoIP <b>Rx WMM [VI]:</b> Video

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug received-config

```
show ap debug received-config {ap-group <ap-group>|ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show the configuration the AP downloaded from the switch.

### Syntax

Parameter	Description
ap-name <ap-name>	Show log information for an AP with a specific name.
bssid <bssid>	Show log information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show log information for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Example

The output of this command displays configuration information for each interface. The example below shows only part of the output for this command. Additional parameters not displayed are described in the table below.

```
(host) #show ap debug received-config ap-name AP12
```

```
Downloaded Config for WIFI 0
-----
Item                               Value

...
```

The output of this command includes the following information:

Parameter	Description
BSSID	The BSSID of the AP.
LMS IP	The LMS IP is the IP address of the local switch used by the AP for client data processing.
Master IP	For environments with multiple switches, the master switch is the central configuration and management point for all local switches.
Mode	Shows the operating modes for the AP. ap-mode: Device provides transparent, secure, high-speed data communications between wireless network devices and the wired LAN. am-mode: Device behaves as an air monitor to collect statistics, monitor traffic, detect intrusions, enforce security policies, balance traffic load, self-heal coverage gaps, etc.
QBSS Probe Response	Quality-of-service BSS (QBSS).
Native VLAN ID	The ID number of the Native VLAN.
SAP MTU	The Maximum Transmission Unit (MTU) for the GRE tunnel.
Heartbeat DSCP	DSCP value for the heartbeat traffic between the AP and the switch.
High throughput enable (radio)	Shows if high-throughput (802.11n) features on tare enabled or disabled on the radio.
Channel	Shows the channel number for the AP's 802.11a/802.11n physical layer.
Beacon Period	Shows the time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.
Transmit Power	Shows the current transmission power level.
Advertise TPC Capability	If enabled, the AP will advertise its Transmit Power Control (TPC) capability.
Enable CSA	Displays whether or not the AP has enabled channel switch announcements (CSAs) for 802.11h.
CSA Count	Number of channel switch announcements that must be sent before the AP will switch to a new channel.
Management Frame Throttle interval	Average interval that rate limiting management frames are sent from this radio, in seconds. If this column displays a zero (0), rate limiting is disabled for this AP.
Management Frame Throttle Limit	Maximum number of management frames that can come from this radio in each throttle interval.
Active Scan	Displays whether or not the active scan feature is enabled. This option elicits more information from nearby APs, but also creates additional management traffic on the network. <b>Active Scan</b> is disabled by default, and should <i>not be enabled</i> except under the direct supervision of Alcatel-Lucent Support.
VoIP Aware Scan	Shows if VoIP aware scanning is enabled or disabled. If you use voice handsets in the WLAN, <b>VoIP Aware Scan</b> should be enabled in the ARM profile so the AP will not attempt to scan a different channel if one of its clients has an active VoIP call. This option requires that <b>Scanning</b> is also enabled.
Power Save Aware Scan	Shows if the power save aware scan is enabled or disabled. If enabled, the AP will not scan a different channel if it has one or more clients and is in power save mode.
Load aware Scan Threshold	The <b>Load Aware Scan Threshold</b> is the traffic throughput level an AP must reach before it stops scanning. Load aware ARM preserves network resources during periods of high traffic by temporarily halting ARM scanning if the load for the AP gets too high.

Parameter	Description
40 MHz intolerance	The specified setting allows ARM to determine if 40 MHz mode of operation is allowed on the 5 GHz or 2.4 GHz frequency band only, on both frequency bands, or on neither frequency band.
Honor 40 MHz intolerance	Shows if 40 MHz intolerance is enabled or disabled. If enabled, the radio will stop using the 40 MHz channels if the 40 MHz intolerance indication is received from another AP or station.
Legacy station workaround	Shows if interoperability for misbehaving legacy stations is enabled or disabled.
Country Code	Display the country code for the AP. The country code specifies allowed channels for that country.
ESSID	An Extended Service Set Identifier (ESSID), for the AP.
Encryption	Encryption type used on this AP.
WPA2 Pre-Auth	802.11x settings are <b>enabled</b> or <b>disabled</b> .
DTIM Interval	Number of beacons that should elapse before an AP sends beacon broadcasts for power save clients.
802.11a Basic Rates	Minimum data rate required for a client to associate with the AP. For an 802.11a radio, this value can be 6, 12 and 24 802.11 data rates. 802.11b/g radios will report a value of 1 and 2 802.11 data rates.
802.11a Transmit Rates	802.11 data rate at which the AP will transmit data to its clients. This value can be 6-54 for 802.11a radios, and 1-54 for 802.11b/g radios.
Station Ageout Time	Number of seconds a station may be idle before it is deauthorized from an AP.
Max Transmit Attempts	maximum number of times the AP will attempt to retransmit data.
RTS Threshold	The minimum packet size at which the AP will issue a request-to-send (RTS) before sending the packet.
Max Associations	The maximum number of clients allowed to associated with the AP
Wireless Multimedia (WMM)	Shows if Wireless Multimedia (WMM) is enabled or disabled for this AP. WMM provides prioritization of specific traffic relative to other traffic in the network.
WMM TSPEC Min Inactivity Interval	Displays the minimum inactivity time-out threshold of WMM traffic for this AP.
DSCP mapping for WMM voice AC	Displays the DSCP value used to map WMM video traffic.
DSCP mapping for WMM video AC	Displays the DSCP value used to map WMM voice traffic.
DSCP mapping for WMM best-effort AC	Displays the DSCP value used to map WMM best-effort traffic
DSCP mapping for WMM background AC	Displays the DSCP value used to map WMM background traffic.
Hide SSID	Shows if the feature to hide a SSID name in beacon frames is <b>enabled</b> or <b>disabled</b> .
Deny_Broadcast Probes	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID.
Local Probe Response	Shows if local probe response is enabled or disabled on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients' probe requests. If this option is disabled, then the switch sends the 802.11 probe responses

Parameter	Description
Disable Probe Retry	Shows if the AP has enabled or disabled MAC-level retries for probe response frames. By default this parameter is enabled, which mean that MAC level retries for probe response frames is disabled.
Maximum Transmit Failures	Display the maximum number of transmission failures allowed before the client gives up.
BC/MC Rate Optimization	Shows if the AP has enabled or disabled scanning of all active stations currently associated to that AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate.
High throughput enable (SSID)	Shows if the AP has enabled or disabled the use of its high-throughput SSID in 40 MHz mode.
40 MHz channel usage	Determines if this high-throughput SSID allows high-throughput (802.11n) stations to associate.
MPDU Aggregation	Shows if the AP has enabled or disabled MAC protocol data unit (MPDU) aggregation.
Max transmitted A-MPDU size	Shows the maximum size, in bytes, of an A-MPDU that can be sent on the AP's high-throughput SSID.
Max received A-MPDU size	Shows the maximum size, in bytes, of an Aggregated-MAC Packet Data Unit (A-MPDU) that can be received on the AP's high-throughput SSID.
Min MPDU start spacing	Displays the minimum time between the start of adjacent MDPU within an aggregate MPDU, in microseconds.
Supported MCS set	Comma-separated list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this high-throughput SSID.
Short guard interval in 40 MHz mode	Shows if the AP has enabled or disabled use of short guard interval in 40 MHz mode of operation.
VLAN	VLAN ID used by the SSID.
Forward mode	Shows the current forward mode (bridge, split-tunnel, or tunnel) for the virtual AP. This parameter controls whether 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the switch, and Internet access remains local). Only 802.1x authentication is supported when configuring bridge or split tunnel mode.
Band Steering	Shows if band-steering has been enabled or disabled for a virtual AP. ARM's band steering feature encourages dual-band capable clients to stay on the 5GHz band on dual-band APs. This frees up resources on the 2.4GHz band for single band clients like VoIP phones. Band steering reduces co-channel interference and increases available bandwidth for dual-band clients, because there are more channels on the 5GHz band than on the 2.4GHz band. Dual-band 802.11n-capable clients may see even greater bandwidth improvements, because the band steering feature will automatically select between 40MHz or 20MHz channels in 802.11n networks. This feature is disabled by default, and must be enabled in a Virtual AP profile.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug remote association

```
show ap debug remote association [ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>]
```

### Description

Show the AP association table to identify the remote clients associated to each AP.

### Syntax

Parameter	Description
ap-group <ap-group>	Show remote client associations for a specific AP group.
ap-name <ap-name>	Show remote client associations for a specific AP.
bssid <bssid>	Show remote client associations for an specific AP Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.

### Usage Guidelines

Use this command to verify if a remote user is connected to an AP, and to validate the AP to which is connected.

### Example

The output of this command displays information about the remote clients associated with an AP with the IP address 192.0.2.32.

```
(host) #show ap debug remote association ip-addr 192.0.2.32
```

```
Flags: W: WMM client, A: Active, R: RRM client
```

```
PHY Details: HT: High throughput; 20: 20MHz; 40: 40MHz  
<n>ss: <n> spatial streams
```

```
Association Table
```

```
-----  
Name bssid          mac                auth assoc aid  l-int  essid  vlan-id  tunnel-id phy  assoc. num  Flags  
-----  
-----  
AP71 00:0a:23:c1:d4:11 00:16:6d:08:1s:fl y  y    1    10    t-lab  111     0x108e   a    23s    1    A  
Num Clients:1
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP.
bssid	The AP Basic Service Set Identifier (BSSID).
mac	MAC address of the AP.
auth	This column displays a <b>y</b> if the AP has been configured for 802.11 authorization frame types. Otherwise, it displays an <b>n</b> .
assoc	This column displays a <b>y</b> if the AP has been configured for 802.11 association frame types. Otherwise, it displays an <b>n</b> .

Column	Description
aid	802.11 association ID. A client receives a unique 802.11 association ID when it associates to an AP.
l-int	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.
ssid	Name that uniquely identifies the AP's Extended Service Set Identifier (ESSID).
vlan-id	Identification number of the AP's VLAN.
tunnel-id	Identification number of the AP's tunnel.
assoc. time	Amount of time the client has associated with the AP, in the format hours:minutes:seconds.
num assoc	Number of clients associated with the AP.
flags	This column displays any flags for this AP. The list of flag abbreviations is included in the output of the <b>show ap association</b> command.

## Command History

Introduced in AOS-W 3.0.

## show ap debug shaping-table

```
show ap debug shaping-table {ap-name <ap-name>|ip-addr <ip-addr>}
```

### Description

Show shaping information for clients associated to an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show shaping table information for a specific AP.
ip-addr <ip-addr>	Show shaping table information for a specific AP IP address by entering its IP address in dotted-decimal format.

### Example

The following command shows the shaping table the an AP named ap22.

```
(host) #show ap debug shaping-table ap-name ap22
```

```
VAP station000
pktin  pktout  pktdrop  pktqd  cmn[C:O:H]  drop  Numcl  TotCl  BWgmt

```

The output of this command includes the following information:

Column	Description
pktin	Number of packets received by the AP.
pktout	Number of packets sent by the AP.
pktdrop	Number of packets dropped by the AP.

Column	Description
pktqd	Number of packets queued.
cmn [C:O:H]	(For internal use only.)
drop	Number of CCK (802.11b) and OFDM (802.11a/g) packets dropped.
Numcl	Number of CCK (802.11b) and OFDM (802.11a/g) packets dropped.
TotCl	Total number of clients associated with the AP
Bwmgmt	This data column displays a 1 if the bandwidth management feature has been enabled. Otherwise, it displays a 0.
d<n>	(For internal use only.)
idx	Association ID.
tokens	This value represents the credits the station has to transmit tokens.
last-t	Number of tokens that were allocated to the station last time token allocation algorithm ran.
in	Number of packets received.
out	Number of packets sent.
drop	Number of dropped packets.
q	Number of queued packets
tx-t	Total time spent transmitting data.
rx-t	Total time spent receiving data.
al-t	Total time allocated for transmitting data to this station.
rate	(For internal use only.)

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug system-status

```
show ap debug system-status {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show detailed system status information for an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show system status data for an AP with a specific name.
bssid <bssid>	Show system status data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show system status data for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

The output of this command displays the following types of information for the selected AP:

**Table 1**

- Bootstrap information
- Descriptor Usage
- Interface counters
- MTU discovery
- ARP cache
- Route table
- Interface Information
- Per-radio statistics
- Encryption statistics
- AP uptime
- memory usage
- Kernel slab statistics
- Interrupts
- Ethernet duplex/speed settings
- Tunnel heartbeat stats
- Boot version
- LMS information
- Power status
- CPU type

The following parameters are included in the output of this command, and can help troubleshoot problems on an AP or wireless network.

Parameter	Description
The <b>Failed</b> column in the <b>Descriptor Usage</b> section	This parameter can tell you if the AP is dropping packets.
<b>Interface Information</b> table	This parameter can tell you if the ethernet network is working properly. This table should not show an excessive number of errors.
<b>AP Uptime</b> table	Low values in this table can indicate problems with the wired network, or with the AP itself.
<b>Tunnel Heartbeat</b> table	This table can indicate the health of the underlying wired network.
<b>Rebootstrap Information</b> table / <b>Reboot Information</b> table	A large number of reboots can mean that the AP has hardware problems.

### Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap debug trace-addr

```
show ap debug trace-addr
```

### Description

Show MAC addresses in the trace buffer.

### Usage Guidelines

Use this command to troubleshoot wireless clients that are being traced for 802.11 communication

### Examples

The output of the command shows the **Trace List** table. If no wireless clients are being traced, this table will be empty.

```
(host) #show ap debug trace-addr
```

```
Trace List
-----
MAC Address
-----
00:1a:1e:c5:ca:b4
00:1a:1e:c5:d6:46
00:1a:1e:c5:d7:40
00:1a:1e:c5:d7:64
00:1a:1e:c5:d9:56
00:1a:1e:c5:d9:b0
```

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap details

```
show ap details [advanced]{ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|installation}
```

### Description

Show detailed provisioning parameters and hardware and operating information and for a specific AP.

### Syntax

Parameter	Description
advanced	Include the following additional data in the output of this command: <ul style="list-style-type: none"><li>switch message counts</li><li>AP group information</li><li>Virtual AP operating information</li></ul>
ap-name <ap-name>	Show data for a specific AP by entering the name of the AP for which you want to display information.
bssid <bssid>	Show data for an AP with the specified BSSID. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with the specified IP address.

### Examples

The example below shows part of the output for the command **show ap details ap-name <ap-name>**.

```
(host) # show ap details ap-name AP32
AP "AL39" Basic Information
-----
Item                Value

Radio 0 BSSID        00:1a:1e:11:73:90
Radio 1 BSSID        00:1a:1e:11:73:80
Enet 1 MAC Address   00:1a:1e:c9:17:39

AP "AL39" Operating Information
-----
Item                Value
```

The output of this command includes the following information:

Column	Description
AP IP Address	IP address of the AP
LMS IP Address	The IP address of the local management switch (LMS)—the Alcatel-Lucent switch which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network.
Group	Name of the AP's AP group.
Location Name	Location of the AP.
Status	Current status of the AP, either <b>Up</b> or <b>Down</b> .
Up time	Number of hours, minutes and seconds since the last switch reboot or bootstrap, in the format <i>hours:minutes:seconds</i> .
Installation	AP Installation mode. The AP can be default (the factory set AP installation type, indoor or outdoor).
AP Type	AP model
Serial #	Serial number for the AP
Wired MAC address	MAC address of the wired interface.
Radio 0 BSSID	Basic Service Set Identifier (BSSID) of the AP's radio 0. This is usually the radio's MAC address.
Radio 1 BSSID	Basic Service Set Identifier (BSSID) of the AP's radio 1. This is usually the radio's MAC address.
Enet 1 MAC address	MAC address of the AP's ethernet port.
AP State	Displays the AP's current operational state.
Entry created	Timestamp showing the time the AP registered with the switch.
Last activity	Timestamp showing the last time the AP communicated with the switch. An AP typically sends keepalive messages every minute.
Reboots	Number of times power to the AP cycled off and then on again. Reboots also known as "hard" restarts.
Bootstraps	Number of times the AP restarted. Bootstraps are also known as "soft" restarts.
Bootstrap threshold	Number of consecutive missed heartbeats on a GRE tunnel (heartbeats are sent once per second on each tunnel) before an AP reboots. On the switch, the GRE tunnel timeout is 1.5 x bootstrap-threshold; the tunnel is torn down after this number of seconds of inactivity on the tunnel.

Column	Description
Slot/Port	<p>The switch port used by the AP, in the format &lt;slot&gt;/&lt;port&gt;.</p> <p>The <b>&lt;slot&gt;</b> number is always 1 except when referring to interfaces on the OmniAccess 6000 switch. For the OmniAccess 6000 switch, the four slots are allocated as follows:</p> <ul style="list-style-type: none"> <li>Slot 0: contains a supervisor card or an OmniAccess Supervisor Card III.</li> <li>Slot 1: can contain either a redundant supervisor card, OmniAccess Supervisor Card III, or a third line card.</li> <li>Slot 2: can contain either a OmniAccess Supervisor Card III or line card (required if slot 0 contains a supervisor card).</li> <li>Slot 3: can contain either a OmniAccess Supervisor Card III or second line card.</li> </ul> <p>The <b>&lt;port&gt;</b> number refers to the network interfaces that are embedded in the front panel of the OmniAccess 4302, OmniAccess 4308T, or OmniAccess 4324 switch, OmniAccess 4504/4604/4704 Multi-Service Switch, OmniAccess Supervisor Card III, or a line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position.</p>
High throughput	Shows if high-throughput (802.11n) features are <b>enabled</b> or <b>disabled</b> .
Mode	<p>Shows the operating modes for the AP.</p> <ul style="list-style-type: none"> <li><b>AP:</b> Device provides transparent, secure, high-speed data communications between wireless network devices and the wired LAN.</li> <li><b>AM:</b> Device behaves as an air monitor to collect statistics, monitor traffic, detect intrusions, enforce security policies, balance traffic load, self-heal coverage gaps, etc.</li> </ul>
Band	<p>The RF band in which the AP should operate:</p> <ul style="list-style-type: none"> <li>802.11g = 2.4 GHz</li> <li>802.11a = 5 GHz</li> </ul>
Channel	Channel number for the AP 802.11a/802.11n physical layer. The available channels depend on the regulatory domain (country).
Secondary Channel	<p>The secondary channel number for the AP. The secondary channel is a 20 MHz channel used in conjunction with the primary channel to create a 40 MHz channel for high-throughput clients.</p> <p>High-throughput capable APs use only the primary channel to communicate with 20 MHz clients. The secondary channel is used for transmissions with 40 MHz capable high-throughput clients.</p>
EIRP	Current effective Isotropic Radiated Power (EIRP).
AP Name	Name of the AP.
AP Group	AP group to which the AP belongs.
Location name	Fully-qualified location name (FQLN) for the AP.
SNMP sysLocation	User-defined description of the location of the AP, as defined with the command <b>provision-ap syslocation</b> .
Master	Name or IP address for the master switch.
Gateway	IP address of the default gateway for the AP.
Netmask	Netmask for the AP's IP address.
IP Addr	IP address for the AP.
Dns IP	IP address of the DNS server.
Domain Name	Domain name used by the AP.
Server Name	DNS name of the switch from which the AP boots.

Column	Description
Server IP	IP address of the switch from which the AP boots
Antenna gain for 802.11a	Antenna gain for 802.11a (5GHz) antenna.
Antenna gain for 802.11g	Antenna gain for 802.11g (2.4GHz) antenna.
Antenna for 802.11a	Antenna use for 5 GHz (802.11a) frequency band. <ul style="list-style-type: none"> <li>1: AP uses antenna 1</li> <li>2: AP uses antenna 2</li> <li>both: AP uses both antennas</li> </ul>
Antenna for 802.11g	Antenna use for 2.4 GHz (802.11g) frequency band. <ul style="list-style-type: none"> <li>1: AP uses antenna 1</li> <li>2: AP uses antenna 2</li> <li>both: AP uses both antennas</li> </ul>
IKE PSK	The IKE pre-shared key.
PPPOE User Name	Point-to-Point Protocol over Ethernet (PPPoE) user name for the AP.
PPPOE Password	PPPoE password for the AP.
PPPOE Service Name	PPPoE service name for the AP.
USB User Name	The PPP username provided by the cellular service provider.
USB Password	A PPP password, if provided by the cellular service provider.
USB Device Type	The USB driver type.
USB Device Identifier	The USB device identifier.
USB Dial String	The dial string for the USB modem.
USB Initialization String	The initialization string for the USB modem.
USB TTY device path	The TTY device path for the USB modem.
Mesh Role	If the mesh role is "none," the AP is operating as a thin AP. An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
Installation	The type of installation ( <b>indoor</b> or <b>outdoor</b> ). The <b>default</b> parameter indicates that the AOS-W automatically selects an installation mode based upon the AP's model type.
Latitude	Latitude coordinates of the AP, in the format <i>Degrees Minutes Seconds</i> (DMS).
Longitude	Longitude coordinates of the AP, in the format <i>Degrees Minutes Seconds</i> (DMS).
Altitude	Altitude, in meters, of the AP. This parameter is supported on outdoor APs only.
Antenna bearing for 802.11a	Horizontal coverage distance of the 802.11a (5GHz) antenna from true north, from 0-360 degrees. <b>NOTE:</b> This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
Antenna bearing for 802.11g	Horizontal coverage distance of the 802.11g (2.4GHz) antenna from true north, from 0-360 degrees. <b>NOTE:</b> This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
Antenna tilt angle for 802.11a	The angle of the 802.11a (5GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.

Column	Description
Antenna tilt angle for 802.11g	The angle of the 802.11g (2.4GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.
Mesh SAE	<p>Enable or disable Secure Attribute Exchange (SAE) on a mesh network. The default setting disables SAE. If used, this feature needs to be enabled on all the Mesh nodes (points and portals) in the network, else there could be mesh link connectivity issues. This is a Beta feature and recommended to be kept "disabled" for 3.4 release."</p> <p><b>NOTE:</b> AP80M and AP85 models require the Outdoor Mesh Access Points license.</p>

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Introduced support for mesh parameters, additional antenna parameters, and AP location parameters.
AOS-W 3.4	<p>Introduced support for the following parameters:</p> <ul style="list-style-type: none"> <li>● installation</li> <li>● mesh-sae</li> <li>● set-ikepsk-by-addr</li> <li>● usb-dev</li> <li>● usb-dial</li> <li>● usb-init</li> <li>● usb-passwd</li> <li>● usb-tty</li> <li>● usb-type</li> <li>● usb-user</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap enet-link-profile

```
show ap enet-link-profile [<profile>]
```

### Description

Show a list of all Ethernet Link profiles.

### Usage Guidelines

Include a profile name to display details for the specified Ethernet Link Profile, or omit the <profile> parameter to display a list of all Ethernet Link profiles.

### Example

This command shows the speed of the Ethernet interface and the current duplex mode for the ethernet link profile “default”:

```
(host) #show ap enet-link-profile default

AP Ethernet Link profile "default"
-----
Parameter  Value
-----  ----
Speed      auto
Duplex     auto
```

The output of this command includes the following parameters:

Parameter	Description
Speed	The speed of the Ethernet interface. This value can be either <b>10 Mbps</b> , <b>100 Mbps</b> , <b>1000 Mbps</b> (1 Gbps), or <b>auto</b> (auto-negotiated).
Duplex	The duplex mode of the AP's Ethernet interface. This value can be either <b>full</b> , <b>half</b> , or <b>auto</b> (auto-negotiated).

### Related Commands

## show ap essid

```
show ap essid
```

### Description

Show a Extended Service Set Identifier (ESSID) summary for the switch, including the numbers of APs and clients associated with each ESSID.

### Examples

The output of the command in the example below shows statistics for four configured ESSIDs.

```
(host) #show ap essid
ESSID Summary
-----
ESSID   APs   Clients  VLAN(s)  Encryption
-----
vocera  21    0         66       WPA2 PSK AES
voip    23    52        66,64    WPA2 8021X AES
guest   49    6         63       Open
wpa2    26    88        65,64    WPA2 8021X AES
Num ESSID:4
```

The output of this command includes the following information:

Column	Description
ESSID	An Extended Service Set Identifier (ESSID) is the identifying name of an 802.11 wireless network.
APs	Number of APs associated with the ESSID.
VLAN (s)	VLAN IDs of the VLANs for the ESSID.
Encryption	The layer-2 authentication and encryption used on this ESSID to protect access and ensure the privacy of the data transmitted to and from the network.

### Command History

Introduced in AOS-W 3.0.

### Command Information

## show ap ht-rates

```
show ap ht-rates bssid <bssid>
```

### Description

Show high-throughput rate information for a basic service set (BSS).

### Syntax

Parameter	Description
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.

### Examples

The output of this command shows high-throughput rates for each supported MCS value. These values are applicable to high-throughput (802.11n-capable) APs only.

```
Host) #show ap ht-rates bssid 00:1a:1e:1e:5a:10
```

```
AP "AL12" Radio 0 BSSID 00:1a:1e:1e:5a:10 High-throughput Rates (Mbps)
```

```
-----  
MCS  Streams  20 MHz  40 MHz  40 MHz SGI  
-----  
 0    1         6.5    13.5    15.0  
 1    1        13.0    27.0    30.0  
 2    1        19.5    40.5    45.0  
 3    1        26.0    54.0    60.0  
 4    1        39.0    81.0    90.0  
 5    1        52.0   108.0   120.0  
 6    1        58.5   121.5   135.0  
 7    1        65.0   135.0   150.0  
 8    2         13.0    27.0    30.0  
 9    2         26.0    54.0    60.0  
10    2         39.0    81.0    90.0  
11    2         52.0   108.0   120.0  
12    2         78.0   162.0   180.0  
13    2        104.0   216.0   240.0  
14    2        117.0   243.0   270.0  
15    2        130.0   270.0   300.0
```

The output of this command includes the following information:

Column	Description
MCS	A Modulation Coding Scheme (MCS) values supported on this high-throughput SSID.
Streams	Number of spatial streams used by the MCS index value.
20 MHz	802.11n data rates for the MCS for 20 Mhz transmissions.
40 MHz	802.11n data rates for the MCS for 40 Mhz transmissions.
40 MHz SGI	802.11n data rates for the MCS for 40 Mhz transmissions using a short guard interval.

### Command History

Introduced in AOS-W 3.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap image version

```
show ap image version [ap-name <ap-name>|ip-addr <ip-addr>]
```

### Description

Display an AP's image version information.

### Syntax

Parameter	Description
ap-name <ap-name>	View image version information for an AP with a specific name.
ip-addr <ip-addr>	View image version information for an AP with a specific IP address. Enter the address of the AP in dotted-decimal format.

### Usage Guidelines

By default, this command displays image version information for all APs associated with the switch. To view image version information for a single AP, specify an AP using the **ap-name** or **ip-addr** parameters

### Example

The output in the example below shows the current running image version as well as the image version stored in the switch's flash memory.

```
(host) #show ap image version ip-addr 192.0.2.45

Access Points Image Version
-----
AP          Running Image Version String
--          -----
10.6.1.200  3.3.2.5 Wed Oct 22 10:46:42 PDT 2008
Flash Image Version String      Matches  Num Matches  Num Mismatches  Bad Checksums  Image Load Status
-----
3.3.2.5 Wed Oct 22 10:46:42 PDT 2008 Yes      3            1              0                Done
```

The output of this command includes the following information:

Column	Description
AP	Name or IP address of an AP
Running Image Version String	String identifying the number of the image version currently running on the AP, as well as the date on which that version was created.
Flash Image Version String	String identifying the number of the image version in the AP's flash memory, as well as the date on which that version was created.
Matches	If <b>yes</b> , the running image version matches the image version currently in the AP's flash memory. If <b>no</b> , the two image versions do not match.
Num Matches	Number of times the running image version matched the flash image version after a reboot.
Num Mismatches	Number of times the running image version did not match the flash image version after a reboot. If the images do not match, the AP will upgrade to the flash image.
Bad Checksums	Number of bad checksum calculations due to an invalid or corrupted image file.

Column	Description
Image Load Status	<p>Current status of the AP following an upgrade.</p> <p><b>Done:</b> This status indicates that the switch reset after the upgrade was performed, or the upgrade was performed after the AP first registered with the switch.</p> <p><b>Completed:</b> The AP was updated after it was registered to the switch, and after the switch's last reset. If AP shows a status of <b>completed</b>, it will also display the time it took it update that AP.</p> <p><b>In progress:</b> The AP is currently updating its image.</p>

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap license-usage

```
show ap license-usage
```

### Description

Show AP license usage information.

### Examples

The output of the command below shows that switch has 82 remaining unused AP licenses.

```
(host) #show ap license-usage
Total AP Licenses           : 128
AP Licenses Used            : 46
Unused AP Licenses         : 82
Total RAP Licenses         : 0
RAP Licenses Used          : 0
Total Indoor Mesh AP Licenses : 8
Indoor Mesh AP Licenses Used : 0
Total Outdoor Mesh AP Licenses : 8
Outdoor Mesh AP Licenses Used : 0
Total 802.11n-120abg Licenses : 0
802.11n-120abg Licenses Used : 0
Total 802.11n-121abg Licenses : 0
Total 802.11n-124abg Licenses : 0
802.11n-124abg Licenses Used : 0
Total 802.11n-125abg Licenses : 0
802.11n-125abg Licenses Used : 0
```

The output of this command includes the following information:

Parameter	Description
Total AP Licenses	Total number of AP licenses currently available on the switch.
AP licenses used	Number of AP licenses used by individual APs.
Unused AP Licenses	Number of AP licenses unused and currently available.
Total RAP Licenses	Total number of Remote AP (RAP) licenses currently available on the switch.
RAP licenses used	Number of RAP licenses currently used by Remote APs.
Total Indoor Mesh AP Licenses	Total number of Indoor Mesh AP (IMP) licenses currently available on the switch. The output of this command shows information for indoor mesh licenses, even though these licenses are not required in this version of AOS-W.
Indoor Mesh AP Licenses Used	Number of IMP licenses currently used by Indoor Mesh APs. The output of this command shows information for indoor mesh licenses, even though these licenses are not required in this version of AOS-W.
Total Outdoor Mesh AP Licenses	Total number of Outdoor Mesh AP (MAP) licenses currently available on the switch.
Outdoor Mesh AP Licenses Used	Number of MAP licenses currently used by Outdoor Mesh APs.
Total 802.11n-120abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 120abg APs.
802.11n-120abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 120abg APs
Total 802.11n-121abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 121abg APs.

Parameter	Description
802.11n-121abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 121abg APs
Total 802.11n-124abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 124abg APs.
802.11n-124abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 124abg APs
Total 802.11n-125abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 125abg APs.
802.11n-125abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 125abg APs

## Command History

Release	Modification
AOS-W 3.0	Command Introduced.
AOS-W 3.3	<p>The following parameters were introduced:</p> <ul style="list-style-type: none"> <li>• Total 802.11n-120abg Licenses</li> <li>• 802.11n-120abg Licenses Used</li> <li>• Total 802.11n-121abg Licenses</li> <li>• 802.11n-121abg Licenses Used</li> <li>• Total 802.11n-124abg Licenses</li> <li>• 802.11n-124abg Licenses Used</li> <li>• Total 802.11n-125abg Licenses</li> <li>• 802.11n-125abg Licenses Used</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system. The output of this command varies, according to the licenses currently installed on the switch.	Enable or Config mode on master switches

## show ap load-balancing

```
show ap load balancing
```

### Description

Show the load-balancing information for each AP with load balancing enabled.

### Examples

The output of the command in the example below shows details for a single AP enabled with the load-balancing feature.

```
(host) #show ap load-balancing
Load Balance Enabled Access Point Table
-----
bss          ess          name s/p ip          phy chan cur-cl util(kbps)
---          ---          ---  --- --          --- ---- -
00:0b:86:cc:8e:4e Wireless_1 mp22 2/24 10.3.148.12 a-HT 413 3      14
```

The output of this command includes the following information:

Column	Description
BSS	The Basic Service Set (BSS) Identifier for the AP. This is usually the APs MAC address.
ESS	The Extended Service Set (ESS) Identifier is the user-defined name of an 802.11 wireless network.
s/p	The switch slot and port used by the AP, in the format <slot>/<port>. The <slot> number is always 1 except when referring to interfaces on the OmniAccess 6000 switch. For the OmniAccess 6000 switch, the four slots are allocated as follows: <ul style="list-style-type: none"><li>Slot 0: contains a supervisor card or an OmniAccess Supervisor Card III.</li><li>Slot 1: can contain either a redundant supervisor card, OmniAccess Supervisor Card III, or a third line card.</li><li>Slot 2: can contain either an OmniAccess Supervisor Card III or line card (required if slot 0 contains a supervisor card).</li><li>Slot 3: can contain either an OmniAccess Supervisor Card III or second line card.</li></ul> The <port> number refers to the network interfaces that are embedded in the front panel of the OmniAccess 4302, OmniAccess 4308T, OmniAccess 4324 switch, OmniAccess 4504/4604/4704, OmniAccess Supervisor Card III, or a line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position.
ip	IP address of the AP.
phy	One of the following 802.11 types <ul style="list-style-type: none"><li>a</li><li>a-HT (high-throughput)</li><li>g</li><li>g-HT (high-throughput)</li></ul>
chan	Channel number for the AP 802.11a/802.11n physical layer. The available channels depend on the AP's regulatory domain (country).
cur-cl	Current number of clients on the AP.
util (kbps)	Current bandwidth utilization, in kbps.

### Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap mesh active

```
show ap mesh active [<mesh-cluster>|{page <page>}|{start <start>}]
```

### Description

Show active mesh cluster APs currently registered on this switch.

### Syntax

Parameter	Description
<mesh-cluster>	Name of a mesh cluster profile.
page <page>	Limit the output of this command to a specific number of entries by entering the number of entries you want to display.
start <start>	Start displaying the index of mesh APs at a chosen index number by entering the index number of the AP at which command output should start.

### Examples

The output of this command displays a list of all active mesh points and mesh portals.

```
(host) #show ap mesh active
Mesh Cluster Name: meshprofile1
-----
Name  Group  IP Address  BSSID  Band/Ch/EIRP/MaxEIRP  MTU  Enet 0/1  Mesh Role
-----
mp1   mp1    10.3.148.245  00:1a:1e:85:c0:30  802.11a/157/19/36      ---  Off/Off    Point
mp2   mp2    10.3.148.250  00:1a:1e:88:11:f0  802.11a/157/19/36      ---  Bridge/Bridge Point
mp3   mp3    10.3.148.253  00:1a:1e:88:01:f0  802.11a/157/19/36      ---  Bridge/Bridge Point
mpp   mpp125 10.3.148.252  00:1a:1e:88:05:50  802.11a/157/19/36      1578 -/Bridge   Portal

Parent #Children AP Type  Uptime
-----
mp3     0         125     13d:2h:25m:19s
mpp     1         125     14d:21h:23m:49s
mp2     1         125     14d:21h:14m:55s
-       1         125     14d:19h:5m:3s
-----
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP.
Group	AP group which includes the specified AP.
IP Address	IP address of the AP.
BSSID	Basic Service Set Identifier (BSSID) for the AP. This is usually the AP's MAC address.
Band/Ch/EIRP/MaxEIRP	The RF band in which the AP should operate ( <b>a</b> or <b>g</b> )/ Radio channel used by the AP/ Current effective Isotropic Radiated Power (EIRP) /maximum EIRP
MTU	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.

Column	Description
Enet 0/1	Shows the current mode of each wired interface. <ul style="list-style-type: none"> <li>● <b>Bridge:</b> 802.11 frames are bridged into the local Ethernet LAN.</li> <li>● <b>Tunnel:</b> 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE).</li> <li>● <b>Split-tunnel:</b> 802.11 frames are either bridged into the local Ethernet LAN or tunneled to the switch, depending upon their destination.</li> <li>● <b>Off:</b> Interface is not available for serving clients.</li> </ul> If an AP has only one wired interface, the output of this command will display a dash (-) for the unavailable port.
Mesh Role	An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
Parent	If the AP is operating as a mesh point, this parameter displays the name of its parent mesh portal. Mesh portals will display a dash (-).
#Children	If the AP is operating as a mesh portal, this parameter shows the number of mesh point children associated with that mesh portal.
AP type	The AP model type.
Uptime	Number of hours, minutes and seconds since the last switch reboot or bootstrap, in the format <i>hours:minutes:seconds</i> .

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh debug counters

```
show ap mesh debug counters {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show counters statistics for a mesh node.

### Syntax

Parameter	Description
ap-name <ap-name>	Show counter statistics for an AP with a specific name.
bssid <bssid>	Show counter statistics for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	View counter statistics for an AP with a specific IP address. Enter the IP address of the AP in dotted-decimal format.

### Example

The example below shows the Mesh Packet Counters table for an AP named meshpoint1. The **Probe Resp**, **Assoc Req**, and **Assoc Resp** data columns show both the total number of counters and, in parenthesis, the number of requests or responses with high-throughput information elements (HE IEs).

```
(host) #show ap mesh debug counters ap-name meshpoint1
```

```
Mesh Packet Counters
```

```
-----  
Interface  Echo Sent  Echo Recv  Probe Req  Probe Resp  Assoc Req  Assoc Resp  Assoc Fail  Link up/  
down Resel.  Switch    Other      Mgmt        Mgmt        Mgmt        Mgmt        Mgmt  
-----  
-----  
Parent      68865      68755      24         8 (8 HT)    3 (1 HT)    3 (1 HT)    1           1  
-           -          0  
Child      68913      67373      6          8           2           2           0           1  
2          0          2618886
```

```
Received Packet Statistics: Total 2890717, Mgmt 2618946 (dropped non-mesh 0), Data 271771 (dropped unassociated 1)HT: pns=8 ans=1 pnr=0 ars=0 arr=1 anr=0
```

```
Recovery Profile Usage Counters
```

The output of this command includes the following information:

Column	Description
Interface	Indicates whether the mesh interface connects to a <b>Parent</b> AP or a <b>Child</b> AP. Each row of data in the <i>Mesh Packet Counters</i> table shows counter values for an individual interface.
Echo Sent	Number of echo packets sent.
Echo Recv	Number of echo packets received.
Probe Req	Number of probe request packets sent from the interface specified in the <b>Mesh-IF</b> parameter.
Probe Resp	Number of probe response packets sent to the interface specified in the <b>Interface</b> parameter.

Column	Description
Assoc Req	Number of association request packets from the interface specified in the <b>Interface</b> parameter.
Assoc Resp	Number of association response packets from the interface specified in the <b>Interface</b> parameter. This number includes valid responses and fail responses.
Assoc Fail	Number of fail responses received from the interface specified in the <b>Interface</b> parameter.
Link up/down	Number of times the link up or link down state has changed.
Resel.	Number of times a mesh point attempted to reselect a different mesh portal.
Switch	Number of times a mesh point successfully switched to a different mesh portal.
Other Mgmt	Management frames of any type other than association and probe frames, either received on child interface, or sent on parent interface.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches.

## show ap mesh debug current-cluster

```
show ap mesh debug current-cluster {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Display information for the mesh cluster currently used by a mesh point or mesh portal.

### Syntax

Parameter	Description
ap-name <ap-name>	Show mesh cluster data for an AP with a specific name.
bssid <bssid>	Show mesh cluster data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show mesh cluster data for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Examples

The output of the command below shows mesh cluster profile configuration parameters for the mesh cluster currently used by an AP named "mp2."

```
(host) #show ap mesh debug current-cluster ap-name mp2
```

```
AP "mp2" Current Cluster Profile: default
```

```
-----  
Item          Value  
-----  
Cluster Name  smettu-mesh  
RF Band       a  
Encryption    opensystem  
WPA Hexkey    N/A  
WPA Passphrase *****
```

The output of this command includes the following information:

Column	Description
Cluster Name	Name of the mesh cluster using this profile
RF band	The RF band in which the mesh point or mesh portal operates: <ul style="list-style-type: none"><li>● <b>g</b> = 2.4 GHz</li><li>● <b>a</b> = 5 GHz</li></ul>
Encryption	Data encryption setting for the mesh cluster profile. <ul style="list-style-type: none"><li>● <b>opensystem</b>—No authentication and encryption.</li><li>● <b>wpa2-psk-aes</b>—WPA2 with AES encryption using a preshared key.</li></ul>
WPA Hexkey	The WPA pre-shared key (only for mesh cluster profiles using WPA2 with AES encryption).
WPA Passphrase	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

### Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh debug forwarding-table

```
show ap mesh forwarding-table {ap-name <ap-name>}|{ip-addr <ip-addr>}
```

### Description

Show the forwarding table for a remote mesh point or remote mesh portal.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for a remote mesh node with a specific name.
ip-addr <ip-addr>	Show data for a remote mesh node with a specific IP address by entering its IP address in dotted-decimal format.

### Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with your mesh network.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh debug hostapd-log

```
show ap mesh debug hostapd-log {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show the debug log messages for the **hostapd** process.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with the **hostapd** process or your mesh network.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh debug meshd-log

```
show ap mesh debug meshd-log {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
[<page>]
```

### Description

Show the debug log messages for the **meshd** process.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering an IP address in dotted-decimal format.
<page>	Display page number 0, 1 or 2, where page 0 has the newest information and page 2 has the oldest. If this parameter is omitted, this command will display all meshd log information, oldest first.

### Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with the **meshd** process or your mesh network.

### Command History

Release	Modification
AOS-W 3.0	Command introduced.
AOS-W 3.4	The <b>page</b> parameter was introduced.

### Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh debug provisioned-clusters

```
show ap mesh debug provisioned-clusters {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show cluster profiles provisioned on a mesh portal or mesh point.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for a mesh node with a specific name.
bssid <bssid>	Show data for a mesh node with a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for a mesh node with a specific IP address by entering an IP address in dotted-decimal format.

### Example

The output of the command below shows statistics for the AP's mesh cluster profile and recovery cluster profile.

```
(host) #show ap mesh debug provisioned-clusters ap-name portal2
```

```
AP Portal Cluster Profile: mesh-cluster-profile
```

```
-----  
Parameter      Value  
-----  
Cluster Name   sw-ad-GB32  
RF Band        a  
Encryption     opensystem  
WPA Hexkey     N/A  
WPA Passphrase *****
```

```
AP "Portal" Cluster Profile: Recovery Cluster Profile
```

```
-----  
Item           Value  
-----  
Cluster Name   Recovery-ZF-xAP15z-g15VN  
RF Band        a  
Encryption     pa2-psk-aes  
WPA Hexkey     *****  
WPA Passphrase N/A
```

The output of this command displays the following information for the AP's mesh cluster profile and recovery cluster profiles:

Column	Description
Cluster Name	Name of the mesh cluster using this profile
RF band	The RF band in which the AP should operate: <ul style="list-style-type: none"><li>● <b>g</b> = 2.4 GHz</li><li>● <b>a</b> = 5 GHz</li></ul>

Column	Description
Encryption	Data encryption setting for the mesh cluster profile. <ul style="list-style-type: none"> <li><b>opensystem</b>—No authentication and encryption.</li> <li><b>wpa2-psk-aes</b>—WPA2 with AES encryption using a preshared key.</li> </ul>
WPA Hexkey	The WPA pre-shared key (only for mesh cluster profiles using WPA2 with AES encryption).
WPA Passphrase	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh neighbors

```
show ap mesh neighbors {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show all mesh neighbors for an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show mesh neighbors for an AP with a specific name.
bssid <bssid>	Show mesh neighbors for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show mesh neighbors for an AP with a specific IP address by entering its IP address in dotted-decimal format.

### Example

The **Flags** column in output of this command indicates the high-throughput (HT) properties of the mesh node. In the example below, the string “HT-40MHzsgi-2ss” indicates that the node uses a 40MHz channel with a short guard interval (sgi) and sends 2 spatial streams (ss).

```
(host) #show ap mesh neighbors ap-name portal
```

```
Neighbor list
```

```
-----  
MAC                Portal                Channel  Age  Hops  Cost  Relation  Flags                RSSI  A-Req  A-Resp  
-----  
00:0b:86:e7:0b:b1  00:00:00:00:00:00  413     2   1    1    N 5m:14s  HT-40MHzsgi-2ss    43   0     0  
00:00:00:50:00:01  00:00:00:00:00:00  157    20   1    1    N 42s     HT-40MHzsgi-2ss    74   0     0
```

```
A-Fail  HT-Details  Cluster ID  
-----  
0       Unsupported  
0       Unsupported  Recovery-uX-IkItDY-BXsID
```

```
Total count: 2, Children: 0
```

```
Relation: P = Parent; C = Child; N = Neighbor; B = Blacklisted-neighbor
```

```
Flags: R = Recovery-mode; S = Sub-threshold link; D = Reselection backoff; F = Auth-failure; H = High Throughput; L = Legacy allowed
```

The output of this command includes the following information:

Column	Description
MAC	MAC address of the mesh node.
Portal	MAC address of the mesh portal.
Channel	Number of a radio channel used by the AP.
Age	Number of seconds elapsed since the AP heard from the neighbor.
Hops	Indicates the number of hops it takes traffic from the mesh node to get to the mesh portal. The mesh portal advertises a hop count of 0, while all other mesh nodes advertise a cumulative count based on the parent mesh node

Column	Description
Cost	A relative measure of the quality of the path from the AP to the switch. A lower number indicates a better quality path, where a higher number indicates a less favorable path (e.g, a path which may be longer or more congested than a path with a lower value.) For a mesh point, the path cost is the sum of the (parent path cost) + (the parent node cost) + (the link cost).
Relation	Shows the relationship between the specified AP and the AP on the neighbor list and the amount of time that relationship has existed. <ul style="list-style-type: none"> <li>● <b>P</b> = Parent</li> <li>● <b>C</b> = Child</li> <li>● <b>N</b> = Neighbor</li> <li>● <b>B</b> = Blacklisted-neighbor</li> </ul>
Flags	This parameter shows additional information about the mesh neighbor. The key describing each flag appears at the bottom of the neighbor list.
RSSI	The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
A-Req	Number of association requests from clients
A-Resp	Number of association responses from the mesh node
A-Fail	Number of association failures
Cluster	Name of the Mesh cluster that includes the specified AP or BSSID.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh tech-support

```
show ap mesh tech-support ap-name <ap-name> <filename>
```

### Description

Display all information for an AP, and save that information in a file on the switch

### Syntax

Parameter	Description
<ap-name>	Name of an AP for which you want to create a report
<filename>	Filename for the report created by this command. The file can only be saved in the flash directory. If desired, you can use FTP or TFTP to copy the file to another destination.

### Usage Guidelines

This command displays the output of the multiple mesh and debug CLI commands, then saves that data into a report file on the switch's flash drive, where it can be analyzed for debugging purposes. The information in this report includes the output of the following commands:

- [show ap mesh neighbors](#)
- [show ap mesh debug current-cluster](#)
- [show ap mesh debug provisioned-clusters](#)
- [show ap mesh debug counters](#)
- [show ap mesh debug forwarding-table](#)
- [show ap mesh debug meshd-log](#)
- [show ap mesh debug hostapd-log](#)

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Config mode on master switches

## show ap mesh topology

```
show ap mesh topology [long] [page <page>] [start <start>]
```

### Description

Show the mesh topology tree.

### Syntax

Parameter	Description
long	Include the names of a mesh portal's children in the output of this command
page <page>	Limit the output of this command to a specific number of entries by entering the number of entries you want to display.
start <start>	Start displaying the mesh topology tree at a chosen index number by entering the index number of the AP at which command output should start.

### Example

An **(N)** in the **Mesh Role** column indicates the node is 11N capable. An **(N)** beside the parent name in the **Parent** column indicates that the mesh node's the parent is also 11N capable.

```
(host) #show ap mesh topology
```

```
Mesh Cluster Name: rgk-mesh
```

```
-----  
Name      Mesh Role  Parent      Path Cost  Node Cost  Link Cost  Hop Count  Last Update  Uplink Age  #Children  
-----  
andy      Point (N)  ap125 (N)   1          0          0          1          2m:29s      3h:35m:29s  0  
ap125     Portal (N)  -           0          1          0          0          3m:16s      3h:37m:50s  1
```

```
Total APs :2
```

```
(R): Recovery AP. (N): 11N Link. For Portals 'Uplink Age' equals uptime.
```

The output of this command includes the following information:

Column	Description
Name	Name of the mesh node.
Mesh Role	An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
Parent	If the AP is operating as a mesh point, this parameter displays the name of its parent mesh portal.
Path Cost	A relative measure of the quality of the path from the AP to the switch. A lower number indicates a better quality path, where a higher number indicates a less favorable path (e.g, a path which may be longer or more congested than a path with a lower value.) For a mesh point, the path cost is the sum of the (parent path cost) + (the parent node cost) + (the link cost).
Node Cost	A relative measure of the quality of the node, where a lower number of is more favorable than a higher number. This cost is related to the number of children on the specified node.
Link Cost	A relative measure of the quality of the link. For example, a more congested link will have a higher link cost than a similar, less-congested link.
Hop Count	Number of hops to the mesh portal.

Column	Description
Last Update	Time elapsed since the mesh node last updated its statistics.
Uplink Age	Time elapsed since the mesh node became active in the mesh topology.
#Children	Number of children associated with a parent mesh point.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh-cluster-profile

```
show ap mesh-cluster-profile [<profile>]
```

### Description

Show configuration settings for a mesh cluster profile.

### Syntax

Parameter	Description
<profile>	Name of a mesh cluster profile

### Usage Guidelines

The command **show ap mesh-cluster-profile** displays a list of all mesh cluster profiles configured on the switch, including the number of references to each profile and each profile's status. Include the optional <profile> parameter to show detailed settings for an individual mesh cluster profile.

### Examples

The example below shows the configuration settings for the mesh cluster profile “meshcluster2”.

```
(host) #show ap mesh-cluster-profile meshcluster2
```

```
Mesh Cluster profile "meshcluster2"
-----
Parameter      Value
-----
Cluster Name   company-mesh
RF Band        a
Encryption     opensystem
WPA Hexkey     N/A
WPA Passphrase N/A
```

The output of this command includes the following information:

Parameter	Description
Cluster Name	Name of the mesh cluster using this profile
RF band	The RF band in which the AP should operate: <ul style="list-style-type: none"><li>● <b>g</b> = 2.4 GHz</li><li>● <b>a</b> = 5 GHz</li></ul>
Encryption	Data encryption setting for the mesh cluster profile. <ul style="list-style-type: none"><li>● <b>opensystem</b>—No authentication and encryption.</li><li>● <b>wpa2-psk-aes</b>—WPA2 with AES encryption using a preshared key.</li></ul>
WPA Hexkey	The WPA pre-shared key (only for mesh cluster profiles using WPA2 with AES encryption).
WPA Passphrase	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

### Command History

Introduced in AOS-W 3.2.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the mesh feature require the Mesh license.	Enable or Config mode on master switches

## show ap mesh-ht-ssid-profile

```
show ap mesh-ht-ssid-profile [<profile>]
```

### Description

Show configuration settings for a mesh high-throughput Service Set Identifier (SSID) profile.

### Syntax

Parameter	Description
<profile>	Name of a mesh high-throughput SSID profile.

### Usage Guidelines

High-throughput APs support additional settings not available in legacy APs. A mesh high-throughput SSID profile can enable or disable high-throughput (802.11n) features and 40 MHz channel usage, and define values for aggregated MAC protocol data units (MPDUs) and Modulation and Coding Scheme (MCS) ranges.

The command **show ap mesh-ht-ssid-profile** displays a list of all mesh high-throughput SSID profiles configured on the switch, including the number of references to each profile and each profile's status. Include the optional **<profile>** parameter to show detailed settings for an individual mesh high-throughput SSID profile.

### Examples

The example below shows the configuration settings for the mesh high-throughput radio profile "default".

```
(host) #show ap mesh-ht-ssid-profile default
```

```
Mesh High-throughput SSID profile "default"
-----
Parameter                               Value
-----
High throughput enable (SSID)            Enabled
40 MHz channel usage                     Enabled
MPDU Aggregation                         Enabled
Max transmitted A-MPDU size              65535 bytes
Max received A-MPDU size                 65535 bytes
Min MPDU start spacing                   0 usec
Supported MCS set                         1-14
Short guard interval in 40 MHz mode      Enabled
Legacy stations                          Allowed
Allow weak encryption                    Disabled
```

The output of this command includes the following information:

Column	Description
High throughput enable (SSID)	Shows if 802.11n high-throughput features are enabled or disabled for this profile. By default, high-throughput features are enabled.
40 MHz channel usage	This parameter shows if the profile enables or disables the use of 40 MHz channels.

Column	Description
MPDU Aggregation	This parameter shows if the profile enables or disables MAC protocol data unit (MPDU) aggregation. High-throughput mesh APs are able to send aggregated MAC protocol data units (MDPUs), which allow an AP to receive a single block acknowledgment instead of multiple ACK signals. This option, which is enabled by default, reduces network traffic overhead by effectively eliminating the need to initiate a new transfer for every MPDU.
Max transmitted A-MPDU size	Maximum size of a transmitted aggregate MPDU, in bytes.
Max received A-MPDU size	Maximum size of a received aggregate MPDU, in bytes.
Min MPDU start spacing	Minimum time between the start of adjacent MPDUs within an aggregate MPDU, in microseconds.
Supported MCS set	A list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20MHz vs. 40MHz) and the number of spatial streams used by the mesh node.
Short guard interval in 40 MHz mode	This parameter shows if the profile enables or disables use of short (400ns) guard interval in 40 MHz mode. A guard interval is a period of time between transmissions that allows reflections from the previous data transmission to settle before an AP transmits data again. An AP identifies any signal content received inside this interval as unwanted inter-symbol interference, and rejects that data.
Legacy stations	This parameter shows if the profile allows or disallows associations from legacy (non-HT) stations.
Allow weak encryption	Using TKIP or WEP encryption for unicast traffic forces legacy transmission rates on high-throughput APs. This option is disabled by default, preventing clients using TKIP or WEP for unicast traffic from associating with the mesh node.

## Command History

Introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap mesh-radio-profile

```
show ap mesh-radio-profile [<profile>]
```

### Description

Show configuration settings for a mesh radio profile.

### Syntax

Parameter	Description
<profile>	Name of a mesh radio profile.

### Usage Guidelines

The radio profile determines the radio frequency/channel used only by mesh nodes to establish mesh links. Mesh nodes operating in different cluster profiles can share the same radio profile. Conversely, mesh portals using the same cluster profile can be assigned different mesh radio profiles to achieve frequency separation.

The command **show ap mesh-radio-profile** displays a list of all mesh radio profiles configured on the switch, including the number of references to each profile and each profile's status. Include the optional *<profile>* parameter to show detailed settings for an individual mesh radio profile.

### Example

The example below shows the configuration settings for the mesh cluster profile "default".

```
(host) #show ap mesh-radio-profile default
Mesh Radio profile "default"
-----
Parameter                               Value
-----
Maximum Children                         6
Maximum Hop Count                        5
Heartbeat threshold                       10
Link Threshold                            12
Reselection mode                         reselect-anytime
Metric algorithm                          distributed-tree-rssi
Retry Limit                               4
RTS Threshold                             2333 bytes
802.11a Transmit Rates                    6 9 12 18 24 36 48 54
802.11g Transmit Rates                    1 2 5 6 9 11 12 18 24 36 48 54
Mesh Private Vlan                         0
Allowed VLANs on mesh link                1
BC/MC Rate Optimization                   Enabled
Mesh High-throughput SSID Profile         default
```

The output of this command includes the following information:

Parameter	Description
Maximum Children	The maximum number of children a mesh portal can accept.
Maximum Hop Count	The maximum number of hops allowed between a mesh point and a mesh portal.
Heartbeat Threshold	Indicates the maximum number of heartbeat messages that can be lost between neighboring mesh nodes before the mesh node is considered inactive and is dropped as a mesh neighbor.

Parameter	Description
Link Threshold	Indicates the threshold for the lowest acceptable Receive Signal Strength Indicator (RSSI) value. Links that drop below this threshold will have an increased link cost. Default: 12.
Reselection Mode	Specifies the one of the following methods used to find a better mesh link. <ul style="list-style-type: none"> <li>• <b>startup-sub-threshold:</b> When bringing up the mesh network, mesh nodes have 3 minutes to find a better uplink. After that time, each mesh node evaluates alternative links only if the existing uplink falls below the configured threshold level (the link becomes a sub-threshold link). The reselection process is canceled if the average RSSI rises on the existing uplink rises above the configured link threshold.</li> <li>• <b>reselect-any-time:</b> Connected mesh nodes evaluate alternative mesh links every 30 seconds. If a mesh node finds a better uplink, the mesh node connects to the new parent to create an improved path to the mesh portal.</li> <li>• <b>reselect-never:</b> Connected mesh nodes do not evaluate other mesh links to create an improved path to the mesh portal.</li> <li>• <b>subthreshold-only:</b> Connected mesh nodes evaluate alternative links only if the existing uplink becomes a sub-threshold link.</li> </ul>
Metric algorithm	Algorithm used by a mesh node to select its parent.
Retry Limit	Maximum number of times a mesh node can re-send a packet.
RTS Threshold	The packet size sent by mesh nodes. Mesh nodes transmitting frames larger than this threshold must issue request to send (RTS) and wait for other mesh nodes to respond with clear to send (CTS) to begin transmission. This helps prevent mid-air collisions.
802.11a Transmit Rates	Indicates the transmit rates for the 802.11a radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.
802.11g Transmit Rates	Indicates the transmit rates for the 802.11g radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.
Mesh Private Vlan	A Vlan ID for control traffic between an RMP and mesh nodes.
BC/MC Rate Optimization	If enabled, the mesh node will use the slowest associated mesh-point rate for broadcast/multicast data (rather than minimum).
Mesh High-throughput SSID Profile	The High-throughput SSID Profile associated with this mesh radio profile.

## Command History

Release	Modification
AOS-W 3.2	Command Introduced.
AOS-W 3.4	The <b>802.11g Portal channel</b> and <b>802.11a Portal channel</b> parameters were deprecated, and the <b>Mesh High-throughput SSID Profile</b> parameter was introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap monitor

```
show ap monitor active-laser-beams|ap-list|channel|client-list|ids-state|mesh-list|pot-  
ap-list|pot-client-list|routers|wired-mac {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr  
<ip-addr>} {ap-bssid <ap-bssid>}|{enet-mac <enet-mac>}
```

### Description

Show information for Alcatel-Lucent Air Monitors.

### Syntax

Parameter	Description
active-laser-beams	Show active laser beam generators. The output of this command shows a list of all APs that are actively performing policy enforcement containment such as rogue containment. This command can tell us which AP is sending out deauthorization frames, although it does not specify which AP is being contained.
ap-list	Show list of APs being monitored.
arp-cache	Show ARP Cache of learned IP to MAC binding
channel	Show state and stats of a specific channel.
client-list	Show list of client being monitored.
ids-state	Show IDS State.
mesh-list	Show list of Mesh APs being monitored.
pot-ap-list	Display the Potential AP table. The Potential AP table shows the following data: <ul style="list-style-type: none"><li>● <b>bssid</b>: the AP's Basic Service Set Identifier.</li><li>● <b>channel</b>: The AP's current radio channel</li><li>● <b>phy type</b>: The radio's PHY type. Possible values are 802.11a, 802.11a-HT-40, 802.11b/g, 802.11b/g-HT-20.</li><li>● <b>num-beacons</b>: Number of beacons seen during a 10-second scan</li><li>● <b>tot-beacons</b>: Total number of beacons seen since the last reset.</li><li>● <b>num-frames</b>: Total number of frames seen since the last rest.</li><li>● <b>mt</b>: Monitor time; the number of timer ticks elapsed since the switch first recognized the AP.</li><li>● <b>at</b>: Active time, in timer ticks.</li><li>● <b>ibss</b>: Shows if ad-hoc BSS is enabled or disabled. It will be enabled if the bssid has detected an ad-hoc BSS (an ibss bit in an 802.11 frame).</li><li>● <b>rssi</b>: The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.</li></ul>
pot-client-list	Display the Potential client table. The Potential Client table shows the following values: <ul style="list-style-type: none"><li>● <b>last-bssid</b>: the Last BSSID to which the client associated.</li><li>● <b>from-bssid</b>,</li><li>● to-bssid</li><li>● mt: Monitor time; the number of timer ticks elapsed since the switch first recognized the client.</li><li>● it: Client Idle time, expressed as a number of timer ticks.</li></ul>
routers	Show Router MAC Addresses learned. The output of this command includes the router's MAC address, IP address and uptime.
wired-mac	Show Wired MAC Addresses learned.
ap-name <ap-name>	Show data for an AP with a specific name.

Parameter	Description
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
ap-bssid <ap-bssid>	Include the optional <b>ap-bssid &lt;ap-bssid&gt;</b> parameters to show how the AP is monitoring information for another AP with a specific BSSID.
enet-mac <enet-mac>	Include the optional <b>enet-mac &lt;enet-mac&gt;</b> parameters to show how the AP is monitoring information for an interface with a specific ethernet MAC address.

## Examples

The output of the command displays the Monitored AP Table, which lists all the APs monitored by a specified AP or BSSID.

```
(host) #show ap monitor ap-list ap-name all2
```

```
Monitored AP Table
```

```

```

The output of this command includes the following information:

Column	Description
bssid	Basic Service Set Identifier for an AP. This is usually the AP's MAC address.
essid	Extended service set identifier that names a wireless network.
chan	Radio channel used by the BSSID
phy-type	Radio phy type. Possible types include: <ul style="list-style-type: none"> <li>802.11a</li> <li>802.11a-HT-40</li> <li>802.11b/g</li> <li>802.11b/g-HT-20</li> </ul>
dos	Shows if the feature to contain DoS attacks has been enabled or disabled.
mt	Monitor time; the number of elapsed timer ticks since the AP first recognized the monitored AP.

Column	Description
it	AP idle time, the number of timer-ticks since the AP last saw any frames from the monitored AP.
load-balance	Shows if the load-balancing feature has been enabled on the AP.

## Command History

Version	Modification
AOS-W 3.0.	Command introduced
AOS-W 3.4.	The <b>ap-bssid</b> and <b>enet-mac</b> parameters were added to the <b>show ap monitor wired-mac</b> command.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap monitor association

```
show ap monitor association {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
<ap-bssid>
```

### Description

Show the association table for an Air Monitor (AM).

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AM with a specific name.
bssid <bssid>	Show data for an AM with a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AM's MAC address.
ip-addr <ip-addr>	Show data for an AM with a specific IP address by entering its IP address in dotted-decimal format.
<ap-bssid>	BSSID of an AP.

### Examples

The output of the command lists the MAC addresses associated with the Air Monitor BSSID.

```
(host) #show ap monitor association ap-name ap9 00:1a:1e:11:74:a1
Association Table
-----
mac                rsta-type  auth  phy-type
---                -
00:1d:d9:01:c4:50  valid      yes   80211a
00:17:f2:4d:01:e2  valid      yes   80211a
00:1f:3b:8c:28:89  valid      yes   80211a
00:1d:d9:05:05:d0  valid      yes   80211a
00:14:a4:25:72:6d  valid      yes   80211a
00:19:7d:d6:74:8d  valid      yes   80211a
```

The output of this command includes the following information:

Column	Description
mac	MAC address associated with the Air Monitor BSSID
rsta-type	Rogue station type: <ul style="list-style-type: none"><li>● <b>interfering</b>: Interfering station.</li><li>● <b>valid</b>: Station is not a rogue station.</li><li>● <b>DoS</b>: Station may have attempted a DoS attack.</li></ul>
auth	Displays a <b>yes</b> if the client has been authenticated.
phy-type	The RF band in which the AP should operate: <b>802.11g</b> = 2.4 GHz <b>802.11a</b> = 5 GHz

### Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap monitor debug

```
show ap monitor debug counters|status {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

```
show ap monitor debug profile-config {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>} ap-radio|ap-system|arm|event-thresholds|ids-dos|ids-general|ids-impersonation|ids-signature-matching|ids-unauthorized-device|interference|regulatory-domain|rf-behavior
```

### Description

Show information for an Air Monitor's current status, message counters, or profile settings.

### Syntax

Parameter	Description
counters	Show Air Monitor (AM) message counters.
status	Show the status of an Air Monitor.
ap-name <ap-name>	Show data for an AM with a specific name.
bssid <bssid>	Show data for an AM with a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AM with a specific IP address by entering its IP address in dotted-decimal format.
profile-config	Show an Air Monitor profile configuration.
ap-radio	Show the Air Monitor radio configuration parameters, as defined in the AM's 802.11a, 802.11b, or high-throughput radio profiles.
ap-system	Show an Air Monitor's system configuration settings, as defined in its AP System profile.
arm	Show an Air Monitor's Adaptive Radio Management (ARM) settings, as defined in its current ARM profile
event-thresholds	Show an Air Monitor Event Thresholds settings, as defined in its current RF Event Thresholds profile
ids-dos	Show an Air Monitor IDS DoS settings, as defined in its current IDS DoS profile.
ids-general	Show an Air Monitor IDS General Configuration settings, as defined in its IDS General profile.
ids-impersonation	Show an Air Monitor IDS Impersonation Configuration settings, as defined in its IDS Impersonation profile.
ids-signature-matching	Show an Air Monitor IDS Signature Matching configuration settings, as defined in its IDS Signature Matching profile
ids-unauthorized-device	Show an Air Monitor IDS Unauthorized Device configuration settings, as defined in its IDS Unauthorized Device profile.
interference	Show an Air Monitor's interference configuration settings, as defined in its current RF Optimization profile.
regulatory-domain	Show an Air Monitor's Regulatory Domain configuration settings, as defined in its Regulatory Domain profile.
rf-behavior	Show an Air Monitor RF Behavior Configuration

## Examples

The output of the following command includes the *WLAN Interface*, *Data Structures*, *WLAN Interface Switch Status* and *RTLS Configuration* tables for the specified AP.

```
(host) #show ap monitor debug status ap-name ap12
```

### WLAN Interface

```
-----  
bssid          scan    monitor  probe-type  phy-type      task   channel  pkts

```

The output of this command includes the following information:

Column	Description
bssid	The Basic Service Set Identifier (BSSID) for the AP. This is usually the AP's MAC address.
scan	Indicates whether or not if active scanning is enabled on this AP.
monitor	Indicates whether the AP radio is currently enabled or disabled.
probe-type	This parameter displays one of the following options to show the AP is configured. <ul style="list-style-type: none"> <li>● <b>sap</b>: Default AP setting.</li> <li>● <b>am</b>: AP is configured as an Air Monitor.</li> <li>● <b>m-portal</b>: AP is configured as a Mesh portal.</li> <li>● <b>m-point</b>: AP is configured as a Mesh point.</li> </ul>
task	This parameter displays one of the following options to show the radio's current task: <ul style="list-style-type: none"> <li>● <b>scan</b>: AP is scanning other channels.</li> <li>● <b>tuned</b>: AP is tuned on one channel.</li> <li>● <b>locate</b>: AP has been asked to locate a specific AP or client.</li> <li>● <b>pcap</b>: The AP is enabled with the Packet Capture feature.</li> </ul>
channel	The radio channel currently used by an AP's WLAN interface.
pkts	Number of packets seen on the interface.
mac	MAC address for the AP's wired interface.
ip	The AP's IP address.
gw-ip	IP address for the AP's gateway.
gw-mac	MAC address for the AP's gateway.
status	Shows if the interface is currently enabled or disabled.
pkts	Number of packets seen on the AP's wired interface.
macs	Number of MAC addresses in the Wired MAC table for that interface.
gw-macs	Number of MAC addresses in the Wired MAC table for that interface.
tagged-pkts	Number VLAN-tagged packets sent to that interface.
vlan	The VLAN ID for the packets sent to that interface.
Packets read	Number of packets read by the AP since it was last reset.
Bytes read	Number of bytes read by the AP since it was last reset.
Num Intercepts	Number of interrupts from the AP's driver.
Num Buffer Overflows	Number of times excessive traffic has filled the AP's buffers.
Max PPS	Maximum throughput rate seen on the interface, in packets per second.
Cur PPS	Current throughput rate seen on the interface, in packets per second.
Max PPI	Maximum interrupt rate seen on the interface, in interrupts per second.
Cur PPI	Current interrupt rate seen on the interface, in interrupts per second.
Uptime	Number of seconds since the AP was last reset.
LMS IP	IP address of the AP's local switch.
Master IP	IP address of the AP's master switch.

Column	Description
AP type	AP model type.
Country Code	The AP's country code. Valid radio channels for your wireless network are based on your country code. If you change the AP's country code, the valid channels will be reset to the defaults for the new country.
ap	Number of other APs monitored by this AP.
sta	Number of clients and APs seen by this AP.
pap	Number of potential APs; APs which have transmitted a beacon, but have not yet been registered.
psta	Number of potential stations; AP has seen a MAC address from the station but hasn't yet received traffic from it.
ch	Number of channel entries in the channel table.
msg-hash	Number of different message types seen on the interface.
ap-l	(For internal use only)
WMS on Master	Indicates if the AP communicates to the wms process on a master or local switch. <b>enabled:</b> Communicates with a master switch. <b>disabled:</b> Communicates with a local switch only.
Stats Update Interval	If the AP is collecting statistics, this value is the interval in seconds in which the AP sends statistics to the WMS process on a switch.
Poll Interval	Interval, in milliseconds, that the AP sends RSSI updates to the WMS process on a switch.
Num Switches	Number of switches to which this AP has access. If the value is 1, the AP has access to a master <i>or</i> a local switch. If the value is 2, the AP has access to a master <i>and</i> a local switch.
Collect Stats	If enabled, the AP will collect statistics to send the WMS process on its switch.
Bssid	BSSID of the radio.
Type	Indicates whether the switch type is <b>master</b> or <b>local</b> .
Status	If <b>up</b> , the AP can reach the switch. If <b>down</b> , the AP cannot reach the switch.
Last-reg	The time the AP last registered with the WMS process.
N-reg	Number of times the AP has registered with the WMS process.
Last-update	The last timer tick time the AP updated the WMS process.
Next-update	Interval between the last update and the next scheduled update.
N-updates	Number of updates sent to the WMS process.
Last-ack	Number of timer ticks since the AP received an acknowledgement from the WMS process.
Type	Type of RTLS server used by the AP, such as MMS or Aeroscout.
Server IP	IP address of the RTLS server.
Port	Port used by the RTLS server.
Frequency	Rate, in seconds, at which RTLS messages are sent to the server.
Active	Indicates if the server is active on the AP.

## Command History

Version	Modification
AOS-W 3.0.	Command introduced
AOS-W 3.4.	The <b>tagged-pkts</b> and <b>vlan</b> parameters were added to the Wired Interface table in the output of the <b>show ap monitor debug status</b> command.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap monitor stats

```
show ap monitor stats advanced {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}  
client-mac <client-mac>
```

```
show ap monitor stats {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>} mac <mac>
```

### Description

Show packet, signal and channel statistics for an AP or a client.

### Syntax

Parameter	Description
advanced	Show advanced statistics for an AP or client.
ap-name <ap-name>	Show statistics for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
mac <mac>	Show data for a specific MAC address by entering the MAC address of a client or AP.
client-mac <client-mac>	Show data for a specific client MAC address by entering the MAC address of a client.

## Example

The output of the following command shows monitoring statistics for the AP all2, and a client with the MAC address 00:03:2a:02:6a:d7.

```
(host) #show ap monitor stats ap-name all2 mac 00:03:2a:02:6a:d7

Aggregate Stats

-----  -----  -----  -----  -----
none     0                0            0            0
```

The output of this command includes the following information:

Column	Description
retry	Percent of 802.11 retry frames sent because a client failed to send an ACK.
Low-speed	Percent of frames sent at a data rate of 18 Mbps or slower.
non-unicast	Percent of non-unicast frames
recev-error	Percent of error frames of all frames seen in the last second.
frag	Rate of fragmented packets, in frames per second
bwth	Current bandwidth, in bps.
avg-signal	Average signal-to-noise ratio over the interval since the AP's last reset.
Low-signal	Lowest signal-to-noise ratio over the interval since the AP's last reset.
high-signal	Highest signal-to-noise ratio over the interval since the AP's last reset.

Column	Description
count	Number of packets seen on the AP over the interval since the AP's last reset.
Duration	Time over which the AP has measured RSSI values.
tx	The total number of deauthorization frames sent to this MAC address for containment in the interval from the AP's last reset until the current timer tick.
old-tx	The total number of deauthorization frames sent to this MAC address for containment until the previous timer tick.
rx	The total number of deauthorization frames spoofing the MAC address in the interval from the AP's last reset until the current timer tick.
old-rx	The total number of deauthorization frames sent to this MAC address for containment until the previous timer tick.
FRR	Frame retry rate, in frames per second.
FRER	Frame error retry rate, in frames per second.
rss-index	This value indicates the number of consecutive timer ticks over which the value of the Receive Signal Strength Indicator (RSSI) of the client has reduced by more than 3 units. <b>NOTE:</b> This value is updated only if 'handoff-assist' is enabled in the AP's RF Optimization profile.
cur-signal	The Receive Signal Strength Indicator (RSSI) of the most recent frame received from the specified MAC address.
old-cur-signal	The most recent Receive Signal Strength Indicator (RSSI) of the MAC which is 3 lower or 5 higher than the current RSSI. <b>NOTE:</b> This value is updated only if 'handoff-assist' is enabled in the AP's RF Optimization profile
ht-type	This parameter indicates support for the following HT types: <b>no:</b> No support for high-throughput. <b>HT-20:</b> Support for 20 Mhz high-throughput only. <b>HT-40:</b> Support for 40 Mhz high-throughput.
primary-channel	Primary radio channel.
sec-channel	Secondary radio channel
gf-supported	If <b>1</b> , this AP supports greenfield mode. If <b>0</b> , greenfield is not supported.
40mhz-intolerance	Indicates whether the specified MAC address is 40 Mhz intolerant.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap pcap status

```
show ap pcap status {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show the status of outstanding packet capture (pcap) sessions.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.

### Usage Guidelines

The Packet Capture (pcap) feature copies control path packets from the Alcatel-Lucent Control Processor, providing visibility for packets to or from the switch. This provides a useful troubleshooting tool for diagnosing communication problems with elements such as a Radius server. You can retrieve these packets by issuing the command **tar logs**, and then viewing the file filter.pcap on the switch's flash drive.

### Example

The example below shows the Packet Capture Sessions table for an AP named AP16.

```
(host) #show ap pcap status ap-name AP16
Packet Capture Sessions
-----
pcap-id  filter  type  intf                channel max-pkt-size  num-pkts  status      url  target
-----  -
1        raw     00:1a:1a:82:ab:b0  161                in-progress
```

The output of this command includes the following information:

Column	Description
pcap-id	ID number of the packet capture session.
filter	Packet Capture filter specification.
type	A <b>raw</b> packet capture type indicates that the switch is streaming raw packets to an external viewer.
intf	BSSID of the interface for the PCAP session.
channel	Channel used by AP to capture packets.
max-pkt-size	Maximum size of all captured packets.
num-pkts	Number of packets captured during the session.
status	Shows the current status of the packet-capture session.
url	Packet capture data can be downloaded to this URL
target	IP address of the client station running Wildpacket's AiroPeek monitoring application

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap profile-usage

```
show ap profile-usage {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

### Description

Show a complete list of all profiles referenced by an individual AP or an AP BSSID.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.

### Usage Guidelines

Use this command to monitor the configuration profiles in use by an AP or a specific BSSID. The output of this command shows the name of each profile type that is associated with the AP or BSSID, as well as the source that associates the profile with the AP.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap provisioning

```
show ap provisioning {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show provisioning parameters currently used by an AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address.

## Example

The output of this command shows that the AP named **AP8** has mostly default parameters. These appear with the value N/A.

```
(host) #show ap provisioning ap-name AP8
AP "mp2" Provisioning Parameters
-----
Item                               Value
----                               -
AP Name                             mp2
AP Group                            mpp1
Location name                       N/A
SNMP sysLocation                   N/A
Master                             N/A
Gateway                             N/A
Netmask                             N/A
IP Addr                             N/A

USB User Name                       N/A
USB Password                        N/A
USB Device Type                     any
USB Device Identifier                N/A
USB Dial String                     N/A
USB Initialization String            N/A
USB TTY device path                 N/A
Mesh Role                           mesh-point
Installation                         default
```

The output of this command includes the following information:

Column	Description
AP Name	Name of the AP.
AP Group	AP group to which the AP belongs.
Location name	Fully-qualified location name (FQLN) for the AP.
SNMP sysLocation	User-defined description of the location of the AP, as defined with the command <b>provision-ap syslocation</b> .
Master	Name or IP address for the master switch.
Gateway	IP address of the default gateway for the AP.
Netmask	Netmask for the AP's IP address.
IP Addr	IP address for the AP.

Column	Description
Dns IP	IP address of the DNS server.
Domain Name	Domain name used by the AP.
Server Name	DNS name of the switch from which the AP boots.
Server IP	IP address of the switch from which the AP boots
Antenna gain for 802.11a	Antenna gain for 802.11a (5GHz) antenna.
Antenna gain for 802.11g	Antenna gain for 802.11g (2.4GHz) antenna.
Antenna for 802.11a	Antenna use for 5 GHz (802.11a) frequency band. <ul style="list-style-type: none"> <li>● <b>1</b>: AP uses antenna 1</li> <li>● <b>2</b>: AP uses antenna 2</li> <li>● <b>both</b>: AP uses both antennas</li> </ul>
Antenna for 802.11g	Antenna use for 2.4 GHz (802.11g) frequency band. <ul style="list-style-type: none"> <li>● <b>1</b>: AP uses antenna 1</li> <li>● <b>2</b>: AP uses antenna 2</li> <li>● <b>both</b>: AP uses both antennas</li> </ul>
IKE PSK	IKE PSK The IKE pre-shared key.
PPPOE User Name	Point-to-Point Protocol over Ethernet (PPPoE) user name for the AP.
PPPOE Password	PPPoE password for the AP.
PPPOE Service Name	PPPoE service name for the AP.
Mesh Role	If the mesh role is “none,” the AP is operating as a thin AP. An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
Latitude	Latitude coordinates of the AP, in the format <i>Degrees Minutes Seconds</i> (DMS).
Longitude	Longitude coordinates of the AP, in the format <i>Degrees Minutes Seconds</i> (DMS).
Altitude	Altitude, in meters, of the AP. This parameter is supported on outdoor APs only.
Antenna bearing for 802.11a	Horizontal coverage distance of the 802.11a (5GHz) antenna from true north, from 0-360 degrees. <b>NOTE:</b> This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
Antenna bearing for 802.11g	Horizontal coverage distance of the 802.11g (2.4GHz) antenna from true north, from 0-360 degrees. <b>NOTE:</b> This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
Antenna tilt angle for 802.11a	The angle of the 802.11a (5GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.
Antenna tilt angle for 802.11g	The angle of the 802.11g (2.4GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.
Mesh SAE	Shows if the AP has enabled or disabled Secure Attribute Exchange (SAE) on a mesh network. The default setting ( <b>sae-default</b> ) also disables SAE.

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	Introduced support for mesh parameters, additional antenna parameters, and AP location parameters.
AOS-W 3.4	Introduced support for the following parameters: <ul style="list-style-type: none"><li>• Installation</li><li>• Mesh SAE</li><li>• USB User Name</li><li>• USB Password</li><li>• USB Device Type</li><li>• USB Device Identifier</li><li>• USB Dial String</li><li>• USB Initialization String</li><li>• USB TTY device path</li></ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap radio-database

```
show ap radio-database [band a|g] [group <group>] [mode access-point|air-monitor|disabled|ht|ht-40mhz|legacy|sap-monitor] [sort-by ap-group|ap-ip|ap-name|ap-type|switch-ip] [sort-direction ascending|descending] [start <start>] [switch <switch-ip-addr>]
```

### Description

Show radio information for Access Points visible to this switch.

### Syntax

Parameter	Description
band	Show only APs with a radio operating in the specified band.
a	Show only APs with a radio operating in the 802.11a band (5 GHz).
g	Show only APs with a radio operating in the 802.11g band (2.4 GHz).
group <group>	Show only APs associated with the specified AP group
mode	Show only APs with a radio operating in the specified mode.
access-point	Show only APs operating as access points
air-monitor	Show only APs operating as air monitors.
disabled	Show only disabled APs.
ht	Show only high-throughput APs.
ht-40mhz	Show only 40 Mhz high-throughput APs
legacy	Show only legacy (not high-throughput) APs.
sap-monitor	Show only APs operating as SAP monitors
sort-by	Sort the output of this command by a specific data column
ap-group	Sort the output of this command by AP group name
ap-ip	Sort the output of this command by AP IP address
ap-name	Sort the output of this command by AP name
ap-type	Sort the output of this command by AP model type.
switch-ip	Sort the output of this command by switch ip address
sort-direction	Select a sort direction for the output of this command
ascending	Sort the output in ascending order.
descending	Sort the output in descending order.
start	Start displaying the output of this command at a chosen index number by entering the index number of the AP at which command output should start.
switch <switch-ip-addr>	Display information for APs associated with a specific switch by entering the IP address of that switch.

## Example

The output of the command shows that the AP is aware of five other access points, three of which are active.

```
(host) #show ap radio-database
```

```
AP Radio Database
```

```
-----  
Name           Group   AP Type  IP Address  Status           Flags  Switch IP      11g Mode/Chan/  
EIRP/Cli  11a Mode/Chan/EIRP/Cli  
-----  
-----  
mp3           default 125     10.3.129.96 Up 14h:45m:0s   M     10.3.129.232  AP(HT)/10/0/0  
AP(HT)/100/4/0  
sw-ad-ap124-11 default 124     10.3.129.99 Up 14h:43m:18s M     10.3.129.232  AP(HT)/10/0/0
```

The output of this command includes the following information:

Column	Description
Name	Name of the AP.
Group	AP group to which the AP is associated.
AP Type	AP model type.
IP address	IP address of the AP.
Status	Current AP status. If the AP is currently up, this data column also shows the amount of time for which the AP has been active.
Flags	This column displays a letter that corresponds to some type of additional information for the AP. The key to the list of possible flags appears at the bottom of the output of this command.
Switch IP	IP address of the AP's switch.
11g Mode/Chan/EIRP/Cli	802.11g radio type and mode/802.11g radio channel used by the AP/current Effective Isotropic Radiated Power (EIRP)/Number of Clients associated with the radio
11a Mode/Chan/EIRP/Cli	802.11a radio type and mode/802.11a radio channel used by the AP/current Effective Isotropic Radiated Power (EIRP)/Number of Clients associated with the radio.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap remote counters

```
show ap remote counters {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Show the numbers of message counters for Remote APs

### Syntax

Parameter	Description
ap-name <ap-name>	Show data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. You must specify an AP's BSSID, which is usually the AP's MAC address
ip-addr <ip-addr>	Show data for an AP with a specific IP address.

### Examples

Use this command to determine the number of message counters recorded for each counter type seen by the remote AP. The output of the command in the example below shows counters for Remote AP State and VoIP CAC State Announcements.

```
(host) #show ap remote counters ap-name a122
```

```
Counters
-----
Name                Value
----                -
Remote AP State     62851
VoIP CAC State Announcement 13605
```

The output of this command includes the following information:

Column	Description
Name	Name of the counter type.
Value	Number of counters recorded since the AP was last reset.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap remote debug flash-config

```
show ap remote debug flash-config {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}  
acls|{vap <vap>|vaps}
```

### Description

Show the remote AP configuration stored in flash memory.

### Syntax

Parameter	Description
ap-name <ap-name>	Show debugging data for an AP with a specific name.
bssid <bssid>	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ip-addr <ip-addr>	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
acls	Display ACLs of offline Virtual APs (VAPs).
vap <vap>	Display the configuration of a specific offline VAP by entering the name of an VAP.
vaps	Display the current number of offline VAPs.

### Example

The output of this command can be used to debug problems with a remote AP. The command below shows statistics for an AP with the IP address 192.0.2.64.

```
(host) #show ap remote debug flash-config ip-addr 192.0.2.64 acls  
Offline ACLs  
-----  
Item                Value  
----                -  
Native VLAN        1  
DHCP VLAN          N/A  
DHCP ADDR           192.168.11.1  
DHCP POOL NETMASK  255.255.255.0  
DHCP POOL START    192.168.11.2  
DHCP POOL END      192.168.11.254  
DHCP DNS SERVER    0.0.0.0  
DHCP ROUTER        192.168.11.1  
DHCP DNS DOMAIN    mycompany  
DHCP LEASE         0  
Session ACL        N/A  
Session ACL Name   N/A  
Session ACL Count  N/A  
Session Aces       N/A  
ACL 1              1  
ACL 1 Name         logon  
ACL 1 Count        21  
Aces 1            16 1 4294  
...
```

The output of this command includes the following information:

Column	Description
Native VLAN	VLAN ID of the native VLAN.
DHCP VLAN	VLAN ID of Remote AP DHCP server used when the switch is unreachable.
DHCP ADDR	IP Address used as DHCP Server Identifier.
DHCP POOL NETMASK	Netmask of the DHCP server pool.
DHCP POOL START	IP Address used as the start of a range of addresses for a DHCP pool.
DHCP POOL END	IP Address used as the end of a range of addresses for a DHCP pool.
DHCP DNS SERVER	IP Address for the DHCP DNS server.
DHCP ROUTER	IP Address for the DHCP default router.
DHCP DNS DOMAIN	Domain name for the DHCP DNS server.
DHCP LEASE	Length of DHCP DNS leases in days. If this parameter displays a zero (0) the DHCP lease is has no defined end.
Session ACL	Name of the ACL applied to the user session.
Session ACL name	Name of the ACL applied to the user session.
Session ACL count	Number of rules in the applied to the user session.
Session Aces	A list of the individual rules in the session ACL.
ACL 1	This parameter shows the position of an individual ACL.
ACL1 Name	Name of the ACL in the first position.
ACL1 Count	Number of rules in the specified ACL.
ACL1 Aces	A list of the individual rules in the specified ACL.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap remote debug mgmt-frames

```
show ap remote debug mgmt-frames {ap-name <ap-name>}|{bssid <bssid>|{ip-addr <ip-addr>}
[client-mac <client-mac>] [count <count>]
```

### Description

Show traced 802.11 management frames for a remote AP.

### Syntax

Parameter	Description
ap-name <ap-name>	Show debugging information for a specific AP.
bssid <bssid>	Show debugging information for a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address
ip-addr	Show debugging information for an AP with a specific IP address by entering its IP address in dotted-decimal format.
client-mac	Show the AP associations for a specific MAC address by entering the MAC address of the client.
count <count>	Limit the amount of information displayed by specifying number of frames to appear in the output of this command.

### Examples

Use this command to debug 802.1 authentication on a remote AP. The example below shows that a client successfully associated with the remote AP, then was later deauthenticated.

```
(host) #show ap remote debug mgmt-frames ap-name AP32
```

```
Traced 802.11 Management Frames
```

```
-----
Timestamp      stype      SA          DA          BSS          signal  Misc
-----
Oct 30 11:20:19  deauth    00:23:6c:2f:9a:85  00:1a:1e:11:56:40  00:1a:1e:11:56:40  0      STA has
left and is deauthenticated
```

The output of this command includes the following information:

Column	Description
Timestamp	The time the management frame was sent
stype	One of the following 802.11 frame types: auth: Authorization frame deauth: Deauthorization frame assoc-req: Association request assoc-resp: Association response
SA	Source MAC address.
DA	Destination MAC address.
BSS	Basic Service Set Identifier (BSSID) of the AP
signal	Signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
Misc	Additional information describing the client's action.

## Command History

Introduced in AOS-W 3.0.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap spectrum-load-balancing

```
show ap spectrum-load-balancing [group <group>]
```

### Description

Show spectrum load balancing information for an AP with this feature enabled.

### Syntax

Parameter	Description
group <group>	Filter this information to show only data for the specified spectrum load balancing domain.

### Examples

The output of the command below shows the APs currently using the spectrum load-balancing domain **default-1**.

```
(host) #show ap spectrum-load-balancing group default-1
```

```
Spectrum Load Balancing Group
-----
Name      IP Address      Domain      Assignment    Clients
-----
ap121-1   192.168.151.253 default-1   149/21        3
ap124-1   192.168.151.254 default-1   48/15         3
ap125-1   192.168.151.251 default-1   44/15         2
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP
IP address	AP IP address
Domain	Name of the spectrum load balancing domain assigned to the AP
Assignment	Current channel and power assignment for the AP.
Clients	Number of clients currently using the AP.

### Command History

Introduced in AOS-W 3.3.2.14.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap system-profile

```
show ap system-profile <profile>
```

### Description

Show an AP's system profile settings.

### Syntax

Parameter	Description
<profile>	Name of a system profile.

### Examples

The output of the command below shows the current configuration settings for the default system profile.

```
(host) #show ap system profile default

AP system profile "default"
-----
Parameter                               Value
-----
LMS IP                                   192.0.2.90
Backup LMS IP                            N/A
LMS Preemption                           Disabled
LMS Hold-down Period                     600 sec
Master controller IP address             N/A
LED operating mode (AP-12x only)         normal
RF Band                                   a
Double Encrypt                           Disabled
Native VLAN ID                           1
SAP MTU                                   N/A
Bootstrap threshold                      7
Request Retry Interval                   10 sec
Maximum Request Retries                  10
Keepalive Interval                       60 sec
Dump Server                              192.0.2.41
Telnet                                    Enabled
SNMP sysContact                          N/A
RFprotect Server IP                      N/A
RFprotect Backup Server IP               N/A
AeroScout RTLS Server                    192.0.2.32.104:1411
RTLS Server configuration                 N/A
Heartbeat DSCP                           0
Session ACL                              N/A
Corporate DNS Domain                     N/A
```

The output of this command includes the following information:

Column	Description
LMS IP	The IP address of the local management switch (LMS)—the Alcatel-Lucent switch which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network.
Backup LMS IP	For multi-switch networks, this parameter displays the IP address of a backup to the IP address specified with the lms-ip parameter.
LMS Preemption	When this parameter is enabled, the local management switch automatically reverts to the primary LMS IP address when it becomes available.
LMS Hold-down Period	Time, in seconds, that the primary LMS must be available before an AP returns to that LMS after failover.

Column	Description
Master switch IP address	For multi-switch networks, this parameter displays the IP address of the master switch.
LED operating mode (AP-12x only)	Displays the LED operating mode for OAW-AP-120 series APs. LEDs display as usual in the default <b>normal</b> operating mode, but are all turned off in <b>off</b> mode.
RF Band	For dual-band radios, this parameter displays the RF band in which the AP should operate: <ul style="list-style-type: none"> <li>• <b>g</b> = 2.4 GHz</li> <li>• <b>a</b> = 5 GHz</li> </ul>
Double Encrypt	This parameter applies only to remote APs. Double encryption is used for traffic to and from a wireless client that is connected to a tunneled SSID. When enabled, all traffic is re-encrypted in the IPsec tunnel. When disabled, the wireless frame is only encapsulated inside the IPsec tunnel.
Native VLAN ID	Native VLAN for bridge mode virtual APs (frames on the native VLAN are not tagged with 802.1q tags).
SAP MTU	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
Bootstrap threshold	Number of consecutive missed heartbeats on a GRE tunnel (heartbeats are sent once per second on each tunnel) before an AP reboots. On the switch, the GRE tunnel timeout is 1.5 x bootstrap-threshold; the tunnel is torn down after this number of seconds of inactivity on the tunnel.
Dump Server	(For debugging purposes.) Displays the server to receive the core dump generated if an AP process crashes.
Telnet	Reports whether telnet access the AP is enabled or disabled.
SNMP sysContact	SNMP system contact information.
RFprotect Server IP	The IP address of the RFprotect server for this AP or group
RFprotect Backup Server IP	The IP address of the RFprotect backup server for this AP or group
AeroScout RTLS Server	IP address of an AeroScout real-time asset location (RTLS) server.
Heartbeat DSCP	DSCP value of AP heartbeats (0-63).
Session ACL	Shows the access control list (ACL) applied on the uplink of a remote AP.
Corporate DNS Domain	DNS name used by the corporate network.
Maintenance Mode	Shows if Maintenance mode is enabled or disabled. If enabled, APs stop flooding unnecessary traps and syslog messages to network management systems or network operations centers when deploying, maintaining, or upgrading the network. The switch still generates debug syslog messages if debug logging is enabled.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap tech-support

```
show ap tech-support ap-name <name> [<filename>]
```

### Description

Display all information for an AP, or save that information to a file on the switch. This information can be used by Alcatel-Lucent technical support to diagnose a problem with an AP.

### Syntax

Parameter	Description
<name>	Name of the AP for which you want to view tech support data.
<filename>	Save the output of this command into a file on the switch with the specified filename.

### Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with an AP or your wireless network.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap vlan-usage

```
show ap vlan-usage [{ap-name <ap-name>}|{bssid <bssid>}|{ssid <ssid>}|{ip-addr <ip-addr>}]
```

### Description

Show the numbers of clients on each vlan.

### Syntax

Parameter	Description
ap-name <ap-name>	Show VLAN data for an AP with a specific name.
bssid <bssid>	Show VLAN data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
ssid <ssid>	Show VLAN data for a specific Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	Show VLAN data for an AP with a specific IP address by entering an IP address in dotted-decimal format.

### Examples

The output of this command displays the VLAN Usage table. Include the optional

```
(host) #show ap vlan
VLAN Usage Table
-----
VLAN ID  Clients
-----  -
64       1
65       32
66       44
```

The output of this command includes the following information:

Column	Description
VLAN ID	ID number of the wireless VLAN
Clients	Number of clients currently using the specified VLAN.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap wired-ap-profile

```
show ap wired-ap-profile [<profile>]
```

### Description

Show a list of all wired AP profiles, or display the configuration parameters in a specific wired AP profile.

### Syntax

Parameter	Description
<profile>	Name of a wired AP profile.

### Usage Guidelines

The command `show ap wired-ap-profile` displays a list of all wired AP profiles, including the number of references to each profile and the profile status. If you include the optional `<profile>` parameter, the command will display detailed information for that one profile.

### Example

The output of this command shows the configuration parameters for the wired AP profile “default”.

```
(host) #show ap wired-ap-profile default
```

```
Wired AP profile "default"
-----
Parameter          Value
-----
Wired AP enable     Disabled
Forward mode        tunnel
Switchport mode     access
Access mode VLAN    1
Trunk mode native VLAN 1
Trunk mode allowed VLANs 1-4094
Trusted             Not Trusted
Broadcast           Broadcast
```

The output of this command includes the following information:

Column	Description
Wired AP enable	Indicates whether the wired AP profile is <b>enabled</b> or <b>disabled</b> .
Forward mode	The configured forward mode for the profile. <ul style="list-style-type: none"><li>● <b>bridge</b>: Bridge locally</li><li>● <b>split-tunnel</b>: Tunnel to switch or NAT locally</li><li>● <b>tunnel</b>: Tunnel to switch</li></ul>
Switchport mode	The profile's switching mode. <ul style="list-style-type: none"><li>● <b>access</b>: Set access mode characteristics of the interface.</li><li>● <b>mode</b>: Set trunking mode of the interface.</li><li>● <b>trunk</b>: Set trunk mode characteristics of the interface.</li></ul>
Access mode VLAN	VLAN ID of the access mode VLAN.
Trunk mode native VLAN	VLAN ID of the native VLAN.
Trunk mode allowed VLANs	Range of allowed VLAN IDs for the native VLAN.

Column	Description
Trusted	Shows if the wired port on an AP using this profile is a trusted port. Possible values are <b>Trusted</b> or <b>Not Trusted</b> .
Broadcast	If set to <b>broadcast</b> , the wired AP port will forward broadcast traffic. If the parameter displays <b>Do Not Broadcast</b> , broadcast traffic will not be forwarded.

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap wmm-flow

```
show ap wmm-flow [{ap-name <ap-name>}|{bssid <bssid>}|{essid <essid>}|{ip-addr <ip-addr>}] dot11a|dot11g
```

### Description

Show the Wireless Multimedia (WMM) flow table.

### Syntax

Parameter	Description
ap-name <ap-name>	View an AP with a specified name.
bssid <bssid>	View data for an AP with a specific BSSID (Basic Service Set Identifier). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
essid <essid>	View data for a specific ESSID (Extended Service Set Identifier). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies the Service Set Identifier (SSID).
ip-addr <ip-addr>	View an AP with a specified IP address by entering an IP address in dotted-decimal format.
dot11a	Show the WMM flow table for a 802.11a radio.
dot11g	Show the WMM flow table for a 802.11g radio.

### Usage Guidelines

WMM, or Wireless Multimedia Extensions, are a subset of the 802.11e standard. WMM provides for four different types of traffic classification: voice, video, best effort, and background, with voice having the highest priority and background the lowest. Issue the **show ap wmm-flow** command to view WMM flow data for all APs. Include any of the optional parameters described in the table above to filter the table by a specific AP, radio channel (a or g), or both an ap and radio type.

### Example

The example below shows WMM flow data for all APs.

```
(host) #show ap wmm-flow

WMM Flow Table
-----
AP Name      ESSID      Client          Description
-----
AP125-srk    NOE        00:90:7a:06:1f:5b  tsid 6:prio 6:inactivity 2157352960 us:bidir:apspd:normalack:tclas prio 6 ip DIP-192.168.101.194 DP-32514 DSCP-48:one-match
AP125-srk    NOE        00:90:7a:06:1f:5b  tsid 0:prio 0:inactivity 100000000 us:bidir:apspd:normalack:no-match

Num Flows:0
```

The output of this command includes the following parameters:

Column	Description
AP name	Name of an AP with recorded WMM flows
ESSID	Extended Service Set Identifier (ESSID) of a wireless network.
Client	MAC address of the client.

Column	Description
Description	<p>The description is a long string that includes the following information.</p> <ul style="list-style-type: none"> <li>● <b>TSID:</b> The transmitting subscriber identification number. The TSID should match the priority level for each flow.</li> <li>● <b>Priority:</b> One of the following IEEE 802.1p priority values: <ul style="list-style-type: none"> <li>■ 0-1 = Best Effort</li> <li>■ 2-3 = Background</li> <li>■ 4-5 = Video</li> <li>■ 6-7 = Voice</li> </ul> </li> <li>● <b>Inactivity:</b> Tspec inactivity threshold, in microseconds.</li> <li>● <b>&lt;country code&gt;:</b> AP country code, e.g. US.</li> <li>● <b>bdir:</b> flow is bidirectional.</li> <li>● <b>apsd:</b> flow has enabled auto power save delivery.</li> <li>● <b>&lt;ack&gt;:</b> Displays the ack policy negotiated for the flow. Possible values are: <ul style="list-style-type: none"> <li>■ normalack</li> <li>■ noack</li> <li>■ blockack</li> <li>■ resack (reserved ack)</li> </ul> </li> <li>● <b>DIP:</b> Destination IP address for the flow.</li> <li>● <b>DP:</b> Destination IP Port specified in the TCLAS for flow negotiation.</li> <li>● <b>DCSP:</b> The Differentiated Services Code Point (DSCP) priority value that matches the flows 802.1p priority.</li> </ul>

## Command History

Introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show aaa authentication all

```
show
show aaa authentication all
```

### Description

Show authentication statistics for your switch, including authentication methods, successes and failures.

### Usage Guidelines

This command displays a general overview of authentication statistics. To view authentication information for specific profiles such as a captive-portal, MAC or 801.x authentication profile, issue the commands specific to those features.

### Example

The output of this command displays an authentication overview for your switch, including the authentication methods used, and the numbers of successes or failures for each method. This example shows the numbers of authentication successes and failures for a switch using TACACS+ and RADIUS authentication methods.

```
(host) #show aaa authentication all
```

```
Auth Method Statistics
-----
Method  Success  Failures
-----  -
tacacs   12       2
Radius   9        1
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show aaa authentication captive-portal

```
show aaa authentication captive-portal [<profile-name>]
```

### Description

This command shows configuration information for captive portal authentication profiles.

### Syntax

Parameter	Description
<profile-name>	The name of an existing captive portal authentication profile.

### Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire Captive Portal Authentication profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

If you do not yet have any captive portal authentication profiles defined, use the command **aaa authentication captive-portal** to configure your captive portal profiles.

### Examples

This first example shows that there are three configured captive portal profiles in the Captive Profile Authentication Profile List. The **References** column lists the number of other profiles with references to a captive portal authentication profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) #show aaa authentication captive-portal

Captive Portal Authentication Profile List
-----
Name           References  Profile Status
----           -
c-portal       2
remoteuser    1
portall       1

Total: 4
```

Include a captive portal profile name to display a complete list of configuration settings for that profile. The example below shows settings for the captive portal profile *portall*.

```
(host) #show aaa authentication captive-portal portall

Captive Portal Authentication Profile "portall"
-----
Parameter                               Value
-----
Default Role                             guest
Server Group                             default
Redirect Pause                            10 sec
User Login                                Enabled
Guest Login                               Disabled
Logout popup window                       Enabled
Use HTTP for authentication               Disabled
Logon wait minimum wait                   5 sec
Logon wait maximum wait                   10 sec
logon wait CPU utilization threshold      60%
Max Authentication failures                0
Show FQDN                                 Disabled
Use CHAP (non-standard)                   Disabled
Sygate-on-demand-agent                    Disabled
Login page                                /auth/index.html
Welcome page                               /auth/welcome.html
Show Welcome Page                          Yes
Adding switch ip address in redirection URL Disabled
Allow only one active user session         Disabled
```

The output of this command includes the following parameters:

Parameter	Description
Default Role	Role assigned to the captive portal user upon login.
Server Group	Name of the group of servers used to authenticate captive portal users.
Redirect Pause	Time, in seconds, that the system remains in the initial welcome page before redirecting the user to the final web URL. If set to 0, the welcome page displays until the user clicks on the indicated link.
User Login	Shows whether the profile has enabled or disabled captive portal with authentication of user credentials.
Guest Login	Shows whether the profile has enabled or disabled captive portal guest login without authentication.
Logout popup window	Shows whether the profile has enabled or disabled a pop-up window that allows a user to log out. If this is disabled, the user remains logged in until the user timeout period has elapsed or the station resets.
Use HTTP for authentication	Shows whether the profile has enabled or disabled the ability to use the HTTP protocol to redirect users to the captive portal page.
Login wait minimum time	Minimum time, in seconds, the user will have to wait for the logon page to pop up if the CPU load is high.
logon wait CPU utilization threshold	CPU utilization percentage above which the logon wait interval is applied when directing a captive portal user with the logon page.
Max Authentication failures	Maximum number of authentication failures before the user is blacklisted.
Show FQDN	If enabled, the user can see and select the fully-qualified domain name (FQDN) on the captive portal login page.

Parameter	Description
Use CHAP (non-standard)	If enabled, the captive portal profile can use the CHAP protocol.
Sygate-on-demand-agent	Shows whether the switch has enabled or disabled client remediation with Sygate-on-demand-agent.
Login page	URL of the page that appears for the user logon.
Welcome page	URL of the page that appears after logon and before the user is redirected to the web URL.

## Related Commands

Command	Description	Mode
<code>aaa authentication captive-portal</code>	Use <code>aaa authentication captive-portal</code> to configure the parameters displayed in the output of this show command.	Config mode

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa authentication captive-portal customization

```
show aaa authentication captive-portal customization <profile-name>
```

### Description

Display customization settings for a captive portal profile

### Syntax

Parameter	Description
<profile-name>	The name of an existing captive portal authentication profile.

### Usage Guidelines

The this command shows how a captive portal profile has been customized with non-default configuration settings. If you do not yet have any captive portal authentication profiles defined, use the command [aaa authentication captive-portal](#) to configure your captive portal profiles

### Example

The output of the following command shows how the captive portal profile *c-portal* has been customized. If an individual parameter has not been changed from its default settings, its value entry will be blank.

```
(host) #show aaa authentication captive-portal customization c-portal

Captive-Portal Customization
-----
Parameter Value
-----
Login page design theme 3
Login page logo image
Login page text URL/flash/upload/custom/ssu-guest-cp/logintext.html
Login policy text URL/upload/custom/ssu-guest-cp/acceptableusepolicy.html
Custom page background color
Custom page background image /upload/custom/default/auth-slider-1.gif
```

The output of this command includes the following parameters:

Parameters	Description
Login page design theme	Indicates whether the switch is using one of the two predefined login page designs (1 or 2) or has a custom background (3).
Login page logo image	Path and filename for a custom captive portal logo. This option is only available if the switch has a predefined login design.
Login page text	Path and filename of the page that appears for the user login.
Login policy text	Path and filename of the page that displays user policy text.
Custom page background color	Hexadecimal value for a custom background color. This option is only available if the switch has a custom login page design theme.
Custom page background image	Path and filename for a custom JPEG captive portal background image. This option is only available if the switch has a custom login page design theme.

## show aaa authentication dot1x

```
show aaa authentication dot1x [<profile-name>|countermeasures]
```

### Description

This command shows information for 802.1x authentication profiles.

### Syntax

Parameter	Description
<profile-name>	The name of an existing Captive Portal authentication profile.
countermeasures	Reports if WPA/WPA2 Countermeasures have been enabled for 802.1x profiles. If enabled, the AP scans for message integrity code (MIC) failures in traffic received from clients.

### Usage Guidelines

Issue this command without the **<profile-name>** or **countermeasures** options to display the entire 802.1x Authentication profile list, including profile status and the number of references to each profile. Include a profile name to display detailed dot1x authentication configuration information for that profile. The **countermeasures** option indicates whether the 802.1x profiles have been configured for WPA/WPS2 countermeasures. If countermeasures have not been configured, the output for this command will be blank.

### Examples

The following example lists all dot1x authentication profiles. The **References** column lists the number of other profiles with references to a 802.1x authentication profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined 802.1x profiles will not have an entry in the **Profile Status** column.

```
(host) #show aaa authentication dot1x

802.1X Authentication Profile List
-----
Name           References  Profile Status
----           -
default        2
default-psk    1           Predefined (editable)
dot1x          5
dot1xtest     0

Total:4
```

To display a complete list of parameters for an individual profile, include the <profile> parameter. The example below displays some of the profile details for the authentication profile **pDot1x**.

```
(host) #show aaa authentication dot1x pDot1x

802.1X Authentication Profile "pDot1x"
-----
Parameter                               Value
-----
Max authentication failures              0
Enforce Machine Authentication           Disabled
Machine Authentication: Default Machine Role  guest
Machine Authentication Cache Timeout      24 hrs
Blacklist on Machine Authentication Failure Disabled
Machine Authentication: Default User Role  guest
Interval between Identity Requests       30 sec
Quiet Period after Failed Authentication   30 sec
Reauthentication Interval                86400 sec
Use Server provided Reauthentication Interval Disabled
Multicast Key Rotation Time Interval      1800 sec
Unicast Key Rotation Time Interval        900 sec
...

```

The output of the **show aaa authentication dot1x** command includes the following parameters:

Parameter	Value
Max authentication failures	Number of times a user can try to login with wrong credentials after which the user is blacklisted as a security threat. Blacklisting is disabled if this parameter is set to 0.
Enforce Machine Authentication	Shows if machine authentication is enabled or disabled for Windows environments. If enabled, either the machine-default-role or the user-default-role is assigned to the user, depending on which authentication is successful.
Machine Authentication: Default Machine Role	Default role assigned to the user after completing only machine authentication.
Machine Authentication Cache Timeout	The timeout period, in hours, for machine authentication. After this period passes, the use will have to re-authenticate.
Blacklist on Machine Authentication Failure	If enabled, the client is blacklisted if machine authentication fails.
Machine Authentication: Default User Role	Default role assigned to the user after 802.1x authentication.
Interval between Identity Requests	Interval, in seconds, between identity request retries
Quiet Period after Failed Authentication	Interval, in seconds, following failed authentication.
Reauthentication Interval	Interval, in seconds, between reauthentication attempts.
Use Server provided Reauthentication Interval	If enabled, 802.1x authentication will use the server-provided reauthentication period.
Multicast Key Rotation Time Interval	Interval, in seconds, between multicast key rotations.
Unicast Key Rotation Time Interval	Interval, in seconds, between unicast key rotations.
Authentication Server Retry Interval	Server group retry interval, in seconds.
Authentication Server Retry Count	The number of server group retries.
Framed MTU	Shows the framed MTU attribute sent to the authentication server.

Parameter	Value
Number of times ID-Requests are retried	Maximum number of times ID requests are sent to the client.
Maximum Number of Reauthentication Attempts	Maximum number of reauthentication attempts.
Maximum number of times Held State can be bypassed	Number of consecutive authentication failures which, when reached, causes the switch to not respond to authentication requests from a client while the switch is in a held state after the authentication failure.
Dynamic WEP Key Message Retry Count	Number of times unicast/multicast EAPOL key messages are sent to the client.
Dynamic WEP Key Size	Dynamic WEP key size, either 40 or 128 bits.
Interval between WPA/WPA2 Key Messages	Interval, in milliseconds, between each WPA key exchange.
Delay between WPA/WPA2 Unicast Key and Group Key Exchange	Interval, in milliseconds, between unicast and multicast key exchanges.
WPA/WPA2 Key Message Retry Count	Number of times WPA/WPA2 key messages are retried.
Multicast Key Rotation	Shows if multicast key rotation is enabled or disabled.
Unicast Key Rotation	Shows if unicast key rotation is enabled or disabled.
Reauthentication	If enabled, this option forces the client to do a 802.1x reauthentication after the expiration of the default timer for reauthentication. (The default value of the timer is 24 hours.)
Opportunistic Key Caching	If enabled, a cached pairwise master key (PMK) is derived with a client and an associated AP and used when the client roams to a new AP.
Validate PMKID	Shows if the <b>Validate PMKID</b> feature is enabled or disabled. When this option is enabled, the client must send a PMKID in the associate or reassociate frame to indicate that it supports OKC; otherwise, full 802.1x authentication takes place. (This feature is optional, since most clients that support OKC do not send the PMKID in their association request.)
Use Session Key	If enabled, the switch will use a RADIUS session key as the unicast WEP key.
Use Static Key	If enabled, the switch will use a static key as the unicast/multicast WEP key.
xSec MTU	Shows the size of the MTU for xSec.
Termination	Shows if 802.1x termination is enabled or disabled on the switch.
Termination EAP-Type	Shows the current Extensible Authentication Protocol (EAP) method, either EAP-PEAP or EAP-TLS.
Termination Inner EAP-Type	When EAP-PEAP is the EAP method, this parameter displays the inner EAP type.
Token Caching	If this feature enabled (and EAP-GTC is configured as the inner EAP method), token caching allows the switch to cache the username and password of each authenticated user.
Token Caching Period	Timeout period, in hours, for the cached information.
CA-Certificate	Name of the CA certificate for client authentication loaded in the switch.

Parameter	Value
Server-Certificate	Name of the Server certificate used by the switch to authenticate itself to the client.
TLS Guest Access	Shows if guest access for valid EAP-TLS users is enabled or disabled.
TLS Guest Role	User role assigned to EAP-TLS guest.
Ignore EAPOL-START after authentication	If enabled, the switch ignores EAPOL-START messages after authentication.
Handle EAPOL-Logoff	Shows if handling of EAPOL-LOGOFF messages is enabled or disabled.
Ignore EAP ID during negotiation	If enabled, the switch will ignore EAP IDs during negotiation.
WPA-Fast-Handover	Shows if WPA-fast-handover is enabled or disabled. This feature is only applicable for phones that support WPA.
Disable rekey and reauthentication for clients on call	Shows if the rekey and reauthentication features for voice-over-WLAN clients has been enabled or disabled.

## Related Commands

## show aaa authentication mac

**show aaa authentication mac** [<profile-name>]

### Description

This command shows information for MAC authentication profiles. Issue this command without the **<profile-name>** option to display the entire MAC Authentication profile list, including profile status and the number of references to each profile. Include a profile name to display detailed MAC authentication configuration information for that profile.

Parameter	Description
<profile-name>	The name of an existing MAC authentication profile.

### Examples

The output of the example below shows two MAC authentication profiles, **default** and **macProfile1**, which are referenced three times by other profiles. the **Profile Status** columns are blank, indicating that these profiles are both user-defined. (If a profile is predefined, the value **Predefined** appears in the Profile Status column.)

```
(host) #show aaa authentication mac

MAC Authentication Profile List
-----
Name           References  Profile Status
----           -
default        3
MacProfile1    3

Total:2
```

The following example displays configuration details for the MAC authentication profile “MacProfile1,” including the delimiter and case used in the authentication request, and the maximum number of times a client can fail to authenticate before it is blacklisted.

```
(host) #show aaa authentication mac MacProfile1

MAC Authentication Profile "MacProfile1"
-----
Parameter           Value
-----
Delimiter            colon
Case                 upper
Max Authentication failures 3
```

### Related Commands

## show aaa authentication mgmt

```
show aaa authentication mgmt
```

### Description

This command displays administrative user authentication information, including management authentication roles and servers.

### Usage Guidelines

Issue this command to identify the default management role assigned to authenticated administrative users, and the name of the group of servers used to authenticate these users.

### Example

The output of the following example displays management authentication information for your switch.

```
(host) #show aaa authentication mgmt

Management Authentication Profile
-----
Parameter      Value
-----
Default Role   root
Server Group   ServerGroup1
Mode           Enabled
```

The output of the **show aaa authentication mgmt** command includes the following parameters:

Parameter	Description
Default Role	This parameter shows which of the following roles the switch uses for authentication management. <ul style="list-style-type: none"><li>● <b>root</b>, the super user role (default).</li><li>● <b>guest-provisioning</b>, guest provisioning role.</li><li>● <b>network-operations</b>, network operator role.</li><li>● <b>read-only</b>, read only role.</li><li>● <b>location-api-mgmt</b>, location API management role.</li><li>● <b>no-access</b>, no commands are accessible.</li></ul>
Server Group	The name of a server group.
Mode	The <b>Mode</b> parameter indicates whether or not this feature is enabled or disabled.

### Related Commands

## show aaa authentication stateful-dot1x

```
show aaa authentication stateful-dot1x [config-entries]
```

### Description

This command displays configuration settings for 802.1x authentication for clients on non-Alcatel-Lucent APs.

### Syntax

Parameter	Description
config-entries	Display details for the AP Server configuration list.

### Usage Guidelines

Issue this command to identify the default role assigned to the 802.1x user group, name of the group of RADIUS servers used to authenticate the 802.1x users, and the 802.1x authentication timeout period, in seconds.

### Example

The output of the following example displays 802.1x authentication information for your switch.

```
(host) #show aaa authentication stateful-dot1x

Stateful 802.1X Authentication Profile
-----
Parameter      Value
-----      -
Default Role   guest
Server Group   newgroup2
Timeout        10 sec
Mode           Enabled
```

The output of this command includes the following parameters:

Parameter	Description
Default Role	This parameter shows which role the switch uses for 802.1x authentication management.
Server Group	The name of a server group.
Timeout	Timeout period for an authentication request, in seconds.
Mode	The <b>Mode</b> parameter indicates whether or not this feature is enabled or disabled.

When you include the **config-entries** parameter, the output shows the AP - Server Configuration List.

```
(host) #show aaa authentication stateful-dot1x config-entries

AP-Server Configuration List
-----
Cfg-Name  AP-IP      Server  Shared-Secret
-----  -
cfg22    10.3.14.6  RADIUS1  secret-pwd
```

The output of this command includes the following parameters:

Parameter	Description
Cfg-Name	is a auto-generated name
AP-IP	IP address of the AP.
Server	Name of the authentication server.
Shared-Secret	Shared authentication secret.

## show aaa authentication vpn

```
show aaa authentication vpn
```

### Description

This command displays VPN authentication settings, including authentication roles and servers.

### Usage Guidelines

Issue this command to identify the default role assigned to VPN users, the name of the group of servers used to authenticate the VPN users, and the maximum number of authentication failures allowed before the user is blacklisted.

### Example

The following example displays configuration details for VPN authentication.

```
(host) #show aaa authentication vpn

VPN Authentication Profile
-----
Parameter                Value
-----
Default Role              VPN-Role-1
Server Group              default
Max Authentication failures 2
```

The output of this command includes the following parameters:

Parameter	Description
Default Role	The default role to be assigned to VPN users.
Server Group	The name of the server group that performs the authentication.
Max Authentication failures	Number of times a user attempted to authenticate, but failed.

### Related Commands

Command	Description	Mode

## show aaa authentication wired

```
show aaa authentication wired
```

### Description

View wired authentication settings for a client device that is directly connected to a port on the switch.

### Usage Guidelines

This command displays the name of the AAA profile currently used for wired authentication.

### Example

The following example shows the current wired profile for the switch is a profile named “secure\_profile\_3.”

```
(host) #show aaa authentication wired

Wired Authentication Profile
-----
Parameter      Value
-----      -
AAA Profile    Secure_profile_3
```

### Related Commands

## show aaa authentication-server all

```
show aaa authentication-server all
```

### Description

View authentication server settings for both external authentication servers and the internal switch database.

### Usage Guidelines

The output of this command displays statistics for the Authentication Server Table, including the name and address of each server, server type and configured authorization and accounting ports.

### Examples

The following command shows information for the internal Authentication server, and another RADIUS server named RADIUS-1.

```
(host) #show aaa authentication-server all

Auth Server Table
-----
Name      Type      IP addr      AuthPort  AcctPort  Status  Requests
-----
Internal  Local    10.168.254.221  n/a       n/a       Enabled  5
SMOKERAD  Radius   10.4.101.123   5555      5556      Enabled  1
```

The following data columns appear in the output of this command:

Parameter	Description
Name	Name of the authentication server.
Type	The type of authentication server. AOS-W supports LDAP, RADIUS and TACACS+ servers, in addition to its own local, internal authentication server.
IP addr	IP address of the server, in dotted-decimal format.
AuthPort	Port number used for authentication. An LDAP server uses port 636 for LDAP over SSL, and port 389 for SSL over LDAP, Start TLS operation and clear text. The default RADIUS authentication port is port 1812.
AcctPort	Accounting port on the server. The default RADIUS accounting port is port 1813.
AcctPort	Accounting port on the server.
Status	Shows whether the Authentication server is enable or disabled.
Requests	Number of authentication requests received by the server.

### Command History

This command was introduced in AOS-W 3.0.

# Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa authentication-server internal

```
show aaa authentication-server internal [statistics]
```

### Description

View authentication server settings for the internal switch database.

### Examples

The output of the command below shows that the internal authentication server has been disabled.

```
(host) #show aaa authentication-server internal

Internal Server
-----
Host      IP addr      Retries  Timeout  Status
-----  -
Internal  10.168.254.221  3        5        Disabled
```

The following data columns appear in the output of this command:

Parameter	Description
Host	Name of the internal authentication server.
IP addr	Address of the internal server, in dotted-decimal format.
Retries	Number of retries allowed before the server stops attempting to authenticate a request.
timeout	Timeout period, in seconds.

Include the **statistics** parameter to display additional details for the internal server.

```
(host) #show aaa authentication-server internal statistics

Internal Database Server Statistics
-----
PAP Requests          8
PAP Accepts          8
PAP Rejects          0
MSCHAPv2 Requests    0
MSCHAPv2 Accepts     0
MSCHAPv2 Rejects     0
Mismatch Response    0
Users Expired        1
Unknown Response     0
Timeouts             1
AvgRespTime (ms)     0
Uptime (d:h:m)       4:3:32
SEQ first/last/free  1,255,255
```

The following data columns appear in the output of this command:

Parameter	Description
PAP Requests	Number of PAP requests received by the internal server.
PAP Accepts	Number of PAP requests accepted by the internal server.
PAP Rejects	Number of PAP requests rejected by the internal server.
MSCHAPv2 Requests	Number of MSCHAPv2 requests received by the internal server.

Parameter	Description
MSCHAPv2 Accepts	Number of MSCHAPv2 requests accepted by the internal server.
MSCHAPv2 Rejects	Number of MSCHAPv2 requests rejected by the internal server.
Mismatch Response	Number of times the server received an authentication response to a request after another request had been sent.
Users Expired	Number of users that were deauthenticated because they stopped responding.
Unknown Response	Number of times the server did not recognize the response, possibly due to internal errors.
Timeouts	Number of times that the switch timed out an authentication request.
AvgRespTime (ms)	Time it takes the server to respond to an authentication request, in seconds.
Uptime (d:h:m)	Time elapsed since the last server reboot.
SEQ first/last/free	This internal buffer counter keeps track of the requests to the authentication server.

## Related Commands

## show aaa authentication-server ldap

```
show aaa authentication-server ldap [<ldap_server_name>]
```

### Description

Display configuration settings for your LDAP servers.

### Syntax

Parameter	Description
<ldap_server_name>	Name that identifies an LDAP server.

### Examples

The output of the example below displays the LDAP server list with the names of all the LDAP servers. The **References** column lists the number of other profiles that reference an LDAP server, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) #aaa authentication-server ldap

LDAP Server List
-----
Name    References  Profile Status
----    -
ldap1   5
ldap2   3
ldap3   1

Total:3
```

Include the **<ldap\_server\_name>** parameter to display additional details for an individual server.

```
(host) #show aaa authentication-server ldap ldap1

LDAP Server "ldap1"
-----
Parameter                Value
-----
Host                      10.1.1.234
Admin-DN                  cn=corp,cn=Users,dc=lm,dc=corp,dc=com
Admin-Password            *****
Allow Clear-Text          Disabled
Auth Port                 389
Base-DN                   cn=Users,dc=lm,dc=corp,dc=com
Filter                    (objectclass=*)
Key Attribute              sAMAccountName
Timeout                   20 sec
Mode                      Enabled
Preferred Connection Type ldap-s
```

The output of this command includes the following parameters:

Parameter	Description
host	IP address of the LDAP server
Admin-DN	Distinguished name for the admin user who has read/search privileges across all of the entries in the LDAP database.

Parameter	Description
Admin Passwd	Password for the admin user.
Allow Clear-Text	If enabled, this parameter allows clear-text (unencrypted) communication with the LDAP server.
Auth Port	Port number used for authentication. Port 636 will be attempted for LDAP over SSL, while port 389 will be attempted for SSL over LDAP, Start TLS operation and clear text.
Base-DN	Distinguished Name of the node which contains the required user database.
Filter	Filter that should be applied to search of the user in the LDAP database (default filter string is: <code>i(objectclass=*)i</code> ).
Key attribute	Attribute that should be used as a key in search for the LDAP server.
Timeout	Timeout period of a LDAP request, in seconds.
Mode	Shows whether this server is <b>Enabled</b> or <b>Disabled</b> .
Preferred Connection Type	Preferred type of connection to the server. Possible values are <ul style="list-style-type: none"> <li>• Clear text</li> <li>• LDAP-S</li> <li>• START-TLS</li> </ul>

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa authentication-server radius

```
show aaa authentication-server radius [<rad_server_name>|statistics]
```

### Description

Display configuration settings for your RADIUS servers.

### Syntax

Parameter	Description
<rad_server_name>	Name that identifies a RADIUS server.

### Examples

The output of the example below displays the RADIUS server list with the names of all the RADIUS servers. The **References** column lists the number of other profiles that reference a RADIUS server, and the **Profile Status** column indicates whether the profile is predefined. User-defined servers will not have an entry in the **Profile Status** column. To view additional statistics for all RADIUS servers, include the **statistics** parameter.

```
(host) #aaa authentication-server radius

RADIUS Server List
-----
Name           References  Profile Status
-----
IAS1           5
SMOKERAD      3

Total:2
```

Include the **<rad\_server\_name>** parameter to display additional details for an individual server.

```
(host) #show aaa authentication-server radius SMOKERAD

RADIUS Server "SMOKERAD"
-----
Parameter      Value
-----
Host            10.4.101.123
Key             *****
Auth Port      5555
Acct Port      5556
Retransmits    3
Timeout        5 sec
NAS ID         SMOKETEST
NAS IP         N/A
Use MD5        Disabled
Mode           Enabled
```

The output of this command includes the following parameters:

Parameter	Description
host	IP address of the RADIUS server
Key	Shared secret between the switch and the authentication server.

Parameter	Description
Acct Port	Accounting port on the server.
auth port	Authentication port on the server.
Retransmits	Maximum number of retries sent to the server by the switch before the server is marked as down.
Timeout	Maximum time, in seconds, that the switch waits before timing out the request and resending it.
NAS ID	Network Access Server (NAS) identifier to use in RADIUS packets.
NAS IP	NAS IP address to send in RADIUS packets. If you do not configure a server-specific NAS IP, the global NAS IP is used.
Use MD5	If enabled, the RADIUS server will use a MD5 hash of cleartext password.
Mode	Shows whether this server is <b>Enabled</b> or <b>Disabled</b> .

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa authentication-server tacacs

```
show aaa authentication-server tacacs [<tacacs_server_name>]
```

### Description

Display configuration settings for your TACACS+ servers.

### Syntax

Parameter	Description
<tacacs_server_name>	Name that identifies an TACACS+ server.

### Examples

The output of the example below displays the TACACS+ server list with the names of all the TACACS+ servers. The **References** column lists the number of other profiles that reference a TACACS+ server, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) #aaa authentication-server tacacs

TACACS Server List
-----
Name           References  Profile Status
-----
LabAuth        5
TACACS1        3

Total:2
```

Include the <tacacs\_server\_name> parameter to display additional details for an individual server.

```
(host) #show aaa authentication-server tacacs tacacs1

TACACS Server "tacacs1"
-----
Parameter      Value
-----
Host            10.1.1.16
Key             *****
TCP Port        49
Retransmits     3
Timeout         20 sec
Mode            Enabled
```

The output of this command includes the following parameters:

Parameter	Description
host	IP address of the TACACS+ server
Key	Shared secret between the switch and the authentication server.
TCP Port	TCP port used by the server.

Parameter	Description
Retransmits	Maximum number of retries sent to the server by the switch before the server is marked as down.
Timeout	Maximum time, in seconds, that the switch waits before timing out the request and resending it.
Mode	Shows whether this server is <b>Enabled</b> or <b>Disabled</b> .

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa tacacs-accounting

```
show aaa tacacs-accounting
```

### Description

Show configuration information for TACACS+ accounting servers.

### Usage Guidelines

This command displays TACACS+ data for your switch if you have previously configured a TACACS+ server and server group. The output includes the current TACACS+ accounting mode (enabled or disabled), and the name of the TACACS+ server group.

### Example

The output of the **show aaa accounting tacacs** command displays configuration information for a TACACS+ accounting server. The output of this command includes the following parameters:

```
(host) #show aaa accounting tacacs
TACACS Accounting Configuration
-----
Parameter      Value
-----
Mode            Enabled
Commands        configuration
Server-Group    tacacs1
```

Parameter	Description
Mode	Shows whether this server group is <b>Enabled</b> or <b>Disabled</b> .
Commands	Displays the types of commands that are reported to the TACACS server group. <ul style="list-style-type: none"><li>● <b>action</b> reports action commands only.</li><li>● <b>all</b> reports all commands.</li><li>● <b>configuration</b> reports configuration commands only</li><li>● <b>show</b> reports show commands only</li></ul>
Server-Group	Shows whether this server is <b>Enabled</b> or <b>Disabled</b> .

### Related Commands

Command	Description	Mode
<code>aaa authentication-server tacacs</code>	Configure the TACACCS+ accounting feature.	Config mode
<code>aaa server-group</code>	Add a configured authentication server to an ordered list in a server group, and configure server rules to derive a user role, VLAN ID or VLAN name from attributes returned by the server during authentication	Config mode

### Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa bandwidth-contracts

```
show aaa bandwidth-contracts
```

### Description

This command shows the contract names, ID numbers and Rate limits for your bandwidth contracts.

### Example

The output of the following command shows that the bandwidth contract **VLAN** has a configured rate of 6 Mbps, and the contract **User** has a rate of 2048 Kbps.

```
(host) #show aaa bandwidth-contracts

Bandwidth Contracts
-----
Contract  Id  Rate (bits/second)
-----  --  -----
VLAN      1   6000000
User      2   2048000

Total contracts = 2
Per-user contract total = 4096
Per-user contract usage = 0
```

### Related Commands

Command	Description	Mode
<code>aaa bandwidth-contract</code>	Use this command to define contracts to limit traffic for a user or VLAN.	Config mode

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show aaa derivation-rules

```
show aaa derivation-rules [server-group <group-name>|user <name>]
```

### Syntax

Parameter	Description
<group-name>	Name of a server group
<name>	Name of a user rule group

### Description

Show derivation rules based on user information or configured for server groups.

### Example

The output of the following command shows that the server group `group1` has the internal database configured as its authentication server, and that there is a single rule assigned to that group. You can omit the **<group-name>** parameter to show a table of all your server groups.

```
(host) #show aaa derivation-rules server-group group1

Server Group

Name      Inservice  trim-FQDN  match-FQDN
----      -
Internal  Yes        No

Server Rule Table
-----
Priority  Attribute  Operation  Operand   Action    Value  Total Hits  New Hits
-----  -
1         Filter-Id  equals     nsFilter  set vlan  111    24          0
Rule Entries: 1
```

The following data columns appear in the output of this command:

Parameter	Description
Name	Name of the authentication server assigned to this server group
Inservice	Specifies if the server is in service or out-of-service.
trim-FQDN	If enabled, user information in an authentication request is edited before the request is sent to the server.
match-FQDN	If enabled, the authentication server is associated with a specified domain.
Priority	The priority in which the rules are applied. Rules at the top of the list are applied before rules at the bottom.
Attribute	This is the attribute returned by the authentication server that is examined for <b>Operation</b> and <b>Operand</b> match

Parameter	Description
Operation	This is the match method by which the string in <b>Operand</b> is matched with the attribute value returned by the authentication server. <ul style="list-style-type: none"> <li>● <b>contains</b> – The rule is applied if and only if the attribute value contains the string in parameter <b>Operand</b>.</li> <li>● <b>starts-with</b> – The rule is applied if and only if the attribute value returned starts with the string in parameter <b>Operand</b>.</li> <li>● <b>ends-with</b> – The rule is applied if and only if the attribute value returned ends with the string in parameter <b>Operand</b>.</li> <li>● <b>equals</b> – The rule is applied if and only if the attribute value returned equals the string in parameter <b>Operand</b>.</li> <li>● <b>not-equals</b> – The rule is applied if and only if the attribute value returned is not equal to the string in parameter <b>Operand</b>.</li> <li>● <b>value-of</b> – This is a special condition. What this implies is that the role or VLAN is set to the value of the attribute returned. For this to be successful, the role and the VLAN ID returned as the value of the attribute selected must be already configured on the switch when the rule is applied.</li> </ul>
Operand	This is the string to which the value of the returned attribute is matched.
Action	This parameter identifies whether the rule sets a server group role ( <b>set role</b> ) or a VLAN ( <b>set vlan</b> ).
Value	Sets the user role or VLAN ID to be assigned to the client if the condition is met.
Total Hits	Number of times the rule has been applied since the last server reboot.
New Hits	Number of times the rule has been applied since the <b>show aaa derivation-rules</b> command was last issued.

To display derivation rules for a user group, include the **user <name>** parameter. You can also display a table of all user rules by including the **user** parameter, but omitting the **<name>** parameter.

```
(host) #show aaa derivation-rules user
```

```
User Rule Table
```

```
-----
```

```
Priority  Attribute  Operation  Operand  Action  Value  Total Hits  New Hits
-----  -
1         location   equals     ap23     set role  guest  56           18
```

The following data columns appear in the output of this command:

Parameter	Description
Priority	The priority in which the rules are applied. Rules at the top of the list are applied before rules at the bottom.
Attribute	This is the attribute returned by the authentication server that is examined for <b>Operation</b> and <b>Operand</b> match.

Parameter	Description
Operation	<p>This is the match method by which the string in <b>Operand</b> is matched with the attribute value returned by the authentication server.</p> <ul style="list-style-type: none"> <li>• <b>contains</b> – The rule is applied if and only if the attribute value contains the string in parameter <b>Operand</b>.</li> <li>• <b>starts-with</b> – The rule is applied if and only if the attribute value returned starts with the string in parameter <b>Operand</b>.</li> <li>• <b>ends-with</b> – The rule is applied if and only if the attribute value returned ends with the string in parameter <b>Operand</b>.</li> <li>• <b>equals</b> – The rule is applied if and only if the attribute value returned equals the string in parameter <b>Operand</b>.</li> <li>• <b>not-equals</b> – The rule is applied if and only if the attribute value returned is not equal to the string in parameter <b>Operand</b>.</li> <li>• <b>value-of</b> – This is a special condition. What this implies is that the role or VLAN is set to the value of the attribute returned. For this to be successful, the role and the VLAN ID returned as the value of the attribute selected must be already configured on the switch when the rule is applied.</li> </ul>
Operand	This is the string to which the value of the returned attribute is matched.
Action	This parameter identifies whether the rule sets a server group role ( <b>set role</b> ) or a VLAN ( <b>set vlan</b> ).
Value	Sets the user role or VLAN ID to be assigned to the client if the condition is met.
Total Hits	Number of times the rule has been applied since the last server reboot.
New Hits	Number of times the rule has been applied since the <b>show aaa derivation-rules</b> command was last issued.

## show aaa main-profile

```
show aaa main-profile summary
```

### Description

Show a summary of all aaa profiles.

### Example

The output of the **show aaa main-profile summary** command shows roles, server group settings, and wire-to-wireless-roaming statistics for each AAA profile.

```
(host) #show aaa main-profile summary
```

```
AAA Profile summary
-----
Name          role  mac-auth  dot1x-auth  rad-acct  XML-api  RFC3576  UDR-group  ww-roam
-----
aaa_dot1x     logon macprof2  dot1x       RADIUS    10.3.1.15 10.3.15.2  Usr1      Disable
default       logon macprof2  dot1x       RADIUS    10.3.1.15 10.3.15.2  Usr1      Disable
defaultguest  guest macprof1  default     RADIUS    10.3.1.15 10.3.15.2  Usr2      Disable
```

The following data columns appear in the output of this command:

Parameter	Description
Name	Name of the AAA profile.
role	Role for unauthenticated users.
mac-auth	Name of the server group used for MAC authentication.
dot1x-auth	Name of the server group used for dot1x authentication.
rad-act	Name of the server group used for RADIUS authentication.
XML-api	IP address of a configured XML API server.
RFC3576	IP address of a RADIUS server that can send user disconnect and change-of-authorization messages, as described in RFC 3576.
UDR-group	Name of the user derivation rule profile.
ww-roam	Shows if wired-to-wireless roaming is enabled or disabled.

## show aaa profile

```
show aaa profile <profile-name>
```

### Description

Show configuration details for an individual AAA profile.

### Example

The output of the following command shows roles, servers and server group settings, and wire-to-wireless-roaming statistics for each AAA profile.

```
(host) #show ap profile aaa_dot1x

AAA Profile "aaa_dot1x"
-----
Parameter                               Value
-----
Initial role                             logon
MAC Authentication Profile                macprof2
MAC Authentication Default Role          guest
MAC Authentication Server Group          svrgrp
802.1X Authentication Profile            dot1x
802.1X Authentication Default Role       guest
802.1X Authentication Server Group       Internal
RADIUS Accounting Server Group           RADIUS
XML API server                           10.3.1.15
RFC 3576 server                           10.3.15.2
User derivation rules Usr1
Wired to Wireless Roaming                Enabled
SIP authentication role                   N/A
```

The following data columns appear in the output of this command:

Parameter	Description
Name	The name of the AAA profile.
Initial Role	Role for unauthenticated users.
MAC Authentication Profile	Name of the MAC authentication profile.
MAC Authentication Default Role	Configured role assigned to the user after MAC authentication.
MAC Authentication Server Group	Name of the server group used for MAC authentication.
8021.X Authentication Profile	Name of the 802.1x authentication profile.
8021.X Authentication Default Role	Configured role assigned to the user after 802.1x authentication.
8021.X Authentication Server Group	Name of the server group used for 802.1x authentication.
RADIUS Accounting Server Group	Name of the server group used for RADIUS authentication.
XML API server	IP address of a configured XML API server.
RFC 3576 server	IP address of a RADIUS server that can send user disconnect and change-of-authorization messages, as described in RFC 3576.
User derivation rules	Name of the user derivation rule profile.
Wired to Wireless Roaming	Shows whether Wired to Wireless Roaming is <b>Enabled</b> or <b>Disabled</b> .

Parameter	Description
SIP authentication role	For switches with an installed Voice Services Module license, this parameter displays the configured role assigned to a session initiation protocol (SIP) client upon registration.

## show aaa rfc-3576-server

```
show aaa rfc-3576-server [statistics|<udp-port>]
```

### Description

Show configuration details for an RFC-3576 server, which is a RADIUS server that can send user disconnect and change-of-authorization (CoA) messages, as described in RFC 3576.

### Example

This first example shows that there are two configured servers in the RFC 3567 Server List. The **References** column lists the number of other profiles with references to the RFC 3567 server, and the **Profile Status** column indicates whether the server is predefined. User-defined servers will not have an entry in the **Profile Status** column.

```
(host) #show aaa rfc-3567-server

RFC 3576 Server List
-----
Name           References  Profile Status
-----
10.2.14.6      2
```

To view details for all RFC 3576 servers, include the **statistics** parameter.

```
(host) #show aaa rfc-3576-server statistics

RADIUS RFC 3576 Statistics
-----
Statistics          10.1.2.3  10.1.2.34
-----
Disconnect Requests  13  3
Disconnect Accepts  12  3
Disconnect Rejects  1   0
No Secret            0    0
No Session ID        0    0
Bad Authenticator    0    0
Invalid Request      0    0
Packets Dropped      0    2
Unknown service      0    0
CoA Requests         1  0
CoA Accepts          1  0
CoA Rejects          0    0
No permission        0    0

Packets received from unknown clients: 0
Packets received with unknown request: 0
Total RFC3576 packets Received       : 0
```

The output of the **show aaa rfc-3576-server statistics** command includes the following parameters:

Parameter	Description
Disconnect Requests	Number of disconnect requests sent by the server.
Disconnect Accepts	Number of disconnect requests sent by the server that were accepted by the user.
Disconnect Rejects	Number of disconnect requests sent by the server that were rejected by the user.
No Secret	Number of authentication requests that did not contain a RADIUS secret.
No Session ID	Number of authentication requests that did not contain a session ID.

Parameter	Description
Bad Authenticator	Number of authentication requests that contained a missing or invalid authenticator field in the packet.
Invalid Request	Number of invalid requests.
Packets Dropped	Number of packets dropped.
Unknown service	Number of requests for an unknown service type.
CoA Requests	Number of requests for a Change of Authorization (CoA).
CoA Accepts	Number of times a CoA request was accepted.
CoA Rejects	Number of times a CoA request was rejected.
No permission	Number of requests for a service that has been defined, but has not been administratively enabled.

## Related Commands

## show aaa server-group

```
show aaa server-group [<group-name>|summary]
```

### Description

Show configuration details for your AAA server groups.

### Syntax

Parameter	Description
<group-name>	The name of an existing AAA server group.

### Usage Guidelines

Issue this command without the **<group-name>** or **summary** options to display the entire server group list, including profile status and the number of references to each profile. The **References** column lists the number of other profiles that reference a server group, and the **Profile Status** column indicates whether the server group is predefined. User-defined server groups will not have an entry in the Profile Status column. Examples

This first example shows that there are five configured server groups

```
(host) #show aaa server-group summary

Server Group List
-----
Name                References  Profile Status
----                -
auth-profile-2      1
coltrane-server-group 1
default             25
group1              0
internal            0          Predefined

Total:5
```

To view additional statistics for all server groups, include the **statistics** parameter.

```
(host) #show aaa server-group summary
Server Groups
-----
Name                Servers  Rules  hits  Out-of-service
----                -
auth-profile-2      1        0    0
coltrane-server-group 1        0    0
default             1        0    0
group1              1        1    0
internal            1        1    0
```

The output of the show aaa server-group summary command includes the following parameters:

Parameter	Description
name	Name of an existing AAA server group.
Servers	Number of servers in the group.
Rules	Number of rules configured for the server group.

Parameter	Description
hits	Number of hits for the server's rules.
Out-of-Service	Indicates whether the server is active, or out of service. Active servers may not have an entry in the Out-of-Service column.

To display detailed authorization, role and vlan statistics for an individual server group, include the name of the group for which you want more information.

```
(host) #show aaa server-group summary group1

Fail Through:No

```

The output of the **show aaa server-group <group-name>** command includes the following parameters:

Parameter	Description
Name	Specifies if the server is in service or out-of-service.
Server-Type	If enabled, user information in an authentication request is edited before the request is sent to the server.
trim-FQDN	If enabled, user information in an authentication request is edited before the request is sent to the server.
Match-Type	If the match type is <b>authstring</b> the authentication server associates with a match rule that the switch can compare with the user/client information in the authentication request. A <b>fdqn</b> match type associates the authentication server with a specified domain. An authentication request is sent to the server only if there is an exact match between the specified domain and the <domain> portion of the user information sent in the authentication request.
Match-Op	This is the match method by which the string in <b>Match-Str</b> is matched with the attribute value returned by the authentication server. <ul style="list-style-type: none"> <li>• <b>contains</b> – The rule is applied if and only if the attribute value contains the string in parameter <b>Operand</b>.</li> <li>• <b>starts-with</b> – The rule is applied if and only if the attribute value returned starts with the string in parameter <b>Operand</b>.</li> <li>• <b>ends-with</b> – The rule is applied if and only if the attribute value returned ends with the string in parameter <b>Operand</b>.</li> <li>• <b>equals</b> – The rule is applied if and only if the attribute value returned equals the string in parameter <b>Operand</b>.</li> <li>• <b>not-equals</b> – The rule is applied if and only if the attribute value returned is not equal to the string in parameter <b>Operand</b>.</li> <li>• <b>value-of</b> – This is a special condition. What this implies is that the role or VLAN is set to the value of the attribute returned. For this to be successful, the role and the VLAN ID returned as the value of the attribute selected must be already configured on the switch when the rule is applied</li> </ul>

Parameter	Description
Match-Str	This is the string to which the value of the returned attribute is matched.
Priority	The priority in which role or VLAN derivation rules are applied. Rules at the top of the list are applied before rules at the bottom.
Attribute	For role or VLAN derivation rules, this is the attribute returned by the authentication server that is examined for <b>Operation</b> and <b>Operand</b> match.
Operation	<p>For role or VLAN derivation rules, this is the match method by which the string in <b>Operand</b> is matched with the attribute value returned by the authentication server.</p> <ul style="list-style-type: none"> <li>• <b>contains</b> – The rule is applied if and only if the attribute value contains the string in parameter <b>Operand</b>.</li> <li>• <b>starts-with</b> – The rule is applied if and only if the attribute value returned starts with the string in parameter <b>Operand</b>.</li> <li>• <b>ends-with</b> – The rule is applied if and only if the attribute value returned ends with the string in parameter <b>Operand</b>.</li> <li>• <b>equals</b> – The rule is applied if and only if the attribute value returned equals the string in parameter <b>Operand</b>.</li> <li>• <b>not-equals</b> – The rule is applied if and only if the attribute value returned is not equal to the string in parameter <b>Operand</b>.</li> <li>• <b>value-of</b> – This is a special condition. What this implies is that the role or VLAN is set to the value of the attribute returned. For this to be successful, the role and the VLAN ID returned as the value of the attribute selected must be already configured on the switch when the rule is applied.</li> </ul>
Operand	For role or VLAN derivation rules, this is the string to which the value of the returned attribute is matched.
Action	This parameter identifies whether the derivation rule sets a server group role ( <b>set role</b> ) or a VLAN ( <b>set vlan</b> ).
Value	Sets the user role or VLAN ID to be assigned to the client if the rule condition is met.

```

The output of the **show aaa state configuration** command includes the following parameters:

Parameter	Description
Switch IP	IP address of the local switch.
Master IP	IP address of the master switch.
Switch Role	Role assigned to the switch on which you issued the <b>show aaa state</b> command.
Current/Max/Total Users	Current number of users on the switch/Maximum number of users that can be assigned to the switch at any time/Total number of users that have been assigned to the switch since the last switch reboot.
Current/Max/Total Stations	Current number of stations registered with the switch/Maximum number of stations that can be registered with the switch at any time/Total number of stations that have registered the switch since the last switch reboot.
Captive Portal Users	Number of current users authenticated via captive portal.
802.1x Users	Number of current users authenticated via 802.1x authentication.
VPN Users	Number of current users authenticated via VPN authentication.
MAC Users	Number of current users authenticated via MAC authentication.
Stateful 802.1x Users	Number of current users authenticated via stateful 802.1x authentication.
Tunneled users	Number of stations in tunneled forwarding mode, where 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE).
Configured user roles	Number of configured user roles.
Configured session ACL	Number of configured session ACLs.
Configured destinations	Number of destinations configured using the <a href="#">netdestination</a> command.
Configured services	Number of service aliases configured using the <a href="#">netservice</a> command.
Configured Auth servers	Number of configured authentication servers.
Auth server in service	Number of authentication servers currently in service.
Radius server timeouts	Number of times the RADIUS server did not respond to the authentication request.
Web	Total number of captive portal authentications or authentication failures since the last switch reset.
MAC	Total number of MAC authentications or authentication failures since the last switch reset.
VPN	Total number of VPN authentications or authentication failures since the last switch reset.
802.1x	Total number of 802.1x authentications or authentication failures since the last switch reset.
Krb	Total number of Kerberos authentications or authentication failures since the last switch reset.
RadAcct	Total number of RADIUS accounting verifications or accounting failures since the last switch reset.
SecureID	Number of authentication verifications or failures using methods which use one-time passwords. (For example, EAP-GTC being used as the inner EAP protocol of EAP-PEAP.)
Stateful-802.1x	Total number of Stateful 802.1x authentications or authentication failures since the last switch reset.

Parameter	Description
Management	Total number of Management user authentications or authentication failures since the last switch reset.
Idled users	Total number of users that are not broadcasting data to an AP.
Mobility	Shows whether the IP mobility feature has been enabled or disabled on the switch.
fast age	When the <b>fast age</b> feature allows the switch actively sends probe packets to all users with the same MAC address but different IP addresses. The users that fail to respond are purged from the system. This parameter shows if fast aging of user table entries has been enabled or disabled.
Bandwidth contracts	Number of configured bandwidth contracts on the switch.
IP takeovers	Number of times a two different stations have attempted to use the same IP address (IP spoofing).
Ping/SYN/Session attacks	Number of reported ping, SYN and session attacks.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode

## show aaa state debug-statistics

```
show aaa state debug statistics
```

### Description

show debug statistics for switch authentication, authorization and accounting.

### Syntax

No parameters.

### Example

The following example displays debug statistics for a variety of authentication errors.

```
(host) #show aaa state debug-statistics
user miss: ARP=47, 8021Q=5216, non-IP=0, zero-IP=0, loopback=0
user miss: mac mismatch=0, spoof=269 (74), drop=390, ncfg=0
Idled users = 3376
Idled users due to MAC mismatch = 0
Logon lifetime iterations = 4501, entries deleted = 121
SIP authentication messages received 29227, dropped 29227
Missing auth user deletes: 0
```

The output of this command includes the following parameters:

Parameter	Description
ARP	Number of ARP packets sent between the datapath and the controlpath.
8021q	Number of 802.1q (VLAN tag) packets sent between the datapath and the controlpath.
non-ip	Number of non-ip type packets sent between the datapath and the controlpath.
zero-ip	Number packets sent without an internet protocol (IP).
loopback	If <b>1</b> , the switch has a defined loopback address. If <b>0</b> , a loopback address has not yet been configured.
mac mismatch	Number of users that were not authenticated due to MAC mismatches.
spoof	Number of users that were not authenticated due to spoofed IP addresses.
drop	Number of user authentication attempts that were dropped.
ncfg	Number of packets sent between datapath and controlpath, where the authentication module has not completed the initialization required to process the traffic.
idled users	Number of inactive stations that are not broadcasting data to an AP.
idled users due to MAC mismatch	For internal use only.
Logon lifetime iteration	Number of users deleted for lack of activity.
SIP authentication message	Number of session initiation protocol (SIP) authentication messages received.
Missing auth user deletes	Number of users removed from the datapath by the auth module, even without a mapping entry in control path. This counter can help identify problems with messages sent between the controlpath and the datapath.

### Command History

**This command was introduced in AOS-W 3.0.**

### **Command Information**

<b>Platforms</b>	<b>Licensing</b>	<b>Command Mode</b>
All platforms	Base operating system	Enable or Config mode on master or local or local switches

## show aaa state messages

### Description

Display numbers of authentication messages sent and received.

### Syntax

No parameters.

### Usage Guidelines

This command displays a general overview of authentication statistics. To view authentication information for specific profiles such as a captive-portal, MAC or 801.x authentication profile, issue the commands specific to those features.

### Example

The output of this command displays tables of statistics for PAPI, RAW socket and Sibyte messages.

```
(host) #show aaa state messages
PAPI Messages
-----
Msg ID  Name                               Since last Read  Total
-----  ---
5004    set master ip                       2                 2
7005    Set switch ip                       1                 1
7007    Set VLAN ip                          5                 5
66      delete xauth vpn users 1           1                 1

RAW socket Messages
-----

## show aaa state station

```
show aaa state station <A:B:C:D:E:F>
```

### Description

Display AAA statistics for a station.

### Syntax

Parameter	Description
<A:B:C:D:E:F>	MAC address of a station/

### Example

The example below shows statistics for a station with four associated user IP addresses. The output of this command shows station data, the AAA profiles assigned to the station, and the station's authentication method.

```
(host) #show aaa state station 00:21:5c:85:d0:4b

# show aaa tacacs-accounting

## Description

Show TACACS accounting configuration.

## Syntax

No parameters.

## Example

The example below shows that TACACS accounting has been enabled, and that the TACACS server is in the server group **acct-server**.

```
(host) #show aaa tacacs-accounting
TACACS Accounting Configuration
-----
Parameter      Value
-----
Mode            Enabled
Server-Group   acct-server
```

The output of this command includes the following parameters:

Parameter	Description
Mode	Shows if the TACACS accounting feature is enabled or disable
Server-Group	The server group that contains the active TACACS server.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show aaa timers

### Description

Show AAA timer values.

### Syntax

No parameters

### Example

The example below shows that the switch has all default timer values:

```
(host) #show aaa timers
User idle timeout = 6 minutes
Auth Server dead time = 10 minutes
Logon user lifetime = 5 minutes
```

### Related Commands

Command	Description	Mode
<code>aaa timers</code>	Use <code>aaa timers</code> to define the settings displayed in the output of this show command.	Config mode

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show aaa xml-api server

```
show aaa xml-api server [<server_ip>]
```

### Description

Show a list of XML servers used for authentication, authorization and accounting.

### Syntax

Parameter	Description
<server_ip>	IP address of an XML API server. Include this parameter to see if a secret key is configured for the specified server.

### Example

The output of this command shows that the switch has two configured XML API servers that are each referenced by two different AAA profiles. Note that user-defined servers will not have an entry in the **Profile Status** column.

```
(host) #show aaa xml-api statistics
XML API Server List
-----
Name      References  Profile Status
----      -
10.1.2.3  2
10.4.3.2  2
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show aaa xml-api statistics

```
show aaa xml-api statistics
```

### Description

Display statistics for an external XML API server.

### Syntax

Parameter	Description
<server_ip>	IP address of XML API server.

### Usage Guidelines

Issue this command to troubleshoot AAA problems and monitor usage on an XML server.

### Example

The example below shows AAA statistics for an external XML server with the IP address 10.1.2.3. This command shows the number of times that a particular event has occurred per client. The first number is the total number of times that this event has occurred is displayed first. The number of new events since the last time the counters were displayed is shown in parentheses.

```
(host) #show aaa xml-api statistics
Statistics                               10.1.2.3
-----
user_authenticate                        0 (0)
user_add                                 0 (0)
user_delete                              0 (0)
user_blacklist                           0 (0)
user_query                               0 (0)
unknown user                             0 (0)
unknown role                             0 (0)
unknown external agent                   0 (0)
authentication failed                     0 (0)
invalid command                          0 (0)
invalid message authentication method     0 (0)
invalid message digest                   0 (0)
missing message authentication            0 (0)
missing or invalid version number         0 (0)
internal error                           0 (0)
client not authorized                     0 (0)
Cant use VLAN IP                          0 (0)
Invalid IP                               0 (0)
Cant use Switch IP                       0 (0)
missing MAC address                       0 (0)
Packets received from unknown clients: 0 (0)
Packets received with unknown request: 0 (0)
Requests Received/Success/Failed       : 0/0/0 (0/0/0)
```

The output of this command includes the following parameters:

Parameter	Description
user_authenticate	Number of users authenticated on the XML server since the last switch reboot.
user_add	Number of users added to the switch's user table.
user_delete	Number of users removed from the switch's user table.

Parameter	Description
user_blacklist	Number of denied user association requests.
user_query	Number of user queries performed.
unknown user	Number of unknown users.
unknown role	Number of unknown user roles.
unknown external agent	Number of requests by an unknown external agent.
authentication failed	Number of failed authentication requests.
invalid command	Number of invalid XML commands
invalid message authentication method	Number of XML commands with an invalid authentication method (when a key is configured on the switch).
invalid message digest	Number of XML commands with an invalid digest type (when a key is configured on the switch).
missing message authentication	Number of XML commands with an missing authentication method (when a key is configured on the switch).
missing or invalid version number	Number of commands with a missing or invalid version number. The version number should always be 1.0.
internal error	Number of internal server errors
client not authorized	Number of unauthorized clients
Cant use VLAN IP	Number of time a user IP is same as the VLAN IP.
Invalid IP	Number of XML commands with an invalid IP address.
Cant use Switch IP	Redirection to a IP failed, possibly because the source IP has been NATted.
missing MAC address	Number of XML commands with a missing MAC address.
Packets received from unknown clients	Number of packets received from unknown clients.
Packets received with unknown request	Number of packets received with unknown request
Requests Received/ Success/Failed	Total number of requests received / number of successful requests / number of failed requests

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show aaa web admin-port

```
show aaa web admin-port
```

### Description

Show the port numbers of HTTP and HTTPS ports used for web administration.

### Syntax

No parameters.

### Example

The example below shows that the switch is configured to use HTTPS on port 4343, and HTTP on port 8888.

```
(host) #show aaa web admin-port
https port = 4343
http  port = 8888
```

### Command History

This command was introduced in AOS-W 3.0.

## show acl ace-table

```
show acl ace-table {ace <0-1999>}|{acl <1-2700>}
```

### Description

Show an access list entry (ACE) table for an access control list (ACL).

### Syntax

Parameter	Description
ace <0-1999>	Show a single ACE entry.
acl <1-2700>	Show all ACE entries for a single ACL.

### Example

The following example shows that there are eighteen access control entries for ACL 1.

```
(host) #show acl ace-table acl 1
 1020: any any 1 0-65535 0-65535 f80001:permit
 1021: any any 17 0-65535 53-53 f80001:permit
 1022: any any 17 0-65535 8211-8211 f80001:permit
 1023: any any 17 0-65535 8200-8200 f80001:permit
 1024: any any 17 0-65535 69-69 f80001:permit
 1025: any any 17 0-65535 67-68 f80001:permit
 1026: any any 17 0-65535 137-137 f80001:permit
 1027: any any 17 0-65535 138-138 f80001:permit
 1028: any any 17 0-65535 123-123 f80001:permit
 1029: user 10.6.2.253 255.255.255.255 6 0-65535 443-443 f80001:permit
 1030: user any 6 0-65535 80-80 d1f90,0000 f80021:permit dnat
 1031: user any 6 0-65535 443-443 d1f91,0000 f80021:permit dnat
 1032: any any 17 0-65535 500-500 f80001:permit
 1033: any any 50 0-65535 0-65535 f80001:permit
 1034: any any 17 0-65535 1701-1701 f80001:permit
 1035: any any 6 0-65535 1723-1723 f80001:permit
 1036: any any 47 0-65535 0-65535 f80001:permit
 1037: any any 0 0-0 0-0 f180000:deny
```

### Related Commands

Configure ACLs using the command `ip access-list session`.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## show acl acl-table

```
show acl acl-table <1-2700>
```

### Description

Display information for a specified access control list (ACL).

### Syntax

Parameter	Description
acl-table <1-2700>	Specify the number of the ACL for which you want to view information.

### Example

The following example displays the ACL table for the switch.

```
(host) #show acl acl-table acl 1

AcLTable
-----
ACL  Type  ACE Index  Ace Count  Name  Applied
---  ---  -
1    role  1459      18         logon  0

Total free ACE entries = 3591
Free ACE entries at the bottom = 2552
Next ACE entry to use = 1480 (table 1)
Ace entries reused 622 times
ACL count 64, tunnel acl 0

Ace entries reused 373 times
ACL count 64, tunnel acl 0
```

The output of this command displays the following parameters:

Parameter	Description
ACL	Number of the specified ACL
Type	Shows the ACL type: <ul style="list-style-type: none"><li>● <b>role</b>: Access list is used to define a user role.</li><li>● <b>mac</b>: MAC ACLs allow filtering of non-IP traffic. This ACL filters on a specific source MAC address or range of MAC addresses.</li><li>● <b>session</b>: Session ACLs define traffic and firewall policies on the switch.</li><li>● <b>ether-type</b>: This type of ACL filters on the Ethertype field in the Ethernet frame header, and is useful when filtering non-IP traffic on a physical port.</li><li>● <b>standard</b>: Standard ACLs are supported for compatibility with router software from other vendors. This ACL permits or denies traffic based on the source address of the packet.</li></ul>
ACE Index	Starting index entry for the ACL's access control entries
ACE count	Number of access control entries in the ACL
Name	Name of the access control list
Applied	Number of times the ACL was applied to a role.
Total free ACE entries	The total number of free ACE entries. This includes available ACE entries at the bottom of the list, as well as free ACE entries in the middle of the table from previous access list entries that were later removed.

Parameter	Description
Free ACE entries at the bottom	The total number of free ACE entries at the bottom of the list.
Next ACE entry to use	Ace number of the first free entry at the bottom of the list.
ACE entries reused	For internal use only.
ACL count	Total number of defined ACLs
Tunnel ACL	Total number of defined tunnel ACLs.

The following example displays the ACL table for ACL 1.

```
(host) #show acl ace-table acl 1
Acl Table
-----
ACL  Type  ACE Index  Ace Count  Name  Applied
---  ----  -
1   role  1020      18         logon  0

Total free ACE entries = 3591
Free ACE entries at the bottom = 2991
Next ACE entry to use = 1041 (table 1)
Ace entries reused 373 times
ACL count 64, tunnel acl 0
```

## Related Commands

## show acl hits

```
show acl hits
```

### Description

Show internal ACL hit counters.

### Syntax

No parameters.

### Usage Guidelines:

Issue this command to see the number of times an access control list defined a user's role, or traffic and firewall policies for a user session.

## Example

In the example below, the output of the *User Role ACL Hits* table is shown in two separate tables to allow the output to fit on a single page of this document. In the actual switch command-line interface, the *User Role ACL Hits* table is shown in a single, wide table.

```
(host) #show acl ace-table acl 1
User Role ACL Hits
-----
Role           Policy           Src           Dst
----           -
logon          control          any           any
logon          control          any           any
logon          control          any           any
visitor        vp-control       any           any
visitor        vp-control       any           any
visitor        vp-access        any           any
visitor        vp-access        user          mswitch-master
visitor        vp-access        any           any

User Role ACL Hits
-----
Service        Action           Dest/Opcode    New Hits    Total Hits    Index
-----
svc-icmp       permit          0              0           6             5052
svc-dhcp       permit          0              0           2             5057
0              deny           0              0           53            5069
svc-dns        permit          9              9           46079         4885
svc-dhcp       permit          0              0           788           4886
svc-icmp       permit          0              0           536           4887
svc-http       permit          0              0           41            4889
6 9100-9100    permit          0              0           31            4892

Port Based Session ACL
-----

-----
ACL  ACE  New Hits  Total Hits  Index
-----
5    22    0         14         2382
```

The output of this command includes the following information:

Parameter	Description
Role	Name of the role assigned by the ACL.
Policy	Name of the policy used by the ACL
Src	The traffic source, which can be one of the following: <ul style="list-style-type: none"> <li>• <b>&lt;alias&gt;</b>: Name of a user-defined alias for a network host, subnetwork, or range of addresses.</li> <li>• <b>any</b>: match any traffic.</li> <li>• <b>host</b>: specify a single host IP address.</li> <li>• <b>network</b>: specify the IP address and netmask.</li> <li>• <b>user</b>: represents the IP address of the user.</li> </ul>

Parameter	Description
Dst	The traffic destination, which can be one of the following: <ul style="list-style-type: none"> <li>• <i>&lt;alias&gt;</i>: Name of a user-defined alias for a network host, subnetwork, or range of addresses.</li> <li>• <b>any</b>: match any traffic.</li> <li>• <b>host</b>: specify a single host IP address.</li> <li>• <b>network</b>: specify the IP address and netmask.</li> <li>• <b>user</b>: represents the IP address of the user.</li> </ul>
Service	Network service, which can be one of the following: <ul style="list-style-type: none"> <li>• IP protocol number (0-255)</li> <li>• name of a network service (use the show netservice command to see configured services)</li> <li>• <b>any</b>: match any traffic</li> <li>• <b>tcp</b>: specify the TCP port number (0-65535)</li> <li>• <b>udp</b>: specify the UDP port number (0-65535)</li> </ul>
Action	Action if rule is applied, which can be one of the following: <ul style="list-style-type: none"> <li>• <b>deny</b>: reject packets</li> <li>• <b>dst-nat</b>: perform destination NAT on packets</li> <li>• <b>dual-nat</b>: perform both source and destination NAT on packets</li> <li>• <b>permit</b>: forward packets</li> <li>• <b>redirect</b>: specify the location to which packets are redirected</li> <li>• <b>src-nat</b>: perform source NAT on packets</li> </ul>
Dest/Opcode	The datapath destination ID.
New Hits	Number of ACL hits that occurred since this command was last issued.
Total Hits	Total number of ACL hits recorded since the switch last reset.
Index	Index number of the ACL..
ACL	ACL number
ACE	ACE number
New Hits	Number of times the ACL was applied since this command was last issued.
Total Hits	Number of times the ACL was applied since the switch was last reset.
Index	Index number of the ACL..

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches

## show adp config

```
show adp config
```

### Description

Show Alcatel-Lucent Discovery Protocol (ADP) configuration settings.

### Syntax

No parameters.

### Example

The following example shows that the switch has all default settings for ADP.

```
(host) #show adp config
ADP Configuration
-----
key          value
---          -
discovery    enable
igmp-join    enable
igmp-vlan    0
```

The output of this command includes the following parameters:

Parameter	Description
discovery	Alcatel-Lucent APs send out periodic multicast and broadcast queries to locate the master switch. If the APs are in the same broadcast domain as the master switch and ADP is enabled on the switch, the switch automatically responds to the APs' queries with its IP address. This command shows whether ADP is enabled or disabled on the switch.
igmp-join	Shows whether the switch has enabled or disabled the sending of Internet Group Management Protocol (IGMP) join requests.
igmp-vlan	ID of the VLAN to which IGMP reports are sent. If this value is set to 0, the switch will use the default route VLAN used.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show adp counters

```
show adp counters
```

### Description

Show Alcatel-Lucent Discovery Protocol (ADP) counters.

### Syntax

No parameters.

### Example

The following example shows the ADP counter table for the switch.

```
(host) #show adp counters
ADP Counters
-----
key          value
---          -
IGMP Join Tx 1
IGMP Drop Tx 0
ADP Tx       0
ADP Rx       0
```

The output of this command includes the following parameters:

Parameter	Description
IGMP Join Tx	Number of Internet Group Management Protocol (IGMP) join requests sent by the switch.
IGMP Drop Tx	Number of Internet Group Management Protocol (IGMP) drop requests sent by the switch.
ADP Tx	Number of ADP responses sent to APs.
ADP Rx	Number of multicast and broadcast queries received from APs trying to locate the master switch.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap-group

```
show ap-group [<ap-group>]
```

### Description

Show settings for an AP group.

### Syntax

Parameter	Description
<ap-group>	The name of an AP group.

### Usage Guidelines

Issue this command without the optional **<ap-group>** parameter to display the entire AP group list, including profile status for each profile. Include an AP group name to display detailed configuration information for that AP group profile.

### Example

This first example shows that the switch has nine configured AP groups. The **Name** column lists the names of all configured AP groups. the **Profile Status** column indicates whether the AP group is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) #show ap-group
AP group List
-----
Name                Profile Status
----                -
corp-office
branch-office-am
corp
corp1
Corp1-AM
Corp1-AM-Ch11
Corp1-AM-Ch6
corp1-AP85
corp1-lab

Total: 9
```

Include an AP group name to display a complete list of configuration settings for that profile. The example below shows settings for the AP group **corp1**.

```
(host) #show ap-group corp1
AP group "corp1"
-----
Parameter                               Value
-----
Virtual AP                               corp1-guest
Virtual AP                               corp1-wpa2
802.11a radio profile                    default
802.11g radio profile                    profile1-g
Wired AP profile                         default
Ethernet interface 0 link profile        default
Ethernet interface 1 link profile        default
AP system profile                        corp1344
VoIP Call Admission Control profile      default
802.11a Traffic Management profile       N/A
802.11g Traffic Management profile       N/A
Regulatory Domain profile                corp1344-channel-profile
SNMP profile                             default
RF Optimization profile                  handoff-aggressive
RF Event Thresholds profile              default
IDS profile                              ids-low-setting
Mesh Radio profile                       default
Mesh Cluster profile                     N/A
```

The output of this command includes the following parameters:

Parameter	Description
Virtual AP	Virtual AP profile that which configures a specified WLAN.
802.11a radio profile	Profile that defines 802.11a radio settings for the AP group.
802.11g radio profile	Profile that defines 802.11g radio settings for the AP group.
Wired AP profile	Profile that defines wired port settings for APs assigned to the AP group.
Ethernet interface 0 link profile	Profile that defines the duplex and speed of the Ethernet 0 interface on the AP.
Ethernet interface 1 link profile	Profile that defines the duplex and speed of the Ethernet 0 interface on the AP.
AP system profile	Name of the AP system profile for the AP group.
VoIP Call Admission Control profile	Name of the AP system profile for the AP group.
802.11a Traffic Management profile	Name of the 802.11a WLAN traffic management profile for the AP group.
802.11g Traffic Management profile	Name of the 802.11g WLAN traffic management profile for the AP group.
Regulatory Domain profile	Name of the regulatory domain profile for the AP group.
SNMP profile	Name of the SNMP profile for the AP group.
RF Optimization profile	Name of the RF optimization profile for the AP group.
RF Event Thresholds profile	Name of the RF event thresholds profile for the AP group.
IDS profile	IDS profile for the AP group.
Mesh Radio profile	Mesh radio profile assigned to the AP group.
Mesh Cluster profile	Mesh cluster profile assigned to the AP group.

## Related Commands

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master switches

## show ap-name

```
show ap-name [<ap-name>]
```

### Description

Show a list of AP names. Include the **<ap-name>** parameter to display detailed configuration information for that AP.

### Syntax

Parameter	Description
<ap-name>	The name of an AP.

### Example

This first example shows that the switch has eight registered APs . The **Name** column lists the names of each registered AP. Note that APs are all user-defined, so they will not have an entry in the **Profile Status** column.

```
(host) #show ap-group
AP name List
-----
Name           Profile Status
----           -
mp3
sw-ad-ap124-11
sw-ad-ap125-13
sw-ad-ap125-15
sw-ad-ap125-17
sw-ad-ap125-18
sw-ad-ap125-19
sw-ad-ap125-3

Total: 8
```

Include an AP name to display a complete list of configuration settings for that AP. If the AP has default settings, the value may appear as N/A. The AP in the example below has all default profile settings

```
(host) #show ap-group corp1
AP name "mp3"
-----
Parameter                               Value
-----
Virtual AP                               N/A
Excluded Virtual AP                       N/A
802.11a radio profile                     N/A
802.11g radio profile                     N/A
Wired AP profile                           N/A
Ethernet interface 0 link profile          N/A
Ethernet interface 1 link profile          N/A
AP system profile                         N/A
VoIP Call Admission Control profile        N/A
802.11a Traffic Management profile         N/A
802.11g Traffic Management profile         N/A
Regulatory Domain profile                 N/A
RF Optimization profile                   N/A
RF Event Thresholds profile                N/A
IDS profile                               N/A
Mesh Radio profile                         N/A
Mesh Cluster profile                       N/A
Excluded Mesh Cluster profile              N/A
```

The output of this command includes the following parameters:

Parameter	Description
Virtual AP	Virtual AP profile that which configures a specified WLAN.
Excluded Virtual AP	Excludes the specified mesh cluster profile from this AP.
802.11a radio profile	Profile that defines 802.11a radio settings for the AP.
802.11g radio profile	Profile that defines 802.11g radio settings for the AP .
Wired AP profile	Profile that defines wired port settings for APs assigned to the AP .
Ethernet interface 0 link profile	Profile that defines the duplex and speed of the Ethernet 0 interface on the AP.
Ethernet interface 1 link profile	Profile that defines the duplex and speed of the Ethernet 0 interface on the AP.
AP system profile	Name of the AP system profile for the AP.
VoIP Call Admission Control profile	Name of the AP system profile for the AP.
802.11a Traffic Management profile	Name of the 802.11a WLAN traffic management profile for the AP group.
802.11g Traffic Management profile	Name of the 802.11g WLAN traffic management profile for the AP.
Regulatory Domain profile	Name of the regulatory domain profile for the AP.
RF Optimization profile	Name of the RF optimization profile for the AP.
RF Event Thresholds profile	Name of the RF event thresholds profile for the AP.
IDS profile	IDS profile for the AP.
Mesh Radio profile	Mesh radio profile assigned to the AP.

Parameter	Description
Mesh Cluster profile	Mesh cluster profile assigned to the AP.
Excluded Mesh Cluster profile	Excludes the specified mesh cluster profile from this AP.

## Related Commands

Configure AP settings using the command **ap-name**.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show arp

```
show arp
```

### Description

Show Address Resolution Protocol (ARP) entries for the switch.

### Syntax

No parameters

### Example

This example shows configured static ARP entries for the switch.

```
(host) #show arp
Protocol      Address      Hardware Address  Interface
Internet     10.3.129.98  00:1A:1E:C0:80:28  vlan1
Internet     10.3.129.253 00:0B:86:42:35:80  vlan1
Internet     10.3.129.250 00:1A:92:45:DB:00  vlan1
Internet     10.3.129.99  00:1A:1E:C0:1C:60  vlan65
Internet     10.3.129.96  00:1A:1E:C0:80:1E  vlan65
Internet     10.3.129.254 00:0B:86:02:EE:00  vlan1
```

The output of this command includes the following parameters:

Parameter	Description
Protocol	Protocol using ARP. Although the switch will most often use ARP to translate IP addresses to Ethernet MAC addresses, ARP may also be used for other protocols, such as Token Ring, FDDI, or IEEE 802.11, and for IP over ATM.
Address	IP address of the device.
Hardware Address	MAC address of the device.
Interface	Interface used to send ARP requests and replies.

### Related Commands

Add a static Address Resolution Protocol (ARP) entry using the command `show arp`.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master and local switches

## show audit-trail

```
show audit-trail {<number>}
```

### Description

Show the switch's audit trail log.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.

### Example

By default, the audit trail feature is enabled for all commands in configuration mode. The example below shows the most recent ten audit log entries for the switch.

```
(host) # show audit-trail 10
Feb  5 06:13:17 cli[1239]: USER: admin has logged in from 10.240.16.118.
Feb  5 06:20:13 cli[1239]: USER: admin connected from 10.240.16.118 has logged out.
Feb  5 06:24:37 cli[1239]: USER: admin has logged in from 10.240.16.118.
Feb  5 06:37:01 cli[1239]: USER:admin@10.3.129.250 COMMAND:<wlan virtual-ap "mp-only" no vap-enable > -- command
executed successfully
Feb  5 06:37:14 cli[1239]: USER:admin@10.3.129.250 COMMAND:<wlan virtual-ap "mp-a-only" no vap-enable > -- command
executed successfully
Feb  5 06:37:20 cli[1239]: USER:admin@10.3.129.250 COMMAND:<wlan virtual-ap "default" no vap-enable > -- command

executed successfully
Feb  5 07:05:48 cli[1239]: USER:admin@10.3.129.250 COMMAND:<wlan virtual-ap "mp-a-only" vap-enable > -- command executed
successfully
```

### Related Commands

Enable or disable the audit trail feature using the command [audit-trail](#).

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes. Audit trails can only be enabled on master switches

## show auth-tracebuf

```
show auth-tracebuf [count <1-250>] [failures] [mac <address>]
```

### Description

Show the trace buffer for authentication events.

### Syntax

Parameter	Description
count <1-250>	limit the output of the command to the specified number of packets.
failures	Filter the output of this command to display only authentication failures
mac <address>	Filter the output of this command to display only information for a specified MAC address.

### Usage Guidelines

Use the output of this command to troubleshoot 802.1x authentication errors. Include the **<address>** parameter to filter data by the MAC address of the client which is experiencing errors. This command can tell you, for example, when 802.1x authentication completed and when keys were plumbed correctly.

### Example

The example below shows the most recent ten trace buffer entries for the switch. Each row shows a timestamp that indicates when the entry was created, the type of exchange that was made, the direction the packet was sent, and the source and destination MAC addresses.

```
(host) # show auth-buffer 10
Auth Trace Buffer
-----

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable or Config modes on master or local switches

## show banner

```
show banner
```

### Description

Show the current login banner

### Syntax

No parameters

### Usage Guidelines

Issue this command to review the banner message that appears when you first log in to the switch's command-line or browser interfaces.

### Example

```
(host) # show banner
This testlab switch is scheduled for maintenance starting Saturday night at 11 p.m.
```

### Related Commands

Configure a banner message using the command [banner motd](#).

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show boot

```
show boot
```

### Description

Display boot parameters, including the boot partition and the configuration file to use when booting the switch.

### Syntax

No parameters.

### Example

```
(host) # show boot
Config File: default.cfg
Boot Partition: PARTITION 1
```

### Related Commands

Configure boot parameters using the command [boot](#).

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show cellular profile

```
show cellular profile [<name>] | [factory]
```

### Description

Display the cellular profiles and profile settings.

### Syntax

Parameter	Description
<name>	Enter the name of an existing cellular profile
factory	Display a list of factory supported cellular profiles.

### Usage Guidelines

Issue this command without the **<name>** parameter to display configuration parameters for the entire list of available cellular profiles. Include a profile name to display configuration information for that one profile.

### Example

The output of this command displays the Cellular Profile Table. The example below shows eight preconfigured cellular profiles.

```
(host) #show cellular profile

Cellular Profile Table
-----
Name          Vend      Prod      Serial  Dialer  Tty      Driver  Priority  Modeswitch
-----
Novatel_U720  1410     2110     evdo_us  ttyUSB0  option  default
Novatel_U727  1410     4100     evdo_us  ttyUSB0  option  default
Kyocera_KPC680 0c88     180a     evdo_us  ttyUSB0  option  default
Sierra_Compass_597 1199     0023     evdo_us  ttyUSB0  sierra  default
Pantech_UM175 106c     3714     evdo_us  ttyUSB1  option  default
Sierra_USBConn_881 1199     6856     gsm_us   ttyUSB0  option  default
USBConn_Mercury_C885 1199     6880     gsm_us   ttyUSB3  option  default
Globetrotter_Icon322 0af0     d033     gsm_us   ttyHS3   hso     default
Default cellular priority: 100
```

The output of this command includes the following parameters:

Parameters	Description
Name	Name of a cellular profile.
Vend	Vendor ID in hexadecimal
Prod	USB product ID in hexadecimal
Serial	USB device serial number.
Dialer	Name of a dialer group profile.
TTY	Modem TTY port.

Parameters	Description
Driver	One of the following cellular modem drivers: <ul style="list-style-type: none"> <li>● <b>acm</b>: Linux ACM driver.</li> <li>● <b>hso</b>: Option High Speed driver.</li> <li>● <b>option</b>: Option USB data card driver (default).</li> <li>● <b>sierra</b>: Sierra Wireless driver.</li> </ul>
Priority	Displays the cellular profile priority; profiles with the default priority of 100 will display the word <b>default</b> in the Priority column Range: 1 to 255. Default: 100
Modeswitch	One of two USB device modeswitch settings: <ul style="list-style-type: none"> <li>● <b>eject</b>: Eject the CDROM device.</li> <li>● <b>rezero</b>: Send SCSI CDROM rezero command.</li> </ul>

## Command History

Introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
600 Series	Base operating system	Config or Enable mode on master or local switches

## show clock

```
show clock [summer-time|timezone]
```

### Description

Display the system clock.

### Syntax

Parameter	Description
summer-time	Show summer (daylight savings) time settings.
timezone	Show the configured timezone for the switch.

### Usage Guidelines

Include the optional summer-time parameter to display configured daylight savings time settings. The timezone parameter shows the current timezone, with its time offset from Greenwich Mean Time.

### Example

The output below shows the current time on the switch clock.

```
(host) # show clock
Thu Feb  5 16:52:28 PST 2009
```

### Related Commands

Configure clock settings using the commands [clock set](#), [clock summer-time](#), and [clock timezone](#).

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show command-mapping

```
show command-mapping [reverse]
```

### Description

Show the mapping new commands to deprecated commands.

### Syntax

Parameter	Description
reverse	Sort the command map by deprecated command syntax. This command is useful to find the current command syntax for a deprecated command.

### Usage Guidelines

The syntax of many commands changed after the release of AOS-W 3.0. Use this command to display a list of current commands and their deprecated command equivalents. Include the **reverse** parameter sort the output of this table by the deprecated command syntax.

### Example

The example below shows part of the output for this command. Note that a single new command may have replaced several older commands.

```
(host) # show command-mapping
Command Map
-----
New Command                               Old Command
-----
show ap active                             show wlan ap
show ap arm neighbors                       show ap arm-neighbors
show ap arm rf-summary                     show am rf-summary
show ap arm scan-times                     show am scan-times
show ap arm state                           show wlan arm
show ap association                         show stm association
show wlan client                             show wlan client
show wlan remote-client                     show stm dos-sta
show ap blacklist-clients                   show stm connectivity
show ap bss-table                           show stm state
show ap client status                       show rfsm coverage-holes
show ap coverage-holes                      show ap global-list
show ap database                            show sapm ap search
show ap registered                          show ap registered
show ap debug association-failure           show wlan association-failure
....
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show configuration

```
show configuration
```

### Description

Show the saved configuration on the switch.

### Syntax

No parameters.

### Usage Guidelines

Issue this command to view the entire configuration saved on the switch, including all profiles, ACLs, and interface settings.

### Example

The example below shows part of the output for this command.

```
(host) # show configuration
version 3.4
enable secret "0078b61601db950378d3d27a33c0b4d61f95b653ce9480a229"
telnet cli
prompt Lab12-800
loginsession timeout 0
hostname "sampleHost"
clock timezone PST -8
banner motd:
This switch is in Lab 12.

location "Building1.floor1"
mms config 0
controller config 1173

ip access-list eth 200
```

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show controller-ip

```
show controller-ip
```

### Description

Show switch's country and domain upgrade trail.

### Syntax

No parameters.

### Example

The output of this command shows the switch's IP address and VLAN interface ID.

```
(host) # show controller-ip  
  
Switch IP Address: 10.168.254.221  
Switch IP is configured to be Vlan Interface: 1
```

### Command History

This command was available in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show country

```
show country [trail]
```

### Description

Show switch's country and domain upgrade trail.

### Syntax

Parameter	Description
trail	Display the record showing how the switch was reconfigured for its current country domain when the switch hardware was upgraded.

### Usage Guidelines.

A switch's country code sets the regulatory domain for the radio frequencies that the APs use. This value is typically set during the switch's initial setup procedure. Use this command to determine the country code specified during setup.

### Example

The output of this command shows the switch's country, model and hardware types.

```
(host) # show country

Country:US
Model:OAW-4306GW-US
Hardware:Restricted US
```

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show cp-bwcontracts

```
show cp-bwcontract
```

### Description

Display a list of Control Processor (CP) bandwidth contracts for whitelist ACLs.

### Syntax

No parameters.

### Example

The *CP bw contracts* table lists the contract names, the ID number assigned to each contract, and its defined traffic rate in bits per second.

```
(host) #show cp-bwcontracts

CP bw contracts
-----
Contract      Id      Rate (bits/second)
-----
limit         4098   2000000000
newcontract   4097   1000000000
```

### Related Commands

Command	Description	Mode
<code>cp-bandwidth-contract</code>	This command configures a bandwidth contract traffic rate which can then be associated with a whitelist session ACL.	Enable or Config modes
<code>firewall cp</code>	This command creates a new whitelist ACL and can associate a bandwidth contract with that ACL.	Enable or Config modes

### Command History

This command was introduced in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the PEF license.	Config mode on master switches

## show cpuload

```
show cpuload [current]
```

### Description

Display the switch CPU load for application and system processes.

### Syntax

Parameter	Description
current	Include this optional parameter at the request of Alcatel-Lucent technical support to display additional CPU troubleshooting statistics.

### Example

This example shows that the majority of the switch's CPU resources are not being used by either application (user) or system processes.

```
(host) #show cpuload
user 6.9%, system 7.7%, idle 85.4%
```

The output of this command includes the following parameters:

Parameter	Description
user	Percentage of switch CPU resources used by application processes.
system	Percentage of switch CPU resources used by system processes.
idle	Percentage of unused switch CPU resources.

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show crypto dp

```
show
show crypto dp [peer <source-ip>]
```

### Descriptions

Displays crypto data packets.

### Syntax

Parameter	Description
dp	Shows crypto latest datapath packets. The output is sent to crypto logs.
peer <source-ip>	Clears crypto ISAKMP state for this IP.

### Usage Guidelines

Use this command to send crypto data packet information to the switch log files, or to clear a crypto ISAKMP state associated with a specific IP address.

### Examples

The command show crypto dp sends debug information to CRYPTO logs.

```
(host) # show crypto
Datapath debug output sent to CRYPTO logs.
```

### Related Commands

Command	Description	Mode
<code>crypto isakmp</code>	Use this command to configure Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP)	Enable and Config modes

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show crypto dynamic-map

```
show crypto dynamic-map [tag <dynamic-map-name>]
```

### Descriptions

Displays IPsec dynamic map configurations.

### Syntax

Parameter	Description
dynamic-map	IPsec dynamic maps configuration.
tag <dynamic-map-name>	A specific dynamic map.

### Usage Guidelines

Dynamic maps enable IPsec SA negotiations from dynamically addressed IPsec peers. Once you have defined a dynamic map, you can associate that map with the default global map using the command **crypto map global-map**.

### Examples

The command **show crypto dynamic-map** shows IPsec dynamic map configuration.

```
(host) #show crypto dynamic-map

Crypto Map Template"default-dynamicmap" 10000
  lifetime: [300 - 86400] seconds, no volume limit
  PFS (Y/N): N
  Transform sets={ default-transform }
```

### Related Commands

Command	Description	Mode
<code>crypto dynamic-map</code>	Use this command to configure a dynamic map.	Config mode

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show crypto ipsec

```
show crypto ipsec {mtu|sa[peer <peer-ip>]|transform-set [tag <transform-set-name>]}
```

### Descriptions

Displays the current IPsec configuration on the switch.

### Syntax

Parameter	Description
mtu	IPsec maximum mtu.
sa	Security associations.
peer <peer-ip>	IPsec security associations for a peer.
transform-set	IPsec transform sets.
tag <transform-set-name>	A specific transform set.

### Usage Guidelines

The command **show crypto ipsec** displays the Maximum Transmission Unit (MTU) size allowed for network transmissions using IPsec security. It also displays the transform sets that define a specific encryption and authentication type.

### Examples

The command **show crypto transform-set** shows the transform sets default-transform and default-ml-transform.

```
(host) #show crypto ipsec transform-set

Transform set default-transform: { esp-3des esp-sha-hmac }
    will negotiate = { Transport, Tunnel }
Transform set default-ml-transform: { esp-3des esp-sha-hmac }
    will negotiate = { Transport, Tunnel }
```

### Related Commands

Command	Description	Mode
<code>crypto ipsec</code>	Use this command to configure IPsec parameters.	Config mode

## show crypto isakmp

```
show crypto isakmp {groupname} | {key} | {policy} | {psk-caching} | {sa [peer <peer-ip>]} | stats}
```

### Descriptions

This command displays Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

### Syntax

Parameter	Description
groupname	Show the IKE Aggressive group name.
key	Show the IKE pre-shared keys.
policy	Show the IKE configured policies.
psk-caching	Shows if the IKE PSK caching is enabled or disabled. This is the refresh status. (Default is disabled.)
sa	Show the security associations
peer <peer-ip>	Shows crypto isakmp security associations for this IP.
stats	Show the IKE statistics.

### Usage Guidelines

Use the `show crypto isakmp psk-caching` command to view whether PSK caching is enabled. If it is enabled then you can refresh the IKE PSK used by remote APs.

### Examples

The command `show crypto isakmp stats` shows the IKE statistics.

```
(host) #show crypto isakmp stats

## show crypto map

```
show crypto ipsec map
```

### Descriptions

This command displays the IPsec map configurations.

### Syntax

Parameter	Description
map	Show the IKE Aggressive group name.

### Usage Guidelines

Use the show crypto map command to view configuration for global, dynamic and default map configurations.

### Examples

The command **show crypto map** shows statistics for the global, dynamic and default maps.

```
(host) #show crypto map

Crypto Map "GLOBAL-MAP" 10000 ipsec-isakmp
Crypto Map Template"default-dynamicmap" 10000
    lifetime: [300 - 86400] seconds, no volume limit
    PFS (Y/N): N
    Transform sets={ default-transform }
Crypto Map "default-local-master-ipsecmap" 9999 ipsec-isakmp
Crypto Map Template"default-local-master-ipsecmap" 9999
    lifetime: [300 - 86400] seconds, no volume limit
    PFS (Y/N): N
    Transform sets={ default-ml-transform }
    Peer gateway: 0.0.0.0

## show crypto pki

```
show crypto pki csr
```

### Descriptions

This command displays the certificate signing request (CSR) for the captive portal feature.

### Syntax

Parameter	Description
csr	The certificate signing request.

### Usage Guidelines

Use the **show crypto pki** command to view the CSR output.

### Examples

The command **show crypto pki** shows output from the **crypto pki csr** command.

```
(host) #show crypto pki csr

## show crypto-local ipsec-map

```
show crypto-local ipsec [tag <ipsec-map-name>]
```

### Descriptions

Displays the current IPsec map configuration on the switch.

### Syntax

Parameter	Description
tag <ipsec-map-name>	Display a specific IPsec map.

### Usage Guidelines

The command **show crypto-local ipsec** displays the current IPsec configuration on the switch.

### Examples

The command **show crypto-local ipsec-map** shows the default map configuration along with any specific IPsec map configurations.

```
(host) #show crypto-local ipsec-map

Crypto Map Template"default-local-master-ipsecmap" 9999
  lifetime: [300 - 86400] seconds, no volume limit
  PFS (Y/N): N
  Transform sets={ default-ml-transform }
  Peer gateway: 0.0.0.0
  Interface: VLAN 0
  Source network: 0.0.0.0/0.0.0.0
  Destination network: 0.0.0.0/0.0.0.0
  Pre-Connect (Y/N): N
  Tunnel Trusted (Y/N): Y
  Forced NAT-T (Y/N): N
Crypto Map Template"testmap" 3
  lifetime: [300 - 86400] seconds, no volume limit
  PFS (Y/N): N
  Transform sets={ default-transform }
  Peer gateway: 0.0.0.0
  Interface: VLAN 0
  Source network: 0.0.0.0/0.0.0.0
  Destination network: 0.0.0.0/0.0.0.0
  Pre-Connect (Y/N): N
  Tunnel Trusted (Y/N): N
  Forced NAT-T (Y/N): N
```

### Related Commands

## show crypto-local isakmp

```
show crypto isakmp {ca-certificates}|{dpd}|{key}|{server-certificate}|{xauth}
```

### Descriptions

This command displays Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

### Syntax

Parameter	Description
ca-certificates	Shows all the Certificate Authority (CA) certificate associated with VPN clients.
dpd	Shows the IKE Dead Peer Detection (DPD) configuration on the local switch.
key	Shows the IKE preshared key on the local switch for site-to-site VPN. This includes keys configured by Fully Qualified Domain Name (FQDN) and local and global keys configured by address.
server-certificate	Shows all the IKE server certificates used to authenticate the switch for VPN clients.
xauth	Shows the IKE XAuth configuration for VPN clients.

### Usage Guidelines

Use the **show crypto-local isakmp** command to view IKE parameters.

### Examples

This example shows sample output for the **show crypto-local ca-certificate**, **show crypto-local dpd**, **show crypto-local key**, **show crypto-local server-certificate** and **show crypto-local xauth** commands .

```
(host) #show crypto-local isakmp ca-certificate
ISAKMP CA Certificates
-----
CA certificate name  Client-VPN  # of Site-Site-Maps
-----
-----

(host) #show crypto-local isakmp dpd
DPD is Enabled: Idle-timeout = 22 seconds, Retry-timeout = 2 seconds, Retry-attempts = 3

(host) #show crypto-local isakmp key
ISAKMP Local Pre-Shared keys configured by FQDN
-----

FQDN of the host  Key
-----

ISAKMP Local Pre-Shared keys configured by FQDN
-----

FQDN of the host  Key
-----

ISAKMP Local Pre-Shared keys configured by Address
-----
IP address of the host  Subnet Mask Length  Key
-----

ISAKMP Global Pre-Shared keys configured by Address
-----

IP address of the host  Subnet Mask Length  Key
-----

(OAW-4324) #show crypto-local isakmp server-certificate
ISAKMP Server Certificates
-----
Server certificate name  Client-VPN  # of Site-Site-Maps
-----
-----

(host) #show crypto-local isakmp xauth
IKE XAuth Enabled
```

## Related Commands

## show crypto-local pki

```
show crypto pki {PublicCert|ServerCert|TrustedCA} <name> <filename>
```

### Descriptions

This command displays imported certificate information.

### Syntax

Parameter	Description
PublicCert <name>	Shows Public key information of a certificate. This certificate allows an application to identify an exact certificate.
ServerCert <name>	Shows Server certificate information. This certificate must contain both a public and a private key (the public and private keys must match). You can import a server certificate in either PKCS12 or x509 PEM format; the certificate is stored in x509 PEM DES encrypted format on the switch.
TrustedCA <name>	Shows trusted CA certificate information. This certificate can be either a root CA or intermediate CA. Alcatel-Lucent encourages (but does not require) an intermediate CA's signing CA to be the switch itself.

### Usage Guidelines

Use the **show crypto-local pki** command to view the name, original filename and reference count for an imported public, server or trusted CA certificates.

### Example

This example displays information about an imported Server certificate. Both the Public and Trusted Ca certificate parameters display similar information.

```
(host) (config) #show crypto-local pki serverCert

Name(total=1)   Original Filename   Reference Count
=====
sialdevice      2400a.pem           1
```

All platforms	VPN server license is required.	Enable mode.

## show database

show database synchronization

### Description

Shows database synchronization status.

### Syntax

No parameters.

### Usage Guidelines

Issue this command to show the status database synchronization status.

### Example

This example shows a database synchronization status.

```
(host) #show database synchronize

Last synchronization time: Not synchronized since last reboot

Periodic synchronization is enabled and runs every 25 minutes
Synchronization includes RF plan data
```

### Related Commands

## show local-userdb username

```
show local-userdb username <name>
```

### Description

Shows information about specific user account in the internal switch database.

### Usage Guidelines

Issue this command to display an overview of a particular user account in the database.

### Example

This example shows the basic summary of a user account **Paula** in the database.

```
(host) #show local-userdb username Paula

User Summary
-----
Name   Password  Role   E-Mail  Enabled  Expiry  Status   Sponsor-Name  Grantor-Name
----  -
paula  *         guest          Yes           Inactive                admin

User Entries: 1
```

wmm counters
```

### Descriptions

Displays system statistics for your switch.

### Syntax

Parameter	Description
acl id <id-name>	Displays datapath statistics associated with a specified ACL. The ACL index is found in the <b>show rights</b> command.
ap-name <ap-name>	Name of the AP.
ip-addr <ip-address>	IP address of the AP
application counters	Shows application counters and errors generated by applications running on a particular AP. These include stateful firewall application layer statistics.
ap-name <ap-name>	Name of the AP.
ip-addr <ip-address>	IP address of the AP.
bridge	Shows bridge table entry statistics including MAC address, VLAN, assigned VLAN, Destination and flag information for an AP.
ap-name <ap-name>	Name of the AP. Shows MAC address, VLAN, assigned VLANs, destination and flags information.
counters	Shows datapath bridge table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures and max link length.

Parameter	Description
ip-addr <ip-address>	IP address of the AP. Shows MAC address, VLAN, assigned VLANs, destination and flags information.
table <macaddr>	Displays the current high, maximum, and total number of bridge table entries for the Alcatel-Lucent switch.
bwm table	Shows bandwidth management table entry statistics such as CPU, contract, Bits/sec, policed, available bytes, queued bytes and packets.
crypto counters	Displays crypto parameter statistics including crypto, IPSEC, PPTP, WEP, TKIP, AESCCM, WEP CRC, crypto hardware, XSEC, DOT1X and L2TP information.
debug	Displays datapath debug details. These are lowlevel datapath details.
dma counters	DMA counters are displayed.
trace-buffers	Debug trace-buffer tables are displayed.
esi table	Displays the contents of the datapath ESI server table entries including server, IP, MAC, destination, VLAN, type, session and flag information.
frame counters	Displays frame statistics that are received and transmitted from the datapath of the switch.
ap-name <ap-name>	Name of the AP.
ip-addr <ip-address>	IP address of the AP.
hardware	Displays datapath hardware counters and hardware packet statistics information.
counters	Hardware counters.
statistics	Hardware packet statistics.
ip-reassembly	Displays the contents of the IP Reassembly statistics table.
ap-name <ap-name>	Name of the AP.
counters	IP reassembly counters.
ip-addr <ip-address>	IP address of the AP
lag table	Displays contents of the datapath link aggregation group (LAG) or port channel table.
maintenance counters	Displays datapath maintenance statistics.
message-queue counters	Displays statistics of messages received by a CPU from other datapath CPUs (only CPUs that receive messages and non-zero statistics are shown).
nat	Displays the contents of the datapath NAT entries table. It displays NAT pools as configured in the datapath. Statistics include pool, SIP start, SIP end and DIP.
ap-name <ap-name>	Name of AP.
counters	Nat counters.
ip-addr <ip-address>	IP address of the AP.
port table	Displays the datapath port-vlan untrusted status and table session entries.
untrusted-vlan <slot/ port>	Show if there are untrusted vlan entries for the indicated slot and port.
vlan-table <slot/ port>	Displays the VLAN and its corresponding SessionACL for a particular slot and port.
route	Displays datapath route table statistics.
ap-name <ap-name>	Name of the AP.

Parameter	Description
counters	Displays route table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures and max link length.
ip-addr <ip-address>	Address of IP.
table	Displays route table entries such as IP, mask, gateway, cost, VLAN and flags.
verbose	Displays all detailed route table entries including IP, mask, gateway, cost, VLAN, flags, Internal VerNum Index.
route-cache	Displays datapath route cache table statistics.
ap-name <ap-name>	Name of the AP.
counters	Displays route cache table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures and max link length.
ip-addr <ip-address>	Address of IP.
table	Displays route cache table entries such as IP, mask, gateway, cost, VLAN and flags.
verbose	Displays all detailed route cache table entries including IP, mask, gateway, cost, VLAN, flags, Internal VerNum Index.
services	Displays the datapath services table statistics including protocol, port and service.
session	Displays datapath session statistics
ap-name <ap-name>	Name of AP
counters	Displays counters statistics including current entries, high water mark, maximum entries, total entries, allocation failures, duplicate entries, cross linked entries, number of reverse entries and maximum link length.
ip-addr <ip-address>	Address of IP
table	Displays all the IP flows of a wireless device or Alcatel-Lucent AP. Statistics include table entries including source IP, destination IP, protocol, SPort, DPort, Cntr, priority, ToS, age, destination, TAge and flags.
station	Displays datapath station association table statistics.
counters	Display the current and high water mark amount of 802.11 associated wireless devices on an Alcatel-Lucent switch. Values output from this command represent the water-marks since the last boot of the switch. This is the same value obtainable from the Num Associations output from the show stm connectivity command.
mac <macaddr>	Hardware address, in hexadecimal format.
table	This command presents the Datapath Station Table Statistics detail. Display all associated wireless devices on the Alcatel-Lucent switch with their corresponding AP BSSID and VLAN ID. Displays the wireless device is associated with the correct encryption type (if the device is associated to an AP BSSID that has encryption enabled and verifies whether the Alcatel-Lucent switch is having a problem in decrypting the wireless device's frames.
tunnel	Displays contents of the datapath tunnel table. This command displays all the tunnels that are terminated by the switch, including Alcatel-Lucent APs' GRE tunnels. For example, a GRE tunnel is created and terminated on the Alcatel-Lucent switch for every SSID/BSSID configured on the Alcatel-Lucent AP.
counters	Tunnel counters.
table	Tunnel table statistics.

Parameter	Description
user	Displays datapath user statistics such as current entries, pending deletes, high water mark, maximum entries, total entries, allocation failures, invalid users and maximum link length.
ap-name <ap-name>	Name of AP.
counters	User counters.
ip-addr <ip-address>	IP address of the AP.
table	User table statistics.
utilization	Displays the current CPU utilization of all datapath CPUs.
vlan	Displays VLAN table information such as VLAN memberships inside the datapath including L@ tunnels which tunnel L2 traffic.
ap-name <ap-name>	Name of the AP.
ip-addr <ip-address>	IP address of AP.
table	Displays VLAN number, flag, port and datapath VLAN multicast entries.
wifi-reassembly counters	Displays wifi reassembly counters including CPU, current entries, high water-mark, maximum entries, total entries and allocation failures.
wmm counters	Displays VOIP statistics including the number of uplink and downlink resets.

## Usage Guidelines

Use the **show datapath** command to display various datapath statistics for debugging purposes.

## Example

In this example, the show datapath user counters command displays datapath user table statistics. .

```
(host) #show datapath user counters
```

```
Datapath User Table Statistics
-----
Current Entries      2
Pending Deletes     0

```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show destination

```
show destination <string>
```

### Description

Display the aliases for default and user-defined network destinations.

### Syntax

Parameter	Description
string	Optional parameter to view details of a specific destination alias.

### Example

This example displays the network destinations configured in the switch.

```
(host) #show destination
controller
-----
Position  Type  IP addr      Mask/Range
-----  -
1         host  10.16.15.1
-----

user
----
Position  Type      IP addr      Mask/Range
-----  -
1         network  255.255.255.255  0.0.0.0
-----

mswitch
-----
Position  Type  IP addr      Mask/Range
-----  -
1         host  10.16.15.1
-----

any
---
Position  Type      IP addr      Mask/Range
-----  -
1         network  0.0.0.0      0.0.0.0
-----
```

The output of this command includes the following parameters:

Parameter	Description
Position	Displays the priority position of the alias.
Type	The rule type of the destination alias.
IP addr	The IP address configured in the alias. This can be a network address, host address or a range.
Mask/Range	Network mark or the IP address range.

### Command History

This command was available in AOS-W 1.0.

Replaced with `netdestination` in 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	You must have a Policy Enforcement Firewall license to configure or view a network destination.	Enable or Config mode on master and local switches

## show dialer group

```
crypto-local
  show dialer group
```

### Description

Display dialer group information.

### Syntax

No parameters.

### Usage Guidelines

Displays the Dialer Group Table with the current dialing parameters.

### Example.

```
(host) #show dialer group
Dialer Group Table
-----
Name      Init String                               Dial String
-----
evdo_us   ATQ0V1E0                                   ATDT#777
gsm_us    AT+CGDCONT=1,"IP","ISP.CINGULAR"         ATD*99#
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## show dir

```
crypto-local
  show dir usb: disk <disk-name><filesystem-path>
```

### Description

Display the list of directories in the specified disk and the filesystem path.

### Syntax

Parameter	Description
<disk-name>	Name of the USB device. If you do not know the name of the USB disk, issue the command <b>show usb-storage</b> to view a list of device names.
<filesystem-path>	The USB file system path.

### Example

The command below displays the USB directory list for a device named **SEGATE-HJ1235\_p1**.

```
(host) #(show dir usb: SEGATE-HJ1235_p1/docs

USB directory list
-----
Permission      Size   Time Stamp   Directory Name
-----
drwxr-xr-x      0     May 13 09:39  samba
```

The output of this command includes the following parameters:

Parameter	Description
Permission	Read, write and execute permissions for the directory.
Size	Size of the directory.
Time Stamp	Date and time that the directory was last modified.
Directory Name	Name of the directory on the USB device.

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## show dot1x ap-table

```
show dot1x ap-table
```

### Description

Shows the 802.1x AP table.

### Syntax

No parameters.

### Example

Issue this command to display details from the AP table.

```
AP Table
-----
MAC      IP      Essid      Type AP name      Vlan Enc      Stations Forwarding-
Mode     Profile  Acl
-----  -
00:1a:1e:87:ff:c0 10.3.9.242      AP  00:1a:1e:c0:7f:fc 0  -      0
```

The output of this command includes the following parameters:

Parameter	Description
MAC	The MAC address of the AP
IP	The IP address of the AP
Essid	The AP's ESSID
Type	Device type
AP name	Name of the AP
Vlan	Number of VLANs associated with the specified AP
Enc	AP's encryption method
Stations	Number of stations associated with the specified AP
Forwarding Mode	Forwarding mode used by the specified AP
Profile	AP profile
Acl	Number of ACLs this AP belongs to

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x ap-table aes

```
show dot1x ap-table aes
```

### Description

Shows the AES keys of all APs.

### Syntax

No parameters.

### Example

Issue this command to display AES keys of all APs.

```
AP Table Showing AES Keys
-----
AP-MAC          GTK/Size/Slot
-----
00:1a:1e:87:ff:d0 * * * * * */128-Bit/1
00:1a:1e:87:ff:d1 * * * * * */128-Bit/1
```

The output of this command includes the following parameters:

Parameter	Description
AP-MAC	AP MAC address
GTK/Size/Slot	GTK: The group temporal key Size: Size of the AES key Slot: Slot number

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x ap-table dynamic-wep

```
show dot1x ap-table dynamic-wep
```

### Description

Shows the dynamic WEP keys of all APs.

### Syntax

No parameters.

### Example

Issue this command to display dynamic keys of all APs.

```
Dynamic-WEP Key Information
-----
AP-MAC  Key1/Size/Slot  Key2/Size/Slot
-----  -----
Num APs: 0
```

The output of this command includes the following parameters:

Parameter	Description
AP-MAC	AP MAC address
Key1/Size/Slot	Key1: The WEP key Size: Size of the WEP key Slot: Slot number
Key12/Size/Slot	Key2: The WEP key Size: Size of the WEP key Slot: Slot number

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x ap-table static-wep

```
show dot1x ap-table static-wep
```

### Description

Shows the static WEP keys of all APs.

### Syntax

No parameters.

### Example

Issue this command to display the static WEP keys of all APs

```
Static-WEP Key Information
-----
AP-MAC  Key1/Size  Key2/Size  Key3/Size  Key3/Size
-----  -
```

The output of this command includes the following parameters:

Parameter	Description
AP-MAC	AP's MAC address
Key1/Size	WEP key 1 and its size
Key2/Size	WEP key 2 and its size
Key3/Size	WEP key 3 and its size
Key3/Size	WEP key 3 and its size

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x ap-table tkip

```
show dot1x ap-table tkip
```

### Description

Displays a table of TKIP keys on the controller.

### Syntax

No parameters.

### Example

Issue this command to display all TKIP keys.

```
AP Table Showing TKIP Keys
-----
AP-MAC          GTK/Size/Slot
-----
00:1a:1e:6f:e5:10 * * * * * */256-Bit/1
Num APs: 1
```

The output of this command includes the following parameters:

Parameter	Description
AP-MAC	AP MAC Address
GTK/Size/Slot	GTK: The group temporal key Size: Size of the AES key Slot: Slot number

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x counters

```
show dot1x counters
```

### Description

Displays a table of dot1x counters.

### Example

Issue this command to display all dot1x count information.

```
802.1x Counters

AP

Message-1.....2630
Message-2.....13
```

The output of this command includes the following parameters:

Parameter	Description
AP	
● Sync Request	● Number of sync requests sent
● Sync Response	● Number of sync responses sent
● Up	● Number of times an AP has come up
● Down	● Number of times an has gone down
● Resps	● Number of response messages ent to the AP due to an AP up message
● Acl	● Number of access control lists

Parameter	Description
Station <ul style="list-style-type: none"> <li>• Sync Request</li> <li>• Sync Response</li> <li>• Up</li> <li>• Down</li> <li>• Unknown</li> </ul>	<ul style="list-style-type: none"> <li>• Number of sync requests sent to find all APs and stations that are connected</li> <li>• Number of sync responses recieved</li> <li>• Number of times a station (any station) connected to the AP</li> <li>• Number of times a station (any station) disconnected from the AP</li> <li>• Number of times a station attempted to start an EAP exchange before associating to an AP. In otherwords, the number of times the auth module saw the start of an EAP exchange before auth was notified that a station has associated an AP</li> </ul>
EAP <ul style="list-style-type: none"> <li>• RX Pkts</li> <li>• Dropped Pkts</li> <li>• TX Pkts</li> </ul>	<ul style="list-style-type: none"> <li>• Number fo EAP packets recieved</li> <li>• Number of EAP packets dropped (ignored) for any reason, such as bad packet, length, EAP ID mismatch, etc.</li> <li>• Number of EAP packets sent</li> </ul>

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x supplicant-info

```
show dot1x supplicant-info <supplicant-mac> <ap-mac>
```

### Description

Shows the details about a specific supplicant.

### Example

Issue this command to display the details about a supplicant

```
Detailed 802.1x Supplicant Information

Name                               Mycompany\ccutler
MAC Address                        00:19:7e:a9:8e:b0
AP MAC Address                     00:1a:1e:11:5f:11
Status                             Authentication Success
Unicast Cipher                     WPA2-AES
Multicast Cipher                   WPA2-AES
EAP-Type                           EAP-PEAP

Packet Statistics:
EAPOL Starts                       0
EAP ID Requests                    0
EAP ID Responses                   0
EAPOL Logoffs from station         0
EAP pkts to the station            2
EAP pkts from station              2
Unknown EAP pkts from station     0
EAP Successes sent                 0
EAP Failures sent                  0
Station failed to respond          0
Station NAKs                       0
Radius pkts to the server          0
Radius pkts from the server        0
Server failed to respond           0
Server rejects                     0
WPA/WPA2-Key Message1             1
WPA/WPA2-Key Message2             1
WPA/WPA2-Key Message3             1
WPA/WPA2-Key Message4             1
WPA-GKey Message1                 0
```

The output of this command includes the following parameters:

Parameter	Description
Name	Supplicant name
MAC Address	Supplicant MAC address
AP MAC Address	AP MAC address
Status	Supplicant's status
Unicast Cipher	Supplicant's unicast cipher
Multicast Cipher	Supplicant's multicast cipher
EAP-Type	Supplicant's EAP-Type

Parameter	Description
EAPOL Starts	Number of EAPOL starts
EAP ID Requests	Number of EAP ID requests
EAP ID Responses	Number of EAP ID responses
EAPOL Logoffs from station	Number of EAPOL logoffs from the station
EAP pkts to the station	Number of EAP packets sent to the station
EAP pkts from station	Number of EAP packets sent from the station
Unknown EAP pkts from station	Number of unknown EAP packets sent from the station
EAP Successes sent	Number of EAP successes sent
EAP Failures sent	Number of EAP failures sent
Station failed to respond	Number of times the station failed to respond
Station NAKs	Number of station negative-acknowledgement characters
Radius pkts to the server	Number of radius packets set to the server
Radius pkts from the server	Number of radius packets sent from the server
Server failed to respond	Number of times the server failed to respond
Server rejects	Number of times ac connection was rejected by the server
WPA/WPA2-Key Message1	Number of WPA message-1s sent
WPA/WPA2-Key Message2	Number of WPA message-2s sent
WPA/WPA2-Key Message3	Number of WPA message-3s sent
WPA/WPA2-Key Message4	Number of WPA message-4s sent
WPA-GKey Message1	Number of WPA group message-1s sent
WPA-GKey Message2	Number of WPA group message-2s sent
ID of the last EAP request	The ID of the last EAP request
Length of the last EAP request	The length of the last EAP request
ID of the last EAP response	The ID of the last EAP response
Length of the last EAP response	The length of the last EAP response
ID of the last radius request	The ID of the last radius request
Length of the last radius request	The length of the last radius request
ID of the last radius response	The ID of the last radius response

Parameter	Description
Length of the last radius response	The length of the last radius response.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x supplicant-info list-all

```
show dot1x supplicant-info list all
```

### Description

Shows all 802.1x supplicants.

### Syntax

No parameters.

### Example

Issue this command to display all 802.1x supplicants as well as additional relevant information.

```
802.1x User Information
```

```
-----  
MAC          Name      Auth  AP-MAC          Enc-Key/Type          Auth-Mode          EAP-  
Type  Remote  
-----  
-----
```

The output of this command includes the following parameters:

Parameter	Description
MAC	Supplicant MAC address
Name	Supplicant name
Auth	Has the supplicant authenticated successfully
AP-MAC	AP MAC address
Enc-Key/Type	Enc-Key: Supplicant's encryption key Type: Encryption type used by the supplicant
Auth-Mode	Authentication mode
EAP-Type	EAP type
Remote	Is the supplicant remote

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x supplicant-info pmkid

```
show dot1x supplicant-info pmkid <supplicant-mac>
```

### Description

Shows the PMKIDs of the various stations on the switch.

### Syntax

No parameters.

### Example

Issue this command to display the PMKIDs of the various stations on the switch.

PMKID Table

```
-----  
Mac                Name                AP                PMKID  
---                -
```

00:03:7f:bf:12:ac	zoobar22	00:0b:86:a0:57:60	c2:7d:12:1a:1c:5b:40:f8:89:46:22:a5:ec:9b:fb:a6
-------------------	----------	-------------------	---

The output of this command includes the following parameters:

Parameter	Description
MAC	Supplicant MAC address
Name	Supplicant name
AP	AP MAC address
PMKID	Station PMKID

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show dot1x supplicant-info statistics

```
show dot1x supplicant-info statistics
```

### Description

Shows the 802.1x statistics of the users.

### Syntax

No parameters.

### Example

Issue this command to display the 802.1x statistics of the users.

```
802.1x Statistics
-----
Mac           Name      AP           Auth-Succs  Auth-Fails  Auth-Tmout  Re-Auths  Supp-Naks
UKeyRotations MKeyRotations
---          - - - -  - -          - - - - -  - - - - -  - - - - -  - - - - -
-----
```

The output of this command includes the following parameters:

Parameter	Description
MAC	Supplicant MAC address
Name	Supplicant name
AP	AP MAC address
Auth-Succs	Number of successful authentications
Auth-Fails	Number of authentication failures
Auth-Tmout	Number of authentication timeouts
Re-Auths	Number of reauthentications
Supp-Naks	Number of negative-acknowledgement characters sent by the supplicant
UKeyRotations	Number of unicast key rotations
MKeyRotations	Number of multicast key rotations

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show esi groups

```
show esi groups [{group-name <groupname>|ping-name <ping-name>}]
```

### Description

Show ESI group information.

### Syntax

Parameter	Description
group-name <groupname>	View the facility used when logging messages into the remote syslog server.
ping-name <ping-name>	Enter the name of a set of ping values to how the names of ESI groups using that set of ping attributes. Define a set of ESI ping values using the command <code>esi ping</code> .
server	Show the IP address of a remote logging server.

### Usage Guidelines

The ESI parser is a mechanism for interpreting syslog messages from third party appliances such as anti-virus gateways. Use this command to view configured ESI server groups.

### Example

This example below displays the name of each configured ESI group, including its ping definitions and ESI server.

```
(host) #show esi groups

ESI Group Table
-----
Name          Tunnel ID  Ping      Flags  Servers
----          -
anything      0x1042    pingset_1 C       0
cupertino     0x1043    -         C       0
Flags:
  C:Datapath Download complete
```

### Related Commands

Platforms	Licensing	Command Mode
<code>esi group</code>	This command configures an ESI group.	Config mode on master or local switches.
<code>esi ping</code>	This command specifies the ESI ping health check configuration.	Config mode on master or local switches.
<code>esi server</code>	This command configures an ESI server.	Config mode on master or local switches.

### Command History

This command was introduced in AOS-W 2.5.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show esi parser

show esi parser domains|rules|stats

### Description

Show ESI parser information.

### Syntax

Parameter	Description
domains	Show ESI parser domain information.
rules	Show ESI parser rule information.
stats	Show ESI parser rule stats.

### Usage Guidelines

The ESI parser is a generic syslog parser on the switch that accepts syslog messages from external third-party appliances such as anti-virus gateways, content filters, and intrusion detection systems. It processes syslog messages according to user-defined rules and takes configurable actions on the corresponding system users.

ESI servers are configured into domains to which ESI syslog parser rules are applied.

Use the `show esi parser domains` command to show ESI parser domain information.

### Example

The ESI Parser Domain Table in the example below shows that the switch has two ESI domains and two ESI servers.

```
(host) #show esi parser domains

ESI Parser Domain Table
-----
Domain          ESI Servers      Peer Controllers
-----
corp_domain     172.21.5.50      10.3.132.14
remote_domain   192.84.66.30

Total number of servers configured: 2
```

### Related Commands

Platforms	Licensing	Command Mode
<code>esi parser domain</code>	This command configures an ESI syslog parser domain.	Config mode on master or local switches.
<code>esi parser rule</code>	This command creates or changes an ESI syslog parser rule.	Config mode on master or local switches.
<code>esi parser rule-test</code>	This command allows you to test all of the enabled parser rules.	Config mode on master or local switches.

### Command History

This command was introduced in AOS-W 3.1.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show esi ping

```
show esi ping [ping-name <ping-name>]
```

### Description

Show settings for ESI ping health check attributes.

### Syntax

Parameter	Description
ping-name <ping-name>	Include the optional <b>ping-name &lt;ping-name&gt;</b> parameters to display settings for one specified set of ping settings.

### Example

This example below shows that the switch has three defined sets of ping attributes.

```
(host) #show esi groups

ESI Ping Table
-----
Name          Frequency (sec)  Timeout (sec)  Retry Count  ID  Num Groups
-----
ping_att1     5                 2              2            0   1
ESIPing       5                 2              2            1   0
ESIPing2      50000            2              2            2   2
```

The output of this command includes the following information:

Column	Description
Name	Name of a group of ping settings.
frequency	Specifies the ping frequency in seconds.
timeout	Specifies the ping timeout in seconds.
retry-count	Specifies the ping retry count
ID	ID number assigned to the ping attributes when that set of attributes was defined.
Num Groups	Number of ESI groups to which this set of ping attributes is assigned.

### Related Commands

Platforms	Licensing	Command Mode
esi ping	This command specifies the ESI ping health check configuration.	Config mode on master or local switches.

### Command History

This command was introduced in AOS-W 2.5.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show esi servers

```
show esi servers [{group-name <groupname>|{server-name <server-name>}}
```

### Description

Show configuration information for ESI servers.

### Syntax

Parameter	Description
group-name <groupname>	Include this optional parameter to display information for all ESI servers assigned to a specific ESI group.
server-name <server-name>	Specify an ESI server name to view configuration information for just that server.

### Usage Guidelines

By default, this command displays configuration settings for all ESI servers. You can include the name of an ESI group to view servers assigned to just that group, or specify a server name to view information for that server only.

### Example

This example below displays configuration details for the ESI server name **forti\_1**.

```
(host) #show esi servers server-name forti_1

ESI Server Table
-----
Name      Trusted IP    Untrusted IP  Trusted s/p  Untrusted s/p  Group   Mode   NAT Port  ID  Flags
-----
forti_1   10.168.173.2  10.168.171.3  -/-          -/-            default route 0      4  U
Flags:
  C :Datapath Download complete
  U :Server Up
  D :Server Down
  PT:Trusted Ping response outstanding
  PU:Untrusted Ping response outstanding
  HT:Health Check Trusted IP
  HU:Health Check Untrusted IP
  FT:Trusted Ping failed
  FU:Untrusted Ping failed
```

The output of this command includes the following information:

Column	Description
Name	Name of the ESI server.
Trusted IP	Displays the server IP address on the trusted network. As an option, you can also enable a health check on the specified address
Untrusted IP	Displays the server IP address on the untrusted network. As an option, you can also enable a health check on the specified address
Trusted s/p	Shows the slot and port connected to the trusted side of the ESI server; slot/port format.
Utrusted s/p	Shows the slot and port connected to the untrusted side of the ESI server.
Group	Name of the ESI group to which this server is assigned. If the server has not yet been assigned to a group, this column will be blank.

Column	Description
Mode	Specifies the ESI server mode of operation: bridge, nat, or route
Nat Port	Displays the NAT destination TCP/UDP port.
ID	ID number assigned to the server when it was first defined.
Flags	This data column displays any flags associated with this server. The flag key appears below the ESI Server Table.

## Related Commands

Platforms	Licensing	Command Mode
<code>esi server</code>	This command configures an ESI server.	Config mode on master or local switches.

## Command History

This command was introduced in AOS-W 2.5.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show faults

```
show fault [history]
```

### Description

Display a list of faults, which are any problematic conditions of the AOS-W software or hardware.

### Syntax

Parameter	Description
history	Include this parameter to display a history of faults cleared by the switch or the operator.

### Usage Guidelines

A switch can maintain a list of up to 100 faults. Once 100 faults have been logged, any faults arising after that are dropped. The switch maintains a history of the last 100 faults that have cleared. Every time a new fault clears clear, the oldest fault in the fault history is purged from the list.

### Example

This example below shows all active faults the switch, including the time the fault occurred, the fault ID number, and a description of the problem..

```
(host) #show firewall
```

```
Active Faults
```

```
-----
```

Time	Number	Description
----	-----	-----

## show firewall

```
show firewall
```

### Description

Display a list of global firewall policies.

### Syntax

No parameters

### Example

This example below shows all firewall policies currently configured on the switch.

```
(host) #show firewall

Global firewall policies
-----
Policy                               Action   Rate   Slot/Port
-----
Enforce TCP handshake before allowing data  Enabled
Prohibit RST replay attack                 Enabled
Deny all IP fragments                     Enabled
Prohibit IP Spoofing                       Enabled
Monitor ping attack                         Enabled   20/sec
Monitor TCP SYN attack                     Disabled
Monitor IP sessions attack                 Disabled
Deny inter user bridging                   Disabled
Log all received ICMP errors               Disabled
Per-packet logging                         Disabled
Session mirror destination                 Disabled
Stateful SIP Processing                     Enabled
Allow tri-session with DNAT                Enabled
Disable FTP server                          No
GRE call id processing                     Disabled
Session Idle Timeout                       Disabled
Broadcast-filter ARP                       Disabled
WMM content enforcement                    Disabled
Session VOIP Timeout                       Disabled
Stateful H.323 Processing                  Enabled
Stateful SCCP Processing                    Enabled
Only allow local subnets in user table    Enabled
Monitor/police CP attacks                   Enabled   255/sec
Rate limit CP untrusted ucast traffic      Enabled   10 Mbps
Rate limit CP untrusted mcast traffic      Enabled   2 Mbps
Rate limit CP trusted ucast traffic        Enabled   80 Mbps
Rate limit CP trusted mcast traffic        Enabled   2 Mbps
Rate limit CP route traffic                Enabled   1 Mbps
Rate limit CP session mirror traffic       Enabled   1 Mbps
Rate limit CP auth process traffic         Enabled   1 Mbps
Deny inter user traffic                     Disabled
Session mirror IPSEC                       Disabled
```

The output of this command includes the following information:

Parameter	Description
Enforce TCP handshake before allowing data	If enabled, this feature prevents data from passing between two clients until the three-way TCP handshake has been performed. This option should be disabled when you have mobile clients on the network as enabling this option will cause mobility to fail. You can enable this option if there are no mobile clients on the network.

Parameter	Description
Prohibit RST replay attack	If enabled, this setting closes a TCP connection in both directions if a TCP RST is received from either direction.
Deny all IP fragments	If enabled, all IP fragments are dropped.
Prohibit IP Spoofing	When this option is enabled, IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.
Monitor ping attack	If enabled, the switch monitors the number of ICMP pings per second. If this value exceeds the maximum configured rate, the switch will register a denial of service attack.
Monitor TCP SYN attack	If enabled, the switch monitors the number of TCP SYN messages per second. If this value exceeds the maximum configured rate, the switch will register a denial of service attack.
Monitor IP sessions attack	If enabled, the switch monitors the number of TCP sessions requests per second. If this value exceeds the maximum configured rate, the switch will register a denial of service attack sessions.
Deny inter user bridging	If enabled this setting prevents the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic.
Log all received ICMP errors	Shows if the switch will log received ICMP errors.
Per-packet logging	If active, and logging is enabled for the corresponding session rule, this feature logs every packet.
Session mirror destination	Destination to which mirrored packets are sent.
Stateful SIP Processing	Shows if the switch has enabled or disabled monitoring of exchanges between a voice over IP or voice over WLAN device and a SIP server. This option should be enabled only when there is no VoIP or VoWLAN traffic on the network
Allow tri-session with DNAT	Shows if the switch allows three-way session when performing destination NAT.
Disable FTP server	If active, this feature disables the FTP server on the switch.
GRE call id processing	If active the switch creates a unique state for each PPTP tunnel.
Session Idle Timeout	Shows if a session idle timeout interval has been defined.
Broadcast-filter ARP	If enabled, this feature reduces the number of broadcast packets sent to VoIP clients, thereby improving the battery life of voice handsets.
WMM content enforcement	If traffic to or from the user is inconsistent with the associated QoS policy for voice, this feature reclassifies traffic to best effort and data path counters are incremented.
Session VOIP Timeout	If enabled, a idle session timeout is defined for sessions that are marked as voice sessions.
Stateful H.323 Processing	Shows if the switch has enabled or disabled stateful H.323 processing.
Stateful SCCP Processing	Shows if the switch has enabled or disabled stateful SCCP processing.
Only allow local subnets in user table	If enabled, the switch only adds IP addresses which belong to a local subnet to the user table.
Monitor/police CP attacks	If enabled, the switch monitors the a misbehaving user's inbound traffic rate. If this rate is exceeded, the switch can register a denial of service attack.

Parameter	Description
Rate limit CP untrusted ucast traffic	Shows the inbound traffic rate
Rate limit CP untrusted mcast traffic	Displays the untrusted multicast traffic rate limit.
Rate limit CP trusted ucast traffic	Displays the trusted unicast traffic rate limit.
Rate limit CP trusted mcast traffic	Displays the trusted multicast traffic rate limit.
Rate limit CP route traffic	Displays the traffic rate limit for traffic that needs generated ARP requests.
Rate limit CP session mirror traffic	Displays the traffic rate limit for session mirrored traffic forwarded to the switch.
Rate limit CP auth process traffic	Displays the traffic rate limit for traffic forwarded to the authentication process.
Denyinterusertraffic	If enabled, this setting disables the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic.
Session mirror IPSEC	If enabled, rframes are sent to IP address specified by the <a href="#">session-mirror-destination</a> option.

## show gateway health-check

```
show gateway health-check
```

### Description

Display the current status of the gateway health-check feature.

### Syntax

No parameters.

### Usage Guidelines

The gateway health check feature can only be enabled by Alcatel-Lucent Technical Support.

### Example

This example below shows that the gateway health-check feature has not been enabled on the switch.

```
(host) #show gateway health-check
Gateway health check not enabled
```

### Related Commands

## show global-user-table count

```
show global-user-table
show global-user-table count
    [current-switch] <IP address>
    [authentication-method] {dot1x | mac | stateful-dot1x | vpn | web}
    [role] <role name>
    [bssid] <bssid MAC>
    [essid] <essid name>
    [ap-name] <AP name>
    [phy-type] {a | b | g}
    [age] <starting time dd:hh:mm> <ending time dd:hh:mm>
```

### Description

This command displays a count of global user based on the specified criteria.

### Syntax

Parameter	Description
current-switch	Match IP address of the switch where the user is currently associated
authentication-method	Count users matching the specified authentication method
role	Count users matching the specified role
bssid	Count users matching the specified BSSID
essid	Count users matching the specified ESSID
ap-name	Count users matching the specified AP name
phy-type	Count users matching the specified Phy type
age	Count users matching the specified age

### Example

Issue this command to display a global user count. The output shown below is a result of the command **show global-user-table count current-switch <ip-address>**.

```
Complete results.
The number of global users is 2
```

The output includes the following parameters:

Parameter	Description
The number of global users:	Total number of global users meeting the specified criteria.

### Command History

This command was introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms Master switch only	Base operating system	Enable or config mode on master switches

## show-global-user-table list

```
show global-user-table list
  [current-switch] <IP address>
  [authentication-method] {dot1x | mac | stateful-dot1x | vpn | web}
  [role] <role name>
  [bssid] <bssid MAC>
  [ssid] <ssid name>
  [ap-name] <AP name>
  [phy-type] {a | b | g}
  [age] <starting time dd:hh:mm> <ending time dd:hh:mm>
  [not]
  [or]
  [rows]
  [sort] {sort_by_ap-name | sort_by_authtype | sort_by_bssid | sort_by_current-switch |
  sort_by_ssid | sort_by_ip | sort_by_mac | sort_by_name | sort_by_phy-type |
  sort_by_role}{asc | desc}
  [start]
```

### Description

This command displays a list of current users on a specified switch.

### Syntax

Parameter	Description
current-switch	Match IP address of the switch where the user is currently associated
authentication-method	Count users matching the specified authentication method
role	Count users matching the specified role
bssid	Count users matching the specified BSSID
ssid	Count users matching the specified ESSID
ap-name	Count users matching the specified AP name
phy-type	Count users matching the specified Phy type
age	Count users matching the specified age
current-switch	Match IP address of the switch where the user is currently associated
authentication-method	Count users matching the specified authentication method
role	Count users matching the specified role
not	Show users that do not satisfy the given criteria
or	Show users that satisfy any of the given criteria
rows	Number of rows to show
sort	Sort the list based on a specified criteria, in ascending or descending order
start	Show user table starting from a specific row

### Example

Issue this command to display a global user count. The output shown below is a result of the command **show global-user-table list current-switch <ip-address>**

Global Users

```

-----
      IP          MAC          Name  Current switch  Role          Age (d:h:m)  Auth  VPN link AP name
  Essid Bssid  Phy Profile
-----
-----
  
```

The output includes the following parameters:

Parameter	Description
IP	IP address of user
MAC	MAC address of user
Name	User name
Current Switch	IP address of the switch where the user is currently associated
Role	User role
Age	User age, displayed as days : hours : minutes
Auth	Authentication method used by user
VPN Link	VPN link
AP name	AP name
Roaming	Roaming status
Essid	ESSID
Bssid	BSSID
Phy	Phy type
Profile	Profile name

## Command History

This command was introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms Master switch only	Base operating system	Enable or config mode on master switches

## show guest-access-email

```
show guest-access-email
```

### Description

This command shows a guest access email profile configuration. The guest access email process sends email to either the guest or the sponsor whenever a guest user account is created or when the Guest Provisioning user manually sends email from the Guest Provisioning page.

### Syntax

No parameters.

### Usage Guidelines

Issue this command to show the current guest access email profile parameters. The **Parameter** and **Value** columns show the configured SMTP server and SMTP ports. that process guest email.

```
(host) #show guest-access-email

Guest-access Email Profile
-----
Parameter      Value
-----
SMTP Server    10.1.1.4
SMTP Port      25
```

### Related Commands

```

## show ids dos-profile

```
show ids dos-profile <profile-name>
```

### Description

Show an IDS Denial Of Service (DoS) Profile

### Syntax

Parameter	Description
<profile-name>	Name of an IDS DoS profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS DoS profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has four configured DoS profiles.

```
(host) # show ids dos-profile
IDS Denial Of Service Profile List
-----
Name                References  Profile Status
----                -
default             1
ids-dos-disabled    1          Predefined
ids-dos-high-setting 1          Predefined
ids-dos-low-setting  1          Predefined
ids-dos-medium-setting 1          Predefined
```

This example displays the configuration settings for the profile **ids-dos-disabled**.

```
(host) # show ids dos-profile ids-dos-disabled
IDS Denial Of Service Profile "ids-dos-disabled" (Predefined)
-----
Parameter                Value
-----
Spoofed Deauth Blacklist  Disabled
Detect AP Flood Attack    false
AP Flood Threshold        50
AP Flood Increase Time    3 sec
AP Flood Detection Quiet Time 900 sec
Detect EAP Rate Anomaly   false
EAP Rate Threshold        60
EAP Rate Time Interval    3 sec
EAP Rate Quiet Time       900 sec
Detect Rate Anomalies     false
Rate Thresholds for Assoc Frames default
Rate Thresholds for Disassoc Frames default
Rate Thresholds for Deauth Frames default
Rate Thresholds for Probe Request Frames default
Rate Thresholds for Probe Response Frames default
Rate Thresholds for Auth Frames default
Detect 802.11n 40MHz Intolerance Setting false
Client 40MHz Intolerance Detection Quiet Time 900
```

The output of this command includes the following parameters:

Parameter	Description
Spoofed Deauth Blacklist	Shows if the profile has enabled or disabled detection of a deauth attack initiated against a client associated to an Alcatel-Lucent AP. When such an attack is detected, the client is quarantined from the network to prevent a man-in-the-middle attack from being successful.
Detect Ap Flood Attack	Shows if the profile has enabled or disabled detection of flooding with fake AP beacons to confuse legitimate users and to increase the amount of processing needed on client operating systems.
AP Flood Threshold	Number of fake AP beacons that must be received within the flood increase time to trigger an alarm.
AP Flood Increase Time	Time, in seconds, during which a configured number of fake AP beacons must be received to trigger an alarm.
AP Flood Detection Quiet Time	Time, in seconds, that must elapse before a second fake AP flood alarm may be triggered.
Detect EAP Rate Anomaly	Shows if the profile has enabled or disabled Extensible Authentication Protocol (EAP) handshake analysis to detect an abnormal number of authentication procedures on a channel and generate an alarm when this condition is detected.
EAP rate Threshold	Number of EAP handshakes that must be received within the EAP rate time interval to trigger an alarm.
EAP Rate Time Interval	Time, in seconds, during which the configured number of EAP handshakes must be received to trigger an alarm.
EAP Rate Quiet Time	Time, in seconds, that must elapse after an EAP rate anomaly alarm has been triggered before another identical alarm may be triggered.
Detect Rate Anomalies	Enables detection of rate anomalies.
Rate Thresholds for Assoc Frames	Rate threshold for associate request frames.
Rate Thresholds for Disassoc Frames	Rate threshold for disassociate frames.
Rate Thresholds for Deauth Frames	Rate threshold for deauthenticate frames.
Rate Thresholds for Probe Request Frames	Rate threshold for probe request frames.
Rate Thresholds for Probe Response Frames	Rate threshold for probe response frames.
Rate Thresholds for Auth Frames	Rate threshold for authenticate frames.
Detect 802.11n 40MHz Intolerance Setting	Shows if the profile has enabled or disabled detection of 802.11n 40 MHz intolerance setting, which controls whether stations and APs advertising 40 MHz intolerance will be reported.
Client 40MHz Intolerance Detection Quiet Time	Seconds of quiet time when the AP stops reporting intolerant STAs if they have not been detected).

## Related Commands

Configure IDS DoS profiles using the command `ids dos-profile`.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config mode on master or local switches

## show ids general-profile

```
show ids general-profile <profile-name>
```

### Description

Show an IDS General profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS General profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS General profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has four configured General profiles.

```
(host) # show ids general-profile
IDS General Profile List
-----
Name                References  Profile Status
----                -
default             3
ids-general-disabled 1           Predefined
ids-general-high-setting 1         Predefined
test1                0
Total:4
```

This example displays the configuration settings for the profile **default**.

```
(host) # show ids general-profile default
IDS General Profile "default"
-----
Parameter          Value
-----
Stats Update Interval 60 sec
AP Inactivity Timeout 5 sec
STA Inactivity Timeout 60 sec
Min Potential AP Beacon Rate 25 %
Min Potential AP Monitor Time 3 sec
Signature Quiet Time 900 sec
Wireless Containment true
Debug Wireless Containment false
Wired Containment false
```

The output of this command includes the following parameters:

Parameter	Description
Stats Update Interval	Interval, in seconds, for the AP to update the switch with statistics. This setting takes effect only if the Alcatel-Lucent Mobility Manager is configured. Otherwise, statistics update to the switch is disabled.
AP Inactivity Timeout	Time, in seconds, after which an AP is aged out.
STA Inactivity Timeout	Time, in seconds, after which a station is aged out.

Parameter	Description
Min Potential AP Beacon Rate	Minimum beacon rate acceptable from a potential AP, in percentage of the advertised beacon interval.
Min Potential AP Monitor Time	Minimum time, in seconds, a potential AP has to be up before it is classified as a real AP.
Signature Quiet Time	After a signature match is detected, the time to wait, in seconds, to resume checking.
Wireless Containment	Shows if the profile has enabled or disabled containment from the wireless side.
Debug Wireless Containment	Shows if the profile has enabled or disable debugging of containment from the wireless side.
Wired Containment	Shows if the profile has enabled or disable containment from the wired side.

## Related Commands

Configure IDS General profiles using the command [ids general-profile](#).

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config mode on master or local switches

## show ids impersonation-profile

```
show ids impersonation-profile <profile-name>
```

### Description

Show an IDS Impersonation Profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS Impersonation profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS Impersonation profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has three configured Impersonation profiles.

```
(host) # show ids impersonation-profile
IDS Impersonation Profile List
-----
Name                References  Profile Status
----                -
default             3
ids-impersonation-disabled  1          Predefined
ids-impersonation-high-setting  1          Predefined
Total:3
```

This example displays the configuration settings for the profile **ids-impersonation-high-setting**.

```
(host) # show ids impersonation-profile ids-impersonation-high-setting
IDS Impersonation Profile "ids-impersonation-high-setting" (Predefined)
-----
Parameter                Value
-----
Detect AP Impersonation   true
Protect from AP Impersonation true
Beacon Diff Threshold     50 %
Beacon Increase Wait Time 3 sec
```

The output of this command includes the following parameters:

Parameter	Description
Detect AP Impersonation	Shows if the profile has enabled or disabled detection of AP impersonation.
Protect from AP Impersonation	Shows if AP impersonation is enabled or disabled for the profile. When AP impersonation is detected, both the legitimate and impersonating AP are disabled using a denial of service attack.
Beacon Diff Threshold	Percentage increase in beacon rates that triggers an AP impersonation event.
Beacon Increase Wait Time	Time, in seconds, after the beacon difference threshold is crossed before an AP impersonation event is generated.

## Related Commands

Configure IDS impersonation profiles using the command `ids impersonation-profile`.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config mode on master or local switches

## show ids profile

```
show ids profile <profile-name>
```

### Description

Show an IDS profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has five configured IDS Profiles.

```
(host) # show ids profile
IDS Profile List
-----
Name           References  Profile Status
----           -
default        1
ids-disabled   0           Predefined
ids-high-setting 0           Predefined
ids-low-setting 5           Predefined
ids-medium-setting 0          Predefined

Total:5
```

This example displays the configuration settings for the profile **ids-low-setting**.

```
(host) # show ids profile ids-low-setting

IDS Profile "ids-low-setting" (Predefined)
-----
Parameter                               Value
-----
IDS General profile                       default
IDS Signature Matching profile            factory-default-signature
IDS DOS profile                           ids-dos-low-setting
IDS Impersonation profile                 default
IDS Unauthorized Device profile           default
```

The output of this command includes the following parameters:

Parameter	Description
IDS General profile	Name of a IDS General profile to be applied to an AP or AP group.
IDS Signature Matching profile	Name of a IDS Signature Matching profile to be applied to an AP or AP group.
IDS DOS profile	Name of a IDS Denial of Service profile to be applied to an AP or AP group.

Parameter	Description
IDS Impersonation profile	Name of a IDS Impersonation profile to be applied to an AP or AP group.
IDS Unauthorized Device profile	Name of a IDS Unauthorized Device profile to be applied to an AP or AP group.

## Related Commands

Configure the IDS profile using the command **ids profile**.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config mode on master or local switches

## show ids rate-thresholds-profile

```
show ids rate-thresholds-profile <profile-name>
```

### Description

Show an IDS Rate Thresholds profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS Rate Threshold profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS Rate Threshold profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has eight configured IDS Rate Threshold Profiles.

```
(host) # show ids rate-thresholds-profile
IDS Rate Thresholds Profile List
-----
Name                               References  Profile Status
----                               -
def-assoc-thresholds                1
def-auth-thresholds                 1
def-deauth-thresholds               1
def-disassoc-thresholds              1
def-probe-request-thresholds         1
def-probe-response-thresholds        1
default                              18
probe-request-response-thresholds    6          Predefined

Total:8
```

This example displays the configuration settings for the profile **probe-request-response-thresholds**.

```
(host) # show ids rate-thresholds-profile probe-request-response-thresholds
IDS Rate Thresholds Profile "probe-request-response-thresholds" (Predefined)
-----
Parameter                           Value
-----
Channel Increase Time                 30 sec
Channel Quiet Time                    900 sec
Channel Threshold                      350
Node Time Interval                    10 sec
Node Quiet Time                       900 sec
Node Threshold                         250
```

The output of this command includes the following parameters:

Parameter	Description
Channel Increase Time	Time, in seconds, in which the threshold must be exceeded in order to trigger an alarm.

Parameter	Description
Channel Quiet Time	The time that must elapse after a channel rate alarm before another identical alarm may be triggered. This option prevents excessive messages in the log file.
Channel Threshold	Number of a specific type of frame that must be exceeded within a specific interval in an entire channel to trigger an alarm.
Node Time Interval	Time, in seconds, in which the threshold must be exceeded in order to trigger an alarm.
Node Quiet Time	The time that must elapse after a node rate alarm before another identical alarm may be triggered. This option prevents excessive messages in the log file.
Node Threshold	Number of a specific type of frame that must be exceeded within a specific interval for a particular client MAC address to trigger an alarm.

## show ids signature-matching-profile

```
show ids signature-matching-profile <profile-name>
```

### Description

Show an IDS Signature Matching profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS Signature Matching profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS Signature Matching profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has two configured Signature Matching profiles.

```
(host) # show ids signature-matching-profile
IDS Signature Matching Profile List
-----
Name                References  Profile Status
----                -
default             2
factory-default-signatures  3          Predefined

Total:2
```

This example displays the configuration settings for the profile **factory-default-signatures**.

```
(host) # show ids signature-matching-profile factory-default-signatures
IDS Signature Matching Profile "factory-default-signatures" (Predefined)
-----
Parameter          Value
-----
IDS Signature      AirJack
IDS Signature      ASLEAP
IDS Signature      Deauth-Broadcast
IDS Signature      Netstumbler Generic
IDS Signature      Netstumbler Version 3.3.0x
IDS Signature      Null-Probe-Response
```

The output of this command includes the following parameters:

Parameter	Description
IDS Signature	Name of a signature profile. See <a href="#">ids signature-profile</a> on page 193.

### Related Commands

Configure the Signature Matching profile using the command [ids signature-matching-profile](#).

## show ids signature-profile

```
show ids signature-profile <profile-name>
```

### Description

Show an IDS signature profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS Signature profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS Signature profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has eight configured Signature profiles.

```
(host) # show ids signature-profile

IDS Signature Profile List
-----
Name                References  Profile Status
-----
AirJack             1          Predefined
ASLEAP              1          Predefined
Deauth-Broadcast   1          Predefined
default             1
Netstumbler Generic 1          Predefined
Netstumbler Version 3.3.0x 1          Predefined
Null-Probe-Response 1          Predefined
sample             0

Total:8
```

This example displays the configuration settings for the profile **AirJack**.

```
(host) # show ids signature-profile
IDS Signature Profile "AirJack" (predefined)
-----
Parameter  Value
-----
Frame Type beacon SSID = AirJack
```

The output of this command includes the following parameters:

Parameter	Description
Frame Type	Type of 802.11 frame. For each type of frame, further parameters may be included to filter and detect only the required frames. <ul style="list-style-type: none"><li>● <b>assoc</b>: Association frame type.</li><li>● <b>auth</b>: Authentication frame type.</li><li>● <b>beacon</b>: Beacon frame type.</li><li>● <b>control</b>: All control frames.</li><li>● <b>data</b>: All data frames.</li><li>● <b>deauth</b>: Deauthentication frame type.</li><li>● <b>disassoc</b>: Disassociation frame type.</li><li>● <b>mgmt</b>: Management frame type.</li><li>● <b>probe-request</b>: Probe request frame type.</li><li>● <b>probe-response</b>: Probe response frame type.</li><li>● <b>ssid</b>: For beacon, probe-request, and probe-response frame types, the SSID as either a string or hex pattern.</li><li>● <b>ssid-length</b>: For beacon, probe-request, and probe-response frame types, the length, in bytes, of the SSID.</li></ul>
payload	Pattern at a fixed offset in the payload of an 802.11 frame.
sequence number	Sequence number of the frame.
src- mac	Source MAC address in the 802.11 frame header.
dst- mac	Source MAC address in the 802.11 frame header.
bssid	BSSID field in the 802.11 frame header.

## Related Commands

## show ids unauthorized-device-profile

```
show ids unauthorized-device-profile <profile-name>
```

### Description

Show an IDS Unauthorized Device Profile.

### Syntax

Parameter	Description
<profile-name>	Name of an IDS Unauthorized Device profile

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire IDS Unauthorized Device profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has four configured Unauthorized Device profiles.

```
(host) # show ids unauthorized-device-profile
IDS Unauthorized Device Profile List
-----
Name                               References  Profile Status
----                               -
default                             2
ids-unauthorized-device-disabled    1           Predefined
ids-unauthorized-device-high-setting 1           Predefined
ids-unauthorized-device-medium-setting 1           Predefined

Total:4
```

This example displays the configuration settings for the profile **ids-unauthorized-device-disabled**.

```
(host) # show ids unauthorized-device-profile ids-unauthorized-device-disabled
IDS Unauthorized Device Profile "ids-unauthorized-device-disabled" (Predefined)
-----
Parameter                               Value
-----
Detect Adhoc Networks                    false
Protect from Adhoc Networks              false
Detect Windows Bridge                    false
Detect Wireless Bridge                   false
Detect Devices with an Invalid MAC OUI   false
MAC OUI detection Quiet Time             900 sec
Adhoc Network detection Quiet Time       900 sec
Wireless Bridge detection Quiet Time     900 sec
Rogue AP Classification                  false
Overlay Rogue AP Classification          true
Valid Wired MACs                         N/A
Allow Well Known MAC                    N/A
Rogue Containment                        false
Suspected Rogue Containment              false
Suspected Rogue Containment Confidence Level 60
Protect Valid Stations                   false
Detect Bad WEP                           false
Detect Misconfigured AP                  false
Protect Misconfigured AP                 false
Protect SSID                             false
Privacy                                  false
Require WPA                              false
Valid 802.11g channel for policy enforcement 11
Valid 802.11a channel for policy enforcement 40
Valid MAC OUIs                           N/A
Valid and Protected SSIDs                N/A
Protect 802.11n High Throughput Devices  false
Protect 40MHz 802.11n High Throughput Devices false
Detect Active 802.11n Greenfield Mode    false
```

The output of this command includes the following parameters:

Parameter	Description
Detect AdHoc Networks	Shows if the profile has enabled or disabled detection of adhoc networks.
Protect from Adhoc Networks	Shows if the profile has enabled or disabled protection from adhoc networks.
Detect Windows Bridge	Shows if the profile has enabled or disabled detection of Windows station bridging.
Detect Wireless Bridge	Shows if the profile has enabled or disabled detection of wireless bridging.
Detect Devices with an Invalid MAC OUI	Shows if the profile has enabled or disabled checking of the first three bytes of a MAC address, known as the organizationally unique identifier (OUI), assigned by the IEEE to known manufacturers.
MAC OUI detection Quiet Time	Time, in seconds, that must elapse after an invalid MAC OUI alarm has been triggered before another identical alarm may be triggered.
Adhoc Network detection Quiet Time	Time, in seconds, that must elapse after an adhoc network detection alarm has been triggered before another identical alarm may be triggered.
Wireless Bridge detection Quiet Time	Time, in seconds, that must elapse after a wireless bridge alarm has been triggered before another identical alarm may be triggered.
Rogue AP Classification	Shows if the profile has enabled or disabled rogue AP classification.
Overlay Rogue AP Classification	Shows if the switch allows APs that are plugged into the wired side of the network to be classified as "suspected rogue" instead of "rogue".

Parameter	Description
Valid Wired MACs	List of valid and protected SSIDs.
Allow Well Known MAC	Shows if the profile allows devices with known MAC addresses to classify rogue APs.
Rogue Containment	Shows if the switch will automatically shut down rogue APs.
Suspected Rogue Containment	Shows if the switch will automatically treat suspected rogue APs as interfering APs.
Suspected Rogue Containment Confidence Level	Confidence level of suspected Rogue AP to trigger containment, expressed as a percentage.
Protect Valid Stations	Shows if the switch will allow valid stations to connect to a non-valid AP.
Detect Bad WEP	Shows if the profile has enabled or disabled detection of WEP initialization vectors that are known to be weak and/or repeating.
Detect Misconfigured AP	Shows if the profile has enabled or disabled detection of misconfigured APs.
Protect Misconfigured AP	Shows if the profile has enabled or disabled protection of misconfigured APs.
Protect SSID	Shows if the profile has enabled or disabled use of SSID by valid APs only.
Privacy	Shows if the profile has enabled or disabled encryption as a valid AP configuration.
Require WPA	Shows if the switch will flag any valid AP not using WPA as a misconfigured AP.
Valid 802.11g channel for policy enforcement	A list of valid 802.11g channels that third-party APs are allowed to use.
Valid 802.11a channel for policy enforcement	A list of valid 802.11a channels that third-party APs are allowed to use.
Valid MAC OUIs	A list of valid MAC Organizationally Unique Identifiers (OUIs).
Valid and Protected SSIDs	A list of valid and protected SSIDs.
Protect 802.11n High Throughput Devices	Shows if the profile enables or disables protection of high-throughput (802.11n) devices.
Protect 40MHz 802.11n High Throughput Devices	Shows if the profile enables or disables protection of high-throughput (802.11n) devices operating in 40 MHz mode.
Detect Active 802.11n Greenfield Mode	Shows if the profile enables or disables detection of high-throughput devices advertising greenfield preamble capability.

## Related Commands

Configure the Unauthorized Device profile using the command `ids unauthorized-device-profile`.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config mode on master or local switches

## show image

show image version

### Description

Show system image version information.

### Syntax

No parameters.

### Example

The following example shows that the switch is running AOS-W 3.4 and booting off partition 0:0.

```
(host) #show image version
-----
Partition           : 0:0 (/dev/hda1) **Default boot**
Software Version    : AOS-W 3.3.2.0
Build number        : 18661
Label               : 18661
Built on            : 2008-06-12 04:24:34 PDT
-----
Partition           : 0:0 (/dev/hda1)
Software Version    : AOS-W 3.3.2.0
Build number        : 18661
Label               : 18661
Built on            : 2008-06-12 04:24:34 PDT
```

The output of this command includes the following parameters:

Parameter	Description
Partition	Partition number and name. The default boot partition will display a <b>**Default boot**</b> notice by the partition name.
Software Version	Version of AOS-W software running on the partition.
Build number	Build number for the software version.
Label	The label parameter can display additional information for the build. By default, this value is the software build number.
Built on	Date the software build was created.

### Command History

```

The output includes the following parameters:

The output of this command will vary between switches.

Parameter	Description
Supervisor Card Slot	Supervisor card slot number
Mobility Processor	Revision of the image downloaded to the FPGA. This can change if a newer image is included in a newer release.
Mobility Processor Assembly#	Assembly number of the mobility processor. This only applies to M3 cards.
Mobility Processor Serial#	Serial number of the mobility processor. This only applies to M3 cards.
SC Assembly#	Assembly number of the supervisor card.
SC Serial#	Serial number of the supervisor card.
SC Model#	Model number of the supervisor card.
Mgmt Port HW MAC Address	MAC address of the mgmt port
HW MAC Address	MAC address
FXPLD Version	Revision of programmable logic device on supervisor card.
PEER Supervisor Card	States whether or not a PEER supervisor card is present.
Line Card <slot number>	States whether or not a line card is present in the specified slot
Line Card <slot number> FPGA	Name/type of FPGA associated with the specified line card slot
Line Card <slot number> Switch Chip	Name/type of switch card associated with the specified line card slot
Line Card <slot number> Mez Card	States whether or not a mezzanine card is present in the specified slot
Line Card <slot number> SPOE	States whether or not a SPOE card is present in the specified slot
Line Card <slot number> Sup Card 0	States whether or not a supervisor card 0 is present in the specified slot
Line Card <slot number> Sup Card 1	States whether or not a supervisor card 1 is present in the specified slot
Line Card <slot number> Assembly#	Assembly number of the line card in the specified slot
Line Card <slot number> Serial#	Serial number of the line card in the specified slot
Line Card <slot number> SPOE Assembly#	Assembly number of SPOE line card in the specified slot
Line Card <slot number> SPOE Serial#	Serial number of SPOE line card in the specified slot

Parameter	Description
Line Card <slot number> MEZZ Assembly#	Assembly number of the mezzanine card in the specified slot
Line Card <slot number> MEZZ Serial#	Serial number of the mezzanine card in the specified slot
FAN <Fan number>	Status of the specified fan
Fan Tray Assembly#	Assembly number of the fan tray
Fan Tray Serial#	Serial number of fan tray
Back Plane Assembly#	Assembly number of the back plane
Back Plane Serial#	Serial number of the back plane
Power Supply Type	Power supply type
Power Supply <power supply number>	Power supply status
M3mk1 Card Temperatures <ul style="list-style-type: none"> <li>M3mk1 card</li> <li>CPU</li> </ul>	<ul style="list-style-type: none"> <li>The temperature from the sensor on the supervisor card</li> <li>The temperature from the CPU die</li> </ul>
AMP Card Temperatures <ul style="list-style-type: none"> <li>Processor Card</li> <li>Mobility Processor</li> </ul>	<ul style="list-style-type: none"> <li>The temperature from the sensor on the Mobility Processor card</li> <li>The temperature from the FPGA die</li> </ul>
M3mk1 Card Voltages	This parameter displays to columns of voltages for many components displayed previously by this command. The voltage displayed in the right column should match the corresponding value in the left column, generally with +/- 5%.

## Command History

This command was introduced in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show ip access-group

```
show ip access-group
```

### Description

Display access control lists (ACLs) configured for each port on the switch.

### Syntax

No parameters.

### Examples

The example below shows part of the output of this command. If a port does not have a defined session ACL, the *Port-Vlan Session ACL* table will be blank.

```
(host) # show ip access-group
FE 1/0:
Rx access list 200 is applied
session access list User14 is applied

Port-Vlan Session ACL
-----
SessionACL      Vlan      Status
-----
coltrane        22        configured
```

The output of this command includes the following parameters:

Parameter	Description
Session ACL	Name of the ACL applied to the interface.
VLAN	If the ACL was applied to a VLAN associated with this port, this column will show the VLAN ID.
Status	Shows whether or not the session ACL is configured.

### Related Commands

Command	Description
<code>interface fastethernet   gigabitethernet ip access-group.</code>	Configure an access group for an interface.

### Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.4	The VLAN output parameters was introduced.

### .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip access-list

```
show ip access-list {brief|<string>}
```

### Description

Display a table of all configured access control lists (ACLs), or show details for a specific ACL.

### Syntax

Parameter	Description
brief	Display a table of information for all ACLs.
<string>	Specify the name of a single ACL to display detailed information on that ACL.

### Examples

The example below shows general information for all ACLs in the Access List table.

```
(Host) #show ip access-list brief
```

```
Access list table
```

```
-----
```

Name	Type	Use Count	Roles
----	----	-----	-----
200	eth		
33	standard		
allowall	session	2	trusted-ap default-vpn-role
ap-acl	session	2	rap_role ap-role
captiveportal	session	4	coltrane-logon wizardtest-logon test-logon logon
control	session	7	ap-role coltrane-logon wizardtest-logon guest stateful test-logon
cplogout	session	1	guest
default	session		
guest	session		
log-https	session		
srcnat	session		
stateful-dot1x	session	2	stateful-dot1x logon
stateful-kerberos	session		
validuser	session	1	test-24325

The output of this command includes the following parameters:

Parameter	Description
Name	Name of an access-control list (ACL).
Type	Shows that the ACL is one of the following ACL policy types: <ul style="list-style-type: none"><li>• Ethertype</li><li>• Standard</li><li>• Session</li><li>• MAC</li><li>• Extended</li></ul>
Use Count	Number of rules defined in the ACL.
Roles	Names of user roles associated with the ACL.

Include the name of a specific ACL to show detailed configuration information for that ACL.

```
(Host)# show ip access-list stateful-dot1x
```

```
ip access-list session stateful-dot1x
stateful-dot1x
```

```
-----
Priority  Source  Destination  Service  Action  TimeRange  Log  Expired  Queue  TOS  8021P  Blacklist  Mirror  DisScan
-----  -
1         any    any          svc-dns  permit                    Low
2         any    any          svc-dhcp permit                    Low
3         any    127.0.0.1   udp 1812  redirect                   Low
```

The output of this command may include some or all of the following parameters:

Parameter	Description
Priority	Name of an access-control list (ACL).
Source	The traffic source, which can be one of the following: <ul style="list-style-type: none"> <li>● <b>alias</b>: The network resource (use the netdestination command to configure aliases; use the show netdestination command to see configured aliases)</li> <li>● <b>any</b>: Matches any traffic.</li> <li>● <b>host</b>: A single host IP address.</li> <li>● <b>network</b>: The IP address and netmask.</li> <li>● <b>user</b>: The IP address of the user.</li> </ul>
Destination	The traffic destination, which can be one of the following: <ul style="list-style-type: none"> <li>● <b>alias</b>: The network resource (use the netdestination command to configure aliases; use the show netdestination command to see configured aliases)</li> <li>● <b>any</b>: Matches any traffic.</li> <li>● <b>host</b>: A single host IP address.</li> <li>● <b>network</b>: An IP address and netmask.</li> <li>● <b>user</b>: The IP address of the user.</li> </ul>
Service	Network service, which can be one of the following: <ul style="list-style-type: none"> <li>● An IP protocol number (0-255).</li> <li>● The name of a network service (use the show netservice command to see configured services).</li> <li>● <b>any</b>: Matches any traffic.</li> <li>● <b>tcp</b>: A TCP port number (0-65535).</li> <li>● <b>udp</b>: A UDP port number (0-65535).</li> </ul>
Action	Action if rule is applied, which can be one of the following: <p><b>deny</b>: Reject packets.</p> <p><b>dst-nat</b>: Perform destination NAT on packets.</p> <p><b>dual-nat</b>: Perform both source and destination NAT on packets.</p> <p><b>permit</b>: Forward packets.</p> <p><b>redirect</b>: Specify the location to which packets are redirected, which can be one of the following: <ul style="list-style-type: none"> <li>● Datapath destination ID (<b>0-65535</b>).</li> <li>● <b>esi-group</b>: Specify the ESI server group configured with the esi group command</li> <li>● <b>opcode</b>: Specify the datapath destination ID (0x33, 0x34, or 0x82). Do not use this parameter without proper guidance from Alcatel-Lucent, Inc.</li> </ul> </p> <p><b>tunnel</b>: Specify the ID of the tunnel configured with the interface tunnel command.</p> <p><b>src-nat</b>: Perform source NAT on packets.</p>
Timerange	Any defined time range for this rule.
Log	Shows if the rule was configured to generate a log message when the rule is applied.
Expired	Shows if the rule has expired.
Queue	Shows if the rule assigns a matching flow to a priority queue (high/low).

Parameter	Description
Tos	Specifies the configured ToS value (0-63)
8021.p	802.11p priority level applied by the rule (0-7).
Blacklist	Shows if the rule should blacklist any matching user.
Mirror	Shows if the rule was configured to mirror all session packets to datapath or remote destination.
DisScan	Shows if the rule was configured to pause ARM scanning while traffic is present.

## Related Commands

Command	Description
<code>ip access-list session</code>	Configure an access list for an interface.

## Command History

Introduced in AOS-W 3.0.

## .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip cp-redirect-address

```
show ip cp-redirect-address
```

### Description

Show the captive portal automatic redirect IP address.

### Syntax

No parameters.

### Examples

The example below shows the IP address to which captive portal users are automatically directed.

```
(host) # show ip cp-redirect-address  
  
Captive Portal redirect Address... 10.3.63.11
```

### Related Commands

Command	Description
<code>ip cp-redirect-address</code>	This command configures a redirect address for captive portal.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip dhcp

```
show ip dhcp {binding|database|statistics}
```

### Description

Show DHCP Server Settings.

### Syntax

Parameter	Description
binding	Show DHCP server bindings.
database	Show DHCP server settings.
statistics	Show DHCP pool statistics.

### Examples

The example below shows DHCP statistics for two configured networks.

```
(host) # show ip dhcp statistics

Network Name      172.19.42.0/24
  Free leases      137
  Active leases    115
  Expired leases   0
  Abandoned leases 0

Network Name      10.14.86.0/24
  Free leases      126
  Active leases    126
  Expired leases   0
  Abandoned leases 0
```

The output of this command includes the following parameters:

Parameter	Description
Network Name	Range of addresses that the DHCP server may assign to clients.
Free leases	Number of available DHCP leases.
Expired leases	Number of leases that have expired because they have extended past their valid lease period.
Abandoned leases	Number of abandoned leases. Abandoned leases will not be reassigned unless there are no free leases available.

### Related Commands

Command	Description
<code>ip dhcp pool</code>	This command configures a DHCP pool on the switch.

### Command History

Introduced in AOS-W 3.0.

## show ip domain-name

```
show ip domain-name
```

### Description

Show the full domain name and server.

### Syntax

No parameters.

### Examples

The example below shows that the IP domain lookup feature is enabled, but that no DNS server has been configured on the switch.

```
(host) #show ip domain-name

IP domain lookup:      Enabled
IP Host.Domain name:  MyCompany2400.

No DNS server configured
```

### Related Commands

Command	Description
<code>ip domain lookup</code>	This command enables Domain Name System (DNS) hostname to address translation.
<code>ip domain-name</code>	This command configures the default domain name.
<code>ip dhcp pool</code>	This command configures a DHCP pool on the switch.

### Command History

Introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip igmp

```
show ip igmp config|counters|{group maddr <maddr>}|{interface [vlan <vlan>]}|{proxy-  
group vlan <vlan>}|{proxy-mobility-group maddr <maddr>}|proxy-mobility-stats|proxy-stats
```

### Description

Display Internet Group Management Protocol (IGMP) timers and counters.

### Syntax

Parameter	Description
config	Show the current IGMP configuration
counters	Display a list counters for the following IGMP queries: <ul style="list-style-type: none"><li>● received-total</li><li>● received-queries</li><li>● received-v1-reports</li><li>● received-v2-reports</li><li>● received-leaves</li><li>● received-unknown-types</li><li>● len-errors</li><li>● checksum-errors</li><li>● not-vlan-dr</li><li>● transmitted-queries</li><li>● forwarded</li></ul>
group maddr <maddr>	Show IGMP group information
interface vlan <vlan>	Show IGMP interface information
proxy-group vlan <vlan>	Show IGMP proxy group information for a specific interface.
proxy-mobility-group maddr <maddr>	Display the IGMP proxy group information stored for mobile clients which are away from the switch.
proxy-mobility-stats	Display the most important messages exchanged between the mobility process and the IGMP proxy.
proxy-stats	Display the number of messages transmitted and received by the IGMP proxy on the upstream interface

### Examples

The example below displays the IGMP interface table for all VLANs on the switch.

```
(host) # show ip igmp interface vlan 2
```

```
IGMP Interface Table
```

```
-----  
VLAN  Addr          Netmask          MAC Address      IGMP      Snooping  Querier          Destination  IGMP Proxy  
----  -  
64    10.6.4.252      255.255.255.0   00:0b:86:01:99:00  disabled  disabled  10.6.4.252      CP            disabled  
65    10.6.5.252      255.255.255.0   00:0b:86:01:99:00  disabled  disabled  10.6.5.252      CP            disabled  
1     10.6.2.252      255.255.255.0   00:0b:86:01:99:00  disabled  disabled  10.6.2.252      CP            disabled  
66    10.6.6.252      255.255.255.0   00:0b:86:01:99:00  disabled  disabled  10.6.6.252      CP            disabled  
63    10.6.3.252      255.255.255.0   00:0b:86:01:99:00  disabled  disabled  10.6.3.252      CP            disabled
```

The output of this command includes the following parameters:

Parameter	Description
VLAN	A VLAN ID number.
Addr	IP address of a VLAN router.
Netmask	Subnet mask for the IP address.
MAC Address	MAC destination address.
IGMP	Shows if IGMP proxy is enabled or disabled.
Snooping	Shows if IGMP snooping is enabled or disabled.
Querier	IP address of an IGMP querier.
Destination	Traffic destination.
IGMP Proxy	Shows if IGMP proxy.

The following example displays the current IGMP configuration settings for the switch.

```
(host) #show ip igmp config

IGMP Config
-----
Name                               Value
----                               -
robustness-variable                 2
query-interval                     125
query-response-interval             100
startup-query-interval              31
startup-query-count                 2
last-member-query-interval          10
last-member-query-count             2
version-1-router-present-timeout    400
```

The output of this command includes the following parameters:

Parameter	Description
robustness-variable	This variable is increased from its default level of 2 to allow for expected packet loss on a subnetwork.
query-interval	Interval, in seconds, at which the switch sends host-query messages to the multicast group address 224.0.0.1 to solicit group membership information.
query-response-interval	Maximum time, in .1 second intervals, that can elapse between when the switch sends a host-query message and when it receives a response. This must be less than the <b>query-interval</b> .
startup-query-count	Number of queries that the switch sends out on startup, separated by startup-query-interval. The default setting is the value of the <b>robustness-variable</b> parameter.
startup-query-interval	Interval, in seconds, at which the switch sends general queries on startup. The default value of this parameter is 1/4 of the <b>query-interval</b> .
last-member-query-count	Number of group-specific queries that the switch sends before assuming that there are no local group members.
last-member-query-interval	Maximum time, in seconds, that can elapse between group-specific query messages.

Parameter	Description
<code>version-1-router-present-timeout</code>	Timeout, in seconds, if the switch detects a version 1 IGM router.

## Related Commands

Command	Description
<code>ip igmp</code>	This command configures Internet Group Management Protocol (IGMP) timers and counters.

## Command History

Introduced in AOS-W 3.0.

## .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master switches.

## show ip mobile

```
show ip mobile
  active-domains
  binding [<host-ip>|<host-macaddr>|brief]
  domain [<name>]
  global
  hat
  host [<host-ip>|<host-macaddr>|brief]
  packet-trace [<count>]
  remote <host-ip>|<host-macaddr>
  trace <ip-addr>|<mac-addr>|{force <ip-addr>|<mac-addr>}
  traffic dropped|foreign-agent|home-agent|proxy|proxy-dhcp
  trail <host-ip>|<host-macaddr>
  tunnel
  visitor [<host-ip>|<host-macaddr>|brief]
```

### Description

Display statistics and configuration information for the mobile protocol.

### Syntax

Parameter	Description
active domains	IP mobility domains active on this switch
binding	Display a list of Home Agent Bindings
[<host-ip>]	Filter the Home Agent Bindings list to display data for a specific host IP address.
[<host-macaddr>]	Filter the Home Agent Bindings list to display data for a specific host MAC address.
[brief]	Limit the output of this command to show just two lines of data.
domain [<name>]	Display subnet, VLAN and home agent information for all mobility domains, or specify a mobility domain name to view data for that domain only.
global	View the current Mobility Agents global configuration
hat	Display the Active Home Agent table.
host	Display a list of Mobile IP hosts.
[<host-ip>]	Filter the Mobile Host List to display data for a specific host IP address.
[<host-macaddr>]	Filter the Mobile Host List to display data for a specific host MAC address.
[brief]	Limit the output of this command to show just two lines of data.
packet-trace [<count>]	Packet trace between Datapath-Mobility
remote <host-ip> <host-macaddr>	Display Mobile IP remote host(s)
trace	Show if the Mobile IP feature will poll remote switches for mobility status of station
<ip-addr>	Host IP address
<mac-addr>	Host MAC address
force <ip-addr> <mac-addr>	Show if the Mobile IP feature will poll remote switches for mobility status of station.

Parameter	Description
traffic	Display mobile IP protocol statistics for: <ul style="list-style-type: none"> <li>Proxy DHCP</li> <li>Proxy Mobile IP</li> <li>Home Agent Registrations</li> <li>Foreign Agent Registrations</li> <li>Registration Revocations</li> </ul>
dropped	Show only counters for dropped mobility traffic.
foreign-agent	Show only mobile IP foreign agent statistics. A foreign agent is the switch which handles all mobile IP communication with a home agent on behalf of a roaming client.
home-agent	Show only mobile IP home agent statistics. A home agent for a mobile client is the switch where the client first appears when it joins the mobility domain.
proxy	Show only counters for mobile IP proxy traffic.
proxy-dhcp	Show only counters for mobile IP proxy DHCP traffic.
trail <host-ip> <host-macaddr>	Show the mobile IP roaming trail by entering a host's IP or MAC address.
tunnel	Show the Mobile Tunnel Table for IPIP Tunnels.
visitor	Display a list of mobile nodes visiting a foreign agent.
[<host-ip>]	Filter the Foreign Agent Visitor list to display data for a specific host IP address.
[<host-macaddr>]	Filter the Foreign Agent Visitor list to display data for a specific host MAC address.
[brief]	Limit the output of this command to show just two lines of data.

## Examples

The example below lists mobility domains configured on the switch, and shows information for any subnets defined on these domains.

```
(host) #show ip mobile domain
Mobility Domains:, 2 domain(s)
-----

Domain name default
  Home Agent Table, 0 subnet(s)

Domain name newdomain
  Home Agent Table, 2 subnet(s)
  subnet          mask          VlanId Home Agent
  -----
  10.2.124.76     255.255.255.255 1          10.4.62.2
  172.21.5.50    255.255.255.255 1          10.4.62.2
```

The output of this command includes the following parameters:

Parameter	Description
subnet	Subnet configured for the IP mobility service.
mask	Subnet mask
VLAN ID	VLAN ID of the VLAN used by the subnet.

Parameter	Description
Home Agent	IP address of the home agent or mobility agent.

Use the **show ip mobile host** command to track mobile users.

```
(host) #show ip mobile host
```

```
mobile Host List, 1 host(s)
```

```
-----
```

```
00:40:96:a6:a1:a4 10.0.100.194
  Roaming Status: Home Switch/Home VLAN, Service time 0 days 00:06:47
  Home VLAN 100 on network 10.0.100.0/24
  DHCP lease for corporate-240 at Thu Sep 21 15:11:44 2006 for 7200 secs from 10.3.26.1
```

The output of this command includes the following parameters:

Parameter	Description
<mac-addr> <ip-addr>	MAC and IP addresses of the host
Roaming Status	Displays how long the host has used its current switch and VLAN.
Home VLAN	VLAN ID, IP address and subnet of the home VLAN.
DHCP lease	Displays the amount of time the station has had its current DHCP lease.

## Related Commands

Command	Description
<code>ip mobile active-domain</code>	This command configures the mobility domain that is active on the switch.
<code>ip mobile domain</code>	This command configures the mobility domain on the switch.
<code>ip mobile foreign-agent</code>	This command configures the foreign agent for IP mobility.
<code>ip mobile home-agent</code>	This command configures the home agent for IP mobility.
<code>ip mobile proxy</code>	This command configures the proxy mobile IP module in a mobility-enabled switch.
<code>ip mobile revocation</code>	This command configures the frequency at which registration revocation messages are sent.
<code>ip mobile trail</code>	This command configures the capture of association trail for all devices.

## Command History

Command introduced in AOS-W 3.0.

## .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip nat pool

```
show ip nat pool
```

### Description

Display pools of IP addresses for network address translation (NAT).

### Syntax

No parameters

### Examples

The example below shows the current NAT pool configuration on the switch.

```
(host) # show ip nat pools
NAT Pools
-----
Name   Start IP   End IP       DNAT IP
----   -
2net   2.1.1.1    2.1.1.125
```

The output of this command includes the following parameters:

Parameter	Description
Name	Name of the NAT pool.
Start IP	IP address that defines the beginning of the range of source NAT addresses in the pool.
End IP	IP address that defines the end of the range of source NAT addresses in the pool.
DNAT IP	Destination NAT IP address, if defined.

### Related Commands

Command	Description
<code>ip nat</code>	This command configures a pool of IP addresses for network address translation (NAT).

### Command History

This command was available in AOS-W 3.0.

### .Command Information

Platforms	Licensing	Command Mode
All platforms	Though this command is available in the operating system, you must have a Policy Enforcement Firewall license to configure a NAT pool.	Available in Config or Enable mode on master or local switches

## show ip ospf

```
show ip ospf [database] [[debug route]] [[interface tunnel|vlan <id>]] [[neighbor]]  
[redistribute] [[subnet]]
```

### Description

Display statistics and configuration information for the Open Shortest Path First (OSPF) routing protocol.

### Syntax

Parameter	Description
database	Show database information for the OSPF protocol.
debug route	Show debugging information for OSPF routes.
interface tunnel vlan <id>	Display the status of OSPF on an individual interface by specifying a tunnel or VLAN ID number.
neighbor	Display data for OSPF neighboring routers.
redistribute	Display OSPF route distribution information.
subnet	Display the subnets manually added to the Subnet Exclude List via the <i>router ospf subnet exclude &lt;addr&gt; &lt;mask&gt;</i> command.

### Example

If you issue this command without any of the optional parameters described in the table above, the **show ip ospf** command will display general router and area settings for the OSPF.

```
(host) (config-subif)# show ip ospf  
OSPF is currently running with Router ID 123.45.110.200  
Number of areas in this router is 1  
Area 10.1.1.0  
  Number of interfaces in this area is 2  
  Area is totally stub area  
  SPF algorithm executed 0 times
```

The output of this command includes the following parameters.

Parameter	Description
OSPF Router ID	Verifies that OSPF is running and the router ID that OSPF is running on.
Number of areas	List the number of areas configured in the router.
Area	Displays the Area ID followed by: <ul style="list-style-type: none"><li>• number of interfaces in the area</li><li>• indicates if the area is a totally stub area</li><li>• number of times the SPF algorithm has been executed</li></ul>

To display OSPF settings for an individual interface, you must specify a VLAN or tunnel ID number. The example below displays part of the output of the **show ip ospf interface vlan** command.

```
(host) # show ip ospf interface vlan 10
Vlan 3 is up, line protocol is up
Internet Address 3.3.3.1, Mask 255.255.255.0, Area 10.1.1.1
Router ID 10.4.131.227, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State WAIT, Priority 1
Designated Router id 0.0.0.0, Interface Address 3.3.3.1
Backup designated Router id 0.0.0.0, Interface Address 3.3.3.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 0
Tx Stat: Hellos 1 DbDescr 0 LsReq 0 LsUpdate 0 LsAck 0 Pkts 1
Rx Stat: Hellos 0 DbDescr 0 LsReq 0 LsUpdate 0 LsAck 0 Pkts 0
        DisCd 0 BadVer 0 BadNet 0 BadArea 0 BadDstAdr 0 BadAuType 0
        BadAuth 0 BadNeigh 0 BadPckType 0 BadVirtLink 0
...

```

The output may include some or all of the following parameters.

Parameter	Description
Vlan <number>	Identifies that the interface type and ID are up and functional.
Internet Address	Internet address, network mask, and area assigned to the interface.
Router ID	Displays the router ID, that the network type is Broadcast, and the cost value.
Transmit Delay	Details of the transmit delay, state, and priority.
Designated Router	Details of the designated router ID and interface address.
Backup Designated Router ID	Details of the backup router ID and interface address.
Timer intervals configured	Details of elapse time intervals for Hello, Dead, Transmit (wait), and retransmit.
Neighbor Count	Details the number of neighbors and adjacent neighbors.
Tx Stat	Counters and statistics for transmitted data. <ul style="list-style-type: none"> <li>● <b>Hellos</b>: Number of transmitted hello packets. These packets are sent every hello interval.</li> <li>● <b>DbDescr</b>: Number of transmitted database description packets.</li> <li>● <b>LsReq</b>: Number of transmitted link state request packets.</li> <li>● <b>LsUpdate</b>: Number of transmitted link state update packets.</li> <li>● <b>LsAck</b>: Number of transmitted link state acknowledgment packets</li> <li>● <b>Pkts</b>: Total number of transmitted packets.</li> </ul>
Rx Stat	Counters and statistics for received data. <ul style="list-style-type: none"> <li>● <b>Hellos</b>: Number of received hello packets. These packets are sent every hello interval.</li> <li>● <b>DbDescr</b>: Number of received database description packets.</li> <li>● <b>LsReq</b>: Number of received link state request packets.</li> <li>● <b>LsUpdate</b>: Number of received link state update packets.</li> <li>● <b>LsAck</b>: Number of received link state acknowledgment packets</li> <li>● <b>Pkts</b>: Total number of received packets.</li> </ul>
DisCd	Number of received packets that are discarded.
BadVer	Number of received packets that have bad OSPF version number.
BadNet	Number of received packets that belong to different network than the local interface.
BadArea	Number of received packets that belong to different area than the local interface.
BadDstAdr	Number of received packets that have wrong destination address.

Parameter	Description
BadAuType	Number of received packets that have different authentication type than the local interface.
BadAuth	Number of received packets where authentication failed.
BadNeigh	Number of received packets which didn't have a valid neighbor.
BadPckType	Number of received packets that have wrong OSPF packet type.
BadVirtLink	Number of received packets that didn't match have a valid virtual link.

## Related Commands

Command	Description
<i>ip ospf</i>	Configure OSPF on the interface
<i>router ospf</i>	Configure OSPF on the router

## Command History

Introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip pppoe-info

```
show ip pppoe-info
```

### Description

Display configuration settings for Point-to-Point Protocol over Ethernet (PPPoE).

### Syntax

No parameters.

### Examples

The example below shows the current PPPoE configuration.

```
(host) #show ip pppoe-info

PPPoE username: rudolph123
PPPoE password: <HIDDEN>
PPPoE service name: ppp2056
PPPoE VLAN: 22
```

The output of this command includes the following parameters:

Parameter	Description
PPPoE username	PAP username configured on the PPPoE access concentrator.
PPPoE password	If this parameter displays the word <b>&lt;HIDDEN&gt;</b> , a PAP password is configured on the PPPoE access concentrator. If this parameter is <b>&lt;NONE&gt;</b> , there is no PPOE password configured.
PPPoE service name	PPPoE service name.
PPPoE VLAN	VLAN configured to use PPPoE to obtain an IP address via the command <b>interface vlan &lt;id&gt; ip address pppoe</b> .

### Related Commands

Command	Description
<code>ip pppoe-password</code>	This command configures the PPP over Ethernet (PPPoE) password.
<code>ip pppoe-service-name</code>	This command configures the PPP over Ethernet (PPPoE) service name.
<code>ip pppoe-username</code>	This command configures the PPP over Ethernet (PPPoE) username.

### Command History

Introduced in AOS-W 3.0.

### .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip radius

```
show ip radius nas-ip|source-interface
```

### Description

Display global parameters for configured RADIUS servers.

### Syntax

Command	Description
<code>nas-ip</code>	Show the Network Access Server (NAS) IP address attribute sent in outgoing RADIUS requests
<code>source-interface</code>	Show the source address of outgoing RADIUS requests

### Examples

The example below shows the RADIUS client NAS IP address.

```
(host) #show ip radius nas-ip  
  
RADIUS client NAS IP address = 10.168.254.221
```

### Related Commands

Command	Description
<code>ip radius</code>	This command configures global parameters for configured RADIUS servers.

### Command History

Introduced in AOS-W 3.0.

### .Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Config or Enable mode on master or local switches

## show ip route

```
show ip route [static]
```

### Description

View the Alcatel-Lucent switch routing table.

### Syntax

Command	Description
<code>static</code>	Include this optional parameter to display only static routes.

### Usage Guidelines

This command displays static routes configured on the switch via the [ip route](#) command. Use the [ip default-gateway](#) command to set the default gateway to the IP address of the interface on the upstream router or switch to which you connect the switch.

### Examples

The example below shows the ip address of routers and the VLANs to which they are connected.

```
(host) #show ip route

Codes: C - connected, O - OSPF, R - RIP, S - static
       M - mgmt, U - route usable, * - candidate default

Gateway of last resort is 10.6.2.254 to network 0.0.0.0

S*   0.0.0.0/0 [1/0] via 10.6.2.254*
C    10.9.2.0 is directly connected, VLAN1
C    10.9.3.0 is directly connected, VLAN63
C    10.9.4.0 is directly connected, VLAN64
C    10.9.5.0 is directly connected, VLAN65
C    10.9.6.0 is directly connected, VLAN66
C    0.0.0.0 is directly connected, Tunnel 1
C    10.100.103.253 is an ipsec map default-local-master-ipsecmap
```

### Related Commands

## show ipc statistics app-ap

```
show ipc statistics app-ap {am|sapd|sta} {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

### Description

Display Inter Process Communication (IPC) statistics for a specific AP or BSSID.

### Syntax

Parameter	Description
am	Show IPC statistics for an air monitor.
sapd	Show IPC statistics for the SAPD process.
stm	Show IPC statistics for station management communications.
ap-name <ap-name>	Show IPC statistics for an AP with a specific name.
bssid <bssid>	Show IPC statistics for a specific Basic Service Set Identifier (BSSID). An AP's BSSID is usually the AP's MAC address.
ip-addr <ip-addr>	Show IPC statistics for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

### Usage Guidelines

Issue this command at the request of Alcatel-Lucent support to troubleshoot application errors.

### Example

The following example shows IPC statistics for the SAPD process on an AP named **mpp125**.

```
(host) #show ipc statistics app-ap sapd ap-name mpp125
Local Statistics
To application      Tx Msg   Tx Blk   Tx Ret   Tx Fail   Rx Ack   Rx Msg   Rx Drop   Rx Err   Tx Ack

Allocated Buffers   0
Static Buffers      1
Static Buffer Size   1444
```

The output of this command includes the following data columns:

Parameter	Description
Tx Msg	Number of transmitted messages.
Tx Blk	Number of blocking messages transmitted.
Tx Ret	Number of transmitted messages that were returned.
Tx Fail	Number of failure messages that were transmitted.

Parameter	Description
Rx Ack	Number of received acknowledgements.
Rx Msg	Number of received messages.
Rx Drop	Number of received messages that were dropped.
Rx Err	Number of received messages with errors.
Tx Ack	Number of transmitted acknowledgements.
Allocated Buffers	Number of allocated buffers for IPC messages.
Static Buffers	Number of static buffers for IPC messages.
Static Buffer Size	Size of the static buffer.

## Command History

This command was available in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show ipc statistics app-id

```
show ipc statistics app-id <app-id>
```

### Description

Display Inter Process Communication (IPC) statistics for a specific AP or BSSID.

### Syntax

Parameter	Description
<app-id>	Application ID number. This number must be obtained from Alcatel-Lucent support.

### Usage Guidelines

Issue this command at the request of Alcatel-Lucent support to troubleshoot application errors.

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show ipc statistics app-name

```
show ipc statistics app-name <name>
```

### Description

Display Inter Process Communication (IPC) statistics for a specific application.

### Syntax

Parameter	Description
<name>	One of the following application names: <ul style="list-style-type: none"><li>● <b>aaa</b>: Administrator Authentication</li><li>● <b>ads</b>: Anomaly Detection</li><li>● <b>authmgr</b>: User Authentication</li><li>● <b>certmgr</b>: Certificate Manager</li><li>● <b>cfgm</b>: Config Manager</li><li>● <b>cts</b>: Transport Service</li><li>● <b>dbsync</b>: Database Synchronization</li><li>● <b>dhcp</b>: DHCP Server</li><li>● <b>esi</b>: Server Load Balancing</li><li>● <b>fpapps</b>: Layer 2,3 control</li><li>● <b>httpd</b>: HTTPD</li><li>● <b>ike</b>: IKE Daemon</li><li>● <b>l2tp</b>: L2TP</li><li>● <b>licensemgr</b>: License Manager</li><li>● <b>mobileip</b>: Mobile IP</li><li>● <b>ntp</b>: NTP Daemon</li><li>● <b>pim</b>: Protocol Independent Multicast</li><li>● <b>pktfilter</b>: Packet Filter</li><li>● <b>pptp</b>: PPTP</li><li>● <b>profmgr</b>: Profile Manager</li><li>● <b>publisher</b>: Publish subscribe service</li><li>● <b>resolver</b>: Resolver</li><li>● <b>snmp</b>: SNMP agent</li><li>● <b>stm</b>: Station Management</li></ul>

### Example

The following example shows IPC statistics for the **STM** process.

```
(host) #show ipc statistics app-name stm
```

```

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master or local switches

## show ipv6 access-list

```
show ipv6 access-list [<string> | brief]
```

### Description

Displays IPv6 access list configured in the switch.

### Syntax

Parameter	Description
string	To view details of a specific ACL.
brief	To view a summary of all IPv6 ACLs.

### Example

This example displays the session access control list details.

```
(host) #show ipv6 access-list brief
```

```
Access list table
```

```
-----
```

Name	Type	Use Count	Roles
v6-allowall	session	2	default-vpn-role authenticated
v6-dhcp-acl	session	1	guest
v6-dns-acl	session	1	guest
v6-http-acl	session	1	guest
v6-https-acl	session	1	guest
v6-icmp-acl	session	1	guest
v6-logon-control	session	1	logon

```
(host) #show ipv6 access-list v6-allowall
```

```
ipv6 access-list session v6-allowall
```

```
v6-allowall
```

```
-----
```

Priority	Source	Destination	Service	Action	TimeRange	Log	Expired	Queue	TOS	8021P	Blacklist
1	any	any	any	permit				Low			

The output of this command includes the following parameters:

Parameter	Description
Name	Name of the IPv6 ACL.
Type	Type of ACL rule.
Use Count	Number of times impacted.
Roles	Roles using the ACL.

### Command History

This command was available in AOS-W 3.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 datapath session table

show ipv6 datapath session table <IPv6 Address>

### Description

Displays current IPv6 session on the switch.

### Syntax

Parameter	Description
<IPv6 IP Address>	Optional parameter. If specified, displays IPv6 datapath session table for that IP address. By defaults, displays session table for all IPv6 addresses.

### Example

This example displays the session access control list details.

```
(host) #show ipv6 datapath session
```

```
Datapath Session Table Statistics
```

```
-----
```

```
Current Entries      45
High Water Mark     47
Maximum Entries     524287
Total Entries       9098
Allocation Failures  0
Duplicate Entries   0
Cross linked Entries 0
No Reverse Entries  0
Max link length     0
```

```
Datapath Session Table Entries
```

```

```

The output of this command includes the following parameters:

Parameter	Description
Source IP	The source IP address of the datapath.
Destination IP	The destination IP address of the datapath.
Prot	Denotes the protocol number.
SPort	Source port of the datapath.
DPort	Destination port of the datapath.
ToS	Specifies the type of service.

Parameter	Description
Age	Age of the session in seconds.
Destination	Destination slot of the switch.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 datapath session counters

```
show ipv6 datapath session counters
```

### Description

Displays datapath session table statistics.

### Example

This example displays the session counter statistics.

```
(host) #show datapath session counters

Datapath Session Table Statistics
-----
Current Entries      7
High Water Mark     167
Maximum Entries     65535
Total Entries       37287
Allocation Failures 0
Duplicate Entries   0
Cross linked Entries 0
No Reverse Entries  0
Max link length     2
```

The output of this command includes the following parameters:

Parameter	Description
Current Entries	Number of session entries in the datapath table.
High Water Mark	The maximum number of session since the switch uptime.
Maximum Entries	The maximum limit for session entries.
Total Entries	The total number of session entries.
Allocation Failures	The number of datapath sessions that could not be established.
Duplicate Entries	The total number of duplicate session entries.
No Reverse Entries	The total number of sessions that does not have reverse entries.

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 datapath user table

```
show ipv6 datapath user table
```

### Description

Displays ipv6 datapath user table entries.

### Example

This example displays the user table entries in the datapath.

```
(host) #show ipv6 datapath user table
```

```
Datapath User Table Entries
```

```
-----
```

```
Flags: P - Permanent, W - WEP, T- TKIP, V - ProxyArp for User, A - ProxyARP to User, N - VPN
```

IP	MAC	ACLs	Contract	Location	Age	Sessions	Flags
---	---	---	---	---	---	---	---
fe80::216:ceff:fe2c:b485	00:16:CE:2C:B4:85	1/0	0/0	1	28	0/65535	W
2003:d81f:f9f0:1001:617c:9151:6d25:f754	00:16:CE:2C:B4:85	1/0	0/0	1	0	0/65535	W

The output of this command includes the following parameters:

Parameter	Description
IP	IP address of the user (client).
MAC	MAC address of the user (client).
ACLs	The access control list assigned to the user.
Contract	Bandwidth contract.
Location	This value refers to the AP-group of the IPv6 client. Use the <code>show aaa state ap-group</code> to get the AP group and the location ID mapping.
Age	Total time connected to the switch.
Sessions	Number of active sessions.

### Command History

This command was available in AOS-W 3.0.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 firewall

```
show ipv6 firewall
```

### Example

This example displays the status of all firewall configurations.

```
(host) #show ipv6 firewall

Global IPv6 firewall policies
-----
Policy                               Action   Rate   Slot/Port
-----
Monitor ping attack                   Disabled
Monitor TCP SYN attack                 Disabled
Monitor IPv6 sessions attack           Disabled
Deny inter user bridging               Disabled
Deny all IPv6 fragments                Disabled
Per-packet logging                     Disabled
Enforce TCP handshake before allowing data Disabled
Prohibit RST replay attack              Disabled
Session Idle Timeout                   Disabled
Session mirror destination              Disabled
Prohibit IPv6 Spoofing                  Disabled
Enable IPv6 Stateful Firewall           Disabled
```

The output of this command includes the following parameters:

Parameter	Description
Monitor ping attack	Displays status on monitoring ICMP pings, frequency (in seconds) at which the attacks are monitored and the port on which the monitoring is configured.
Monitor TCP SYN attack	Status on monitoring TCP SYN messages, frequency (in seconds) at which the attacks are monitored and the port on which the monitoring is configured.
Monitor IPv6 sessions attack	Status on TCP and UDP connection requests, in seconds) at which the attacks are monitored and the port on which the monitoring is configured.
Deny inter user bridging	Status on Layer-2 traffic forwarding between wired and wireless users, frequency (in seconds) at which the messages are monitored and the port on which the monitoring is configured.
Deny all IPv6 fragments	Status on IPv6 fragments to be dropped.
Per-packet logging	Status on packet logging for the corresponding session rule.
Enforce TCP handshake before allowing data	Status on TCP handshake between two clients.
Prohibit RST replay attack	Status on a TCP connections in both directions.
Session Idle Timeout	Status on TCP session idle timeout.
Session mirror destination	Status on mirrored session packet traffic.
Prohibit IPv6 Spoofing	Status on IP spoofing. When this option is enabled, IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.
Enable IPv6 Stateful Firewall	Status of IPv6 firewall.

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 mld config

```
show ipv6 mld config
```

### Description

Displays Multicast Listener Discover (MLD) configuration details.

### Example

This example displays the current MLD configuration values.

```
(host) #show ipv6 mld config

MLD Config
-----
Name                Value
----                -
robustness-variable 2
query-interval      125
query-response-interval 100
startup-query-interval 31
startup-query-count 2
last-member-query-interval 10
last-member-query-count 2
```

The output of this command includes the following parameters:

Parameter	Description
robustness-variable	Denotes the value that is used to calculate the timeout value of a MLD client.
query-interval	Denotes the the time interval at which the MLD query is sent.
query-response-interval	Denotes the time interval during the MLD query response should be received.
startup-query-interval	Denotes the time interval between successive MLD queries during startup.
startup-query-count	Number of times queries are sent during startup.
last-member-query-interval	Denotes the time interval between successive MLD queries after the last member has left the MLD group.
last-member-query-count	Number of times queries are sent after the last member has left the MLD group.

### Command History

This command was available in AOS-W 3.3.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 mld counters

```
show ipv6 mld counters
```

### Description

Displays the statistics of MLD.

### Example

This example displays the MLD statistics for the following values.

```
(host) #show ipv6 mld counters

MLD Statistics
-----
Name                Value
----                -
received-total      0
received-queries    0
received-v1-reports 0
received-leaves     0
received-unknown-types 0
len-errors          0
checksum-errors     0
not-vlan-dr         0
transmitted-queries 0
forwarded           0
```

The output of this command includes the following parameters:

Parameter	Description
received-total	The total number of MLD messages.
received-queries	The total number of MLD queries.
received-v1-reports	The total number of MLD v1 reports received.
received-leaves	The total number of MLD v1 leave messages received.
received-unknown-types	The total number of unrecognized messages received.
len-errors	The total number of error message where the length check has failed.
checksum-errors	The total number of error message where the checksum has failed.
not-vlan-dr	The number of messages received for which the current switch is not the designated router.
transmitted-queries	The total number of transmitted MLD queries.
forwarded	The total number of MLD messages forwarded.

### Command History

This command was available in AOS-W 3.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 mld group

```
show ipv6 mld group
```

### Example

This example displays MLD group details.

```
(host) #show ipv6 mld group
```

```
MLD Group Table  
-----  
Group  Members  
-----  -----
```

The output of this command includes the following parameters:

Parameter	Description
Group	Name of MLD groups.
Members	Number of members in an MLD group.

### Command History

This command was available in AOS-W 3.3.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 mld interface

```
show ipv6 mld interface
```

### Example

This example displays MLD status on VLANs. To view details for a specific VLAN, you can specify the VLAN ID.

```
(host) #show ipv6 mld interface
```

```
MLD Interface Table
```

VLAN	Addr	Netmask	MAC Address	MLD	Snooping	Querier	Destination
224	10.224.224.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
1	10.15.44.10	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
50	156.1.50.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
211	211.1.1.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
51	156.1.51.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
999	99.1.1.2	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
7	7.7.7.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP
170	192.170.1.1	255.255.255.0	00:0b:86:f0:20:20	disabled	disabled	::	CP

The output of this command includes the following parameters:

Parameter	Description
VLAN	Denotes the VLAN ID.
Addr	IP address of the VLAN interface.
Netmask	Network mask of the VLAN interface IP address.
MAC Address	MAC address of VLAN interface.
MLD	Status of MLD.
Snooping	Status of MLD snooping.
Querier	IPv6 address of the MLD querier for the VLAN.
Destination	Denotes the destination of the MLD messages.

### Command History

This command was available in AOS-W 3.3.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

## show ipv6 user-table

```
show ipv6 user-table [authentication-method {dot1x | mac | stateful-dot1x | vpn | web} |
  bssid <bssid> |
  debug {rows | unique} |
  essid <ssid-name> |
  internal {rows} |
  ip <IPv6-address> |
  location <ap-group-name> |
  mac <mac-address> |
  mobile { bindings | rows | unique | visitors } |
  name <user-name> |
  phy-type {a | b} |
  role <role-name> |
  rows |
  station |
  verbose ]
```

### Description

Displays IPv6 user table entries. You can filter the output based on various parameters are described in table.

### Syntax

Parameter	Description
authentication-method	Displays entries in the IPv6 user-table that matches the following authentication methods: <ul style="list-style-type: none"><li>• dotx</li><li>• mac</li><li>• stateful-mac</li><li>• vpn</li><li>• web</li></ul>
bssid	Displays entries in the IPv6 user-table that are associated to the specified BSSID.
debug	Displays entries in the IPv6 user-table that are in debug mode.
ssid	Displays entries in the IPv6 user-table that are associated to the specified ESSID.
internal	Displays internal IPv6 users.
ip	Displays IPv6 users that match the specified IPv6 IP address.
location	This value refers to the AP-group of the IPv6 client. Use the <code>show aaa state ap-group</code> to get the AP group and the location ID mapping.
mac	Displays users with the specified MAC address.
mobile	Displays list of mobile users in the IPv6 user table. The following filters are available for this parameter: <ul style="list-style-type: none"><li>• <b>bindings</b>—list of users that have moved away from the current switch.</li><li>• <b>rows</b>—displays entries that match the specified row number.</li><li>• <b>unique</b>—displays unique entries in the IPv6 user-table.</li><li>• <b>visitors</b>—displays users that have associated with the current switch.</li></ul>
name	Displays IPv6 user table entries that match the specified name.
phy-type	Displays IPv6 user table entries that match <b>a</b> or <b>b</b> phy-type.
role	Displays IPv6 user table entries that match the specified role.

Parameter	Description
rows	Displays specific rows in the IPv6 user table. Enter the starting row number and the number of rows to be displayed.
station	Displays the station table information for the IPv6 user table entries.
verbose	Displays the complete IPv6 user table with all details.

## Example

This example displays dot1x authenticate users in IPv6 user table.

```
(host) show ipv6 user-table authentication-method dot1x
```

```
Users
-----
   IP                               MAC           Name      Role      Age(d:h:m)  Auth      VPN link  AP name
Roaming  Essid/Bssid/Phy                Profile
-----
fe80::216:ceff:fe2c:b485           00:16:ce:2c:b4:85  Wing-A    logon     00:00:06    802.1x
00:0b:86:c1:0e:8c  Wireless  Wing-A/00:0b:86:90:e8:c0/g  default-dot1x
2003:d81f:f9f0:1001:617c:9151:6d25:f754  00:16:ce:2c:b4:85  Wing-A    logon     00:00:06    802.1x
00:0b:86:c1:0e:8c  Wireless  Wing-A/00:0b:86:90:e8:c0/g  default-dot1x
```

The output of this command includes the following parameters:

Parameter	Description
IP	IP address of the client in that row that authenticating using dot1x
MAC	MAC address of the client.
Name	Name of the client.
Role	The role assigned to the client.
Age (d:h:m)	Total time that client is connected to switch.
Auth	Authentication type.
AP name	Name of the AP associated with the client.
Roaming	Current roaming status of the client.
Essid/Bssid/Phy	ESSID/BSSID/Phy to which the client is associated.
Profile	Displays the aaa profile.

## Command History

This command was available in AOS-W 3.3.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or Config mode on master and local switches

show

## show keys

```
show keys {all}
```

### Description

Show whether optional keys and features are enabled or disabled on the switch.

### Syntax

Parameter	Description
all	Include this optional parameter to display the status of all optional keys and features. If this parameter is omitted, the output will display the status of the most commonly used features and keys.

### Example

The following example shows the status of all optional keys and features on the switch.

```
(host) #show keys all
Licensed Features
-----
Feature                               Status
-----

## Related Commands

To view the license usage database (including the license key strings) use the command [show license](#).

## Command History

This command was available in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show license

```
show license [limits]
```

### Description

Show the license database.

### Syntax

Parameter	Description
limits	Include this optional parameter to show the limits for currently installed licenses.

### Example

The following example shows the license database. Note that the verbose parameter has been omitted, so the output shows only part of each license key.

```
(host) #(smettu) #show license

```

The output of this command includes the following data columns:

Parameter	Description
Key	License key string.
Installed	Date and time that the license key was installed on the switch.
Expires	Expiration date for the key, if applicable.
Flags	This column displays additional information for the license key. The key describing each flag letter key appears at the bottom of the license table.

Parameter	Description
Service Type	Name of the feature or option enabled by the license key.

## Related Commands

To view additional statistics for license key usage, use the command [show keys](#).

## Command History

Release	Modification
AOS-W1.0	Command introduced.
AOS-W 3.4	Verbose parameter was deprecated. This command now displays the entire license key by default.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on local and master switches

## show license-usage

```
show license-usage ap|user|vpn|xsec
```

### Description

Display license usage information.

### Syntax

Parameter	Description
ap	Show AP license usage information.
user	Show Policy Enforcement Firewall (PEF) user license usage.
vpn	Show VPN server module license usage.
xsec	Show Extreme Security (xSec) user and tunnel license usage.

### Example

This example below the total available AP licenses and the number of licenses currently in use.

```
(host) # (ethersphere-lms3) # show license-usage ap

Total AP Licenses           : 128
AP Licenses Used            : 47
Unused AP Licenses         : 81
Total RAP Licenses          : 0
RAP Licenses Used           : 0
Total Indoor Mesh AP Licenses : 8
Indoor Mesh AP Licenses Used : 0
Total Outdoor Mesh AP Licenses : 8
Outdoor Mesh AP Licenses Used : 0
Total 802.11n-120abg Licenses : 0
802.11n-120abg Licenses Used : 0
Total 802.11n-121abg Licenses : 0
Total 802.11n-124abg Licenses : 0
802.11n-124abg Licenses Used : 0
Total 802.11n-125abg Licenses : 0
802.11n-125abg Licenses Used : 0
```

The output of this command includes the following information:

Parameter	Description
Total AP Licenses	Total number of AP licenses currently available on the switch.
AP licenses used	Number of AP licenses used by individual APs.
Unused AP Licenses	Number of AP licenses unused and currently available.
Total RAP Licenses	Total number of Remote AP (RAP) licenses currently available on the switch.
RAP licenses used	Number of RAP licenses currently used by Remote APs.
Total Indoor Mesh AP Licenses	Total number of Indoor Mesh AP (IMP) licenses currently available on the switch. The output of this command shows information for indoor mesh licenses, even though these licenses are not required in this version of AOS-W.

Parameter	Description
Indoor Mesh AP Licenses Used	Number of IMP licenses currently used by Indoor Mesh APs. The output of this command shows information for indoor mesh licenses, even though these licenses are not required in this version of AOS-W.
Total Outdoor Mesh AP Licenses	Total number of Outdoor Mesh AP (MAP) licenses currently available on the switch.
Outdoor Mesh AP Licenses Used	Number of MAP licenses currently used by Outdoor Mesh APs.
Total 802.11n-120abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 120abg APs.
802.11n-120abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 120abg APs
Total 802.11n-121abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 121abg APs.
802.11n-121abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 121abg APs
Total 802.11n-124abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 124abg APs.
802.11n-124abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 124abg APs
Total 802.11n-125abg Licenses	Total number of high-throughput (802.11n-capable) licenses available for 125abg APs.
802.11n-125abg Licenses Used	Number of high-throughput (802.11n-capable) licenses currently used by 125abg APs

## Command History

Release	Modification
AOS-W 3.0	Command Introduced.
AOS-W 3.3	The following parameters were introduced in the output of <b>show license-usage ap</b> . <ul style="list-style-type: none"> <li>● Total 802.11n-120abg Licenses</li> <li>● 802.11n-120abg Licenses Used</li> <li>● Total 802.11n-121abg Licenses</li> <li>● 802.11n-121abg Licenses Used</li> <li>● Total 802.11n-124abg Licenses</li> <li>● 802.11n-124abg Licenses Used</li> <li>● Total 802.11n-125abg Licenses</li> <li>● 802.11n-125abg Licenses Used</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system. The output of this command varies, according to the licenses currently installed on the switch.	Enable or Config mode on master switches

## show localip

```
show localip
```

### Description

Displays the IP address and VPN shared key between master and local.

### Syntax

No parameters.

### Example

The output of this command shows the switch's IP address and shared key between master and local switches.

```
(host) # show localip

Local Switches configured by Local Switch IP
-----
Switch IP address of the Local  Key
-----  ---
0.0.0.0                          *****
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show local-userdb

```
show local-userdb {[maximum-expiration][start <offset> page <page_size]}
```

### Description

Shows information about user's accounts in the local user database.

### Syntax

Parameter	Description
maximum-expiration	How long the account is valid, in minutes, in the internal database.
<offset>	The user account record's location (by number) as it is listed in the database.
<page_size>	The number of user account records that display on one page.

### Usage Guidelines

Issue this command without any parameters to display a general overview of user's accounts in the database. Use the **maximum-expiration** parameter to show how long the account is valid for in minutes. Use the **start <offset> page <page\_size>** parameters to control which user account records in the database display initially and the number of account records displayed on a page.

### Example

This example shows the basic summary of a user accounts in the database.

```
(host) #show local-userdb maximum-expiration start 5 page 4

local-userdb maximum-expiration 90

User Summary
-----
Name          Password    Role   E-Mail  Enabled  Expiry  Status  Sponsor-Name  Grantor-Name
----          -
guest-0657984 *****    guest      Yes     Yes      Active  Active  admin         admin
guest-8330301 *****    guest      Yes     Yes      Active  Active  admin         admin
guest-5433352 *****    guest      Yes     Yes      Active  Active  admin         admin
guest-3469360 *****    guest      Yes     Yes      Active  Active  admin         admin

User Entries: 11
```

The output of this command includes the following parameters:

Parameter	Description
Name	Name of the user.
Password	The user's password.
Role	Role for the user. This role takes effect when the internal database is specified in a server group profile with a server derivation rule. If there is no server derivation rule configured, then the user is assigned the default role for the authentication method.
E-mail	Shows the email address of the user account.
Enabled	Shows whether the account is enabled or disabled.
Expiry	Shows the expiration date for the user account. If this is not set, the account does not expire.

Parameter	Description
Status	Shows whether the profile has enabled or disabled the ability to use the HTTP protocol to redirect users to the captive portal page.
Sponsor-Name	Shows the sponsor's name.
Grantor-Name	Shows the grantor's name.
User Entries	Shows the number of user accounts in the database.

## Related Commands

Command	Description	Mode
<code>local-userdb add</code>	Use <b>this command</b> to configure the parameters displayed in the output of this show command.	Enable and Config modes
<code>local-userdb-guest add</code>	Use this command to configure parameters for a guest user account.	Enable and Config modes

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.4	The <b>Expiry</b> , <b>Status</b> , <b>Sponsor-name</b> and <b>Grantor-name</b> were introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master and local switches

## show local-userdb username

```
show local-userdb username <name>
```

### Description

Shows information about specific user account in the internal switch database.

### Usage Guidelines

Issue this command to display an overview of a particular user account in the database.

### Example

This example shows the basic summary of a user account **Paula** in the database.

```
(host) #show local-userdb username Paula

User Summary
-----
Name      Password  Role   E-Mail  Enabled  Expiry  Status   Sponsor-Name  Grantor-Name
-----  -
paula    *         guest          Yes           Inactive                admin

User Entries: 1
```

### Command History

Release	Modification
AOS-W 3.0	Command introduced

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master and local switches

## show log all

```
show log all [<number>]
```

### Description

Show the switch's full log.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.

### Example

This example shows the most ten recent log entries for the switch.

```
(host) #show log all 10
```

```
Mar 3 13:26:20 localdb[567]: <133006> <ERRS> |localdb| User admin Failed Authentication

Mar 3 13:57:53 localdb[567]: <133019> <ERRS> |localdb| User admin was not found in the database
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show log ap-debug

```
show log ap-debug{[<number>][all]}
```

### Description

Show the switch's AP debug logs.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the AP debug logs for the switch.

### Example

This example shows the ten most recent AP debug logs for the switch.

```
(host) #show log ap-debug 10

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show log bssid-debug

```
show log bssid-debug{[<number>] [all]}
```

### Description

Show the switch's Bssid debug logs.

A Basic Service Set Identifier (BSSID) uniquely defines each wireless client and Wireless Broadband Router.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the Bssid debug logs for the switch.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes

## show log errorlog

```
show log errorlog{[<number>][all]}
```

### Description

Show the switch's system errors and other critical information.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the error logs for the switch.

### Example

This example shows the ten most recent system log errors.

```
(host) #show log errorlog 10
```

```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show log essid-debug

```
show log essid-debug{[<number>][all]}
```

### Description

Show the switch's Essid debug logs.

An Extended Service Set Identifier (ESSID) is used to identify the wireless clients and Wireless Broadband Routers in a WLAN. All wireless clients and Wireless Broadband Routers in the WLAN must use the same ESSID.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the Essid debug logs for the switch.

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show log network

```
show log network{[<number>][all]}
```

### Description

Show the switch's system network errors.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the network logs for the switch.

### Example

This example shows the switch's recent network log errors.

```
(host) #show log network all
```

```
Feb 17 14:47:14 :209801: <WARN> |fpapps| Physical link down: port 1/1  
Feb 17 14:48:04 :209801: <WARN> |fpapps| Physical link down: port 1/1
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show log security

```
show log security{[<number>][all]}
```

### Description

Show the switch's security logs.

### Syntax

Parameter	Description
<number>	Start displaying the log output from the specified number of lines from the end of the log.
all	Shows all the security logs for the switch.

### Example

This example shows the switch's last seven security logs.

```
(host) #show log security 7
```

```

```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show logging

```
show logging facility|server|{level [verbose]}
```

### Description

the IP address of the remote logging server, as well as facility log types and their associated facility levels.

### Syntax

Parameter	Description
facility	View the facility used when logging messages into the remote syslog server.
server	Show the IP address of a remote logging server.
level [verbose]	Show logging levels at which the messages are logged. Include the optional verbose parameter to display additional data for logging subcategories and processes.

### Usage Guidelines

The AOS-W logging levels follow syslog convention:

- level 7: Emergency
- level 6: Alert
- level 5: Critical
- level 4: Errors.
- level 3: Warning
- level 2: Notices
- level 1: Informational
- level 0: Debug

The default logging level is **level 1**. You can change this setting via the **logging** command.

### Example

This example below displays defined logging levels for each logging facility.

```
(host) #show logging level

LOGGING LEVELS
-----
Facility  Level
-----  -
network   warnings
security  warnings
system    warnings
user      warnings
wireless  warnings
```

This example below displays the IP address of a remote log server. If a remote log server has not yet been defined, this command will not display any output.

```
(host) #show logging server

Remote Server: 10.4.114.12
```

## Related Commands

Command	Description	Mode
<code>logging</code>	Use this command to specify the IP address of the remote logging server, as well as facility log types and their associated facility levels.	Config mode on master and local switches

## Command History

This command was introduced in AOS-W 2.5.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches

## show loginsessions

```
show loginsessions
```

### Description

Displays the current administrator login sessions statistics.

### Syntax

No parameters.

### Example

Issue this command to display the admin login session statistics.

```
Session Table
-----
ID  User Name  User Role  Connection From  Idle Time  Session Time
--  -
```

The output includes the following parameters:

Parameter	Description
ID	Sessions identification number
User Name	Administrator's user name
User Role	Administrator's role
Connection From	The IP address from which the administrator is connecting
Idle Time	Amount of time the user has been idle
Session Time	Total time the session has been open

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show mac-address-table

```
show mac-address-table
```

### Description

Displays a MAC forwarding table.

### Syntax

No parameters.

### Example

Issue this command to display the MAC forwarding table.

```
Dynamic Address Count:          0
Static Address (User-defined) Count:      0
System Self Address Count:          0
Total MAC Addresses :           6
Maximum MAC addresses :           6
MAC Address Table
-----
Destination Address  Address Type  VLAN  Destination Port
-----
00:0b:86:00:00:00   Mgmt         1     vlan 1
```

The output includes the following parameters:

Parameter	Description
Dynamic Address Count	Count of dynamic addresses currently associated with the switch.
Static Address (User-defined) Count	Count of static, user-defined addresses associated with the switch.
System Self Address Count	Number of self system addresses.
Total MAC Addresses	Total number of MAC addresses associated with the switch.
Maximum MAC Addresses	Maximum number of MAC addresses.
Destination Address	Destination MAC address.
Address Type	Destination address type.
VLAN	Associated VLAN.
Destination Port	Destination port.

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show master-local stats

```
show master-local stats [<ip-addr>] [<page>]
```

### Description

Display statistics for communication between master and local switches.

### Syntax

Parameter	Description
<ip-addr>	Include the IP address of a switch to display statistics that switch only.
<page>	Start displaying the output of this command at the specified page number.

### Usage Guidelines

By default, master and Local switches exchange heartbeat messages every 10 seconds. These "Heartbeats" include configuration timestamp. If a master switch has later timestamp than the local switch, the state of the local switch changes from 'Update Successful' to 'Update Required'.

### Example

This example below shows statistics for all communications between the master and local switch.

```
(host) #show master-local stats

Missed -> HB Resp from Master
-----
IP Address  HB Req      HB Resp      Total Missed  Last Sent Missed  Peer Reset  Cfg Terminate  Last Synced
-----
10.6.2.252  194721      194208       926           0                 105         1              Thu Feb 26 21:12:04 2009
```

The output of this command includes the following data columns:

Parameter	Description
IP Address	IP address of the local switch.
HB Req	Heartbeat requests sent from the local switch.
HB Resp	Heartbeat responses sent from the master switch.
Total Missed	Total number of heartbeats that were not received by the local switch.
Last Sent Missed	This counter will increment if switch misses the last heartbeat from the peer switch. This counter will keep on incrementing until the heartbeat message is received from peer.
Peer Reset	The number of times the connection to peer is been reset. The connection could reset due to network connectivity problems or when the peer switch reboots.
Cfg Terminate	Number of times the switch has failed to upgrade to a new configuration
Last Synced	Timestamp showing the last time the local switch synched its configuration from the master switch.

### Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show master-redundancy

```
show master-redundancy
```

### Description

Display the master switch redundancy configuration.

### Syntax

No parameters.

### Example

This example below shows the current master redundancy configuration, including the ID number of the master VRRP virtual router and the IP address of the peer switch for master redundancy.

```
(host) #show master-redundancy
Master redundancy configuration:
  VRRP Id 2 current state is MASTER
  Peer's IP Address is 2.1.1.4
```

### Related Commands

Command	Description
<code>master-redundancy</code>	This command associates a VRRP instance with master switch redundancy.
<code>vrrp</code>	This command configures the Virtual Router Redundancy Protocol (VRRP).

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master switches.

## show memory

```
show memory [ap {meshd|rfd|sapd} {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}]  
            |[auth|cfgm|dbsync|fpapps|fpcli|isakmpd|l2tpd|mobileip|ospf|pim|ptpd|profmgr|slb  
            |snmpd|stm|udbserver|wms]
```

### Description

Show the amounts of free and available memory on the switch, or include a process name to show memory information for a process on the AP or switch.

### Syntax

Parameter	Description
ap	Show memory information for a process running on a specific AP.
meshd	Display memory information for the meshd process on the specified AP.
rfd	Display memory information for the rfd process on the specified AP.
sapd	Display memory information for the rfd process on the specified AP.
ap-name <ap-name>	Display memory information for an AP with the specified AP name.
bssid <bssid>	Display memory information for an AP with the specified BSSID.
ip-addr <ip-addr>	Display memory information for an AP with the specified IP address.
auth	Display memory information for the <b>auth</b> process on the switch.
cfgm	Display memory information for the <b>cfgm</b> process on the switch.
dbsync	Display memory information for the <b>dbsync</b> process on the switch.
fpapps	Display memory information for the <b>fpapps</b> process on the switch.
fpcli	Display memory information for the <b>fpcli</b> process on the switch.
isakmpd	Display memory information for the <b>isakmpd</b> process on the switch.
l2tpd	Display memory information for the <b>l2tpd</b> process on the switch.
mobileip	Display memory information for the <b>mobileip</b> process on the switch.
ospf	Display memory information for the <b>ospf</b> process on the switch.
pim	Display memory information for the <b>pim</b> process on the switch.
ptpd	Display memory information for the <b>ptpd</b> process on the switch.
profmgr	Display memory information for the <b>profmgr</b> process on the switch.
slb	Display memory information for the <b>slb</b> process on the switch.
apsnmpd	Display memory information for the <b>apsnmpd</b> process on the switch.
stm	Display memory information for the <b>auth</b> process on the switch.
udbserver	Display memory information for the <b>udbserver</b> process on the switch.
wms	Display memory information for the <b>wms</b> process on the switch.

## Usage Guidelines

Include the name of a process to show memory information for that process. Use this command under the supervision of Alcatel-Lucent technical support to help debug process errors.

## Example

The command **show memory** displays, in Kilobytes, the total memory on the switch, the amount of memory currently being used, and the amount of free memory.

```
(host) # show memory

Memory (Kb): total: 256128, used: 162757, free: 93371
```

Include the name of a process to show memory statistics for that process. The example below shows memory statistics for **mobileip**.

```
(host) # show memory mobileip
Type      Num Allocs      Size Allocs      Total Allocs      Total Size
default   92              145622           441               241087

      PC              Allocs          Size
0x1000be14      1              64
0x10016cb0      1             41000
0x10021604      1              80
0x10032e34      1              24
0x30019a24      1             2200
0x30019bd8      1             41000
0x30019bf0      1             41000
0x30019c28      1             11263
0x3001b134      2             1967
0x300326b8      9              72
0x30032738      4              64
0x3019dfdc      1              44
0x3019ee60      3              48
0x3019ef18      1             784
0x301b63bc     13             312
0x301b6470     10             200
0x301b648c     10             920
0x301b7614      3              36
0x301b7770      8             128
0x301bd460      3              60
```

The output of this command includes the following columns:

Column	Description
Type	The <b>show memory</b> command currently shows information for predefined processes only, so this column always displays the parameter <b>default</b> .
Num Alloc	Current number of memory allocations.
Size Allocs	Total size of all memory allocations, in bytes.
Total Allocs	Maximum number of allocations used throughout in the life of the process.
Total Size	Maximum size of allocations used throughout in the life of the process, in bytes.
PC	Program counter: the address of a memory allocation. (For internal use only.)
Allocs	Number of memory allocations at that program counter. (For internal use only.)
Size	Size of all memory allocations at that program counter. (For internal use only.)

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show mgmt-role

```
show mgmt-role
```

### Description

This command allows the user to view a list of management role configurations.

### Syntax

No parameters.

### Example

Issue this command to display a list of management user roles.

```
Management User Roles
-----
ROLE                DESCRIPTION
----                -
root                Super user role
read-only           Read only commands
network-operations network-operations
guest-provisioning  guest-provisioning
```

The output includes the following parameters:

Parameter	Description
ROLE	Name of the management user role
DESCRIPTION	Description of the management user role

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master switches

## show mgmt-users

```
show mgmt-users [ <username> |  
  local-authentication-mode <username> |  
  ssh-pubkey <username> |  
  webui-cacert <username> ]
```

### Description

Displays list of management users on the switch and also details of each management users.

### Syntax

### Syntax

Parameter	Description
username	To view details of a specific management user.
local-authentication-mode	Status of local-authentication mode.
ssh-pubkey	Number of management users using the ssh-pubkey.
webui-cacert	Number of management users using web CA certificates.

### Example

The output of this command shows the number of management users in the switch.

```
(host) # show mgmt-user  
  
Management User Table  
-----  
USER      PASSWD  ROLE   STATUS  
-----  
admin     ***** root   ACTIVE
```

### Command History

This command was available in AOS-W 3.3.2

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show netdestination

```
show netdestination <netdestination name>
```

### Description

Displays network destination information.

### Syntax

No parameters.

### Example

Issue this command to display all netdestinations configured on this switch. The output shown below displays information for all configured netdestinations. To display detailed information for an individual netdestination, include the name of the netdestination at the end of the command.

```
(host) #show destination
controller
-----
Position  Type  IP addr      Mask/Range
-----  ----  -
1         host  10.16.15.1
user
----
Position  Type      IP addr      Mask/Range
-----  ----  -
1         network  255.255.255.255  0.0.0.0
mswitch
-----
Position  Type  IP addr      Mask/Range
-----  ----  -
1         host  10.16.15.1
any
---
Position  Type      IP addr      Mask/Range
-----  ----  -
1         network  0.0.0.0      0.0.0.0
```

The output includes the following parameters:

Parameter	Description
Position	Network destination position.
Type	Network destination type.
IP addr	IP address of the network destination.
Mask/Range	Network destination subnet mask and range.

### Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	You must have a Policy Enforcement Firewall license to configure or view a network destination	Enable or config mode on master switches

## show netservice

```
show netservice [<string>]
```

### Description

Show network services

### Syntax

Parameter	Description
<string>	Name of a network service.

### Usage guidelines

Issue this command without the optional **<string>** parameter to view a complete table of network services on the switch. Include the **<string>** parameter to display settings for a single network service only.

### Example

The following example shows the protocol type, ports and application-level gateway (ALG) for the DHCP service.

```
(host) #show netservice svc-dhcp
Services
-----
Name      Protocol  Ports  ALG
----      -
svc-dhcp  udp       67     68
```

### Related Commands

To configure an alias for network protocols, use the command [netservice](#).

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show netstat

```
show netstat [stats]
```

### Description

Show current active network connections.

### Syntax

Parameter	Description
<string>	Show network statistics, filtered by protocol type.

### Usage guidelines

Issue this command without the optional **stats** parameter to view a complete table of active network connections. Include the **stats** parameter to display aggregate statistics for IP, ICMP, TCP and UDP protocols.

## Example

The following example shows incoming and outgoing packet statistics for the switch.

```
(host) #show netstat stats

Ip:
 1084012095 total packets received
 2 with invalid headers
 3 forwarded
 426940 incoming packets discarded
 932097114 incoming packets delivered
 1004595164 requests sent out
 52847 fragments dropped after timeout
 201323411 reassemblies required
 50179757 packets reassembled ok
 53204 packet reassembles failed
 136827034 fragments created

Icmp:
 1969625 ICMP messages received
 5 input ICMP message failed.
 ICMP input histogram:
   destination unreachable: 1752058
   timeout in transit: 1684
   redirects: 70805
   echo requests: 145073
   echo replies: 5
 249806 ICMP messages sent
 0 ICMP messages failed
 ICMP output histogram:
   destination unreachable: 51944
   time exceeded: 52796
   redirect: 2
   echo replies: 145064

Tcp:
 3 active connections openings
 0 passive connection openings
 0 failed connection attempts
 0 connection resets received
 2 connections established
 1006383 segments received
 1147229 segments send out
 9603 segments retransmitted
 0 bad segments received.
 2568 resets sent

Udp:
 928478757 packets received
 40767 packets to unknown port received.
 426937 packet receive errors
 910267627 packets sent
```

## Related Commands

To configure an alias for network protocols, use the command [netservice](#).

## show network-printer

```
show network-printer [ config | job <printer-name> | status ]
```

### Description

Displays configuration, job status details, and printer status of USB printers connected to a OmniAccess 4306 series switch.

### Syntax

Parameter	Description
config	Displays the configuration details of the printer service on the switch.
job	Displays the list of job in queue in all printers connected to the switch.
status	Displays the status of all printers connected to the switch.

### Example

The output of this command shows the status of all printers connected to the switch.

```
(host) #show network-printer status

Networked Printer Status
-----
Printer Name                Printer Alias  Status  Comment
-----
usb1p_Hewlett-Packard_HP_Color_LaserJet_CP3505_CNBJ8B1003  HPLJ_P3005    idle   enabled
usb1p_HP_Officejet_Pro_L7500_MY872231FX                    HPOJ_L7500    idle   enabled
```

### Command History

This command was available in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 series switch	Base operating system	Enable mode

## show network-storage

```
show network-storage [ files opened |
  shares {<file-system-path> | disk |
  status |
  users {disk <disk-name>} ]
```

### Description

Displays details about the USB storage device connect to a OmniAccess 4306 series switch.

### Syntax

Parameter	Description
files opened	Displays the list of opened files in the USB storage device connected to the switch.
shares	Displays the list of shares that are created in the USB storage device. This option provides the following details: <ul style="list-style-type: none"><li>• name of the share</li><li>• name of the disk by alias.</li><li>• the folder associated with the share,</li><li>• the access mode</li></ul>
status	Displays the status of the storage service on the switch.
users	Displays the list of users by IP address, connected share name and connection time.

### Example

The output of this command shows the status of all printers connected to the switch.

```
(host) #show network-storage users

NAS Users
-----
Share Name  Machine      Connected at
-----  -

```

### Command History

This command was available in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 series switch	Base operating system	Enable mode

## show ntp peer

```
show ntp peer <a.b.c.d>
```

### Description

Show NTP peer information.

### Syntax

Parameter	Description
<a.b.c.d>	IP address of an NTP peer

### Usage guidelines

The **show ntp peer** command is used for NTP server troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the **show ntp servers** command to view basic settings for currently configured NTP servers.

### Related Commands

To configure an NTP server, use the command **ntp server**.

### Command History

This command was available in AOS-W 3.0.

#### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show ntp servers

```
show rft servers [brief]
```

### Description

Show information for Network Time Protocol (NTP) servers.

### Syntax

Parameter	Description
brief	Display only the IP address of the defined NTP servers.

### Example

The following example shows values for the primary and backup NTP servers. The primary server is marked with an asterisk (\*) and the backup server is marked with an equals sign (=). Note that a backup server will not display delay, offset or dispersion data, as it is not currently in use.

```
(host) #show ntp servers
```

```
      remote          local      st poll reach  delay  offset  disp
=====
=10.4.0.21          10.6.2.253      16 1024    0 0.00000 0.000000 0.000000
*10.1.1.250        10.6.2.253      2  1024   377 0.00081 -0.010376 0.03040
```

The output of this command includes the following parameters:

Parameter	Description
remote	IP address of the remote NTP server defined using the cli command <a href="#">ntp server</a> .
local	IP address of the local clock.
st	NTP uses hierarchical levels of clock sources, or strata, and assigns each layer a number starting with zero at the root. The <b>st</b> column in the output of this command represents the number of servers between the configured NTP server and the root reference clock.
poll	Interval, in seconds, between the local NTP server's attempt to poll the remote NTP server.
reach	An index that measures whether or not the remote NTP server could be reached at eight most recent polling intervals. If the NTP server has just been configured and hasn't yet been polled successfully, the value will be zero (0). A value of 377 indicates that the last eight poll queries were successful.
delay	Delay, in seconds, between the time that the local clock polls the NTP server and the NTP server returns a reply.
offset	The difference in time, in seconds, between the local clock and the NTP server.
disp	Dispersion represents the maximum error of the local clock relative to the reference clock, and is a measurement of the time server and network quality. Lower dispersion values are preferred over higher dispersion values.

### Related Commands

To configure an NTP server, use the command [ntp server](#).

### Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show ntp status

```
show ntp status
```

### Description

Show information for a NTP server.

### Syntax

No parameters.

### Example

The following example shows values for the primary NTP server.

```
(host) #show ntp status

system uptime:          7594
time since reset:      7594
bad stratum in packet: 0
old version packets:   113
new version packets:   0
unknown version number: 0
bad packet format:     0
packets processed:     110
bad authentication:    0
packets rejected:      0
system peer:           10.1.1.250
system peer mode:      client
leap indicator:        00
stratum:                3
precision:             -18
root distance:         0.03236 s
root dispersion:       0.06728 s
reference ID:           [10.1.1.250]
reference time:         cd45b701.bcbc05d5 Tue, Feb 17 2009 14:21:53.737
system flags:           auth monitor ntp kernel stats
jitter:                0.005020 s
stability:              0.866 ppm
broadcastdelay:        0.003998 s
authdelay:              0.000000 s
```

The output of this command includes the following parameters:

Parameter	Description
system uptime	The number of seconds the local NTP server has been associated with the switch.
time since reset	The number of seconds since the last time the local NTP server was restarted.
bad stratum in packet	The number of NTP packets with a corrupted stratum bit.
old version packets	Number of packets that match the previous NTP version. A version number is in every NTP packet.
new version packets	Number of packets that match the current NTP version.
unknown version number	Number of packets with an unknown NTP version.
bad packet format	Number of NTP packets dropped due to an invalid packet format.
packets processed	Number of NTP packets received and processed by the switch.
bad authentication	Number of NTP packets that failed to be authenticated.

Parameter	Description
packets rejected	Number of NTP packets rejected because they had an invalid format.
system peer	The IP address of the peer NTP server.
system peer mode	The peer mode of this remote association: <ul style="list-style-type: none"> <li>• Symmetric Active</li> <li>• Symmetric Passive</li> <li>• Client</li> <li>• Server</li> <li>• Broadcast</li> </ul>
leap indicator	This parameter indicates whether or not a leap-second should be inserted or removed at the end of the last day of the current month. <ul style="list-style-type: none"> <li>• 00 no warning</li> <li>• 01 +1 second (following minute has 61 seconds)</li> <li>• 10 -1 second (following minute has 59 seconds)</li> </ul>
stratum	The stratum level of the peer
precision	The advertised precision of the switch. This value can range from -4 and -20, inclusive.
root distance	Total round trip delay to the stratum 1 reference clock.
root dispersion	Total dispersion to the stratum 1 reference clock. This value is a cumulative measure of all errors associated with the network hops and servers between the NTP server and its stratum 1 server.
reference ID	IP address of the remote NTP server
reference time	Time when the local system clock was last set or corrected, in NTP timestamp format.
system flags	This parameter displays any flags configured for this NTP entity.
jitter	The average magnitude of jitter between several time queries.
stability	The average magnitude of offset between several time queries
broadcastdelay	The broadcast delay of this NTP server association, in seconds.
authdelay	The authentication delay of this NTP server association, in seconds.

## Related Commands

To configure an NTP server, use the command [ntp server](#).

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show packet-capture

show packet-capture

### Description

Displays packet capture status on the switch.

### Syntax

No Parameters

### Example

The output of this command shows the packet capture configuration details.

```
(host) # show packet-capture

Current Active Packet Capture Actions(current switch)
=====
Packet filtering TCP with 1 port(s) enabled:
  2
Packet filtering UDP with 1 port(s) enabled:
  5
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets enabled.

Packet Capture Defaults(across switches and reboots if saved)
=====
Packet filtering TCP with 1 port(s) enabled:
  2
Packet filtering UDP with 1 port(s) enabled:
  5
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets enabled.
```

### Command History

This command was available in AOS-W 3.3.2

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show packet-capture-defaults

show packet-capture-defaults

### Description

Displays the status of default packet capture options.

### Syntax

No Parameters

### Example

The output of this command shows packet capture status.

```
(host) # show packet-capture-defaults

Current Active Packet Capture Actions(current switch)
=====
Packet filtering for TCP ports disabled.
Packet filtering for UDP ports disabled.
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets disabled.

Packet Capture Defaults(across switches and reboots if saved)
=====
Packet filtering for TCP ports disabled.
Packet filtering for UDP ports disabled.
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets disabled.
```

### Command History

This command was available in AOS-W 3.3.2

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show papi-security

```
show papi-security
```

### Description

This command shows a configured papi-security profile.

### Syntax

Parameter	Description	Range	Default
PAPI Key	The key string. The key authenticates the messages between systems.	Range: 10–64 characters	—
Enhanced security mode	Indicates if the enhanced security mode is enabled or disabled. This mode causes the system to reject messages when an incorrect key is used.	—	disabled

### Usage Guidelines

Issue this command to show the a selected papi-security profile configuration. The **papi-security** command is used by the Alcatel-Lucent system to enforce advanced security options and provides an enhanced level of security.

The **Parameter** column displays the PAPI Key and Enhanced security mode parameters. The **Value** column displays a Papi key value (encrypted) and indicates whether the Enhanced security mode is enabled or disabled. If an AP cannot be authenticated because it has the wrong key, the show ap database command displays a “Bad key” status.

```
.
(host) #show papi-security

PAPI Security Profile
-----
Parameter          Value
-----          -
PAPI Key            *****
Enhanced security mode Enabled
```

### Related Commands

Use the command **papi-security** to configure a papi-security profile.

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master or local switches

## show poe

```
show poe [slot/port]
```

### Description

Displays the PoE status of all or a specific port on the switch.

### Syntax

No Parameters

### Example

The output of this command shows the PoE status of port 10 in slot 1.

```
(host) # show poe 1/10

PoE Status
-----
Port      Status  Voltage (mV)  Current (mA)  Power (mW)
-----  -
FE 1/10  Off     N/A           N/A           N/A
```

### Command History

This command was available in AOS-W 3.0

## show port link-event

```
show port link-event
```

### Description

Displays the link status on each of the port on the switch.

### Syntax

No Parameters

### Example

The output of this command shows the link status status on all ports in the switch.

```
(host) # show port link-event
```

## show priority-map

```
show priority-map
```

### Description

Displays the list of priority maps on a interface.

### Syntax

No Parameters

### Example

The output of this command shows the priority maps configured on all interfaces.

```
(host) # show priority-map

Priority Map
-----
ID  Name      DSCP-TOS  DOT1P-COS
--  -
1   my-map    4-20,60   4-7
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show processes

```
show processes [sort-by {cpu | memory}]
```

### Description

Displays the list of all process running on the switch. You can sort the list either by CPU intensive or memory intensive processes.

### Syntax

Parameter	Description
sort-by	To add sort filter to the output
cpu	This will sort output based on CPU usage.
memory	This will sort output based on memory usage.

### Example

The output of this command shows list of processes sorted by CPU usage.

```
(host) # show priority-map

%CPU S  PID  PPID  VSZ  RSS  F  NI  START      TIME      EIP  CMD

## show profile-errors

```
show profile-errors
```

### Description

Displays the list of invalid user-created profiles. The following are the list of some profile errors:

**Table 1** List of Profile Errors

Error Name	Description
Named VLAN [named_VLAN] is removed	These errors are displayed if a virtual AP profile is configure with a VLAN that does not exist.
Named VLAN [named_VLAN] is not mapped	
Named VLAN [named_VLAN] is invalid	
VLAN [x] does not exist	
Server group is invalid	This error is displayed if a aaa profile is configured an invalid server group.
User derivation rule is invalid	This error is displayed if a user role in a aaa profile is invalid.
User role is invalid	
Controller country code is undefined	These errors are displayed, if your switch is not set to the correct country code or if the country code specified in a WLAN profile does not match the switch's country code.
Country [country_name] does not match controller country [country_name]	
Opmode requires WPA key	This message is displayed if a SSID profile is configured without a WPA key.
WARNING: if weptxkey = [x], wepkey[x] must be set in order to use static WEP	This message is displayed if a SSID profile is configured to use a static WEP and the WEP is not configured.

### Syntax

No Parameters

### Example

The output of this command shows list of profiles that are invalid and also displays the error in those profiles. In this example, the VLAN 1000 that is mapped to virtual-ap *test-vap* does not exist.

```
(host) #show profile-errors

Invalid Profiles
-----
Profile           Error
-----
wlan virtual-ap "test-vap"  VLAN 1000 does not exist
```

## Command History

This command was available in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-hierarchy

```
show profile-hierarchy
```

### Description

Displays the profile hierarchy template. All user-defined profiles must be created in compliance with this template.

### Syntax

No Parameters

### Example

The output of this command shows list of profiles that are invalid and also displays the error in those profiles.

```
(host) # show profile-hierarchy

ap-group
  wlan virtual-ap
    aaa profile
      aaa authentication mac
      aaa server-group
      aaa authentication dot1x
      aaa xml-api server
      aaa rfc-3576-server
    wlan ssid-profile
      wlan edca-parameters-profile station
      wlan edca-parameters-profile ap
      wlan ht-ssid-profile

## Command History

This command was available in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list aaa

```
show profile-list aaa [{authentication [captive-portal | dot1x | mac ]} |  
  {authentication-server [ldap | radius | tacas ]} |  
  {profile} | {rfc-3576-server} | {server-group} | {xml-api}]
```

### Description

Displays the list of aaa profiles.

### Syntax

Parameter	Description
authentication	List of aaa authentication profiles.
captive-portal	Profile using captive-portal authentication profiles.
dot1x	Profiles using dot1x authentication profiles.
mac	Profiles using mac authentication profiles.
authentication-server	List of aaa authentication servers
ldap	List of servers using LDAP for aaa authentication.
radius	List of servers using RADIUS for aaa authentication.
tacacs	List of servers using tacacs for aaa authentication.
profile	Displays the aaa profile details.
rfc-3576-server	Displays IP address of RADIUS servers that use RFC 3576 specification to exchange authorization messages.
server-group	List of server group used for RADIUS accounting.
xml-api	List of servers configured in an external XML API server.

### Example

The output of this command shows list of aaa profiles that use captive-portal authentication.

```
(host) # show profile-list aaa authentication captive-portal  
  
Captive Portal Authentication Profile List  
-----  
Name      References  Profile Status  
----      -  
default  1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list ap

```
show profile-list ap [ enet-link-profile | mesh-cluster-profile |  
  mesh-ht-ssid-profile | mesh-radio-profile | regulatory-domain-profile |  
  snmp-profile | snmp-user-profile | system-profile | wired-ap-profile ]
```

### Description

Displays the list of AP profiles.

### Syntax

Parameter	Description
enet-link-profile	Details of AP ethernet link profile.
mesh-cluster-profile	Details of mesh cluster profiles used by mesh nodes.
mesh-ht-ssid-profile	Details of mesh high-throughput SSID profiles used by mesh nodes.
mesh-radio-profile	Details of mesh radio profile used by mesh nodes.
regulatory-domain-profile	Details of AP regulatory profile.
snmp-profile	Details of SNMP profile.
snmp-user-profile	Details of SNMPv3 user profiles.
system-profile	Details of AP system profile.
wired-ap-profile	Details of wired AP profile.

### Example

The output of this command shows list of profiles that are invalid and also displays the error in those profiles.

```
(host) # show profile-list aaa authentication captive-portal  
  
Captive Portal Authentication Profile List  
-----  
Name      References  Profile Status  
----      -  
default  1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list ap-group

```
show profile-list ap-group
```

### Description

Displays the status of AP groups profiles in the switch.

### Syntax

No Parameters

### Example

The output of this command shows the status of AP group profiles in the switch.

```
(host) # show profile-list ap-group
```

```
AP group List
-----
Name      Profile Status
----      -
default

Total:1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list ap-name

```
show profile-list ap-name
```

### Description

Displays the status of AP profiles in the switch.

### Syntax

No Parameters

### Example

The output of this command shows status of AP profiles in the switch.

```
(host) # show profile-list ap-name

AP name List
-----
Name  Profile Status
----  -
Total:0
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list ids

```
show profile-list ids [dos-profile | general-profile | impersonation-profile |  
  profile | rate-thresholds-profile | signature-matching-profile |  
  signature-profile | unauthorized-device-profile ]
```

### Description

Displays the status of all IDS profiles in the switch.

### Syntax

Parameter	Description
dos-profile	Details of DoS profile settings.
general-profile	Details of AP attributes.
impersonation-profile	Details of profile to capture impersonation attacks.
profile	Details of IDS profile.
rate-thresholds-profile	Details of profile used to check different frame type rates.
signature-matching-profile	Details of profile that contains pre defined signature.
signature-profile	Details of profile that contains signatures for wireless intrusion detection.
unauthorized-device-profile	Details of profile used to detect unauthorized devices and rogue APs.

### Example

The output of this command shows details and status of DoS profile.

```
(host) # show profile-list ids dos-profile  
  
IDS Denial Of Service Profile List  
-----  
Name                References  Profile Status  
-----  
default             1  
ids-dos-disabled    1          Predefined  
ids-dos-high-setting 1          Predefined  
ids-dos-low-setting  1          Predefined  
ids-dos-medium-setting 1          Predefined  
  
Total:5
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list rf

```
show profile-list rf [ arm-profile | dot11a-radio-profile | dot11g-radio-profile |  
event-thresholds-profile | ht-radio-profile | optimization-profile ]
```

### Description

Displays the status of all radio profiles.

### Syntax

Parameter	Description
arm-profile	Details of Adaptive Radio Management (ARM) Profile.
dot11a-radio-profile	Details of AP radio settings for the 5GHz frequency band, including the ARM profile and the high-throughput (802.11n) radio profile.
dot11g-radio-profile	Details of AP radio settings for the 2.4 GHz frequency band, including the ARM profile and the high-throughput (802.11n) radio profile.
event-thresholds-profile	Details of events thresholds profile.
ht-radio-profile	Details of high-throughput AP radio settings
optimization-profile	Details of the RF optimization profile

### Example

The output of this command shows status of ARM profile.

```
(host) # show profile-list rf arm-profile  
  
Adaptive Radio Management (ARM) profile List  
-----  
Name      References  Profile Status  
----      -  
default  2  
  
Total:1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show profile-list wlan

```
show profile-list wlan [ edca-parameters-profile | ht-ssid-profile |  
    ssid-profile | traffic-management-profile | virtual-ap | voip-cac-profile ]
```

### Description

Displays the status of WLAN profiles on the switch.

### Syntax

Parameter	Description
edca-parameters-profile	Details of enhanced distributed channel access (EDCA) profile for APs or for clients (stations)
ht-ssid-profile	Details of high-throughput SSID profile.
traffic-management-profile	Details of traffic management profile.
virtual-ap	Details of the virtual AP profile.
voip-cac-profile	Details of voice over IP (VoIP) call admission control (CAC) profile

### Example

The output of this command shows status of ARM profile.

```
(host) # show profile-list rf arm-profile  
  
Adaptive Radio Management (ARM) profile List  
-----  
Name      References  Profile Status  
----      -  
default  2  
  
Total:1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show provisioning-ap-list

```
show provisioning-ap-list
```

### Description

Displays the list of all APs that are in queue to be provisioned by the admin.

### Syntax

No Parameters

### Command History

This command was available in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show provisioning-params

show provisioning-params

### Description

Displays the list of parameters and the values used to provision the APs.

### Syntax

No Parameters

### Example

The output of this command shows list of all provisioning parameters and their values.

```
(host) # show provisioning-params
AP provisioning
-----
Parameter                               Value
-----
AP Name                                  N/A
AP Group                                  default
Location name                             N/A
SNMP sysLocation                          N/A
Master                                    N/A
Gateway                                    N/A
Netmask                                    N/A
IP Addr                                    N/A
DNS IP                                     N/A
Domain Name                               N/A
Server Name                               N/A
Server IP                                  N/A
Antenna gain for 802.11a                   N/A
Antenna gain for 802.11g                   N/A
Use external antenna                       No
Antenna for 802.11a                        both
Antenna for 802.11g                        both

Antenna tilt angle for 802.11g            N/A
Mesh SAE                                   sae-default
```

## Command History

This command was available in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show rap-wml

```
show rap-wml [cache <server-name> | server | wired-mac <bssid-of-AP> ]
```

### Description

Displays the name and attributes of a MySQL database or a MySQL server.

### Syntax

Parameter	Description
cache	Displays the cache of all lookups for a database server
servers	Displays the database server state.
wired-mac	Displays the wired MAC discovered on traffic through the AP

### Example

The output of this command shows status of all database servers.

```
(host) # #show rap-wml servers

WML DB Servers
-----
name ip type user password db-name cache ageout(sec) in-service
-----
WML DB Tables
-----
server db table column timestamp-column lookup-time(sec) delimiter query-count
-----
Mesh SAE sae-default
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show references aaa authentication

```
crypto-local
show references aaa authentication {captive-portal <profile-name>}|{dot1x <profile-
name>}|{mac <profile-name>}|mgmt|stateful-dot1x|vpn|wired [page <number>] [start
<number>]
```

### Description

Show AAA profile references.

### Syntax

Parameter	Description
captive-portal <profile-name>	Show the number of references to a captive-portal profile.
dot1x <profile-name>	Show the number of references to a 802.1x authentication profile.
mac <profile-name>	Show the number of references to a MAC authentication profile.
mgmt <profile-name>	Show the number of references to a management authentication profile.
stateful-dot1x	Show the number of references to the stateful 802.1X authentication profile.
vpn	Show the number of references to VPN authentication.
wired	Show the number of references to wired authentication.
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

Use this command to show where a specified AAA profile has been applied. The output of the example shown below indicates that the aaa profile **default-dot1x** contains a single reference to the 802.1x authentication profile **default**.

```
(host) #show references aaa authentication dot1x default

References to 802.1X Authentication Profile "default"
-----
Referrer                                     Count
-----                                     -
aaa profile "default-dot1x" authentication-dot1x  1
Total References:1
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references aaa authentication-server

```
crypto-local
show references aaa authentication-server {ldap <ladp-server-name>}|{radius <radius-
server-name>}|{tacacs <tacacs-server-name>} [page <number>] [start <number>]
```

### Description

Display information about AAA authentication servers.

### Syntax

Parameter	Description
ldap <ladp-server-name>	Show the number of server groups that include references to the specified LDAP server.
radius <radius-server-name>	Show the number of server groups that include references to the specified RADIUS server.
tacacs <radius-server-name>	Show the number of server groups that include references to the specified TACACS server.
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

Issue this command to show the AAA server groups that include references to the specified server. The example below shows that two server groups, **default** and **rad**, each include a single reference to the radius server **rad01**.

```
(host) #show references aaa authentication-server radius rad01

References to RADIUS Server "rad01"
-----
Referrer                               Count
-----
aaa server-group "default" server_group 1
aaa server-group "rad" server_group     1
Total References:2
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references aaa profile

```
crypto-local
show references aaa profile <profile-name>
```

### Description

Show references to an AAA Profile.

### Syntax

Parameter	Description
profile <profile-name>	Name of an AAA profile for which you want to view references.

### Example

Issue this command to show the wlan virtual AP profiles that include references to the specified AAA profile. The example below shows that seven different virtual AP profiles include a single reference to the AAA profile **default**.

```
(host) #References to AAA Profile "default"
-----
Referrer                               Count
-----
wlan virtual-ap "1.0.0_corporateHQ-wpa2" aaa-profile 1
wlan virtual-ap "110.0.corporateHQ-wpa2" aaa-profile 1
wlan virtual-ap "default" aaa-profile 1
wlan virtual-ap "corporateHQ-vocera" aaa-profile 1
wlan virtual-ap "corporateHQ-voip-wpa2" aaa-profile 1
wlan virtual-ap "Test123" aaa-profile 1
wlan virtual-ap "branch12" aaa-profile 1
Total References:7
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references aaa server-group

```
crypto-local
show references aaa server-group <sg-name> [page] [start]}
```

### Description

Show references to a server group.

### Syntax

Parameter	Description
server-group <sg-name>	Name of the server group for which you want to show references
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

**.Issue this command to display a list of AAA profiles that include references to the specified server group.**

```
(host) #show references aaa server-group default

References to Server Group "default"
-----
Referrer                               Count
-----
aaa profile "aircorp-office-ssid" mac-server-group 1
aaa profile "amigopod-guest" mac-server-group 1
aaa profile "default" mac-server-group 1
aaa profile "default-airwave-office" mac-server-group 1
aaa profile "defaultcorporate" mac-server-group 1
aaa profile "defaultcorporate-no-okc" mac-server-group 1
aaa profile "defaultcorporate-okc" mac-server-group 1
aaa profile "default-dot1x" mac-server-group 1
aaa profile "default-India" mac-server-group 1
aaa profile "default-india-hotel" mac-server-group 1
aaa profile "default-India-split" mac-server-group 1
aaa profile "voip-psk" mac-server-group 1
aaa profile "default-dot1x-psk" mac-server-group 1
aaa profile "default-mac-auth" mac-server-group 1
aaa profile "default-open" mac-server-group 1
aaa profile "default-xml-api" mac-server-group 1
Total References:16
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references ap

```
crypto-local
show references ap
  enet-link-profile <profile-name>
  mesh-cluster-profile <profile-name>
  mesh-ht-ssid-profile <profile-name>
  mesh-radio-profile <profile-name>
  regulatory-domain-profile <profile-name>
  system-profile <profile-name>
  wired-ap-profile <profile-name>
  page <number>
  start <number>
```

### Description

Show the number of references to a specific AP profile.

### Syntax

Parameter	Description
enet-link-profile <profile-name>	Show AP groups that include a references to this ethernet link profile.
mesh-cluster-profile <profile-name>	Show AP groups that include a references to this mesh cluster profile.
mesh-ht-ssid-profile <profile-name>	Show AP groups that include a references to this mesh high-throughput SSID profile.
mesh-radio-profile <profile-name>	Show AP groups that include a references to this mesh radio profile.
regulatory-domain-profile <profile-name>	Show AP groups that include a references to this regulatory domain profile.
system-profile <profile-name>	Show AP groups that include a references to this system profile.
wired-ap-profile <profile-name>	Show AP groups that include a references to this wired AP profile.
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

The example below shows that 10 different AP groups include links to the AP ethernet link profile **Default**. These 10 AP groups reference the **Default** ethernet link profile for both their ethernet 0 and ethernet 1 interfaces, for a total of 20 references altogether.

```
(host)#show references ap enet-link-profile default
```

```
References to AP Ethernet Link profile "default"
-----
Referrer                                     Count
-----
ap-group "10.0.0" enet0-profile             1
ap-group "10.0.0" enet1-profile             1
ap-group "corp" enet0-profile               1
ap-group "corp" enet1-profile               1
ap-group "Corp_AM_Ch1" enet0-profile        1
ap-group "Corp_AM_Ch1" enet1-profile        1
ap-group "Corp_AM_Ch6" enet0-profile        1
ap-group "Corp_AM_Ch6" enet1-profile        1
ap-group "corpTest" enet0-profile           1
ap-group "corpTest" enet1-profile           1
ap-group "default" enet0-profile            1
ap-group "default" enet1-profile            1
ap-group "India_Local" enet0-profile        1
ap-group "India_Local" enet1-profile        1
ap-group "ops" enet0-profile                1
ap-group "ops" enet1-profile                1
ap-group "voip-test" enet0-profile          1
ap-group "voip-test" enet1-profile          1
ap-group "voip-test-nokia" enet0-profile    1
ap-group "voip-test-nokia" enet1-profile    1
Total References:20
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references guest-access-email

```
crypto-local  
show references guest-access-email [page <number>] [start <number>]
```

### Description

Show references to the global guest access email profile.

### Syntax

Parameter	Description
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

```
(host) #show references guest-access-email  
  
References to Guest-access Email Profile  
-----  
Referrer Count  
-----  
Total References:0
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references ids

```
crypto-local
show references ids
  dos-profilegeneral-profile
  general-profile
  impersonation-profile
  profile
  rate-thresholds-profile
  signature-matching-profile
  signature-profile
  unauthorized-device-profile
```

### Description

Displays IDS profile references.

### Syntax

Parameter	Description
dos-profilegeneral-profile	Show references to an IDS Denial Of Service Profile
general-profile	Show references to an IDS General Profile
impersonation-profile	Show references to an IDS Impersonation Profile
profile	Show references to an IDS Profile
rate-thresholds-profile	Show references to an IDS Rate Thresholds Profile
signature-matching-profile	Show references to an IDS Signature Matching Profile
signature-profile	Show references to an IDS Signature Profile
unauthorized-device-profile	Show references to an IDS Signature Profile

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references papi-security

```
crypto-local  
show references papi-security [page <number>] [start <number>]
```

### Description

Show references to a PAPI security profile.

### Syntax

Parameter	Description
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

```
(host) #show references papi-security  
  
References to PAPI Security Profile  
-----  
Referrer Count  
-----  
Total References:0
```

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references rf

```
crypto-local
show references rf
  dot11a-radio-profile <profile-name>
  dot11g-radio-profile <profile-name>
  event-thresholds-prof <profile-name>
  ht-radio-profile <profile-name>
  optimization-profile <profile-name>
```

### Description

Show RF profile references.

### Syntax

Parameter	Description
dot11a-radio-profile	Show references to a 802.11a radio profile
dot11g-radio-profile	Show references to a 802.11g radio profile
event-thresholds-prof	Show references to an RF Event Thresholds Profile
ht-radio-profile	Show references to a High-throughput radio profile
optimization-profile	Show references to an RF Optimization Profile

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references user-role

```
crypto-local  
show references user-role <role_name>
```

### Description

Show access rights for user role.

### Syntax

Parameter	Description
<role_name>	The role name assigned to a user.

### Example

```
(host) #show references user-role guest  
  
References to User Role "guest"  
-----  
aaa profile "airwave-office-ssid" mac-default-role  
aaa profile "amigopod-guest" mac-default-role  
aaa profile "corp1344-voip" mac-default-role  
aaa profile "default" mac-default-role  
aaa profile "default-airwave-office" mac-default-role  
aaa profile "default-corp1344" mac-default-role  
aaa profile "default-corp1344-no-okc" mac-default-role  
aaa profile "default-corp1344-okc" mac-default-role  
aaa profile "default-dot1x" mac-default-role  
aaa profile "default-dot1x-psk" mac-default-role  
aaa profile "default-dot1x-psk" dot1x-default-role  
aaa profile "default-India" mac-default-role  
aaa profile "default-india-hotel" mac-default-role
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references web-server

```
crypto-local  
show references web-server [page <number>] [start <number>]
```

### Description

Show the Web server configuration references.

### Syntax

Parameter	Description
page <number>	Include this optional parameter to limit output of this command to the specified number of items.
start <number>	Include this optional parameter to start displaying the output of this command at the specified index number.

### Example

```
(host) #show references web-server  
  
References to Web Server Configuration  
-----  
Referrer Count  
-----  
Total References:0
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show references wlan

```
crypto-local
show references wlan
  dot11k-profile <profile-name>
  edca-parameters-profile <profile-name>
  ht-ssid-profile <profile-name>
  ssid-profile <profile-name>
  traffic-management-pr <profile-name>
  virtual-ap <profile-name>
  voip-cac-profile <profile-name>
```

### Description

Shows WLAN profile references.

### Syntax

Parameter	Description
dot11k-profile <profile-name>	Shows references to a 802.11K profile.
edca-parameters-profile <profile-name>	Shows references to an EDCA parameters profile.
ht-ssid-profile <profile-name>	Shows references to a high-throughput SSID profile.
ssid-profile <profile-name>	Shows references to an SSID management profile.
traffic-management-pr <profile-name>	Shows references to a traffic management profile.
virtual-ap <profile-name>	Shows references to a virtual AP profile.
voip-cac-profile <profile-name>	Shows references to a VOIP Call Admission Control profile.

### Example

```
(host) #show references web-server

References to Web Server Configuration
-----
Referrer  Count
-----  -----
Total References:0
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
Available on all platforms	Base operating system	Config mode on master and local switches

## show rf arm-profile

```
show rf arm-profile [<profile>]
```

### Description

Show an Adaptive Radio Management (ARM) profile.

### Syntax

Parameter	Description
<profile>	Name of an ARM profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire ARM profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has five configured ARM profiles. The **References** column lists the number of other profiles with references to the ARM profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf arm-profile
Adaptive Radio Management (ARM) profile List
-----
Name                References  Profile Status
----                -
airwave             2
default             4
default-AP85       2
no-scanning         1
Wireless-rf-profile 1

Total:5
```

This example displays the configuration settings for the profile **Wireless\_rf\_profile**.

```
(host) #show rf arm-profile default
Adaptive Radio Management (ARM) profile "test"
-----
Parameter                               Value
-----
Assignment                               disable
Allowed bands for 40MHz channels         a-only
Client Aware                            Enabled
Max Tx Power                             30 dBm
Min Tx Power                             9 dBm
Multi Band Scan                          Enabled
Rogue AP Aware                           Disabled
Scan Interval                             10 sec
Active Scan                              Disabled
Scanning                                 Enabled
Scan Time                                 110 msec
VoIP Aware Scan                          Disabled
Power Save Aware Scan                    Enabled
Ideal Coverage Index                     10
Acceptable Coverage Index                 4
Free Channel Index                        25
Backoff Time                             240 sec
Error Rate Threshold                      50 %
Error Rate Wait Time                     30 sec
Noise Threshold                           75 -dBm
Noise Wait Time                           120 sec
Minimum Scan Time                         8 sec
Load aware Scan Threshold                  1250000 Bps
Mode Aware Arm                            Disabled
```

The output of this command includes the following parameters:

Parameter	Description
Assignment	Displays the current ARM channel/power assignment mode.
Allowed bands for 40MHz channels	Shows if 40 MHz mode of operation is allowed on the 5 GHz (802.11a) or 2.4 GHz (802.11b/g) frequency band only, on all frequency bands, or on neither frequency band.
Client Aware	Shows if the client aware feature is enabled or disabled. When enabled, the AP does not change channels when there are active clients.
Max Tx Power	The highest transmit power levels for the AP, from 0-30 dBm in 3 dBm increments. Higher power level settings may be constrained by local regulatory requirements and AP capabilities. In the event that an AP is configured for a Max Tx Power setting it cannot support, this value will be reduced to the highest supported power setting.
Min Tx Power	The lowest transmit power levels for the AP, from 0-30 dBm, in 3 dBm increments. Note that power settings will not change if the Assignment option is set to disabled or maintain.
Multi Band Scan	If enabled, single-radio APs will try to scan across bands for rogue AP detection.
Rogue AP Aware	If enabled, Alcatel-Lucent APs may change channels to contain off-channel rogue APs with active clients. This security features allows APs to change channels even if the Client Aware setting is disabled.  This setting is disabled by default, and should only be enabled in high-security environments where security requirements are allowed to consume higher levels of network resources. You may prefer to receive Rogue AP alerts via SNMP traps or syslog events.

Parameter	Description
Scan Interval	If Scanning is enabled, the Scan Interval defines how often the AP will leave its current channel to scan other channels in the band. Off-channel scanning can impact client performance. Typically, the shorter the scan interval, the higher the impact on performance. If you are deploying a large number of new APs on the network, you may want to lower the Scan Interval to help those APs find their optimal settings more quickly. Raise the Scan Interval back to its default setting after the APs are functioning as desired.
Active Scan	If enabled, the AP initiates active scanning via probe request. This option elicits more information from nearby APs, but also creates additional management traffic on the network. Active Scan is disabled by default, and should not be enabled except under the direct supervision of Alcatel-Lucent Support.
Scanning	Shows if the AP has enabled or disabled AP scanning of other channels.
Scan Time	The amount of time, in milliseconds, an AP will drift out of the current channel to scan another channel.
VoIP Aware Scan	Shows if Alcatel-Lucent's VoIP Call Admission Control (CAC) prevents any single AP from becoming congested with voice calls. If CAC is enabled, you should also enable VoIP Aware Scan in the ARM profile, so the AP will not attempt to scan a different channel if one of its clients has an active VoIP call.
Power Save Aware Scan	When enabled, the AP will not scan if Power Save is active.
Ideal Coverage Index	The coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be.
Acceptable Coverage Index	The minimal coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be.
Free Channel Index	The difference in the interference index between the new channel and current channel must exceed this value for the AP to move to a new channel. The higher this value, the lower the chance an AP will move to the new channel.
Backoff Time	Time, in seconds, an AP backs off after requesting a new channel or power level.
Error Rate Threshold	The percentage of errors in the channel that triggers a channel change.
Error Rate Wait Time	Time, in seconds, that the error rate has to maintain or surpass the error rate threshold before it triggers a channel change.
Noise Threshold	Maximum level of noise (in -dBm) in a channel that triggers a channel change.
Noise Wait Time	Time, in seconds, the noise has to be high to trigger a channel change.
Minimum Scan Time	Time, in seconds, that a channel must be scanned before it is considered for assignment.
Load aware Scan Threshold	The traffic throughput level an AP must reach before it stops scanning, in bytes/second. A value of 0 to disables this feature.
Mode Aware Arm	If enabled, ARM will turn APs into Air Monitors (AMs) if it detects higher coverage levels than necessary. This helps avoid higher levels of interference on the WLAN. Although this setting is disabled by default, you may want to enable this feature if your APs are deployed in close proximity (e.g. less than 60 feet apart).

## Command History

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rf dot11a-radio-profile

```
show rf dot11a-radio-profile [<profile>]
```

### Description

Show an 802.11a Radio profile.

### Syntax

Parameter	Description
<profile>	Name of an 802.11a profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire 802.11a Radio profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has three configured 802.11a Radio profiles. The **References** column lists the number of other profiles with references to the 802.11a Radio profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf dot11a-radio-profile
802.11a radio profile List
-----
Name           References  Profile Status
----           -
default        18
default-AP85   1
test           1

Total:3
```

This example displays the configuration settings for the profile **default**.

```
(host) # show rf dot11a-radio-profile default
802.11a radio profile "default"
-----
Parameter                                           Value
-----
Radio enable                                       Enabled
Mode                                               ap-mode
High throughput enable (radio)                   Enabled
Channel                                             157+
Beacon Period                                     100 msec
Transmit EIRP                                     15 dBm
Advertise 802.11d and 802.11h Capabilities        Enabled
Spectrum load balancing                           Disabled
RX Sensitivity Tuning Based Channel Reuse        dynamic
RX Sensitivity Threshold                          0 -dBm
Enable CSA                                         Disabled
CSA Count                                          4
Management Frame Throttle interval                1 sec
Management Frame Throttle Limit                  20
ARM/WIDS Override                                 Enabled
Adaptive Radio Management (ARM) Profile          default
High-throughput Radio Profile                     default-a
```

The output of this command includes the following parameters:

Parameter	Description
Radio enable	Shows if the AP has enabled or disabled transmissions on this radio band.
Mode	Access Point operating mode. Available options are: <ul style="list-style-type: none"> <li>am-mode: Air Monitor mode</li> <li>ap-mode: Access Point mode</li> <li>apm-mode: Access Point Monitor mode</li> <li>sensor-mode: RFprotect sensor mode</li> </ul>
High throughput enable (radio)	Name of a high-throughput profile referenced by this 802.11a radio profile. A high-throughput profile manages 40 Mhz tolerance settings, and controls whether or not APs using this profile will advertise intolerance of 40 MHz operation. (This option is disabled by default, allowing 40 MHz operation.) A high-throughput profile also determines whether an AP radio using the profile will stop using the 40 MHz channels surrounding APs or stations advertise 40 Mhz intolerance. This option is enabled by default.
Channel	Channel number for the AP 802.11a/802.11n physical layer.
Beacon Period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients
Transmit EIRP	Maximum transmit power (EIRP) in dBm from 0 to 51 in .5 dBm increments. Further limited by regulatory domain constraints and AP capabilities.
Advertise 802.11d and 802.11h Capabilities	If enabled, the radio advertises its 802.11d (Country Information) and 802.11h (Transmit Power Control) capabilities.
Spectrum load balancing	The Spectrum load balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the switch is responding to the wireless clients' probe requests. If enabled, the switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.
RX Sensitivity Tuning Based Channel Reuse	Shows if the channel reuse feature's current operating mode, static, dynamic or disable. <ul style="list-style-type: none"> <li><b>Static:</b> This mode of operation is a coverage-based adaptation of the Clear Channel Assessment (CCA) thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa.</li> <li><b>Dynamic:</b> In this mode, the Clear Channel Assessment (CCA) thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client.</li> <li><b>Disable:</b> This mode does not support the tuning of the CCA Detect Threshold.</li> </ul>
RX Sensitivity Threshold	If the Rx Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold (-dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBm to -64 dBm. If the value is set to zero, the feature will automatically determine an appropriate threshold.

Parameter	Description
Enable CSA	Shows if Channel Switch Announcements (CSAs) are enabled or disabled. CSAs, as defined by IEEE 802.11h, enable an AP to announce that it is switching to a new channel before it begins transmitting on that channel. This allows clients that support CSA to transition to the new channel with minimal downtime.
CSA Count	Number of channel switch announcements that must be sent prior to switching to a new channel. The default CSA count is 4 announcements.
Management Frame Throttle Interval	Averaging interval for rate limiting mgmt frames from this radio, in seconds. A management frame throttle interval of 0 seconds disables rate limiting.
Management Frame Throttle Limit	Maximum number of management frames that can come in from this radio in each throttle interval.
ARM/WIDS Override	If enabled, this option disables Adaptive Radio Management (ARM) and Wireless IDS functions and slightly increases packet processing performance. If a radio is configured to operate in Air Monitor mode, then the ARM/WIDS override functions are always enabled, regardless of whether or not this check box is selected.
Adaptive Radio Management (ARM) Profile	Name of an Adaptive Radio Management profile associated with this 802.11a profile.
High-throughput Radio Profile	Name of a High Throughput Radio profile associated with this 802.11a profile.

## Command History

Release	Modification
AOS-W 3.0	Command introduced.
AOS-W 3.3.2	Introduced support for the high-throughput IEEE 802.11n draft standard.
AOS-W 3.4	Support for the following parameters: <ul style="list-style-type: none"> <li>• Spectrum load balancing</li> <li>• RX Sensitivity Tuning Based Channel Reuse</li> <li>• RX Sensitivity Threshold</li> <li>• ARM/WIDS Override</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rf dot11g-radio-profile

```
show rf dot11g-radio-profile [<profile>]
```

### Description

Show an 802.11g Radio profile.

### Syntax

Parameter	Description
<profile>	Name of a 802.11g profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire 802.11g profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has four configured 802.11g profiles. The **References** column lists the number of other profiles with references to the 802.11g profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf arm-profile
Adaptive Radio Management (ARM) profile List
-----
Name                References  Profile Status
----                -
airwave             4
default             4
no-scanning         1
nokia-rf-profile    1

Total:4
```

This example displays the configuration settings for the profile **airwave**.

```
(host) # show rf dot11g-radio-profile default

802.11g radio profile "default"
-----
Parameter                               Value
-----
Radio enable                             Enabled
Mode                                     ap-mode
High throughput enable (radio)           Enabled
Channel                                  1
Beacon Period                            100 msec
Transmit EIRP 20 dBm
Advertise 802.11d and 802.11h Capabilities Enabled
Spectrum load balancing                   Disabled
RX Sensitivity Tuning Based Channel Reuse disable
RX Sensitivity Threshold                  0 -dBm
Non 802.11 Interference Immunity         Level-2
Enable CSA                                Disabled
CSA Count                                 4
Management Frame Throttle interval       1 sec
Management Frame Throttle Limit          20
ARM/WIDS Override                         Enabled
Protection for 802.11b Clients            Enabled
Adaptive Radio Management (ARM) Profile   default-AP85
High-throughput Radio Profile             default-g
```

The output of this command includes the following parameters:

Parameter	Description
Radio enable	Shows if the AP has enabled or disabled transmissions on this radio band.
Mode	Access Point operating mode. Available options are: <ul style="list-style-type: none"> <li>am-mode: Air Monitor mode</li> <li>ap-mode: Access Point mode</li> <li>apm-mode: Access Point Monitor mode</li> <li>sensor-mode: RFprotect sensor mode</li> </ul>
High throughput enable (radio)	Name of a high-throughput profile referenced by this 802.11a radio profile. A high-throughput profile manages 40 Mhz tolerance settings, and controls whether or not APs using this profile will advertise intolerance of 40 MHz operation. (This option is disabled by default, allowing 40 MHz operation.) A high-throughput profile also determines whether an AP radio using the profile will stop using the 40 MHz channels surrounding APs or stations advertise 40 Mhz intolerance. This option is enabled by default.
Channel	Channel number for the AP 802.11a/802.11n physical layer.
Beacon Period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients
Transmit EIRP	Maximum transmit power (EIRP) in dBm from 0 to 51 in .5 dBm increments. Further limited by regulatory domain constraints and AP capabilities.
Advertise 802.11d and 802.11h Capabilities	If enabled, the radio advertises its 802.11d (Country Information) and 802.11h (Transmit Power Control) capabilities.

Parameter	Description
Spectrum load balancing	<p>The Spectrum load balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the switch is responding to the wireless clients' probe requests.</p> <p>If enabled, the switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.</p>
RX Sensitivity Tuning Based Channel Reuse	<p>Shows if the channel reuse feature's current operating mode, static, dynamic or disable.</p> <ul style="list-style-type: none"> <li>● <b>Static:</b> This mode of operation is a coverage-based adaptation of the Clear Channel Assessment (CCA) thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa.</li> <li>● <b>Dynamic:</b> In this mode, the Clear Channel Assessment (CCA) thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client.</li> <li>● <b>Disable:</b> This mode does not support the tuning of the CCA Detect Threshold.</li> </ul>
RX Sensitivity Threshold	<p>If the RX Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold (-dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBm to -64 dBm. If the value is set to zero, the feature will automatically determine an appropriate threshold.</p>
Non 802.11 Interference Immunity	<p>Show the current value for 802.11 Interference Immunity on the 2.4 Ghz band. The default setting for this parameter is level 2. When performance drops due to interference from non-802.11 interferers (such as DECT or Bluetooth devices), the level can be increased up to level 5 for improved performance. However, increasing the level makes the AP slightly "deaf" to its surroundings, causing the AP to lose a small amount of range.</p> <p>The levels for this parameter are:</p> <ul style="list-style-type: none"> <li>● Level-0: no ANI adaptation.</li> <li>● Level-1: noise immunity only.</li> <li>● Level-2: noise and spur immunity.</li> <li>● Level-3: level 2 and weak OFDM immunity.</li> <li>● Level-4: level 3 and FIR immunity.</li> <li>● Level-5: disable PHY reporting.</li> </ul>
Enable CSA	<p>Shows if Channel Switch Announcements (CSAs) are enabled or disabled. CSAs, as defined by IEEE 802.11h, enable an AP to announce that it is switching to a new channel before it begins transmitting on that channel. This allows clients that support CSA to transition to the new channel with minimal downtime.</p>
CSA Count	<p>Number of channel switch announcements that must be sent prior to switching to a new channel. The default CSA count is 4 announcements.</p>
Management Frame Throttle Interval	<p>Averaging interval for rate limiting mgmt frames from this radio, in seconds. A management frame throttle interval of 0 seconds disables rate limiting.</p>
Management Frame Throttle Limit	<p>Maximum number of management frames that can come in from this radio in each throttle interval.</p>

Parameter	Description
ARM/WIDS Override	If enabled, this option disables Adaptive Radio Management (ARM) and Wireless IDS functions and slightly increases packet processing performance. If a radio is configured to operate in Air Monitor mode, then the ARM/WIDS override functions are always enabled, regardless of whether or not this check box is selected.
Protection for 802.11b Clients	Shows if the profile has enabled or disabled protection for 802.11b clients.
Adaptive Radio Management (ARM) Profile	Name of an Adaptive Radio Management profile associated with this 802.11a profile.
High-throughput Radio Profile	Name of a High Throughput Radio profile associated with this 802.11a profile.

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.2	Introduced protection for 802.11b clients and support for the high-throughput IEEE 802.11n draft standard
AOS-W 3.4	Support for the following parameters: <ul style="list-style-type: none"> <li>• Spectrum load balancing</li> <li>• RX Sensitivity Tuning Based Channel Reuse</li> <li>• RX Sensitivity Threshold</li> <li>• ARM/WIDS Override</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rf event-thresholds-profile

```
show rf event-thresholds-profile [<profile>]
```

### Description

Show an Event Thresholds profile.

### Syntax

Parameter	Description
<profile>	name of an Event Thresholds profile

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire Event Thresholds profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has two configured Event Thresholds profiles. The **References** column lists the number of other profiles with references to the Event Thresholds profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf event-thresholds-profile

RF Event Thresholds Profile List
-----
Name      References  Profile Status
-----
default   6
event1    2

Total: 2
```

This example displays the configuration settings for the profile **default**.

```
(host) # show rf event-thresholds-profile default
RF Event Thresholds Profile "default"
-----
Parameter                               Value
-----
Detect Frame Rate Anomalies              Disabled
Bandwidth Rate High Watermark            0 %
Bandwidth Rate Low Watermark             0 %
Frame Error Rate High Watermark          0 %
Frame Error Rate Low Watermark           0 %
Frame Fragmentation Rate High Watermark  16 %
Frame Fragmentation Rate Low Watermark   8 %
Frame Low Speed Rate High Watermark      16 %
Frame Low Speed Rate Low Watermark       8 %
Frame Non Unicast Rate High Watermark    0 %
Frame Non Unicast Rate Low Watermark     0 %
Frame Receive Error Rate High Watermark  16 %
Frame Receive Error Rate Low Watermark   8 %
Frame Retry Rate High Watermark          16 %
Frame Retry Rate Low Watermark           8 %
```

The output of this command includes the following parameters:

Parameter	Description
Detect Frame Rate Anomalies	Shows of the profile enables or disables detection of frame rate anomalies.
Bandwidth Rate High Watermark	If bandwidth in an AP exceeds this value, it triggers a <b>bandwidth exceeded condition</b> . The value represents the percentage of maximum for a given radio. (For 802.11b, the maximum bandwidth is 7 Mbps. For 802.11 a and g, the maximum is 30 Mbps.) The recommended value is 85%.
Bandwidth Rate Low Watermark	If an AP triggers a <b>bandwidth exceeded condition</b> , the condition persists until bandwidth drops below this value.
Frame Error Rate High Watermark	If the frame error rate (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>frame error rate exceeded condition</b> .
Frame Error Rate Low Watermark	If an AP triggers a <b>frame error rate exceeded condition</b> , the condition persists until the frame error rate drops below this value.
Frame Fragmentation Rate High Watermark	If the frame fragmentation rate (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>frame fragmentation rate exceeded condition</b> .
Frame Fragmentation Rate Low Watermark	If an AP triggers a <b>frame fragmentation rate exceeded condition</b> , the condition persists until the frame fragmentation rate drops below this value.
Frame Low Speed Rate High Watermark	If the rate of low-speed frames (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>low-speed rate exceeded condition</b> .
Frame Low Speed Rate Low Watermark	After a <b>low-speed rate exceeded condition</b> exists, the condition persists until the percentage of low-speed frames drops below this value.
Frame Non Unicast Rate High Watermark	If the non-unicast rate (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>non-unicast rate exceeded condition</b> . This value depends upon the applications used on the network.
Frame Non Unicast Rate Low Watermark	If an AP triggers a <b>non-unicast rate exceeded condition</b> , the condition persists until the non-unicast rate drops below this value.
Frame Receive Error Rate High Watermark	If the frame receive error rate (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>frame receive error rate exceeded condition</b> .
Frame Receive Error Rate Low Watermark	If an AP triggers a <b>frame receive error rate exceeded condition</b> , the condition persists until the frame receive error rate drops below this value.
Frame Retry Rate High Watermark	If the frame retry rate (as a percentage of total frames in an AP) exceeds this value, it triggers a <b>frame retry rate exceeded condition</b> .
Frame Retry Rate Low Watermark	If an AP triggers a <b>frame retry rate exceeded condition</b> exists, the condition persists until the frame retry rate drops below this value.

## Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rf ht-radio-profile

```
show rf ht-radio-profile [<profile>]
```

### Description

Show a High-throughput Radio profile.

### Syntax

Parameter	Description
<profile>	Name of a High-throughput Radio profile.

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire High-throughput Radio profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has five configured High-throughput Radio profiles. The **References** column lists the number of other profiles with references to the High-throughput Radio profile, and the **Profile Status** column indicates whether the profile is predefined and editable, and if that predefined profile has been changed from its default settings. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf ht-radio-profile
High-throughput radio profile List
-----
Name           References  Profile Status
----
default        0
default-a      8           Predefined (editable)
default-g      3           Predefined (changed)
legacystation  1
test           1

Total:5
```

This example displays the configuration settings for the predefined profile **default-a**.

```
(host) #show rf ht-radio-profile default-a
High-throughput radio profile "default-a" (Predefined (editable))
-----
Parameter           Value
-----
40 MHz intolerance  Disabled
Honor 40 MHz intolerance  Enabled
Legacy station workaround  Disabled
```

The output of this command includes the following parameters:

Parameter	Description
40 MHz intolerance	Shows whether or not APs using this radio profile will advertise intolerance of 40 MHz operation. By default, 40 MHz operation is allowed.
Honor 40 MHz intolerance	If this parameter is enabled, the radio will stop using the 40 MHz channels if the 40 MHz intolerance indication is received from another AP or station.

Parameter	Description
Legacy station workaround	Shows if the profile enables interoperability for misbehaving legacy stations. This parameter is disabled by default.

## Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rf optimization-profile

```
show rf optimization-profile [<profile>]
```

### Description

Show an Optimization profile.

### Syntax

Parameter	Description
<profile>	name of an ARM profile

### Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire Optimization profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has two configured Optimization profiles. The **References** column lists the number of other profiles with references to the Optimization profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show rf optimization-profile
RF Optimization Profile List
-----
Name      References  Profile Status
----      -
default   6
profile2  1

Total:2
```

This example displays the configuration settings for the profile **profile2**.

```
(host) #show rf optimization-profile profile2
RF Optimization Profile "profile2"
-----
Parameter                               Value
-----
Station Handoff Assist                   Disabled
Detect Association Failure                Disabled
Coverage Hole Detection                   Disabled
Hole Good RSSI Threshold                  20
Hole Good Station Ageout                  30 sec
Hole Detection Interval                   180 sec
Hole Idle Station Ageout                  90 sec
Hole Poor RSSI Threshold                  10
Detect interference                       Disabled
Interference Threshold                    90 %
Interference Threshold Exceed Time        25 sec
Interference Baseline Time                25 sec
RSSI Falloff Wait Time                    0 sec
Low RSSI Threshold                        0
RSSI Check Frequency                      0 sec
```

The output of this command includes the following parameters:

Parameter	Description
Station Handoff Assist	If enabled, this parameter allows the switch to force a client off an AP when the RSSI drops below a defined minimum threshold.
Detect Association Failure	Shows if the profile enables or disables STA association failure detection.
Coverage Hole Detection	Shows if the profile enables or disables coverage hole detection.
Hole Good RSSI Threshold	Time, in seconds, after a coverage hole is detected until a coverage hole event notification is generated. The Wireless Intrusion Protection license must be installed.
Hole Good Station Ageout	Stations with signal strength above this value are considered to have good coverage. The Wireless Intrusion Protection license must be installed.
Hole Detection Interval	Time, in seconds, after which a station with good coverage is aged out. The Wireless Intrusion Protection license must be installed.
Hole Idle Station Ageout	Time, in seconds, after which a station in a poor coverage area is aged out. The Wireless Intrusion Protection license must be installed.
Hole Poor RSSI Threshold	Stations with signal strength below this value will trigger detection of a coverage hole. The Wireless Intrusion Protection license must be installed.
Detect interference	Enables or disables interference detection.
Interference Threshold	Percentage increase in the frame retry rate (FRR) or frame receive error rate (FRER) before interference monitoring begins on a given channel.
Interference Threshold Exceed Time	Time, in seconds, the FRR or FRER exceeds the threshold before interference is reported.
Interference Baseline Time	Time, in seconds, the air monitor should learn the state of the link between the AP and client to create frame retry rate (FRR) and frame receive error rate (FRER) baselines.
RSSI Falloff Wait Time	Time, in seconds, to wait with decreasing RSSI before a deauthorization message is sent to the client. The maximum value is 8 seconds.
Low RSSI Threshold	Minimum RSSI above which deauthorization messages should never be sent.
RSSI Check Frequency	Interval, in seconds, to sample RSSI.

## Command History

Version	Modification
AOS-W 3.0	Base operating system
AOS-W 3.4	Output parameters displaying load balancing status were removed. You can now view the status of the load balancing feature via the commands <a href="#">show rf dot11a-radio-profile</a> and <a href="#">show rf dot11g-radio-profile</a> .

This command was available in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rft profile

```
show rft profile {all|antenna-connectivity|link-quality|raw}
```

### Description

Show parameters for the predefined RF test profiles.

### Syntax

Parameter	Description
all	Show all predefined profiles.
antenna-connectivity	Show configured parameters for the predefined <b>Antenna Connectivity</b> test profile.
link-quality	Show configured parameters for the predefined <b>Link Quality</b> test profile.
raw	Show configured parameters for the predefined <b>RAW</b> test profile.

### Usage guidelines

The **rft** command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the **show rft profile** command to view the profiles used for these RF tests.

### Example

The following example shows the testing parameters for the predefined link-quality RF test profile.

```
(host) #show rft profile link-quality

Profile LinkQuality: Built-in profile
-----
Parameter      Value
-----
Antenna         1 and/or 2
Frame Type      Null Data
Num Packets     100 for each data-rate
Packet Size     1500
Num Retries     0
Data Rate       All rates are tried
```

### Related Commands

To view the results of an RF test, use the command [show rft result](#).

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rft result

```
show rft result all|{trans-id <trans-id>}
```

### Description

Show the results of an RF test.

### Syntax

Parameter	Description
all	Show the most recent test result for each test type (antenna-connectivity, link-quality or raw).
trans-id <trans-id>	Each RF test is assigned a transaction ID. Include the <b>trans-id &lt;trans-id&gt;</b> parameters to show the test result for a specific transaction ID.

### Usage guidelines

The **rft** command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support.

### Related Commands

To view a list of the most recent transaction IDs for each test type, use the command **show rft transactions**.

### Command History

This command was available in AOS-W 3.0.

#### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rft transactions

```
show rft transactions
```

### Description

Show transaction IDs of RF tests.

### Syntax

No parameters.

### Usage guidelines

The **rft** command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the **show rft transaction** command to view the transaction IDs for the most recent test of each test type.

### Example

The following example shows the transaction IDs for the latest RAW, link-quality and antenna-connectivity tests.

```
(host) #show rft transactions

RF troubleshooting transactions
-----
Profile                Transaction ID
-----
RAW                    2001
LinkQuality            2101
AntennaConnectivity   1801
```

### Related Commands

Use transaction IDs with the command **show rft result** to view results for individual RF tests.

### Command History

This command was available in AOS-W 3.0.

#### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show rights

```
show rights [ <name-of-a-role> ]
```

### Description

Displays the list of user roles in the roles table with high level details of role policies. To view role policies of a specific role specify the role name.

### Syntax

Parameter	Description
name-of-a-role	Enter the role name to view its policy details.

### Example

The output of this command shows the list of roles in the role table.

```
(host) # show rights

RoleTable
-----
Name          ACL  Bandwidth          ACL List          Type
-----
ap-role       4    Up: No Limit,Dn: No Limit  control/,ap-acl/  System
authenticated 39   Up: No Limit,Dn: No Limit  allowall/,v6-allowall/  User
default-vpn-role 37   Up: No Limit,Dn: No Limit  allowall/,v6-allowall/  User
guest         3    Up: No Limit,Dn: No Limit  http-acl/,https-acl/,dhcp-acl/User
guest-logon   6    Up: No Limit,Dn: No Limit  logon-control/,captiveportal/  User
logon         1    Up: No Limit,Dn: No Limit  logon-control/,captiveportal/  User
stateful-dot1x 5    Up: No Limit,Dn: No Limit
voice         38   Up: No Limit,Dn: No Limit  sip-acl/,noe-acl/,svp-acl/,vocera-acl/  User
```

### Command History

## show rrm dot11k admission-capacity

```
show rrm dot11k admission-capacity
```

### Description

Displays the available admission capacity for voice traffic on an APs.

### Syntax

No Parameters

### Example

The output of this command shows the available admission capacity for voice traffic on all APs..

```
(host) # show rrm dot11k admission-capacity

802.11K Available Admission Capacity for Voice
-----

Flags: B: Bandwidth based CAC, C: Call-count based CAC
       D: CAC Disabled,      E: CAC Enabled

AP Name      IP Address      Freq Band  Chan  Total  Available  Flags
-----
r-wing-94    10.16.12.247    5 GHz      40    31250  0          EC
r-wing-94    10.16.12.247    2.4 GHz    11    31250  0          EC

## show rrm dot11k ap-channel-report

```
show rrm dot11k ap-channel-report [ ap-name <name-of-an-ap> |  
  bssid <bssid-of-an-ap> | ip-addr <ip-address-of-an-ap> ]
```

### Description

Displays the channel information gathered by the AP. You can either specify an ap-name, bssid or ip-address of an AP to see more details.

### Syntax

Parameter	Description
ap-name	Enter the name of the AP.
bssid	Enter the BSSID address of the AP.
ip-addr	Enter the IP address of the AP.

### Example

The output of this command shows the channel information for r-wing-94:94.

```
(host) # show rrm dot11k ap-channel-report ap-name r-wing-94  
  
802.11K AP Channel Report Details  
-----

## show rrm dot11k neighbor-report

```
show rrm dot11k neighbor-report [ ap-name <name-of-an-ap> [essid] |  
    bssid <bssid-of-an-ap> | ip-addr <ip-address-of-an-ap> ]
```

### Description

Displays the neighbor information for a particular AP. If the AP name or the AP's IP address is specified, the user can optionally specify the ESSID to get the neighbor information. If the ESSID is not specified, the command will display the neighbor information for all the Virtual AP's configured on the AP.

### Syntax

Parameter	Description
ap-name	Enter the name of the AP.
bssid	Enter the BSSID address of the AP.
ip-addr	Enter the IP address of the AP.

### Example

The output of this command shows the neighbor information for r-wing-94.

```
(host) # show rrm dot11k neighbor-report ap-name r-wing-94  
  
802.11K Neighbor Report Details  
-----  
  
Flags: S: Spectrum Management, Q: QoS, A: APSD, R: Radio Measurement

## show slots

```
show slots
```

### Description

Displays the list of slots in the switch, including the status and card type.

### Syntax

No Parameters

### Example

The output of this command shows slot details on the switch.

```
(host) # show slots

Slots
-----
Slot  Status  Card Type
----  -
1     Present  A2400
```

### Command History

This command was available in AOS-W 3.4

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show snmp community

```
show snmp community
```

### Description

Displays the SNMP community string details.

### Syntax

No Parameters

### Example

The output of this command shows slot details on the switch.

```
(host) # show snmp community

SNMP COMMUNITIES
-----
COMMUNITY  ACCESS      VERSION
-----  -
public    READ_ONLY  V1, V2c
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show snmp inform

```
show snmp inform
```

### Description

Displays the length of SNMP inform queue.

### Syntax

No Parameters

### Example

The output of this command shows slot details on the switch.

```
(host) # show snmp inform stats

Inform queue size is 100

SNMP INFORM STATS
-----
HOST  PORT  INFORMS-INQUEUE  OVERFLOW  TOTAL INFORMS
----  -

```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show snmp trap-host

```
show snmp trap-host
```

### Description

Displays the configured SNMP trap hosts.

### Syntax

No Parameters

### Example

The output of this command shows details of a SNMP trap host.

```
(host) # show snmp trap-hosts

SNMP TRAP HOSTS
-----
HOST          VERSION   SECURITY NAME  PORT  TYPE  TIMEOUT  RETRY
-----
10.16.14.1    SNMPv2c  public       162   Trap  N/A      N/A
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show snmp trap-list

```
show snmp trap-list
```

### Description

Displays the list of SNMP traps.

### Syntax

No Parameters

### Example

The output of this command shows the list of SNMP traps and the status.

```
(host) # show snmp trap-list

SNMP TRAP LIST
-----
TRAP-NAME                                CONFIGURABLE  ENABLE-STATE
-----
authenticationFailure                    Yes           Enabled
coldStart                                 Yes           Enabled
linkDown                                  Yes           Enabled
linkUp                                    Yes           Enabled
warmStart                                 Yes           Enabled
wlsxAPBssidEntryChanged                  Yes           Enabled
wlsxAPEntryChanged                       Yes           Enabled
wlsxAPImpersonation                      Yes           Enabled
wlsxAPIinterferenceCleared               Yes           Enabled
wlsxAPIinterferenceDetected              Yes           Enabled
wlsxAPRadioAttributesChanged             Yes           Enabled
wlsxAPRadioEntryChanged                  Yes           Enabled
wlsxAccessPointIsDown                    Yes           Enabled
wlsxAccessPointIsUp                      Yes           Enabled
wlsxAdhocNetwork                         Yes           Enabled
wlsxAdhocNetworkBridgeDetected           Yes           Enabled

## show snmp trap-queue

show snmp trap-queue

### Description

Displays the list of SNMP traps in queue.

### Syntax

No Parameters

### Example

The output of this command shows the list of SNMP traps sent to host.

```
(host) # show snmp trap-queue

2009-04-29 00:47:40 An AP/AM 00:0b:86:cd:cc:14, radio 2 at Location 00:0b:86:cd:cc:14 and channel 1, det
interfering access point (BSSID 00:e0:fc:18:b5:35, SSID WA1003A). More information can be obtained from

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show snmp user-table

```
show snmp user-table [user <username> auth-prot [sha | md5] <value> priv-prot [aes | des] <value>]
```

### Description

Displays the list of SNMP user profile for a specified username.

### Syntax

Parameter	Description
auth-prot	Authentication protocol for the user, either HMAC-MD5-98 Digest Authentication Protocol (MD5) or HMAC-SHA-98 Digest Authentication Protocol (SHA), and the password for use with the designated protocol.
priv-prot	Privacy protocol for the user, either Advanced Encryption Standard (AES) or CBC-DES Symmetric Encryption Protocol (DES), and the password for use with the designated protocol.

### Example

The output of this command shows the list of SNMP traps sent to host.

```
(host) # show snmp user-table

SNMP USER TABLE
-----
USER      AUTHPROTOCOL  PRIVACYPROTOCOL  FLAGS
-----
Sam       SHA           AES
fire     SHA           AES
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show ssh

```
show ssh
```

### Description

Displays the SSH configuration details.

### Syntax

No Parameters

### Example

The output of this command shows SSH configuration details.

```
(host) # show ssh

SSH Settings:
-----
DSA                               Enabled
Mgmt User Authentication Method   username/password
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show startup-config

```
show startup-config
```

### Description

Displays the configuration which will be used the next time the switch is rebooted. It contains all the options last saved using the write memory command. Any unsaved changes are not included.

### Syntax

No Parameters

### Example

The output of this command shows slot details on the switch.

```
(host) # show startup-config

## show station-table

```
show station-table [mac <mac_address>]
```

### Description

Displays the internal station table entries and also details of a station table entry.

### Syntax

No Parameters

### Example

The output of this command shows details of an entry in the station table.

```
(host) # show station-table mac 00:1f:6c:7a:d4:fd

Association Table
-----
      BSSID           IP           Essid    AP name  Phy  Age

All platforms	Base operating system	Config or Enable mode on master or local switches

## show storage

```
show storage
```

### Description

Displays the storage information on the switch.

### Syntax

No Parameters

### Example

The output of this command shows the storage details on the switch.

```
(host) # show storage
Filesystem      Size      Used Available Use% Mounted on
/dev/root       57.0M     54.6M      2.3M   96% /

/dev/hda3       149.7M    9.3M     132.6M    7% /flash
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show switch ip

```
show switch ip
```

### Description

Displays the IP address of the switch and VLAN ID.

### Syntax

No Parameters

### Example

The output of this command shows the IP address and VLAN ID of the switch.

```
(host) # show switch ip  
  
Switch IP Address: 10.16.15.1  
  
Switch IP is from Vlan Interface: 1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show switch software

```
show switch software
```

### Description

Displays the details of the software running in the switch.

### Syntax

No Parameters

### Example

The output of this command shows the details of software running in the switch.

```
(host) # show switch software

Alcatel-Lucent Operating System-Wireless.

## show switches

```
show switches [all | state {complete | incomplete | inprogress | required} |  
summary ]
```

### Description

Displays the details of switches connected to the master switch including the master switch.

### Syntax

Parameter	Description
all	List of all switches.
state	Configuration status of all switches.
summary	Status of all switches connected to the master.

### Example

The output of this command lists all switches connected to the master switch including the master switch.

```
(host) # show switches all  
  
All Switches  
-----  
IP Address  Name           Location           Type   Version  Status  Configuration State  Config Sync Tin  
-----  
10.16.12.1  r-wing-94      Building1.floor1  master 3.4.0.0  up      UPDATE SUCCESSFUL    0
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show switchinfo

```
show switchinfo
```

### Description

Displays the latest and complete summary of switch details including role, last configuration change, hostname, reason for last reboot.

### Syntax

No Parameters

### Example

The output of this command lists all switches connected to the master switch including the master switch.

```
(host) # show switchinfo
Hostname is TechPubs

Location not configured
System Time:Fri Jun  5 09:54:06 PST 2009

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show syscontact

```
show syscontact
```

### Description

Displays the contact information for support.

### Syntax

No Parameters

### Example

The output of this command shows the contact information for technical support.

```
(host) # show syscontact  
  
admin@mycompany.com
```

### Command History

This command was available in AOS-W 3.1

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show syslocation

```
show syslocation
```

### Description

Displays the location details of the switch.

### Syntax

No Parameters

### Example

The output of this command location of the switch.

```
(host) # show syslocation  
  
Building 1, Floor 1
```

### Command History

This command was available in AOS-W 3.1

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show tech-support

```
show tech-support
```

### Description

Displays all information about the switch required for technical support purposes.

### Syntax

No Parameters

### Command History

This command was available in AOS-W 3.1

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show telnet

```
show telnet
```

### Description

Displays the status of telnet access using command line interface (CLI) or serial over ethernet (SOE) to the switch.

### Syntax

No Parameters

### Example

The output of this command shows the status of CLI and SOE access to the switch.

```
(host) # show telnet

telnet cli is enabled
telnet soe is enabled
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show time-range

```
show time-range [ <string> | summary ]
```

### Description

Displays the list of time range configured in the system and rules affected by the time range.

### Syntax

No Parameters

### Example

The output of this command shows the absolute time range details

```
(host) # show time-range

Time-Range monitoring, Absolute
-----
StartDate  Start-time  EndDate    End-time    Applied
-----
4/29/2009  23:00      4/30/2009  12:00      No
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show trunk

```
show trunk
```

### Description

Displays the list of trunk ports on the switch.

### Syntax

No Parameters

### Example

The output of this command shows details of a trunk port.

```
(host) # show trunk

Trunk Port Table
-----
Port      Vlans Allowed                Vlans Active                Native Vlan
-----
FE2/12    1, 613, 615-617, 632-633, 636-640, 667-668  1, 613, 615-617, 632-633, 636-640, 667-668  1
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show uplink

```
crypto-local
show uplink [config |{connection <link_id>}|signal|{stats <link_id>}]
```

### Description

Displays uplink configuration details on an OmniAccess 4306 series switch.

### Syntax

Parameter	Description
config	Enter the keyword <b>config</b> to display the uplink manager, the default wired priority and default cellular priority
connection	Enter the keyword <b>connection</b> followed by the uplink ID number to display the connection details.
signal	Enter the keyword <b>signal</b> to display the cellular uplink signal strength.
stats	Enter the keyword <b>stats</b> followed by the uplink ID number to display the statistical information on the designated uplink.

### Example

The output of this command displays the switch uplink status .

```
(host) ##show uplink
Uplink Manager: Enabled

Uplink Management Table
-----
Id  Uplink Type  Properties  Priority  State        Status
--  -
1   Wired        vlan 1      200      Initializing  Waiting for link
2   Cellular Novatel_U727 100 Standby Ready
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## show usb

```
crypto-local
  show usb [cellular|ports|test|verbose]
```

### Description

Display detailed USB device information.

### Syntax

Parameter	Description
cellular	Enter the keyword <b>cellular</b> to display cellular devices.
ports	Enter the keyword <b>ports</b> to display detailed TTY port information such as signal strength.
test	Enter the keyword <b>test</b> to test the USB TTY ports. <b>NOTE:</b> Testing an invalid modem port may cause the switch to “hang”. To resolve this, unplug and re-plug the modem.
verbose	Enter the keyword <b>verbose</b> to display detailed USB information including serial number and USB type.

### Examples

The USB Device table, in the example below, displays the USB port is in the 'Device Ready' state, meaning that the port has passed the diagnostic test and is ready to send and receive data.

```
(host) (config-cellular new_modem)# show usb
USB Device Table
-----
Address  Product                Vendor  ProdID  Serial          Type      Profile      State
-----  -
18       Novatel Wireless CDMA  1410   4100    091087843891000 Cellular  new_modem   Device ready
```

Below is an example of the **show usb verbose** display output (partial).

```
(host) #show usb verbose
...
T: Bus=01 Lev=02 Prnt=02 Port=00 Cnt=01 Dev#= 3 Spd=12 MxCh= 0
D: Ver= 1.10 Cls=00(>ifc ) Sub=00 Prot=00 MxPS=64 #Cfgs= 1
P: Vendor=1410 ProdID=4100 Rev= 0.00
S: Manufacturer=Novatel Wireless Inc.
S: Product=Novatel Wireless CDMA
S: SerialNumber=091087843891000
C:* #Ifs= 5 Cfg#= 1 Atr=a0 MxPwr=500mA
...
```

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## show user

```
show user
  authentication-method {[dot1x][mac][stateful-dot1x][vpn][web]} [rows <NUMBER>
<NUMBER>]
  bssid <A:B:C:D:E:F> rows <NUMBER> <NUMBER>
  essid <STRING> rows <NUMBER> <NUMBER>
  internal rows <NUMBER> <NUMBER>
  ip <A.B.C.D> rows <NUMBER> <NUMBER>
  location b.f.l rows <NUMBER> <NUMBER>
  mac <A:B:C:D:E:F>
  mobile {[bindings][visitors]} [rows <NUMBER> <NUMBER>]
  name <STRING>
  phy-type {[a][b]} [rows <NUMBER> <NUMBER>]
  role <STRING> rows <NUMBER> <NUMBER>
  rows <NUMBER> <NUMBER>
```

### Description

Displays detailed information about the switch's connection in regards to mobility state and statistics, authentication statistics, VLAN assignment method, AP datapath tunnel info, radius accounting statistics, user name, user-role derivation method, datapath session flow entries, and 802.11 association state and statistics. The **show user** command allows you to filter specific information by parameter.

### Syntax

Parameter	Description
authentication-method	Authentication method used for the device.
dot1x	Number of users to create starting with <ipaddr>.
mac	Authentication method.
stateful-dot1x	802.1x authentication.
vpn	MAC authentication.
web	Stateful 802.1x authentication.
rows <NUMBER> <NUMBER>	Displays the log output from the specified number of rows from the end of the log and the total number of rows to display.
bssid <A:B:C:D:E:F>	BSSID address of the device.
ssid <STRING>	ESSID of the device.
internal rows <NUMBER> <NUMBER>	Displays the log output from the specified number of rows from the end of the log and the total number of rows to display
ip <A.B.C.D>	IP address of user.
location b.f.l	Displays the building, floor and location of the device.
mac <A:B:C:D:E:F>	MAC address .
mobile	Mobile users.
bindings	Users that have moved away.
visitors	Users that are visitors.
name <STRING>	User's name.
phy-type	801.11 type

Parameter	Description
a	Matches PHY type a.
g	Matches PHY type b or g.
role <STRING>	User role such as employee, visitor and so on.
rows <NUMBER> <NUMBER>	Displays the output from the specified number of rows from the end of the log and the total number of rows to display
rows <NUMBER> <NUMBER>	Displays the output from the specified number of rows from the end of the log and the total number of rows to display

## Usage Guidelines

Use the **show user** command to show detailed output (which matches the switch output of user statistics) and includes the entire output of show user-table, mobility state and statics, authentication statistics, VLAN assignment method, AP datapath tunnel information, radius accounting statistics, user-role derivation method, datapath session flow entries and 802.11 association state and statistics.

## Example

This example is split into two tables, however it appears in one table in the CLI.

```

Users
-----
      IP                MAC                Name                Role                Age (d:h:m)  Auth                VPN link  AP name
-----

```

The output of this command includes the following information:

Column	Description
IP	IP address of the device.
MAC	MAC address of the device.
Name	User's name of the device.
Role	User's assigned role.
Age (d:h:m)	
Auth	Authentication method.
VPN link	

Column	Description
AP name	Name of the AP.
Roaming	Roaming type.
Essid/Bssid/Phy	The Extended Service Set Identifier (ESSID), unique hard-wireless MAC address of the AP (BSSID), and the 802.11 (PHY) type.
Profile	Profile assigned to the device.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Available in Enable and Config modes.

## show user\_session\_count

```
show user_session_count
```

### Description

Show the number of users using an ESSID for different time intervals.

### Syntax

No parameters.

### Usage Guidelines

Issue this command to show the numbers of users using each configured ESSID for the following time intervals:

- 1-4 minutes
- 5-14 minutes
- 15-29 minutes
- 30-49 minutes
- 50-119 minutes
- 120-239 minutes
- 240 minutes and longer

### Example

The example below shows that 95 users on the **guest** ESSID have been using that ESSID for between 120 and 239 minutes, and that 22 users have been using that ESSID for 240 minutes or longer.

```
(host) #show user_session_count

User Session Count
-----
ESSID           Time Bucket  Number of Users
-----
guest           1             8
guest           5             1
guest           15            2
guest           30            1
guest           60            1
guest           120           96
guest           240           22
companySSID-voip 1             0
companySSID-voip 5             0
companySSID-voip 15            0
companySSID-voip 30            0
companySSID-voip 60            1
companySSID-voip 120           43
companySSID-voip 240           46
```

### Command History

This command was available in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show util\_proc

```
show util_proc guest-email counters
```

### Description

Show counters for the guest email process.

### Syntax

No parameters.

### Usage Guidelines

As part of guest provisioning, the guest access email feature allows you to define the SMTP port and server that processes guest provisioning email. This server sends email to the guest or the sponsor when a guest user manually sends email from the Guest Provisioning page, or when a user creates a guest account.

### Example

The output of this command shows the numbers of guest emails received, sent and dropped since the switch was last reset.

```
(host) #show util_proc guest-email counters

Guest Email Counters
-----
Name                Value
----                -
Email Received      14
Email Sent           3
Email Dropped        0
```

### Related Commands

To configure SMTP servers and server ports for guest email, use the command [guest-access-email](#).

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show version

```
show version
```

### Description

Show the system software version.

### Syntax

No parameters.

### Example

The output of this command in this example shows that the switch is a OmniAccess 4302 model running AOS-W version 3.4.0.0.

```
(host) #show version
Alcatel-Lucent Operating System-Wireless.
AOS-W (MODEL: OAW-4302-US), Version 3.4.0.0
Website: http://www.alcatel.com/enterprise
All Rights Reserved (c) 2005-2009, Alcatel-Lucent.
Compiled on 2008-12-17 at 22:52:36 PST (build 20263) by p4build

ROM: System Bootstrap, Version CPBoot 1.2.11 (Sep 13 2005 - 17:39:11)

Switch uptime is 41 days 8 hours 57 minutes 18 seconds
Reboot Cause: User reboot.
Supervisor Card
Processor 16.20 (pvr 8081 1014) with 256M bytes of memory.
32K bytes of non-volatile configuration memory.
256M bytes of Supervisor Card System flash (model=CF 256MB).
```

The output of this command includes the following information

Parameter	Description
Model	Switch model type.
Version	Version of AOS-W software.
ROM	System bootstrap version.
Switch Uptime	Switch uptime (time elapsed since the last switch reset).
Reboot Cause	Reason the switch was last rebooted.
Supervisor Card	Details for the switch's internal supervisor card.

### Command History

This command was available in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on local and master switches

## show vlan

```
show vlan <id>
```

### Description

This command shows a configured VLAN interface number, description and associated ports.

### Syntax

Parameter	Description	Range	Default
<id>	Identification number for the VLAN.	1-4094	1

### Usage Guidelines

Issue this command to show the a selected VLAN configuration. The **VLAN** column lists the VLAN ID. The **Description** column provides the VLAN name or number and the **Ports** column shows the VLAN's associated ports.

```
(host) #show vlan 2

VLAN CONFIGURATION
-----
VLAN  Description  Ports
-----  -
2     VLAN0002        FE1/0 FE1/2
```

### Related Commands

```
(host) (config) #vlan
(host) (config) #vlan-name
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master or local switches

## show vlan mapping

```
show vlan mapping
```

### Description

This command shows a configured VLAN name, its pool status and the VLAN IDs assigned to the pool.

### Syntax

Parameter	Description	Range	Default
<id>	Identification number for the VLAN.	1-4094	1

### Usage Guidelines

Issue this command to show the a selected VLAN configuration. The **VLAN Name** column displays the name of the VLAN pool. The **Pool Status** column indicates if the pool is enabled or disabled. The **VLAN IDs** column lists the VLANs that are part of the pool. .

```
(host) #show vlan mapping

VLAN Name   Pool Status  VLAN IDs
-----
mypool      Enabled      65,210
mypool2     Enabled      212,256
```

### Related Commands

```
(host) (config) #vlan
(host) (config) #vlan-name
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master or local switches

## show vlan summary

```
show vlan summary
```

### Description

This command shows the number of existing VLANs.

### Syntax

Parameter	Description
Number of existing VLANs	The number of existing VLANs on the switch.

### Usage Guidelines

Issue this command to show the number of existing VLANs on the switch.

```
(host) #show vlan summary
```

```
Number of existing VLANs           :13
```

### Related Commands

```
(host) (config) #vlan
```

```
(host) (config) #vlan-name
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable or config mode on master or local switches

## show vlan status

```
show vlan status <id>
```

### Description

This command shows the current status of all VLANs on the switch.

### Syntax

This command has no parameters.

### Usage Guidelines

Issue this command to show the status of VLANs on the switch. The **VLAN ID** column displays the VLAN ID name or number. The **IP Address** column provides the VLAN's IP address. The **Adminstate** column indicates if the VLAN is enabled or disabled. The **Operstate** column indicates if the VLAN is currently up and running. The **PortCount** column shows how many ports are associated with the VLAN. The **Nat Inside** column displays whether source Nat is enabled for the VLAN interface. If Nat is enabled, all the traffic passing through this VLAN interface is the source natted to the outgoing interface's IP address..

```
(host) #show vlan status
```

```
Vlan Status
```

```
-----
```

VlanId	IPAddress	Adminstate	Operstate	PortCount	Nat Inside
-----	-----	-----	-----	-----	-----
1	10.168.254.221/255.255.255.252	Enabled	Up	5	Disabled
2	unassigned/unassigned	Enabled	Down	2	Disabled
4	unassigned/unassigned	Enabled	Down	1	Disabled
25	unassigned/unassigned	Enabled	Down	1	Disabled
212	10.168.212.2/255.255.255.0	Enabled	Down	2	Disabled
213	10.168.213.2/255.255.255.0	Enabled	Down	2	Disabled
1170	10.3.132.14/255.255.255.0	Enabled	Up	2	Disabled

### Related Commands

## show voice call-cdrs

```
show voice call-cdrs [bssid <value> | count <number> | detail | essid <value> |  
  extn <value> | ip <ip-address> | proto {sip | svp | noe | sccp | vocera | h323}  
  | sta <mac-address> ]
```

### Description

Displays detailed call records of voice client.

### Syntax

Parameter	Description
bssid	Filter records based on BSSID of voice clients.
count	Specify the number of records to be displayed by entering a number.
detail	Displays detailed records that can be filtered using bssid, count, essid, exten, ip, proto, and sta.
essid	Filter records based on ESSID of voice clients.
extn	View detailed records for a particular extension number.
ip	View detailed records of voice client using its IP address.
proto	View detailed records filtered on protocol.
sta	View detailed records filtered on MAC address.

### Example

The output of this command shows detailed call records filtered on SIP protocol and limited to 5 entries.

```
(host) # show voice call-cdrs proto sip count 5
```

```
Voice Client(s) CDRs
```

```
-----

## show voice call-density

```
show voice call-density [ bssid <value> | essid <value> | extn <value> |  
  ip <ip-address> | proto <protocol> ]
```

### Description

Displays voice call density report during a time period.

### Syntax

No Parameters

### Example

The output of this command shows call density report filtered on SIP protocol.

```
(host) # show voice call-counters  
  
VoIP Call Density Report for protocol 'sip'  
-----

## show voice call-stats

```
show voice call-stats [ bssid <value> | cip <client-ip-address> | essid <value> |  
  extn <value> | ip <ip_address> | proto <value> | sta <value>
```

### Description

Displays voice call statistics for each client.

### Syntax

No Parameters

### Example

The output of this command shows call quality report for calls made by extension 6210.

```
(host) # show voice call-stats
```

```
Voice Client(s) Call Statistics
```

```
-----  
Client IP      Client MAC      Client Name ALG   Originated  Terminated  Active  Failed  Success  Blocked  Aborted  
Duration      R-Value        Band

## show voice msg-stats

```
show voice msg-stats [
  sccp { bssid <value> | cip <client-ip-address> | essid <value> | ip <ip_address> |
  sta <client-MAC-address> } | sip { bssid <value> | cip <client-ip-address> | essid
  <value> | ip <ip_address> | sta <client-MAC-address> } ]
```

### Description

Displays voice message counters for each call using either the SCCP or SIP protocol.

### Syntax

No Parameters

### Example

The output of this command shows voice message statistics for essid sam filtered on SCCP protocol.

```
(host) # show voice msg-stats sccp essid sam

SCCP Voice Client(s) Msg Statistics
-----
Client Name  Client IP    AP Name      BSSID          ESSID  Register  Register Ack  Unregister  Unregister Ack

## show voice statistics

```
show voice statistics [ cac | tspec-enforcement ]
```

### Description

Displays the CAC and TSPEC enforced voice statistics.

### Syntax

No Parameters

### Example

The output of this command shows statistics for TSPEC enforced calls.

```
(host) # show voice statistics tspec-enforcement

TSPEC Enforcement statistics
-----
Name                               Value
----                               -
TSPEC ADDTS Request                 16
TSPEC accepted                      16
TSPEC denied due to CAC              0
TSPEC enforcement timer events       2
Calls established within enforcement period 0
TSPEC deleted after enforcement period 1
```

## show voice trace

```
show voice trace [ sccp {count <value> | ip <ip_address> | mac <mac_address>} |  
sip {count <value> | ip <ip_address> | mac <mac_address>} ]
```

### Description

Displays the signalling message trace details for all clients.

### Syntax

No Parameters

### Example

The output of this command shows signalling message trace.

```
(host) # #show voice trace sccp count 10
```

```
SCCP Voice Client(s) Message Trace
```

```

## show vpdn pptp local pool

```
show vpdn pptp local pool <pool_name>
```

### Description

Displays the IP address pool for VPN users using Point-to-Point Tunneling Protocol.

### Syntax

No Parameters

### Example

The output of this command shows the all IP address pools for VPN users.

```
(host) # show vpdn pptp local pool

IP addresses used in pool localgroup
0 IPs used - 11 IPs free - 11 IPs configured
```

### Command History

This command was available in AOS-W 3.0

### Command Information

## show vrrp

```
show vrrp <vrid>
```

### Description

Displays the list of all VRRP configuration on the switch. To view a specific VRRP configuration, specify the VRID number.

### Syntax

No Parameters

### Example

The output of this command shows the VRRP configuration enabled in one of the floors of the building.

```
(host) # show vrrp
```

```
Virtual Router 2:  
  Description Floor-1 Settings  
  Admin State DOWN, VR State INIT  
  IP Address 10.15.1.10, MAC Address 00:00:5e:00:01:02, vlan 1  
  Priority 2, Advertisement 10 sec, Preemption Enable  
  Auth type PASSWORD, Auth data: 123456  
  tracking type is master-up-time, duration 500 minutes, value 3  
  tracking type is vrrp-master-state, vrid 10, value 1  
  tracking type is vlan, vlanid 1, subtract value 3  
  tracking type is interface, fastethernet 1/1, subtract value 3  
  tracked priority 2
```

### Command History

Version	Modification
AOS-W 1.0	Command introduced
AOS-W 3.3	The <b>tracking interface</b> and <b>tracking vlan</b> parameters were introduced.
AOS-W 3.3.2	The <b>add</b> option was removed from the <b>tracking interface</b> and <b>tracking vlan</b> parameters.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show web-server

```
show web-server
```

### Description

Displays the configuration of the switch's web server.

### Syntax

No Parameters

### Example

The output of this command shows the web-server configuration.

```
(host) # show web-server

Web Server Configuration
-----
Parameter                               Value
-----
Cipher Suite Strength                   high
SSL/TLS Protocol Config                 sslv3 tlsv1
Switch Certificate                      default
Captive Portal Certificate             default
Management user's WebUI access method  username/password
User session timeout <30-3600> (seconds) 900
Maximum supported concurrent clients <25-400> 25
```

### Command History

This command was available in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on master or local switches

## show wlan dot11k-profile

```
show wlan dot11k-profile [<profile>]
```

### Description

Show a list of all 802.11k profiles, or display detailed configuration information for a specific 802.11k profile.

### Syntax

Parameter	Description
<profile>	Name of an 802.11k profile.

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire ARM profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has two configured 802.11k profiles. The **References** column lists the number of other profiles with references to the 802.11k profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan dot11k-profile

802.11K Profile List
-----
Name           References  Profile Status
----           -
default        8
11kprofile2    1

Total: 2
```

The following example shows configuration settings defined for the profile **11kprofile2**.

```
(host) #show wlan dot11k-profile default

802.11K Profile "11kprofile2"
-----
Parameter                                           Value
-----
Advertise 802.11K Capability                         Enabled
Forcefully disassociate on-hook voice clients      Disabled
Measurement Mode for Beacon Reports                 beacon-table
```

The output of this command includes the following data columns:

Parameter	Description
Advertise 802.11K Capability	Shows if the profile has enabled or disabled the 802.11K feature.
Forcefully disassociate on-hook voice clients	If enabled, the AP may forcefully disassociate “on-hook” voice clients (clients that are not on a call) after period of inactivity.

Parameter	Description
Measurement Mode for Beacon Reports	<p>Shows the profile's beacon measurement mode:</p> <ul style="list-style-type: none"> <li>• <b>active:</b> In this mode, the client sends a probe request to the broadcast destination address on all supported channels, sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report.</li> <li>• <b>beacon-table:</b> In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. This is the default beacon measurement mode.</li> <li>• <b>passive:</b> In this mode, the client sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report.</li> </ul>

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show wlan edca-parameters-profile

```
show wlan edca-parameters-profile ap|station [<profile>]
```

### Description

Display an Enhanced Distributed Channel Access (EDCA) profile for APs or for clients (stations). EDCA profiles are specific either to APs or clients.

### Syntax

Parameter	Description
<profile>	Name of a EDCA Parameters profile.

### Usage Guidelines

Issue this command without the <profile> parameter to display a EDCA Parameters profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has three EDCA Parameters profiles configured for stations. The **References** column lists the number of other profiles with references to the EDCA Parameters profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan edca-parameters-profile station
EDCA Parameters profile (Station) List
-----
Name           References  Profile Status
----           -
station-corp1  3
station-corp2  1
testprofile    0

Total:3
```

The following example shows configuration settings defined for the profile **station-corp1**.

```
(host) #show wlan edca-parameters-profile ap station-corp1
EDCA Parameters
-----
AC           ECWmin  ECWmax  AIFSN  TXOP  ACM
--           -
Best-effort  4       6       3       0     0
Background  4       10      7       0     0
Video       3       4       1       94    0
Voice       2       3       1       47    0
```

The output of this command includes the following data columns:

Parameter	Description
AC	Name of an Access channel queue ( <b>Best-effort</b> , <b>Background</b> , <b>Video</b> or <b>Voice</b> ).
ECWmin	The exponential (n) value of the minimum contention window size, as expressed by $2^n-1$ . A value of 4 computes to $2^4-1 = 15$ .
ECWmax	The exponential (n) value of the maximum contention window size, as expressed by $2^n-1$ . A value of 4 computes to $2^4-1 = 15$ .

Parameter	Description
AIFSN	Arbitrary inter-frame space number.
TXOP	Transmission opportunity, in units of 32 microseconds.
ACM	If this column displays a 1, the profile has enabled mandatory admission control. If this column displays a 0, the profile has disabled this feature.

## Command History

This command was introduced in AOS-W 3.1.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system, but the switch must have the Voice Services Module license in order to configure EDCA Parameter Profiles.	Enable and Config mode on master or local switches

## show wlan ht-ssid-profile

```
show wlan ht-ssid-profile [<profile>]
```

### Description

Show a list of all High-throughput SSID profiles, or display detailed configuration information for a specific High-throughput SSID profile.

### Syntax

Parameter	Description
<profile>	Name of a High-throughput SSID profile.

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire High-throughput SSID profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has two configured High-throughput SSID profiles. The **References** column lists the number of other profiles with references to the High-throughput SSID profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan ht-ssid-profile
High-throughput SSID profile List
-----
Name           References  Profile Status
-----
HT-profile1    16
default2       1

Total:2
```

The following example shows configuration settings defined for the profile **default2**.

```
(host) #show wlan ht-ssid-profile default
High-throughput SSID profile "default"
-----
Parameter                               Value
-----
High throughput enable (SSID)            Enabled
40 MHz channel usage                     Enabled
MPDU Aggregation                        Enabled
Max transmitted A-MPDU size              65535 bytes
Max received A-MPDU size                 65535 bytes
Min MPDU start spacing                   0 usec
Supported MCS set                        0-15
Short guard interval in 40 MHz mode      Enabled
Legacy stations                          Allowed
Allow weak encryption                    Disabled
```

The output of this command includes the following data columns:

Parameter	Description
High throughput enable (SSID)	Shows if the profile enables or disables high-throughput (802.11n) features.
40 MHz channel usage	Shows if the profile enables or disables the use of 40 MHz channels.

Parameter	Description
MPDU Aggregation	Shows if the profile enables or disables MAC protocol data unit (MPDU) aggregation.
Max transmitted A-MPDU size	Configured maximum size of a transmitted aggregate MPDU, in bytes.
Max received A-MPDU size	Configured maximum size of a received aggregate MPDU, in bytes.
Min MPDU start spacing	Configured minimum time between the start of adjacent MPDUs within an aggregate MPDU, in microseconds.
Supported MCS set	Displays a list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20MHz vs. 40MHz) and the number of spatial streams used by the mesh node.
Short guard interval in 40 MHz mode	Shows if the profile enables or disables use of short (400ns) guard interval in 40 MHz mode.
Legacy stations	Allow or disallow associations from legacy (non-HT) stations. By default, this parameter is enabled (legacy stations are allowed).
Allow weak encryption	Shows if the profile enables or disables the use of TKIP or WEP for unicast traffic.

## Command History

Version	Description
AOS-W 3.3	Command introduced
AOS-W 3.3.1	The <b>legacy-stations</b> parameter was introduced
AOS-W 3.3.2	De-aggregation of MAC Service Data Units (A-MSDUs) on the OmniAccess 4504/4604/4704 and the OmniAccess Supervisor Card III (OmniAccess Supervisor Card III) was introduced

## Command Information

Platforms	Licensing	Command Mode
All platforms but operates with IEEE 802.11n compliant devices only	Base operating system	Config mode on master switches

## show wlan ssid-profile

```
show wlan ssid-profile [<profile>]
```

### Description

Show a list of all SSID profiles, or display detailed configuration information for a specific SSID profile.

### Syntax

Parameter	Description
<profile>	Name of an SSID profile.

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire SSID profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has six configured SSID profiles. The **References** column lists the number of other profiles with references to the SSIDs profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan ssid-profile
SSID Profile List
-----
Name                               References  Profile Status
----                               -
coltrane-ssid-profile              1
corp1-ssid-profile                 3
Remote                             1
Secure-Profile2                   0
test-ssid-profile                  1
wizardtest-ssid-profile            1

Total:6
```

The following example shows configuration settings defined for the SSID Profile **Remote**.

```
(host) #show wlan ssid-profile remote
```

```
SSID Profile "Remote"
-----
Parameter                               Value
-----
SSID enable                             Enabled
ESSID                                   remoteoffice
Encryption                               opensystem
DTIM Interval                            1 beacon periods
802.11a Basic Rates                      6 12 24
802.11a Transmit Rates                   6 9 12 18 24 36 48 54
802.11g Basic Rates                      1 2
802.11g Transmit Rates                   1 2 5 6 9 11 12 18 24 36 48 54
Station Ageout Time                      1000 sec
Max Transmit Attempts                    8
RTS Threshold                            2333 bytes
Short Preamble                           Enabled
Max Associations                          64
Wireless Multimedia (WMM)                Disabled
Wireless Multimedia U-APSD (WMM-UAPSD) Powersave Enabled
WMM TSPEC Min Inactivity Interval        0 msec
DSCP mapping for WMM voice AC             56
DSCP mapping for WMM video AC             40
DSCP mapping for WMM best-effort AC       24
DSCP mapping for WMM background AC        8
90211 Compatibility Mode                  Disabled
Hide SSID                                Disabled
Deny_Broadcast Probes                    Disabled
Local Probe Response                      Enabled
Disable Probe Retry                       Enabled
Battery Boost                             Disabled
WEP Key 1                                 N/A
WEP Key 2                                 N/A
WEP Key 3                                 N/A
WEP Key 4                                 N/A
WEP Transmit Key Index                    1
WPA Hexkey                                N/A
WPA Passphrase                            N/A
Maximum Transmit Failures                  0
EDCA Parameters Station profile            N/A
EDCA Parameters AP profile                 N/A
BC/MC Rate Optimization                    Disabled
Strict Spectralink Voice Protocol (SVP)   Disabled
High-throughput SSID Profile              default
```

The output of this command includes the following data columns:

Parameter	Description
SSID	Shows of the profile has enabled or disabled this SSID
ESSID	Name that uniquely identifies the Service Set Identifier (SSID).
Encryption	The layer-2 authentication and encryption type used on this ESSID.
DTIM Interval	The interval, in milliseconds, between the sending of Delivery Traffic Indication Messages (DTIMs) in the beacon.
802.11a Basic Rates	List of supported 802.11a rates, in Mbps, that are advertised in beacon frames and probe responses.
802.11a Transmit Rates	Set of 802.11a rates at which the AP is allowed to send data.
802.11g Basic Rates	List of supported 802.11b/g rates, in Mbps, that are advertised in beacon frames and probe responses.

Parameter	Description
802.11g Transmit Rates	Set of 802.11b/g rates at which the AP is allowed to send data.
Station Ageout Time	Time, in seconds, that a client is allowed to remain idle before being aged out.
Max Transmit Attempts	Maximum transmission failures allowed before the client gives up.
RTS Threshold	Wireless clients transmitting frames larger than this defined threshold must issue Request to Send (RTS) and wait for the AP to respond with Clear to Send (CTS).
Short Preamble	Shows if the profile enables or disables short preamble for 802.11b/g radios
Max Associations	Maximum number of wireless clients for the AP
Wireless Multimedia (WMM)	Shows if the profile enables or disables WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function (EDCF)
Wireless Multimedia U-APSD (WMM-UAPSD) Powersave	Shows if the profile enables or disables Wireless Multimedia (WMM) UAPSD powersave.
WMM TSPEC Min Inactivity Interval	Specifies the minimum inactivity time-out threshold of WMM traffic.
DSCP mapping for WMM voice AC	DSCP value used to map WMM voice traffic.
DSCP mapping for WMM video AC	DSCP value used to map WMM video traffic.
DSCP mapping for WMM best-effort AC	DSCP value used to map WMM best-effort traffic.
DSCP mapping for WMM background AC	DSCP value used to map WMM background traffic.
902iL Compatibility Mode	(For clients using NTT DoCoMo 902iL phones only) When enabled, the switch does not drop packets from the client if a small or old initialization vector value is received.
Hide SSID	Shows if the profile enables or disables hiding of the SSID name in beacon frames.
Deny_Broadcast Probes	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID
Local Probe Response	Shows if the profile enables or disables local probe response on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients' probe requests. If this option is disabled, then the switch sends the 802.11 probe responses
Disable Probe Retry	Shows if the profile enables or disables battery MAC level retries for probe response frames.
Battery Boost	If enabled, this feature converts multicast traffic to unicast before delivery to the client, thus allowing you to set a longer DTIM interval.
WEP Key 1	Displays the Static WEP key associated with this key index.
WEP Key 2	Displays the Static WEP key associated with this key index.
WEP Key 3	Displays the Static WEP key associated with this key index.
WEP Key 4	Displays the Static WEP key associated with this key index.
WEP Transmit Key Index	Show the key index that specifies which static WEP key is to be used

Parameter	Description
WPA Hexkey	WPA pre-shared key (PSK).
WPA Passphrase	WPA passphrase used to generate a pre-shared key (PSK).
Maximum Transmit Failures	Maximum transmission failures allowed before the client gives up.
EDCA Parameters Station profile	Name of the enhanced distributed channel access (EDCA) Station profile that applies to this SSID.
EDCA Parameters AP profile	Name of the enhanced distributed channel access (EDCA) AP profile that applies to this SSID.
BC/MC Rate Optimization	Shows if the profile enables or disables scanning of all active stations currently associated to an AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate
Strict Spectralink Voice Protocol (SVP)	Shows if the profile enables or disables strict Spectralink Voice Protocol (SVP).
High-throughput SSID Profile	Name of the high-throughput SSID profile associated with this SSID profile.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show wlan traffic-management-profile

```
show wlan traffic-management-profile [<profile>]
```

### Description

Show a list of all traffic management profiles, or display detailed configuration information for a specific traffic management profile.

### Syntax

Parameter	Description
<profile>	Name of a Traffic Management profile.

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire Traffic Management profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has three configured Traffic Management profiles. The **References** column lists the number of other profiles with references to the Traffic Management profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan
Traffic management profile List
-----
Name      References  Profile Status
----      -
mgmt1     1
mgmt3     0
mgmt4     2

Total: 3
```

The following example shows configuration settings defined for the profile **mgmt1**.

```
(host) #show wlan traffic-management-profile mgmt1
Traffic management profile "default"
-----
Parameter                               Value
-----
Proportional BW Allocation               N/A
Report interval                           5 min
Station Shaping Policy                   default-access
```

The output of this command includes the following data columns:

Parameter	Description
Proportional BW Allocation	Minimum bandwidth, as a percentage of available bandwidth, allocated to an SSID when there is congestion on the wireless network. An SSID can use all available bandwidth if no other SSIDs are active.
Report interval	Number of minutes between bandwidth usage reports.

Parameter	Description
Station Shaping Policy	<p>Shows which of three possible Station Shaping policies is configured on the profile.</p> <ul style="list-style-type: none"> <li>• <b>default-access:</b> Traffic shaping is disabled, and client performance is dependent on MAC contention resolution. This is the default traffic shaping setting.</li> <li>• <b>fair-access:</b> Each client gets the same airtime, regardless of client capability and capacity. This option is useful in environments like a training facility or exam hall, where a mix of 802.11a/g, 802.11g and 802.11n clients need equal to network resources, regardless of their capabilities. The <b>bw-alloc</b> parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when there is congestion on the wireless network. You must set traffic shaping to <b>fair-access</b> to use this bandwidth allocation value for an individual virtual AP.</li> <li>• <b>preferred-access:</b> High-throughput (802.11n) clients do not get penalized because of slower 802.11a/g or 802.11b transmissions that take more air time due to lower rates. Similarly, faster 802.11a/g clients get more access than 802.11b clients.</li> </ul>

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show wlan virtual-ap

```
show wlan virtual-ap [<profile>]
```

### Description

Show a list of all Virtual AP profiles, or display detailed configuration information for a specific Virtual AP profile.

### Syntax

Parameter	Description
<profile>	Name of a Virtual AP profile

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire Virtual AP profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has six configured Virtual AP profiles. The **References** column lists the number of other profiles with references to the Virtual AP profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan virtual-ap
```

```
Virtual AP profile List
```

```
-----
```

Name	References	Profile Status
----	-----	-----
coltrane-vap-profile	1	
default	2	
MegTest	1	
Remote	1	
test-vap-profile	1	
wizardtest-vap-profile	1	

```
Total: 6
```

The following example shows configuration settings defined for the profile **wizardtest-vap-profile**.

```
(host) #show wlan virtual-ap test-vap-profile
Virtual AP profile "wizardtest-vap-profile"
-----
Parameter                               Value
-----
Virtual AP enable                         Enabled
Allowed band                             all
AAA Profile                              default
802.11K Profile                          default
SSID Profile                             default
VLAN                                       N/A
Forward mode                             tunnel
Deny time range                          N/A
Mobile IP                                 Enabled
HA Discovery on-association               Disabled
DoS Prevention                           Enabled
Station Blacklisting                     Enabled
Blacklist Time                           3600 sec
Authentication Failure Blacklist Time    3600 sec
Fast Roaming                             Disabled
Strict Compliance                         Enabled
VLAN Mobility                             Disabled
Remote-AP Operation                      standard
Drop Broadcast and Multicast              Disabled
Convert Broadcast ARP requests to unicast Enabled
Band Steering                             Disabled
```

The output of this command includes the following data columns:

Parameter	Description
Virtual AP enable	Shows if the profile enables or disables the virtual AP.
Allowed band	The band(s) on which to use the virtual AP: <ul style="list-style-type: none"> <li>• <b>a</b>—802.11a band only (5 GHz)</li> <li>• <b>g</b>—802.11b/g band only (2.4 GHz)</li> <li>• <b>all</b>—both 802.11a and 802.11b/g bands (5 GHz and 2.4 GHz)</li> </ul>
AAA Profile	Name of the AAA profile associated with this virtual AP.
802.11K Profile	Name of an 802.11k profile associated with this virtual AP.
SSID Profile	Name of an SSID profile associated with this virtual AP.
VLAN	The VLAN(s) into which users are placed in order to obtain an IP address.
Forward mode	Forwarding mode defined on the profile: <ul style="list-style-type: none"> <li>• bridge mode</li> <li>• <b>split-tunnel mode</b></li> <li>• tunnel mode</li> </ul> <p>The forwarding mode controls whether 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the switch, and Internet access remains local).</p>
Deny time range	Time range for which the AP will deny access.
Mobile IP	Shows if the profile has enabled or disabled IP mobility.
HA Discovery on-association	If enabled, all clients of a virtual-ap will received mobility service on association.
DoS Prevention	If enabled, APs ignore deauthentication frames from clients. This prevents a successful deauth attack from being carried out against the AP. This does not affect third-party APs.

Parameter	Description
Station Blacklisting	Shows if the profile has enabled or disabled detection of denial of service (DoS) attacks, such as ping or SYN floods, that are not spoofed deauth attacks.
Blacklist Time	Number of seconds that a client is quarantined from the network after being blacklisted.
Authentication Failure Blacklist Time	Time, in seconds, a client is blocked if it fails repeated authentication. An authentication failure blacklist time of 0 blocks failed users indefinitely.
Fast Roaming	Shows if the AP has enabled or disabled fast roaming.
Strict Compliance	If enabled, the AP denies client association requests if the AP and client station have no common rates defined. Some legacy client stations which are not fully 802.11-compliant may not include their configured rates in their association requests. Such non-compliant stations may have difficulty associating with APs unless strict compliance is disabled.
VLAN Mobility	Shows if the AP has enabled or disabled VLAN (Layer-2) mobility.
Remote-AP Operation	Shows how the virtual AP operates on a remote AP: <ul style="list-style-type: none"> <li>• <b>always:</b> Permanently enables the virtual AP.</li> <li>• <b>backup:</b> Enables the virtual AP if the remote AP cannot connect to the switch.</li> <li>• <b>persistent:</b> Permanently enables the virtual AP after the remote AP initially connects to the switch.</li> <li>• <b>standard:</b> Enables the virtual AP when the remote AP connects to the switch.</li> </ul>
Drop Broadcast and Multicast	If enabled, the virtual AP will filter out broadcast and multicast traffic in the air.
Convert Broadcast ARP requests to unicast	If enabled, all broadcast ARP requests are converted to unicast and sent directly to the client
Band Steering	If enabled, ARM's band steering feature encourages dual-band capable clients to stay on the 5GHz band on dual-band APs. This frees up resources on the 2.4GHz band for single band clients like VoIP phones.

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show wlan voip-cac-profile

```
show wlan voip-cac-profile [<profile>]
```

### Description

Show a list of all VoIP Call Admission Control profiles, or display detailed configuration information for a specific VoIP Call Admission Control profile.

### Syntax

Parameter	Description
<profile>	Name of a VoIP Call Admission Control profile

### Usage Guidelines

Issue this command without the <profile> parameter to display the entire VoIP Call Admission Control profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

### Examples

The example below shows that the switch has three configured VoIP Call Admission Control profiles. The **References** column lists the number of other profiles with references to the VoIP Call Admission Control profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan voip-cac-profile
VoIP Call Admission Control profile List
-----
Name           References  Profile Status
----           -
corp-voip      6
kgtest         0
QAlab-voip    1

Total:3
```

The following example shows configuration settings defined for the profile **QAlab-voip**.

```
(host) #show wlan voip-cac-profile
VoIP Call Admission Control profile "QAlab-voip"
-----
Parameter                                           Value
-----
VoIP Call Admission Control                         Disabled
VoIP Bandwidth based CAC                           Disabled
VoIP Call Capacity                                  10
VoIP Bandwidth Capacity (kbps)                     2000
VoIP Call Handoff Reservation                       20 %
VoIP Send SIP 100 Trying                            Enabled
VoIP Disconnect Extra Call                         Disabled
VOIP TSPEC Enforcement                             Disabled
VOIP TSPEC Enforcement Period                      1 sec
VoIP Drop SIP Invite and send status code (client) 486
VoIP Drop SIP Invite and send status code (server) 486
```

The output of this command includes the following data columns:

Parameter	Description
VoIP Call Admission Control	Shows if the profile enables or disables WiFi VoIP Call Admission Control features.
VoIP Bandwidth based CAC	Shows the desired call admission control (CAC) Mechanism: <ul style="list-style-type: none"> <li>• Disable - CAC is based on Call Counts</li> <li>• Enable - CAC should be based on Bandwidth.</li> </ul>
VoIP Call Capacity	Number of simultaneous calls that can be handled by one radio.
VoIP Bandwidth Capacity (kbps)	The maximum bandwidth that can be handled by one radio, in kbps.
VoIP Call Handoff Reservation	Percentage of call capacity reserved for mobile VoIP clients on call.
VoIP Send SIP 100 Trying	Shows if the profile enables or disables sending of <i>SIP 100 - trying</i> messages to a call originator to indicate that the call is proceeding.
VoIP Disconnect Extra Call	If enabled, the switch disconnects calls that exceed the high capacity threshold by sending a deauthentication frame.
VOIP TSPEC Enforcement	Shows if the profile enables or disables validation of TSPEC requests for CAC.
VOIP TSPEC Enforcement Period	Maximum time for the station to start the call after the TSPEC request
VoIP Drop SIP Invite and send status code (client)	Display the status code sent back to the client if the profile is configured to drop a SIP Invite: <ul style="list-style-type: none"> <li>• <b>480</b>: Temporary Unavailable</li> <li>• <b>486</b>: Busy Here</li> <li>• <b>503</b>: Service Unavailable</li> <li>• <b>none</b>: Don't send SIP status code</li> </ul>
VoIP Drop SIP Invite and send status code (server)	Display the status code sent back to the server if the profile is configured to drop a SIP Invite: <ul style="list-style-type: none"> <li>• <b>480</b>: Temporary Unavailable</li> <li>• <b>486</b>: Busy Here</li> <li>• <b>503</b>: Service Unavailable</li> <li>• <b>none</b>: Don't send SIP status code</li> </ul>

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config mode on master or local switches.

## show wms ap

```
show wms ap {<bssid>}|{list [mon-mac <mon-mac> bssid <bssid>]}|{stats [mon-mac <mon-mac> bssid <bssid>]}
```

### Description

Display information for APs currently monitored by the AOS-W Wireless Management System (WMS).

### Syntax

Parameter	Description
<bssid>	Enter the AP's BSSID number in hexadecimal format (XX:XX:XX:XX:XX:XX).
list	Show the AP Tree Table for all APs.
mon-mac <mon-mac>	Show the AP Tree Table for an AP with the specified MAC address.
bssid <bssid>	Show the AP Tree Table for an AP with the specified BSSID.
stats	Show the AP Tree Table for all APs.
mon-mac <mon-mac>	Show the AP Tree Table for an AP with the specified MAC address.
bssid <bssid>	Show the AP Tree Table for an AP with the specified BSSID.

### Usage Guidelines

The WMS feature periodically sends statistics that it has collected for APs and Probes to the WMS process. When WMS receives an event message from an AM, it will save the event information along with the BSSID of the AP that generated the event in the WMS database. When WMS receives statistics from the AM, it updates its state, and the database.

### Examples

The command **show wms ap <bssid>** displays a list of AP MAC addresses and the BSSIDs seen by each AP.

```
(host)# show wms ap 00:1a:1e:88:01:e0
```

```
AP Info
-----
BSSID          SSID    Channel  Type    RAP_Type  Status  Match MAC          Ageout  HT-Type  HT-Sec-Chan
-----
00:1a:1e:88:01:e0  sw-ad  11      soft-ap  valid     up      00:00:00:00:00:00  -1
Probe Info
-----
MAC            IP       Name      Type    Status  AP Type
-----
00:1a:1e:88:02:80  10.3.129.94  ad-ap125-13  soft-ap  up      125
00:1a:1e:88:01:e0  10.3.129.96  mp3         soft-ap  up      125
00:1a:1e:81:c6:00  10.3.129.99  ad-ap124-11  soft-ap  down    124
00:0b:86:8a:15:20  10.3.129.93  sap61-1-6   soft-ap  down    65
```

The output of this command includes the following information:

Column	Description
BSSID	Basic Service Set Identifier for the AP. This is usually the AP's MAC address.
SSID	The Service Set Identifier that identifies a wireless network.
Channel	Channel used by the AP's radio.

Column	Description
Type	A WMS AP type can be one of the following: <ul style="list-style-type: none"> <li>● <b>soft-ap</b>: an Alcatel-Lucent Access Point (AP).</li> <li>● <b>air-monitor</b>: An Alcatel-Lucent Air Monitor (AM).</li> </ul>
RAP_Type	Indicates one of the following Rogue AP types: <ul style="list-style-type: none"> <li>● Valid (not a rogue AP)</li> <li>● Interfering</li> <li>● Rogue</li> <li>● Suspected Rogue</li> <li>● Disabled Rogue</li> <li>● Unclassified</li> <li>● Known Interfering</li> </ul>
Status	If <b>up</b> , the AP is active. If <b>down</b> (or no information is shown) the AP is inactive.
Match MAC	MAC address of a wired device that helped identify the AP as a rogue. If the AP has not been identified as a rogue, this column will display the MAC address 00:00:00:00:00:00.
Ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a <b>-1</b> , the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
HT-type	The type of high-throughput traffic sent by the AP: <ul style="list-style-type: none"> <li>● <b>HT-20mhz</b>: The AP radio uses a single 20 MHz channel</li> <li>● <b>HT-40mhz</b>: The AP radio uses a 40 MHz channel pair comprised of two adjacent 20 MHz channels.</li> </ul>
HT-Sec-Chan	Secondary channel used for 40 MHz high-throughput transmissions.
MAC	MAC address of a probe that can see the specified AP.
IP	IP address of a probe that can see the specified AP.
Name	Name of the probe.
Type	Displays the probe type: A WMS probe can be one of the following: <ul style="list-style-type: none"> <li>● <b>soft-ap</b>: an Alcatel-Lucent Access Point (AP).</li> <li>● <b>air-monitor</b>: An Alcatel-Lucent Air Monitor (AM).</li> </ul>
Status	If <b>up</b> , the AP is active. If <b>down</b> (or no information is shown) the AP is inactive.
AP Type	AP model type.

The example below shows received and transmitted data statistics for each BSSID seen by a monitoring AP.

```
(host)# show wms ap stats

```

The output of this command includes the following information:

Column	Description
Monitor-MAC	MAC address of an AP.
BSSID	Basic Service Set Identifier of a station.
RSSI	Received Signal Strength Indicator for the station, as seen by the AP.
txPkt	Number of transmitted packets.
RxPkt	Number of received packets.
TxByte	Number of transmitted bytes.
RxByte	Number of received bytes.
HTRates-Rx	Number of bytes received at high-throughput rates.

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode

```

The output of this command includes the following information:

Column	Description
Monitor-MAC	MAC address of an AP.
Channel	802.11 radio channel.
NumAP	Number of other APs seen on the specified channel.
NumSta	Number stations seen on the specified channel.
TotalPkt	Number of received packets.
TotalByte	Number of received bytes.
Noise	Current noise level.

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms client

```
show wms client <mac>|[list]|[probe <mac>]|[stats [mon-mac <mon-mac> mac <mac>]]
```

### Description

Display a list of client information for the clients that can be seen by monitoring APs.

### Syntax

Parameter	Description
<mac>	Show statistics for a client with the specified MAC address, including the BSSID of the AP to which that client is currently associated, and the MAC addresses of other monitoring APs that can see that client.
list	Show statistics for all monitored clients.
probe <mac>	Specify a client's MAC address to show the BSSIDs of all probes that can see that client.
stats	Show the STA stats table, which displays data for all clients seen by each monitoring AP.
mon-mac <mon-mac> mac <mac>	Enter a monitoring AP's MAC address (<mon-mac>) and the MAC address of a client (<mac>) to show data for traffic received from and sent to a specific client as seen by a specific AP.

### Example

The AP Info table in the example below shows that the client is associated to an AP with the BSSID **00:0b:86:cd:86:a0**. The Probe info table shows the MAC addresses of three other APs that can see the client.

```
(host) #show wms client 00:0e:35:29:9b:28
```

#### STA Info

```
-----  
MAC                Type   Status  Ageout  
----                -
```

MAC	Type	Status	Ageout
00:0e:35:29:9b:28	valid	up	-1

#### AP Info

```
-----  
BSSID              SSID    Channel  Type    RAP_Type  Status  Match MAC      Ageout  
-----
```

BSSID	SSID	Channel	Type	RAP_Type	Status	Match MAC	Ageout
00:0b:86:cd:86:a0	MySSID	11	soft-ap	valid	up	00:00:00:00:00:00	-1

#### Probe Info

```
-----  
MAC                IP          Name  Type    Status  Name    AP Type  
-----
```

MAC	IP	Name	Type	Status	Name	AP Type
00:0b:86:a2:2b:50	192.168.2.10	0	soft-ap	up	LeftAP	61
00:0b:86:ad:94:40	192.168.2.5	0	soft-ap	up	1.1.1	61
00:0b:86:cd:86:a0	192.168.2.4	0	soft-ap	up	CEO	70

The output of this command includes the following information:

Column	Description
MAC	MAC address of the client
Type	Station type ( <b>valid</b> , <b>interfering</b> , or <b>disabled rogue client</b> )
Status	If <b>up</b> , the client is active. If <b>down</b> (or no information is shown) the client is inactive.

Column	Description
ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a <b>-1</b> , the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
BSSID	BSSID of the AP to which the client is associated.
SSID	Extended service set identifier (ESSID) of the BSSID.
RAP_Type	Indicates one of the following Rogue AP types: <ul style="list-style-type: none"> <li>Valid (not a rogue AP)</li> <li>Interfering</li> <li>Rogue</li> <li>Disabled Rogue</li> <li>Suspected Rogue</li> <li>Unclassified</li> <li>Known Interfering</li> </ul>
Status	If <b>up</b> , the AP is active. If <b>down</b> (or no information is shown) the AP is inactive.
Match MAC	MAC address of a wired device that helped identify the AP as a rogue. If the AP has not been identified as a rogue, this column will display the MAC address 00:00:00:00:00:00.
Ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a <b>-1</b> , the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
MAC	MAC address of a WMS probe.
IP	IP address of a WMS probe.
Type	A WMS AP type can be one of the following: <ul style="list-style-type: none"> <li><b>soft-ap</b>: an Alcatel-Lucent Access Point (AP).</li> <li><b>air-monitor</b>: An Alcatel-Lucent Air Monitor (AM).</li> </ul>
Status	If <b>up</b> , the probe is active. If <b>down</b> (or no information is shown) the probe is inactive.
Name	Name of the probe. If a name has not been defined for the probe, this column may display a zero (0).
AP type	Model type of the probe.

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms counters

```
show wms counters [debug|event]
```

### Description

Show WMS event and debug counters. If you omit the optional **debug** and **events** parameters, the **show wms counters** command will display wms debug and events counters in a single table.

### Syntax

Parameter	Description
debug	Show show debug counters only
events	Show events counters only. If you omit the debug and events parameters, the show wms counters will display debug and events counters in a single table.

### Usage Guidelines

This command displays counters for database entries, messages and data structures. The counters displayed will vary for each switch; if the switch does not have an entry for a particular counter type, it will not appear in the output of this command

### Example

This example shows part of the output of the command **show wms counters**.

```
(host) #show wms counters

Counters
-----
Name                               Value
----                               -
DB Reads                           288268
DB Writes                           350870
Probe Table DB Reads                2477
Probe Table DB Writes                952
AP Table DB Reads                    143992
AP Table DB Writes                  138867
STA Table DB Reads                   40404
STA Table DB Writes                  99687
Probe STA Table DB Reads             101352
Probe STA Table DB Writes            117566
Probe Register                       2476
Probe State Update                   37077
Set RAP Type                         42552
Set RAP Type Conf Level              152
...
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms general

```
show wms general
```

### Description

Display general statistics for the wms configuration.

### Syntax

No parameters

### Example

This example shows per-channel statistics for all monitored APs.

```
(host) #show wms general

General Attributes
-----
Key                               Value

sta-ageout-interval                30
learn-ap                           enable
persistent-known-interfering       disable
propagate-wired-macs               enable
stat-update                        enable
collect-stats                      enable
classification-server-ip           10.4.151.19
rtls-port                           0
wms-on-master                       disable
use-db                             disable
calc-poll-interval                 176000
Switch IP                          10.6.2.253
Is Master                           enable
```

The output of this command includes the following information:

Column	Description
poll-interval	Interval, in milliseconds, for communication between the switch and Alcatel-Lucent AMs. The switch contacts the AM at this interval to download AP to station associations, update policy configuration changes, and download AP and station statistics.
poll-retries	Maximum number of failed polling attempts before the polled AM is considered to be down.
ap-ageout-interval	Time, in minutes, that an AP must remain unseen by any probes before it is deleted from the database.
sta-ageout-interval	Time, in minutes, that an client must unseen by any probes before it is deleted from the database.
learn-ap	Enables “learning” of non-Alcatel-Lucent APs.
persistent-known-interfering	If enabled, APs that are marked as known interfering from being aged out.
propagate-wired-MACs	Shows if the switch has enabled or disabled the propagation of the gateway wired MACs.
stat-update	Shows if the switch has enabled or disabled WMS statistics updates in the database.

Column	Description
collect-stats	If enabled, if the master switch will collect up to 25,000 statistic entries for monitored APs and clients.
classification-server-ip	IP address of an AMP (Airwave Management Platform) that will perform Rogue AP classification. If there is a classification server defined, the wms-on-master and use-db parameters will be disabled.
rtls-port	Port number on the RTLS server to which WMS statistics should be sent.
wms-on-master	The WMS process is enabled on the master switch.
use-db	Shows if WMS data is updated to the database on the master switch.
calc-poll-interval	Interval (in milliseconds) specifies the frequency with which an AP sends updates about monitored APs and monitored clients to the switch. By default it uses the configured <b>poll-interval</b> value. If the # of deployed radios is more than 30, the <b>calc-poll-interval</b> is computed as 2000*number-of-radios.
Switch IP	IP address of the switch.
Is Master	If enabled, the switch is a master switch. Otherwise, it is defined as a local switch.

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms monitor-summary

```
show wms channel stats
```

### Description

Display the numbers of different AP and client types monitored over the last 5 minutes, 1 hour, and since the switch was last reset.

### Syntax

No parameters.

### Usage Guidelines

The WLAN management system (WMS) on the switch monitors wireless traffic to detect any new AP or wireless client station that tries to connect to the network. When an AP or wireless client is detected, it is classified and its classification is used to determine the security policies which should be enforced on the AP or client. Use the **show wms monitor-summary** command to view a quick summary of each classified AP and client type currently on the network.

If AP learning is enabled (with the `wms general` command), non-Alcatel-Lucent APs connected on the same wired network as Alcatel-Lucent APs are classified as valid APs. If AP learning is disabled, a non-Alcatel-Lucent AP is classified as an unsecure or suspect-unsecure AP.

### Example

This example shows that the switch currently has 144 valid APs and 32 active valid clients, and verifies that the switch currently aware of a single disabled rogue AP.

```
(host) #show wms monitor-summary

WMS Monitor Summary
-----
-                Last 5 Min  Last Hour  All
-----
Valid APs        0           0          144
Interfering APs  0           0           0
Rogue APs        0           0           0
Disabled Rogue APs  0           0           1
Unclassified APs  0           0           0
Known Interfering APs  0           0           0
Suspected Rogue APs  0           0           0
Valid Clients    0           0           32
Interfering Clients  0           0           0
Disabled Rogue Clients  0           0           0
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

All platforms	Base operating system	Config mode on master switches

## show wms probe

show wms probe

### Description

Display detailed information for a list of WMS probes.

### Syntax

No parameters

### Example

This example shows the Probe List table for WMS probes.

```
(host) #show wms probe
```

```
Probe List
-----
Monitor Eth MAC      BSSID                PHY Type             IP                   LMS IP              Scan  Status  Updates  Reqs  Stats  Type

```

The output of this command includes the following information:

Column	Description
Monitor Eth MAC	Ethernet MAC address of a probe.
BSSID	Probe Radio BSSID.
PHY Type	Radio PHY type: <ul style="list-style-type: none"><li>● 802.11A</li><li>● 802.11AHT-40Mbps</li><li>● 802.11AHT-20Mbps</li><li>● 802.11G</li><li>● 802,11GHT-20Mbps</li></ul>
IP	IP address of the AP.
LMS IP	IP address of the AP's local switch.
Scan	Shows if the Air Monitor is performing scanning.
Status	If the scan column displays a status of Up, the AP or AM is active
Updates	Number of updates the AP or AM sent to the WMS database since the switch was last reset.
Reqs	Number of database update requests that have not yet been added into the database.
Stats	Total number of statistics updates sent to the database.

Column	Description
Type	<p>A WMS AP type can be one of the following:</p> <ul style="list-style-type: none"> <li>● <b>soft-ap</b>: an Alcatel-Lucent Access Point (AP).</li> <li>● <b>air-monitor</b>: An Alcatel-Lucent Air Monitor (AM).</li> </ul>

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms rogue-ap

```
show wms rogue-ap <mac>
```

### Description

Display statistics for APs classified as rogues APs.

### Syntax

Parameter	Description
<mac>	MAC address of a rogue AP.

### Example

The output of this command shows statistics for a suspected Rogue AP, including how it was classified as a suspected rogue.

```
(host) #show wms rogue-ap 00:0b:86:d4:ca:12

Suspect Rogue AP Info
-----
Key          Value
---          -
BSSID       00:0b:86:d4:ca:12
SSID        corp1-voip
Channel     36
Type        generic-ap
RAP Type    suspect-unsecure
Confidence  Level 55%
Status      up
Match Type  Base-BSSID-Override
Match MAC   00:0b:86:c5:4c:a0
Match IP    1.1.1.249
Match AM    corp802.11n
Match Method Exact-Match
Suspect Match Types Base-BSSID-Override Base-BSSID-Override
Helper AP BSSID 00:0b:86:d4:ca:10
Match Time Sun Jul 27 13:08:16 2008

Match MAC Seen at APs
-----
AP-name
-----
ap-044
```

The output of this command includes the following information:

Column	Description
BSSID	BSSID of the suspected rogue AP.
SSID	The rogue AP's Extended service set identifier.
Channel	Channel used by a radio on the rogue AP.
Type	Indicates if the AP is an <b>Alcatel-Lucent</b> AP, a <b>Cisco</b> AP, or an AP from any other manufacturer ( <b>generic AP</b> ).
RAP Type	Type of rogue AP, <ul style="list-style-type: none"><li>● Suspect-unsecure: AP has not been confirmed as a rogue AP.</li><li>● unsecure: AP has been confirmed as a rogue AP</li></ul>

Column	Description
Status	Shows if the AP is active ( <b>up</b> ) or inactive ( <b>down</b> ).
Match Type	<p>Describes how the AP was classified as a rogue.</p> <ul style="list-style-type: none"> <li>Eth-Wired-MAC: An Alcatel-Lucent AP or AM detected that a single MAC address was in both the Ethernet Wired-Mac table and a non-valid AP wired-Mac table.</li> <li>AP-Wired-MAC: An interfering AP is marked as rogue when the Alcatel-Lucent AP finds a MAC address in one of its valid AP wired-mac table and in an interfering AP wired-mac table. You can enable or disable the AP-Wired-MAC matching method using the CLI command <code>ids unauthorized-device-profile overlay-classification</code>.</li> <li>Config-Wired-MAC: This type of classification occurs when an Alcatel-Lucent AP or AM detects a match between a wired MAC table and a pre-defined MAC address that has manually defined via the command <code>ids unauthorized-device-profile valid-wired-mac</code>.</li> <li>External-Wired-MAC: This type of classification occurs when an Alcatel-Lucent AP or AM detects a match between a wired MAC table entry and a pre-defined MAC address manually defined in the <code>rap-wml</code> table.</li> <li>Base-BSSID-Override: If an Alcatel-Lucent AP is detected as rogue, then all virtual APs on the particular rogue are marked as rogue using Base-BSSID-Override match type.</li> <li>Manual: An AP is manually defined as a rogue by via the command <code>wms ap &lt;bssid&gt; mode unsecure</code>.</li> <li>EMS: An AP is manually defined as a rogue by via the Element Management System</li> </ul>
Match MAC	MAC address of a wired device that helped identify the AP as a rogue. If the AP has not been identified as a rogue, this column will display the MAC address 00:00:00:00:00:00.
Match IP	IP address of a wired device that helped identify the AP as a rogue.
Match AM	Alcatel-Lucent Air Monitor that reporting seeing the rogue AP.
Match Method	This variable indicates the type of match.
Suspect Match Types	Describes how an AP was classified as a suspected rogue AP.
Helper Ap BSSID	BSSID of the AP or AM that helped classify a rogue AP.
AP name	Names of APs that are able to see the specified MAC address.
Match Time	Time the AP was identified as a rogue AP.

## Command History

This command was introduced in AOS-W 3.0

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms routers

```
show wms routers <mac>
```

### Description

Show Learned Router Mac Information for WMS APs.

### Syntax

Column	Description
<mac>	MAC address of a probe that can see the router.

### Usage Guidelines

This command displays the MAC addresses of devices that have been determined to be routers by the listed APs. This output of this command will be blank if there is not any broadcast/multicast activity in an AP's subnet.

### Example

In the example below, a single WMS AP has learned MAC information for four different routers.

```
(host) #show wms routers

Router Mac 00:08:00:00:11:12 is Seen by APs
-----
AP-Name
-----
AP32
Router Mac 00:08:00:00:11:29 is Seen by APs
-----
AP-Name
-----
AP32
Router Mac 00:08:00:00:11:57 is Seen by APs
-----
AP-Name
-----
AP32
Router Mac 00:08:00:00:11:6e is Seen by APs
-----
AP-Name
-----
AP32
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms system

```
show wms system
```

### Description

Show the WMS system configuration and system state.

### Syntax

No parameters.

### Example

This example shows the WMS System Configuration and System State tables.

```
(host) #show wms system

System Configuration
-----
Key                Value
---                -
max-threshold     30000

System State
-----
Key                Value
---                -
Max Threshold     30000
Current Threshold 28470
Total AP Count    27153
Total STA Count   3294
MAX RB-tree Count 50000
Total Tree Count  50000
Poll Count (Max)  10(365)
```

The output of this command includes the following information:

Column	Description
Max Threshold	The maximum number of table entries allowed. If this table displays a zero (0), there is no configured limit. <b>NOTE:</b> If a configured maximum limit has reached, the switch will not create new WMS entries for monitored APs and monitored stations. If new APs are deployed after this limit is reached, those APs will not be marked as 'valid', which will impair the effectiveness of the Adaptive Radio Management feature. If there are new Rogue APs in the network, they will not be classified as a rogue.
Current Threshold	Current number of table entries.
Total AP Count	Total number of statistics entries for monitored APs in the AP table.
Total STA Count	Total number of statistics entries for monitored stations in the Station table.
MAX RB-tree Count	Maximum number of entries allowed in the statistics.
Total Tree Count	Total number of entries currently in the statistics tree. If this limit has been reached, the switch will not add entries with the RSSI information for APs, monitored APs and monitored clients that are seen by them. This can negatively affect the RF Plan application.
Poll Count (Max)	Current and maximum poll counts.

### Command History

This command was introduced in AOS-W 3.0

# Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## show wms wired-mac

```
show wms wired-mac [{<mac>}|{ap-name <ap-name>}]
```

### Description

Show a table of gateway wired addresses. This command can display a list of APs aware of a specific gateway MAC address, or list the wired MAC addresses known to a single AP.

### Syntax

Column	Description
<mac>	Specify a wired MAC address to display a list of APs that are aware of this wired MAC.
ap-name <ap-name>	Specify the IP address of an AP to list the wired MAC addresses of which it is aware.

### Example

This example shows that the AP Corp-AP125-AM is aware of four different gateway wired MAC addresses.

```
(host) #show wms wired-mac ap-name Corp-AP125-AM
```

```
Learned Wired Macs for AP: Corp-AP125-AM
```

```
-----  
Wired-Mac  
-----  
00:0b:86:41:01:20  
00:0b:86:60:2e:ac  
00:0b:86:40:1e:60  
00:0b:86:08:e1:00
```

### Command History

This command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## shutdown

```
shutdown all
```

### Description

This command disables all interfaces on the switch.

### Usage Guidelines

This command stops all traffic through the physical ports on the switch. The console port remains active. Use this command only when you have physical access to the switch, so that you can continue to manage using the console port.

To shut down an individual interface, tunnel, or VLAN, use the `shutdown` option within the interface command. To restore the ports, use the `no shutdown` command.

### Example

The following example shuts down all physical interfaces on the switch.

```
(host) (config)#shutdown all
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master or local switches

## snmp-server

```
snmp-server
  community <string>
  enable trap
  inform queue-length <size>
  stats
  trap enable|disable|{source <ipaddr>}
  host <ipaddr> version {1 <name> udp-port <port>}|2c|{3 <name>} [inform] [interval
    <seconds>] [retrycount <number>] [udp-port <port>]}
  user <name> [auth-prot {md5|sha} <password>] [priv-prot {AES|DES} <password>]
```

### Description

This command configures SNMP parameters.

### Syntax

Parameter	Description	Range	Default
community	Sets the read-only community string.	—	—
enable trap	Enables sending of SNMP traps to the configured host.	—	disabled
inform	Specifies the length for the SNMP inform queue.	100-350	250
stats	Allows file-based statistics collection for OmniVista Mobility Manager. The switch generates a file that contains statistics data used by OmniVista Mobility Manager to display information in chart and graph formats. File-based statistics collection is transparent to the user and increases the efficiency of transferring information between the switch and OmniVista Mobility Manager.		enabled
trap	Source IP address of SNMP traps.	—	disabled
disable	Disables an SNMP trap. You can get a list of valid trap names using the <code>show snmp trap-list</code> command.	—	—
enable	Enables an SNMP trap.	—	—
source	The IP address of the destination to which the trap is sent.	—	—
host	Configures the IP address of the host to which SNMP traps are sent. This host needs to be running a trap receiver to receive and interpret the traps sent by the switch.	—	—
version	Configures the SNMP version and security string for notification messages.	—	—
inform	Sends SNMP inform messages to the configured host.	—	disabled
interval	Estimated round trip time to this host.		60 seconds
retrycount	Number of times that SNMP inform messages are attempted to be sent to the host before giving up.		3
udp-port	The port number to which notification messages are sent.	—	162
user	Configures an SNMPv3 user profile for the specified username.	—	—
auth-prot	Authentication protocol for the user, either HMAC-MD5-98 Digest Authentication Protocol (MD5) or HMAC-SHA-98 Digest Authentication Protocol (SHA), and the password for use with the designated protocol.	MD5/ SHA	SHA

Parameter	Description	Range	Default
priv-prot	Privacy protocol for the user, either Advanced Encryption Standard (AES) or CBC-DES Symmetric Encryption Protocol (DES), and the password for use with the designated protocol.	AES/DES	DES

## Usage Guidelines

This command configures SNMP on the switch only. You configure SNMP-related information for APs in an SNMP profile which you apply to an AP group or to a specific AP. To configure SNMP hostname, contact, and location information for the switch, use the **hostname**, **syscontact**, and **syslocation** commands.

## Example

The following command configures an SNMP trap receiver:

```
(host) (config) #snmp-server host 191.168.1.1 version 2c 12345678
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.3.1	The <b>stats</b> parameter was introduced

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## spanning-tree (Global Configuration)

```
spanning-tree  
  [forward-time <value> | hello-time <value> | max-age <value> | priority <value>]
```

RSTP is backward compatible with STP and is enabled by default. For ease of use, this command uses the spanning tree keyword.

### Description

This command is the global configuration for the Rapid Spanning Tree Protocol (RSTP). See [spanning-tree \(Configuration Interface\)](#) for details on the RSTP (config-if) command.

### Syntax

Parameter	Description	Range	Default
forward-time	Specifies the time, in seconds, the port spends in the listening and learning state. During this time, the port waits to forward data packets.	4-30	15 seconds
hello-time	Specifies the time, in seconds, between each bridge protocol data unit (BPDU) transmitted by the root bridge.	1-10	2 seconds
max-age	Specifies the time, in seconds, the root bridge waits to receive a hello packet before changing the STP topology.	6-40	20 seconds
priority	Set the priority of a bridge to make it more or less likely to become the root bridge. The bridge with the lowest value has the highest priority. When configuring the priority, remember the following: The highest priority bridge is the root bridge. The highest priority value is 0 (zero).	0-65535	32768

### Usage Guidelines

This command configures the global RSTP settings on the switch and is backward compatible with past versions of AOS-W using STP.

By default, all interfaces and ports on the switch run RSTP as specified in 802.1w and 802.1D. The default RSTP values can be used for most implementations.

Use the `no spanning-tree` command to disable RSTP.

### Example

The following command sets the time a port spends in the listening and learning state to 3 seconds:

```
spanning-tree forward-time 3
```

The following command sets the time the root bridge waits to transmit BPDUs to 4 seconds:

```
spanning-tree hello-time 4
```

The following command sets the time the root bridge waits to receive a hello packet to 30 seconds:

```
spanning-tree max-age 30
```

The following command sets the bridge priority to 10, making it more likely to become the root bridge:

spanning-tree priority 10

## Command History

Release	Modification
AOS-W 3.4	Upgraded STP to RSTP with full backward compatibility
AOS-W 1.0	Introduced the Spanning Tree Protocol (STP)

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Configuration (config)

## spanning-tree (Configuration Interface)

```
spanning-tree [cost <value> | point-to-point | port-priority <value> | portfast]
```

RSTP is backward compatible with STP and is enabled by default. For clarity, this RSTP command uses the spanning tree keyword.

### Description

Alcatel-Lucent's RSTP implementation interoperates with both PVST (Per VLAN Spanning Tree 802.1D) and Rapid-PVST (802.1w) implementation on industry-standard router/switches. Syntax

Parameter	Description	Range	Default
cost <value>	Enter the RSTP path cost. Use the cost values to determine the most favorable path to a particular destination: the lower the cost, the better the path	1 - 65536	Default: Based on Interface type: <ul style="list-style-type: none"><li>Fast Ethernet 10Mbps—100</li><li>Fast Ethernet 100Mbps—19</li><li>1Gigabit Ethernet—4</li><li>10 Gigabit Ethernet—2</li></ul>
point-to-point	Set the interface to a point-to-point	n/a	Enabled
port-priority <value>	Change the RSTP priority.	0 - 255	128
portfast	Change from blocking to forwarding	n/a	Disabled

### Usage Guidelines

Alcatel-Lucent supports global instances of STP and RSTP only. Therefore, the ports on industry-standard routers/switches must be on the default or untagged VLAN for interoperability with Alcatel-Lucent switches.

AOS-W supports RSTP on the following interfaces:

- FastEthernet IEEE 802.3—fastethernet
- Gigabitethernet IEEE 802.3—gigabitethernet
- Port Channel ID—port-channel

In addition to port state changes, RSTP introduces port roles for all the interfaces (see [Table 1](#)).

**Table 1** Port Role Descriptions

RSTP (802.1w) Port Role	Description
Root	The port that receives the best BPDU on a bridge.
Designated	The port can send the best BPDU on the segment to which it is connected.
Alternate	The port offers an alternate path, in the direction of root bridge, to that provided by bridge's root port.
Backup	The port acts as a backup for the path provided by a designated port in the direction of the spanning tree.

## Example

The RSTP default values are adequate for most implementation. Use caution when making changes to the spanning tree values.

```
(host) (config-if) #spanning-tree cost 345

(host) (config-if) #spanning-tree point-to-point ?

(host0) (config-if) #spanning-tree portfast ?
```

## Related Commands

[spanning-tree \(Global Configuration\) on page 958](#)

## Command History

Release	Modification
AOS-W 3.4	Upgraded STP to RSTP with full backward compatibility.
AOS-W 1.0	Introduced the Spanning Tree Protocol (STP).

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Configuration Interface (config-if)

## ssh

```
ssh disable_dsa | mgmt-auth {public-key [username/password] | username/password  
[public-key]}
```

### Description

This command configures SSH access to the switch.

### Syntax

Parameter	Description	Default
disable_dsa	Disables DSA authentication for SSH. Only RSA authentication is used.	—
mgmt-auth	Configures authentication method for the management user. You can specify username/password only, public key only, or both username/password and public key.	username/ password

### Usage Guidelines

Public key authentication is supported using a X.509 certificate issued to the management client. If you specify public-key authentication, you need to load the client X.509 certificate into the switch and configure certificate authentication for the management user with the `mgmt-user ssh-pubkey` command.

### Example

The following commands configure SSH access using public key authentication only:

```
(host) (config) #ssh mgmt-auth public-key  
mgmt-user ssh-pubkey client-cert ssh-pubkey cli-admin root
```

### Command History

Version	Modification
AOS-W 3.0	Command introduced
AOS-W 3.1	The <b>mgmt-auth</b> parameter was introduced

## stm

```
stm add-blacklist-client <macaddr> | kick-off-sta <macaddr> <bssid> | remove-blacklist-client <macaddr> | start-trace <macaddr> | stop-trace <macaddr>
```

### Description

This command is used to manually control the blacklisting of clients.

### Syntax

Parameter	Description
add-blacklist-client	MAC address of the client to be added to the denial of service list.
kick-off-sta	MAC address of the client to disassociated.
<macaddr>	MAC address from which the client is to be blacklisted.
<bssid>	BSSID from which the client is to be blacklisted.
remove-blacklist-client	MAC address of the client to remove from the denial of service list.
start-trace	Client or BSSID on which to start tracing.
stop-trace	Client or BSSID on which to stop tracing.

### Usage Guidelines

When you blacklist a client, the client is not allowed to associate with any AP in the network. If the client is connected to the network when you blacklist it, a deauthentication message is sent to force the client to disconnect. The blacklisted client is blacklisted for the duration specified in the virtual AP profile.

### Example

The following command blacklists a client:

```
(host) #stm add-blacklist-client 00:01:6C:CC:8A:6D
```

### Command History

This command was introduced in AOS-W 1.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master or local switches

# support

support

## Description

This command, which should be used only in conjunction with Alcatel-Lucent customer support, is for switch debugging purposes only.

## Syntax

No parameters.

## Usage Guidelines

This command is used by Alcatel-Lucent customer support for debugging the switch. Do not use this command without the guidance of Alcatel-Lucent customer support.

In AOS-W 2.4 and 2.5, this command was named `secret`.

## Example

The following command allows Alcatel-Lucent customer support to debug the switch:

```
(host) #support
```

## Command History

Version	Modification
AOS-W 2.4	Command introduced as the <b>secret</b> command
AOS-W 3.1	Command renamed to <b>support</b>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## syscontact

syscontact <syscontact>

### Description

This command configures the name of the system contact for the switch.

### Syntax

Parameter	Description
syscontact	An alphanumeric string that specifies the name of the system contact.

### Usage Guidelines

Use this command to enter the name of the person who acts as the system contact or administrator for the switch. You can use a combination of numbers, letters, characters, and spaces to create the name. To include a space in the name, use quotation marks to enclose the alphanumeric string. For example, to create the system contact name Lab Technician 1, enter "Lab Technician 1" at the prompt.

To change the existing name, enter the command with a different string. The new name takes affect immediately. To unconfigure the name, enter "" at the prompt.

### Example

The following command defines **LabTechnician** as the system contact name:

```
(host) (config) #syscontact LabTechnician
```

### Command History

This command was introduced in AOS-W 3.1.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## syslocation

syslocation <syslocation>

### Description

This command configures the name of the system location for the switch.

### Syntax

Parameter	Description
syslocation	An alphanumeric string that specifies the name of the system location.

### Usage Guidelines

Use this command to indicate the location of the switch. You can use a combination of numbers, letters, characters, and spaces to create the name. To include a space in the name, use quotation marks to enclose the text string.

To change the existing name, enter the command with a different string. To unconfigure the location, enter "" at the prompt.

### Example

The following command defines **SalesLab** as the location for the switch:

```
(host) # syslocation "Building 10, second floor, room 21E"  
syscontact LabTechnician
```

### Command History

This command was introduced in AOS-W 3.1.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## tar

```
tar clean {crash|flash|logs}| crash | flash | logs [tech-support]
```

### Description

This command archives a directory.

### Syntax

Parameter	Description
clean	Removes a tar file
crash	Removes crash.tar
flash	Removes flash.tar.gz
logs	Removes logs.tar
crash	Archives the crash directory to crash.tar. A crash directory must exist.
flash	Archives and compresses the /flash directory to flash.tar.gz.
logs	Archives the logs directory to log.tar. Optionally, technical support information can be included.

### Usage Guidelines

This command creates archive files in Unix tar file format.

### Example

The following command creates the log.tar file with technical support information:

```
tar logs tech-support
```

### Command History

The command was introduced in AOS-W 3.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## telnet

```
telnet {cli|soe}
```

### Description

Enable telnet to the switch or to an AP through the switch.

### Syntax

Parameter	Description	Default
cli	Enable telnet using the CLI.	Disabled
soe	Enable telnet using Serial over Ethernet (SoE).	Disabled

### Usage Guidelines

Use the **cli** option to enable telnet to the switch.

Use the **soe** option to enable telnet using the SoE protocol. This allows you to remotely manage an AP directly connected to the switch.

### Example

The following example enables telnet to the switch using the CLI.

```
(host) (config) #telnet cli
```

### Command History

The command was introduced in AOS-W 1.0

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## time-range

```
time-range <name> absolute [end <mm/dd/yyyy> <hh:mm>] [[start <mm/dd/yyyy> <hh:mm>]
time-range <name> periodic
Daily <hh:mm> to <hh:mm>
Friday <hh:mm> to <hh:mm>
Monday <hh:mm> to <hh:mm>
Saturday <hh:mm> to <hh:mm>
Sunday <hh:mm> to <hh:mm>
Thursday <hh:mm> to <hh:mm>
Tuesday <hh:mm> to <hh:mm>
Wednesday <hh:mm> to <hh:mm>
Weekday <hh:mm> to <hh:mm>
Weekend <hh:mm> to <hh:mm>
no ...
```

### Description

This command configures time ranges.

### Syntax

Parameter	Description
<name>	Name of this time range. You can reference this name in other commands.
absolute	Specifies an absolute time range, with a specific start and/or end time and date.
periodic	Specifies a recurring time range. Specify the start and end time and Daily, Weekday, Weekend, or the day of the week.
no	Negates any configured parameter.

### Usage Guidelines

You can use time ranges when configuring session ACLs. Once you configure a time range, you can use it in multiple session ACLs.

### Example

The following command configures a time range for daytime working hours:

```
(host) (config) #time-range working-hours periodic
weekday 7:30 to 18:00
```

### Command History

The command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## traceroute

```
traceroute <ipaddr>
```

### Description

Trace the route to the specified IP address.

### Syntax

Parameter	Description
<ipaddr>	The destination IP address.

### Usage Guidelines

Use this command to identify points of failure in your network.

### Example

The following command traces the route to the device identified by the IP address 10.1.2.3.

```
(host) (config) #traceroute 10.1.2.3
```

### Command History

The command was introduced in AOS-W 2.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	User, Enable, and Config modes on local or master switches

## trusted

```
trusted all
```

### Description

This command makes all physical interfaces on the switch trusted ports.

### Syntax

Parameter	Description
all	Makes all ports on the switch trusted.

### Usage Guidelines

Trusted ports are typically connected to internal controlled networks. Untrusted ports connect to third-party APs, public areas, or any other network to which the switch should provide access control. When Alcatel-Lucent APs are attached directly to the switch, set the connecting port to be trusted.

By default, all ports on the switch are treated as trusted. You can use the **interface fastethernet** or **interface gigabitethernet** commands to make individual ports trusted.

### Example

The following command makes all ports trusted:

```
(host) (config) #trusted all
```

### Command History

The command was introduced in AOS-W 2.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## uplink

crypto-local

```
uplink {cellular priority <prior>}|enable| disable|{wired priority <prior>}|{wired  
vlan <id>}|{healthcheck cellular|wired enable|disable [host <ipaddr>] [interval  
<seconds> threshold <tries>]}
```

### Description

Manage and configure an uplink network connection by defining primary and backup links.

### Syntax

Parameter	Description	Range
cellular priority <prior>	Set the priority of the cellular uplink. By default, the cellular link has a lower priority than the wired uplink, making the wired link the primary link and the cellular link the secondary, backup link.  If you set the priority of the cellular link higher than the wired link priority, the cellular link will become the primary switch link. Links with the same priority level are activated at the same time.	1-255
enable	Enable the uplink manager.	—
disable	Disable the uplink manager.	—
wired priority <prior>	Set the priority of the wired uplink. Each uplink type has an associated priority, with wired ports having the highest priority by default.	1-255
wired vlan <id>	Define the VLAN id of the uplink VLAN.	1-4094
healthcheck	Manage the uplink manager healthcheck feature.	
cellular wired	Specify either <b>cellular</b> or <b>wired</b> to configure the healthcheck feature for the cellular link or the wired link.	
enable disable	If health check messages are enabled, the uplink manager verifies the connectivity of a wired or cellular uplink by sending sends periodic health checks through the link to the switch's gateway or an other specified IP address.  Uplink health checks are enabled by default. If you disable health check messages, the switch will not be able to determine when a link has failed and will not automatically enable the backup link.	
host <ipaddr>	By default, health checks are sent to the switch's gateway. To send health checks to a different IP address, use the <b>host &lt;ipaddr&gt;</b> parameters to specify a different host to receive these messages. This option is useful for verifying an end-to-end connection to a corporate office.	
interval <seconds>	Interval, in seconds, that the switch sends health check messages through the link.	
threshold <tries>	If the switch's gateway (or other user-defined IP address) fails to receive a specified number of health check messages, the link will be classified as disabled, and a lower-priority link will be enabled as a backup link.	

## Usage Guidelines

An OmniAccess 4306 switch supports multiple 3G cellular uplinks in addition to the its standard wired ports, providing redundancy in the event of a connection failure. If an OmniAccess 4306's wired link cannot access the internet, the switch can fail over to a secondary cellular link and continue routing traffic.

An OmniAccess 4306 switch uses a ping health check mechanism to monitor uplink connectivity . The switch periodically verifies the health of the primary link by sending health checks through the link to the switch's internet gateway (or another user-specified IP address). If too many health checks fail, the switch declares the link inactive. If there are no other active uplinks with the same priority, the switch enables a lower-priority backup link to serve client traffic. This transition from higher-priority link to lower-priority link is seamless and transparent to the user.

Once the backup link is active, the switch will wait a brief period before attempting to reactivate the higher-priority uplink. When the primary connection has been restored, the backup link returns to standby mode until it is needed again. If, however, the switch failed to activate any backup link, it will immediately attempt to restore the primary uplink without that same waiting period.

## Example

**The following example defines health check ip addresses for a primary wired link and backup cellular uplink, then enables the uplink manager feature.**

```
(host) #uplink wired priority 200 healthcheck host 10.3.2.14
(host) #uplink cellular priority 100 healthcheck host 10.3.0.1
(host) #uplink enable
```

## Command History

This command was introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## usb reclassify

```
crypto-local
  usb reclassify <address>
```

### Description

Disconnect and reclassify an USB device.

### Syntax

Parameter	Description
<address>	USB device address from the <code>show usb</code> command.

### Usage Guidelines

There's no way to power off an USB port on the OmniAccess 4306 switch, but you can re-initialize the device using the `usb reclassify` command. This command removes the modem from the USB device list, then detects it via the USB table.

### Command History

Introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 switches	Base operating system	Config mode on master and local switches

## usb-printer

```
usb-printer [ printer <printer-name> alias <alias-name> ]
```

### Description

This command allows you to provide an alias to a USB printer connected to a Alcatel-Lucent OAW-AP65 series switch.

### Syntax

Parameter	Description
printer	Enter the default printer name. To get the default printer name use the <code>show network-printer status</code> command.
alias	Enter a new alias name for the printer.

### Example

The following command creates an alias for a printer:

```
(host) usb-printer printer usblp_HP_Officejet_Pro_L7500_MY872231FX alias HPOJ_L7500
(host) #show network-printer status
```

```
Networked Printer Status
```

```
-----
```

Printer Name	Printer Alias	Status	Comment
-----	-----	-----	-----
usblp_Hewlett-Packard_HP_Color_LaserJet_CP3505_CNBJ8B1003	HPLJ_P3005	idle	enabled
usblp_HP_Officejet_Pro_L7500_MY872231FX	HPOJ_L7500	idle	enabled

### Command History

This command was introduced in AOS-W 3.4.

### Command Information

Platforms	Licensing	Command Mode
OmniAccess 4306 series	Base operating system	Enable mode.

## user-role

```
user-role <name>
  access-list {eth|mac|session} <acl> [ap-group <group>] [position <number>]
  bw-contract <name> [per-user] {downstream|upstream}
  captive-portal <profile>
  dialer <name>
  max-sessions <number>
  no ...
  pool {l2tp|pptp} <name>
  reauthentication-interval <minutes>
  session-acl <acl> [ap-group <group>] [position <number>]
  vlan {VLAN ID|VLAN name}
```

### Description

This command configures a user role.

### Syntax

Parameter	Description	Range	Default
<name>	Name of the user role.	—	—
access-list	Type of access control list (ACL) to be applied: <b>eth</b> : Ethernets ACL, configured with the <b>ip access-list eth</b> command. <b>mac</b> : MAC ACL, configured with the <b>ip access-list mac</b> command. <b>session</b> : Session ACL, configured with the <b>ip access-list session</b> command.	—	—
<acl>	Name of the configured ACL.		
ap-group	(Optional) AP group to which this ACL applies.	—	—
position	(Optional) Position of this ACL relative to other ACLs that you can configure for the user role. 1 is the top.	—	(last)
bandwidth-contract	Name of a bandwidth contract or rate limiting policy configured with the <b>aaa bandwidth-contract</b> command. The bandwidth contract must be applied to either downstream or upstream traffic.	—	—
downstream	Applies the bandwidth contract to traffic from the switch to the client.	—	—
per-user	Specifies that bandwidth contract is assigned on a per-user basis instead of a per-role basis. For example, if two users are active on the network and both are part of the same role with a 500 Kbps bandwidth contract, then each user is able to use up to 500 Kbps.	—	(per role)
upstream	Applies the bandwidth contract to traffic from the client to the switch.	—	—
captive-portal	Name of the captive portal profile configured with the <b>aaa authentication captive-portal</b> command.	—	—
dialer	If VPN is used as an access method, name of the VPN dialer configured with the <b>vpn-dialer</b> command. The user can login using captive portal and download the dialer. The dialer is a Windows application that configures the VPN client.	—	—
max-sessions	Maximum number of datapath sessions per user in this role.	0-65535	65535
no	Negates any configured parameter.	—	—

Parameter	Description	Range	Default
pool	If VPN is used as an access method, specifies the IP address pool from which the user's IP address is assigned: l2tp: When a user negotiates a Layer-2 Tunneling Protocol (L2TP)/IPsec session, specifies an address pool configured with the <b>ip local pool</b> command. pptp: When a user negotiates a Point-to-Point Tunneling Protocol (PPTP) session, specifies an address pool configured with the <b>pptp ip local pool</b> command.	—	—
<name>	Name of the L2TP or PPTP pool to be applied.	—	—
reauthentication-interval	Interval, in minutes, after which the client is required to reauthenticate.	0-4096, 0 to disable	0 (disabled)
session-acl	Session ACL configured with the <b>ip access-list session</b> command.	—	—
ap-group	(Optional) AP group to which this ACL applies.	—	—
position	(Optional) Position of this ACL relative to other ACLs that you can configure for the user role. 1 is the top.	—	(last)
vlan	Identifies the VLAN ID or VLAN name to which the user role is mapped. This parameter works only when using Layer-2 authentication such as 802.1x or MAC address, ESSID, or encryption type role mapping because these authentications occur before an IP address is assigned. If a user authenticates using a Layer-3 mechanism such as VPN or captive portal this parameter has no effect. <b>NOTE:</b> VLAN IDs and VLAN names cannot be listed together.	—	—

## Usage Guidelines

Every client in an Alcatel-Lucent user-centric network is associated with a user role. All wireless clients start in an initial role. From the initial role, clients can be placed into other user roles as they pass authentication.

## Example

The following command configures a user role:

```
(host) (config) #user-role new-user
    dialer default-dialer
    pool pptp-pool-1
```

## Command History

The command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the Policy Enforcement Firewall license.	Config mode on master switches

## vlan

```
vlan {<id> [<description>]| [<name>][<vlan-ids>]}
```

### Description

This command creates a VLAN with an identification number on the switch.

### Syntax

Parameter	Description	Range	Default
<id>	Identification number for the VLAN.	2-4094	1
<description>	Description of a VLAN ID.	1-32 characters; cannot begin with a numeric character	VLAN000x, where x is the ID number.
<name>	(Optional) Identification name of the VLAN. The VLAN name was created using the <b>vlan-name</b> command.	1-32 characters; a name cannot begin with a numeric character	VLAN<id>
<vlan-ids>	(Optional) List of VLAN IDs that are associated with this VLAN. If two or more IDs are listed, the VLAN needs to be specified first as a VLAN pool using the <b>vlan-name</b> command.	Existing VLAN IDs	1

### Usage Guidelines

Use the **interface vlan** command to configure the VLAN interface, including an IP address. Use the **vlan-name** command to create a named VLAN to set up a VLAN pool. A VLAN pool consists of a set of VLAN IDs which are grouped together to efficiently manage multi-switch networks from a single location.

### Example

The following command creates VLAN ID 27 with the description **myvlan** on the switch.

```
(host) (config) #vlan 27 myvlan
```

The following command associates the VLAN IDs 5, 12 and 100 with VLAN **guestvlan** on the switch.

```
vlan guestvlan 5,12,100
```

### Related Commands

```
(host) (config) #show vlan
```

### Command History

Release	Modification
AOS-W 3.0	Command available.
AOS-W 3.4	vlan-ids option available.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## vlan-name

```
vlan-name <name> [pool]
```

### Description

This command creates a named VLAN on the switch and can enable it as a pool. A named VLAN needs to be first created to assign one or a pool of VLAN IDs to that name.

### Syntax

Parameter	Description	Range
<name>	Name for the VLAN.	1–32 characters
[pool]	(Optional) Sets the named VLAN to be a pool.	—

### Usage Guidelines

Create a named VLAN so you can set up a VLAN pool. A VLAN pool consists of a set of VLAN IDs which are grouped together to efficiently manage multi-switch networks from a single location.

### Example

The following command creates a VLAN pool named **mytest** on the switch:

```
vlan-name mytest pool
```

### Related Commands

```
(host) (config) #show vlan
```

### Command History

Version	Modification
AOS-W 3.0	Command introduced.
AOS-W 3.4	the <b>pool</b> parameter was introduced.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## voip

```
voip [prioritization {disable|enable}]
```

### Description

This command enables Voice over IP (VoIP) traffic prioritization.

### Syntax

Parameter	Description	Default
<code>prioritization</code>	Allows voice traffic to be assigned automatically to the high priority queue.	disabled

### Usage Guidelines

This command allows VoIP traffic to be automatically assigned to the high-priority queue. When this command is enabled, you do not need to configure a session ACL to place voice traffic into the high-priority queue.

### Example

The following command enables VoIP traffic prioritization:

```
(host) (config) #voip prioritization
```

### Command History

The command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the Voice Services Module license	Config mode on master switch

## vpdn group l2tp

```
vpdn group l2tp
  client configuration {dns|wins} <ipaddr1> [<ipaddr2>]
  disable|enable
  l2tp tunnel hello <seconds>
  no ...
  ppp authentication {CACHE-SECURID|CHAP|EAP|MSCHAP|MSCHAPv2|PAP}
  ppp securid cache <minutes>
```

### Description

This command configures an L2TP/IPsec VPN connection.

### Syntax

Parameter	Description	Range	Default
client configuration	Configures parameters for the remote clients.	—	—
dns	Configures a primary and optional secondary DNS server.	—	—
wins	Configures a primary and optional secondary WINS server.	—	—
disable enable	Disables or enables termination of L2TP clients.	—	enabled
l2tp tunnel hello	Configures L2TP tunneling hello timeout, in seconds.	10-1440	60 seconds
no	Negates any configured parameter.	—	—
ppp authentication	Enables the protocols for PPP authentication. This list should match the L2TP configuration configured with the <b>vpn-dialer</b> command on the switch.	—	—
CACHE-SECURID	The switch caches Secure ID tokens so that the user does not need to reauthenticate each time a network connection is lost.	—	—
CHAP	Use CHAP with PPP authentication.	—	—
EAP	Use EAP-TLS with PPP authentication. Specify this protocol for Windows IPsec VPN clients that use Common Access Card (CAC) Smart Cards that contain user information and digital certificates.	—	—
MSCHAP	Use MSCHAP with PPP authentication.	—	—
MSCHAPv2	Use MSCHAPv2 with PPP authentication. This is the default for L2TP	—	—
PAP	Use PAP with PPP authentication.	—	—
ppp securid	If CACHE-SECURID is configured for PPP authentication, this specifies the time, in minutes, that the token is cached.	15-10080	1440 minutes

### Usage Guidelines

L2TP/IPsec relies on the PPP connection process to perform user authentication and protocol configuration. You specify the protocol used for PPP authentication and whether SecureID tokens are cached on the switch. Client addresses are assigned from a pool configured with the **ip local pool** command.

## Example

The following command configures virtual private dial-in networking:

```
(host) (coconfig) #vpdn group l2tp
  ppp authentication PAP
  client configuration dns 10.1.1.2
  client configuration wins 10.1.1.2
```

## Command History

The command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the VPN Server and/or Remote AP license	Config mode on master switches

## vpdn group pptp

```
vpdn group pptp
  client configuration {dns|wins} <ipaddr1> [<ipaddr2>]
  disable|enable
  no ...
  ppp authentication {MSCHAP|MSCHAPv2}
  pptp echo <seconds>
```

### Description

This command configures a PPTP VPN connection.

### Syntax

Parameter	Description	Range	Default
client configuration	Configures parameters for the remote clients.	—	—
dns	Configures a primary and optional secondary DNS server.	—	—
wins	Configures a primary and optional secondary WINS server.	—	—
disable enable	Disables or enables termination of PPTP clients.	—	enabled
no	Negates any configured parameter.	—	—
ppp authentication	Enables the protocols for PPP authentication. This list should match the PPTP configuration configured with the <b>vpn-dialer</b> command on the switch.	—	—
MSCHAP	Use MSCHAP with PPP authentication.	—	—
MSCHAPv2	Use MSCHAPv2 with PPP authentication. This is the default for L2TP	—	—
pptp echo	Time, in seconds, that the switch waits for a PPTP echo response from the client before considering the client to be down. The client is disconnected if it does not respond within this interval.	10-300	60 seconds

### Usage Guidelines

PPTP connections require user-level authentication through a PPP authentication protocol (MSCHAPv2 is the currently-supported method.) Client addresses are assigned from a pool configured with the **pptp** command.

### Example

The following command configures virtual private dial-in networking:

```
vpdn group pptp
  ppp authentication MSCHAPv2
  client configuration dns 10.1.1.2
```

client configuration wins 10.1.1.2

## Command History

The command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the VPN Server license	Config mode on master switches

## vpn-dialer

```
vpn-dialer <name>
  enable dnetclear|l2tp|pptp|securid_newpinmode|wirednowifi
  ike {authentication {pre-share <key>|rsa-sig}|encryption {3des|des}|
  group {1|2}|hash {md5|sha}|lifetime [<seconds>]}
  ipsec {encryption {esp-3des|esp-des}|hash {esp-md5-hmac|esp-sha-hmac}|
  lifetime [<seconds>]|pfs {group1|group2}}
  no {enable...|ipsec...|ppp...}
  ppp authentication {cache-securid|chap|mschap|mschapv2|pap}
```

### Description

This command configures the VPN dialer.

### Syntax

Parameter	Description	Range	Default
<name>	Name that identifies this VPN dialer configuration.	—	—
enable	Enables dialer operations:	—	—
dnetclear	Enables “split tunneling” functionality so that traffic destined for the internal network is tunneled while traffic for the Internet is not. This option is not recommended for security reasons.	—	disabled
l2tp	Allows the dialer to negotiate a Layer-2 Tunneling Protocol (L2TP)/IPsec tunnel with the switch.	—	enabled
pptp	Allows the dialer to negotiate a Point-to-Point Tunneling Protocol (PPTP) with the switch.	—	disabled
securid_newpinmode	Supports SecurID new and next pin mode.	—	disabled
wirednowifi	Allows the dialer to detect when a wired network connection is in use, and shuts down the wireless interface.	—	disabled
ike	Configures internet key exchange (IKE) protocol. This configuration must match the IKE policy configured with the <b>crypto isakmp policy</b> command on the switch.	—	—
authentication	Specifies whether preshared keys or RSA signatures are used for IKE authentication.	pre-share   rsa-sig	pre-share
encryption	Specifies the IKE encryption protocol, either DES or 3DES.	3des   des	3des
group	Specifies the Diffie-Hellman group, either 1 or 2.	1   2	2
hash	Specifies the HASH algorithm, ether SHA or MD5.	md5   sha	sha
lifetime	Specifies how long an IKE security association lasts, in seconds.	300-86400	28800 seconds
ipsec	Configures IPsec. This configuration must match the IPsec parameters configured with the <b>crypto dynamic-map</b> and <b>crypto ipsec</b> commands on the switch.	—	—
encryption	Specifies the encryption type for IPsec, either DES or 3DES.	esp-3des   esp-des	esp-3des

Parameter	Description	Range	Default
hash	Specifies the hash algorithm used by IPsec, either MD5 or SHA.	esp-md5-hmac   esp-sha-hmac	esp-sha-hmac
lifetime	Specifies how long an IPsec security association lasts, in seconds.	300-86400	7200 seconds
pfs	Specifies the IPsec Perfect Forward Secrecy (PFS) mode, either group 1 or group 2.	group1   group2	group2
no	Negates any configured parameter.	—	—
ppp authentication	Enables the protocols for PPP authentication. This list should match the L2TP or PPTP configuration configured with the <b>vpdn</b> command on the switch.	—	—
cache-secure-id	The switch caches Secure ID tokens so that the user does not need to reauthenticate each time a network connection is lost.	—	disabled
chap	Use CHAP with PPP authentication.	—	enabled
mschap	Use MSCHAP with PPP authentication.	—	enabled
mschapv2	Use MSCHAPv2 with PPP authentication.	—	enabled
pap	Use PAP with PPP authentication.	—	enabled

## Usage Guidelines

A VPN dialer is a Windows application that configures a Windows client for use with the VPN services in the switch. When VPN is used as an access method, a user can login using captive portal and download a VPN dialer. You can customize a VPN dialer for a user role configured with the **user-role** command. After the user authenticates via captive portal, a link appears to allow download of the VPN dialer if a dialer is configured for the user role.

## Example

The following command configures a VPN dialer:

```
(host) (config) #vpn-dialer default-dialer
ike authentication pre-share f00xYz123BcA
```

## Command History

The command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the VPN Server license.	Config mode on master switches

## vrrp

```
vrrp <id>
  advertise <interval>
  authentication <password>
  description <text>
  ip address <ipaddr>
  no...
  preempt
  priority <level>
  shutdown
  tracking interface {fastethernet <slot>/<port>|gigabitethernet <slot>/<port>}
    {sub <value>}
  tracking master-up-time <duration> add <value>
  tracking vlan <vlanid> {sub <value>}
  tracking vrrp-master-state <vrid> add <value>
  vlan <vlanid>
```

### Description

This command configures the Virtual Router Redundancy Protocol (VRRP).

### Syntax

Parameter	Description	Range	Default
id	Number that uniquely identifies the VRRP instance, also known as the VRID. This number should match the VRID on the other member of the redundant pair. For ease in administration, you should configure this with the same value as the VLAN ID. After you configure the VRID, the command platform enters VRRP mode. From here, you can access the remaining VRRP commands.	1-255	—
advertise	Specifies the time, in seconds, between successive VRRP advertisements sent by the current <i>master</i> . Alcatel-Lucent recommends that you use the default value.	1-60 seconds	1 second (1s=1000ms)
authentication	Configure an optional password of up to eight characters to be used to authenticate VRRP peers in their advertisements. The password must be the same on both members of the redundant pair. The password is sent in plain-text and therefore should not be treated as a security measure. Rather, the purpose of the password is to guard against misconfigurations in the event that other VRRP devices exist on the same network.	8 characters	—
description	Configure an optional text string to describe the VRRP instance.	1-80 characters	—

Parameter	Description	Range	Default
ip address	Configure the virtual IP address that will be owned by the elected VRRP <i>master</i> . Use the same IP address on each member of the redundant pair. This IP address will be redundant - it will be active on the VRRP master, and will become active on the VRRP backup in the event that the VRRP master fails. The IP address must be unique; the IP address cannot be the loopback address of the switch. Only IPv4 address formats are supported.	—	—
no	Negates all configured VRRP parameters.	—	—
preempt	Preempt mode allows a switch to take over the role of master if it detects a lower priority switch currently acting as master. Alcatel-Lucent recommends that you use the default setting to avoid excessive interruption to users or “flapping” if a problematic switch is cycling up and down.	—	disabled
priority	Defines the priority level of the VRRP instance for the switch. This value is used in the election mechanism for the master. A higher number specifies a higher priority. The default priority setting is adequate for most networks.	100	1-255
shutdown	Administratively shutdown VRRP. When down, VRRP is not active, although the switch maintains the configuration information. To start the VRRP instance, use <b>no shutdown</b> .	—	enabled (VRRP is down)
tracking interface	Configures VRRP tracking based on Layer-2 interface state transitions. You can configure this on Fast Ethernet or Gigabit Ethernet interfaces. You can track a combined maximum of 16 VLAN and Layer-2 interfaces.	—	—
<slot>	<slot> is always 1 except for the OmniAccess 6000 switch, where the slots can be 0, 1, 2, or 3.	—	—
<port>	Number assigned to the network interface embedded in the switch or in the line card installed in the OmniAccess 6000 switch. Port numbers start at 0 from the left-most position.	—	—
sub	Decreases the priority of the VRRP instance by the specified amount. When the interface comes up again, the value is restored to the previous priority level. The combined priority and tracking values cannot exceed 255. If the priority value exceeds 255, the switch displays an error message.	0-255	—
tracking master-up-time duration	Monitors how long the switch has been master for the VRRP instance.	0-1440 minutes	—
tracking master-up-time add	Instructs the switch to add the specified value to the existing priority level. The combined priority and tracking values cannot exceed 255. If the priority value exceeds 255, the switch displays an error message similar to the following: Error: Vrrp 30 priority + tracking value exceeds 255	0-255	—

Parameter	Description	Range	Default
tracking vlan	Configures VRRP tracking based on VLAN state transitions. You can track a combined maximum of 16 VLAN and Layer-2 interfaces.	—	—
sub	Decreases the priority of the VRRP instance by the specified amount. When the VLAN comes up again, the value is restored to the previous priority level. The combined priority and tracking values cannot exceed 255. If the priority value exceeds 255, the switch displays an error message.	0-255	—
vrrp-master-state	Specifies the VRID to use for tracking the state of the VRRP master switch.	1-255	—
vrrp-master-state add	Instructs the switch to add the specified value to the existing priority level. The combined priority and tracking values cannot exceed 255. If the priority value exceeds 255, the switch displays an error message similar to the following: Error: Vrrp 30 priority + tracking value exceeds 255	0-255	—
vlan	Specifies the VLAN ID of the VLAN on which VRRP will run.	1-4094	—

## Usage Guidelines

Use this command to set parameters for VRRP on the switch. The default VRRP parameters can be left for most implementations.

You can use a combination of numbers, letters, and characters to create the authentication password and the VRRP description. To include a space in the password or description, enter quotation marks around the string. For example, to create the password Floor 1, enter “Floor 1” at the prompt.

To change the existing password or description, enter the command with a different string. The new password or description takes affect immediately.

To unconfigure the existing password or description, enter “” at the prompt. If you update the password on one switch, you must update the password on the redundant member pair.

## Interface Tracking

You can track multiple VRRP instances to prevent asymmetric routing and dynamically change the VRRP master to adapt to changes in the network. VRRP interface tracking can alter the priority of the VRRP instance based on the state of a particular VLAN or Layer-2 interface. The priority of the VRRP instance can increase or decrease based on the operational state of the specified interface. For example, interface transitions (up/down events) can trigger a recomputation of the VRRP priority, which can change the VRRP master depending on the resulting priority. You can track a combined maximum of 16 interfaces.

You must enable preempt mode to allow a switch to take over the role of master if it detects a lower priority switch currently acting as master

## Example

The following command configures a priority of 105 for VRRP ID (VRID) 30:

```
(host) (config) #vrrp 30
  priority 105
```

The following commands configure VLAN interface tracking and assumes the following:

- You have two switches, a primary and a backup.
- The configuration highlights the parameters for interface tracking. You may have other parameters configured for VRRP.

#### Primary Configuration

```
vrrp 10
  vlan 10
  ip address 10.200.22.254
  priority 105
  preempt
  tracking vlan 20 sub 10

vrrp 20
  vlan 20
  ip address 10.200.22.254
  preempt
  priority 105
  tracking vlan 10 sub 10

vrrp 30
  vlan 30
  ip address 10.200.22.254
  preempt
  priority 105
  tracking vlan 20 sub 10
```

#### Backup Configuration

```
vrrp 10
  vlan 10
  ip address 10.200.22.254
  priority 100
  preempt
  tracking vlan 20 sub 10

vrrp 20
  vlan 20
  ip address 10.200.22.254
  preempt
  priority 100
  tracking vlan 10 sub 10

vrrp 30
  vlan 30
  ip address 10.200.22.254
  preempt
  priority 100
  tracking vlan 20 sub 10
```

If VLAN 20 goes down, VRRP 20 automatically fails over, VRRP 10 and VRRP 30 would drop their priority to 95, causing a failover to the backup switch. Once VLAN 20 comes back up, the primary switch restores the VRRP priority to 105 for all VRRP IDs and resumes the master VRRP role.

## Command History

Version	Modification
AOS-W 1.0	Command introduced
AOS-W 3.3	The <b>tracking interface</b> and <b>tracking vlan</b> parameters were introduced.
AOS-W 3.3.2	The <b>add</b> option was removed from the <b>tracking interface</b> and <b>tracking vlan</b> parameters.

## Command Information

Platforms	Licensing	Command Mode
All platforms	This command requires the VPN Server license.	Config mode on master switches

## web-server

```
web-server
  captive-portal-cert <name>
  ciphers {high|low|medium}
  mgmt-auth [certificate] [username/password]
  no ...
  ssl-protocol [sslv2] [sslv3] [tlsv1]
  session-timeout <session-timeout>
  switch-cert <name>
```

### Description

This command configures the switch's web server.

### Syntax

Parameter	Description	Range	Default
captive-portal-cert	Name of the server certificate associated with captive portal. Use the <b>show crypto-local pki ServerCert</b> command to see the server certificates installed in the switch.	—	default
ciphers	Configures the strength of the cipher suite: <b>high</b> : encryption keys larger than 128 bits <b>low</b> : 56 or 64 bit encryption keys <b>medium</b> : 128 bit encryption keys	high, low, medium	high
mgmt-auth	Authentication method for the management user; you can choose to use either username/password or certificates, or both username/password and certificates.	username/ password, certificate	username/ password
no	Negates any configured parameter.	—	—
session-timeout <session-timeout>	Specifies the amount of time after which the WebUI session times out and requires login for continued access.	30-3600 seconds	900 seconds
ssl-protocol	Secure Sockets Layer (SSL) or Transport Layer Security (TLS) protocol version used for securing communication with the web server: SSLv3 TLSv1	sslv3, tlsv1	sslv3, tlsv1
switch-cert	Name of the server certificate associated with WebUI access. Use the <b>show crypto-local pki ServerCert</b> command to see the server certificates installed in the switch.	—	default

### Usage Guidelines

There is a default server certificate installed in the switch, however this certificate does not guarantee security in production networks. Alcatel-Lucent strongly recommends that you replace the default certificate with a custom certificate issued for your site by a trusted Certificate Authority (CA). See the *AOS-W User Guide* for more information about how to generate a Certificate Signing Request (CSR) to submit to a CA and how to import the signed certificate received from the CA into the switch. After importing the signed certificate into the switch, use the **web-server** command to specify the certificate for captive portal or WebUI access. If you need to specify a different certificate for captive portal or WebUI access, use the **no** command to revert back to the default certificate before you specify the new certificate (see the Example section).

You can use client certificates to authenticate management users. If you specify certificate authentication, you need to configure certificate authentication for the management user with the **mgmt-user webui-cacert** command.

## Example

The following commands configure WebUI access with client certificates only, and specify the server certificate for the switch:

```
(host) (config) #web-server mgmt-auth certificate
  switch-cert ServerCert1
  mgmt-user webui-cacert serial 11111111 web-admin root
```

To specify a different server certificate, use the **no** command to revert back to the default certificate *before* you specify the new certificate:

```
(host) (config) #web-server mgmt-auth certificate
  switch-cert ServerCert1
  no switch-cert
  switch-cert ServerCert2
```

## Command History

Version	Modification
AOS-W 3.0	Command introduced
AOS-W 3.1	The <b>mgmt-auth</b> parameter was introduced.
AOS-W 3.2	The <b>captive-portal-cert</b> parameter was introduced.

## Command Information

Platforms	Licensing	Command Mode
All platforms	The <b>web-server ciphers</b> and <b>web-server ssl-protocol</b> commands require the PEF license	Config mode on master switches

# whoami

whoami

## Description

This command displays information about the current user logged into the switch.

## Syntax

No parameters.

## Usage Guidelines

Use this command to display the name and role of the user who is logged into the switch for this session.

## Example

The following command displays information about the user logged into the switch:

```
(host) #whoami
```

## Command History

This command was available in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes on master and local switches

## wlan dot11k-profile

```
wlan
wlan dot11k <profile>
    bcn-measurement-mode {active|beacon-table|passive}
    clone <profile>
    dot11k-enable
    force-disassoc
    no ...
```

### Description

Configure a 802.11k radio profile.

### Syntax

Parameter	Description	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	“default”
bcn-measurement-mode	Configures an <b>active</b> , <b>beacon-table</b> or <b>passive</b> beacon measurement mode for the profile.	beacon-table
active	Enables <b>active</b> beacon measurement mode. In this mode, the client sends a probe request to the broadcast destination address on all supported channels, sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report.  <b>NOTE:</b> If the station doesn't support active measurement mode, it returns a Beacon Measurement Report with the <i>Incapable</i> bit set in the <i>Measurement Report Mode</i> field.	—
beacon-table	Enables <b>beacon-table</b> beacon measurement mode. In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. This is the default beacon measurement mode.  <b>NOTE:</b> If a station doesn't support beacon-table able measurement mode, it returns a Beacon Measurement Report with the <i>Incapable</i> bit set in the <i>Measurement Report Mode</i> field.	—
passive	Enables <b>passive</b> beacon measurement mode. In this mode, the client sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report.  <b>NOTE:</b> If a station doesn't support passive measurement mode, it returns a Beacon Measurement Report with the <i>Incapable</i> bit set in the <i>Measurement Report Mode</i> field.	—
clone <profile>	Copy settings from another specified 802.11k profile.	—
dot11k-enable	Enables the 802.11K feature. This feature is disabled by default.	Disabled

Parameter	Description	Default
force-dissasoc	<p>This feature allows the AP to forcefully disassociate “on-hook” voice clients (clients that are not on a call) after period of inactivity.</p> <p>Without the forced disassociation feature, if an AP has reached its call admission control limits and an on-hook voice client wants to start a new call, that client may be denied. If forced disassociation is enabled, those clients can associate to a neighboring AP that can fulfil their QoS requirements.</p> <p>This feature is disabled by default.</p>	Disabled
no	Negates or removes any configured parameter	

## Usage Guidelines

In a 802.11k network, if the AP with the strongest signal is reaches its maximum capacity, clients may connect to an underutilized AP with a weaker signal. A 802.11k profile can assigned to each virtual AP.

## Example

The following command enable the 802.11k feature on the 802.11k profile:

```
(host) (config) #wlan dot11k-profile default
(host) (802.11K Profile "default") #dot11k-enable
```

## Command History

This command was introduced in AOS-W 3.4.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on master switches

## wlan edca-parameters-profile

```
wlan
wlan edca-parameters-profile {ap|station} <profile>
    {background | best-effort | video | voice}
    [acm][aifsn <number>] [ecw-max <exponent> [ecw-min <exponent>] [txop <number>]
    [clone <profile>
```

### Description

This command configures an enhanced distributed channel access (EDCA) profile for APs or for clients (stations).

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
background	Configures the background queue.	—	—
best-effort	Configures the best-effort queue.	—	—
video	Configures the video queue.	—	—
voice	Configures the voice queue.	—	—
acm	Specifies mandatory admission control. The client reserves the access category through traffic specification (TSPEC) signaling. Enter 1 to enable, 0 to disable.	0, 1	0 (disabled)
aifsn	Arbitrary inter-frame space number.	1-15	0
ecw-max	The exponential (n) value of the maximum contention window size, as expressed by $2^n-1$ . A value of 4 computes to $2^4-1 = 15$ .	1-15	0
ecw-min	The exponential (n) value of the minimum contention window size, as expressed by $2^n-1$ . A value of 4 computes to $2^4-1 = 15$ .	0-15	0
txop	Transmission opportunity, in units of 32 microseconds. Divide the desired transmission duration by 32 to determine the value to configure. For example, for a transmission duration of 3008 microseconds, enter 94 (3008/32).	0-2047	0
clone	Name of an existing EDCA profile from which parameter values are copied.	—	—

### Usage Guidelines

EDCA profiles are specific either to APs or clients. You apply an EDCA profile to a specific SSID profile. use this command only under the guidance of your Alcatel-Lucent representative.

The following are the default values configured for APs:

Access Category	ecw-min	ecw-max	aifsn	txop	acm
best-effort	4	6	3	0	No
background	4	10	7	0	No
video	3	4	1	94	No

Access Category	ecw-min	ecw-max	aifsn	txop	acm
voice	2	3	1	47	No

The following are the default values configured for clients:

Access Category	ecw-min	ecw-max	aifsn	txop	acm
best-effort	4	10	3	0	No
background	4	10	7	0	No
video	3	4	2	94	No
voice	2	3	2	47	No

### Example

The following command configures an EDCA profile for APs:

```
(host) (config) #wlan edca-parameters-profile ap edca1
    best-effort ecw-min 15 ecw-max 15 aifsn 15 txop 100 acm 1
```

### Command History

This command was introduced in AOS-W 3.1.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Voice Services Module license	Config mode on master switches

## wlan ht-ssid-profile

```
wlan ht-ssid-profile <profile>
  40MHz-enable
  allow-weak-encryption
  clone <profile>
  high-throughput-enable
  legacy-stations
  max-rx-a-mpdu-size {8191|16383|32767|65535}
  max-tx-a-mpdu-size <bytes>
  min-mpdu-start-spacing {0|.25|.5|1|2|4|8|16}
  mpdu-agg
  no...
  short-guard-intvl-40MHz
  supported-mcs-set <mcs-list>
```

### Description

This command configures a high-throughput SSID profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
40MHz-enable	Enables or disables the use of this high-throughput SSID in 40 MHz mode.	—	enabled
allow-weak-encryption	Enabling the use of TKIP or WEP for unicast traffic disables A-MPDU aggregation but allows the association to proceed. Disabling this prevents stations using TKIP or WEP for unicast traffic from associating at all. It is disabled by default.	—	disabled
clone	Name of an existing high-throughput SSID profile from which parameter values are copied.	—	—
high-throughput-enable	Determines if this high-throughput SSID allows high-throughput (802.11n) stations to associate. Enabling high-throughput in an ht-ssid-profile enables Wi-Fi Multimedia (WMM) base features for the associated SSID.	—	enabled
legacy-stations	Controls whether or not legacy (non-HT) stations are allowed to associate with this SSID. By default, legacy stations are allowed to associate. This setting has no effect on a BSS in which HT support is not available.	—	enabled
max-rx-a-mpdu-size	Controls the maximum size, in bytes, of an Aggregated-MAC Packet Data Unit (A-MPDU) that can be received on this high-throughput SSID.	8191/ 16383/ 32767/ 65535	65535
8191	Maximum size of 8191 bytes.		
16383	Maximum size of 16383 bytes.		
32767	Maximum size of 32767 bytes.		
65535	Maximum size of 65535 bytes.		
max-tx-a-mpdu-size	Controls the maximum size, in bytes, of an A-MPDU that can be sent on this high-throughput SSID.	1576- 65535	65535

Parameter	Description	Range	Default
min-mpdu-start-spacing	Minimum time between the start of adjacent MDPUs within an aggregate MDPU in microseconds.	0/.25/.5/1/2/4/8/16	0
0	No restriction on MDPU start spacing.		
.25	Minimum time of .25 μsec.		
.5	Minimum time of .5 μsec.		
1	Minimum time of 1 μsec.		
2	Minimum time of 2 μsec.		
4	Minimum time of 4 μsec.		
8	Minimum time of 8 μsec.		
16	Minimum time of 16 μsec.		
mpdu-agg	Enables or disables MAC protocol data unit (MDPU) aggregation.	—	enabled
no	Negates any configured parameter.	—	—
short-guard-intvl-40MHz	Enables or disables use of short guard interval in 40 MHz mode of operation.		enabled
supported-mcs-set	Comma-separated list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this high-throughput SSID.	0-15	0-15

## Usage Guidelines

The ht-ssid-profile configures the high-throughput SSID.

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices.

De-aggregation of MAC Service Data Units (A-MSDUs) is supported on the OmniAccess 4504/4604/4704 switch and the OmniAccess Supervisor Card III (OmniAccess Supervisor Card III) with a maximum frame transmission size of 4k bytes; however, this feature is always enabled and is not configurable. Aggregation is not currently supported.

## Example

The following command configures the maximum size of a received aggregate MDPU to be 8191 bytes for the high-throughput SSID named “htcorpnet:”

```
(host) (config) #wlan ht-ssid-profile htcorpnet
max-rx-a-mpdu-size 8191
```

## Command History

Version	Description
AOS-W 3.3	Command introduced
AOS-W 3.3.1	The <b>legacy-stations</b> parameter was introduced

Version	Description
AOS-W 3.3.2	De-aggregation of MAC Service Data Units (A-MSDUs) on the OmniAccess 4504/4604/4704 and the OmniAccess Supervisor Card III (OmniAccess Supervisor Card III) was introduced

```

### Description

This command configures an SSID profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
902il-compatibility-mode	(For clients using NTT DoCoMo 902iL phones only) When enabled, the switch does not drop packets from the client if a small or old initialization vector value is received. (When TKIP or AES is used for encryption and TSPEC is enabled, the phone resets the value of the initialization vector after add/delete TSPEC.) <b>NOTE:</b> The Voice Services Module license must be installed.	—	disabled

Parameter	Description	Range	Default
a-basic-rates	List of supported 802.11a rates, in Mbps, that are advertised in beacon frames and probe responses.	6, 9, 12, 18, 24, 36, 48, 54 Mbps	6, 12, 24 Mbps
a-tx-rates	Set of 802.11a rates at which the AP is allowed to send data. The actual transmit rate depends on what the client is able to handle, based on information sent at the time of association and on the current error/loss rate of the client.	6, 9, 12, 18, 24, 36, 48, 54 Mbps	6, 9, 12, 18, 24, 36, 48, 54 Mbps
ageout	Time, in seconds, that a client is allowed to remain idle before being aged out.		1000 seconds
battery-boost	Converts multicast traffic to unicast before delivery to the client, thus allowing you to set a longer DTIM interval. The longer interval keeps associated wireless clients from activating their radios for multicast indication and delivery, leaving them in power-save mode longer and thus lengthening battery life. <b>NOTE:</b> The Voice Services Module license must be installed.	—	disabled
clone	Name of an existing SSID profile from which parameter values are copied.	—	—
deny-bcast	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID.	—	disabled
disable-probe-retry	Enable or disable battery MAC level retries for probe response frames. By default this parameter is enabled, which mean that MAC level retries for probe response frames is disabled.		Enabled
dtim-period	Specifies the interval, in milliseconds, between the sending of Delivery Traffic Indication Messages (DTIMs) in the beacon. This is the maximum number of beacon cycles before unacknowledged network broadcasts are flushed. When using wireless clients that employ power management features to sleep, the client must revive at least once during the DTIM period to receive broadcasts.		1
edca-parameters-profile	Name of the enhanced distributed channel access (EDCA) profile that applies to this SSID. <b>NOTE:</b> This profile requires the Voice Services Module license in the switch. Configure this parameter only under the guidance of your Alcatel-Lucent representative.	—	—
ap sta	Assigns the specified EDCA profile to AP or station (client).	—	—
ssid	Name that uniquely identifies the Service Set Identifier (SSID). The SSID can be up to 31 characters.	—	“corp-ap”
g-basic-rates	List of supported 802.11b/g rates that are advertised in beacon frames and probe responses.	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps	1, 2 Mbps
g-tx-rates	Set of 802.11b/g rates at which the AP is allowed to send data. The actual transmit rate depends on what the client is able to handle, based on information sent at the time of association and on the current error/loss rate of the client.	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps
hide-ssid	Enables or disables hiding of the SSID name in beacon frames. Note that hiding the SSID does very little to increase security.	—	disabled

Parameter	Description	Range	Default
ht-ssid-profile	Name of high-throughput SSID profile to use for configuring high-throughput support. See “wlan ht-ssid-profile” on page 1003.	—	“default”
local-probe-response	Enable or disable local probe response on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients’ probe requests. If this option is disabled, then the switch sends the 802.11 probe responses.	—	enabled
max-clients	Maximum number of wireless clients for the AP.	0-256	64
max-retries	Maximum number of retries allowed for the AP to send a frame.	0-15	4
max-tx-fail	Maximum transmission failures allowed before the client gives up.		0
mcast-rate-opt	Enables or disables scanning of all active stations currently associated to an AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate. <b>NOTE:</b> Do not enable this parameter unless instructed to do so by your Alcatel-Lucent representative.	—	disabled
no	Negates any configured parameter.	—	—
opmode	The layer-2 authentication and encryption to be used on this ESSID to protect access and ensure the privacy of the data transmitted to and from the network.	(see following )	opensyste m
dynamic-wep	WEP with dynamic keys.		
opensystem	No authentication and encryption.		
static-wep	WEP with static keys.		
wpa-aes	WPA with AES encryption and dynamic keys using 802.1x.		
wpa-psk-aes	WPA with AES encryption using a preshared key.		
wpa-psk-tkip	WPA with TKIP encryption using a preshared key.		
wpa-tkip	WPA with TKIP encryption and dynamic keys using 802.1x.		
wpa2-aes	WPA2 with AES encryption and dynamic keys using 802.1x.		
wpa2-psk-aes	WPA2 with AES encryption using a preshared key.		
wpa2-psk-tkip	WPA2 with TKIP encryption using a preshared key.		
wpa2-tkip	WPA2 with TKIP encryption and dynamic keys using 802.1x.		
hide-ssid	Enables or disables hiding of the SSID name in beacon frames. Note that hiding the SSID does very little to increase security.	—	disabled
ht-ssid-profile	Name of high-throughput SSID profile to use for configuring high-throughput support. See “wlan ht-ssid-profile” on page 1003.	—	“default”
local-probe-response	Enable or disable local probe response on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients’ probe requests. If this option is disabled, then the switch sends the 802.11 probe responses.	—	enabled
max-clients	Maximum number of wireless clients for the AP.	0-256	64
max-retries	Maximum number of retries allowed for the AP to send a frame.	0-15	4
max-tx-fail	Maximum transmission failures allowed before the client gives up.		0

Parameter	Description	Range	Default
mcast-rate-opt	Enables or disables scanning of all active stations currently associated to an AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate. Do not enable this parameter unless instructed to do so by your Alcatel-Lucent representative.	—	disabled
no	Negates any configured parameter.	—	—
opmode	The layer-2 authentication and encryption to be used on this ESSID to protect access and ensure the privacy of the data transmitted to and from the network.	(see following)	opensys tem
dynamic-wep	WEP with dynamic keys.		
opensystem	No authentication and encryption.		
static-wep	WEP with static keys.		
wpa-aes	WPA with AES encryption and dynamic keys using 802.1x.		
wpa-psk-aes	WPA with AES encryption using a preshared key.		
wpa2-psk-tkip	WPA2 with TKIP encryption using a preshared key.		
wpa2-tkip	WPA2 with TKIP encryption and dynamic keys using 802.1x.		
xSec	Encryption and tunneling of Layer-2 traffic between the switch and wired or wireless clients, or between switches. To use xSec encryption, you must use a RADIUS authentication server. For clients, you must install the Funk Odyssey client software. Requires installation of the xSec license. For xSec between switches, you must install an xSec license in each switch.		
rts-threshold	Wireless clients transmitting frames larger than this threshold must issue Request to Send (RTS) and wait for the AP to respond with Clear to Send (CTS). This helps prevent mid-air collisions for wireless clients that are not within wireless peer range and cannot detect when other wireless clients are transmitting.		2333 bytes
short-preamble	Enables or disables short preamble for 802.11b/g radios. Network performance may be higher when short preamble is enabled. In mixed radio environments, some 802.11b wireless client stations may experience difficulty associating with the AP using short preamble. To use only long preamble, disable short preamble. Legacy client devices that use only long preamble generally can be updated to support short preamble.	—	enabled
ssid-enable	Enables/disables this SSID.	—	enabled
strict-svp	Enable Strict Spectralink Voice Protocol (SVP)	—	disabled
wepkey1 - wepkey4	Static WEP key associated with the key index. Can be 10 or 26 hex characters in length.	—	—
weptxkey	Key index that specifies which static WEP key is to be used. Can be 1, 2, 3, or 4.	1, 2, 3, 4	1
wmm	Enables or disables WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function (EDCF). WMM provides prioritization of specific traffic relative to other traffic in the network.	—	disabled
wmm-be-dscp	DSCP value used to map WMM best-effort traffic.	0-255	24

Parameter	Description	Range	Default
wmm-bk-dscp	DSCP used to map WMM background traffic.	0-255	8
wmm-ts-min-inact-int	Specifies the minimum inactivity time-out threshold of WMM traffic. This setting is useful in environments where low inactivity interval time-outs are advertised, which may cause unwanted timeouts.	0-3,600,000	0 milliseconds
wmm-uapsd	Enable Wireless Multimedia (WMM) UAPSD powersave.	—	enabled
wmm-vi-dscp	DSCP used to map WMM video traffic.	0-255	40
wmm-vo-dscp	DSCP used to map WMM voice traffic.	0-255	56
wpa-hexkey	WPA pre-shared key (PSK).	—	—
wpa-passphrase	WPA passphrase with which to generate a pre-shared key (PSK).	—	—

## Usage Guidelines

The SSID profile configures the SSID.

AP configuration settings related to the IEEE 802.11n draft standard are configurable for Alcatel-Lucent's OAW-AP-120 series access points, which are IEEE 802.11n draft standard compliant devices.

Default WMM mappings exist for all SSIDs. After you customize an WMM mapping and apply it to the SSID, the switch overwrites the default mapping values and uses the user-configured values.

## Multicast Rate Optimization

The Multicast Rate Optimization feature dynamically selects the rate for sending broadcast/multicast frames on any BSS. This feature determines the optimal rate for sending broadcast and multicast frames based on the lowest of the unicast rates across all associated clients.

When the Multicast Rate Optimization option (**mcast-rate-opt**) is enabled, the switch scans the list of all associated stations in that BSS and finds the lowest transmission rate as indicated by the rate adaptation state for each station. If there are no associated stations in the BSS, it selects the lowest configured rate as the transmission rate for broadcast and multicast frames.

This feature is disabled by default. Multicast Rate Optimization applies to broadcast and multicast frames only. 802.11 management frames are not affected by this feature and will be transmitted at the lowest configured rate.

The Multicast Rate Optimization feature should only be enabled on a BSS where all associated stations are sending or receiving unicast data. If there is no unicast data to or from a particular station, then the rate adaptation state may not accurately reflect the current sustainable transmission rate for that station. This could result in a higher packet error rate for broadcast/multicast packets at that station.

## Example

The following command configures an SSID for WPA2 AES authentication:

```
(host) (config) #wlan ssid-profile corpnet
  ssid Corpnet
  opmode wpa2-aes
```

## Command History

Release	Modification
AOS-W 3.0	Command introduced
AOS-W 3.2	The <b>wmm-ts-min-inact-int</b> parameter was introduced. The <b>wpa2-preauth</b> parameter was removed,
AOS-W 3.3	Support for the high-throughput IEEE 802.11n draft standard was introduced including the <b>ht-ssid-profile</b> parameter and various rate changes.
AOS-W 3.3.1	Support for configurable WMM AC mapping was introduced including the <b>wmm-be-dscp</b> , <b>wmm-bk-dscp</b> , <b>wmm-vi-dscp</b> , and <b>wmm-vo-dscp</b> parameters.
AOS-W 3.4	The <b>deny-bcast</b> and <b>disable-probe-retry</b> parameters were introduced. The <b>drop-mcast</b> parameter was deprecated.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system except for the noted parameters	Config mode on master switches

## wlan traffic-management-profile

```
wlan traffic-management-profile <profile>
  bw-alloc virtual-ap <virtual-ap> share <percent>
  clone <profile>
  no ...
  report-interval <minutes>
  shaping-policy default-access|fair-access|preferred-access
```

### Description

This command configures a traffic management profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
bw-alloc	Minimum bandwidth, as a percentage of available bandwidth, allocated to an SSID when there is congestion on the wireless network. An SSID can use all available bandwidth if no other SSIDs are active.		
virtual-ap	Name of the virtual AP profile which pertains to the SSID.	—	—
share	Percentage of available bandwidth allocated to this SSID.	0-100	—
clone	Name of an existing traffic management profile from which parameter values are copied.	—	—
no	Negates any configured parameter.	—	—
report-interval	Number of minutes between bandwidth usage reports.		5 minutes
shaping-policy	Define Station Shaping Policy This feature has the following three options: <ul style="list-style-type: none"><li>• <b>default-access:</b> Traffic shaping is disabled, and client performance is dependent on MAC contention resolution. This is the default traffic shaping setting.</li><li>• <b>fair-access:</b> Each client gets the same airtime, regardless of client capability and capacity. This option is useful in environments like a training facility or exam hall, where a mix of 802.11a/g, 802.11g and 802.11n clients need equal to network resources, regardless of their capabilities. The <b>bw-alloc</b> parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when there is congestion on the wireless network. You must set traffic shaping to <b>fair-access</b> to use this bandwidth allocation value for an individual virtual AP.</li><li>• <b>preferred-access:</b> High-throughput (802.11n) clients do not get penalized because of slower 802.11a/g or 802.11b transmissions that take more air time due to lower rates. Similarly, faster 802.11a/g clients get more access than 802.11b clients.</li></ul>	default-access fair-access preferred-access	default-access

## Usage Guidelines

The traffic management profile allows you to allocate bandwidth to SSIDs. When you enable the band-steering feature, an AP keeps track of all BSSIDs active on a radio, all clients connected to the BSSID, and 802.11a/g, 802.11b, or 802.11n capabilities of each client. Every sampling period, airtime is allocated to each client, giving it opportunity to get and receive traffic. The specific amount of airtime given to an individual client is determined by;

- Client capabilities (802.11a/g, 802.11b or 802.11n)
- Amount of time the client spent receiving data during the last sampling period
- Number of active clients in the last sampling period
- Activity of the current client in the last sampling period

The **bw-alloc** parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when there is congestion on the wireless network. You must set traffic shaping to fair-access to use this bandwidth allocation value for an individual virtual AP.

## Example

The following command configures a traffic management profile that allocates bandwidth to the corpnet virtual AP:

```
(host) (config) #wlan traffic-management-profile best
    bw-alloc virtual-ap corpnet share 75
```

## Command History

This command was introduced in AOS-W 3.0. The mode parameters were introduced in AOS-W 3.2.

```

### Description

This command configures a virtual AP profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
aaa-profile	Name of the AAA profile that applies to this virtual AP.	—	“default”
allowed-band	The band(s) on which to use the virtual AP: a—802.11a band only (5 GHz) g—802.11b/g band only (2.4 GHz) all—both 802.11a and 802.11b/g bands (5 GHz and 2.4 GHz)	a/g/all	all
auth-failure-blacklist-time	Time, in seconds, a client is blocked if it fails repeated authentication. 0 blocks indefinitely.		0

Parameter	Description	Range	Default
band-steering	<p>ARM's band steering feature encourages dual-band capable clients to stay on the 5GHz band on dual-band APs. This frees up resources on the 2.4GHz band for single band clients like VoIP phones.</p> <p>Band steering reduces co-channel interference and increases available bandwidth for dual-band clients, because there are more channels on the 5GHz band than on the 2.4GHz band. Dual-band 802.11n-capable clients may see even greater bandwidth improvements, because the band steering feature will automatically select between 40MHz or 20MHz channels in 802.11n networks. This feature is disabled by default, and must be enabled in a Virtual AP profile.</p> <p>The Band Steering feature will not work unless you use the enable the "Local Probe Response" parameter in the Wireless LAN SSID profile for the SSID that requires band steering. You can enable the local probe response parameter using the CLI command <b>wlan ssid-profile &lt;profile&gt; local-probe-response</b>.</p>	—	disabled
blacklist	Enables detection of denial of service (DoS) attacks, such as ping or SYN floods, that are not spoofed death attacks.	—	enabled
blacklist-time	Number of seconds that a client is quarantined from the network after being blacklisted.		3600 seconds (1 hour)
broadcast-filter	Filter out broadcast and multicast traffic in the air.	—	disabled
broadcast-filter-arp	If enabled, all broadcast ARP requests are converted to unicast and sent directly to the client. You can check the status of this option using the <b>show ap active</b> and the <b>show datapath tunnel</b> command. If enabled, the output will display the letter a in the flags column.	—	disabled
clone	Name of an existing traffic management profile from which parameter values are copied.	—	—
deny-time-range	Time range for which the AP will deny access.	—	—
dos-prevention	If enabled, APs ignore deauthentication frames from clients. This prevents a successful death attack from being carried out against the AP. This does not affect third-party APs.	—	disabled
dot11k-profile	Name of an 802.11k profile to be associated with this VAP.	—	default
fast-roaming	Enable or disable fast roaming.	—	disabled
forward-mode	<p>Controls whether 802.11 frames are tunneled to the switch using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the switch, and Internet access remains local).</p> <p>Only 802.1x authentication is supported when configuring bridge or split tunnel mode.</p> <p><b>NOTE:</b> For split tunnel mode, the Remote AP license must be installed.</p>	bridge/ split-tunnel/ tunnel	tunnel
ha-disc-onassoc	If enabled, all clients of a virtual-ap will received mobility service on association.	—	disabled

Parameter	Description	Range	Default
mobile-ip	Enables or disables IP mobility for this virtual AP.	—	enabled
no	Negates any configured parameter.	—	—
rap-operation	Configures when the virtual AP operates on a remote AP: always—Permanently enables the virtual AP. backup—Enables the virtual AP if the remote AP cannot connect to the switch. persistent—Permanently enables the virtual AP after the remote AP initially connects to the switch. standard—Enables the virtual AP when the remote AP connects to the switch. Use always and backup for bridge SSIDs. Use persistent and standard for 802.1x, tunneled, and split-tunneled SSIDs. The Remote AP license must be installed.	always/ backup/ persistent/ standard	standard
ssid-profile	Name of the SSID profile that applies to this virtual AP.	—	“default”
strict-compliance	If enabled, the AP denies client association requests if the AP and client station have no common rates defined. Some legacy client stations which are not fully 802.11-compliant may not include their configured rates in their association requests. Such non-compliant stations may have difficulty associating with APs unless strict compliance is disabled.	—	disabled
vap-enable	Enable or disable the virtual AP.	—	enabled
vlan	The VLAN(s) into which users are placed in order to obtain an IP address. Enter VLANs as a comma-separated list of existing VLAN IDs or VLAN names. A mixture of names and numeric IDs are not allowed.		1
vlan-mobility	Enable or disable VLAN (Layer-2) mobility.	—	disabled

## Usage Guidelines

Wireless LAN profiles configure WLANs in the form of virtual AP profiles. A virtual AP profile contains an SSID profile which defines the WLAN and an AAA profile which defines the authentication for the WLAN. You can configure and apply multiple instances of virtual AP profiles to an AP group or to an individual AP.

A named VLAN can be deleted although it is configured in a virtual AP profile. If this occurs the virtual AP profiles becomes invalid. If the named VLAN is added back later the virtual AP becomes valid again.

## Example

The following command configures a virtual AP:

```
wlan virtual-ap corpnet
  vlan 1
  aaa-profile corpnet
```

## Command History.

Release	Modification
AOS-W 3.0	Command introduced

Release	Modification
AOS-W 3.2	Support for the split tunneling option and the rap-operation parameter was introduced.
AOS-W 3.3	In support of the IEEE 802.11n draft standard, a change to the allowed-band parameter was introduced.
AOS-W 3.3.2	<ul style="list-style-type: none"> <li>Support for the ha-disc-onassoc parameter was introduced.</li> <li>The band-steering parameter is not a released feature and was introduced. Do not use band-steering without proper guidance from Alcatel-Lucent.</li> <li>Support for the voip-proxy-arp parameter was introduced.</li> </ul>
AOS-W 3.4	The <b>voip-proxy-arp</b> parameter was renamed to <b>broadcast-filter-arp</b> and it does not require a Voice license.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system, except for the noted parameters.	Config mode on master switches

## wlan voip-cac-profile

```
wlan voip-cac-profile <profile>
  bandwidth-cac
  bandwidth-capacity <bandwidth-capacity>
  call-admission-control
  call-capacity
  call-handoff-reservation <percent>
  clone <profile>
  disconnect-extra-call
  no ...
  send-sip-100-trying
  send-sip-status-code client|server <code>
  wmm_tspec_enforcement
  wmm_tspec_enforcement_period <seconds>
```

### Description

This command configures a voice over iP (VoIP) call admission control (CAC) profile.

### Syntax

Parameter	Description	Range	Default
<profile>	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
bandwidth-cac	Select the desired call admission control (CAC) Mechanism: <ul style="list-style-type: none"><li>• Disable - CAC is based on Call Counts</li><li>• Enable - CAC should be based on Bandwidth.</li></ul>	—	disabled
bandwidth-capacity	Define the maximum bandwidth that can be handled by one radio, in kbps. The default value is 2000 kbps (2 Mbps)	—	—
<bandwidth-capacity>	Maximum bandwidth that can be handled by one radio, in kbps. The default value is 2000 kbps (2 Mbps)	1-600000	2000
call-admission-control	Enables or disables WiFi VoIP Call Admission Control features.	—	disabled
call-capacity	Number of simultaneous calls that can be handled by one radio.	0-8000	10
call-handoff-reservation	Percentage of call capacity reserved for mobile VoIP clients on call.	0-100	20%
clone	Name of an existing VoIP CAC profile from which parameter values are copied.	—	—
disconnect-extra-call	Disconnects calls that exceed the high capacity threshold by sending a deauthentication frame.	—	disabled
no	Negates any configured parameter.	—	—
send-sip-100-trying	Enables sending of SIP 100 - trying messages to a call originator to indicate that the call is proceeding. This is useful when the SIP invite may be redirected through a number of servers before reaching the switch.	—	enabled

Parameter	Description	Range	Default
send-sip-status-code client server <code>	Use this parameter with the <b>client</b> or <b>server</b> options to drop a SIP Invite and send status code back to the client or server. You must also include one of the following codes: <ul style="list-style-type: none"> <li>● <b>480</b>: Temporary Unavailable</li> <li>● <b>486</b>: Busy Here</li> <li>● <b>503</b>: Service Unavailable</li> <li>● <b>none</b>: Don't send SIP status code</li> </ul>	—	486
wmm_tspec_enforcement	Enables validation of TSPEC requests for CAC.	—	disabled
wmm_tspec_enforcement_period	Maximum time for the station to start the call after the TSPEC request.	1-100	1 second

## Usage Guidelines

The VoIP CAC profile prevents any single AP from becoming congested with voice calls.

## Example

The following command enables VoIP CAC:

```
(host) (config) #wlan voip-cac-profile cac1
    call-admission-control
    disconnect-extra-call
```

## Command History

Version	Change
AOS-W 3.0	Command introduced
AOS-W 3.4	<p>The following parameters were deprecated:</p> <ul style="list-style-type: none"> <li>● active-load-balancing</li> <li>● high-threshold-capacity</li> <li>● noe-call-capacity</li> <li>● sccp-call-capacity</li> <li>● svp-call-capacity</li> <li>● vocera-call-capacity</li> </ul> <p>The following parameters were introduced:</p> <ul style="list-style-type: none"> <li>● bandwidth-cac</li> <li>● bandwidth-capacity</li> <li>● call-capacity</li> </ul>

## Command Information

Platforms	Licensing	Command Mode
All platforms	Voices Services Module license	Config mode on master switches

## wms ap

```
wms ap <bssid> mode {dos|interfering|known-interfering|suspect-unsecure|unsecure|valid}
```

### Description

This command allows you to classify an AP into one of several categories.

### Syntax

Parameter	Description
<bssid>	BSSID of the AP.
mode	Classify the AP into one of the following categories.
dos	Enables denial of service for this AP. Any clients connected to this AP are disconnected.
interfering	An AP seen in the RF environment but is not connected to the wired network.
known-interfering	An interfering AP whose BSSID is known.
suspect-unsecure	A suspected rogue AP that is plugged into the wired side of the network but may not be an unauthorized device. Automatic shutdown of rogue APs does not apply to these devices.
unsecure	A rogue AP that is unauthorized and is plugged into the wired side of the network. You can configure automatic shutdown of rogue APs in the IDS unauthorized device detection profile.
valid	An AP that is part of the enterprise providing WLAN service.

### Usage Guidelines

If AP learning is enabled (with the `wms general learn-ap enable` command), non-Alcatel-Lucent APs connected on the same wired network as Alcatel-Lucent APs are classified as valid APs. If AP learning is disabled, a non-Alcatel-Lucent AP is classified as an unsecure or suspect-unsecure AP.

### Example

The following command classifies an interfering AP as a known-interfering AP:

```
(host) #wms ap 01:00:00:00:00:00 mode known-interfering
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms clean-db

wms clean-db

### Description

This command deletes the WMS database.

### Syntax

Parameter	Description
clean-db	Cleans the WMS database.

### Usage Guidelines

This command deletes all entries from the WMS database. Do not use this command unless instructed to do so by an Alcatel-Lucent representative.

### Example

The following command cleans the WMS database:

```
(host) #wms clean-db  
WMS Database will be deleted. Do you want to proceed with this action [y/n]:
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms client

```
wms client <macaddr> mode {dos|interfering|valid}
```

### Description

This command allows you to classify a wireless client into one of several categories.

### Syntax

Parameter	Description
client	MAC address of the client.
mode	Classify the client into one of the following categories:
dos	Enables denial of service to this client.
interfering	A client seen in the RF environment that is outside of the enterprise.
valid	A client that is part of the enterprise.

### Usage Guidelines

AOS-W can automatically determine client classification based on client behavior, but this command allows you to explicitly classify a client. The classification of a client is used in certain policy enforcement features. For example, if **protect-valid-sta** is enabled in the IDS Unauthorized Device Profile, then clients that are classified as valid cannot connect to non-valid APs.

### Example

The following command classifies a client as valid:

```
(host) #wms client 00:00:A4:34:C9:B3 mode valid
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms export-class

```
wms export-class <filename>
```

### Description

This command exports classification information into a file.

### Syntax

Parameter	Description
<filename>	Name of the file into which you want to export classification information

### Usage Guidelines

This command writes classification data into comma separated values (CSV) files—one for APs and one for clients. You can import these files into the Alcatel-Lucent Mobility Manager system.

### Example

The following command exports classification data into an AP and a client file:

```
(host) #wms export-class class
```

```
Exported data to class_ap.csv and class_sta.csv
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms export-db

```
wms export-db <filename>
```

### Description

This command exports the WMS database to a specified file.

### Syntax

Parameter	Description
<filename>	Name of the file into which you want to export the database. The filename plus any extensions must be no longer than 32 characters and may contain only keyboard characters.

### Usage Guidelines

The file is exported as an ASCII text file. If you have configured the switch for operation with the Alcatel-Lucent OmniVista Mobility Manager (OmniVista Mobility Manager), this command will fail and an error will be returned.

### Example

The following command exports the WMS database to a file:

```
(host) #wms export-db database
```

```
Exported WMS DB to database
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms general

```
wms general ap-ageout-interval <minutes> | collect-stats {disable|enable} |  
learn-ap {enable|disable} | persistent-known-interfering {enable|disable} |  
poll-interval <milliseconds> | poll-retries <number> | propagate-wired-macs  
{enable|disable} | sta-ageout-interval <minutes> | stat-update  
{enable|disable}
```

### Description

This command configures the WLAN management system (WMS).

### Syntax

Parameter	Description	Range	Default
ap-ageout-interval	Time, in minutes, that an AP remains unseen by any probes before it is deleted from the database.	0 to disable	30 minutes
collect-stats	Enables collection of statistics (up to 25,000 entries) on the master switch for monitored APs and clients. This only applies when OmniVista Mobility Manager is not configured.	enable disable	disabled
learn-ap	Enables “learning” of non-Alcatel-Lucent APs.	enable disable	disabled
persistent-known-interfering	Enables APs that are marked as known interfering from being aged out.	enable disable	disabled
poll-interval	Interval, in milliseconds, for communication between the switch and Alcatel-Lucent AMs. The switch contacts the AM at this interval to download AP to station associations, update policy configuration changes, and download AP and station statistics.	(any)	60000 milliseconds (1 minute)
poll-retries	Maximum number of failed polling attempts before the polled AM is considered to be down.	(any)	2
propagate-wired-macs	Enables the propagation of the gateway wired MAC information.	enable disable	enabled
sta-ageout-interval	Time, in minutes, that a client remains unseen by any probes before it is deleted from the database.	0 to disable	30 minutes
stat-update	Enables statistics updating in the database.	enable disable	enabled

### Usage Guidelines

By default, non-Alcatel-Lucent APs that are connected on the same wired networks as Alcatel-Lucent APs are classified as “rogue” APs. Enabling AP learning classifies non-Alcatel-Lucent APs as “valid” APs. Typically, you would want to enable AP learning in environments with large numbers of existing non-Alcatel-Lucent APs and leave AP learning enabled until all APs in the network have been detected and classified as valid. Then, disable AP learning and reclassify any unknown APs as interfering.

### Example

The following command enables AP learning:

```
(host) #wms general learn-ap enable
```

To disable AP learning:

```
(host) #wms general learn-ap disable
```

## Command History

This command was introduced in AOS-W 3.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## wms import-db

```
wms import-db <filename>
```

### Description

This command imports the specified file into the WMS database.

### Syntax

Parameter	Description
<filename>	Name of the file into which you want to import into the database. The filename plus any extensions must be no longer than 32 characters and may contain only keyboard characters.

### Usage Guidelines

The imported file replaces the WMS database. The imported file must be a valid WMS database file that you previously exported using the **wms export-db** command.

### Example

The following command imports the WMS database from a file:

```
(host) #wms import-db database
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms reinit-db

```
wms reinit-db
```

### Description

This command reinitializes the WMS database to its factory defaults.

### Syntax

No parameters.

### Usage Guidelines

When you use this command, there is no automatic backup of the current database. If an OmniVista Mobility Manager server is configured on the switch (see “[mobility-manager](#)” on page 296), this command will fail and return an error.

### Example

The following command reinitializes the WMS database:

```
(host) #wms reinit-db  
WMS Database will be re-initialized. Do you want to proceed with this action [y/n ]:
```

### Command History

This command was introduced in AOS-W 3.0.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable mode on master switches

## wms-local system

```
wms-local system max-threshold <max-threshold>
```

### Description

This command defines local WMS system settings for the maximum number of APs and client stations.

### Syntax

Parameter	Description
<max-threshold>	Set the max threshold for the total number of APs and Stations. This value can be any 32-bit number.

### Usage Guidelines

Use this command with caution. Increasing the limit will cause an increase in usage in the memory by WMS. In general, each entry will consume about 500 bytes of memory. If the setting is bumped up by 2000, then it will cause an increase in WMS memory usage by 1MB

### Example

The following command sets the maximum number of APs and stations at 500.

```
host) (config)# wms-local system max-threshold 500
```

### Command History

This command was introduced in AOS-W 3.3.2.

### Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config mode on master switches

## write

```
write {erase [all] | memory | terminal}
```

### Description

This command saves the running configuration to memory or displays the running configuration on the screen. This command can also be used to erase the running configuration and return the switch to factory defaults.

### Syntax

Parameter	Description
erase	Erases the running system configuration file. Rebooting the switch resets it to the factory default configuration. If you specify <code>all</code> , the configuration and all data in the switch databases (including the license, WMS, and internal databases) are erased.
memory	Saves the current system configuration to memory. Any configuration changes made during this session will be made permanent.
terminal	Displays the current system configuration.

### Usage Guidelines

Configuration changes made using the CLI affect only the current session. You must save your changes for them to be retained across system reboots. Changes are lost if the system reboots before saving the changes. To save your configuration changes, use the `write memory` command.

If you use the `write erase` command, the license key management database on the switch is not affected. If you use the `write erase all` command, all databases on the switch are deleted, including the license key management database. If you reset the switch to the factory default configuration, perform the Initial Setup as described in the *Alcatel-Lucent Quick Start Guide*.

If you use the `write terminal` command, all of the commands used to configure the switch appear on the terminal. If paging is enabled, there is a pause mechanism that stops the output from printing continuously to the terminal. To navigate through the output, use any of the commands displayed at the bottom of the output, as described in below. If paging is disabled, the output prints continuously to the terminal. For more information about the **paging** command, see [“paging” on page 309](#).

Key	Description
Q	Exit the display.
U	Page up through the output.
spacebar	Page down through the output.
/	Enter a text string to search for.
N	Repeat the text string to search for.

### Example

The following command saves your changes so they are retained after a reboot:

```
(host) #write memory
```

The following command deletes the running configuration and databases and returns the switch to the factory default settings:

```
(host) #write erase
```

## Command History

This command was introduced in AOS-W 1.0.

## Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Enable and Config modes

The AOS-W command-line interface offers different levels of user access by differentiating between different command modes.

When you first log in to the CLI, you start your session in *User mode*, which provides only limited access for basic operational testing. You must enter an additional password to access *Enable mode*, which allows you to issue show commands run certain management functions. Configuration commands can only be issued in *Config mode*. You can access Config mode by entering **configure terminal** at the command prompt. You can exit your current command mode and return to a lower-level command mode at any time by entering **exit** at the command prompt.

The following sections describes how to access each command mode, the command prompt for each mode, and links to its available commands.

## User mode

You always begin a CLI session in user mode, the command mode with the lowest level of user access. The command prompt for a user mode session is a greater-than (>) symbol:

**(host) >**

The following commands are available in user mode.

- [enable](#)
- [exit](#)
- [help](#)
- [logout](#)
- [ping](#)
- [traceroute](#)

## Enable Mode

To move from user mode to enable mode, you must enter the command **enable**, press **Enter**, then enter config mode password that was defined during the switch's initial setup process. (The default password is **enable**.) Users in enable mode may return to user mode at any time by entering the command **exit**.

The command prompt for a CLI session in enable mode is a pound (#) symbol:

**(host) #**

The following commands are available in enable mode.

- `aaa authentication dot1x clear`
- `aaa authentication stateful-dot1x clear`
- `aaa inservice`
- `aaa ipv6 user add`
- `aaa ipv6 user clear-sessions`
- `aaa ipv6 user clear-sessions`
- `aaa ipv6 user delete`
- `aaa ipv6 user logout`
- `aaa query-server`
- `aaa test-server`
- `aaa user add`
- `aaa user clear-sessions`
- `aaa user delete`
- `aaa user logout`
- `am`
- `ap wipe out flash`
- `ap-regroup`
- `ap-rename`
- `apboot`
- `apdisconnect`
- `apflash`
- `audit-trail`
- `backup`
- `boot`
- `clock`
- `configure terminal`
- `copy`
- `crypto isakmp packet-dump`
- `crypto pki`
- `crypto pki-import`
- `database synchronize`
- `delete`
- `dir`
- `dynamic-ip`
- `encrypt`
- `exit`
- `export`
- `halt`
- `help`
- `license`
- `localuserdb`
- `local-userdb-guest`
- `packet-capture`
- `page`
- `paging`
- `panic`
- `pcap`
- `ping`
- `reload`
- `reload-peer-sc`
- `rename`
- `restore`
- `rft`
- `show`
- `stm`
- `support`
- `tar`
- `traceroute`
- `usb reclassify`
- `whoami`
- `wms ap`
- `wms clean-db`
- `wms client`
- `wms export-class`
- `wms export-db`
- `wms import-db`
- `wms reinit-db`
- `write`

## Config Mode

To move from enable mode to config mode, enter the command **config terminal**. Users in config mode may return to enable mode at any time by entering the command **exit**.

When you are in config mode, (**config**) appears before the # prompt:

**(host) (config) #**

The following commands are available in basic config mode.

- aaa authentication
- aaa bandwidth-contract
- aaa derivation-rules
- aaa inservice
- aaa ipv6 user add
- aaa derivation-rules
- aaa derivation-rules
- aaa profile
- aaa radius-attributes
- aaa rfc-3576-server
- aaa server-group
- aaa sygate-on-demand
- aaa tacacs-accounting
- aaa timers
- aaa user fast-age
- aaa xml-api
- adp
- am
- ap enet-link-profile
- ap mesh-cluster-profile

## Configuration Sub-modes

Some config mode commands can enter you into a sub-mode with a limited number of available commands specific to that mode. When you are in a configuration sub-mode, the **(config)** that appears before the command prompt will change to indicate your current mode; e.g **(config-if)** for config-interface mode, and **(config-tunnel)** for config-tunnel mode.

You can exit a sub-command mode and return to the basic configuration mode at any time by entering the `exit` command.
